The Dynamic Academy System for Larger High Schools: An Example Application.

This document presents the basics of the career academy, a method of integrating vocational with academic educational systems and of providing a contextually valid education. The first section outlines the problems that the academy systems attempt to address, the four major principles essential for the success of career academies, and the nine major defining components used by all career academies. The second section describes the dynamic academy system, a system in which students from the 7th through 12th grades generally participate in two successive academies. Academy focus areas, the dynamism of the system, and what is done during those five years are discussed. The remainder of the document outlines a specific example of how the dynamic academy might be implemented. It presents, in a hierarchical format, a description of the academy example, beginning with the broad overview and successively narrowing the focus until the lessons in one unit of one class are detailed. The example given is that of an academy preparing students for a variety of careers using the World Wide Web. These sections follow: general academy information; specific academy example; information on courses and units; example course information; unit information for the course, Resources for Continued Learning; and description of the seven lessons in the Producers and Suppliers unit of the course.

(YLB)
The Dynamic Academy System for Larger High Schools

an Example Application

by Christopher Weeks
As a reform movement, the integration of academic and vocational education has the potential to overcome many of the shortcomings that have been identified in the high schools:

- a curriculum that is available to all students (no tracks);
- a curriculum that is flexible and fluid to adapt the content to evolving work and life skills (less reliance on traditional textbooks);
- hands-on learning strategies that incorporate relevant content with “real world” life experiences to enhance transferability (irrelevant subject matter);
- motivated, interested students who value their learning (increased drop-out rates); and
- faculty that are no longer divided into vocational and academic departments where labels determine the importance of the subject matter (no competition).

Instead, the promise of vocational and academic integration rests on the premise of providing education for all students, regardless of academic ability, socioeconomic status, and career goals. What this means is that the skills that are necessary for all students to become productive citizens must be incorporated into a whole curriculum. Skills, such as communications (reading, writing, listening, and speaking), human relations, math, scientific principles, technology, problem solving/decision making, creativity, and critical thinking, are common to all occupations.

To this end, the state of Missouri has approved a set of Show-Me Standards that are grouped around four goals that recognize the commonality of competencies essential to leading productive, fulfilling, and successful lives:

- Students in Missouri public schools will acquire the knowledge and skills to gather, analyze, and apply information and ideas.
- Students in Missouri public schools will acquire the knowledge and skills to communicate effectively within and beyond the classroom.
- Students in Missouri public schools will acquire the knowledge and skills to recognize and solve problems.
- Students in Missouri public schools will acquire the knowledge and skills to make decisions and act as responsible members of society.

The Show-Me Standards reflect the competencies that are needed to succeed in today’s business, social, and global environment. They are intended to foster the commonalities of both academic and vocational education. They serve as a blueprint to enhance curriculum that will help students apply their knowledge and skills—making it imperative that teachers choose instructional methods to help all students achieve their maximum potential.
Students at the University of Missouri-Columbia in a graduate class entitled, *Strategies for Integrating Academic and Vocational Subjects*, utilized the Show-Me Standards, the SCANS\(^1\) competencies, and the workplace basics skills\(^2\) to develop a curriculum based on one of the eight models proffered by Grubb\(^3\):

- **Model 1:** Incorporating more academic content in vocational courses
- **Model 2:** Involving academic teachers in vocational programs to enhance academic content in vocational programs
- **Model 3:** Making academic courses more vocationally relevant
- **Model 4:** Curricular alignment modifying both academic and vocational courses
- **Model 5:** Senior projects
- **Model 6:** The academy model
- **Model 7:** Occupational high schools and magnet schools
- **Model 8:** Occupational clusters, careers paths, and majors

The model used in this curriculum focuses on Model 6: The academy model. It is the author's intention through the development of this model to present the possibilities and promises of academic and vocational integration.

