A project to identify alternative strategies for assessing the academic language of English language learners is reported. First, literature on the concept of academic language is reviewed, and then findings from classroom research are used to propose an alternative conceptualization of academic language, one which focuses on the role of stylistic register in communicating about academic tasks. Next, results of a survey of 157 English-as-a-Second-Language (ESL) educators concerning academic language and assessment are presented. Responses to five of the most salient questions are analyzed in detail; others are appended. A number of alternative assessment strategies are considered: physical demonstrations; pictorial products; K-W-L (Know-Want-Learn) charts; oral performances; portfolios; oral and written products; and teacher-made measures that complement alternative assessment. Implications of the project's findings for educators, educational practice, reform, and policy are discussed. Appendices which make up over 50% of the document contain the survey instruments, classroom data sheet, and the compiled data from all questionnaires. Contains 43 references. (MSE)
Assessing Academic Language of English Language Learners

Introduction

During the past decade, there has been increasing interest in techniques for assessing the academic language of English language learners (ELLs). Most instruments that are designed to assess English language proficiency do not assess academic language skills. Generally, they assess various discrete language skills and even global communicative language skills, but they are not designed to assess language skills of the sort that students need to successfully accomplish academic tasks in mainstream classrooms.

The purpose of this project is to identify alternative assessment strategies that are appropriate for the academic language proficiencies of ELLs. In doing so, we show how findings from classroom research we carried out on academic language, as well as results from a survey of teachers we conducted, provide justification for using alternative assessments for the academic language proficiencies of ELLs. We believe that implementing alternative assessment strategies with ELLs is one important means of enhancing the educational outcomes and experiences of ELLs.

In this report we begin by reviewing the literature on the concept of academic language. We then use the findings from our own classroom research to propose a model of academic language. Next, we discuss results from a survey we conducted of ESL educators on academic language and assessment. We then review several alternative assessment strategies that we believe are appropriate for the academic language proficiencies of ELLs. And
finally, in the conclusion we discuss the implications of our project for educators, educational practice, reform, and policy.

**Academic Language**

We turn our attention first to clarifying the concept of academic language to provide a basis for understanding what types of assessment strategies are most relevant. We begin by reviewing the literature on academic language and related research on classroom discourse. Next, we propose an alternative conceptualization of academic language. Finally, we discuss examples from classroom transcripts that illustrate our framework for academic language. This section will form the basis for our discussion of assessment below.

**Research Literature on Academic Language**

Two distinct hypotheses dominate the relatively small body of research literature on academic language. The first hypothesis proposes that academic language is a compilation of unique language functions and structures that are difficult for language minority students to master (Hamayan & Perlman, 1990, p. 1). O’Malley (1992, p. 177) and Pierce & O’Malley (1991, pp. 4-5) hypothesize, for example, that a handful of academic language functions are characteristic of classrooms in general: seeking information, informing, analyzing, comparing, classifying, predicting, hypothesizing, justifying, persuading, solving problems, synthesizing, and evaluating.
Other researchers have also viewed academic language in terms of a set of unique language functions and structures. For example, Spanos, Rhodes, Dale, & Crandall (1988) apply this perspective to mathematics. Basing their findings on simulated mathematics problem-solving sessions among community college algebra students, Spanos, et al. argue that syntactic features, such as comparatives ("greater than/less than"), logical connectors ("if...then," "given that"), reliance on the passive voice, and various uses of prepositions are particular to the language used in mathematics classes.

According to Spanos, et al., the semantic features of mathematics language consist of new technical vocabulary (e.g., "additive inverse," "coefficient"), ordinary vocabulary that has different meanings in math ("square," "power"), complex strings of words (e.g., "least common denominator," "negative exponent"), synonymous words and phrases (e.g., "add," "plus," and "combine" all mean addition), and various mathematical symbols and notations (1988, pp. 226-227).

The National Science Teachers Association (1991, p. 7) and Chamot & O'Malley (1986, p. 23) describe the functions of scientific academic language as formulating hypotheses, proposing alternative solutions, describing, classifying, using time and spacial relations, inferring, interpreting data, predicting, generalizing, and communicating findings. Chamot and O'Malley further note that science utilizes certain non-technical terms that have unique meanings in a scientific context (e.g., "table,"
"energy"), a scientific discourse which is characterized by a particular sequence of steps, and a heavy reliance on the use of the passive voice and long noun phrases (1986, pp. 24-25). Lemke (1990) also notes a preference for the passive voice in science.

Halliday (1989) suggests that science uses the following academic language features: interlocking definitions, technical taxonomies, special expressions, lexical density, syntactic ambiguity, grammatical metaphor, and semantic discontinuity. These features, Halliday stresses, do not occur in isolation, but do, in fact, overlap with one another, particularly in text passages.

Short (1994, p. 597) notes that students must be able to effectively use the following language functions in American history classes: explaining, describing, defining, justifying, giving examples, sequencing, comparing, and evaluating. Short writes that history texts employ a variety of syntax types, including simple past, historical present, sequence words, active voice, temporal signals, and causative signals. She points out that, while these language functions are not exclusive to American history, they do play an important role in the language learning of students.

Coelho (1982) discusses the functions of the academic language of social studies by subject area. For example, history often uses time-specific language, signalling of cause and effect, hypothesizing, generalizing, comparing and contrasting, and adopting specialized vocabulary. Chamot and O'Malley also
discuss the following features of the academic language of social studies that might be difficult for language minority students to learn: the use of unfamiliar political/cultural concepts (such as "democracy"), an expository discourse style, and textbook sentences with multiple embeddings (1986, p. 68).

In a second area of academic language research, advanced by Cummins (1981), scholars attempt to distinguish academic language from "conversational language" (what is at times referred to as Basic Interpersonal Communicative Skills, or BICS) in terms of the "contextual support available for expressing or receiving meaning" (Cummins, 1981, p. 11). Cummins, and those who have built upon his model (Chamot & O'Malley, 1987, 1986; Collier, 1987; Hamayan & Perlman, 1990; Mohan, 1989, 1986; O'Malley, 1992; Saville-Troike, 1984, 1991; Schleppegrell & Christian 1986; Spanos, et al., 1988; Pierce & O'Malley, 1992), argue that BICS is more context-embedded in nature than academic language. That is, BICS obtains meaning among those communicating through the aid of various situational and paralinguistic cues. This means that students do not have to rely exclusively on language in order to comprehend meaning; students draw on a variety of cues, such as body language, speech intonation, and sequence of events, to understand language.

In contrast, these scholars claim, academic language is context-reduced in nature, meaning that students do not have an abundance of situational and paralinguistic cues at their disposal to obtain meaning (Cummins, 1981, p. 11). This means
that students must rely, in the most extreme cases, on verbal and spoken language for comprehension. The degree that academic language is context reduced varies, however, according to context. A classroom discussion, Cummins argues, will be marked by a fair amount of situational cues, while a textbook passage requires that the reader base his or her understanding solely on the actual words he or she reads (1981, p. 12).

Cummins further distinguishes academic language according to its cognitive demands. As he explains, the less automatized a language task is, the more cognitively demanding it is (1981, p. 13). For example, "persuading other individuals that your point of view rather than theirs is correct, or writing an essay on a complex theme" are cognitively demanding tasks (1981, p. 13). Academic language is most difficult for language minority students, then, when they are required to carry out cognitively demanding tasks in context-reduced situations.

Our research, as we discuss in greater detail below, builds upon the literature on academic language in two respects. First, we emphasize the relationship between language and academic tasks. Second, as a result of our emphasis, we provide detailed transcripts of actual classroom lessons to show how students and teachers use academic language to accomplish academic tasks.

Research Literature on Classroom Discourse

Although research on classroom discourse has been concerned with turn-taking and participation patterns, rather than describing the features of academic language, it is important to
review this body of research literature because of its relevance to our research project. Mehan (1979) pioneered research in the field by demonstrating that classroom lessons are not arbitrarily structured, but are governed by unique interactional sequences he calls the Initiation-Reply-Evaluation (IRE) pattern. The initiation phase of IRE refers to a communicative act on the part of the teacher, usually in the form of a verbalized question, that sets the discourse structure in motion. Teacher questions can be addressed to individual students, segments of the class, or the class as a whole. The second phase of the sequence is comprised of a reply to the teacher's initiation by a student or group of students. In the evaluation phase of IRE the teacher indicates to the students whether the reply phase is "right" or "wrong."

Mehan provides the following examples from his research to illustrate basic IRE interactional sequences (1979, pp. 52-53):

<table>
<thead>
<tr>
<th>Initiation</th>
<th>Reply</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>T:And whose is this?</td>
<td>Many: Veronica</td>
<td>T:Oh, a lot of people knew that one.</td>
</tr>
<tr>
<td>T:Um, whose name is this?</td>
<td>L: Mercedes</td>
<td>T:Mercedes, right.</td>
</tr>
<tr>
<td>T:Now who knows what this one says (holds up new card)?</td>
<td>A: Cafeteria.</td>
<td>T: Cafeteria, Audrey, good for you.</td>
</tr>
<tr>
<td>This is the long word. Who knows what this says?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
T: Um, why do you think that's a job for them.
J: 'Cause that's a job for them.
T: Yes, it would be a job.

Note that in each case the teacher begins the interactional sequence with a question. A student then offers a reply. In the third and final phase of the sequence the teacher evaluates the students' responses, thereby bringing to a close the IRE structure. While Mehan does state that there are more complex variations on the IRE structure, he notes that it is important to remember that the majority of classroom interactions are constrained by the IRE sequence.

Since Mehan's study, other scholars have advanced research in this area by suggesting that there is a relationship between various classroom discourse structures and the academic outcomes of language minority children (Au, 1980; Cazden, 1988; Macias, 1990; Michaels & Collins, 1984; Mohatt & Erickson, 1981; McCollum, 1989; Philips, 1983; Ripich & Spinelli, 1985; Trueba & Delgado-Gaitan, 1988; Tattershall & Creaghead, 1985). In what scholars have come to view as a classic ethnography in this vein, Philips (1983) explores the negative effects of mainstream classroom participation structures on the academic achievement of Warm Springs Indians in Oregon. Philips refers to the following data to demonstrate that Warm Springs Indians are less successful than Anglo students in effectively responding to and utilizing the mainstream communicative patterns of the first- and sixth-
grade classrooms in her study (1983, pp. 95-114). Warm Springs Indians talk less than their Anglo peers during official classroom discourse structures; teachers negatively evaluate Warm Springs Indians with greater frequency than they do Anglo students; Warm Springs Indians question the meaning of teacher instructions with greater frequency; Warm Springs Indians are "reprimanded more often that non-Indian students for not paying attention" (p. 100); Warm Springs Indians appear not to listen as attentively to teachers as their Anglo peers; and "Indian students generally make less effort than Anglo students to get the floor in classroom interaction" (p. 108).

Such disparities between Warm Springs Indian and Anglo students, Philips argues, can be traced to culturally incompatible notions of communication. As Philips notes (1983, p. 115):

For the Indian students, getting the floor in classroom encounters regulated in Anglo fashion requires them to behave in ways that run counter to expectations of socially appropriate behavior in the Warm Springs Indian community. Warm Springs Indians, Philips points out, are socialized with the notions that "address by a speaker is more often general, rather than focused on a particular individual;" "an Indian response to what a speaker has said is not always necessary;" and "Indian speakers control the ends of their own turns" at talk (1983, p. 115). Anglo communication, Philips argues, is based on the notion that speakers exercise greater control "over the turns of others" (1983, p. 115). This Anglo ideal, embodied in a teacher who systematically determines who will speak and when, conflicts
with most of the fundamental tenets of Warm Springs communicative conventions. The manifestation of such a conflict, Philips states, is the relatively high academic failure rate of Warm Springs students.

In a more recent study, McCollum (1989) compared the lesson structures in a third-grade classroom in Puerto Rico and in Chicago. The IRE structure of the Puerto Rican classroom, she points out, is much more fluid and open-ended than the IRE of the Chicago classroom. That is, although an initiation-reply-evaluation sequence characterizes the Puerto Rican classroom, there is much more informal give and take between the students and the teacher than in the Chicago classroom. As such, McCollum explains why immigrant Puerto Rican students have difficulties adapting to the IRE discourse structure of the Chicago school. She argues that educators should take native discourse structures into account when dealing with students from cultures that use more fluid IRE sequences.

As our review of some of the classroom discourse literature indicates, researchers have demonstrated that certain interaction patterns can limit the participation of language minority students in mainstream classrooms. The strength of this research is its use of linguistic data from actual classroom lessons to support researchers' claims. What is needed to further understand language use in classrooms, however, is the study of the quality or nature of the language that students must use to be deemed successful by teachers and administrators. As
Gumperz suggests, it is important to focus on "contextualization-based, on-line, discourse-level inferencing rather than just concentrating on regularities of sequential organization across speech exchanges" (1992, p. 231). We will follow Gumperz' suggestion and focus on a variety of discourse features, rather than limiting our analysis to isolated instances of IRE sequences, when we discuss our research findings below.

An Alternative Conceptualization of Academic Language

The sociolinguistic concept that frames much of the literature on academic language that we have discussed is register. Halliday introduced the concept of register to account for "a variety of a language distinguished according to use," rather than one tied closely to the user (what is traditionally defined as dialect) (1964, p. 87). Simply stated, register refers to the notion that "the language we speak or write varies according to the type of situation" (Halliday 1978, pp. 31-32). According to Halliday (1978, p. 31), gaining insight into the properties of a particular register involves exploring what is taking place, who is taking part, and what part language is playing.

In Halliday's model, registers are distinct from one another according to lexical and syntactic features. That is, Halliday argues that different contexts call for different lexical and syntactic items. Halliday states:

the crucial criteria of any given register are to be found in its grammar and its lexis. Probably lexical features are
the most obvious. Some lexical items suffice almost by
themselves to identify a certain register: "cleanse" puts us
in the language of advertising, "probe" of newspapers,
especially headlines, "tablespoon" of recipes or
prescriptions, "neckline" of fashion reporting or
dressmaking instructions (1964, p. 88).

Halliday's conceptualization of register has had a strong
influence on other scholars' research on registers.
For example, Biber and Hared (1992) delineated various Somali
oral and written texts according to register. Doing so involved
tagging "each word in a text for its grammatical category" and
counting "the frequency of each feature in each text" (1992, p.
48). Biber and Hared generated the following list of linguistic
features to delineate different registers: dependent clauses,
main clause and verbal features, nominal features, pronouns,
adjectival features, lexical classes, lexical choice, preverbal
particles, reduced and interactive features, coordination, and
focus constructions (1992, p. 50-51).

Other examples of Halliday's notion that registers are
distinguished by lexical, syntactic, grammatical, and
phonological features can be found in Hoyle's (1990) research on
children's uses of "sportscasting" registers, Irvine's (1990)
analysis of Wolof registers of affect and status, Snider's (1990)
examination of tonal registers in the Krachi language of Ghana,
and Christie's (1991) research on "pedagogical and content
registers" during a classroom writing lesson.

Halliday's conceptualization of register has also influenced
how scholars discuss register in introductory sociolinguistics
textbooks. For example, Romaine (1994), Saville-Troike (1989),
Hudson (1980), Gregory and Carroll (1978), and Ure and Ellis (1977) all state that registers are distinguished by discrete lexical, syntactic, grammatical, and phonological features.

While Halliday's model of register is important because it focuses on relationships between context and language, data we collected from two classrooms suggest that academic language is not solely distinguished by lexis, syntax, or various other discrete linguistic features. As we show below, the teachers in our study imply that their students are to use particular styles of language to accomplish various academic tasks. These styles of language, which we will refer to as stylistic registers, are associated with broad, discourse-levels of language, rather than discrete, sentence-level linguistic features, as Halliday's theory asserts. That is, the teachers in our study attempt to get their students to talk in a particular style to accomplish certain academic tasks.

Various other sociolinguistic concepts, such as "speech event," "code," and "linguistic variety" also refer to broad, discourse levels of language. Unlike "stylistic register," however, these concepts generally are not conditioned by predictable contextual factors. The advantage of viewing academic language in terms of stylistic registers is that one can assume that various academic tasks (contextual factors) influence the style of language to be used.
Classroom Research

To understand how students and teachers use academic language in actual class lessons, we attended and tape recorded lessons in two fifth grade classes in a public bilingual school in Washington, D.C. during the 1993-1994 school year (see Appendix A for data gathering sheet). All of the lessons we tape recorded were in English. The teachers are Ms. Alvarado, who taught a pull-out English as a second language (ESL) class, and Mr. Fuentes, who taught a social studies class.

Example One

We examine first a stylistic register of academic language that we call "story retelling," from Ms. Alvarado’s class. Story retelling is characterized by the teacher’s insistence that students retell a story they have read in precise chronological order. As our transcript shows below, the teacher encourages students to use a specific style of language to accomplish the academic task at hand.

Acquiring this skill can be difficult for language minority students who are not accustomed to discussing written material in such a manner. The difficulty was further compounded for language minority students in this classroom because the teacher was not explicit about her academic language requirements at the onset.

* In order to maintain teachers' anonymity, we use pseudonyms in this paper.
In the example below, Ms. Alvarado asks a male Spanish-speaking student, K, to retell the beginning of a story that the class had read, *The Invisible Hunters* (1987). Confusion arises, however, when K interprets "beginning" as the beginning portion of the story, rather than the literal beginning of the events:

T: Ok, before we start reading, who can raise their hand and tell us what has happened in the story so far? What happened in the story so far? Tell us the story. Imagine that I don’t know that story. Tell me the story so far, part of it. K, what happens at the beginning of the story?

S: Um, /?/ found his friend?

T: Ok, good. But can you start by saying--

S: I mean, he heard a voice saying, "Dar, Dar, Dar" [character's name].

T: Ok, good. Can you go back even further? Can you tell us-

S: They were hunting for--

T: Ok, they were--

S*: Wari [type of animal in story].

T: Hold on. Who was hunting?

S: Three brothers.

T: Ok, three brothers were .. hunting.

Ms. Alvarado indicates to K that he is not using the correct stylistic register of academic language (line 7) by negatively evaluating his response ("Can you start by saying"), but K interrupts her in the next line in an attempt to correct himself.
His second response also proves to be an unsatisfactory starting point for retelling the story, as the teacher indicates in a more explicit manner: "Can you go back even further?" (line 10). K interrupts Ms. Alvarado once again, but this time mentions part of what she considers to be the appropriate stylistic register of academic language, the actual beginning of the story ("They were hunting"). In the remainder of the segment, Ms. Alvarado probes for more information concerning K’s response ("Who was hunting?") and uses K’s answer, plus the first bit of information he provides ("They were hunting"), to model a sentence that reflects an appropriate chronological retelling of the beginning of the story ("Ok, three brothers were...hunting").

Several interpretations of this interaction are possible. Observers who do not focus on academic language as an important classroom activity might conclude that K has a problem with reading comprehension, resulting perhaps from some sort of cognitive deficit, because he cannot correctly answer what appears to be a straightforward and simple question. When viewed from a sociolinguistic perspective, however, it becomes clear that K might not be familiar with the academic language requirements for chronological story retelling. Perhaps he needs explicit instruction regarding chronological story retelling, as well as repeated exposure to it, in order to gain proficiency in this register of academic language.
Example Two

In this example, the academic task at hand is responding to a pen-pal letter. As such, the stylistic register in the exchange below between Ms. Alvarado and R, a Latino student, is specific to the task of letter-writing. Ms. Alvarado, noticing that R has mistakenly written responses to a pen-pal letter on the actual letter instead of a clean sheet of paper, and has written in incomplete sentences, works one-on-one with him to formulate correct responses. As the transcript begins, Ms. Alvarado reads a question from the pen-pal’s letter and then engages in a discussion with R about appropriate ways to respond.

1 T: Alright, let’s see what else. “Do you have pets at home?”
2 And you wrote what?
3 R: “Yes, a /?/”
4 T: Yes.
5 R: A monkey(?).
6 T: Ok, why don’t you explain that to her.
7 R: I said, “Yes, a /?/”
8 T: So what sentence are you going to write?
9 R: “Yes, I do”?
10 T: “I do” what?
11 R: “I do have”..
12 T: Have.. have what?
13 R: A dog.
14 T: Ok, you can tell her that...(S writes sentence). “I have a dog in /?/” What goes at the end? Ok, now you said you have a dog and two cats, and then you put “no dog.” Do you know why you put that?
R: /?/

T: Alright, the important thing is that you understand that when you're writing back to your pen pal you have to answer the questions in your letter, right? Because this letter is for you. You are going to keep this letter. So if you write the answers on her letter, she will never know the answers. Right? You have to write them on your letter. Ok, what I'd like you to do now, then, is go to your final copy.

In line 6 Ms. Alvarado suggests that R's response to the question of whether he has pets is not the appropriate academic language register because it is not explicit enough (Ok, why don't you explain that to her). In line 7 R attempts to clarify his initial response by repeating it to Ms. Alvarado, but she continues to suggest that he is not using the correct register of academic language by implying that his response must be in the form of a complete sentence (So what sentence are you going to write?).

R attempts on three more occasions (lines 9, 11, and 13) to respond to Ms. Alvarado's question, but in each case Ms. Alvarado notes that his responses are not explicit enough: "I do" what? (line 10) and Have..have what? (line 12). In line 14 Ms. Alvarado suggests that R should compile the information that, until this point he had related to her in piecemeal fashion, in one complete sentence: Ok, you can tell [write] her that. At the end of the transcript (lines 19-26), Ms. Alvarado reinforces the purpose of her discussion with R by discussing what constitutes appropriate academic language for writing letters.
As in the first example we discussed (see above), the interaction between Ms. Alvarado and R suggests that he does not have difficulty comprehending his pen-pal’s letter, but, instead, is not accustomed to the particular style of language needed to respond to letters.

Example Three

In this final example, the academic task is a discussion of a filmstrip from a critical perspective, that is, "reading between the lines" of the superficial content of the filmstrip. As such, Mr. Fuentes tries to get his students to adopt a register of language that we refer to as critical discourse. The filmstrip was about the lifestyles of native peoples in regions of northern Canada and the Arctic. As the transcript begins, Mr. Fuentes explains his reaction to the filmstrip and then poses a question to the class.

1 T: Now, the narrator, in my opinion, painted this thing a little bit more neutrally than I believe a lot of this stuff really happens. When he begins to say that many people now choose to live in settlements [oil company sponsored residential areas for employees; the settlements are cramped and "lower class" in appearance], in cities, and many of these traditional ways were sort of, oh, they’re not lost, and they’re not forgotten, and they weren’t lost and forgotten on purpose. A lot of these traditions are still maintained because many times these are the few opportunities that they get to practice their traditional sort of cultural traditions and practices. A lot of these people who have actually begun to live in settlements like this, can anybody sort of give me an idea why many people have chosen to do this? Ms. R?

16 R: It’s easier to live /?/

17 T: Ok, it’s easier to live like this [than in indigenous housing]. M?
M: Some people like don't like crowded areas, and a lot of
people don't want to live there. Well some people don't, a
lot of people don't live there.

T: A lot of people live where?

M: In...

T: In these communities?

M: Yeah.

T: Ok. Ok, those are good reasons. Other ones? Mr. L?

L: They want their kids to get an education so they can work?

T: Ok, they want their kids to get an education so they want
to work. Anybody else?

(A few minutes later in the lesson....)

E: Because everything's in the way, like cars.

T: Everything's in the way, like cars. How did cars get in
their way?

L: No, like when their ancestors lived there were no cars, so
it was, like, easier for them without having to ask the
government if they could /?/--

T: Ah, good point. They have to ask the government for
permission to fish and hunt and all those things? Alright, and I think Mr. E. is pretty close to what's been going on
for the last several hundred years. This gentleman [oil
worker in film strip], he works on the oil rigs. Now these
oil rigs, these companies are owned by, these oil companies
are owned by big, big, big, huge corporations that go into
the land and they pull the oil out. You heard what the
gentlemen [the narrator] said, well some of the agreements
that have been made with the people [natives] haven't always
been fair. Mr. E?

E: Well they like take advantage of them?

T: Sure. Why do they take advantage of them? Mr. L?

L: Because they, like, they don't know what money was?

T: At one time they didn't know what money was. But, go on.

L: They've never been in that kind of environment?
In the beginning portion of the transcript (lines 1-15), Mr. Fuentes models a critical discourse stylistic register for his students by noting that the narrator, in my opinion, painted this thing a little bit more neutrally than I believe a lot of this stuff really happens. He then goes on to question the filmstrip's portrayal of the integrity and maintenance of various native cultural traditions. Mr. Fuentes concludes his opening statement by posing a question to the class about why many native peoples live in oil company-sponsored housing.

In lines 16-29 several students offer responses to his question. Mr. Fuentes uses an interesting technique to indicate to his students that they are not using an appropriate stylistic register without discouraging additional students from offering their ideas. Note that Mr. Fuentes repeats each student’s response but does not explicitly evaluate its content. Instead, he suggests that the response is not appropriate by continuing to elicit responses from other students.

The pattern shifts in line 30, however, when Mr. Fuentes, in response to an idea offered by E (line 30), asks him to elaborate on his comment. This suggests that E has begun to use language in the style Mr. Fuentes desires because he does not simply repeat E’s utterance and move on to another student.

E further elaborates on his point in lines 33-35, which leads Mr. Fuentes to provide the first explicit positive
evaluation of a student thus far in the transcript: *Ah, good point* (line 36). Mr. Fuentes then uses E’s comments as the basis to advance the critical discourse of the lesson further by discussing the value of the oil company’s practice of digging on native land (lines 36-46).

Mr. Fuentes’ expansion of the critical discourse register spurs E to use the critical discourse register more boldly in line 47 when he offers the idea that *they like take advantage of them*? In the remainder of the transcript Mr. Fuentes indicates that his students are getting the hang of using a critical discourse stylistic register by providing explicit positive evaluations of their comments, as opposed to neutral evaluations, as he did at the beginning of the transcript when the students were having difficulty adjusting to the register to complete the task.

As the three examples from class lessons that we have examined reveal, academic language stylistic registers are shaped by the particular academic task at hand. Although lexis and syntax might distinguish some types of language use in classrooms, our data suggest that this is not the case for the lessons we have examined. In our three examples, the teachers shape the specific styles of language they think are required of the students for the academic tasks at hand.

**Assessment Strategies for Academic Language**

Our finding that academic language stylistic registers are associated with various academic tasks overlaps with the
philosophical underpinnings concerning the nature of language in the field of alternative assessment. That is, our research confirms the views of writers on alternative assessment that language is best understood as a tool for carrying out concrete tasks and activities. As Harp (1994, pp. 8-9) notes in his introduction to a volume on alternative assessment,

Language is used for real purposes and to solve real problems. Language is used to get things done, for interpersonal relations, to solve problems, to pretend and imagine, to explain to others, and to re-create past experiences.

Other writers on alternative assessment have expressed similar views regarding language (cf. García & Pearson, 1994; Goodman & Goodman, 1989). Bertrand (1994), reacting to the tendency of many teachers and researchers to focus on discrete aspects of academic language, writes in a volume on alternative assessment that "language is integrative...it cannot be broken down into fragments and retain meaning" (p. 36).

Because standardized tests focus on discrete aspects of language in a decontextualized manner, we suggest that various alternative assessments, with their holistic focus on the relationship between language and practical tasks, are most appropriate for assessing the academic language proficiencies of English language learners.
Survey Research

We conducted a survey of over 500 ESL educators across the United States to learn about their perceptions of academic language and the strategies they find most useful for assessing it. Responses were received from 157 educators. The survey consisted of eight open-ended questions that asked educators, among other things, to define and describe academic language, give examples of students who proficiently use it in speaking and writing, discuss the problems some students have with it, and provide examples of how best to assess it (see survey instrument in Appendix B). Below we present responses to and discuss questions that we believe are most relevant to ESL educators (questions 1, 4c, 5, 6, and 8) (see Appendix C for all survey responses).

QUESTION 1

Many people have said that ESL students need to learn a particular style of language in classrooms, called "academic language," meaning the type of written and spoken language students need to successfully participate in academic tasks in...
the classroom. Please give an example or two of academic language from a recent classroom lesson of yours.

Most respondents (59 percent) suggested in their descriptions that vocabulary is a key feature of academic language. Respondents in this category stated that the language used in various content areas, such as math, social studies, science, and so on, requires mastery of specific terms and phrases unique to those areas. The following are examples of responses that focus on the importance of vocabulary in academic language:

- **In math lessons students need to learn the mathematical tenses.** My 3rd graders whom I help in math, have learned the English terms for + "plus," - "minus" (or take away), > larger than and < less than. Also, when learning money they've had to learn the names of American coins and their values, ex. dime.

- **Grade K--shapes:** triangle, square, circle; **math:** more or less; **science:** seed, sprout, life cycle.
  - Grades 1&2--community; transportation; market; habitat.
  - Grades 3&4--continental shelf; intertidal zone; oceans and continents; compass rose, etc.
  - Grades 5-8th--nutrition, protein; carbohydrate; vitamins and minerals; grams; liters.
  - Please note: This is language taught at intermediate ESL level; I have excluded the extensive content-based "academic language" taught in the sheltered social studies class that I teach.

- **Vocabulary issues:** use of "pick" or "choose" in social language versus "select" in the classroom; "show" versus "indicate"; explanation of test language such as "corresponding item."

As these comments show, many respondents view academic language as comprised of unique vocabulary words and phrases that can be unfamiliar to ELL students, and, consequently, difficult to acquire.
Other respondents (41 percent) described academic language in terms of various activities. Respondents mentioned writing in journals, following directions, presenting findings to classmates, discussing science labs, identifying parts of the food chain, and stating opinions. The following are examples of responses in this category:

- Alternate reading with your partner; report to the class about what your group found; list causes and effects for WWII; predict what the outcome of the O.J. Simpson trial will be; paraphrase what you just read/heard.

- Compare and contrast the story of Thanksgiving (taken from Elizabeth Claire’s "ESL Teachers Holiday Activity Packet") with "How Many Days to America: A Thanksgiving Story" (by Eve Bunting).

- The food web -- identify which of these are producers, herbivores, carnivores and omnivores.

