Within the last few years, American schools have moved toward routinely measuring the outcomes of their educational programs. Two major national associations, the American Association of Community Colleges and the League for Innovation in the Community College, have not only addressed the importance of institutional assessment in community colleges, but also displayed indicators and definitions to estimate effectiveness in the two-year sector (Community College Roundtable, 1990; Doucette and Hughes, 1994). The reports flowing into the ERIC system from individual colleges,
researchers, and state systems show a trend toward assessing outcomes. This Digest discusses gains made by community colleges in using the more quantitative indicators to assess outcomes.

The trend toward using indicators is encouraging for those who understand the value of institutional measures that document outcomes, successes, and effectiveness in the various programmatic efforts that community colleges undertake. The arguments in favor of assessment typically boil down to the need to document institutional effects so that students, the public, and the professional community understand how the institutions use their resources in fulfilling their missions.

But the millennium has not yet arrived; pockets of resistance still exist. While some colleges employ exemplary practices, others make "minimalist" efforts at assessment and cite the inability to produce evidence of effective performance, uneven institutional responses, and poor communication as hurdles (Hudgins, 1993). Some of the arguments against assessment are well-founded; for example, a common complaint is that available assessment technologies are fairly primitive. Other arguments are delusive, betraying a reluctance to consider outcomes on the part of educators whose professional life has been dedicated to process, not product. Still other justifications are offered by those who don't understand its usefulness or who shrink from the effort of obtaining reliable data. Some of the antagonists are practical, contending that the political arena in which institutional support is generated and sustained thrives on image, good news, and successes; therefore, the validity of the research methods (if any) used to derive that information are irrelevant.

Another assessment concern involves qualitative indicators. While headway has been made in using quantitative indicators, considerably less progress has been made in employing more abstract indicators of institutional effectiveness, such as general education outcomes. The reason can be attributed in part to the community colleges' diverse clientele, pointing to a disjuncture of methods and motives (Palmer, 1993).

Nevertheless, the move toward assessing institutional effectiveness seems steady and we can anticipate more reports, more concise definitions, more attempts to display institutional value through providing evidence of student progress.

ESTABLISHING INDICATORS

The League for Innovation monograph describes five major missions: transfer; career preparation; basic skills; continuing education and community service; and access; and further breaks down the five missions into 69 sub-sets. The authors suggest assessing the transfer mission variously by measuring student knowledge, the college's transfer rate, the grades that students earn when they transfer to universities, and the number of college credits that universities accept (Doucette and Hughes, 1990). The Community College Roundtable document describes seven missions and thirteen indicators: three
listed under student progress; two under career preparation; two under transfer; one in
developmental education; two in general education; one under customized education;
and two in community development (1994).
The important characteristic of the works cited is that each of them offers an operational
definition for each indicator. The League document lists the questions to be asked and
the data sources from which answers can be derived for each of the indicators that it
sets forth. For example, under the transfer mission, they suggest that the college's
transfer rate can be reasonably measured by using "enrollment reports and student
profile data; transcripts; student surveys; reports from transfer institutions" (p. 11). The
Community College Roundtable document offers two indicators for the transfer mission:
"the number and rate who transfer" and "performance after transfer" (p. 11). Cohen
(1992) further refined a transfer indicator by specifying the method of calculation within
the definition itself: "A transfer rate can be calculated by counting the number of
students who enter in a given term with no prior college experience and who receive a
minimum of twelve units in the college [divided into the number who] matriculate at a
university within the next four years" (p. 45). Thus, the validity of the indicators is
suggested by the extent to which they reflect the colleges' basic missions; they provide
a continual report on institutional effects.

The indicators that have been articulated also display certain other valuable
characteristics. They are readily understandable by members of the college community
and the lay public--an important characteristic because an indicator in which the
measurement is couched in arcane terms, buried under masses of data, and reliant on
esoteric statistical manipulations is not likely to convince anyone that the college is
doing a good job. A second important characteristic of indicators is that they must be
declared so that the data necessary for measurement are available or can be gathered at
minimal expense; few colleges have the resources to conduct involved research
studies. And while it is inevitable and unfortunate that outside agencies will use some
data comparatively, it is essential that institutions treat indicators as measures of
institutional effectiveness so that faculty will buy into the process. The indicators are for
the use of the college community itself in estimating how it is doing year after year in
each of its major missions.

THE METHODS IN USE

A review of ERIC documents processed for the period between 1982 and March 1994
found 48 studies that included data useful in assessing institutional effectiveness. The
follow-up survey of students who had recently graduated, dropped out, or transferred
was the predominant form of data receipt. Such surveys typically asked about student
satisfaction, jobs obtained, earnings, and further schooling involvements. The
contemporary interest in transfer rates was exhibited by a number of studies that
calculated the rate of transfer from the colleges to the neighboring universities. Several
of these studies also reported student performance at the university. Interestingly,
student performance at the university as a criterion of college success and the use of
follow-up surveys to estimate student satisfaction and earnings are the two measures that have been traditionally used by community colleges in the past to assess outcomes. Other measures that appeared repeatedly were occupational education outcomes; pre- and post-measures of student learning in college courses and programs; and a few public-image studies in which members of the community were asked what they thought of the college or students were asked if they were satisfied. A new category of assessment that has achieved considerable interest in recent years includes studies done in response to state or accreditation association mandates. Here, the colleges follow the directives of these agencies and produce documentation which often centers on basic numbers of students according to ethnicity and gender, and patterns of enrollment, attrition, graduation, job placement, and transfer.

The basis for defining institutional effectiveness is readily at hand. Since the community college is a school it is expected to effect learning. But it is also expected to have an impact on the students' successive enrollments in institutions of higher learning and attaining jobs that they might not have received had they not been associated with the community college. Most of the indicators of institutional effectiveness center on one or another of the colleges' basic missions: career upgrading; general education; job entry; literacy development; personal interest; and transfer. As long as indicators are not used to rank colleges normatively, their routine acceptance seems assured.