---

Introduction

Career Academies are being used across the country as a method of integrating vocational with academic educational systems and as a method of providing a contextually valid education. Since 1969, many of the academy efforts have met with success on several fronts. These academies have provided a superior education to students of all success levels as well as an impetus for staying in school for countless at-risk students.

This document is the result of a process of compilation of several sources of related literature and of creative application of the ideas presented therein. This is intended to present career academy basics and to provide an expanded example of what I think that the academy model can do to improve the state of education in America. This document is also the culmination of my work for a graduate course at the University of Missouri entitled Strategies for Integrating Academic and Vocational Subjects and the emphasis herein is on the integration of vocational and academic curricula. This has two reasons. First, my exposure to information and the bias which my training as a vocational educator has taken leads me to more concern for and understanding of the vocational/academic issue. Second, there is a synthetic, yet distinct and damaging rift between the vocational and academic educational communities in America, which must be addressed and corrected. I intend that the concepts presented be taken to apply to integration of any set of subject materials without regard to academic or vocational status. Reintegration of all the curricula is necessary to insure that the infusion of reality and meaningful context into education, that our students and our society so desperately need, takes place.

The academy model for curricular integration was selected over the other seven outlined by Grubb because it provides a number of benefits and has proven successful in several instances. The focus of the academy environment as well as the conveyance of realistic technical skills in a multidisciplinary environment works to satisfy a great many standards which educational programs are measured against. Several of the other standard models of integration were deemed too easy to mishandle such that the changes to the curricula and to the instructional methods resulting would be insignificant. In addition, an academy implementation, as a smaller version of many magnet school implementations, is more feasible for many school districts and more equitable for the students involved. The smaller scale allows more diversity in the focus areas especially in medium sized school districts.

Career Academies

The problems that the academy systems attempt to address are:

- general track education lacks focus and leads the participating students to neither post-secondary education, nor to the work force
- perceived irrelevance of curriculum leads to increased dropout rates for high school aged young people
- an increasing number of high school graduates are unemployable due to a distinct lack of marketable skills.

It is popularly accepted that these accurately describe the state of many educational institutions in America and that this situation is an acute societal problem.
Because the academy approach to integrative education can take a quite diverse set of manifestations, the most appropriate method for describing what a career academy is, is to list the defining components of the variety of academy programs. There are four major principles which all of the major academy efforts have subscribed to and are considered essential for their success, these are:

- building a sense of community,
- enhancing teacher professionalism,
- integrating the curriculum, and
- facilitating students' school to work transition.

These principles can lead to a variety of plans and implementations, but there seem to also be at least nine major defining components which are used by all of the career academies. These are:

- the school within a school methodology for particular grades which is taught and administered by a core group of teachers from across the disciplines,
- the recruitment of students who want to be involved in the academy,
- the focus on a career theme which is locally relevant and profitable,
- combination of vocational and academic subjects for reality, perceived relevance, and to keep open the option of a continued education,
- the inclusion of practical experience through employment in the focus field,
- alliance with industry which provides assistance in planning the program, speakers, field trips, job supervisors, and career mentors,
- small and personal classes, parent involvement, and motivational activities, all of which enhance the students' sense of community membership,
- administrative support, at least in the form of extra time for collaboration and planning, and
- curricular inclusion of lessons on 'employability skills.'

The rest of the academies' implementations vary widely.

While academies originally targeted at-risk students, many are now targeting an audience of maximum diversity in which understanding of the real world can be obtained. Many of the academies revolve around high-technology professions such as biotechnology, computers, aviation, law and government, and medicine. In these academies, as in the related professions, there are students at every level of educational success. Many of the graduates go on to college. In fact, some of the academy programs show better rates of continued education than their 'mother' schools.