Note that respondents in this category focus more on broader aspects of language associated with academic tasks, rather than the discrete aspects of language (vocabulary) of respondents in the preceding category.

Other definitions/examples of academic language offered by respondents to question 1 included such statements as: "academic language is formal language used in formal writing, instruction by teachers, etc. It’s not usually used on social occasions between friends." An ESL (K-12) teacher focused on the cultural aspects of language: "Academic language is the accumulation of language that has built up as the results of being schooled in a particular culture. It is required for the building of a frame of reference of social, political, and economic issues."

Finally, one K-12 ESL program coordinator emphasized that this
type of language can only be acquired at school. "Academic language is the language of lecture and of textbooks. It is filled with expectations of prior knowledge and background and cultural uniformity. The vocabulary can be very technical and is topic-specific."

A few teachers did question the validity of the construct of academic language. A university ESL teacher trainer stated that "I believe [academic language] is a bogus concept. The teachers decide the type of language needed to survive their classrooms -- not a label." Other teachers, including a K-6 ESL pull-out teacher who uses whole language instruction, felt that the term applied mostly to written language, as illustrated in math word problems. She stated that written word problems "give my students great difficulties, i.e., 'if the length of the garden is 6 feet and the width is four feet, what is the total area?' Words such as 'take away,' 'combined,' 'all together,' etc. [are especially hard]." In general, though, the teachers had strong views of what academic language is in the classroom and expressed a wide range of views covering both oral and written language.

QUESTION 4C

Can you describe the particular difficulties that an ESL student has or had with academic English?

More than half of respondents (53 percent) to this question stated that ESL students have the most difficulty with academic language vocabulary. This is not surprising, given that so many respondents described academic language in terms of vocabulary.
for question 1 (see above). The following are examples of responses to question 4c:

- Many times missing a word or phrase in a question will make the student misunderstand the question. If they don’t have the words to express their knowledge it impairs their academic learning.

- He [a student] knows common language but not how it could relate to academic language, i.e., "we have neighbors; stars have neighboring stars."

- The language related to social studies is (or can be) enormously troublesome. Academic English for the 4th grade social studies curriculum, for example, includes such vocabulary and concepts as grids, natural resources, longitude, latitude, boundary, landforms, etc.

These responses suggest that academic language as a whole, and various content areas in particular, are comprised of unique vocabulary items with which ESL students might be unfamiliar.

Other respondents stated that ESL students have problems with academic language reading (24 percent) and grammar (15 percent). Twenty-five percent of respondents wrote that ESL students' difficulties adjusting to a new culture and educational system complicated the acquisition of academic language skills.

It is interesting to note that responses to question 4c parallel the pattern of responses to question 1. That is, educators discuss academic language in discrete linguistic terms (vocabulary, grammar) as well as in more global terms (cultural influences).

**QUESTION 5**

*If another teacher asked for suggestions about how to assess the academic language abilities of his or her ESL students, what suggestions would you offer?*
The majority of respondents to this question advocated alternative assessment strategies, as opposed to standardized testing. Thirty-eight percent of respondents suggested assessing academic language orally. Within this category, however, 41 percent of respondents were not specific about what aspect of oral language should be assessed (see list below). Respondents in this category made comments such as, We would test the student to determine oral...levels; I suggest oral tests; and Talk to student to assess oral skills. Future research could explore whether those who gave unspecific responses concerning oral assessment would, in reaction to further prompting, provide similar details.

**Oral Language (38%)**
- Unspecified - 41%
- Retell reading passages - 11%
- Discuss/answer questions about material read - 7%
- Describe/name objects - 7%
- Explain concepts - 4%
- Discussion - 4%
- Explain task carried out - 4%
- Answer questions - 4%
- Define terms - 2%
- Give examples - 2%
- Produce understandable speech - 2%
- Repeat what others say - 2%
- Give a report - 2%
- Ask questions - 2%
- Discuss visuals - 2%
- Analyze, evaluate, synthesize - 2%

The next largest groups of responses concerning oral assessment included retelling reading passages (11 percent), describing/naming objects and meaningful situations (7 percent) and discussing/answering questions about reading passages (7 percent). Representative responses from the describing/naming
objects category include: Have the student describe articles of furniture in the room, or name them. A teacher can show a picture to a student and ask him/her to describe the action in the picture. Another respondent wrote, Ask children to describe meaningful situations.

Respondents described discussing/answering questions about reading passages as follows: When he [the student] reads something, if you asked him what happened, can he tell you? and Use a question hierarchy about a reading passage to see how far above simple recall of facts a student is able to go.

The remainder of the responses that concern oral assessment are diverse but occur at relatively low percentages. Categories of these responses include: explain concepts, discussion, explain task carried out, answer questions, define terms, give examples, produce understandable speech, repeat what others say, give a report, ask questions, discuss visuals, and analyze, evaluate, synthesize.

The second largest group of respondents to Question 5 is comprised of those who suggested assessing academic language through writing (30 percent). Of these respondents (see below), however, exactly one half (50 percent) made non-specific suggestions. For example, one respondent suggested teachers assess...individual writing assignments, while another noted that writing samples are good diagnostic tools, and a third stated, I would suggest giving a written test to find out the level. The high rate of non-specific responses suggests that the question
might have yielded more specific responses had it been worded differently.

<table>
<thead>
<tr>
<th>Writing (30%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unspecified - 50%</td>
</tr>
<tr>
<td>Essay - 8%</td>
</tr>
<tr>
<td>Essay exam - 8%</td>
</tr>
<tr>
<td>Answer questions - 8%</td>
</tr>
<tr>
<td>Report - 6%</td>
</tr>
<tr>
<td>Samples from various disciplines - 6%</td>
</tr>
<tr>
<td>Journals - 6%</td>
</tr>
<tr>
<td>Respond to reading passages - 3%</td>
</tr>
<tr>
<td>Research paper - 3%</td>
</tr>
<tr>
<td>Written retelling 3%</td>
</tr>
</tbody>
</table>

Eight percent of those who suggested writing as an appropriate assessment activity fell into each of the three following groups: writing essays, taking essay exams, and answering questions. Those who suggested writing essays made comments such as, *See if the student can write a comprehensible essay after the student has either had a model outline explained or after the student has been guided to create an outline [to be used as] a graphic organizer.* Another respondent from this group noted: *Some teachers ask a student to write an essay on a particular topic--without realizing it, teachers can end up assessing the structure, form, etc., rather than content.*

Of those who suggested essay exams, one respondent noted that an essay test on a particular topic is as important as a role-playing game that allows students to utilize and integrate a variety of language skills. Another respondent stated, *Administer an essay exam to determine the students’ control over the basic writing/reading skills.*
Those who suggested answering questions made comments such as, at the start of the school year I have them [students] write me a long letter describing as much about their writing experience as they can think of—especially school experiences. Other respondents were less specific about the types of questions they have students answer.

The remainder of respondents who suggested using writing as an assessment activity fall into the following categories: reports (6 percent), samples from various disciplines (6 percent), journals (6 percent), respond to readings (3 percent), research paper (3 percent), and written retelling of readings (3 percent).

**QUESTION 6**

How do you assess a student's knowledge of academic content if the student does not have the English language skills to express it to you? Are there some subjects for which it is easier than others? Can you give an example?

Most respondents to this question answered both parts at once by listing particular methods or content areas that they believe are most conducive to assessing content knowledge. Listed below are the methods/areas respondents discussed and their frequencies.

- Graphic-based (41%)
- Math (40%)
- Science (19%)
- Native Language (19%)
- Hands-on Activity (4%)
- Ask Students Questions (3%)
- Simulate Academic Activity (3%)
- Performance Assessment (3%)
- Social Studies Task (1%)
- Geography Task (1%)
As the list shows, 41 percent of respondents to Question 6 suggested assessing content knowledge through various graphic-based means. Graphic-based refers to the production and/or interpretation of visual representations of concepts. Graphic-based media include: drawings, charts, tables, webs, diagrams, maps, and so on. The majority of respondents in this category were specific about the types of graphic-based media they suggested using. For example, one respondent wrote: Use graphic organizers like webs, Venn diagrams, T-charts, mind maps, etc., rather than typical measures, i.e., tests, essays, reports.

Another respondent suggested, You can assess comprehension of academic content by allowing students to: draw maps, graphs, pictures.... The high frequency of responses in this category suggests that respondents are sensitive to methods of assessment that do not directly rely on language.

Many respondents (40 percent) to Question 6 suggested math as an optimal content area through which to assess knowledge. It is important to note, though, that the vast majority of respondents in this category qualified their answers by stating that one should focus on computational skills, which are perceived as independent of language and universal, rather than word problems, which rely heavily on language. For example, one respondent stated: The easiest example is computational skills in
math. A child either knows how to regroup for adding or knows a multiplication table, or s/he doesn’t. It becomes much more difficult to assess math concepts needed for solving word problems.... Another respondent wrote, Math, because numbers are international--the only problem would be word problems.

Nineteen percent of respondents suggested science activities as appropriate for assessing various types of science knowledge. Most respondents in this category specified lab activities as a particularly viable means of assessing knowledge because they are perceived to rely little on language. For example, one respondent noted, science...student can demonstrate, e.g., an electrical current or effect of soap on surface tension of water.

Nineteen percent of respondents also suggested utilizing students’ native languages to assess knowledge of content areas. Respondents suggested teachers directly converse with students, or, if the teacher cannot speak the student’s native language, a bilingual student or faculty member can act as an intermediary.

QUESTION 8

Do you explain to your students that, in order to succeed academically, they need to learn how to use a particular type of language in the classroom that differs from “social language?” If yes, please give examples.

Most respondents (66 percent) to this question stated that they explicitly teach academic language; 34 percent stated that they do not. Of those who responded affirmatively, 27 percent said they focused on teaching vocabulary, 7 percent on grammar, and 6 percent on syntax. Several respondents (27 percent) said
that they tell their students that academic language is "formal," as opposed to social language, which is "informal." In a representative response, one teacher noted that instruction begins with the distinction between colloquial and formal language (gonna-going to), [and the] importance of selecting vocabulary words (enthusiastic vs. nice)....

Alternative Assessments for Academic Language

Working with the survey results and an experienced elementary ESL teacher, we identified alternative assessment strategies for the academic language of ELLs. Once we compiled the strategies, we sent them out to seven local ESL teachers for review of appropriateness and practicality in the classroom. The strategies we discuss below include the teachers’ changes and suggestions (see Appendix D for published ERIC Digest on the topic).

We will discuss the following seven types of alternative assessment:

- Physical Demonstration
- Pictorial Products
- K-W-L Charts
- Oral Performances
- Portfolios
- Oral and Written Products
- Teacher-made Measures

It is important to note that this list is not a comprehensive survey of alternative assessment strategies, but includes strategies that teachers have found especially useful with ESL students. Teachers should use, and experiment with, a variety of assessment strategies to ensure that the language proficiency and learning style needs of students are being met. Genesee (1994)
advises teachers not to depend on a single approach but to develop a "repertoire" of complementary assessment methods.

It is also important to remember that traditional assessments are not necessarily bad. In fact, when used appropriately, in moderation, and in conjunction with alternative assessments, traditional assessments can help paint a well-rounded picture of students' academic abilities and development. We will discuss examples of alternative assessments below.

Physical Demonstrations

Physical demonstrations refer to non-verbal means of expressing academic concepts. These include pointing and other gestures, performing hands-on tasks, miming vocabulary, concepts, events, and so on. Total Physical Response (TPR) is a common cover term that refers to using various gestures and motions and is an effective way for students to demonstrate learned concepts and understanding across the curriculum. When a teacher simply asks a student, "Show me..." or "Point to..." s/he can assess the student's knowledge by evaluating the child's response. In a unit on Native Americans, for instance, students can respond with thumbs up, thumbs down, or other non-verbal signs to communicate whether the statement read by the teacher is true or false or whether the teacher has grouped illustrations (of homes, food, environment, clothing, etc.) under the correct tribe name. Later, students can be asked to respond to such true-false or classification tasks individually. Teachers can also invite
individual students to put misplaced illustrations in the correct place.

Science provides ideal hands-on opportunities for students to demonstrate understanding. Teachers can ask students studying electric circuits to build circuits or to solve circuit design problems. In a unit on Earth Materials, students can classify rocks and minerals according to their characteristics.

Lenore Blank Kelner (1993) encourages the use of dramatization as an effective strategy with ESL students in content subjects. When studying the life of Martin Luther King, students can create motions which they feel best reflect the meanings of such key words as "nonviolent," "prejudice," etc. Students can use the motions in a variety of activities throughout the unit to reinforce the concepts. Later, a student's retention and understanding can be assessed through pantomime (Kelner, 1993).

Pictorial Products

Pictorial products are related to physical demonstrations in that the emphasis is on nonverbal means of expressing content knowledge. The difference, however, is that pictorial products focus more on the production and manipulation of drawings, dioramas, models, graphs, and charts.

Activities involving illustrations or graphics with word cards or labels provide ideal vehicles for assessing ESL students with limited English proficiency because little language is required. Illustrations can be collected over time from
commercial products or can be made by the teacher or students. When studying Colonial America, for example, teachers can give students a map of the colonies and labels with the names of the colonies. Students can then attempt to place the labels in the appropriate locations. This activity can be used across the curriculum to label diagrams, webs, or illustrations.

Illustrations can be grouped according to theme or heading. Teachers can ask students who are learning about the seasons to classify pictures of clothing or activities by season. Illustrations can also be matched with word cards in any subject area. This would be useful to assess retention of important vocabulary or facts. For example, pictures that include the names of famous explorers can be matched with the countries of origin or events.

Two related assessment strategies are the use of pictorial time line puzzles and flowcharts. Students can arrange pictorial time line puzzles chronologically regarding, for example, the life of an historic figure or events leading up to the Revolutionary War.

Flowcharts (with pictures or words) are useful to assess a student's knowledge of a procedure necessary to perform a task. This can be used after conducting a science experiment, such as making crystals.

In general, graphic organizers provide wonderful visual frameworks for conveying and assessing content information, as well as nurturing higher order thinking skills. In addition to
time lines, diagrams, table charts, graphs, grids, and story lines lend themselves well to illustrations. As teachers use graphic organizers in their instruction, students learn how to read, and subsequently, how to construct them. Tang espouses the value of using graphic representations to make textbook language comprehensible to ESL learners (Tang, 1992/1993). She emphasizes the importance of training students in their use during a unit of study and repeatedly throughout the school year.

In the early stages of language learning, information and concepts on graphs can be expressed, by both teacher and student, with illustrations and simplified language. These learning tools lend themselves well to cooperative, as well as individual, settings. Students can create living visuals of any of the pictorial products we have described. For example, students with some reading ability often have fun creating a living web. This activity can involve one student holding a main idea card in the center of a table and other students using supporting statement cards to branch out from the center. As a variation, students using supporting statements could decide what the main idea should be (Kelner, 1993).

As another example of the use of pictorial products, students can work with one another to construct models of rural and urban settings in a social studies unit. They can make dioramas or murals of community services. Students can also mime the responsibilities of community workers. Similarly, in a unit on Colonial American communities, older students can be involved
in the same types of activities in order to assess understanding.

To culminate a unit on butterflies, teachers can ask beginner ESL students to illustrate, rather than explain, the life cycle of butterflies. In response to the teacher’s request, students can point to different parts of a butterfly on their own drawing or on a diagram as an assessment of vocabulary retention. Pictorial journals can be kept during the unit to record observations of the butterflies in the classroom as well as to illustrate comprehension of classroom material about different kinds of butterflies, their habitats and their characteristics. Similarly, in a unit on plants, students can illustrate parts, graph or chart growth over time, and keep a pictorial journal of needs, care, and observable changes. In an oral assessment on the topic, students can point to the correct illustration in their pictorial journal in response to the teacher’s questions.

K-W-L Charts

Many teachers have success using K-W-L charts (what I \textit{KNOW}/what I \textit{WANT} to know/what I’ve \textit{LEARNED}) to begin and end a unit of study, particularly in social studies and science. This strategy enables teachers to gain a deeper awareness of students’ background knowledge, interests, and content material learned. K-W-L charts can be conducted as a class activity or on an individual basis. For students with limited English proficiency, the chart can be completed in the first language or with illustrations.
Abraham Lincoln was important. Why is that in compare? Abraham Lincoln was president of the U.S.

He was on a penny. What was a coin president? He was one coin president.

Let's deal now. Why is Lincoln on a penny? There was twice in American when Lincoln was president.

I think Lincoln was a president. Did he have a family? He let the states of Texas.

He was a tall person. How did he die? Two of his sons died.
Before a unit of study, teachers can have students fill in the K and W columns by asking them what they know about the particular unit and what they would like to know by the end of the unit. Doing so helps keep students focused and interested during the unit of study and gives them a sense of accomplishment when they realize, following the unit (filling in the L column), that they have learned something.

Oral Performances

Oral performances, or presentations, are a form of performance-based assessment, and include individual interviews, oral reports, role plays, describing, explaining, summarizing, retelling/paraphrasing stories or text material, and so on. Oral assessments should be conducted on an on-going basis in order to monitor comprehension and thinking skills and the tasks should be meaningful to students.

In the early stages of language development, a teacher who is conducting interviews in English might find it best to ask students questions using visual cues as much as possible and allowing for a minimum amount of English in the responses. Pierce and O’Malley (1992) suggest having students choose one or two pictures they would like to talk about and leading the students by asking questions, especially ones that elicit the use of academic language (comparing, explaining, describing, analyzing, hypothesizing, etc.) and vocabulary pertinent to the topic.
Science experiments lend themselves well to cause/effect explanations. Concrete materials or flowcharts illustrating procedures are helpful aids for an ESL student’s oral presentations. Illustrations, story maps, etc., offer support when students are asked to talk about historical events.

Teachers can also ask students to explain how they solved a certain problem in math. This sheds light on students’ thinking processes. It also allows a student the opportunity to demonstrate the use of language functions and vocabulary specific to the content area.

In the case of oral reports or presentations, teachers should give students a choice of topics and advance time to prepare. For example, allow a beginner level student to speak in his/her native language if someone is available to interpret. As a student’s English language proficiency increases so will the opportunities to assess a student’s academic language.

Role play can be used with all grade levels, with any number of people and across the curriculum. The teacher might transform him-/herself into a character who knows less than the students about a particular subject area. Students are motivated to help by conveying facts or information prompted by the character. This is a fun-filled way for a teacher to conduct informal assessments in any subject (Kelner, 1993).

Teachers can also ask students to use role play to express mathematical concepts. For example, a group of students can become a numerator, a denominator, a traction line, a proper
fraction, an improper fraction and an equivalent fraction. Speaking in the first person, students can introduce themselves and their functions in relationship to one another (Kelner, 1993). Role play can also be extended to science to demonstrate concepts such as the lifecycle.

Some teachers use role play as an alternative to traditional book reports. Students can transform themselves into a character or object from a story (Kelner, 1993). For example, a student might become Christopher Columbus, one of his sailors, or a mouse on the ship. Besides telling the story from the character's point of view, the other students can write interview questions to pose.

Portfolios

A valuable strategy in alternative assessment is the use of portfolios. A portfolio includes samples of a student's work over time. The collection is often described as "meaningful" because students collaborate with teachers in both the criteria for, and choice of, samples. Students are also given opportunities for self-evaluation, an important piece in portfolio assessment. Parents' input is also invited through conferences, questionnaires, or surveys. Portfolios are defined as "alternative" because they use a much more holistic approach to grading, compared to traditional measures of student performance. Tierney, Carter, and Desai (1991, pp. 125-143) suggest that, among other things, teachers maintain anecdotal
records from reviews of portfolios and from regularly scheduled portfolio conferences with students, keep checklists that index various criteria that teachers consider integral to the type of work being collected, and devise continua of descriptors to plot student achievement. Whatever methods teachers choose, they should work with students to help them reflect on their work to develop better academic skills.

There are many kinds of portfolios. Portfolios are used across the curriculum for evidence of individual or group performance, and they can contain any of the following in either English or a student’s native language:

- Audio- and videotaped recordings: readings or oral presentations

- Writing samples/computer printouts: dialogue journal entries
  book reports
  writing assignments (drafts or final copies)
  reading long entries
  projects

- Art work:
  pictures or drawings
  graphs and charts

- Conference or interview notes/anecdotal records

- Evaluations/Checklists (by teacher, peer or student)

- Test/Quiz sample

- Lists of books read

To gain multiple perspectives on students' academic development, it is important for teachers to use more than one type of portfolio assessment.
Oral and Written Products

Oral and written products encompass a wide variety of activities. Some of the products most suited to ESL students are content area/thinking and learning logs, reading response logs, writing assignments (both structured and creative), writers notebooks/folders, dialogue journals, and audio or video cassette tapes.

A content area log is designed to encourage the use of metacognitive strategies when students deal with expository reading material. Entries can be made on a form with the headings: What I Understood/What I Didn’t Understand (ideas or vocabulary). These logs provide teachers an opportunity to monitor and assess students on an on-going basis. Student-led discussion groups or teacher-directed mini-lessons can evolve from the students’ difficulties. Final unit tests can evolve from this as well.

A reading response log is a student’s written response or reaction to a piece of literature. Typically, a teacher asks students to respond to questions, some generic, some specific to the literature, which encourage critical thinking. This offers an effective way to evaluate an ESL student’s understanding of the material. It is meaningful when the reading material directly relates to and reinforces the content unit being studied at the time. For example, The Drinking Gourd, by F.N. Monjo (Harper and Row, 1970), is a high-interest, low-reading level historical fiction novel which supports African-American history
studies. Student reading log responses can reveal to teachers comprehension of reading, as well as academic, content material.

Beginning ESL students often experience success when an expository writing activity is controlled or structured. The teacher can guide students through a pre-writing stage which includes discussions, brainstorming, webbing, outlining, and so on. Both the pre-writing stage, as well as the independently written product, can serve as informal assessments.

Questionnaires offer another means of collecting information from students in a planned, structured format. As fluency increases, students are better able to respond to open-ended questions or writing prompts. Later, essays or reports can be assigned and rated by teachers and students with the use of rubrics, checklists, or evaluation forms.

Student writing is often motivated by content-based themes. Samples from their writing folders or notebooks give further insight into content understandings and retention of vocabulary. Narrative stories from alternative characters' perspectives (e.g., a sailor accompanying Christopher Columbus, an Indian who met the Pilgrims, a drop of water experiencing the water cycle, etc.) would be valuable inclusions in a student's content subject portfolio.

A dialogue journal is an interactive, on-going correspondence between students and teachers. Students determine the choice of topics, and they participate at their level of English language proficiency. Beginners draw pictures which can
be labeled by the teacher. Those with stronger English skills often write about their feelings concerning various aspects of school life, including subject matter, their successes and struggles, peer interactions, and so on. Attitudes are important in the learning process, and a dialogue journal can serve an important purpose in the assessment process.

Audio and video cassettes are also valuable alternative assessment tools. Recordings can be made of student oral readings, presentations, dramatics, interviews, or conferences (with teacher or peer), etc. These can be kept in portfolios and used as evidence of growth.

Teacher-Made Measures That Compliment Alternative Assessment

Traditional teacher-made measures, such as multiple choice, true-false, matching, and cloze activities, are often criticized as revealing little about what a student knows or how a student thinks (Jones, 1994). However, when appropriately used in conjunction with alternative assessments, various teacher-made measures can reveal important information about ESL students' academic development. For example, teachers can ask students to match sentence parts that relate events leading up to and during the Boston Tea party. As a follow-up activity, teachers can then ask students to work with one another to write a dialogue or play about the event, involving both the Colonists and the English. Students might also choose to role play the historic events. The advantage of providing role plays is that students have the
opportunity to better show their understanding of the events, including the causes leading up to the conflict.

Teachers often find it necessary to design or modify tests to match the English proficiency levels of their ESL students. True-false and multiple choice questions can inadvertently be tricky and ambiguous if not written with care. Teachers can make adjustments to simplify the language while keeping the concepts at the appropriate grade level. Language is much less of an obstacle if grammar is simplified as a practical matter. Traditional tests can be construed as "alternative" classroom measures for ESL students if modifications are made. Short (1991) makes the following suggestions about modifying such classroom measures:

- Use short sentences with simple grammatical structures.
- Use the simpler verb tenses (such as present, simple past and simple future).
- Write in the active voice, not the passive.
- Use pronouns judiciously, only where their antecedents are obvious.
- Be careful with indefinite words like "it," "there," and "that" at the beginning of sentences.
- Eliminate relative clauses with "who," "which," whom" wherever possible.
- Minimize the use of negatives.

Other modifications to consider when writing or conducting multiple choice, true-false, matching or other types of tests are:

- If possible, translate the assessment into the student's native language.
• Allow the use of an interpreter.

• The teacher of English-speaking students can read and explain the directions and test questions.

• Simplify the directions.

• Allow for bilingual dictionary use.

• Preview and pre-test important information and vocabulary.

• Familiarize students with test format through practice sessions.

• Give the ESL student fewer questions.

• Organize the test by levels of difficulty.

• Give the ESL student extra time for test completion.

• Give the ESL student the opportunity to give oral explanations as to why certain answers were chosen.

• Include graphics with questions.

Multiple choice, true-false, or matching types of assessments can also be conducted through cooperative activities. For example, teachers can give half of the students statements written on strips of paper, one per student. The statements contain either correct or incorrect information from a unit of study. The other half of the students are given cards indicating either "true" or "false." In this problem-solving task, students must find a partner with the answer to demonstrate understanding of the material. Students can be invited to explain or support the match.

Similarly, teachers can distribute fill-in-the-blank sentences for a cloze or multiple choice group assessment. Every sentence is missing a key word. Each of the remaining students
has a card with one of the missing words. The challenge for students is to find their match.

To determine how well a student has retained important terms, teachers can ask students to match words with definitions, vocabulary in English with vocabulary in the native language, historic persons or places with events, causes with effects, etc. In like manner, teachers can give students a worksheet listing vocabulary which can be categorized according to two or more themes. When studying terrain types, for example (grassland, tundra, desert, and rainforest), students can determine the correct category for each word and write it under the correct heading. Similarly, supporting statements can be written under main ideas, all of which are supplied on a worksheet or sentence strips.

As proficiency increases, requirements for written products increase. Supports for labeling activities, such as illustrations or prepared labels, can be systematically removed. Determining whether to provide a word bank would need to be made by a teacher. In like manner, cloze activities (sentences, paragraphs, outlines or graphics missing words or phrases) can be completed by students with or without the help of word banks, notes, outlines or books.

Just as students can learn to create graphics from text readings, they can learn to effectively translate graphic organizers (e.g., outlines, webs, tables, graphs) into expository composition writing. Once they have the ability to understand
and use graphic organizers, students have a means of "expressing content knowledge and academic language" (Tang, 1992/93).

Conclusion

Implications for Educators

Our research indicates that before teachers think about what type of alternative assessment to use, and how it should be implemented, it is important to reflect on what they consider to be appropriate ways of using language to accomplish various academic tasks. For example, Mr. Fuentes, in an example we discussed above, believed that his students should talk about the filmstrip they viewed from a critical perspective. As such, he used a variety of linguistic cues, most of them implicit, to encourage students to adopt a critical discourse register. Other teachers might have different ideas about what constitutes an appropriate manner of talking about a filmstrip.

Once teachers have reflected on the registers they deem appropriate for carrying out tasks, they can begin to think about what types of alternative assessment are best suited for assessing a student's ability to use language to accomplish tasks.

Implications for Educational Practice, Reform, and Policy

Our results, particularly those from classroom observations and discourse analyses, suggest that teachers can be more effective with their ELL students if they 1) engage in reflective thought about the underlying discourse styles they want their
students to appropriate, and 2) explain to students the criteria that comprise various types of academic language, giving examples when appropriate. All too often teachers are not explicit about the academic language demands of their classrooms because they appear to take them for granted. As Gumperz, Cook-Gumperz, and Sysmanski show (in press), students have their own sophisticated strategies for discussing academic content. If teachers can understand these strategies they will have a better sense of what type of explicit instruction in academic language is necessary.

While the discrete aspects of language that many teachers mentioned as comprising academic language are certainly important, our research indicates that more attention to overarching discourse styles on the part of teachers will help both students and teachers understand the nature of academic language. We hypothesize that once students have an understanding of academic language styles, they will be more likely to master them.

Results from the survey suggest that teachers are assessing the academic language of ELL students through a wide variety of alternative assessments, including demonstrations, graphic organizers, manipulatives, and oral language interviews. It is important, however, that teachers inform students in advance about how they will be assessed so students understand what teachers are looking for and have the opportunity to prepare for the assessment.
In the area of education reform, we suggest that a key site for change is at the teacher training level. During the last 30 years or so, research in the field of sociolinguistics has shown that language is more than combinations of discrete words or sentences. Discourse styles and conventions that are shaped by specific contexts are crucial as well. Unfortunately, many teachers' exposure to language issues during their training years focuses on research models in which a priority is placed on discrete aspects of language. Providing teachers-in-training with more current research models that focus on discourse would give them a better foundation for understanding academic language in their future classrooms.

And finally, in the area of education policy, federal and state governments can help to facilitate the creation of educational environments conducive to the success of English language learners by adopting resolutions that affirm the value of language diversity. Fostering such attitudes will give educators and students a greater appreciation for the diverse ways in which language varies across contexts, cultures, regions, and, ultimately, in the classroom. Academic language will come to be seen as a discourse style that is appropriate for the classroom, but is just one of many context-specific ways of using language.

APPENDIX B

QUESTIONNAIRE "ASSESSING ACADEMIC LANGUAGE OF ESL STUDENTS"
Assessing Academic Language of ESL Students

We're doing a study of the use of academic language in schools. Please take 25-30 minutes to complete this form and return it to us in the envelope provided. Your cooperation is very much appreciated.