At the beginning, I stated that academies were targeting certain problems in American education. The attempts at solutions, imparted by the academies are multifaceted. Career academies teach students how to acquire and maintain important skills and knowledge which will be demanded of the students in their post-secondary experiences. Also, the relationship formed between educational faculty of a three-year academy and the students is more likely to allow the instructors to demand rigor without alienating the students. By making the curriculum relevant to a projected future life, the students are motivated to participate and excel in academic subject areas. The career focus of the academy system gives students the skills which allow for meaningful employment immediately following, and even concurrent with, the secondary education experience.
The Dynamic Academy System

The Dynamic Academy System, as I have conceptualized it, is a system in which students from the seventh through twelfth grades generally participate in two successive academies. There are a number of key features of this system which bear explanation. Specifically, the academy focus areas, the dynamism of the system, and what is done during those five years each require a bit of understanding.

In the traditional career academy, the focus area is obviously vocational in nature. It is my intention to provide a system which allows for and encourages less clearly vocational focus areas in addition to the traditional occupational focus areas. In one of these academies, the area of focus might be career-based as in a traditional academy, but it could also be academic or artistic in nature. These focus areas could be considered vocational as well, but the intent and the flavor of the academy needn't be job-related. The limit on the available subject matter is determined by the imaginations and enthusiasm of the teachers, administration, and students who are participating. Within one high school, there could simultaneously be an academy of finance, an academy of poetry, and an academy of fraternal orders operating. One of these is obviously vocational, the other two are less so. The approach of the designers influences the degree to which the academy is vocationally preparatory.

The dynamism of the system that I've designed and herein exemplified come from the changing nature of the academies. In most high schools which sponsor an academy program of some kind, the academy is created and then stays as long as the program can report significant success. The academy will change its methods and attempt to meet new challenges appropriately, but the focus of the academy doesn't change.

The dynamic part of The Dynamic Academy System is that determination of the focus area is market driven after a fashion. Students suggest or nominate focus areas a year in advance of when the academy will begin. The instructional staff examines the focus areas selecting the ones which are thought to be possible given the sum of their resources and their situation. They then present to the student body the list of nominations which would be possible to implement. Discussion and editorial comments in the school newspaper follows for two weeks and the students and teachers then vote for their preferences. As many of the academy options as possible are implemented and planning gets underway. It is believed that many times, a successful academy will be nominated and selected repeatedly, and that unsuccessful academies will be replaced by others. In this way, an attempt to meet the needs of the students is continually getting better.

The students have one academy option during the eighth and ninth grades and another daring the tenth and eleventh grades. Generally, the academies will be targeted for one of those age groups and will be restricted to that group. Also, the second academy slot only may take on an intense occupational flavor with career mentors, summer work programs, etc. Under exceptional circumstances, students of one grade level will be allowed to participate in an academy designed for the other grade level. Extra work is required by the student and the instructors to make sure that the curriculum is appropriate for the grade level.

During the five year participation in the Dynamic Academy System, the students generally spend half of each day of the seventh through eleventh grades in a traditional classroom and half of each
day in an academy environment. The traditional half of the day is tailored to catch what the academy is addressing the least and to satisfy any local, state, and federal requirements which don't fit neatly into the academy curriculum. The organization of the time spent in the academy varies considerably from one academy to another. During the twelfth grade, prior to graduation, the students take courses at the high school to catch any graduation requirements which were not addressed prior to that time. During this year, there is also a senior project required which includes production of some unique work. The work must reflect the participation in any academies and may also include any personal or scholarly areas of emphasis or interest. A significant written report must be completed by each student in addition to some model or application which may take a variety of forms. If time and circumstances permit, the students may take courses at local colleges and count the time spent toward graduation while obtaining advanced college credit.

The remainder of this document outlines a specific example of how the Dynamic Academy might be implemented. Presented here, in a hierarchical format, is a description of this academy example beginning with the broad overview and successively narrowing the focus until the lessons in one unit of one class are detailed. The example given is that of an academy preparing students for a variety of careers using the World Wide Web, a part of the internet.