Your name ___________________________ Date ___________________________

How many years have you been teaching? ___________________________

Type of teacher:

____ Mainstream classroom

____ ESL

____ Other (please specify) ___________________________

If ESL, please describe the nature of your program (e.g., content-based, thematic based, pullout, etc.) and the number of hours per day:

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

What grade level(s) do you teach? (Check all that apply)

K____ 1____ 2____ 3____ 4____ 5____ 6____ 7____ 8____ other (please specify) ___________________________

If the language(s) of instruction is other than English, please specify what language(s):

________________________________________________________________________

Percentage of time per week spent in the language(s) ___________________________

Questions

1. Many people have said that ESL students need to learn a particular style of language in classrooms, called "academic language," meaning the type of written and spoken language students need to successfully participate in academic tasks in the classroom. Please give an example or two of academic language from a recent classroom lesson of yours.
2. Describe how one of your ESL students, whom you consider to be a good writer, effectively uses language.

3. Take a moment to think about an actual ESL student of yours who you think talks about academic topics effectively. What does this student do that makes him or her a good speaker?

4a. Do you sense that some of your ESL students have enough English language skills to make them understandable in situations outside the classroom, but are not succeeding academically in school?

   Yes ___ No ___ Don't Know ___ If you answered "yes," please answer the other parts of Question 4. Otherwise, skip to Question 5.

4b. Do you think ESL students' difficulties in the classroom are due to their need to develop better academic language skills? If yes, how so?

4c. Can you describe the particular difficulties that an ESL student has or had with academic English?
5. If another teacher asked for suggestions about how to assess the academic language abilities of his or her ESL students, what suggestions would you offer?

6. How do you assess a student's knowledge of academic content if the student does not have the English language skills to express it to you? Are there some subjects for which it is easier than others? Can you give an example?

7. Based on your experience or discussions with colleagues, do non-ESL students seem to have similar problems with academic language? If yes, in all areas? Which ones in particular?

8. Do you explain to your students that, in order to succeed academically, they need to learn how to use a particular type of language in the classroom that differs from "social language?" Yes__ No__ If yes, please give examples.
Additional comments (attach additional sheet if needed):  

Would you be willing to take part in a follow-up phone call to discuss some of your responses further?  
Yes ___ No ___ If yes, please include your day and evening phone numbers and the best time to reach you.  
Day telephone  ____________________________  
Evening telephone ____________________________  
Best time  ____________________________  

If you would like a summary of the findings of our study, please check here ___.

APPENDIX C

COMPiled DATA FROM ALL QUESTIONNAIRES
SURVEY RESPONSES

1. Many people have said that ESL students need to learn a particular style of language in classrooms, called "academic language," meaning the type of written and spoken language students need to successfully participate in academic tasks in the classroom. Please give an example or two of academic language from a recent classroom lesson of yours.

#1: -alternate reading with your partner
   -report to the class about what your group found
   -list causes and effects for WWII
   -predict what the outcome of the O.J. Simpson trial will be
   -paraphrase what you just read/heard

#2: What is a noun? What is a verb? Find the organizational structure of the reading? How many paragraphs give the background? etc.

#3: NO RESPONSE

#4: Our school is new and non-traditional so I’m not sure this survey applies to us. ESL students are doing very well in class. Even our beginners can do K-1 because of the techniques of the regular classroom teachers.

#5: How can living things be grouped? Traits describe a thing, or tell what it is like. Scientists classify living things into large groups called kingdoms.

#6: NO RESPONSE

#7: In math lessons students need to learn the mathematical tenses. My 3rd graders whom I help in math, have learned the English terms for + "plus," - "minus" (or take away), > larger than and < less than. Also, when learning money they’ve had to learn the names of American coins and their values, ex. dime.

#8: 1) Compare and contrast the story of Thanksgiving (taken from Elizabeth Claire’s "ESL Teachers Holiday Activity Packet") with "How Many Day to America: A Thanksgiving Story" (by Eve Bunting).
   2) You are a piece of Thanksgiving turkey. Explain how you move through a person's digestive system.

#9: In comparing a previously read book with our present one by the same author, the students are learning how to complete a story map, to answer WH questions, and write answers succinctly, in a list form when possible. From the story map they will try
BIG BOOK, and will use a Venn diagram to note similarities and differences. All the activities will stimulate higher cognitive thinking and will familiarize the students with the story maps and Venn diagrams in their mainstream classes.

#10: Business English for students who will study accounting, economics, etc. Use of the word "capital." Technical language of the balance sheet.

#11: I teach basic concepts so that students will understand classroom directions. Recently we focused on spatial relations: over/above, under/below, behind, in back of, in front of, next to.

#12: NO RESPONSE

#13: Today we were looking in the dictionary and using guide words to help us locate definitions. For writing we are using journals for several reasons: to practice expressing our feelings, describing events, vocabulary enlargement.

#14: We recently had a series of reading lessons on skimming and scanning--looking for topic sentences and learning word meaning from context. I then transferred the context and topic portion to listening for in context and topic words. This seemed to facilitate in a small way their comprehension. The subject of social studies is their most difficult subject because of its strong cultural base.

#15: In ESL, the language I use is tailored to the students’ understand. One main problem I see in the students’ mainstreamed classes is that the teacher simply speaks too quickly, and our ESL students can not understand.

#16: Lesson: Learning the three branches of government. Academic language: executive, legislative, judicial. The language my students speak do not have these words. The students have no reference for this vocabulary. They easily memorize the words and their meaning but often do not understand the concept.

#17: Following directions. Use of prepositions. Above/below, belong/does not belong.

#18: One of the first and I feel most important thing I do is teach all the commands teachers use in the classroom daily. Then I teach directions so students can understand what to do on papers (circle, match, doesn’t belong).

#19: My last thematic unit was on "ands". The students had to research a sub-topic and present findings to the class.

#20: Students use worksheets that have directions which need
to be decoded before they can complete the exercises.

#21: We will conduct a survey and illustrate our findings on a table. Discuss a food chain.

#22: I made a list of terms used in space. Solar system, stars, planets, etc. We had a test on it. I wrote a story with blanks. They filled them in. We also have studied about the inside of the earth--inner core, outer core, mantle, crust magma, mountains, explosion, lava.

#23: I believe that is a bogus concept. The teachers decide the type of language needed to survive--their classrooms--not a label.

#24: K-1 class use of the words "point" and "trace."

#25: All language is academic language. Discussion of the reading process. Discussion of the cueing systems of language.

#26: NO RESPONSE

#27: Az. student assessment plan tests are used as teaching devices--grades 2-8--in reading and writing and math. CALLA lessons arranged around the 6th grade social studies text.

#28: Sentence and paragraph construction. Capitalization and punctuation. Vocabulary development.

#29: We spent class time today discussing "cultural diffusion" and how they might see the word "diffusion" in a science lesson also.

#30: At kinder, there is very little of pure academic language--I work with "playground English"--naming common objects, etc. They are just beginning to learn the language. We do lots of songs and fingerplays--build common experiences so we can talk about them.

#31: Grade K--shapes: triangle, square, circle; math: more or less; science: seed, sprout, life cycle.
   Grades 1&2--community; transportation; market; habitat.
   Grades 3&4--continental shelf; intertidal zone; oceans and continents; compass rose, etc.
   Grades 5-8th--nutrition, protein; carbohydrate; vitamins and minerals; grams; liters.
   Please note: This is language taught at intermediate ESL level; I have excluded the extensive content-based "academic language" taught in the sheltered social studies class that I teach.

#32: Language needed to perform and discuss a lab based on
the topic of electrical circuitry/development of a written lab report. Locating, plotting (latitude and longitude), discussing ancient native American civilizations.

#33: Several of my students were confused about the difference between fact and fiction. We had a short lesson discussing this subject. They were then able to do classroom assignments that had been based on this distinction.

#34: For beginning ESL--(those with no English) learning such things as 1) classroom objects—pencils, desk, crayons, etc. 2) things like "standup, raise your hand, open your book" etc. 3) learning how to say "may I go to the bathroom?" or "May I sharpen my pencil?", etc.

#35: NO RESPONSE

#36: Note: I am basing these answers on my high school classes only. I use American literature extensively in my high school class, so I routinely use terms such as "elements of a short story: plot, characters, setting" or talk about point of view, theme, use of [?], etc. in analyzing a piece of literature with my students. I also teach my students how to respond to test/essay questions in their classes by helping them learn to understand the question and the type of response being elicited, i.e. "list, describe, outline, compare/contrast, summarize, elaborate, support, explain, etc." All require different types of answers regardless of the subject matters, and students need to understand the differences. Another example would be math—terms which need to be explained so students can translate them to their own language and use them.

#37: NO RESPONSE

#38: The food web—identify which of these are producers, herbivores, carnivores and omnivores. What happens to the carnivore/producer population if the herbivore population is decreased because of disease? (4th grade science text). Pictures of wheat, corn, mice, rabbits, deer, hawks, fish, insects, bear, leopard, people, rats.

#39: Current further publications deal with 1) school survival English 2) communicating with mainstream students and sensitizing them to ESL/LEP students—3) gradually introducing "academic language" oral and written.

#40: We have been studying the water cycle with 2-4th grade students with the help of a song by Tom Chapin called "The Wheel of Water." Academic language in that lesson consisted of evaporation, condensation, humidity, precipitation—all presented in a hands-on fashion.
#41: Lesson on sentence parts—we used the terms "subject" and "predicate." We read two similar stories and I explained the meaning of "version."

#42: Study—creative dramatics to show meaning of the word homework—collect-mark-return to students.

#43: Please categorize the plants into field or horticultural crops. What are the effects of not following safety rules?

#44: I have been teaching comparison/contrast written development of paragraphs. The terms comparison and contrast needed to be introduced with examples of each. I also used a Venn diagram to make my point as the pre-lesson activities.

#45: Vocab. issues: use of "pick" or "choose" in social language vs. "select" in the classroom; "show" vs. "indicate"; explanation of test language such as "corresponding item."

#46: Students who had recently been on a field trip to Mount Vernon were asked to make a web about the trip as a pre-writing activity. Students who had recently read several stories about giants were asked to compare the qualities of two giants from different stories using a Venn diagram to show similarities and differences.

#47: Students must understand and identify characters, setting, problem and solution during reading discussion.

#48: Rate the following in order of preference. Underline the nouns; circle the verbs. Change these statements to questions using who or what as object.

#49: Categorize, compare, indent/margins, history/sequence.

#50: Give evidence to support your position.

#51: I can't. But, if we believe that language development has cognitive implications for the learner, does that mean the development of this particular type of language, "academic lang."

#52: N/A FOR MY CLASS.

#53: Examples are in Addison-Wesley's Algebra text—in Spanish.

#54: NO RESPONSE

#55: Brainstorming on a topic such as friendship, outlining
ideas, creating a thesis statement, main points to support it, rebuttal and conclusion, revising, small group roles: timer, speaker, listener's approval or disagreeing tactics.

#56: One of the students I work with is ESL. I try to model specific correct speaking English when he say something grammatically incorrect.

#57: N/A

#58: NO RESPONSE

#59: Math: greater than, less than, plus, minus, equals. Social studies: direction words--north northeast, east, southeast, south, southwest, west, northwest.

#60: In a recent lesson that combined the present progressive tense and telling time, students learned to read the numbers and learned the vocabulary needed. (i.e. hand of the clock, face, chime, second hand).

#61: Reading strategies--visualization, summarization, prediction, global understanding, characters, motivation, conflict, resolution, etc.

#62: This was from a fifth grade classroom teacher: Take notes in phrase form on a separate piece of paper as you use each resource. From 5th grade text book on Magellan: The discovery of the New World on the other side of the Atlantic was a disappointment to those who had hoped to sail direct to Asia.

#63: Terms: the writing process (steps), prewriting, drafting, revising, proofreading and editing, presenting, tenses, topic sentence.

#64: Last year I taught 3 second year student with the goal of making topic taught in the 4th grade curriculum more accessible to them. These topics included the "Middle Ages" and "Maya Indians". The study of both topic requires a specialized vocabulary.

#65: Stating an opinion of someone else--the student didn’t know the language "Other authors have stated/believe" or "there are several different opinions on this topic." Also stating the student’s opinion is necessary.

#66: Civil War lesson includes: new vocabulary (slavery, supply lines, Civil War, etc.), comparisons (North and South), and economics (some basic principles).

#67: I teach social studies, words like "label," "compare," and "summarize" are often used in a lesson.
#68: Our graduate students, for the most part, teach in surrounding school districts. Some are from Puerto Rico and teach with provisional certification. Several are from Japan, Taiwan, and Portugal. The errors they make are mostly in the writing of English. My courses are general to helping them understand content in English (which they know in their languages). Academic language such as philosophy (education) poses a great difficulty for some. The concepts are new for the students and new language must be learned.

#69: The electoral college voting structure vs. direct popular election. The series of checks and balances in federal government.

#70: Grade 1: I know a house is a place where I live. In my book I see some pictures of animals. Listen to this story and look at the pictures to find out about animals’ houses. (To go with story A House is a House for Me. Grade 3: Do you agree with Alice’s grandfather that everybody should do something to make the world better? Tell me why.

#71: My students had to role play a problem situation and while doing the role play they worked on "academic language."

#72: The type the students use and I use formal and informal English. This a difficult question to answer.

#73: Grammar, nouns, adjectives in language arts. Nutrition, carbohydrates, vitamins in science.

#74: I feel this applies mostly to written language. Math word problems: these give my students great difficulties, ie, if the length of the garden is 6' and the width is 4', what is the total area? Words such as "take away," "combined," "all together," etc.

#75: Scientific language: in the science lessons there are a variety of terms needed for the mastery of that subject. Historical language: providing the instruction of past event in the history class.

#77: N/A

#78: Since I am not currently teaching, the best way for me to look at this is to think of what it would be like for someone
to be transported to another country, whereby they could transfer their job description and skills only everything is in another language. This would be extremely challenging even if we already have the prior knowledge. Imagine what it is like for a student coming here who may not have the benefits of a bilingual program.

#79: In my social studies classes, students are asked to interpret data from various graphic forms--charts, tables, graphs, timelines, lists--and come up with some connection so the names of each tool and what "interpret" in this sense means is important for students to group. Students are also asked to "assess the extent to which a particular statement is valid." The meaning of the underlined terms is crucial.

#80: I taught present tense third person singular "s" endings; students responded orally and in writing. Students learned short answers with "does," "do," "doesn't," and "don't." This was taught in a game format with teams. Students answered questions orally.

#81: Computers require specific vocabulary. "Put the floppy disk in the A drive and close the latch." "Be sure to check the spelling before printing your document."

#82: In my 6-8th grade groups, when we work on content area studies I help my students take the needed vocabulary and place the words in context. For example, in developing an essay on "balance of powers," "checks and balances," "three branches of government," students would need to know how to develop sentences: the three branches of government, as written in the constitution, contain a series of checks and balances, etc.

#83: Compare the two stories. What was the same and what was different. Predict what might happen in the story.

#84: Simple present tense "s" with vocabulary: 1--Blood circulates throughout the body in tubes called blood vessels. 2--Each time your heart beats it pumps blood through the body. 3--Blood carries away waste products, for example, carbon dioxide and waste heat. 4--The circulatory system has two important functions.

#85: Math--measurement units, ie, 12 in.=1 foot, 16 oz.=1 lb., and application in word problems. ex--Measure to the nearest centimeter. How many inches in 2 feet? Which weighs more--an apples of 2 pounds of spaghetti? Social studies--study of corn. Native Americans, natural resource, where did corn come from? What products use corn? What do we know about corn? What do we want to find out about corn?

#86: In a theme cycle on rain forests with 3 and 4th grade students: Let’s compare the trees, leaves, seeds, weeds, flowers,
etc. in the forest next to the school with what we'd find in a tropical rain forest. If 80 acres of rainforest disappear every minute, how many acres are being cut down or burned every day/every year?

#87: Math--Problem solving vocabulary used in directions to students in a specific lesson on measurement. Written directions in text and tasks assigned. Science--Oral language used by teacher to direct a lab experiment that was highly science loaded vocab.

#88: Social studies--primary source, secondary source, chronological order of historical events--students must be able to interpret a timeline of historical events.

#89: Lesson: The food pyramid, using Healthy You, Happy You plus materials from the mainstream 2nd grade. Students: 1 first, 2 second graders. Academic language: As they looked at the mainstream materials, they discussed underlining, circling, and crossing out. With the HY, HY materials, they talked about the differences between fruits and vegetables, using "school concepts" of where the food grows and where it goes in the pyramid rather than "home concepts" of whether it's main dish or dessert, or eaten hot or cold.

#90: Vocab. words as they relate to an academic subject. Vocab. Bingo--students find words in an upcoming reading story that they do not know. We use this student generated list in Bingo prior to doing the story to help the students become familiar with the words. During the game meanings and multiple meanings are discussed.

#91: 1st grade lesson--cutting a pumpkin, students dictated a LEA story. Academic language involved sequence words, eg. first, next, then, finally. 2nd grade--animal characteristics in comparison/contrast. "Owls have feathers but cats have fur. Owls have bones and cats have bones too." 5th grade--discussion of two characters in a chapter book. Sort the vocabulary used to describe the two characters: scowling, jeering, limping, European, heathen, etc.

#92: Use of the word "column" in math. Use of the word "table."

#93: Studied about endangered species and the environment. Learned names of animals and where they live. Used Oxford Picture Dictionary and library books as a resource. Used scholastic illustrated books also.

#94: 3rd grade--Construct a pictograph using the data from the table. 1st grade--What characteristic or attribute do these members of this set have in common?
#95: Our elementary school program employs many whole language strategies. Our emphasis is on a literature based approach to instruction. ESL teachers support the mainstream curriculum by emphasizing the literacy skills based on student English language proficiency.

#96: The use and understanding of terms in a regular classroom. After reading a story about ants, we enriched it by writing a report. We planned, brainstormed, webbed, outlined terms used in regular classrooms. The ESL children were introduced to the terms and we used the terms in practices to write a report.

#97: Describe the similarities/differences between the two tales. Explain the terms: climate, location, etc.

#98: I agree that ESL students need to learn social studies academic language. In a recent lesson on early Americas, students needed to learn: society, migration, culture, occupation. In a geography lesson related to early Americas, students needed to locate rivers, lakes, canyons, mountains--and needed to see visuals on this. Contributions, achievements are others.

#99: In a lesson related to building an aquarium the students had to use the following: What effect does temperature have on the fish in the tank? How many fish can a ten gallon tank safely hold? Find the ratio of fish to water.

#100: Students had to find an editorial in newspaper list opinions and facts found therein. Story about boy who races--student had to learn vocabulary.

#101: Water is a liquid. Ice is a solid. Water freezes at 32 degrees F or at 0 degrees C. What strategy or strategies did you use to figure out this word?

#102: A basketball star from Ukraine had to learn with difficulty that "guys" was ok on the basketball court, not in academic writing.

#103: NO RESPONSE

#104: Oral--Farmers raise cows for their milk and meat. Written--Cattle are raised on the farms in order to provide a living from the sale of beef and dairy products.

#105: NO RESPONSE

#106: Science--"classify, scientific method, variables." Math--"average, how much more, total, difference." Social studies--"boycott, tariff, democracy."
Academic language is formal language used in formal writing, instruction by teachers, etc. It's not usually used on social occasions between friends. Ex: The sum of 1+1 is two.

Academic language can be described as how teachers, texts, standard tests, phrase what they are expressing. Photocopied sheets are handouts. Tests ask you to discuss, explain, etc.

Academic language is more formal and, certainly less national/situational. More directions involved from K on up.

Academic language is the accumulation of language that has built up as the result of being schooled in a particular culture. It is required for the building of a frame of reference of social, political and economic issues.

Academic language would refer to words such as metaphor, simile, and other literary terms, as well as words such as timeline. They are words that students are expected to know.

Academic language is often more easily read than heard. It tend to use jargon and may be stilted. It often differs from "real" language in that people outside the field have difficulty understanding it.

Students in high school must learn to write a 5 paragraph essay. The ideas of theses statement, main ideas, supporting ideas, and conclusions can be no more than 1-2 sentences for a student who just wants to turn in an assignment, or quite detailed for an ESL student who has more appreciation for the importance and value of written English.

According to the survey, the following examples of immoral behavior are....

Academic language is different for each core subject. Math includes: graph, paper, protractors, addition, etc. History includes dates, places and events--constitution, amendments, etc.

Academic language would refer to the technical words used in a classroom or content are such as equation, parabola, or substitute in algebra.

The following step: , fill in the blanks, P.E., media center. Various terms in specific content areas also, such as calculate, multiply by...sentence, outline, etc.

To me academic language is well learned language. It is content area language as well as well spoken and well written flawless language.
119: Academic language is the language of lecture and of textbooks. It is filled with expectations of prior knowledge and background and cultural uniformity. The vocabulary can be very technical and is topic-specific.

120: Summary--acknowledgements--glossary, headings--in context.

121: Academic language is the vocabulary, structure and tone used in oral discourse in the classroom and in written texts. Oral: What would be an example of the application of this formula? Written: It was ratified ten months after Reconstruction.

122: Writing instruction uses the writing process format. The students need to be familiar with all of the academic terms used in the writing process. Class presentations require that the student speak well enough to be understood by his/her audience.

124. Positive, negative.

125. NO RESPONSE

126. We did a lesson on classroom objects. The blackboard, chalk, desk, etc.

127. NO RESPONSE

128. NO RESPONSE

130. My last students were first and second graders in a full bilingual class. Their knowledge of English was so basic that we were basically involved in simple communication.

131. Compare and contrast; describe.

132. Writing a summary on a reading passage discussed in class. Taking notes on a reading passage.

133. "Let's break down into groups and work together with a partner to describe each other's favorite pastime. First discuss, then work cooperatively to write an essay of less than 50 words."

134. NO RESPONSE

135. Analyze; compare and contrast.
136. I use a homework lesson each week called "quote of the week." I use a new quote every week. The students have to paraphrase the quote; give an example of the meaning using their life, books, or the lives of others; and explain why the quote is important or not. The quote usually has symbolism or academic language that the students generally have to look up. They have found this challenging.

138. N/A

141. In one activity that serves as a precursor to group work/discussion, students are informed of question/interview strategies with concentration on how to elicit factual data and more [?] opinions.

142. I have taught a physical therapist (from Peru)--using his text in English. I am teaching an accountant from Venezuela. I have worked with an ambassador from Spain.

143. I explain that in academic writing, we refer to texts we write about in the present tense. For example, we write: "Cisneros suggests," not "Cisneros suggested".

144. Using English to explain math problems while writing on the board.

145. The grandfather is kissing the baby. Could you please tell me how to get to....?

146. Our program does not focus on academic language, and I am teaching beginning level ESL, so this question does not apply to me. However, my school does have a TOEFL preparation course, and it's possible that the teachers use more academic language in that class.

147. A list of verbs was written on the chalkboard. Students were asked to fabricate a story using these verbs. Students were given a list of sentences. They were to form paragraphs by arranging the sentences in the correct sequence.

149. Most mammals are born alive. Two exceptions are the duck-billed platypus and the spiny ?. These mammals hatch from eggs. Once hatched, they are nursed by their mothers.
2. Describe how one of your ESL students, whom you consider to be a good writer, effectively uses language.

#1: She is able to organize her ideas, use transitions to move from one idea to the next and has started to use the thesaurus for synonyms.

#2: Includes feeling, opinions, adjectives which enliven the writing.

#3: NO RESPONSE

#4: I have only had these children 6 weeks and none writes well yet.

#5: NO RESPONSE

#6: NO RESPONSE

#7: One of my students successfully uses written English to express herself about how she feels, describes the pictures she draws and writes stories as well as the endings to stories I read to my students (predicting).

#8: The student writes clearly and maintains focus. The student uses examples effectively and appropriately.

#9: Christine, a 3rd grader and an advanced ESL student, has improved her writing tremendously. As a result of our classroom use of synonyms and antonyms, she is expanding her writing by using synonyms, etc. as well as more detailed adjectives to make her writing more interesting. She also now uses colloquial speech and idiomatic expressions (we keep them on walls) to color her writing.

#10: They write directly, using fairly simple constructions, and are aware that they cannot translate from their language into English, so they learn the English forms of expression more rapidly.

#11: This year I don't have any students past second grade. In the past, my good writers would use dictionaries and other books that contain frequently used words to help them with their writing.

#12: NO RESPONSE

#13: Thao thinks and plans mentally before beginning her writing in English. (She already is fluent in Vietnamese, bright and motivated). She works on the mechanics (conventions) of her writing. She tries to incorporate idioms, conversation and other new ideas into her writing. She makes sure that she understand
the directions before beginning.

#14: One of my more successful middle school students utilizes analogies quite often when she cannot remember the exact English word. She also will use several adjectives in describing whatever she is talking about so that the reader can comprehend her intent.

#15: Most all of my student this year are in the early levels of language development. As writing skills develop later, this is not possible to accurately determine.

#16: This student constantly adds new vocabulary to her writing. She writes down new vocabulary heard during a week, learns the meaning, and makes audio cassettes to listen to while she does chores. She always finds a native speaker to correct her writing. Her writing uses simple sentence structure but the message comes from her heart.

#17: The student is able to communicate his/her thoughts.

#18: He uses good grammar, proper syntax, has an adequate vocabulary.

#19: Uses details. Well-organized ideas--beginning, middle, end. Descriptive language.

#20: Hugo, a recent arrival (1 year, 2 months) uses English to write stories. He writes stories about his home life and family. He then gives me the stories to read. He does this writing at home.

#21: He uses a lot of conversational phrases to make himself understood.

#22: Brenda wrote a paper (one page) on volcanoes. She used the books I loaned her for her information. She also drew pictures, reflecting what she saw in the books. She is able to follow my discussion and answers questions.

#23: Grad. student: The way native speakers do, but often more effectively.

#24: He uses simple sentence structures so he doesn’t make too many mistakes. He writes much like the way he talks.

#25: NO RESPONSE

#26: My K-6 students are beginners and do not write standard English. We use writing process and "invented spelling" which has improved the writing of this age/level student 100%.
#27: Writing is indistinguishable from that of non-LEP students in a "blind" situation.

#28: A recent lesson on oral interviews that were tape recorded gave the students an opportunity to practice listening to different people speaking and then to write up the information. Prior knowledge and practice enabled the students to write this independently, make a bulletin board display of new "friends" and then write thank you notes.

#29: A good writer has learned the conventions of the written language, i.e., phrases that are appropriate for introducing an essay or bringing one to closure.

#30: N/A--They drew a tepee and wrote "tepee."

#31: a nine year old boy, who came with no exposure to the English language from Paraguay one a half years ago, has been able to produce 2 research reports based on areas of interest that were elicited from reading 2 books from the Magic School Bus series. These reports were developed via the use of the student self-selecting a topic, generating a semantic map of questions to be answered, conducting research in the library, writing first and second drafts, and typing the final copy. A bibliography and author page was also part of the project. Because of his intrinsic motivation he was able to develop papers that showed not only an effective use of language, but learned important information specific to his chosen topics, as well as to utilize his extraordinary ability to use his native language and transfer those skills to his L2.

32: The student is able to develop a topic sentence and provide details/examples/evidence to support the statement. The student's writing is both clear and concise.

33: One of my second grade Japanese students is able to write creatively and descriptively. Giving a situation (or subject), she can then expand upon it or use it as a springboard for her own ideas. She writes with humor and great style, although she does make grammatical errors.

34: My third graders are only beginning to write 1 or 2 sentences to describe a picture.

35: NO RESPONSE

36: I don't have any currently. However, in recent years I have had students who used metaphors and similes very effectively in conveying personal reactions to literature or in discussing personal goals. I have also had examples of insight into a character's motivation (in literature) expressed in a very effective way by students, although the sentences were not
syntactically or grammatically perfect. I focus on content first and form later.

37: NO RESPONSE

38: Expresses details, opinions and "flows" unselfcritically, compared to students hesitant because of fears of failure or no confidence in the worth of their own ideas.

39: N/A

40: One of my students used language effectively by transferring knowledge from her first language and applying it to English written skills. Her L1 writing skills are extremely well developed and therefore she is a good writer in English (even if her spelling is lousy--but who cares--hooray for spell checkers!)

41: NO RESPONSE

42: When answering a written question, student uses many of words in the question to make up answer sentence.

43: The student self-corrects, rereads, uses novel construction.

44: My student uses descriptive language much as an artist uses color to enhance and enliven an image in a drawing. She is an artist of exceptional talent and extends this ability to her writing assignments. She also used a bilingual dictionary and although she is not always accurate in the selection of words, she takes risks and when she makes mistakes, she learns the correct usage in context for her next attempt.

45: She reads teen novels a lot, and makes a concerted effort to apply the new vocab. in describing her own feeling and opinions, rather than using the ESL standard good/bad/nice/sad.

46: Narisco C. can: write a story or retell an event in proper sequential order (beginning, middle, end); use adjectives when describing something; write from his imagination as well as from experience; write in various forms (paragraph, letter, poem) as appropriate.

47: Uses appropriate content vocabulary such as capital city or climate in a sentence that suggests understanding. That would include supplying additional vocabulary such as the name of the capital city and words like "hot," "rainy," etc.

48: She writes as she speak--in clear coherent phrases.

50: The student has the vocabulary to write a story or report, but has difficulty with grammar, syntax, and clauses.

51: N/A

52: N/A for my class.

53: NO RESPONSE

54: NO RESPONSE

55: 1) as negotiator--in small group discussions, students rotate roles and take noted before making final decisions. 2) as debater--team member and leadership practice.

56: He is good at writing dialect though it isn't precise.

57: Orally--can communicate but drops inflections. Reading--same as above. Writing--far better than the 2 above (this is probably because in our program a child is taught to slow down in order to analyze the spoken word).

58: NO RESPONSE

59: I consider a student who can write an idea clearly, keeping the idea in mind, to be a good writer. Often my second grade students will get bogged down in the act of writing and forget the idea that they wanted to express.

60: One of my Asian students is very hard to understand. However, he shows his command of English and grammar in his written work. He correctly uses idioms and shows humor in his writing. In my opinion, when a student understands humor in a second language that shows true understanding of the language.

61: Integrates/uses what has been learned orally and through reading into writing; reads critically and borrows from what has been learned in terms of authors' styles, etc; looks back to find/use correct spelling, new vocabulary; proof-reads and self corrects or asks for help; takes risks; sometimes inserts/intersperses Ll words.

62: Note: When my ESL students become, or approach being a "good writer" they no longer get ESOL services. They only receive services for minimal English proficiency--surface proficiency in listening, speaking, reading and writing. They become the sole responsibility of the classroom teacher. My ESL "good writers" can write about something we have actively done together or read, re-read and discussed thoroughly--very context-dependent language.