**General Academy Information:**

<table>
<thead>
<tr>
<th>Title:</th>
<th>Dynamic Academy System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade Level:</td>
<td>8-12</td>
</tr>
<tr>
<td>Description:</td>
<td>The Dynamic Academy is a system of education for a large high school in which a variety of subjects is available to the students. In this case, an academy is a series of courses with a related theme spanning two years. In some cases the academies are vocational in focus, and partnerships with corporate or industrial entities help to strengthen the academies. The academies available change in response to a number of factors including: student demand, the abilities of the instructors, the job-availability market, and administration approval.</td>
</tr>
<tr>
<td>Prerequisite Knowledge/Skills:</td>
<td>Generally, the academies are designated for a specific grade level while other prerequisite considerations are avoided. There is an application process which must be completed by all students who wish to participate. Prior knowledge isn’t generally an acceptance criterion.</td>
</tr>
</tbody>
</table>

Following this description of the overall program, a specific example academy will be further detailed.
Example Academy Information:

Title: World Wide Web Engineer
Grade Level: 10-11
Description: This Academy is intended to prepare successful students for one of several careers in design, maintenance, and implementation of World Wide Web documents and services.

Prerequisite Knowledge/Skills: A general understanding of the World Wide Web and proficiency with a web browser is required for this course. If these requirements are not met before the academy begins, a two day remedial class prior to the beginning of the school year is available to the students which will satisfy the requirements.

Assessment Procedures: For each lesson the students receive a score of one to five. The mean of these daily scores is considered the base course score. This base score is modified by projects and papers required in the course. The maximum that the base score may be modified by the project score is ±1 point.

The procedure for determining the students’ scores is as follows modified by instructions found in the itemized lessons. A student who is unexplainedly absent receives no points. A student who is tardy starts with a base of one point. A student who is one time as expected starts with a base of three points. Up to two points are awarded for participation in the given exercise.

Following this general information about the academy, is information detailing the series of courses contained within the academy.
Course Information:

Number of Courses: 11

Course Length: The course lengths vary. Each course has an assigned place in the sequence of courses within the academy and time is provided for each course during its specified semester.

Course Names:

Semester One:
- Professional Skills
- Programming in C++
- Technical Writing

Semester Two:
- Digital Layout Design
- HTML for the Professional

Semester Three:
- Customer Relations and the Business World
- Digital Graphics
- Resources for Continued Learning

Semester Four:
- Multimedia Competency
- Programming for the WWW using Perl
- Training Technological Concepts

Major Units of Each Course:

Professional Skills:
- Workplace Attitude
- Workplace Attire
- Speaking Clarity
- Timeliness
- Professional Resources
- Workplace Courtesy
- Telephone Habits

Programming in C++:
- Programming Overview
- The Object-Oriented Environment
- Objects and Data Structures
- Functions
- Memory Management
- Looping Mechanisms and Conditional Statements
- File I/O
- Libraries
Technical Writing:
  Introductory Composition
  Technical Writing Standard
  Models and Examples
  Conversion of Knowledge to Text
Digital Layout Design:
  History of Layout Methods
  Design Strategies
  Desktop Publishing Software - PageMaker
  Utility Collaboration and Interaction
  Advanced Topics
HTML for the Professional:
  HTML as a Layout Medium
  Text Formatting
  Image Tags
  Links
  Lists
  Tables
  Colors and Backgrounds
  Downloadable Information
Customer Relations and the Business World:
  Business Essentials
  Marketing of Technology
  Introduction to Sales Theory
  Customer Service
  Customer Interaction
  You Work for the Customer
Digital Graphics:
  Legal Issues in Graphics
  Graphic Formats
  Scanning and Capturing Images
  Introduction to Adobe Interaction
  Photoshop Basics
  Illustrator Basics
  Premier Basics
  Advanced Topics
Resources for Continued Learning:
  Software Manufacturers
  Professional Liaison and Networking
  Conferences
  The World Wide Web
  Usenet and Mailing Lists
Multimedia Competency:
Multimedia Hardware and Examples
The Aspects of Multimedia Presentations
Multimedia Software
Sound Manipulation
Element Coordination
Interactivity
End Production of Multimedia