63: They organize ideas in pre-writing steps: outline or
web. They sequence and use their ideas from web. They have a topic sentence. They are not "hung up" on spelling during drafting phase. They revise.

64: I recently had a 6th grade French student who had some knowledge of spoken English, but had never read or written in English. Because she was determined to learn and had a lively interest in topics covered, she took time in the process, doing a lot of reading, thinking, discussing, writing, rewriting. She knew exactly what she wanted to say in French, had a well-developed vocabulary and was very attentive to grammar. Simple translation worked well for her--she easily retained new vocabulary items and new grammatical rules.

65: This student uses examples. His language is stretching to make analogies. I can see how he's using his imagination to create.

66: Since my class is a high school class, my good writers are quite skilled at writing using vocabulary, correct grammar, sentence variety, etc. I ask them to write on every quiz I give them.

67: Diana, an honor roll student, was able to learn key vocabulary in my class, to understand directions of an activity. She began to use examples and references to prior exercises/knowledge to explain answers. For example, in explaining the characteristics of a Russian leader, she'll use phrases, "like _____ in China" or "bad like hitting a peasant." She began using descriptive examples.

68: My answers are from my present experiences. The graduate students whose first language is not English often have difficulty expressing themselves orally and when writing. They need several session of painstaking assistance to help correct major errors. Gradually, most of them become more fluent when speaking and writing. Student who speak Spanish and Portuguese are more expressive in their writing than those who are from Asian countries.

69: They use the dictionary, write and rewrite, and often talk to the teacher about the assignment before handing it in for a grade.

70: S/he pays attention to the mechanics of writing. S/he uses a variety of interesting words. Sh/he makes use of straight line narrative style (beginning-middle-end).

71: My ESL student can successfully communicate with a pen pal by sending letters.

72: He uses language in activities to share ideas [?] formal
and informal language.

73: When he answers or writes, he uses academic language to identify the academic content.

74: PAGE MISSING--PHOTOCOPIED INCOMPLETELY

75: My bilingual students I consider that they are good writers when they are able to provide me with the basic idea of the topic they are discussing and are able to defend them.

76: All elementary students participate in writing workshops or interactive journals daily. Stress at middle high school level is geared towards writing educated opinions backed by factual information.

77: N/A

78: NO RESPONSE

79: Angelica is able to convey complex ideas clearly using a variety of sentence structures and high level vocabulary.

80: I wouldn’t describe any of my students as good writers at this point.

81: He types fairly quickly, uses the spell checker to catch at least most spelling mistakes and reads aloud to hear what he has written.

82: When writing an essay or answering test essay questions, the student can integrate the vocabulary into sentence contexts, using the appropriate verbs and adjectives that are specific to the context. In addition to specific verbs, adjectives and complete sentences, the student can develop a paragraph.

83: The student used a very direct style, stating ideas simply so that errors with complex grammar structures did not interfere with the meaning.

84: Most intermediate students are not good writers yet.

85: She writes more fluently when she chooses the topic and is more familiar with the vocabulary. We use "process writing" method--brainstorm, write, read to a friend or teacher, revise, edit, publish sometimes. She writes as she speaks. She reads a great deal so she can self-correct many past tense errors, punctuation and capitalization.

86: He can describe the plants and animals found in the rain forest with errors in subject-verb agreement, use of the plural, definite and indefinite articles, spelling, but with language
that can be understood by a native speaker.

87: Can use vocabulary appropriately in a variety of written situations that express coherent thoughts with good form, function and use of conventions.

88: Marcelino can write good descriptive essays that describe scenes and situations in regard to sensory observations—what is seen, heard, smelled, etc. He has a god sense of the main parts of an essay and is able to construct a viable topic sentence. He stays on topic in the body of the essay in order to validate his topic statement. Finally, he understands the necessity to summarize and restate in his ending paragraph.

89: A fourth grade girl is moving to a more "academic" style from the type of writing that reads like speech: that is, she is consciously trying to vary her sentences, rather than one sentence of and...and...and. She looks for words which sound interesting and unusual. She asks questions like "how can I make this story more exciting?" "Can I put Spanish in to make it sound real?"

90: I consider a student a good writer when he/she can both read and understand what has been read. If a student has progressed to this point, keeping in mind my students are 9-11 years old, I feel they are effectively using language.

91: Good writers, in my classrooms, can organize writing in some fashion—usually introducing a topic statement followed by supporting details. Good writers use many examples, and are able to use specific (rather than general) vocabulary to describe. Signal words are used to indicate transitions and logical connections.

92: She uses the writing to send letters to companies whose product she is not satisfied with (i.e. Everready Battery).

93: Zeroes in on interesting vocabulary and takes note mentally. Tries to use words (2nd grader).

94: Student gives a topic sentence followed by details that support his idea.

95: At the elementary grades K-6 all students are involved in the writing process using voice-over IBM computers to facilitate fluency in writing. Students publish on a regular basis.

96: Same as question #3, with the addition of correct writing skills.

97: N/A
98: M, who has been in this country (from El Salvador) for 2 years, has excellent basic interpersonal communication skills. He questions words he comes across in reading, asks how to spell it, tries to figure out how words are used in context. When writing a paragraph, he uses notes taken in his own words to construct sentences.

99: QUESTION NOT AVAILABLE--NOT PHOTOCOPIED COMPLETELY.

100: Student in first grade illustrates and writes story.

101: specific vocabulary; idiomatic; "juicy" descriptors involving various senses; good grammar and mechanics.

102: NO RESPONSE

103: NO RESPONSE

104: This second grade student can get his meaning and depth of thought across better in writing than orally. He has been encouraged by his regular classroom teachers to use inventive spelling. He is able to do so very well since his ESL teacher of the previous year gave him good training in sound/letter correspondence. (The whole school used the Open Court reading program, published in LaSalle, IL).

105: NO RESPONSE

106: Searches for the proper word he needs to express his thoughts in the dictionary or by asking someone. Decides what he's going to write in advance--makes notes first.

107: My good writers really work to expand their vocabulary so that they don't use the same boring words continuously. They also have learned how to vary their sentence structure. In addition, good papers use a little humor so that the reader is entertained.

108: N/A I sometimes receive letters but we do not focus on writing in the conversation class.

109: I do not yet teach ESL, but, as a language arts teacher, my student from homes in which only their L1 is spoken have success in writing when they include their own experiences, thoughts, and ideas.

110: She is a good storyteller.

111: She takes her time to really think about what she is going to write. She also plans her work out (networking and brainstorming), and she never erases (I told them not to).
112: His mother values education, thereby reinforcing proper behavior and attention to school. Writing is valued and reinforced in the home. He is encouraged to write at home.

113: Practice, rewrites, asks questions—is not satisfied with understandable writing, but wants everything in standard English.

114: Organizes his thoughts, is careful, checks his work.

115: I believe he had a strong writing ability in his native language and the transfer has been natural.

116: Expresses ideas clearly, uses simple words rather than complicated words that he cannot use correctly yet, good handwriting, strong support from parents to excel in school.

117: She connects her thoughts clearly without a lot of "and"s and run-on sentences. Her writing is descriptive, not brief and choppy.

118: An 8th grade student of mine has solid academic language skill and is well integrated socially and culturally. Even though she has language problems she works hard and makes good grades.

119: While a good writer may not possess the structural elements of writing, he does have a way of communicating ideas in a meaningful way. Student A could write beautiful, creative stories about people in various situations, but has been afraid to do so outside of my classroom because of her many mechanical errors, which I did not dwell on, but other teachers did.

120: She has a good education in her own language (grades 1-3) and a family who is education oriented.

121: Rewrites, checks/self-monitors, plans using plan, uses dictionary, loves to read.

122: Good to excellent sentence structure. Some ability to "think in English" and thus does not hesitate to translate from native language [?] her writing is starting to flow naturally.

123: N/A

124. N/A

125. Students who can answer some questions fluently and can express themselves correctly.

126. In a paragraph they described their experience in the U.S. I didn’t consider any of my students to be good writers at
the level they're in.

127. Students who can write sentences with correct grammar.

128. To know the basic rule for writing (introduction, body, conclusion and so on). To know a lot of phrases, conjunctions that are useful for writing.

130. None of my students were able to write in English.

131. Writes methodically but cannot speak well.

132. He writes his ideas in complete sentences. He also incorporates my comments and suggestions into his writing.

133. The student writes in a linear fashion, describes situations clearly and uses idioms on occasion. She is very clear in her explanations or descriptions.

134. 1st grade student can name objects they have drawn. Some can use subject-verb-object sentences to describe their pictures or their thoughts on an academic concept such as I hear music, or plants drink water.

135. The student is able to give a clear introduction with the theme idea in it. He supports this central idea with effective and convincing examples. He concludes the points made in a summary paragraph.

136. The students who I think are good writers know how to read the question asked if need be, answer the question directly, and give proof. They will experiment with words that they haven’t used before and know how to help others with their writing.

138. N/A

141. My best ESL students have not just a sure (?) at structure (paragraph, grammar, usage, etc.), but more importantly an ability to utilize strong verbs and specific nouns in describing people, places, things. They are also able to draw effective (accurate) (?) on more analytical papers.

142. I have only had one student that was concerned with writing. He wrote an autobiography and had me proof some business correspondence. He was very proficient--only a few errors with "he buy(s)" and an added "that": "I want that you go."

143. Many of my students reinvent figures of speech, both accidentally or on purpose. For example, one student wrote of someone "yelling at the top of her tongue," instead of "lungs."
also many of them have sentence and phrase rhythms that are not standard to academic writing but that are still grammatical and more importantly, interesting and fluid.

144. My students do not write in English yet.

145. This student would be able to read a note from her son’s teacher and write a short reply.

146. As I stated before, my students are at the beginning level. One student who is a good communicator in the dialogue journal uses many adjectives to describe whatever she is talking about. For example, instead of simply telling me the names and ages of her children, she will write things like “they are very shy girls” and “they have big eyes.” She also doesn’t shy away from big topics because of her limited vocabulary and syntax. Dictionary use is apparent in sentences such as, “I like Canada so much, but there are a economic no good. No chance.”

147. N/A for me.

148. not photocopied

149. not photocopied
3. Take a moment to think about an actual ESL student of yours who you think talks about academic topics effectively. What does this student do that makes him or her a good speaker?

1: He gives reasons for his opinions, tends to speak slowly and repeat some ideas, uses eye contact, uses proper pronunciation and inflections so that it doesn’t become monotonous.

2: A real interest in the topic.

3: NO RESPONSE

4: They all communicate. Few have useful academic vocabularies yet. I plan to work with them on expanding and holding visual images. We do this with stories, dramas, drawings, etc. We use no AV equipment, only human contact.

5: Not afraid or shy: asks many questions, very alert.

6: NO RESPONSE

7: My student has a good vocabulary in English and is able to interpret what he hears and reads and put it in his own words. This student is bilingual and is able to think in English and no longer has to translate from his native language to English.

8: The student is able to correctly organize his thoughts. He is able to effectively use examples. His fluency of English and his correct use of grammar also contribute to his being a good speaker.

9: Most of our students are showing signs of improvement now, and I think it’s because we have begun to concentrate on including who, what, when, and why in our writing (journals, creative writing), which has transferred to their speaking!

10: I cannot say any student of ours speaks about academic topic "effectively."

11: NO RESPONSE

12: NO RESPONSE

13: Humberto is very inquisitive and curious. In fact, he never stops talking! He brings to the ESL class ideas he has heard or read from home, his mainstream class, TV, everywhere. He wants to know about everything and isn’t afraid to take risks. He remembers and uses new words and ideas.

14: The above description in [question #2] would also
describe this student’s spoken English.

15: She is very organized in all aspects of her life and studies. This helps her to keep excellent records of what is expected of her in each class. This, in turn, makes it easier for her to explain what is required.

16: This student practices, asks a lot of questions, tries to incorporate new ideas, listens and consciously works to improve.

17: Besides understanding the content the student is able to communicate it through the academic language.

18: He pronounces well. He knows enough vocabulary that he can make himself understood.

19: Uses appropriate vocabulary. Asks thought-provoking questions.

20: Cristina uses academic English. When a grammar topic comes up in class she can explain to the other students the rule and why it is needed. She can also give examples of other instances where it is necessary.

21: Stays on topic and asks for help when he can’t complete his thought or express it well enough to be understood.

22: She seems to understand what is going on because she borrows my books. We can then discuss it.

23: Grad. student: He has a point of view and convictions that he wants to communicate.

24: He uses simple sentences. He understands the topic.

25: Willing to take risks.

26: The concept and vocabulary have been learned well and internalized. The student usually understands the subject matter in their native language due to help and materials used at home.

27: See above [question #2].

28: I don’t actually have anyone in this category, but the one who comes closest is an older student who is willing to speak about something even if he doesn’t know the word.

29: He is able to reword the same idea in many ways, all of which are accurate.

30: N/A
31: Another nine year old girl, who is part of the same ESL group as the above-mentioned boy, is an extremely effective speaker. She is, however, about 2 grade levels below her peers in reading and writing, and is receiving intensive remedial services via Chapter I funds to improve her literacy skills. This girl can recount information conveyed orally in an amazing coherent manner. To a certain extent, I believe that this enormous capacity for recalling academic language so completely and conveying it so clearly is due to her level of interest in the material presented, as well as a matter of compensation for her literacy problems. In addition, her interpersonal intelligence (cf. Gardner) is absolutely astounding. She has a clear sense of what her audience needs to know about a topic when she speaks to them.

32: The student is able to use vocabulary which is specific to the subject rather than broad or general terminology. The student is able to give evidence to support statements.

33: The student is able to use vocabulary and terminology learned in content based curriculum in an effective way.

34: I have no one like this. All of my students have little or no English.

35: NO RESPONSE

36: I usually consider a student to be a good speaker in my class when he/she can argue a point effectively with me or classmates. This student shows me command of the language and confidence in its use which enables him/her to "think on his/her feet."

37: NO RESPONSE

38: Has self-confidence, reads and absorbs information plus, isn't afraid to ask questions or use a dictionary. Often re-reads to get a clear understanding, which produces confidence in speaking. Has an attitude of joining in laughter if she makes others laugh by mistake, but most don't laugh because they respect her.

39: N/A--but most likely attended preschool/K in English medium school and parents fairly fluent in English, as well as older siblings.

40: He uses many examples and when he cannot think of the word in English he used many other words to describe what he actually wants to say (eg, in talking about how you can fly to a small space--he didn't know how to say "helicopter," so he explained, "it's like a plane but the propeller is on top and it can go up and down).
41: NO RESPONSE

43: Summarizes well. Adds examples of the concept under discussion. Relates the material to her prior knowledge.

44: Not a current student, but memory tells me that the student, again, took risks. Even though he didn't have all the correct syntax, he was exuberant in his delivery of spoken language. Having limited vocabulary did not humble him.

45: He actively sounds like a talking book. He is bright and informed, which is important, but his wording and air of confidence give a credibility to what he say—it smacks of academic "author"-ity.

46: Sorry--drawing a blank on this one today.

47: Although the grammar would be "broken," the elaboration of his discussion on a topic would demonstrate understanding, not just a rote mimicry of the information. He would use the particular vocabulary in his answer, perhaps.

48: Communicates complete thoughts. Usually follows a logical progression. Doesn't take a lot for granted.

49: Ana thinks before she speaks. She listens to questions. Her language skills are strong enough that her replies are accurate.

50: The student has a good experience background and an interest in academic subjects to draw upon. The student is able to talk about academic subjects because he feels comfortable speaking English in ESOL. He is not concerned about grammatical or syntactical errors.

51: Organization of ideas, rhythm of delivery, eye contact, motivation.

52: N/A for my class.

53: NO RESPONSE

54: NO RESPONSE

55: The successful ESL student has learned to inspire him/herself about a topic, to develop it, and to see the other side of any argument he/she chooses to tackle.
56: He knows the subject matter, but still searches for words he needs.

57: Is able to communicate, understand and be understood.

58: NO RESPONSE

59: This student may not have fluency to speak quickly and may still have structural difficulties, but is able to express himself/herself using the academic vocabulary.

60: He has an excellent vocabulary and knows the vocabulary in content areas. He was able to verbalize why he put something in a Venn diagram the he did effectively. His oral command of English is excellent--his reading and writing are low (Hebrew).

61: Listens actively; questions; takes risks in trying out new language; relates academic topics to Ll background and often uses Ll to expand/check/clarify; paraphrases.

62: This student retells information that he has read on a topic that he is very interested in. The student I'm thinking of is a fifth grader who retold information he had read about ants in a 3rd grade level text. He was able to argue contested information and support his argument with text.

63: Sticks to the point; uses concise style; plans the presentation and uses the plan.

64: The three students I mentioned earlier were given lists of vocabulary words designed to make the material more understandable to them. The student who spoke most effectively (about the content of a chapter read for homework, for example), a) had the best verbal command of the language; b) had a very high level of confidence; c) always did her homework. Reading and comprehending the text provided her with the structure and vocabulary necessary to effectively discuss it.

65: He's able to inference and guess. Things don't need to be spelled out.

66: The student is able to articulate her thoughts clearly using appropriate vocabulary. The student is easily understood, with good pronunciation and intonation and inflection. Body language is appropriate (eye contact, smiling, gestures).

67: Diana was 1) beginning to be able to answer a question using vocabulary words (not definitions) from a previous lesson; 2) the ability to express reactions to an incident without a lot of assistance from me!!

68: I do not teach ESL students in elementary school or
secondary school contexts. The students I teach whose first language is not English know English quite well. They need support, assistance for a time, and frequent opportunities to express themselves. Usually, if they speak well in L1, they will adapt these skills to L2.

69: Tries and is not discouraged when there is a misunderstanding.

70: The student I have in mind uses many questions in his/her delivery. "How do you say?" "What is the...?" If the exact word is not in his/her repertoire s/he will talk around it using the vocabulary s/he has.

71: My ESL student speaks slow and faces the person in which he is communicating with.

72: Uses many new words that her or she has learned.

73: He has just made a chart of nouns. This student makes good use in oral and written form of proper, collective, and abstract nouns.

74: Question not photocopied.

75: That student is able to communicate the thoughts even if grammatical errors occur. A student is a good speaker if he/she is able to internalize the material and then talks effectively about it.

76: The writing exercises are preceded by discussion and brainstorming (webbing). By ensuring oral use of language, writing improves.

77: NO RESPONSE

78: Such a student would have strong skills in the native language so he/she could readily exchange or transfer knowledge and a higher degree of native language proficiency to the new language. The student has a great deal of inner motivation and perhaps has found a way to ask for what she/he needs from teachers. His or her study of the language extends far beyond the classroom setting.

79: This student takes the time to formulate her thoughts before presenting them and will often make analogies to something others are familiar with in explaining.

80: NO RESPONSE

81: Tries to incorporate new words into his speech. Asks for feedback concerning proper use. Listens to teachers and
peers to obtain new vocabulary.

82: The student can discuss the information in vocabulary terms needed for that area of study. The student does not speak in phrases only but can develop and explain ideas in complete thought phrases and sentences. The student can describe a scientific process or historical happening from beginning to end.

83: The student uses examples and comparisons to explain her ideas.

84: These students understand the material and are able to summarize it in their own words, rather than copy answers or recite answers directly from the text provided.

85: Feels confident and self-assured. Speaks loudly. Has learned the information he wants to give to others. Uses visual aids.

86: He stops on the topic, he uses adjectives well to show the listener what he's talking about rather than just tell. He uses native-like intonation.

87: Communicates with fluency, clearly and uses vocabulary in an appropriate manner in various contexts.

88: His pronunciation is clear and succinct. Rene is a good aural learner who readily accepts new vocabulary words and eagerly uses them in classroom discussions. Also, he has a good memory and very good aural discrimination skills.

89: She takes a moment to think! This third grade girl is generally quiet (in Khmer, too, her mother says), but when she is ready to talk about academics, or anything else, she is organized and clear. When she isn't sure she has now begun to ask for information instead of waiting for it to appear, and this has helped her express herself.

90: He/she demonstrates an understanding of what he/she is saying.

91: Same as above [question #2]--particularly the use of effective and specific vocabulary.

92: She organizes her thoughts well before speaking through the use of mapping and/or outline.

93: Uses words in complete phrases and sentences (2nd grader). Thinks and spends time consulting references before speaking. Has made friends gradually with students from other ethnic groups. He Ghanian. They are mostly Latino.
94: He is able to summarize and condense his thoughts.

95: NO RESPONSE

96: He understands basic concepts and shows understanding through examples, transfer, etc. He sees relationships of concepts, and can speak about the relationship. He can mentally organize main concepts and supporting details. He may not be very fluent yet but the key words he chooses are concept words and deliver the message that he knows what he is talking about.

97: N/A

98: M makes connections, asks questions, restates knowledge, can problem solve. Listens, asks for clarification.

99: not photocopied

100: Student uses oral English skills outside of school setting (has developed self-confidence).

101: He uses specific vocabulary (not this "thing"). He can use more abstract terms, like "the soil eroded," rather than "washed away." He can describe a process clearly, well sequenced and with explanation of cause and effect.

102: Good vocabulary. Thinks of various aspects and can express them.

103: NO RESPONSE

104: She is an advanced level student who seems to internalize meanings and relate to others the facts she learned in her own words.

105: NO RESPONSE

106: Stays on the subject. Knows the subject. Is a good listener to me, the TV, other students. Looks us in the eye. Enunciates.

107: They read a lot, which helps them get a feel for the language. It's not easy for them, but the more they practice speaking, the better they get. My good speakers really try hard to articulate well and get rid of accents.

108: I tried a 7th grade topic of Tom Sawyer as a cultural experience. Two of my students were able to follow the saga of the white wash after I used TPR, retold the story, and we read it together. They are smart women! They have courage to try.

109: She is enthusiastic and knowledgeable (same as an L1
They have been able to do this in their own language.

Rigoberto loves social studies and can speak to any topic that has been discussed in class. Orally, he is easy to understand because he speaks slowly and thinks about what he wants to say. I think he speaks well because he has the general knowledge necessary.

He’s secure in himself and not afraid to make grammatical errors as he speaks. He has received unconditional affirmation of his worth and importance in his home and in the classroom.

Such students always come back and ask questions. They want to know how to ask questions and will ask the teachers to restate their questions or oral presentations so they can model the teacher’s language. They ask the teacher to listen to them and want feedback.

Organizes his thoughts—sees the whole picture, can understand more than one point of view.

I don’t think I have a student who could!

Clear pronunciation of words, self-confidence, general knowledge of grade-level content material.

I can’t think of any!

As an ESL student, to be a good speaker, he/she has to have self-confidence as well as good language skills.

A student who can talk about academic topic effectively uses key vocabulary at appropriate times. The sentences surrounding the vocabulary may not be grammatically sound, but the meaning is not obscured.

Confidence—self-esteem.

Uses props, effective group participant, speaks slowly, asks questions.

This student thinks in English (or at least is attempting). Since he/she does not require time for direct translation of his thoughts form his native language to English, he speaks well on his favorite academic subject.

NO RESPONSE

As an ESL student, to be a good speaker, he/she has to have self-confidence as well as good language skills.

Confidence—self-esteem.

Uses props, effective group participant, speaks slowly, asks questions.

This student thinks in English (or at least is attempting). Since he/she does not require time for direct translation of his thoughts form his native language to English, he speaks well on his favorite academic subject.
125. He/she can express himself/herself well. He/she should have a second language context.

126. He continues to learn and become more effective.

127. NO RESPONSE

128. Eye contact. The competence to speak the content of the story in the right order. Gestures.

130. N/A

131. He thinks about what his is saying, choosing his words.

132. I do not have a student who talks about academic topics effectively.

133. The student is convincing, or tries to convince.

134. He was uses complete sentences to demonstrate his knowledge of a concept just recently taught.

135. The student uses appropriate words that are relevant to the topic. In other words, he knows the appropriate register used in a particular academic content area.

136. She talks about the story we’ve read, referring to aspects of the story as well as perhaps comparing/contrasting to stories we’ve read in the past.

138. N/A

141. ESL students who speak effectively are conscious of how they speak as what they say. One student in particular has worked hard this past year on eye contact, articulation, voice projection, etc., and his progress has carried over into the quality/quantity of his information shared.

142. N/A

143. She thinks critically. She not only links the text she read to her own experience but she compares and analyzes, raising interesting, meaningful questions and drawing thoughtful conclusions.

144. Uses a wide range of vocabulary and is very literate in his native language.

145. Uses the same tense as the question. Uses subject-verb agreement correctly. Generally uses correct word order.

146. The student I mentioned above talks in much the same
way as she writes. The only difference is that without the time to reference her dictionary, she will talk around the meaning. She might say something like, "In Canada it's hard...the money..." Then, through negotiation of meaning, we can work out what she wants to say. At this level, her willingness to attempt to express her opinions is the best thing going for her.

147. N/A for me.
4a. Do you sense that some of your ESL students have enough English language skills to make them understandable in situations outside the classroom, but are not succeeding academically in school? If you answer yes, please answer the other parts of question 4. Otherwise, skip to question 5.

4b. Do you think ESL students' difficulties in the classroom are due to their need to develop better academic language skills? If yes, how so?

1: Concepts, content, vocabulary, material alone are complicated enough. The fact that they are expected to perform so many tasks to illustrate understanding and participation often overwhelms them. Academic language is important, but so is modeling what you expect them to do or showing them samples of work you expect.

2: Yes--study skills in particular. Learn what is expected and how to respond to the teacher.

3: NO RESPONSE

4: This depends upon the school. Our school is Waldorf-based and I do not expect a lag in their classroom performance based on an academic language barrier. We have no grades, only portfolios.

5: Yes, my pull-out program does not allow me sufficient time to develop skills, but I would zero-in on outlining, finding key words, etc.

6: Some lack vocabulary necessary to understand the textbooks and sometimes the teacher. Some students appear to have other problems that prevent them from being successful.

7: Yes. Some of my students do not have good academic skills in their native language or even a good first language. Both of these cause them academic difficulties in the classroom.

8: Many of our students speak well and exhibit good understanding of English but are not reading and writing well. This limitation causes them problems when faced with academic language experiences in the classroom.

9: This is particularly true, which is why I try to include literacy/reading skills and vocab. as well as bar graphs (math) in our lessons. This is important for even our beginners who are particularly bright. However, for a recent arrival, who may also be shy, it is more important to refer and resort to survival skills, and leave academic language for later.

10: Not really.

11: Students don't know the vocabulary of academic language used in the classrooms.

12: Although some students have sufficiently progressed in...
their oral language skills, writing and reading comprehension skills remain very weak. Once oral language skills have been mastered attention must be given to writing and reading comprehension.

13: Yes--I see them as feeling more intimidated and seemingly "helpless" in their mainstream classes as they compare themselves and are compared with other students. Often they are held up to the same academic standards as native English speakers, and their limited vocabulary/grammar/speaking skills aren't provided for.

14: Yes. Many of our students are older (4th grade and up) when they enter the program and thus do not have the academic cultural base (such as social studies, science, written problem solving in math and reading) to be successful in the mainstream classroom.

15: My students are actually succeeding, but it takes a great deal of my assistance. Much of their difficulty is not based so much on language, but more on their lack of desire to learn and poor organizational qualities. They may also be lacking strong motivational input from home. This probably is due strongly to their culture and life habits.

16: Yes, and also understanding of the concepts words represent. How--constant exposure and study of academic language in a meaningful way.

17: NO RESPONSE

18: If the students cannot speak, read or write, or know only a little, naturally they are going to have difficulties in the classroom.

19: In part, yes. To be successful in the classroom one needs learning strategies to assist in learning content. How to negotiate a social studies text, how to make the difficult language and ideas more comprehensible.

20: They might know the concept from their native language but cannot transfer it to English.

21: Mainstream teachers make academic expectations based on students' conversational ability in English. Students need to learn how to access academic language.

22: They need the "background experience" that Anglo students have received in earlier years of instruction.

23: No.
24: NO RESPONSE
25: NO RESPONSE

26: Yes. Social language is a very different skill from academic English. Students need to learn the vocabulary for academic subjects.

27: Sometimes. (There are many factors contributing to difficulties in the classroom).

28: NO RESPONSE

29: One example might be that they have to learn what the verb tenses signal to us as native speakers.

30: At kinder--they are successful in their native language (most are), but English?

31: Yes and no. Some difficulties are simply related to lack of exposure to concepts in L1, or in the development of adequate literacy skills at home where parental involvement is minimal, due to the constraint of their jobs or other conditions. Still other problems appear to be a lack of motivation on the part of the student, or a failure of the teacher to provide adequate support and/or opportunities for learning academic language.

32: NO RESPONSE
33: NO RESPONSE
34: NO RESPONSE
35: NO RESPONSE

36: Definitely! I have had many students over the years who can converse easily with their peers--I cal that playground or street speech--but who aren't able to participate in oral discussion in another classroom because of lack of vocabulary, background or shyness of speaking to "stranger" even though those "strangers" in another setting are teammates, etc.

37: NO RESPONSE

38: Reading academic texts takes five times longer for an "advanced" ESL learner than a native speaker. Few students put in that time; few MS teachers tailor the work to the student. Students (grade 4 and above) fear laughter in academic settings and are conditioned by painful experiences to shut up.

39: NO RESPONSE
40: Yes, I feel very strongly that this is the case. Students very often sound proficient, so teachers assume that they have developed CALP, therefore expect that students won’t have any problems.

41: Students must grasp academic language skills in order to understand concepts being taught in a school setting.

42: Comprehension/practice of academic language skills through games of the computer.

43: No, they need to be better communicators, not especially with academic language, but with language that is easily understood by others.

44: Yes, sometimes. Academic lecture pace is swift. There is not much opportunity for LEP students to ask teachers to repeat and/or go over what was said. Content area teachers assume students come from the same cultural reference points that they do and it’s not often the case.

45: Yes, but this is only the tip of the iceberg. Most of my students whose success in and out of the curriculum are polar [sic] have learning disabilities that would be causing problems regardless of language medium.

46: Yes, I think the lack of academic language skills is often the source of their difficulties. They may know the basic factual information that is being called for but not understand how they are being asked to present it.

47: I don’t know. They’re young, disinterested, uninspired, don’t get enough sleep, nutrition—good parenting.

48: In some cases yes, but more often it’s not language, but inattention to detail or unfamiliarity with general study skills.

49: NO RESPONSE

50: Yes, in part they lack academic language skills, but also they tend to show weaknesses in reading and writing skills.

51: I guess it’s one of the factors, and maybe not even a priority factor. There must be more real and urgent problems like: family environment, prior knowledge, or simply language in general.

52: I think it is a component but not the main driving force. There are many other contributing factors, i.e., stress, pressure, lack of support, lack of family involvement, lack of English discussions outside of the classroom, etc.
55: Yes. With academic language skills, non-native speakers will be able to hold their own with other English speakers and develop meaningful relationships as well.

56: He can get by. His English isn’t up to par with other native English speakers.

57: Books written in English are written for the child who was born speaking English. Since an ESL child has several years "to catch up," obviously there will be some unknown sounds, words, phrases, idioms, and deep-rooted meaning in the texts.

58: Our students need vocabulary to understand instruction and to read text. Many have had little education in their own countries--come here as refugees.

59: NO RESPONSE

60: NO RESPONSE

61: Many of my students have not developed skills in their first language. They enter school lacking basic concepts in L1 and quickly fall behind. For many, bilingual instruction would help as well as Head Start programs or "ungraded" K, 1st graders. Also involvement of parents--explain school programs, etc. to parents.

62: Need to understand directions. Need to be able to read. Need in depth understanding of vocabulary specific to topic being studied.

63: School is very unnatural to many kids. They are always faced with thing they do not know and may tend to think they are "dumb." The topics and organization of school turn off many kids.

64: Our students typically stay in this country for 2-3 years, only long enough to begin to be ready to acquire academic language.

65: Yes. Often these students do not participate in class because they’re not sure about what to say.

66: Yes. Some of them don't have the vocabulary needed to analyze literature or do a verbal math problem. They do pick it up eventually or they are not successful outside of ESL class.

67: There is verbal success before written skills are
comfortable. Frustration with different words for the same thing. They are often able to do "functional" writing but this doesn't carry them through class.

68: NO RESPONSE

69: There is just too much material and they need more time.

70: Yes. They need to learn to think automatically and authentically in English, rather than think about what they want to say in L1 and then translate it into L2.

71: NO RESPONSE

72: Not always.

73: We study the academic language in Spanish and reinforce it in English.

74: not photocopied properly

75: Sometimes, but most of the time is lack of support from people outside of school:

76: Students need more background knowledge in content areas and they need to see the relationships of content to become analysts rather than copiers.

77: The preschool age and K-1 young ESL students need to practice following 2 and 3 step directions. Some of them seem to understand because they can follow the behaviors of their classmates, but yet don't truly have the academic language abilities/skills in English.

78: The challenges are many and great and involve a whole host of areas. Much has to do with the teaching style, prior knowledge, learning style and amount of time attention a teacher can give the student. A student from a country where he of she has had a minimum amount of formal schooling who is according to age placed in a secondary program will experience great challenges.

79: Many of my students can function in a familiar everyday situation--work, home--but are stymied by the amount of vocabulary course work demands, especially the large number of synonyms for many English terms.

80: I know that many students enter school and seem to be limited in both languages (English and Spanish). Their English has many features of "Black English," but I'm not sure if their difficulty is due to a need to develop better academic language in general, (neither of which seems to have been developed
fully).

81: Many first year ESL students, even with good NL academic skills, encounter difficulty with academic subjects in English. By year 2, these kids are on their way. Kids with few academic skills in NL need intensive NL academic instruction, or they almost never catch up.

82: They need the terminology--particular language of the situation to succeed. They need the ability to express themselves in science, social studies to do this. In addition, when asked to analyze something, in which prior experience is needed, they can't do it. They don't have the particular linguistic flexibility to do it.

83: Many of my students are very successful in conversational English but have difficulty understanding content in history and literature studied in the classroom. Scientific terms can also be difficult. Language involved in tests can also be confusing for them. Even math can include language that is confusing: trading, renaming, dimensions, greatest common denominator, least common multiple, etc. Also, the patterns of algorithms vary from country to country, particularly for division.

84: Yes, by reading and comprehending through hands-on experiments in the content areas.

85: ESL students are frequently in socially interactive situations and learn (or acquire) language they need to "survive." However, academic language is not always presented in experiential, hands-on activities to better acquire it naturally. ESL students need to learn the strategies and skills just as English speaker s do, but they are also involved in learning English language which makes the whole process doubly difficult.

86: Primarily reading textbooks which are too densely packed with information, using too many new vocabulary words.

87: Definitely--Their basic interpersonal communication skills are sophisticated and develop quickly, but their comprehension of academic language is much slower and they do not receive as much practice with this level of language.

88: Yes, but more importantly, these students must raise their reading levels/abilities. Too often, there is not enough time spent in elementary grades with reading experiences in English that challenge the ESL student.

89: Partially. A 5th grade boy, for example, misses some of what is said because he doesn't know a key word, loses the sentence, and spaces out. In a groups he'll try to contribute,
realize he's not saying it "like the other kids and say, "Oh, I don't know." (We've talked about this).

90: Students need to be encouraged to use the language in the classroom. If not, they may never get to use English. Since many ESL students do not get this opportunity, they rely on situations outside (friends, neighbors, store cashiers) to practice the language.

91: Yes. Need to develop technical and sub-technical vocabulary. Technical vocabulary is that related to the specific content area (e.g., "metamorphosis" in science). Sub-technical vocabulary refers to the academic language needed to indicate chronological time, comparison/contrast, cause and effect, description, persuasion, etc.

92: NO RESPONSE

93: Yes. They need to be able to handle increasingly abstract language. This is aural understanding of school talk and ability to take notes and write.

94: Yes. They need to understand the concepts and thinking strategies behind the concept.

95: Yes, but this must be reinforced in mainstream classrooms. Mainstream teachers need more training in language development for all students. Too many teachers make assumptions for all students which ignore developmental growth in language acquisition.

96: Yes, I believe more content will help sharpen academic language skills. I also believe that expectations play a big part in developing academically. Some teachers equate no language to no brain and do not challenge ESOL students enough academically.

97: In some cases, yes. They are intelligent, hard-working students who have not been in the US long enough to develop "academic language." Also, some come from schools so different (stressing rote learning rather than understanding) that our "academic language is totally new.

98: Many in my sheltered instruction 7th grade were learning hands-on, concrete skills. Constitutional ideas need more [?] thinking than "describe your day at the zoo."

99: not photocopied

100: Students might be in a mainstream class that the teacher is going at a faster pace.
101: Yes--ability to use specific vocabulary, more abstract ways of describing something, use of passive voice and correct word forms.

102: Learn to separate slang or street language from classroom language. Learn to think and express original thoughts. Learn to back opinions with reasons.

103: NO RESPONSE

104: Yes. They can follow one’s train of thought in the content area with a good oral base. Even if they look words up in a dictionary, however, they still have trouble with the texts since different language structures are used such as passive voice. Dictionary definitions also use academic language and so it doesn’t make sense even when other unknown words in the definition are looked up.

105: NO RESPONSE

106: Practice using materials and computers to do research projects in the library to prepare oral reports. Work with other American students in cooperative learning groups.

107: NO RESPONSE

108: My adult learners are strong students with college, medical degrees, etc. But the pronunciation and meaning of words is difficult. Conversations are easier for them face to face. Phone calls can be difficult, but writing takes a lot longer.

109: NO RESPONSE

110: Yes. They don’t have the experience of the continued academic setting.

111: Yes. Many students do not have the schooling experience that is necessary to be successful. They simply need more practice.

112: NO RESPONSE

113: The language of academic expectations is assumed, but not taught to ESL students. In the high pressure high school classroom, content area teachers don’t have time to develop the background necessary for ESL students to understand a lot of academic language. They learn definitions, but not comprehension.

114: It’s not just a need for better academic skills, many are not in a home where books, reading, and an appreciation of academics for academics sake is present.

51
115: Yes, understanding the textbook language is a more formal style of writing, as well as perhaps the way the teacher lectures.

116: Somewhat, but I think that more of the problems arise from having adequate listening and speaking skills but continuing to struggle with reading and writing.

117: Yes, through some direct instruction, but also through practice and mere experience. It can be acquired gradually but instruction aids in the process.

118: Yes. The lack of academic language skills make ESL students very difficult to understand in the classroom.

119: In some instances students have the background knowledge, but do not have the vocabulary (in English) to communicate this. They also lack confidence.

120: If a child has little or no experience in school culture, in his own country (country of origin) the chances are the academic language multiplies his/her confusion.

121: In part: They cannot express the concepts they may already understand in a form that teachers find acceptable. Without modification of text and oral presentation they cannot access unknown concepts.

122: One must be realistic. Socialization does not happen overnight. Difficulties should not be viewed as necessarily bad, but as part of a stage of acquisition of language and cultural adjustment. The psychological adjustment aspect must not be overlooked. Psychological orientation takes a bit longer than we would like to admit.

123: They have to learn the vocabulary, just like non-ESL students do. The vocabulary and concepts must be taught as concretely as possible using real demonstration, pictures, drama.

124: Yes--including cognitive skills, study methods, organizational method.

125. Yes, they have to write and speak correctly in the class.

126. No, not mine.

127. Yes, they have to read and write correctly in the classroom.

128. No.
130. no response

131. Lack strategies appropriate to individual situations.

132. This is true somewhat, however with the students I am currently working with, their lack of familiarity with the activities and lack of motivation is a large factor which affects their success in school.

133. Yes. Perhaps by learning, or being taught, learning strategies, note-taking skills, time management strategies, etc.

134. no response

135. Yes, since test directions are typically written in academic language and to successfully perform on these evaluating measurements, students need to know what the words mean and what the criteria are for a successful response.

136. Yes, the students have BICS, but are "handicapped" academically in their L1. They need to take a paired course to teach them how to go to school.

138. N/A

141. Of course, understanding academic language has a direct impact on confidence and desire to participate in a more informal oral setting.

142. Most of my students work where only Spanish is spoken.

143. Yes. I believe this because I have non-ESL students in the same classroom who are ignorant of academic language conventions as well. How would any of them know this stuff unless they learn it in school, since their parents aren't academics or college educated?

144. Not necessarily. They do not do well academically in their native language either.

145. no response

146. no response

147. Most of my students are L1 Spanish speakers. They find English spelling a struggle since more than one sound can map onto a letter and many vowel digraphs (e.g., boat) have one sound. Also, their vocabulary level is weak.
4c. Can you describe the particular difficulties that an ESL student has or had with academic English?

1. A 7th grader is having lots of trouble with a science project in which "typical" American procedures and activities are required. Coming from an Asian culture where students listen and write (and memorize), he has no idea what to do or how to go about it. Some of the requirements are design an experiment, make a hypothesis, set up procedures, gather data, write a bibliography, design a display, present work to the class.

2. Try to memorize but without recognizing the usefulness of the material.

3. NO RESPONSE

4. Our students are all from traditional schools and most have poor school records. They don’t do well on tests.

5. Understanding vocabulary, difficulty with lengthy sentences, clauses in sentences.

6. Reading and understanding content-area textbooks.

7. One of my ESL students has some difficulties with social studies because of the vocabulary (lack of it) and little background knowledge.

8. Many of the children lack a background in content area subjects. They have not had many first hand experiences (such as visiting a museum, traveling, visiting a farm, etc.) that would assist them. Many do not have native language literacy. They have not been read to enough in the past.

9. As far as academic language that a student may encounter: as long as the mainstream teacher is sensitive the difficulties are minimal. ESL and mainstream teachers need to incorporate as many visuals (pictures, photos, diagrams) to explain academic language as possible, whether or not it involves instruction, descriptions, or vocabulary.

10. Only in writing, and here it is because basic grammatical constructions are wanting. "Academic English" is a moot point, they cannot (for the most part) write decent English.

11. ESL students find difficulty with reading academic English because the written work is at or much more difficult reading level.

12. Spelling seems to be the number one problem that all ESL students have in common. With the complexities of a non-phonic language like English some students take years to master this
13. I've already mentioned vocabulary, grammar and speaking limitations. They often don't pick up subtle cues and clues from teachers and classmates. In writing, English spelling is almost impossible, and they have interference from their first language at times.

14. Their reading and analytical skills seem to be the weakest when trying to function in the classroom. Their vocabulary acquisition is very limited, especially when many times it is culturally viewed (from their culture's concept of the word).

15. The main problem I have observed is simply the fact that while most classroom teachers may speak at a "normal" rate of speed, it is too fast for the ESL student to understand.

16. A former high school student, now an nor student at the university majoring in education, is failing psychology 101. Not only does he not know the vocabulary, but nothing in his cultural background relates to western psychology.

17. These students usually come with a very weak academic knowledge or have some learning difficulty. While they are struggling to learn English they usually follow behind their classmates in the content area. Some of these students are very weak in their own language.

18. I'm not exactly sure what you mean by academic English, so it is difficult to answer the question. If you just mean proper written English, sometimes this is easier for them than spoken or conversational English. If the student has studied English in their country, they are much better at academic English than the others.

20. Many times missing a word or phrase in a question will make the student misunderstand the question. If they don't have the words to express their knowledge it impairs their academic learning.

21. Student had difficulty with inferencing skills in 5th grade classroom. Same student had difficulty with a unit on idioms.

22. He doesn't know the questions to ask. He knows common language but not how it could relate to academic language, i.e., "we have neighbors. Stars have neighboring stars."
23. The one referenced to in 2 and 3 alone has a difficult time only when a single, non-negotiable answer is required. Example: "What is second person?" The question would accept only "you" as the answer.

24. Not knowing the appropriate vocabulary.

25. Density of material covered in syllabus; quantity of material covered by syllabus.

26. Many students have a great deal of difficulty with academic subjects especially science and social studies because their reading level is not at the level needed for comprehension of the textbook and the vocabulary is lacking.

27. Vocabulary and idioms/expressions are problems, as are inexperience with "dense" text, complex sentence structures and need for making inferences and deductions, to name a few.

28. NO RESPONSE

29. As in 4b, an example that comes to mind is a student who doesn't fully understand all the implications of a present perfect verb versus a past tense verb.

30. They don't know all the color words, etc. Have difficulty following oral directions.

31. The language related to social studies is (or can be) enormously troublesome. Academic English for the 4th grade social studies curriculum, for example, includes such vocabulary and concepts as grids, natural resources, longitude, latitude, boundary, landforms, etc. Without adequate visual and kinesthetic experiences, as well as a supportive teaching environment, the students can easily "turn off" and lose their motivation to learn.

32. NO RESPONSE

33. NO RESPONSE

34. NO RESPONSE

35. NO RESPONSE

36. 1. Learning how to "read" a social studies or science textbook which are language heavy--the students need to learn how to use boldface, chapter heads, the glossary, etc. to their advantage. 2. Interpreting chapter review questions in textbooks--if they are not asking for literal responses. Often the language in the question itself is unknown to the student, so they are at a disadvantage before they even begin. 3.
Understanding a lecture, taking notes when they don’t know how to spell the words, copying from an overhead when they can’t use cursive yet, doing "higher order" tasks with limited vocabulary and background knowledge.

37. NO RESPONSE

38. On a beginning level, many ESL students may not even recognize what subject the m.s. [mainstream?] teacher’s lesson is on because the teacher uses no visuals. Social studies concepts, U.S. history and culture have no "pegs" to hold them. Reading literature above 4th grade is painful. 50-80 new words per page for student who has tested out of ESL.

39. NO RESPONSE

40. One 3rd grade child I was working with was verbally proficient in English yet is somewhat limited in her English CALPs. She was reading "The Courage of Sara Noble" with her class and because she did not know the meaning of the word "cave" she couldn’t follow the story line.

41. Our bilingual teachers help clarify concepts for the ESL students. However, there are times when a student still will have difficulty comprehending. This may be due to a poor educational background, or when the bilingual teacher does not speak the native language of the student.

42. Comprehension, focus, listening, speaking, reading, writing: need for practice constantly.

43. World view is not linear and thus conflicts with linear academic style. Embedded clauses are difficult to understand and more difficult to write.

44. I have had students suffer from the language of the math classroom: division, divided by, into, multiplication, equivalent, equal to...in addition--cultural, problems are worked differently south of the USA and in Europe. I think this is one of the biggest obstacles I face as an advocate for LEP students in my school district today. I also find that the human math teacher is often so steeped in his subject area, suggestions about adapting instruction is often scoffed at and ignored.

45. One extremely gifted student (mathematically) stressed that he knew how to do the problem--he just didn’t know which vehicle was in front, because of the bookish wording of the problem. At the last state TESOL meeting I entreated the exhibitors to produce a math language text/resource.

46. I have a 5th grader whose conversational English is adequate, and who can answer recall or factual knowledge
questions about a reading passage, but who can’t answer higher level questions requiring thinking skills such as synthesis or analysis. I think he just doesn’t understand what the question is asking him to do mentally.

47. Spelling, use of the language in proper written context.

48. No.

49. NO RESPONSE

50. Spelling difficulties, limited sight vocabulary, weak decoding skills, inability to use high level comprehension skills.

51. I can imagine that in writing, but hardly in oral presentations.

52. Most of my students are very good with academic English (and the learning process). They need more survival skills training.

53. NO RESPONSE

54. NO RESPONSE

55. For Korean students, clear directions and a teacher’s motives must be clear for trust between teachers and students to develop. Encouragement and clear and concise directions about each lesson helps build this trust.

56. The grammar isn’t correct. He leaves off word endings.

57. I believe what I mentioned above would be the most difficult.

58. NO RESPONSE

59. Understanding and asking vocabulary to describe abstract concepts. Understanding the use of the passive voice, e.g., "What is being done locally about pollution?" instead of "What are people doing in Silver Spring to clean up rivers?"

60. NO RESPONSE

61. Relating academic English to their background knowledge/experience and first language. A lot of academic English is abstract and understanding is often "assumed."

62. ESL students’ reading skills are just developing by 3rd grade. They are thrust into classrooms by 3rd grade (and up) where expository text is dense, abstract and loaded with
unfamiliar vocabulary. They can barely decode a small percentage of the text, much less make sense of it. Reading instruction virtually stops in the 3rd grade (and up). Maybe a big part of the academic English questions needs to focus on reading ability of students. Appropriate reading level texts on upper grade topics are simply not available.

63. They use slang. They are not able to use an exact term and may use ten words trying to describe a point. Example: "You know, the little part of the door that you pull to open the door," instead of "the door knob."

64. Again, referring to my 3 students, the child who experiences the most difficulty had the poorest overall proficiency of English. The introduction of academic language was perhaps too early for her; she became easily discouraged.

65. Sometimes a student tries to express himself in writing but it doesn’t make sense in English. I think he is translating an expression or idea from his language into English.

66. Reading a text is difficult since the level of the classroom text is often above their skill level. History/social studies and English classes are difficult. Taking tests is hard since ESL students are sometimes not clear on what is being asked—if it’s reworded or explained, they often can respond correctly.

67. Beginning ESL—verb "to be" over use in text. Inferences and cause and effect exercises. They appear to do well with sequence words when first identified.

68. NO RESPONSE

69. When they don’t understand in a mainstream situation there is not the environment to deal with the individual.

70. Moving from contextually rich and explicit language use and environments predominant in the earlier stages of language acquisition to the more demanding implicit and decontextualized use of language in the CALP stage takes a lot of time and moral support (coaching) most mainstream teachers do not have the time or training to provide these. They are driven by the "covering" of the curriculum rather than the grasping of the "bottom line" of the curriculum.

71. NO RESPONSE

72. It is a matter of time. As the student learns more words he or she will become more successful.

73. Take more time to learn.
74. not copied

75. For bilingual students it is not fair to judge them using the same rules that monolingual English students are judged due to the fact that some of their failure is due to the need of time for a better understand not to the lack of knowledge. They know their material but are not able to compete yet, with the students that have been exposed to the English language since they were born.

76. Vocabulary is extremely difficult in social studies. Science needs attention to specific marker words indicating time, intensity and process. Each content area needs to be addressed in context by unit of study.

77. NO RESPONSE

78. Sometimes they don’t have the conceptual knowledge in their native language so they cannot transfer this.

79. In a standardized national test one very good student was asked to “explain how the views of two historical figures diverged.” She was not able to accomplish the task even though she knew both figures and could explain their similarities and differences. She did not know the word “diverge” in this context.

80. Many difficulties in vocabulary and comprehension.

81. Reading language assignments. Understanding spoken explanations—“and/or” directions, instructions. Producing homework assignments: reports, presentations, etc. Shyness.

82. In my school there is a health program called Quest. Students often need to discuss and express different solutions to social problems. They need to create, for example, sample scenarios in which they have experienced peer pressure and then respond with positive and negative reactions. This is a real struggle for my students.

83. Language that is confusing: trading, renaming, dimensions, greatest common denominator, least common multiple, etc. Also, the patterns of algorithms vary from country to country, particularly for division.

84. They fail courses. They don’t comprehend complex text. They can’t write comparison compositions. All of these activities and learning skills should be provided by the ESL teacher. (I was in an ESL pull-out situation for 3 years, so I know how difficult it can get to coordinate classes, but it’s necessary.)
85. Reading a text to learn concepts. Learning vocabulary. Following directions. Understanding abstract concepts in all subject areas. Understanding videos. Whole group instruction that is totally oral. Pronunciation if student hasn’t had good or enough modeling.

86. Textbooks are the main problem. When I use resources and materials that were not written for instructional purposes, the students understand better what they read.

87. Don’t understand lecture style classes in social studies, science, etc. because they miss so much academic English. Will have difficulty comprehending text material without assistance or modifications to the material.

88. Again, reading to gain vocabulary, reading to gather main idea or details, summarizing and predicting events, and making inferences or seeing cause-effect relationships.

89. See above. This child says, "I don’t know how to say it. You know."

90. Not understanding directions. Limited use of key content area words. No or little support from home. No knowledge base to build upon. Afraid of failure. Multiple meanings of words.

91. Lack of familiarity with textbook vocabulary. Lack of familiarity with textbook grammar, e.g., passive voice, present perfect tense, past perfect tense, embedded clauses, complex sentences, compound noun groups.

92. NO RESPONSE

93. Has trouble in the regular class after exiting a bilingual program. Cries because he doesn’t understand much of what is said in content area 6th grade classes. Need for family support and counseling.

94. The ESOL student tries to be literal. Many of the concepts have figurative language or multiple meanings, eg., "table".

95. Once students enter upper elementary and secondary grades the dependency on content learning and expository text places these students at risk if instruction and scaffolding has not been developed in the use of expository text along the grade levels.

96. I’ve already mentioned low expectations of many teachers, another is that ESL teachers are not very qualified to teach academic English. It is important that ESL teachers work
with regular teachers to find out the nature of a subject. Once the nature of a subject is known, language can be structured around it. ESL students need to be shown how English can effectively be used to transmit their academic ideas and not be merely a vehicle for social communication.

97. A student from the Philippines had real problems with comprehension problems--anything that involved thinking and explaining rather than a quick, memorized answer.

99. not copied

100. A student who comes here with limited previous education. Comes from illiterate family in first language as well as English.

101. In general, my Hmong students (k-5) have little practice or exposure to academic language in their 1st language, which I believe makes it harder for them to express academic language functions in English.

102. Still in US high school mode and hard to change those habits when English first learned including casual responses (yeah, uh huh) to instructor as well as high school mentality for presentation of an essay (pictures, fancy cover, etc) rather than concentrating on writing and revision.

103. NO RESPONSE

104. New meanings for familiar words caused problems for this student, especially when it changed function in the sentence. (Example: verb forms become nouns and adjectives.)

105. NO RESPONSE

106. Asking questions of the teacher. Choosing topics for science fair projects--designing experiments. Doing well on tests. Understanding assignments.

107. NO RESPONSE

108. Listening to and catching information in straight lecture college classes.

109. NO RESPONSE

110. They have difficulty of making the transition unless
they have been schooled adequately in their own language.

111. Difficulties with idiomatic language, vocabulary, affixes, the double meanings of many words. Pronunciation of words--spelling also.

112. NO RESPONSE

113. High school ESL students must pass English, which means reading literature that is impossible for them. In our program we read aloud, paraphrase, read and discuss, summarize, teach higher level reading skills--only memorization for tests.

114. Not understanding the vocabulary or idioms. The sheer volume of information in a textbook.

115. Understanding the terminology of each class--it is very overwhelming.

116. Multiple meanings of words, pronunciation.

117. Students are expected to write a sentence or even a paragraph but have no idea of what it is. Also, at later stages writing an outline then a rough draft is hard to do without knowing to what those terms refer. By giving examples and explaining, then having them write their own with my guidance if necessary and checking for understand.

118. High school ESL students have had difficulties in US history, biology, and P.E.L., because their lack of academic English skills.

119. Again--they may have the knowledge but lack the vocabulary.. They may also have cultural differences or opinions about the topic (i.e., Korean students’ knowledge of the Korean war may differ greatly from an American student’s knowledge of the same war).

120. Being asked to summarize chapters in a book. Being expected to interpret graphs.

121. Lack of prior knowledge (often assumed they know); lack of cultural awareness; complex sentence structure; lack of repetition; unnecessarily advanced vocabulary; cannot interpret graphs.

122. ESL students believe that an English class is for absorbing English only. They have to be convinced into believing that the academic work in English is vital in order for their preparation before they are mainstreamed into regular English classes.
123. Understanding the vocabulary, sentence structure, idioms, and background knowledge.

124. I feel many difficulties stem from various affective filters (low self-esteem); poor ear for vowel sounds.

125. Yes, sometimes he/she forgets the vocabularies or doesn’t know how the express in some cases.

126. My students are at a basic level and have difficulties with all English.

127. NO RESPONSE

128. I think most of the ESL students don’t have a serious problem in academic English. They can understand what the professor says or the content of the texts. I think it is more difficult to understand the everyday conversation that students or people outside the classroom use.

130. no response

131. One student consistently uses present participle for all verbs.

132. Taking notes; writing summaries; making formal presentations; writing outlines.

133. In the test-taking arena, perhaps interpreting directions present some difficulties.

134. no response

135. Understanding the register and vocabulary.

136. Reading literature that is symbolic; taking notes; writing academically sophisticated papers without referring to themselves.

138. One particular difficulty when I was teaching was that one of my students could not express herself verbally in the class, but she had very good written skills. One thing that I thought it was that she was a quiet person.

141. Two things come to mind. ESL students tend to view "academic" in English as another rule that either confines them or moves them further into structure. Few have been able to see the long range goal of using academic English to access a more formal, natural usage.

142. "He say that questions hard"--avoids use of do and did. "What did you do yesterday?" "I go swimming."
143. Tenses--using the present tense to discuss certain ideas and all texts; to be careful with using slang; how to move from writing descriptive narratives to writing analytically. Any non-ESL student has to learn the same things.

144. My students receive most of the academic language in their native language.

145. no response

146. At this point, academic English is just too advanced for my students.

147. N/A for me.
5. If another teacher asked for suggestions about how to assess the academic language abilities of his or her ESL students, what suggestions would you offer?

1. I’m not really sure. A vocabulary pretest of the various terms might shed some light on what they do and don’t understand. Actually, the content teachers have never asked me that. The feeling has just been that the content is too difficult because the language is. It’s a complicated issue.

2. Ask them to read a passage and answer short essay questions.

3. NO RESPONSE

4. Especially in K-2 look at what you’re expecting children to do. None of our children is faced with a worksheet or homework at this age. We do assess in Spanish in the upper grades.

5. Initially, use oral assessment—use of diagrams, pictures, and use of visual questioning.

6. Orally assess by having students explain particular concepts, or draw or act out, demonstrate.

7. Before assessment can be made, the student needs to have the lessons modified. Also, I would make some assessment in their first language (Spanish, in my case) for the LEP students.

8. I would have the student use graphic organizers with pictures to show that they understand a topic. For example arrange the continents and countries correctly on this form [diagram included on survey].

9. Is the speech/writing understandable, ignoring the syntax, grammar, etc.? If the child cannot speak or write as yet, they can still be assessed as to their understanding by using TPR, pointing, hands-on activities, bookmaking, etc.

10. Give textbook readings, then ask questions. Possibly write short summaries by students.

11. Other teachers have never asked for suggestions of how to assess this—they just want to know how to help the ESL student in academic areas.

12. NO RESPONSE

13. I’d give them some background of the student, i.e., time in US, educational background/involvement of parents, previous education (both in US and native country), proficiency of reading
and writing in first language. I'd encourage them to compare this student's skills/progress with others of similar and experience. I'd remind them that speaking skill usually precedes reading and writing.

14. Can they read analytically? Can they guess the word meaning from context?

15. We would test the student to determine oral, listening, reading and writing levels.

16. Why do you want to assess the academic language abilities of this student? How is the student doing in this class?

17. I would suggest that the student should be tested in his native language and check his school records.

18. There are a variety of assessment tests available.

19. Performance based, multidimensional.

20. A test should cover various learning styles. A student might not be able to express himself with written English, but can do it orally. Use alternative assessment devices.

21. Try to separate the language knowledge versus the skill needed to accomplish a task.

22. Give cloze test. Have them draw a picture.

23. The same way they assess the academic language abilities of native speakers.

24. Ask yes or no questions to see if he understands.

25. Retelling of text assigned. Reflections by the student.

26. Have students read and retell material in English. The students' ability to do work in the classroom. Use of vocabulary--can the student use the vocabulary but lack the ability to understand the concepts?

27. Look at tasks assigned, and student's performance. Work with student on similar task and invite "thinking aloud" by student to gain insight into her skills and processes.

28. A lot depends on the ethnic background, personality and stage of English language development, but a one-on one student/teacher task may work. Few classroom teachers today have or take the time for this.
29. NO RESPONSE

30. Talk--provide student experiences.

31. Suggestions I have offered include the following: Utilize as many visual and kinesthetic props as possible; identify the most important concepts that the student should be able to understand to adequately address/learn about a topic; use cooperative learning techniques or a "buddy system" to produce a product about a given topic; use as much praise as possible for each small gain evidenced; use TPR to find out if the receptive vocabulary is there.