Programming for the WWW using Perl:
Overview of the Unix Environment
Filehandles, Variables, Lists, and Arrays
Data Manipulation, Pattern Matching, and File I/O
Operators, Statements, and Regular Expressions
Functions
The Perl Library
Interaction with HTML
CGI-bin Scripting
Forms
Advanced Topics

Training Technological Concepts:
Your Relationship With Students
Use of Instructional Technology
Technophobia and Technophilia
Analogies as an Aid for Abstraction
Examples and Hands-On Learning
One-to-One and Group Interaction

This section on the courses and their units is followed by a more detailed examination of one of the courses in the program, *Resources for Continued Learning*. 
Example Course Information:

Title of Course: Resources for Continued Learning

Grade Level: 10

Description: This class is taught in the second semester of the students' participation in the academy. This is one of the courses in which the emphasis is more on professional skills than on technical skills related to the focus area. Students in this course gain a familiarity with the techniques thought to be important for further growth in the related fields of electronic publishing.

Class Meeting Time: Three hours daily

Prerequisite Knowledge/Skills: None beyond successful completion of the preceding courses in the academy sequence.

Following this brief description of the course is a list of the major units of study in the course and a detailed examination of the first unit, Producers and Suppliers.
Unit Information for the Course, Resources for Continued Learning:

Units in course: Producers and Suppliers
Professional Liaison and ‘Networking’
Conferences
The World Wide Web
Usenet and Mailing Lists

Unit #1 — Producers and Suppliers:

Scope/Rationale: This unit is used to introduce the students to the benefits available through the judicious use of vendors and producers of: software, hardware, equipment, office supplies, services, etc. Students should know how to make use of their current suppliers as well as how to acquire new ones. Other useful information in this unit includes how companies react to customer feedback, what services different types of companies are likely to provide, and how to acquire demonstration and preview products. The students will complete this unit able to compose business letters and use the telephone in a professional manner.

Unit Description: This unit consists of seven lessons, six of which primarily address cognitive concerns. Lesson #4, however, as a hands-on exercise addresses sensorimotor and affective skills as well.

Unit Objectives: In order to stay current with the field’s growing body of information, the students will learn to effectively work with vendors and producers of hardware and software used in the fields of print and electronic publishing. Students also will know how these companies respond to the needs of the customers and how they may affect the companies’ decisions. Students will demonstrate proficiency at composing business letters and using the telephone in a professional manner.

Related Guidance Competencies: The instructors should be familiar with the appropriate policies regarding library use, television/VCR requests, field trips, and computer lab scheduling.

Unit Teaching Strategies/Activities: The strategies and activities vary with the lessons. A field trip is ideal for showing the students how a corporation uses customer feedback. Videos are available which can help the students learn professional letter-writing and telephone skills. These videos are then supported with follow-up labwork using telephones and word processing computers. As in any subject and class, trips to the library are helpful during this unit.
Unit Resources: The videotapes, *The Professional Telephone Way* and *Letterwriting in the Business World* are each available for use during class along with the student manuals that accompany each of these. The annual *Register of Graphic Suppliers and Producers* is helpful for many facets of this unit.

You will now see a description of the seven lessons in the *Producers and Suppliers* unit of the *Resources for Continued Learning Course*. 
Unit #1 Lessons:

Number of Lessons: 7

Lesson Length: Each lesson is three hours long. There is generally one lesson per day.

Lesson Names:
- Companies You Already Know
- New Corporate Contacts
- What Companies Will do for You
- Letter Writing and Telephone Requests
- How Companies Handle Customer Feedback
- How to Acquire Demonstration Products
- Summary of Corporate Support

This Brief list is followed by detailed explanation of each lesson in the Producers and Suppliers unit of the Resources for Continued Learning Course.
Lesson #1: Companies You Already Know

Description: This lesson combines an introduction to resources for continued learning in general with a survey of the companies with which the students are already familiar. The students brainstorm a list of companies they are already familiar with. They then repeat the process regarding what kinds of information that would be available from each of those companies. After the class is over, the students are expected to compose a one or two page essay summarizing the class' findings.

Primary Instructional Objectives: To get the class started and comfortable and to get them thinking about their continued education.

Secondary Instructional Objectives: To give the students a list of companies in the field which they and their peers are familiar with.

Resources Required: A dry-erase board and markers, chalkboard and chalk, or an overhead projector, slides, and pens are required to guide the brainstorming activities. The students should have paper and writing implements for notetaking.

Specific Directions for Organizing and Conducting Activities: This lesson is generally free form and the role of the teacher is truly that of a guide. Ideally, the instructor would act as the secretary for the students, writing the results of the brainstorming so that they are visible to the whole group. If the students stray too far off topic, the instructor can nudge them back into the exercise by suggesting a company or service that has yet to be suggested. Asking the students to defend their statements and opinions is also in order. As the students are preparing to leave, the teacher should assign the short paper as homework for the next day.

Assessment Procedures/Criteria: The standard grading policy holds for this exercise, modified as follows. If no paper is returned, two points are subtracted. A poor paper is worth no point modification, an average paper is worth an extra point, and a superior paper is worth two extra points. As always, the score is limited to values between zero and five inclusive.

Connections to other Disciplines: This exercise is designed to increase the students' ability to think creatively, to write cogently, and to expand their understanding of the vocational world.
Suggestions for Modifications for Learners with Special Needs:

None. Within the context of this academy, the range of special needs students, regarding both 'faster' and 'slower' students, is shallow. During this lesson, the students who are either ahead of or behind the average will be normalized and assisted by the other students. The students who become bored easily are able to participate fully as they have new ideas. The students who are a bit slower, will be able to participate at their own rate and will gain from the atmosphere of free creativity.
Lesson #2: New Corporate Contacts

Description: This lesson is designed to get the students to identify potentially useful companies from sources such as the literature, ads, professional recommendations, etc. and to be able to contact the companies and put them to work for the students' continued growth. The lesson consists of discussion between the instructor and the students regarding their suggestions for how these goals might be obtained. After this, the students work in groups to review periodical literature in search of unfamiliar companies. Each group presents a few companies that were found as well as a short assessment of their estimated uses. The class then comments on each presentation and a discussion may ensue.

Primary Instructional Objectives: To show the students how to find, contact, and assess the value of new companies.

Secondary Instructional Objectives: To get the students to assess the potential uses of companies prior to contact based on available information.

Resources Required: Periodical literature for the students. The students should have paper and writing implements for notetaking.

Specific Directions for Organizing and Conducting Activities:
Group size for the periodical search depends on class size, but groups of two are probably best. Make sure that everyone understands that they must participate even though it would sometimes be easy to let other group-members do more than their fair share of the work.

Assessment Procedures/Criteria: The standard grading system for the academy is used in this lesson.

Connections to other Disciplines: While this is founded as a vocational exercise, the building of critical thinking skills is required by every discipline. (e.g. math, science, English, history.)

Suggestions for Modifications for Learners with Special Needs:
If the instructor is assigning groups, make sure that any slow students get grouped with students who are capable but are likely to give their peers a fair input in the assessment process.
Lesson #3: What Companies Will do for You

Description: This lesson consists of a discussion of what types of services are available from various types of companies. While the emphasis is on obtaining information, the acquisition of products is often as viable a means of continued learning and is discussed as well. Both producers and distributors in this field often conduct workshops or classes to support the newest versions of their products, and these services are often quite valuable as a resource for continued learning. Each of these options, as well as others are discussed as fully as possible. The students classify the companies found during the prior lesson, based on what services the students expect to be able to receive. After the students are done with this, the instructor distributes a packet of business letters enquiring after different types of support. These are to be examined by the students in relation to their list of categorized companies.