32. Assess whether or not the student is able to function as a contributing member to pair or small group activities. Does the student appear to be actively participating? Is the student able to discuss or present information in written form which directly addresses the topic at hand? Is the student able to be specific?

33. If students can follow instructions in their main classroom and perform tasks, even if modified, they are beginning to use and understand academic language. When they are doing all the classroom work near the level of the other students, they have come close to "mastering" academic language.

34. I think everyday observations is best. Can he work independently, or does he need to see what everyone else is doing first? When he reads something if you asked him what happened, can he tell you?

35. NO RESPONSE

36. I would suggest that s/he allow the student to draw a picture, make a graph or chart, or write a list as opposed to writing a paragraph to determine factual knowledge of material presented. Other methods would be modifying a test to eliminate extraneous words and devising simpler tests of knowledge such as matching. multiple choice (short sentences, though), filling in the words from a list provided, etc. I always suggest oral tests instead of written or the use of visuals or maps when possible, plus I offer to administer the tests so I can explain the directions and questions themselves.

37. NO RESPONSE

38. Short, non-tricky multiple choice or WH questions on materials covered in class and text. (Option of reading and explaining the question to the students). Have student read a column in a text book (silently) looking for an answer to a specific higher-order thinking question (compare _____ with ____).

40. Preteaching vocabulary. Teaching student "learner strategies". Previewing material.

41. Oral tests--define terms in their own words; giving examples; drawing pictures.

42. Language levels must be assessed-- preproduction=gestures. Early production=one/two words. Speech emergence=short sentences. Intermediate fluency=conversation.

43. See if the student can write a comprehensible essay after the student has wither had a model outline explained or after the student has been guided to create an outline, a graphic organizer.

44. Begin with diagnostic kits and tests to assess. Discover what student do know in L1. Use native or home language if possible. Provide academic assessment in English next using diagnostic tests, normed tests, standardized tests. See how much less a student demonstrates when comparing step 1 and step 2.

45. Give a test--language test totally undemanding cognitively.

46. Notice if student is able to read and understand directions on his/her own or is s/he relying on others either overtly or covertly to find out what to do. Use a question hierarchy about a reading passage to see how far above simple recall of facts a student is able to go.

47. Does the student use the language in discussion? Does the student demonstrate reading comprehension? Is the language used appropriately in writing?

48. ?

49. Unites where academic vocabulary is used. Teach content.

50. Assess performance on content subject tests or ability to follow direction on written assignments.

51. I would recommend study and reading from textbook, try to get them to talk and write in the way textbooks do.

52. I haven't been doing this long enough. I would refer the other teacher to someone more qualified to answer the question.
55. Have a personal interview with the students to determine speaking and listening levels. Administer an essay exam to determine the students’ control over the basic writing/reading skills.

56. Can he speak so others can understand? Does he get his point across when writing?

57. The closest I come to in my program would be an observation task called "Concepts About Print," written by Dr. Marie Clay. It’s purpose is to see how much "book language" a child understands.

59. Use the passive voice and abstract vocabulary and assess understanding. Then use the active voice with specific concrete vocabulary and assess the student’s understanding.

60. I would ask them to use graphic organizers with the students to see if they could understand information well enough to organize it.

61. Use L1! Question/clarify--ask the student to paraphrase and give examples, synonyms; have the students use the academic language (oral and written). Are we assessing language or content or both? This is an issue teachers need to resolve.

62. We would start with reading ability. Can student decode texts? Then, assess familiarity with vocabulary being used? If these are strong, student should be able to cope with concept development and using cognitive strategies.

63. First, I would dodge. Then, I would suggest portfolio assessment. I would stress the importance of understanding directions and having very clear and predictable directions in both written and spoken form, with examples.

64. As far as vocabulary is concerned, unless a body of particularly useful and common terms occurring in a variety of subject areas has been identified, it is difficult to assess academic language ability independent of a particular field of study. The other component of academic language ability, I would imagine, is mostly of more complex structure, easy enough to test.

65. By talking to the student, the teacher can assess the
academic language ability. The teacher should listen for complex/compound sentences, not just basic sentences. Also the teacher should listen for sophisticated language and the extent to which the student is able to answer questions.

66. I would ask him to sit individually with the student and ask questions to probe for his/her understanding. Ask what, if any, material was covered in the home country school. I realize that this individual interview is easier because we have so few ESL students so few teacher have more than one or two of them.

67. Check with ESL teacher!! I don’t feel I assess correctly so I’d try to help with specific problems.

68. Have student repeat what I have said to them. answer questions on the blackboard (depending on the environment). Answer questions in writing. Use assessment guidelines (LAS scales).

69. Take time aside to orally question. Written instruction can often not be a good evaluation tool. Memorization can often camouflage lack of understanding.

70. Know what stage of L2 development their students are in. Provide realistic expectations of what is achievable for that student. Give examples of work and or teacher talk which that student can handle.

71. You could role play various classroom situations. You could give student a list of directions to see what child could do.

72. Listen to the student in formal and informal situations.

73. Work together in peer coaching.

74. Can the student accomplish the task or do the problem asked of him or her? Keep record/observations of progress or lack of progress...Do certain problems of lack of understanding keep arising? If yes, they could be ESL related.

75. Provide a pre/post test and they judge the progress accordingly with those results. Look for improvement within that student, not with others.

76. Both essay question and multiple choice can be used after a unit of study. Daily checks should be routine to assure lesson objectives are met by students but long term retention and synthesis of information and concepts are of greatest importance.

77. Look at other ways the student can illustrate his knowledge--a graph, pictorial representation. Allow the student
o use a tape recorder to record his report orally--then use that as a basis for his written report. Share information with the teacher on the importance and the impact of L1 ability on his L2 English.

78. Same as below [question #6], use as many different approaches to elicit information in a variety of ways: writing, drawing, non-verbal, verbal, etc. Remember, you are looking for what the student knows. Some teachers ask a student to write an essay on a particular topic--without realizing it, teachers can end up assessing the structure, form, etc., rather than content.

79. Note which tasks students seem confused doing and develop the language related to those skills.

80. Focus on vocabulary and comprehension rather than grammatical features.

81. Give production tasks--ask the student to explain the process as he/she carries it out. Tell students which linguistic aspects will be assessed, make sure these have been taught.

82. I think you need writing samples from different disciplines (i.e., social studies, science, health, reading, math). You need to analyze style, errors, vocabulary content of sample. This way you can see if the errors/difficulty is universal or exists in particular disciplines.

83. Take a sample from the literature, text, or research material that the teacher expects students in the mainstream classroom to understand. Read it with the students and discuss it to determine their comprehension.

84. Provide a social studies reading. Ask questions. Have students write answers. Have student explain answers to others. Have student pose new questions and answers those.

85. Performance assessment: Assess pieces of writing over several months; math manipulations; social studies projects; science experiments; cooperative learning groups (look for fluency, ideas, organization, spelling, syntax in these areas). Running reading records--shows strategies, types of errors, fluency. Cloze, plays, dramatic presentations.

86. Ask the student to demonstrate what he knows through a performance, rather than with a paper and pencil test.

87. Prepare vocabulary ahead of time for students to preview and pretest knowledge; prepare key ideas of content for student to preview and pretest knowledge; use some performance activities to discern if students understand vocabulary and key concepts.
88. Using thematic units that arouse interest and challenge student (exs--rainforest, multicultural topics) and assess learning via cooperative learning projects, individual writing assignments and using portfolio assessment.

89. (No one has yet--they assume that the students need help with academic language). My observation of class to see what the "teacher talk" is and what levels and types of oral academic language are expected and actually used. Comparison of the ESL students' written work with that of NL peers, focusing on academic language. Checking to see if comprehension/expressions differ with different materials: written, charts and graphs, oral.

90. The entire student must be looked at. As with all students, we all learn in different ways: orally, visually, hands-on, a combination, students test differently--some do better on written projects, others on oral reports and so on. Whatever way the student is able to show knowledge was gained should be acceptable.

91. Writing samples are good diagnostic tools. Also oral retellings of reading passages.

92. Ask them to use content area assessments such as following science experiment directions and doing a project in social studies with other students.

93. Ask teacher to give a model of how a task should be completed to the group or class and then see how well the student can follow it.

94. Give the student a series of tasks using the target academic language.

95. Writing samples provide diagnostic information as to students' vocabulary, organizational skills, syntax, etc. Participation in cooperative learning activities also allow teachers to observe organizational, problem-solving and oral language ability.

96. I would find out how a student writes a report or project from the planning stage to note taking to rough draft to editing to final copy. This would show a child's grasp of academic language.

97. This should only be done after a student completes at least level II of ESOL. Then I might suggest that the teacher takes various instructions in different subjects and after reading with the student, see if the student can follow the instructions. Ex. Find the opposite meaning, or solve the story problem using multiplication.
98. Check cumulative (?) folder. Check with bilingual coordinator for test scores. Written, verbal assignments.

99. Have student describe articles of furniture in the room, or name them. A teacher can show a picture to a student and ask him/her to describe the action in the picture. As she can ask the student to point to a particular action or item.

100. Use a first language peer tutor. Ask to have LEP student use a book.

101. Journaling in content areas--eg., learning logs. Audio/video tape of student presenting an explanation orally of a math problem or science experiment or social studies topic/project (eg., a diorama). Careful listening as student does #2--anecdotal record.

102. Have them write, especially a research paper or one relating to another class or have them bring in one from another class.

103. NO RESPONSE

104. Ask the student to read a passage in a text and observe if the meaning is clear in oral or written re-telling. A cloze test could also be used. Have the student interpret several types of graphs and charts.

105. NO RESPONSE

107. Give a diagnostic test using the same kind of language you usually would on a test. Also, orally test the student.

108. I like a video tape. I also like training (?) I have from Glenda Reece to rate them P ratings. I'd sign her up for a workshop.

109. I would suggest giving a written test to find out the level and also that the teacher develop on his own a verbal test with herself/himself and the student.

110. These students should be given the LASR/W for appropriate grade level.

111. Cloze test for reading. Talk to student to assess oral skills. Send the student to the ESL teacher.

112. Use authentic assessments! Ask child(ren) to describe meaningful situations. Give the child choices.
113. Write directions or homework assignments on the board and watch to see if ESL students copy them and follow them. Ask ESL students oral questions of various difficulties beginning with "very easy" questions. Talk to the student informally before or after class. Ask the ESL teacher for language assessments already completed and for information concerning the student’s educational background in home country.

114. Test them. We use the Idea Test for oral, written and reading.

115. I suggest a one-on-one conversation. Also, I suggest meeting with the parents.

116. Informal discussion with the student about a content area topic with a small requirement of reading and writing.

117. Look at past performance and possibly interview or talk with them, see how they do in particular situations or with certain activities.

118. To test orally, reading, and writing. Cloze test.

119. Cloze reading passage to assess reading level would be helpful. Assess background knowledge of each topic to be taught by showing visuals and asking students to talk about them—again, they may not be able to communicate this in English.

120. We have LAS-O and RW.

121. Ask for a paragraph written about a task the student enjoyed doing last year. Observe in a group situation. Keep a checklist. Keep a portfolio. One-on-one responses.

122. Alternative assessment (eg, portfolio from previous English class), writing sample (or anything to assess actual language improvement over the summer). P-rating (improvement will be evident if student had a summer job, etc.)

123. Do the same thing with them you’d do with regular, non-ESL students—pretest or whatever.

124. Give an appropriate proficiency test and/or test battery.

125. NO RESPONSE

126. If you’re talking about advanced students, maybe you should give them a sample WPE.

127. NO RESPONSE
128. NO RESPONSE

130. Teacher observation; participation in class; cloze tests; holistic assessment.

131. One-on-one interviewing.

132. The teacher can give a vocabulary quiz to see if the students understands key terms or use of a variety of activities (hands-on, note-taking, exercises) to see if the student is able to complete activities successfully.

133. Are there any academic language testing instruments? I am not certain what suggestions to make.

134. The teacher should give a test to students about academic skills such as the CARE test in English.

135. Portfolios. Test tasks that reflect classroom activities.

136. Orally and through written work. I would assess on a rubric. My goal would be to have them analyze, evaluate, and synthesize. My questions would require the students to do these things.

138. One suggestion that I would offer is to emphasize to build a good relationship with the students. This is important because it will enable students to be in a comfortable environment.

141. Use a combination of established methods and informal strategies--an essay test on a particular topic is as important as a role-playing game that allows students to utilize and integrate a variety of language skills.

142. Use cloze tests--have students write autobiographies and keep a journal.

143. Assessment: at the start of the quarter I have them write me a long letter describing as much about their writing experience as they can think of--especially school experiences. This works for me.

144. I have never assessed the academic language abilities of ESL students.

145. Be sure to test what you taught. Make the evaluation oral and written, if at all possible.

146. I'm not really experienced or particularly knowledgeable in this area. I might suggest that the teacher try
having a classroom discussion, or have the students write a short essay, a topic the teacher is pretty sure the students are familiar with. Then the teacher could subjectively determine how well the students were able to express the knowledge they have.

147. In my case I would encourage the teacher to give the students opportunities to display their language skills (reading aloud, writing, speaking, and listening) to determine their strengths/weaknesses.

148. To give an oral test--asking pertinent questions depending on grade level. Also to give a written test, having students express themselves in writing.

149. Have the student read a passage in a social studies or science book. Then follow up with discussion or questions. Perhaps an informal reading inventory such as Harris' Word could be used.
6. How do you assess a student's knowledge of academic content if the student does not have the English language skills to express it to you? Are there some subjects for which it is easier than others? Can you give an example?

1. Use graphic organizers like webs, venn diagrams, T-charts, mind maps, etc. rather than the typical measures, i.e., tests, essays, reports. Accept pictures, models, projects instead. These alternative methods of assessment can be implemented in any subject at any level. Ex: Have student make a comic strip for today's lesson.

2. Very difficult [this question]. Subjects where the student had prior knowledge are easier. The study of math or science in his own language first.

3. NO RESPONSE

4. NO RESPONSE

5. Math--(no word problems) easier. Use graphs, charts, etc.

6. NO RESPONSE

7. I assess my students' academic knowledge in the content areas in Spanish. It can be done in math easily without needing any Spanish except for word problems which I do in Spanish.

8. Science and math are easier because you can not only teach using hands on experiments or manipulatives, you can assess using them. In social studies I might have students use graphic organizers to show that they understand the subject. The students might sequence the events leading to the first Thanksgiving.

9. They may not be able to verbally describe something, but they may understand--so assessment can be through art, drawn answers, sequenced picture stories. Supposedly math, as long as instructions are explained. Story content--through sequenced picture book-making.

10. You can't.

11. You can assess comprehension of academic content by allowing students to: draw maps, graphs, pictures; cooperative learning groups.

12. There are standardized tests similar to the California Achievement Test which can be administered in the student's native language. EX SABE--Spanish Assessment Basic Education.
Math transcends all languages and can be a good indicator of a student’s academic knowledge.

13. Given a student’s ability to understand the question (through interpreter, peer, or adult, if necessary), I’d ask for the student to show me—pictures, diagrams, single words or phrases, making models, diaramas, science, or social studies concepts.

14. Can he/she follow simple directions? Patterned conversations are simpler than free, creative speaking. Problem solving in math is generally easier than content that involves extensive reading.

15. It is difficult to determine until the student is at least conversationally fluent. Past records are helpful. Our new math at middle schools (Chicago Style Transitions) is difficult due to the language content. Electives are good for beginners. I also place our students in geography as it is so visual and universal.

16. We have access to bilingual paraprofessionals who can do such assessment. Math functions are the easiest, math theory the most abstract.

17. Math is the easiest subject to be tested so we can get an idea of the student’s level. Drawing is another way.

18. All hands-on subjects are easier to assess: art, gym, computer, cooking, music, science. My students take tests in other classes and do what they can do—the teacher read the tests aloud and help them spell the answers. They give them answers to choose from.

19. Science is usually easiest because it is hands-on and visual by nature. It is also the least culture-based. Testing should be performance-based, multidimensional, given in 1st language if possible, given over very specific, important, and explicitly stated objectives.

20. They can use visuals to express. They can complete math problems.

21. Through pictures, diagrams, drawings. Science is easier because often I can demonstrate a principle.

22. Draw a picture, label the parts. Write a sentence about it. Timelines and charts make social studies superficially ideal. Dong and observing science activities are good. Math is rote except for word problems. I liked it when I was teaching 1st grade math concepts.
23. I guess. It depends.

24. Ask yes or no questions.

25. I teach reading in English only.

26. Math is easier. Some subjects are easier because students can read material in native language to understand concept. (Science, math). Other subjects are difficult, especially social sciences as they are very American in orientation.

27. Models, drawings, drama, manipulations help. So does asking the student to elaborate an explanation to an indecipherable response.

28. It depends on the subject, but drawings and various kinds of art media are possible ways the student can demonstrate knowledge.

29. Social studies concepts can be expressed in many visual ways, such as using graphs, diagrams and maps.

30. They can point to the object. Yes, some things are easier if they have had some experiences.

31. The easiest example is in computational skills in math. A child either knows how to regroup for adding or knows a multiplication table, or s/he doesn’t. It becomes much more difficult to assess math concepts needed for solving word problems, or for dealing with fractions because of the anomaly of the U.S. math curriculum. (Learning fractions outside of the U.S. is not as important because of the use of the metric system and percentages.)

32. Science [is easier than other subjects]. Illustrating/diagramming. Using electrical symbols to diagram circuits—Are the circuits open or closed? Are they series circuits or parallel circuits? Plotting latitude and longitude.

33. The area we general assess our students’ academic language is in mathematics. There is no problem with computation, and word problems can be explained through pictures, manipulatives or use of a dictionary. We also do the above in science when possible.

34. I don’t know. I’m not a bilingual teacher. Yes, math because numbers are international—the only problem would be word problems.

35. NO RESPONSE
36. I don't. Our students are all mainstreamed and I try to keep them with whatever classes they are enrolled in during my resource hours or extra time. During class I try to fill the holes as fast as I can. Subjects which are easier to assess are math, science, art, music, industrial arts, foreign language, etc. The hardest classes like regular English, social studies, biology, etc. which have a great deal of content specific vocabulary are a lot of reading and writing.

37. NO RESPONSE

38. See above [question’s response]. Allow student to draw pictures, use notes, use a dictionary, open book, tell answers; use illustrations in test.

39. Work sheets with lots of illustrations and minimum of instructions (written). Math, once basic concepts and language acquired.

40. Generally if they know content area material in L1, I try to get native speakers in their L1 to help me assess the students abilities in L1. Science is often easiest, also reading ability in L1.

41. We have a large bilingual program in my district, and therefor I do not have to do this.

42. Comprehension of content--art, music, dance. Arts can divulge understanding. LAB test.

43. Check sheets, demonstrations, drawings, lists, graphic organizers. Science = easiest as it lends itself to pictorial representation.

44. See above. Use non-verbal interviews, drawing, acting out, role play, TPR.

45. Illustrations--e.g., in [question] #4c. Oral testing, with rewording of questions until comprehensible speech is achieved.

46. Let the student demonstrate knowledge in other, non-verbal ways, such as drawing or constructing something. It's easier in math, especially at a strictly computational level, and any other subject that is hands-on or performance oriented, like home ec. or music.

47. Beginning students draw and label; tests and cloze are multiple choice. I only teach content social studies and reading/language arts. I manage to make some abstract points more emblematic for the beginner maps and information that can be conveyed through maps are easiest.
48. ?

49. I don't know how to assess social studies. Math is easier to assess because number concepts can be tested.

50. Drawings or charts for science or social studies. Students may be able to make visual representations of scientific experiments or anything else which they have observed.

51. You can test indirectly by testing their receptive skills and responding in whatever language that student feels comfortable in.

52. N/A--this isn't an issue in adult education (at least in my practice so far).

53. NO RESPONSE

54. NO RESPONSE

55. Obviously, math and science use universal formulas/rules that require specific, infield knowledge.

56. Actual classroom performance--hands on. Ex. science experiment, math examples.

57. My current job has me teaching 3 students daily in a one-on-one situation. For this reason it is easy for me to dialogue with a child for comprehension of the reading being done.

58. We have designed a different report card--give comments showing growth, not grades, for many of the subjects.

59. If the student speaks a language that I know (or a staff member knows) and is literate in that language, he/she can keep a journal in his/her language. Math is the easiest subject in the lower grades because there is limited vocabulary and the concepts (greater than, less than, addition and subtraction) can be easily demonstrated using manipulatives.

60. Hands on subjects and math are easier. The problem with math is the word problem. Any subject with visuals help the ESOL student.

61. Math--easier as MCPS ISM assessments are available in other languages. Other areas try to assess in L1 through translators, interpreters, parent involvement, report cards/prior school subjects/grades/experiences.

62. Students reveal their knowledge as we work through materials together with lots of read aloud, rereading, retelling,
rewriting. Science—say a unit on plants or animals which are in
the classroom are easier than social studies. In watching bulbs
grow we measure, chart, observe, describe. Students learn
language of measurements and repeat experiences.

63. I will have Hispanic students speak or write in Spanish
to me. Other kids I will pair up with a child of the same L1 and
have him/her act as translator or scribe. We use art or
manipulatives if appropriate.

64. It's been my understanding that whole ESL children
appear to be verbally proficient (in social situations) after 2
years, it takes 5-7 years to achieve academic parity with native
speakers. Somewhere between the first and 7th year, academic
language may be introduced, but not, in my opinion, before more
basic skills are acquired.

65. I think in math ESL students are able to perform without
knowing the English. However, in other areas like history or
gEOGRAPHY, the students can’t express the content without the
English.

66. I can’t unless I have their transcripts from the native
country. Subjects such as math are often easier because there
are more numbers and less language. We enroll ESL students in
classes and pull them out and place them elsewhere when they
falter. Non-verbal classes are easier: Tech. ed, cooking, etc.

67. Visual projects, maps, group work, some skills are
difficult to check. Map and graph reading skills are easy to
assess.

68. Find out if the student knows this material in their L1,
if possible. Math and science are easier than social studies when
expressing academic knowledge in English. However, ESL students
know social studies even though content in their L1 might be very
different from content in our school.

69. Test in resource where there is one to one interaction.
At 11-12th level there are no "simple" lessons. Language must
come first.

70. It is easier to assess a student’s cognitive grasp of
subject matter if s/he can demonstrate his/her knowledge base to
you rather than tell you. Math and science seem to have more
potential for this. A student can show you that 3x5 is by making
arrays of [dots] rather than saying I have three groups of five
which make 15.

71. I get another child who speaks this child’s language to
interpret, therefore, I’m able to learn more about their academic
knowledge. Math is one of the easier subjects to assess because
the numbers are the same in most languages.

72. I assess it in their native language.

73. I make questions like this, oral and written: sustantivos propios comunes abstractos/proper common abstract nouns.

74. See if student can respond to the follow-up questions. Math computations--easy to assess. Word problems--more difficult. Reading/literature--can the student retell the story, or draw a picture to react to it?

75. Use student’s native language. It is easier with subjects where the difficulty of the language is less intense, like math and social studies (science is more complex due to the terminology).

76. At the high school, we permit students to respond to tests and in essays in Spanish as receptive skills are often quicker to develop.

77. For young children: check student’s knowledge by using manipulatives, pictures, realia; science concepts can be expressed at a sand table, a water table; multisensory approach.

78. Most importantly, find a native speaker of the language (ideally) who is familiar with the culture and educational system of the country who is bilingual. This person can work with U.S. teachers to assess and correlate skills from one system to the other. Also most teachers use text or curriculum guides as a reference to keep them on track throughout the academic year. Excerpts or adaptations, translations, unit test, ending course test could be used to assess. Understanding culture is important. Example--a student from Hong Kong arrived with many "F"s on his transcript. All kinds of assumptions were made when it was discovered that the letter "F" in this school system was equivalent to a "C" or satisfactory here. This small piece of information curtailed the almost immediate setting of lower standards, tracking, special ed., etc.

79. I have students use drawings, illustrations, and demonstrations in social studies for many complex concepts. I find geography easier than history because of the concrete examples geography affords.

80. I’m not sure.

81. Subjects where concrete manipulatives, such as lab science, or computer applications are easier. More abstract subjects, such as history, are harder. I assess by having students show and tell.
82. They will list ideas in short phrases. I, also, quiz them with flash cards (that I make) or I use diagrams and have them tag things with flash cards or little papers. Put things in time order. Science is easier. (See [question] #7).

83. Use more performance-based measures. Science and math: students can manipulate objects, do an experiment or draw pictures to show what they mean.

84. I can assess it if student speaks Spanish. Have students draw a picture of what they understand about new material taught.

86. I've never done this.

87. Try to use graphics, visuals and activities that would allow them to express key skills. Math computation--rote skills are easiest to assess.

88. I use my students' native language (Spanish) when their English skills are not developed enough to express academic content. It seems that social studies and science are easier to assess because so many of the basic vocabulary words in lessons are cognates in the Spanish language. Ex.: photosynthesis, democracy, cellular reproduction, constitutional amendment.

89. Differences with ages, language, and educational backgrounds. Mine is not a bilingual program, and I'm in a state without many multicultural resources. We use a lot of pictures, maps, realia, and more (supposedly) language-free concepts like math (additional and subtraction facts, not story problems).

90. See above explanation [previous question]. Math is much easier for a second language learner, except for word problems.

91. I use comprehension questions requiring non-verbal responses (thumbs up/down). Students can respond in writing journals. Students can illustrate their understanding. Science seems to be easier to do this than other subject areas.

92. In mathematics it is easier because numbers are universal and if there is a computation problem the child would have less problems than if a word problem.

93. One can judge the level of literacy of students by handwriting, use of dictionaries, etc. But one may assume that particular items of content are unknown until proven otherwise. Geography may be easier for the knowledgeable student. Math of
course, but not word problems or algebra.

94. Use pictures or objects. Have the student sort, graph, classify, plot, etc.

95. Demonstration through hands-on projects--science lends itself to this.

96. If a child is not fluent, webbing, etc. can help you with what a child knows (usually with dictionary help). Math is easier than others because diagrams, etc. can help bring the understanding across.

97. Math computation requires little English language skills.

98. Student translator; alternative assignment (other than oral/written, such as illustration). Social studies seems to be the most difficult. English/reading classes seem to personalize assignments (poetry/short story).

99. If a student lacks the skills to express himself verbally he may be able to respond by demonstrating as in science, or in music, or in mathematics which are subjects where concrete actions can take place.

100. Math is fairly universal.

101. Math and science are easier--student can demonstrate, eg., an electrical current or effect of soap on surface tension of water. Student knowledge can be expressed in L! to a bilingual teacher/aide. Graphics--a diagram, map, etc.

102. Math, of course. Some computer work. Area where already trained in 1st language, even medicine, etc.

103. NO RESPONSE

104. The student could make a visual interpretation of the information, charts, drawings, graphs, role playing events in social studies.

105. NO RESPONSE

106. Picture tests--matching picture with key word we've been studying.

107. Pictures. Ex.: draw a picture that describes what is happening in a scene of a play.

108. It's a judgement call. Sometimes responses can be made to pick between answers or to share what you do know.
109. I had a Spanish speaking student who was mainstreamed but just learning English. I paired her with a girl her own age who was much more linguistically advanced. Girl 2 helped interpret for girl 1. This helped both girl 1 and me.

110. Drawings, cartoons, etc. Express in first language.

111. Use of pictures, peer tutors assessment.

112. Try to use authentic assessments—roleplay, develop games, demonstrate with manipulatives, observation by teachers, anecdotal records.

113. Organization skills, using pictures, diagrams, symbols, use peer tutors who are familiar with students' first language.

114. Ask him to illustrate, act out, choose one of several choices, or sequence to illustrate his knowledge.

115. In my situation, I have no standardized test. I use picture dictionaries and pictures of everyday things.

116. Use pictures, numbers, body language, etc. to illicit responses to questions. In math, give a small pre-test to try to figure out math skill level.

117. See how well he/she can perform a certain task, either following your example or a picture.

118. Look into his/her transcript from his native country. Test the student in his own native language if it is available.

119. Try to use non-verbal assessments (matching photos/pictures) or ideally use a bilingual associate to determine student's knowledge.

120. Show me—a heading, a graph.

121. Actions; yes/no responses; one word, two word, etc. progressive responses; completing an oral command; making a graphic organizer of material covered.

122. Except for P-O's [sic], most students are able to communicate at some level of understanding. Literature involves values and most kids can express themselves fairly well on where they stand on an issue.

123. Let him draw a picture, sequence objects, pictures (on sentences), do a demonstration.

124. Using pictures and basic math concepts I can find out. Also, they can make drawings and charts.
125. Math is easier because it just needs calculations.

126. Math might be easier than English.

127. Math is easier because it only needs calculating, but with word problems, they seem to have difficulties.

128. NO RESPONSE

130. It could be done in their native language. Pictures and diagrams would also be used in multiple choice tests. Math could be easier to assess because it has its own language, and on many occasions does not even need evaluation.

131. Subjects that can be understood through use of charts, mapping and other organizational matrix.

132. I would use Spanish because all of my students speak and understand Spanish.

133. no response

134. Speak to the student in his L1. If you don’t know how to speak the student’s L1, ask for a translator. If none is available ask the student questions that require one word responses.

135. Science, rather than political science or literature [is easier to assess]. Since the former subjects can be presented with more hands-on material whereas the latter two courses rely heavily on language itself.

136. The content is secondary. My goal in addition to teaching language is to teach student how to think and manipulate their thoughts. I work where they are at academically.

138. N/A

141. Not sure. I work with more advanced ESL students.

142. They ask me in Spanish.

143. no response

144. N/A

145. There is little need to assess anything other than language acquisition in my classes. However, math is probably the easiest subject to assess. When I taught home economics, students’ projects were a valid assessment tool.

146. Students’ knowledge of academic content can be
demonstrated with labeling exercises, matching, fill in the blank (with appropriate vocabulary items which are listed at the beginning of the exercise), and other activities which require very little language and production. I think that math is easier to assess because it involves more numbers than words. Any subject which involves concrete, rather than abstract concepts would be easier to test. For example, a science test, in which you ask the students to label the parts of the brain, is easier to pull off than a psychology test, in which pictures may not be adequate tools to use in conveying knowledge.