Primary Instructional Objectives: To explore the variety of services which are available from different companies leading toward furthering the goal of continued learning.

Secondary Instructional Objectives: To prepare for the next lesson in which students will be required to practice letter writing and telephone skills.

Resources Required: Students should have paper and a writing implement for notetaking. The instructor needs to have a variety of prepared letters requesting information, product samples, etc. for distribution to the students.

Specific Directions for Organizing and Conducting Activities
As in the prior lesson, the discussion should be guided by the instructor who, rather than supplying the ideas, should get the students to generate the ideas themselves. When the company categorization exercise begins, the instructor should have extra lists of companies so that any students who don’t have their own lists from the prior lesson can be given one for participation in this exercise. When the packets of business letters are distributed, the teacher should ask the students to examine them in relation to their lists and to try to match a request letter, as appropriate, with each of the companies on their lists.

Assessment Procedures/Criteria: This lesson uses the standard grading system.

Connections to other Disciplines: In the discussion regarding the various companies, history is fully integrated while aspects of other disciplines always arise.
The main focus of this lesson is to further research and learning skills which are metadisciplinary.
Lesson #4: Letter Writing and Telephone Requests

Description: In this lesson, the students watch two short video tapes, one about letter writing, and another about professional telephone etiquette. Practice phone conversations are held and assessed with the students. In this exercise, two students enact an exchange on the phone while the rest of the students and the instructors listen on a remote speakerphone. Each time this is done, the class briefly discusses anything about the exchange that bears comment. Time is then allocated for the students to use the computer lab to write a business letter to each of four companies from their lists. The students are supplied a simple schematic of business letters, but are not permitted to use actual letters as a guide from which to copy.

Primary Instructional Objectives: To give the students enough practice at telephone and written communication skills to be able to effectively function in the workplace.

Resources Required: A room with the two small offices and the three-way telephone setup is required. A computer lab sufficient for the class size is the other basic requirement. A TV/VCR and the two course video tapes, The Professional Telephone Way and Letterwriting in the Business World are each required for the demonstration section of the lesson. Copies of the business letter schematic are required as guides for each student when typing.

Specific Directions for Organizing and Conducting Activities: The order in which the two exercises in this lesson are pursued is irrelevant. The instructors should have the students watch the video for each section immediately before practicing that exercise rather than just watching both tapes and then proceeding to the lab. When participating in the telephone exercise, the students should be aware that the first participants are likely to make more 'mistakes' and draw more comments than the later participants because as time passes, they will learn from the earlier participants. Their evaluation is based on participation and attempt to learn, not the precise quality of their phone exercise. The students should be given enough time to complete their business letters, 20-30 minutes should suffice.

Assessment Procedures/Criteria: Each student starts with a score of zero. For paying attention to the videos, a point is added to the students' scores. For participating in the telephone exercise, a point is added. For exceptional participation in the telephone evaluation conversations, another point is added to the score. An extra
Connections to other Disciplines: While clearly a hands-on type vocational exercise, the communication skills gained are typically addressed in an English or language arts course.

Suggestions for Modifications for Learners with Special Needs: During the telephone practice exercise, if there are students who require it, a script-like sheet can be given to the student to help them work through the conversation. For students who are unable to work in front of an audience, the instructor should record the exchange assuring the students that they are not being overheard. The instructor or the class may then review the recording after the fact.
Lesson #5: How Companies Handle Customer Feedback

Description:
This lesson consists of a field trip to two or three companies' public relations offices. (The closer to WWW and publishing these companies are, the better.) A representative of the office will lead a discussion regarding how their office uses letters, phone calls, and other forms of communication from customers. The students can and should ask questions to fill out the presentation. During each of these presentations, the teachers prompt alterations to the discussion by asking questions on relevant matters. The students also get a feel for the business world by being exposed to the corporate setting. Another of the benefits of this lesson is that the students have the opportunity to compare and contrast the different PR reps' attitudes and discussions. The students write a paper on some aspect of the trip and the presentations which will modify the overall grade for the class rather than the day's grade and is thus a longer project which will be worked on in collaboration with the teachers.

Primary Instructional Objectives: To show the students how companies really react to customer feedback.

Secondary Instructional Objectives: To give the students a feel for how real companies operate.

Resources Required: Students should be neatly dressed and have paper and a writing implement for notetaking. The instructors must be able to conduct a field trip and maintain field trip security.

Specific Directions for Organizing and Conducting Activities:
If the different locations are near each other, conducting the excursion is greatly simplified. Pointing out to the students that these companies are potential employers helps to keep them on their best and most professional behavior. Also, if the field trip travels to some of the companies that have ties with the academy, the students may be able to make contacts for their internship employment for the remaining summers during high school. This trip can also be worked in with the overall structure of the academy to include a meeting with potential mentors.

Assessment Procedures/Criteria: For this exercise, the students are assigned a base of four out of five points. Each incident of unprofessional behavior at a corporate sight subtracts a point. For each presentation in which a student participates more than minimally, that student receives an extra point. Tardy students are left, and any students unexpectedly absent from the trip get zero points.
Suggestions for Modifications for Learners with Special Needs:

Assuming that the special needs are not so great as to preclude participation, accommodations for wheelchair-bound students should be made by using a handicap-accessible bus and other special needs must be addressed as encountered.
Lesson #6: How to Acquire Demonstration Products

Description: This lesson builds on the earlier work regarding requesting services in that the goals are to acquire goods and services for preview. This lesson starts with a discussion between the teachers and the students about the potential for this sort of resource acquisition. The teachers and perhaps guest speakers can site examples from personal experience of both successful and unsuccessful attempts. These examples can be used to get the students to discuss why some attempts succeeded and others failed. The discussion turns to how these products and services help further learning. A key topic is how the students will be able to justify their requests, both within their own organizations and to the companies of which the requests are being made.

Primary Instructional Objectives: To explain what goods and services are likely to be available for use and preview, and what types of companies are most likely to supply these demonstrations.

Resources Required: The students should have paper and writing implements for notetaking.

Specific Directions for Organizing and Conducting Activities:
Typically, the instructors should have the students participate as much as possible during the conversations in this lesson. A significant part of the conversation is presentation by teachers and guests, but during each of the conversations, the students have the opportunity to comment, question, and analyze the situations. If the presenters can mix with the students while the discussion is taking place, it helps to encourage participation on all parts.

Assessment Procedures/Criteria: The standard evaluation system is used in this lesson.
Lesson #7: Summary of Corporate Support

Description: This lesson begins with a teacher-programmed review of the ideas and findings discussed in the previous six lessons. The students are asked to review any ideas that they thought were of special importance or significance. There is time to further explore any of the topics that the students or teachers feel was cut short during the unit. Once the first section of the review process is done, the students may meet with the instructors who are not currently engaged with the class to discuss their progress on their paper assignments.

Primary Instructional Objectives: To reinforce the concepts and trends discussed throughout the unit's lessons.

Secondary Instructional Objectives: To encourage the students to seek guidance regarding their papers by speaking with the instructors.

Resources Required: Notes from the previous six classes are required by each student and teacher. Everyone should have paper and writing implements for further notetaking.

Specific Directions for Organizing and Conducting Activities: The first section of the class should be led by as many of the instructors as have comments and were active throughout the rest of the unit. After the programmed review, the teachers who have comments and concerns should stay and discuss them with the students. The others should be available to help with the students' papers in a one to one atmosphere.

Assessment Procedures/Criteria: For this exercise, the students are assigned a base of four of the five points. For each student who participates more than minimally, an extra point is added to the score. Tardy attendance earns a subtraction of two points and absence results in a score of zero.