147. Where a student is weak might appear when after having covered a lesson the student is unable to satisfactorily respond orally or in writing. Math and science deal with facts, not opinions or emotions. Language arts and social studies might include all the above.

148. In ESL many pictures are used and by bidng the model for presenting situations, the students grasp what is being taught. Because of the varying levels of understand in the ESL class, there is always someone in the class who knows much more than the newest member of the class. Thus, he acts as the interpreter for the teacher in very difficult situations.

149. Maps, pictures, charts, etc. are used. If students can understand but not speak, they can point, draw, categorize, play some games (BINGO), follow directions (written and oral).
7. Based on your experience or discussions with colleagues, do non-ESL students seem to have similar problems with academic language? If yes, in all areas? Which ones in particular?

1. I tend to agree because even native speakers of English have trouble with high level thinking tasks. They do have some trouble when asked to evaluate, synthesize, predict, etc. This is particularly noticeable in English essays and in history classes.

2. With respect to ability to express one's self in writing—yes, at least at first.

3. NO RESPONSE

4. Yes. Children are children.

5. Yes in some areas—that are very context-reduced.

6. Some do, particularly in science and social studies. Word problems in math are also difficult.

7. No, non-ESL students usually do not have the same problems with academic language. They have the vocabulary, background and cultural background which ESL students usually do not have.

8. Yes. I was a learning disabilities teacher for 4 years and most of my LD students had similar problems. A lot of this was due to reading and writing deficits, lack of background knowledge, limited amount of being read to. My ESL students who have literacy in their L1 seem to overcome the challenges of learning academic English more quickly.

9. Only when they are first presented with a new concept—at which time constant reinforcement is appropriate.

10. We have no experience with non-ESL students.

11. Yes, depending on the difficulty level of the concepts being taught. It's usually in science or social studies.

12. Following and understanding a specific series of directions. Obtaining information from a textbook in order to answer questions or in other words reading comprehension.

13. Yes, especially in expressing meanings (vocabulary) in science and social studies and health concepts. They, too, have difficulty in writing clear, precise and sequential pieces. The mechanics of writing are difficult for them.

15. I don’t believe you can accurately compare.

16. Yes, especially the areas with which they are most unfamiliar--American history and government.

17. They usually complain that writing is the most difficult areas.

18. English class where novels are being read, reading, writing classes and social studies are the most difficult.

19. Yes! Social studies is the hardest for many students.

20. I believe each student is different. They all have different strengths and weaknesses.

21. Students who have difficulty with abstract concepts and verbal reasoning have difficulty along with the ESL students in social studies or other areas where generalizations are made and conclusions drawn.

22. Probably, but I haven’t had the discussion with colleagues.

23. I comprehension is a problem, yes. but the label comprehension can vocal a multitude of [?]

25. Yes--I only teach reading. Language correlates with social class.

26. Problems are the same--it is a question of degree.

27. Yes, so far as I can tell.

28. Some non-ESL students have trouble with the language of science as do ESL students.

29. Reading textbooks that don’t provide enough visual support to give them an overview of the material.

30. Yes and no. Phonetics can be difficult for a 5--

31. Yes, but not in all areas. For the younger students, there are similar but not exactly the same problems with literacy development. For the older students, cognitively demanding and context-reduced material, such as in social studies, can be equally difficult, for both ESL and non-ESL students.

32. Yes. Supporting a topic sentence in written communication. Staying on subject, both verbally and in writing.
33. I am not familiar with the particular types of problems non-ESL students have with academic language.

34. Making inferences. Getting the main idea. Cause and effect.

35. NO RESPONSE

36. Yes, sometimes. It seems that many students have difficulty with writing standard English either in response to questions or in creative projects. I think many students have trouble mastering the vocabulary in science classes or in learning the concepts in history books. Students do not seem to be reading as well these days now they seem to learn more easily when computers or TV screens are involved in the process.

37. NO RESPONSE

38. Yes, especially in thinking skills in social studies—cause and effect, synthesis, drawing conclusions, predicting consequences.

39. Don't know.

40. Some non-ESL children seen to have difficulties with academic language especially in math.

41. Since most of our students come from low income households, many of them do struggle with academic language. Yes, in all areas, maybe a little less so in math, since this subject is more graphic than the others. However, when it comes to solving word problems, native speakers appear to have problems as well.

42. Comprehension: reading, following directions, evaluating (inquiry methodology), problem solving.

43. Yes. Often because lecture precedes demonstration, calling up background knowledge and extension activities which make the concept more easily understood.

44. Yes. I particularly hear this when I speak to or do training at alternative schools. Some potential dropouts are characterized as lacking "CALP" by their teachers and administrators.

45. No, because they acquire it gradually if in school from kindergarten on. Kindergarten teachers spend time from the first talking about "patterns," etc.

46. Yes, I think so. I think this is where many students find themselves getting stuck. If you stay on a literal level
they're okay, but as soon as you ask them to use higher level thinking skills, which call for an understanding of academic language, they fall apart.

47. In my particular school, there appears to be lower performance in the area of academic use. However, we are largely a school of current or former ESL students. There isn't one subject where low frequency of academic language is dominant.

48. ?

49. 5th grade teachers were complaining that most students lack word attack skills. Social studies and science vocabulary.

50. Yes. See [question] 4c.

51. I think so.

52. In adult literacy classes the ESL students are better in academic language than the non-ESL students. The non-ESL students have been failed by our education system and they have survived by learning "street language". It is much harder to break bad habits than to start from scratch like we do with ESL students.

53. NO RESPONSE

54. NO RESPONSE

55. Yes. Speakers of non-standard English, for example, working class English.

56. Some grammar is incorrect if that is what is heard in the home. There are weaknesses in background and vocabulary.

57. This has not appeared to be an area of concern. Again, I think books are generally written with a particular client in mind (age, academic experience, cognitive age appropriate, etc.)

58. NO RESPONSE

59. African American students with a limited background that do not speak standard English often experience the same problems.

60. Unsure how to respond.

61. Many children (non-ESL) have problems with academic language for a variety of reasons (emotional concerns, language delays, etc., as well as socioeconomic disadvantages) but, although ESL students may also have these problems there is still the language issue. Reading is a particular area of concern for many ESL students.
62. Yes. We work with a minority student population whose
world knowledge base is limited. There is limited literacy in
the homes. Knowledge of the language of books and information
learned from being read to is limited. They are limited in all
areas. Again, reading ability is a huge factor.

63. Yes. Low motivation; high speaking and understanding,
but low reading and writing; discipline challenges reflecting low
self-esteem.

64. To the extent that there is always a lot of individual
variation in aptitude for academic learning, a certain number of
native English speaking children will struggle as well. On the
whole, though, my colleagues have not discussed this as an
important problem.

65. Actually, ESL students get blamed for their lack of
vocabulary, spoken language and writing skills. However, the
non-ESL students are not much better in their vocabulary and
writing skills. I think content level teachers often use ESL
students as scapegoats.

66. I've not have these discussions with colleagues.

67. There is less difficulty in math language for non-ESL.
I think social studies and grammar class are difficult due to
abstract concepts, science has said that there are more visual
concepts to show.

68. In graduate studies, non-ESL students do have problems
with terminology with which they are not familiar. Once
philosophical, technological, and scientific terms are explained,
they can proceed. Clearly, the need to explain content so that
it is understood is critical to helping students transmit this
knowledge in English.

69. Yes, particularly when understanding is connected to
American culture or history where they have no background.

70. Yes. I believe they do. In the non-exact sciences and
fine arts. Social studies and literature appreciation are tough
subjects. There are a lot of "big picture" concepts, for
example, government(s) or heroism.

71. I've never noticed my non-ESL students having trouble
with academic language.

72. I believe sometimes they do.

73. Science, language arts and math.

74. Mostly they have difficulties using standard English/
standard grammar. They have great difficulties with math word problems. Most students at my school do not use standard English.

75. Yes, academic language is not something that you acquire within a year or two. It takes time, no matter if that is your primary language.

76. We are attempting to end tracking in our district. We have a very high welfare roll and many children do less well than our ESOL students.

77. Some do, yes. And the strategies I use with my ESL students (for example, providing input in all modalities also helps the non-ESL students).

78. Not to the same extent or for the same reasons. But I have found students’ abilities to convey their ideas clearly through discussion or essays has weakness.

79. It seems to be more related to socioeconomic background and parental involvement in the formative development of the children than language per se. The ESL students who have visited museums, travelled around the world and been exposed to a variety of experiences have fewer language problems.

80. In our school, more students have problems than don’t have them. Reading materials are too difficult.

81. Many, yes. Unless pressed, many students tend to use imprecise diction. Their grammar and general writing style can be pretty poor, too.

82. Non-ESL students have problems doing comparative essays, explaining the significance of a plot detail, developing an essay explaining the development of a character, a plot line, an historical event. Students can usually do development of scientific events (i.e., the cell).

83. Yes. Story problems in math, technical vocabulary in all areas. Figurative language and inferential comprehension in literature and social studies.

84. Yes, but they understand all the words, so total meaning is not lost.

85. Yes, in all areas. Cognitive development is an important influence as background knowledge and experiences. Science and social studies and math word problems are difficult.

86. Absolutely. Textbooks are the problem particularly
science books. Some social studies books that emphasize memorizing dates, wars, generals, etc. are also difficult.

87. Yes. Those students whose language development skills are poor have difficulty in math, science, social studies in particular.

38. Yes, it appears that most native English speaking middle school students have difficulty with speech parts, run-on sentences, seeing cause/effect relationships, summarizing, and understanding number place value.

89. To some extent--after all, they’re all learning this forum of discourse. For example, an 8th grade teacher told me she's having a hard time getting the concept and parameters of plagiarism across to her social studies class.

90. Many of the problems are similar. The TV and the acceptance of our culture ways could be a factor. In general, we expect less and we get less. I teach in an urban setting. The home lives, the street lives of these children do not generally project higher academic standards.

91. Yes, particularly in vocabulary acquisition of specific vocabulary. Students who have not been read to or who read very little, have not acquired academic English.

92. No, the problem is more immediate for ESL students.

93. I don’t know.

94. Yes--especially in 3rd grade when a number of terms are introduced. "Predict the outcome of the story. Write a diary entry for_______."

95. Yes, written communication.

96. It all boils down to understanding main concepts, transferring and/or relating those concepts to others. If non ESL students do not understand they will have the same problems as ESL students.

97. Yes--especially in science, math word problems and comprehension--type conclusions in any area.

98. Students whose parents are able to assist their children with homework, supervision, seem more successful. The students are able to relate/make connections more easily due to more experiences and skills.

99. Yes, in many cases where a so-called dialect of English is spoken such as Caribbean English or Black English, the so-
called street language which is often used by students particularly in the inner cities.

100. Science.

101. Yes, especially in using specific vocabulary and more abstract descriptions.

102. Some need to learn difference between high school and college thinking and expression. Some need to learn to think for themselves. Some need to learn to back opinions with facts.

103. NO RESPONSE

104. This seems to vary from student to student. The more figured a student is or the keener the interest the student has in the material the less they need graphic organizers and manipulatives. They are actually turned off by the use of manipulatives being used when the concept is already well in hand. On the other hand many non-ESL students do seem to have similar problems.

105. NO RESPONSE

106. Some LD or ADHD students might have the same problems understanding content-based terms and concepts.

107. Yes, non-ESL students also have problems understanding academic language. It’s so different from the language they use with their family and friends that it’s almost like a foreign language to them. The vocabulary gives them trouble.

108. There can be key word that they don’t have. End of year testing indicated this because they couldn’t have questions answered. We didn’t test science so I noticed it more in language arts.

109. The formal language of classic literature includes much vocabulary which the students have not been exposed to.

110. Yes--math.

111. No, but "regular" students still experience problems with some words in social studies and language arts.

112. Yes, they may, especially if they come from homes with little or no academic tools (i.e., reading materials, writing materials, cultural arts materials, etc.) or from homes that don’t value education.

113. Low performing English speaking student have similar problems in English, math, science, and social studies,
especially in vocabulary comprehension, concept development, and other higher level thinking skills.

114. Yes, they do have problems. For students not planning to go on to college there is too much information not necessary or needed for a successful adult life. In all areas.

115. Yes, we are seeing an entire generation of poor readers!

116. Yes. They have more problems in social studies and language arts then they do with science or math. Science and math are more absolute so they can attach words to real things. SS and LA vocabulary are more abstract.

117. I’m not sure. Writing sentences is hard for others at 2nd grade as well.

118. Yes, non-ESL students do have problems with content areas because they do not study.

119. Non-ESL students seem to have similar problems with academic language, particularly if they have not been taught higher level thinking skills and if they have not been held accountable for retention of material taught.

120. Yes, most especially science, social studies.

121. Yes: social studies particularly; science; literature; math--word problems.

122. Sentence structure, spelling, verb usage, slang usage, short on content on composition.

123. Yes. I’ve tutored students and I as the tutor wasn’t always sure of what to do in elementary and middle school and high school. If I don’t understand, I would assume students would also have problems.

124. Study skills.

125. NO RESPONSE

126. I think some people use it better than others.

127. Yes, in all areas.

128. NO RESPONSE

130. I think people have problems with a particular kind/ register of language when they have not experienced it. When exposed to it by means of reading or lectures, they would acquire
It more easily. That happens to ESL and non-ESL alike.

131. Not really.

132. Yes. Writing is a big problem as is understanding reading passages, making inferences and taking notes.

133. No response

134. Note-taking skills, writing composition such as creative writing or expository writing.

135. Yes, in all.

136. Yes, in all areas. (I work in an inner-city school in LA).

138. Cannot think of one right now. Sorry.

141. Absolutely. Many non-ESL students have more problems because of the perception of language rules as contrary and boring. Grammar has been and will continue to be one of the biggest challenges for any student to acquire effectively.

142. No response

143. Yes, yes, yes! They do not usually know the conventions, they often write slang, for example. They often haven’t yet grasped the Western convention of compare/contrast, of writing introductory paragraphs, of keeping paragraphs on one topic.

144. Yes, in the area of math.

145. No response

146. Oh sure. With writing in particular. Academic writing is very structured, and I myself didn’t have formal instruction on how to write an essay or how to write a research paper. It wasn’t until I got a D on a college mid-term, that one of my professors finally explained to me the proper way to organize an essay.

147. N/A for me.

148. Not sure, I have not taught non-ESL students for 14 years.

149. I’m not sure about all areas, but I have heard many subject teachers complain that students do not write grammatically. They are very needy in writing skills, using writing conventions and creativity.
8. Do you explain to your students that, in order to succeed academically, they need to learn how to use a particular type of language in the classroom that differs from "social language?" If yes, please give examples.

1. This begins with the distinction between colloquial and formal language (gonna/going to), importance of selecting effective vocabulary words (enthusiastic vs. nice, tall and lanky vs. big), sticking to a verb tense they feel confident using and use correctly as opposed to trying to impress by using the conditional or subjunctive incorrectly.

2. Yes. Need a knowledge of "higher" level vocabulary. For example, the vocabulary of The Reader's Digest, which can be read by most high school graduates, is unknown to them. Also metaphoric expressions. Also, there are specific styles of writing used in the various academic fields.

3. NO RESPONSE

4. We do discuss social terms which are not for the classroom such as "shut up". But inside and outside the classroom we work on proper language, posture, eye contact and human interaction with all students.

5. More formal writing and speaking. Use of full sentences.

6. NO RESPONSE

7. No, I have not explained this to them and I need to do it.

8. NO RESPONSE

9. We don't spend time talking about rules. Corrections of this sort are noted in their writing (changing a sentence to be more specific; circling "um" and explaining that what the student really means is "them"). It's more important to enjoy the writing or not be intimidated in speaking, whatever the language may be. Refining their language comes with the advanced intermediate or advanced student.

10. See answer to question 1.

11. I try to teach them the vocabulary they will encounter in the curriculum.

12. Slang and street language and expressions are not acceptable in an academic situation.

13. I tell them they must be able to explain what a word means and be able to use it in a formal sentence, excluding slang
or inappropriate words--go for precise, clear, sequential, logical, well planned responses. We use a lot of webbing (semantic mapping) to plan and organize.

14. We classify this as formal (classroom, academic) language as compared to casual (social) language. We will present and discuss both styles where warranted.

15. I don’t specify the 2 types. Generally, I insist they try their best to succeed in all areas. I encourage them to be very organized and ask as many questions as possible. If they still do not understand, they need to tell me and together we determine the lessons.

16. We discuss many types of language, i.e., playground language, home language, classroom/study language, TV language.

17. NO RESPONSE

18. No, they know that. My high school ESL students are making As and Bs in their classes because they can read and memorize words, but they can't speak. My younger students learn it all together and do amazingly well in their classes. It always surprises me.

19. NO RESPONSE

20. They need to use correct English language complete sentences. They need to be more specific in answering questions. In informal speech they can say, "I like it." In academic speech they need to say, "I like it because...."

21. I don’t usually label it as such--I just try to make this language more intelligible to my students.

22. No. But they realize they cannot understand their 8th grade texts, but they understand my easy books.

23. No became a yes because classroom language is one of a variety of social languages.

24. I try, but it really is difficult to explain to young children.

25. I teach registers of language. Everyone needs to know how to switch registers.

26. Yes.

27. No, but it sounds like a good idea.

28. NO RESPONSE
29. Yes. We practice answering questions not in phrases, but in complete sentences, and then forming a few of those sentences into an introduction to an essay.

30. Yes--they need to learn English so they can read and write (Big tests is Texas by 4th grade.)

31. I explain that it is not enough to be able to discuss the weather, their health, and their likes and dislikes to succeed in school. They are asked to understand that they will be asked to learn, remember and discuss the kinds of things that their peers in the mainstream classes are asked to do. I remind them (if they are old enough) to remember the kinds of subjects/topics that they were responsible to learn in their L1 before coming to this country. I also try to make them aware of the demands of the workplace in this country, and that a minimum requirement is to obtain a H.S. diploma.

32. Yes. Explaining that the types of activities: science labs, research, reporting that are engaged in the sheltered English classes are they types of activities that students participate in mainstream classes. Discussing that what is learned in sheltered classes is being addressed in mainstream classes also. That there is a relationship between sheltered curricula and mainstream curricula.

33. No. I don’t explain it in that way. I actually spend more time with developing good study skills which will lead to their learning academic language.

34. Yes. In my class they can’t say things like "shut up". It’s better to say "be quiet". Maybe with their friends they could say that but in the class it’s not polite.

35. NO RESPONSE

36. See question 1. I also focus on communication skills, in proper responses to questions, on nuances of meaning, on body language, on correct word usage, and on polite requests. I don’t worry too much about pronunciation skills if the students are able to communicate what they are trying to say in a comprehensible manner. I work hard to give them confidence in speaking and I don’t think constant correction of an accent is going to increase their self confidence. However, I don’t let them use inappropriate or slang words (no "ain’t", for example) and if they clearly miss the boat in an answer, I’ll focus on the reason why.

37. NO RESPONSE

38. Yes. This is as a home tutor. I have learned far more in this "behind the scenes" work in the past 10 years about the
long range devastating effect on average students and of ESL, but not academically prepared. MS teachers regard these students as fully capable and grade them in competition with MS students, so often their level of success drops from high in ESL classes to bottom of the class. Very depressing, even after 4 years. I try to train Japanese, for example to use specifics, not be vague, speak louder.

39. Yes. Levels of formality introduced early, eg, "May I please____". When inappropriate language used, restate student's words into appropriate phrases with time ask student to repeat. Classroom charts with heavy illustration for requests/responses (eg, "Please repeat that", "I don't understand", "I don't know", "I'm not ready/finished") same charts work well for native English speaking students.

40. We develop vocabulary lists for each content area so they can speak the "language of the subject".

41. Yes. I can't recall specific examples, but I have introduced more specific terms when general ones were being used (for example: "ocean" instead of "water") and I often correct grammar.

42. Yes. "School language"--words to help you be successful: ask, help, assist, spell, rewrite, redo, library, read, summary, show, tell.

43. No. However, I do make use of "frames" which use the type of language structure associated with particular disciplines. I also use acetate over text to have students search out specific constructions in a given text.

44. I have. I do not always. This depends on the group. Sometimes I have students who model my style without having to approach this. I have taught standard English to Black dialect speakers in Chicago. Some students were very militant about the idea of becoming bidialectal. Sometimes explaining has not helped. Showing a film called "American Tongue" can help.

45. Yes. A good bit of attention is given to language. Ok among kids but inappropriate with adults or authorities--slang, for example. "It sucks" causes no flinches on the playground but certainly would draw a negative reaction on paper.

46. Because I work mostly with beginning level elementary school children, I don't give too much explicit explanation of that sort. I do use and explain graphic organizers, which I think are very helpful in teaching the types of thinking skills we require to be successful in our classrooms.

47. NO RESPONSE
48. Yes, but in a limited way. I teach certain vocabulary and encourage attention to directions and follow-through. Example: (verbs) alphabetize, underline, choose, select, circle, define, describe, summarize, use, explain.

49. Yes. I use the term "school English" or "good English" for grammar and try to help them express themselves by stretching their vocabularies.

50. NO RESPONSE

51. Yes, one should.

52. Yes. When I teach a writing skills class to GED students, I work very hard on this. I have them pretend that they are talking to strangers when they are trying to explain something. Otherwise, they make assumptions or write as if they were writing a telephone conversation with a lot of missing information. If they are explaining something to a stranger, they realize that they must provide more accurate and descriptive information.

53. NO RESPONSE

54. NO RESPONSE

55. Yes. The students and I discuss the purpose of language and language as a power tool.

56. Yes. There is appropriate language on the playground and to friends which is inappropriate in school and to adults.

57. No. Again, my teaching situation is quite different. My answer would be different if I worked in a whole group situation. My lessons are strictly designed around reading and writing materials with my particular students in mind. Our purpose in writing is to put down on paper a child's story/words/thoughts.

58. NO RESPONSE

59. No.

60. No.

61. Yes. Students are well aware of academic language! They are also well aware of the differences between spoken and written language (example: gonna/going to). We use strategy-based instruction in my school and the language used in the classroom is also used in ESOL and clarified, "tested" by students. Social language is usually only explicitly taught to beginners.
62. No. We do detailed work in understanding directions and close readings of texts.

63. Yes. I often say that they will be to high school and then into college or tech. school. They will need to be able to write well to be successful in school and in the working world. I tell them, "This is not easy! Now, your job is to be a good student. You CAN do it. This is not a day at the beach, kids, but you can do it one step at a time!"

64. No.

65. Yes. In class we go over the different writing conventions, such as comparison/contrast, description, narration, classification, cause and effect, and writing outlines.

66. No. I don’t think I explain it per se. I do point out to them that many have operated quite successfully on the social level--very important at high school, but that some still have a great deal of difficulty with the academic language. I do have an example in reverse of a Japanese student who is very successful in his academic work but not so great on a social level. He realizes this and wants to make friends and join activities. Many of my ESL kids are not making friends--my high school has little diversity and they’re so "different".

67. Yes. In order to do well on MSPAP (MD state test). Completing college essay questions (applications). Reports, oral especially!

68. Students whose first language is not English often pick up "street English" thinking it is correct. With practice, they learn to use the correct register in the classroom.

69. Yes. More technical, more formal.

70. Yes. The use of connectors in academic discourse is very important. Unity is another area tied into this. The probable key to the academic language kids need is to use an organization style matched to the purpose of the task. Describe, expand, compare, instruct, contrast, analyze, summarize, etc.

71. NO RESPONSE

72. Yes. Probably I should, but I don’t believe it is necessary when they are beginning to learn a new language.

73. Yes. I have explained to them that a survival English is the one that people learn just to communicate but not the academic language, they need the academic language to confront their studies and get a good job.
74. No. I do not feel that academic language is as significant in the elementary years as it is in higher learning. That is my opinion; I may be misled, however. Also, there is a focus on "integrated" learning now, and I notice less emphasis on academic language per se.

75. Yes. In order to communicate effectively to others that don’t know you, it is necessary to talk correctly, precisely and confidently. When you speak socially you can improvise, delete words and speak more freely.

76. Yes. Vocabulary taught for specific content; the difference between oral and written language is made clear; audience communicated with is given as a factor in language use; purpose for communication is determined.

77. NO RESPONSE

78. Yes. Only if they are troubled by their progress and down on themselves. Then I will explain this using textbook examples or share when it has been difficult for me. I make sure they understand it is not an indication of intellectual ability.

79. Yes. Before beginning new content we look at the terms students will need to be able to use, how to use those terms and we practice them.

80. Yes. I explain to my students that the way we read English written in books or write is different than the way people speak. I ask them if they’ve ever heard people say.....when I’m teaching a particular grammatical structure (No, she don’t, instead of, No she doesn’t, etc.)

81. Yes. I emphasize standard academic English, right out of Strunk and White. Verbs need to be conjugated. Adjectives and adverbs are different, and so on.

82. Yes. I often give them formula expressions with the target vocabulary to use in a particular academic area. Example: __ Name __ is a significant character in the story because he/she __ plot info. ___.

83. Sometimes. I tend to do this in the context of the lesson. I might compare the literature I’m using to material they’re using in class. We discuss what is difficult for them in the mainstream classroom and what they can do to help themselves.

84. No. but perhaps I will now that you’ve mentioned it. I explain that in order to provide a better future for themselves, success in school is important.

85. No. At his level (3rd grade), I don’t compare or
distinguish between social and academic uses of language.

86. NO RESPONSE

87. NO RESPONSE

88. No. My students are new immigrants who don’t really see the difference between colloquial language and formal language. At times, I deal with taboo English that they might hear in the street or on cable TV. We do review proper ways of asking for help from adults, words that show respect, acceptable politeness/courtesy to others, etc.

89. Yes. Lately I’ve been doing a lot of work on register with my more advanced students. ("It’s really more appropriate to tell your teacher ‘I don’t like homework’ rather than, ‘homework sucks’"). What I find interesting is that the middle school boys say "I can’t say that--I’d sound like a retard."

90. On a very limited basis. My students are young and struggling to use English and their own language even semi-effectively. Many of my students are from homes where parents cannot read or write in even their native language. My students are desperate to survive in any basic language.

91. No. I explain that in order to succeed they must work hard--and then I tell them what that means: doing homework; reading everyday; studying for tests; trying in school--taking risks to raise their hands and guessing when they don’t know for sure.

92. Yes. We go over specific vocabulary and syntax that is specific for certain subjects. Passive voice for math: divided by.

93. Yes. I do. But I have observed monolingual classes where non-standard English use was not addressed at all, ie., a 7th grade science class in which student gave oral responses to the teacher. Teacher spoke standard English and made no corrections nor obvious modeling.

94. Yes. We do lots of activities that help them become familiar with this type of language.

95. NO RESPONSE

96. Yes. I read a content book and we break down concepts into statements lifted from the book. I ask them how they would say the same statement to a friend; make note of formal and informal language (some language use both forms). Give example: we do not use contractions in written reports, etc.
97. No. I've never explained this need but I have addressed the problem. For example, I made a large chart of math terms and showed examples of each. We took a small amount of time each day matching vocabulary to examples. Furthermore, I have tried to incorporate academic language into my assignment--ex. compare/contrast, make a conclusion, give references, etc.

99. Yes. I often did role playing with my students where they would be given a scenario and they would have to carry on various conversations or carry out certain roles. They would often demonstrate the differences between "proper" English and slang. It was interesting to note that if I used slang in the course of a lesson, my students would become uncomfortable and voice their disapproval at my use of language that they used everyday.

100. Yes. Students do journal writing, then are encouraged to edit and eventually publish.

101. NO RESPONSE

102. This comes up during the work--also that it needs to be USA academic if they from an English speaking country such as India or Pakistan. Theirs is not worse, but there are differences. While in the USA need to write like USA professors want.

103. NO RESPONSE

104. Yes. Though some texts have removed the heavy use of passive voice, I teach that in passive voice the thing you are talking about did not do the action but the action happened to it. I also have them memorize the 8 forms of the verb "to be." I teach the 3 principal parts of the verb as the 1st form, 2nd form, and 3rd form. Passive voice is "be" + 3rd form.

105. NO RESPONSE

106. No.

107. NO RESPONSE

108. No.

109. Yes.

110. Yes. "List the important factors." "Compare and contrast." "Give the significance of..." "Terms of the class" "Tools of the academic setting."
111. No. Also teach about real-life situations, problem-solving, cultural adaptations.

112. Yes. Only as necessary—I try to assimilate it into the everyday lesson as much as possible.

113. No. But I realize after thinking about this that I should.

114. Yes. We take the vocabulary and expressions and discuss them before reading the information in the text or other book.

115. No.

116. No. I try to teach about real-life situations and vocabulary as well as academic language.

117. No. Languages only when I see a need (a "teachable moment").

118. Yes. My instruction is based on whole language and also working closely with content area teachers, I teach academic language.

119. No.

120. No. When it becomes part of my lessons.

121. Yes. Certain vocabulary in specific content: "science=weight, height, etc." Particular forms in specific genres: Modals (should, ought to, could).

122. No.

123. Yes. Following directions on a test, circle, underline, draw a line under.

124. I do not explain it. My expectations make that obvious.

125. NO RESPONSE

126. no

127. yes

128. NO RESPONSE

130. no response

131. I talk about pragmatics (?), appropriateness, and sensitivity.
132. Yes. Cannot rely on their native language as much; need to distinguish between formal and informal speech; cannot use slang too much.

133. no response

134. Yes. There are terms that are used in academic language that are not used during conversation. Sentence must be complete and more detailed in content. We can't rely on the visual aspect that is present during social situations.

135. Yes. Appropriate ways of addressing the instructor, language used in class discussions or presentations.

136. No.

138. No.

141. Yes. To an extent. Students already have a sense (ability) to turn "general language" on and off. Content has everything to do with their willingness. So using context simulation to teach students? practicing/adding academic language and language is key.

142. no response

143. Yes! Well--actually I focus on their writing rather than their speech: slang, tenses, complete sentences.

144. no response

145. Yes. It is ok to say don't or can't, but try not to use contractions in written material.

146. No.

147. Yes. I try to stress the difference between playground vs. classroom language. I point out that on the yard the language used is like a fly flitting about from topic to topic whereas in the classroom we stay with one topic, we are concerned with ideas (not personalities) and the language that goes with them. I point out on the affective side that they need to come to the classroom with an attitude and motivation to learn and they need to build vocabulary, vocabulary, vocabulary!

148. No. The students learn mostly from spoken language as used by the teachers and other English speaking students. The academic content is learned via textbooks and the reading of stories. Most dialogues learned reflect social language.

149. Yes. Absolutely! Many students are upset when they do not pass out of ESL in 1 or 2 years. I explain to them, and
their parents, that playground English is quite different from the English they need to know to succeed in school and also that the English language has a tremendous vocabulary.
Additional Comments:

2. It will be difficult to quantify these answers.

3. I was hoping to help you out, yet I am not currently teaching in a K-12 situation. So, sorry. However, I am interested in obtaining a copy of your results. Your questions are very appropriate and I look forward to hearing from you.

4. Our school is Waldorf-based. It becomes very academic but it begins in a developmentally appropriate manner.

6. I am currently a consultant with an education service center, beginning my third year. I work with teachers and administrators in their Chapter 1 Regular and Migrant programs and ESL/Bilingual programs.

8. I find that allowing, encouraging and allowing students to work cooperatively on tasks strengthens all language areas including academic language.

15. I work with many students at various levels of English. The demands are very high and our time together is therefore very intense and involved. I would like to see more hours available to work with them. As our enrollment increases, so do the demands and needs. My students are from Mexico, Korea, South Vietnam, North Vietnam, Thailand, Venezuela, China, and Cambodia.

18. Most of my students enter the country not knowing a word of English. I do not see the students as much as I should because the school district doesn't want to hire me full time (financial reasons). I work with teachers, tutors, aides, volunteers to give the students as much English instruction as possible. By the end of the year they can speak, read, and write and usually do not need ESL the following year. I feel a regular classroom teacher who has an ESL student could answer these questions better.

19. I have been experimenting with the CALLA method and it has been very helpful. Many regular educators have commented that it would be equally relevant for their non-ESOL students.

22. I've just started teaching middle school ESL. My experience runs especially with 1st and 2nd grades. My current 8th graders are intermediates—both high and low. They need to understand their texts.

23. You're assessing something you have not defined, eg., question 1. Do native English speaking monolinguals who do not succeed in the classroom lack academic language?

27. Whom did you survey? Who responded?
32. It has been my experience that students who participate in sheltered English classes have a higher degree of success as they make the transition from ESL classes to the mainstream content area classes.

34. Most of my students come from single, welfare mothers. Many parents are illiterate themselves. So my students are deficient in their first language. To me, this makes teaching English a little more difficult, but the plus is that young children with exposure to different concepts and if lessons are presented as enjoyable they will learn English.

35. I am not teaching ESL in elementary school but I do understand the difficulties of ESL students because I was once an ESL student in college. My comments are limited to bilingual pull-out programs. I believe that language is a learning process and every student does not learn the same way. There is no specific way to teach or learn language. I talk to my students a great deal and use their background to their advantage. I do not teach but help them to bring out their best and work on what they have rather than what I have.

36. I taught adults before I began teaching in the public schools in 1986 and there's a big difference in the kinds of academic language in the 2 settings. Unless the adults were planning to go on to college (which most weren't) there wasn't much point in teaching them literacy terms, test responses, etc. They needed the more practical, job-oriented or home-oriented types of language for practical everyday life. Although many of my students may not go on to college, I think it’s important that they learn the academic language they need to succeed if they do go to college, but which will serve to make them more well-rounded and enable them to be lifelong learners, even if they don’t go to college.

37. I do not feel these questions apply to my program. I teach ESL using whole language--reading nursery rhymes, singing, poetry, Scholastic News stories, writing (experience stories on chart paper), a basal text, and any other topics my students can relate to. Your questions could best be answered by a bilingual teacher. I really did not understand what you were looking for.

45. I want publications to help me--my wracked brain is weary of developing my own materials.

49. Many ESL textbooks do not use academic vocabulary. Readings deal with social settings not school content.

51. That's a very interesting [?] and very tough one.

54. This will be the first year in which my school will have ESL children in grades 1-6. Knowing this, I felt it important
that I attend this program. My classroom has, however, been chosen as a fall inclusion room for children with special needs—not ESL. I hope to share what I have learned with my fellow teachers, and I would love to be part of the ESL program in the years to come.

56. I'm not sure my answers are helpful. They are based on my present experience with one ESL student who is from a Hispanic family from the city. I only see him for 3 1/2 hours a week.

58. We have a great deal of difficulty helping our students. Problems include: lack of education in their land of origin; most parents speak no English; nine languages in '93-'94 school year; teacher speaks none of language other than English; spend majority of time in regular classrooms of 25-30 students.

62. The term academic language is used in an all inclusive way that obscures specific components. I view reading skills as the most crucial component at the elementary level. Students arriving with weak literacy skills, especially in the upper elementary grades, will probably never catch up to the increasing literacy demands in English as they progress to upper grades. Basic, crucial, reading/writing help at their level, if available at all, is inadequate. Schools have simply not taken responsibility for these students. Business as usual is not going to do it. ESOL pull out programs are not going to do it. Radical models for delivering educational services are needed.

67. I never spend enough time identifying weakness in academic language. I try to use similar objective words and warm-up questions to help increase their comfort zone, while slowly introducing higher level skills/questions throughout the year. Visual hands-on projects help vocabulary development, I know, but here needs to be more resources available by content area for teacher use. A teacher hands checklist of questions/ideas on improving use of academic language would be helpful. My lack of knowledge may be an example of content teachers' need for information.

68. I enjoyed the conference and will present what I heard and learned to my students.

69. These and most surveys like this seem silly to experienced teachers. The questions are not thought provoking. They are similar to the ones that, in a medical survey, would lead to the statement, "cigarettes cause cancer." There is a need for research and topic that the experienced classroom teachers say they need.

76. I believe the students at risk are not always ESOL children but those who need additional help in organizing information and in clearly defining goals in learning or
expressing learning. The language issue is real but it can mask other problems that keep students from mastering academic material.

77. In working with preschool special educators, I look at the cognitively demanding language activities young ESL children are involved in, and point out to teachers that some of these activities are 2 and 3 times more difficult for the ESL child that for the monolingual English speakers. We begin to use academic language with children as young as 3 years old!

80. When children with a L1 other than English enter our school (K-5) they are given the Maculitis Test, which determines placement in the bilingual program. I’ve often thought that many other children who speak non-standard dialect would be eligible if tested, although we don’t test them. Many bilingual children seem to be able to negotiate fairly well in English and yet test under the cut off. I’ll often ask them on questions they missed if they knew the answer in either language. They often don’t. It seems that these are the students that tend to have the most academic difficulties.

82. Assessing content language except through personally developed teacher tools is non-existent (as far as I know). In addition, guidelines are non-existent. Assistance to students developing academic language has taken on for me a plan--it goes something like this: words-pictures; phrases-pictures; matching timeline activities; modified testing taking regular tests and adjusting vocabulary, shortening test, using word banks.

83. The difficulties of using and understanding academic language is one of the main reasons that many of my returning students are still in ESL. They are fluent conversationally but still need support and attention to fully benefit from classroom instruction.

90. I also teach ESL adults from many different countries. Many of the same techniques apply to them. I try to make classes fun and relevant. Adults especially, are pressed for time and if they make the effort to come to class, I want them to feel it was worth the trip. I write with them (books of their own). We play vocabulary games.

91. Assessment by ESL educators and assessment by mainstream teachers seem to be 2 different animals. Secondary mainstream educators, in particular are concerned with objective criteria to determine grades. Primary educators are better informed about the developmental aspects of learning but they too have a notion of grade level performance expectations. They are more willing to grade students for learning rate and effort (at a below grade level standard than secondary educators. Portfolio assessment is a buzzword in New York state--we’re still a long way from really
understanding or using it successfully.

93. Have observed teachers conducting so-called ESL lessons with little or no reading or writing. This will not help to promote academic language development.

105. I do not feel qualified to answer these questions since I have not yet worked with ESL students. Perhaps at a later time I could participate more accurately in your survey.

130. I am afraid I cannot be of much help in the survey. I have been out of the classroom for two years and my experience with ESL students is very short, just three years in elementary school.

145. The major part of my ESL teaching experience has been in the lower level ESL classes where life skills and basic oral communication are emphasized. I did teach a VESL (vocational ESL) class for a short time. Technical vocabulary was the major challenge for these students since they used the same textbooks native English speakers used.
Survey Responses--Part Two

Question 1.

150. Directional cues, such as top of the page, bottom of the page, corner. Comparisons: smaller, bigger, greater than/less than, same/different.

151. One important lesson to beginning level students in a high school setting is teaching classroom words or phrases "turn to page. . .," "number from 1-10," etc. Also, we discuss how to talk to another teacher when they have problems, ex., "I'm sorry, but I didn't understand the homework."

152. In my composition course, students learn types of essays--descriptive, narration, process analysis, summary--response, argumentative, classification. These are examples of academic language.

153. Language regarding speaking skills--verbal communication, eg., diction, debate, persuasion. Language regarding study skills, types of tests.

154. My focus was conversational English rather than academic English. Many grammar points were covered but in the context of useable spoken English rather than academics.

155. We have been talking about the welfare reform debate and have been using the newspaper a lot. They have a hard time understanding the academic language of the newspaper. After reading it aloud, they always say to me, "Will you say that in English"--they mean their street English.

156. I believe ESL students need to first learn the survival language and then academic language. An example of academic language should include reading and writing comprehension. The key is understanding, not proficiency. It must be authentic and meaningful language, not just academic!

157. Concepts often covered in US history include "Isolationism" vs. "Imperialism". If these are not taught in context, the student might not understand that they are international relations policies. These words have meanings on their own, that might not be readily associated as policies. Another item/concept taught was "propoganda". This was easier to illustrate, especially because it is a cognate. Clues to help transfer knowledge were available.

158. Gr. 3--water cycle, evaporation, reservoir, precipitation; Gr. 6--neolithic, storage, Cromagnon; Gr. 8--climate, weather, precipitation, prevailing winds, latitude, longitude. In addition to vocabulary and the concepts which go
along with it, we teach our students what is meant by direction words such as "explain," "essay," "support," "argument," etc.

159. "Shakespeare was baptized in Holy Trinity Church, Stratford-upon-Avon, Warwickshire on April 26, 1564. He is buried in the same church, where a memorial records his death on April 23, 1616."

Question 2.

150. This student is resourceful and draws on all that she has using inventive spelling and code-switching to get her point across.

151. I have a student who is very fluent for a student of his level and is also very creative. He doesn’t stick to the pattern, but adds extra details and ideas that surprise me. He uses invented spelling rather than simplify his ideas.

152. Theresa uses direct questions, exact descriptive words, and lots of examples in her writing. Her organization is clear, with smooth and effective transitions between ideas.

153. Uses correct grammar, varies sentence structure, attempts advanced vocabulary.

154. Now jumping to observations of ESL classrooms, I have seen ESL students who had very good writing skills. One that sticks in my mind was using a computer to write about one of her national holidays.

155. Uses introduction, body, and conclusion; organizes her thoughts; uses academic, not street, English; pays attention to punctuation, form and structure.

156. From observations/experience a good writer is anyone who feels confident with their writing and uses their skills to make progress (correctly or not) and not just to produce something! They are ready to make mistakes and learn from them. I don’t categorize good or bad writers. I think of it as a strong person/writer.

157. The student that I have in mind constantly refers to his dictionary and repeats the wording aloud to himself before finalizing work. He also asks for help. He wants others to look at his work and help him correct it as needed.

158. no response
159. Able to read new material and produce output in writing which represents an accurate expression of material’s /?/ and his understanding of it.

**Question 3.**

150. She is not self-conscious about her output but is concerned primarily with articulating the thought process. Her Spanish (L1) is being maintained at home so she is in an additive bilingual situation.

151. I don’t have many students who can speak clearly in English about academic topics. I do have an especially expressive student who has a high level of academic understanding and who communicates this with me through nods, expressions and limited English with Spanish code-switching.

152. She has the specific vocabulary to communicate her needs and get answers to her questions. She knows how to rephrase her questions if necessary to get an answer she understands. And she is aggressive about seeking help from the instructors.

153. Speaks clearly and in a correct volume, makes eye contact, takes time to formulate ideas before speaking.

154. Again, going back to ESL classroom observations, I found that one student who spoke well on academic subjects seemed to think things out before he said them.

155. Makes inferences; interprets information in a way that makes sense to her; backs up her opinions with facts; articulates, not vague and ambiguous.

156. He/she puts himself into his topic--he uses his prior knowledge to produce and progress.

157. The student knows the vocabulary/terms to make sense to others. They can do this in L1, which helps them with their L2.

158. no response

159. Topic knowledge.

**Question 4a.**

150. yes
151. yes
152. no response
153. yes
154. don't know
155. yes
156. yes
157. yes
158. yes
159. no

Question 4b.

150. Yes. Through a developmental schema/background knowledge that can give them the footing that their monolingual peers already have obtained through solid L1 development.

151. Yes, because sometimes their BICS are developed enough that they feel they speak English, but in reality their English isn’t fully developed. Some programs may exit these students too soon. A common phenomenon is described below (question 4c).

152. no response

153. Sometimes students’ practical knowledge of language is more extensive than their academic language. However, often students are more inhibited in a classroom situation and appear less understandable in the class.

154. Yes. That would be part of it. After all, academic language is the language of school and the classroom. Not only ESL students, but also African Americans sometimes have a problem with this.

155. Yes. They speak an entirely different language than textbooks, newspapers, articles, etc. They have not been exposed to academic language much.

156. No, I think that in many situations ESL students do not need better academic language skills to succeed. What they need are patient teachers!

157. Yes. This primarily because many of my students have come to my classroom without the necessary first language instruction of academic subjects. The students are then asked to learn new content as well as new language. This is a great task to accomplish in a short period of time, especially if the
students are at the high school level.

158. Sometimes students come to our classrooms without the academic background they need to be successful, regardless of their experience with English. That can be a big problem, separate from academic language skills. However, lack of academic language can also be a big problem, which is why we do content-area ESL.

159. no response

Question 4c.

150. With the formalism and with the discrete points--such as comparison...and fine vocabulary richness that make the difference in concept development during class, be it formal lecture or group work.

151. I have had several (many) students who are either illiterate or have low academic skills/language in their own language. These students have an almost impossible time developing academic English. This confirms my understanding of the "dual iceburg" type theories of transference between L1 & L2.

152. no response

153. Students’ lack of vocabulary prevents them from knowing parts of speech and thus they are unable to vary sentence structure and develop extensive paragraphs.

154. No specific ESL examples in my experience.

155. Vocabulary.

156. One particular difficulty I had as an ESL student was when I did not understand the directions that I was to follow in order to successfully complete an assignment. If I had been given more thorough directions or perhaps been allowed to speak my native language to ask and receive clear directions I would not only have successfully completed my work but also felt proud!

157. In mathematics, where more contextualized clues exist, the academic language appears to transfer more readily. In my history and social studies classes, the students have more difficulty when new vocabulary or concepts are introduced in isolation without contextual clues. One example comes to mind: when I introduced how a bill becomes a law, some of my students wanted to know how a "cuenta" or promise to pay could become law. They did not realize that the word bill, in English, had more than one meaning.

158. Many of our students, particularly in the upper grades,
have difficulty. For example, one eighth grader--very capable--is in honors math. She finds it incredibly difficult to follow lectures explaining new concepts, and has equal difficulty with science, which is delivered as a lecture. Such students would do well with hands-on, graphics and pre-teaching of vocabulary.

159. Background knowledge. Unfamiliarity with content topics.

Question 5.

150. Ask through an interpreter some basic conceptual questions such as spatial, math, counting money, adding on, weather, elaboration on a concept introduced. With more advanced students this can be expressed in English.

151. I would ask her to have her students write a journal about their experiences in education in their country and have them describe what they learned. I would also suggest she take charts or graphs and ask the students to explain them. Comparisons between characters in readings would be a good thing to try as well.

152. Perhaps a checklist of academic terms, to be used in an individual interview with the student.

153. Assign writing sample on a particular academic theme; assigning a reading selection and check reading comprehension orally by questioning student.

154. Tell them to try to locate documented source materials. If none exist or cannot be located then I might...[sentence not completed by respondent].

155. Good question. To my knowledge there are no tests. We use SABE standardized tests to figure out their grade level (although the test is in Spanish), and math problems from different grade levels, but this isn’t very effective.

156. Performance-based assessment--oral and writing/reading comprehension. As little "testing" (paper and pencil) as possible. Look at the meaningful contents not just the correctness side of it. Take time out to explain and teach!

157. I would suggest that the teacher informally make observations and note when students are making mistakes. Next, the teacher could develop tests for the student that would
measure performance in the noted deficit areas. This would help to assess if there is indeed a problem and under what circumstances.

158. Give an individualized practical test, based on performance, using normal academic language but prepared to simplify or re-explain to determine if problems are conceptual or linguistic.

159. Oral interview; read and discuss material; write summary.

Question 6.

150. More concrete subjects such as basic science and math with manipulatives.

151. You can show something pictorial and see if they get a look of understanding or nod. Many students are excited about telling you what they already studied in their countries. Also, math is easy to use because it's easy to do without much English.

152. Good question. I'm not sure. It should be easier to assess it for math and science, since terms are more universal and mostly Latin- or Greek-derived.

153. Assessing academic content is easier in subjects like math where charts and diagrams can be used, numerical symbols are also easier to understand. Using pictures and oral explanation as much as possible also can be helpful.

154. If you could gather some information from his actions in his native language to activities related to the content this might give you a tiny glimpse of his knowledge. Math and some science skills would be easier than other areas.

155. Yes. Math is easy to evaluate because each grade level must master certain concepts. Social studies, science, writing, etc. are much more difficult and the standardized tests we have only give you a vague idea of their level.

156. Academic content could be assessed in their native language. If this is impossible, have students try to communicate with you, perhaps through another student who speaks both English and the L2's language. Math might be easier than language arts, but there are still cultural biases there!

157. It may be that math and science is the best place to start with assessing academic language because of the nature of the content. I have found that utilizing non-verbal activities can help some of my students show what they know, i.e., making posters during a propaganda unit.
158. Math operations, without word problems, are more accessible. Also, any subject where concepts can be explained using pictures or hands-on, such as science experiments, geography.

159. Math related subjects are easier. Students can deal with a number problem. Other topics can be assessed through pictures, native language and with help of a translator.

Question 7.

150. Some do, but these monolingual students who do may well have indentified or yet to be identified conceptual problems. Second language students if their L1 continues do not have the same conceptual problems if bilingualism were not in the picture.

151. People often complain that "students these days" are worse than they used to be, but I'm not really sure if non-ESL teachers have specific trouble with academic language.

152. Do not know.

153. Although some students may have a little difficulty this is usually due to their lack of education at lower levels. Most students I work with don’t have difficulty with academic language.

154. Some non-ESL students experience language problems. The African Americans who speak Black English have problems adapting to middle-class white academic standards and language. The same could be said for smaller cultural groupos with a distinct language such as Native Americans, Creole in Louisiana, etc.

155. Yes, my English speaking students have a lot of difficulty with academic language because it's not a language they are familiar with.

156. Non-ESL students may have problems, but since they have academically and socially been raised in English they are not faced with the frustration of not being able to communicate! Different learning needs and difficulties are everywhere but an individual whose first language is English will never experience what a non-English speaking student does unless they are put in the situation (ex., American in all Spanish school in Spain.

157. Some students have difficulties in learning academic language because of memory retention problems and auditory or visual processing problems. These students can be noted in any subject area.

158. Any student who comes to school with limited
experiences and from a home where books are not part of the home environment could have difficulties with academic language.

159. Language related, social studies.

**Question 8.**

150. Yes. Depending on the level and maturity of the student. Most important I make sure the pragmatic use is evident and the transferability/generalizability occurs throughout the year.

151. Yes. From the first day I emphasize: "This is the classroom" and "that is the street" (pointing). We discuss appropriate behavior and use of language register. Usually I used modeling of the different types of language and tell where they are appropriate.

152. Yes. This is a discussion in my oral communications class where we not only describe the appropriate language but role-play how to act in the classroom.

153. No. I try not to differentiate between these two types of language.

154. I do not have a classroom, so this is a difficult question to answer. The statement is true but the explanation has to be done in such a way that it is not offensive to any party.

155. Yes. I tell them that speaking language is much more informal than formal written language.

156. No. Academic language is very important--in the real world and within the workforce that is the language we use but I think (from observation and own personal experience) that social language must come first. Once a person can speak socially and make himself heard and understood he is more willing to want to learn the academic language. We can’t force it. The want and desire has to be alive!

157. Yes. My colleagues in math have an easier time getting their students to see the relevancy of math in everyday use. I, on the other hand, have more difficulty explaining the relevance of history in everyday life. There are some fairly basic concepts that social scientists can internalize and see relevance, i.e., democracy, civil rights, concept of unions, labor laws, etc. These are terms that do exist in social settings.

158. No.

159. Yes. Examples of what, the language or examples of
what I say to them?

Comments

155. We are really in desperate need of assessment to measure academic skills of non-English and English speaking ESL students.

157. I found that I had to do quite a bit of remediating with my ESL students because their Ll literacy skills were low. This made it more difficult to get my students motivated to learn the academic language when they were struggling in their Ll skills.
APPENDIX D

ERIC DIGEST (PRACTICAL IDEAS ON ALTERNATIVE ASSESSMENT, BY JO-ELLEN TANNENBAUM)
Practical Ideas on Alternative Assessment for ESL Students
Jo-Ellen Tannenbaum, Montgomery County Public Schools (MD)

Many educators have come to recognize that alternative assessments are an important means of gaining a dynamic picture of students' academic and linguistic development. Alternative assessment provides many possibilities for evaluating student progress using non-conventional strategies, on a continuing basis, and involves both the teacher and the student in making judgments about the student's progress. It is particularly useful with English as a second language students because it employs strategies that ask students to show what they can do. In contrast to traditional testing, "students are evaluated on what they integrate and produce rather than on what they show what they can do. In contrast to traditional testing, "students are evaluated on what they integrate and produce rather than on what they are able to recall and reproduce" (Huena-Maclas, 1995, p. 9). Although there is no single definition of alternative assessment, the main goal is to "gather evidence about how students are approaching, processing, and completing real-life tasks in a particular domain" (Huerta-Macías, 1995, p. 9). Alternative assessments generally meet the following criteria:

- Focus is on documenting individual student growth over time, rather than comparing students with one another.
- Emphasis is on student strengths (what students know), rather than weaknesses (what students don't know).
- Consideration is given to the learning styles, language proficiencies, cultural and educational backgrounds, and grade levels of students.

Alternative assessment includes a variety of measures that can be adapted for different situations. This Digest provides examples of measures that are well suited for assessing ESL students.

Examples of Alternative Assessment Strategies

Nonverbal Strategies

**Physical Demonstration.** In this approach, students use nonverbal means of expressing academic concepts. Physical demonstration can include pointing and other gestures (also known as Total Physical Response, or TPR), performing hands-on tasks, miming vocabulary/concepts/events, and even acting out concepts. In a unit on Native Americans, for instance, students can respond with thumbs up, thumbs down, or other nonverbal signs to communicate whether statements read by the teacher are true or false or whether the teacher has grouped illustrations (of homes, food, environment, clothing, etc.) under the correct tribe name.

**Pictorial Products.** These are related to physical demonstrations in that the emphasis is on nonverbal means of expressing content knowledge. Pictorial products focus on the production and manipulation of drawings, dioramas, models, graphs, and charts. When studying Colonial America, for example, teachers can give students a map of the colonies and labels with the names of the colonies. Students can then attempt to place the labels in the appropriate locations. This activity can be used across the curriculum to label diagrams, webs, or illustrations.

To culminate a unit on butterflies, teachers can ask beginner ESL students to illustrate, rather than explain, the life cycle of butterflies. Students can point to different parts of a butterfly on their own drawing or on a diagram as an assessment of vocabulary retention. Pictorial journals can be kept during the unit to record observations of the butterflies in the classroom or to illustrate comprehension of classroom material about types of butterflies, their habitats, and their characteristics.

**K-W-L Charts**

Many teachers have success using K-W-L charts (what I know/what I want to know/what I've learned) to begin and end a unit of study, particularly in social studies and science. This strategy enables teachers to gain a deeper awareness of students' background knowledge, interests, and content material learned. K-W-L charts can be developed as a class activity or on an individual basis. For students with limited English proficiency, the chart can be completed in the first language or with illustrations. (See the example below.)

<table>
<thead>
<tr>
<th>K</th>
<th>W</th>
<th>L</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lincoln was important.</td>
<td>Why is Lincoln famous?</td>
<td>Lincoln was President of the U.S.</td>
</tr>
<tr>
<td>His face is on a penny.</td>
<td>Was he a good president?</td>
<td>He was the 16th President.</td>
</tr>
<tr>
<td>He's dead now.</td>
<td>Why is he on a penny?</td>
<td>There was a war in America when Lincoln was President.</td>
</tr>
<tr>
<td>I think Lincoln was a President.</td>
<td>Did he have a family?</td>
<td>He let the slaves go free.</td>
</tr>
<tr>
<td>He was a tall person.</td>
<td>How did he die?</td>
<td>Two of his sons died.</td>
</tr>
</tbody>
</table>

Before a unit of study, teachers can have students fill in the K and W columns by asking them what they know about the particular unit and what they would like to know by the end of the unit. Doing so helps to keep students focused and interested during the unit of study and gives them a sense of accomplishment when they realize, following the unit (filling in the L column), that they have learned something, even if it does not logically follow the K and W columns.

**Oral Performances or Presentations**

These are forms of performance-based assessment and include individual interviews, oral reports, role plays, describing, explaining, summarizing, retelling, paraphrasing stories or text material,
and so on. Oral assessments should be conducted on an ongoing basis in order to monitor comprehension and thinking skills, and the tasks should be meaningful to students.

A teacher who is conducting interviews in English with students in the early stages of language development might find it best to ask questions using visual cues as much as possible and allowing for a minimal amount of English in the responses. Pierce and O’Malley (1992) suggest having students choose one or two pictures they would like to talk about and leading the students by asking questions, especially ones that elicit the use of academic language (comparing, explaining, describing, analyzing, hypothesizing, etc.) and vocabulary pertinent to the topic.

Role play can be used with all grade levels, with any number of people, and across the curriculum. The teacher might transform himself or herself into a character who knows less than the students about a particular subject area. Students are motivated to help by conveying facts or information prompted by the character. This is a fun-filled way for a teacher to conduct informal assessments in any subject (Kelner, 1993).

Teachers can also ask students to use role play to express mathematical concepts. For example, a group of students can become a numerator, a denominator, a fraction line, a proper fraction, an improper fraction, and an equivalent fraction. Speaking in the first person, students can introduce themselves and their functions in relationship to one another (Kelner, 1993). Role play can also be extended to science to demonstrate concepts such as the life cycle.

In addition, role play can serve as an alternative to traditional book reports. Students can transform themselves into a character or object from a story (Kelner, 1993). For example, a student might become Christopher Columbus, one of his sailors, or a mouse on the ship, and tell the story from that character’s point of view. The other students can write interview questions to pose.

**Portfolios**

Portfolios are used to collect samples of student work over time to track student development. Tierney, Carter, and Desai (1991) suggest that, among other things, teachers do the following: maintain anecdotal records from reviews of portfolios and from regularly scheduled portfolio conferences with students; keep checklists that index various criteria that they consider integral to the type of work being collected; and devise continua of descriptors to plot student achievement. Whatever methods teachers choose, they should work with students to help them reflect on their work to develop better academic skills.

The following types of materials can be included in a portfolio:

- Audio- and videotaped recordings of readings or oral presentations.
- Writing samples or computer printouts of dialogue, journal entries, book reports, writing assignments (drafts or final copies), reading log entries, or other writing projects.
- Art work, such as pictures or drawings, and graphs and charts.
- Conference or interview notes and anecdotal records.
- Evaluations/Checklists (by teacher, peers, or student).
- Tests and quizzes.

To gain multiple perspectives on students’ academic development, it is important for teachers to use more than one type of portfolio assessment.

**Oral and Written Products**

Oral and written products encompass a wide variety of activities. Some of the products most suited to ESL students are content area thinking and learning logs, reading response logs, writing assignments (both structured and creative), writers’ notebooks, dialogue journals, and audio or video cassette tapes.

Content area logs are designed to encourage the use of metacognitive strategies when students deal with expository reading material. Entries can be made on a form with the headings: What I Understood/Didn’t Understand (ideas or vocabulary).

Reading response logs are used for students’ written responses or reactions to a piece of literature. Typically, a teacher asks students to respond to questions—some generic, some specific to the literature—that encourage critical thinking.

Beginning ESL students often experience success when an expository writing assignment is controlled or structured. The teacher can guide students through a pre-writing stage, which includes discussions, brainstorming, webbing, outlining, and so on. Both the pre-writing stage, as well as the independently written product, can serve as informal assessments.

Student writing is often motivated by content-based themes. Samples from their writing folders or notebooks give further insight into content understandings and retention of vocabulary. Narrative stories from alternative characters’ perspectives (e.g., a sailor accompanying Christopher Columbus, an Indian who met the Pilgrims, a drop of water experiencing the cycle, etc.) would be valuable inclusions in a student’s content subject portfolio.

Dialogue journals provide a means of interactive, ongoing correspondence between students and teachers. Students determine the choice of topics and participate at their level of English language proficiency. Beginners can draw pictures that can be labeled by the teacher.

Audio and video cassettes can be made of student oral readings, presentations, dramatics, interviews, or conferences (with teacher or peers).

**Conclusion**

Alternative assessment holds great promise for ESL students. Although the challenge to modify existing methods of assessment and to develop new approaches is not an easy one, the benefits for both teachers and students are great. The ideas and models presented here are intended to be adaptable, practical, and realistic for teachers who are dedicated to creating meaningful and effective assessment experiences for ESL students.
