The League of Professional Schools consists of 5 self-governing chapters in 3 states and has more than 100 member schools. For this study, a total of 1,379 teachers from 43 Georgia public schools (29 elementary, 7 middle and 7 high schools) were surveyed to determine their sense of efficacy about teaching effectiveness and their degree of participation in activities advocated by the League of Professional Schools, a school restructuring program to which their schools belonged. The four participation factors were school involvement, involving students, outside involvement, and action research. The two factors derived from the sense of efficacy instrument (Guskey and Passaro 1994) were the power of external forces and the power of teaching in affecting student achievement. Consistent with previous research, teachers' sense of efficacy was found to be lowest in high schools and highest in elementary schools. All participation factors except Action Research differed with school level, in line with sense of efficacy. Female teachers were found to have a higher sense of efficacy than their male counterparts but only in regard to belief in external factors as influencing student achievement. Participation factors of school involvement and student involvement varied significantly by gender while other participation factors did not. Participation generally increased with length of time in the League, but sense of efficacy was not related to time in the League. (Contains 43 references.) (JLS)
Lessons from the League: Relationship between Teacher Involvement and Sense of Efficacy

Lessons from the League:  
Relationship between Teacher Involvement and Sense of Efficacy

Introduction

Ashton and Webb (1986) wrote that education is in crisis and that the "single greatest impediment to school improvement" is teacher motivation. "Unless something is done to overcome the demoralization of teachers, it is unlikely that any reforms will improve significantly the quality of education in the United States." (p. 1) In support of their assertions, Ashton and Webb cited reports by Boyer and Gallup, respectively, which blamed low teacher motivation on the failure of teacher salaries to keep pace with inflation, the lack of rewards for competence, a loss of confidence from the public, and growing disrespect and hostility from students. The 1995 annual Phi Delta Kappa/Gallup Poll of attitudes toward public schools found similar results, with the major problem facing public schools cited as lack of discipline (Elam & Rose, 1995). Certainly these unfavorable conditions do exist, although they, or equally unmotivating conditions, have probably always existed (see related discussion in Glickman, 1993). Increased salaries based, at least in part, on measures of teaching competence are probably the only measures that would eliminate the first two possible causes cited of teachers' lack of motivation, but more fundamental changes are needed to involve students and the public in the educational process in such a way as to engender their respect for both teachers and the educational system.

Two Rand Corporation studies, in reviewing the effectiveness of federal education programs, found teachers' sense of efficacy to be a significant variable affecting not only the continuation and effectiveness of these programs, but also student achievement. Ashton and Webb (1986) cited these studies as a major breakthrough in that previous research attempting to correlate teacher attitudes with student achievement had yielded discouraging results. Writing of teachers' sense of efficacy, Ashton (1984) asserted "that no other teacher characteristic has demonstrated such a consistent relationship to student achievement" (p. 28).

Teachers' sense of efficacy is a teacher attitude that has been found to be positively related to increased student achievement, decreased student dropout rates, and decreased teacher burnout and attrition. The League of Professional Schools is a school restructuring program incorporating shared site-based governance, action research and a focus on student instruction. It was anticipated that there would be a high relationship between involvement in the programs advocated by the League and teachers' sense of efficacy. The purpose of this project was to investigate that relationship.

Research Question

The main research question for this study is: What is the relationship between participation of teachers (degree and length) in the League of Professional Schools and their sense of efficacy?
What the Research Says about Teachers’ Sense of Efficacy

One consistent finding of studies of teachers’ sense of efficacy is that collegial relations in a school have a positive effect on efficacy. These collegial relations are not only among faculty and administrators but also between faculty and students (Ashton, Webb, and Doda, 1982). Ashton et al. (1982) identified eight characteristics which distinguish high from low sense of efficacy teachers, these being (1) a sense of personal accomplishment, (2) positive expectations for student behavior and achievement, (3) personal responsibility for student learning, not placing such responsibility solely upon the students, (4) strategies for achieving objectives, including goal setting for themselves and their students, (5) positive affect about teaching, themselves, and their students, (6) a sense of control with confidence in their ability to influence student learning, (7) a sense of common teacher-student goals, seeing themselves as engaged in a joint venture with their students to achieve common goals rather than a struggle with students, and (8) democratic decision-making, involving their students in decision-making about goals and the strategies for achieving those goals.

Rosenholtz studied commitment and sense of efficacy in 1,213 teachers at 78 elementary schools in Tennessee (Rosenholtz, 1989a; Rosenholtz & Simpson, 1990), finding sense of efficacy to predict commitment and four school variables to predict sense of efficacy directly: receipt of positive feedback on their teaching performance, collaboration with other teachers, parental involvement in the school, and school-wide coordination of student behavior. The strongest predictor of teachers’ sense of efficacy found in this study was the degree of teacher collaboration. Rosenholtz (1989b) proposed that the more freedom teachers have to make decisions, the more "...they become aware of themselves as causal agents in their own performance" (p. 423), and that those with a high sense of efficacy are more likely to attribute results in the classroom to internal factors while low sense of efficacy teachers tend to attribute results to external factors.

Woven through the review of studies of teachers’ sense of efficacy are findings that characteristics such as collaboration, having a voice in school and classroom decision-making, coordination of curriculum and discipline, having an instructional focus, etc., are positively correlated with and probably affect teachers’ sense of efficacy. These variables are all characteristic of schools which are members of the League of Professional Schools.

The League of Professional Schools consists of five self-governing chapters in three states and has more than 100 member schools. Membership is voluntary in this network bonded by common goals and a commitment to three premises: (1) governance that is shared democratically from throughout the school and extending in many cases into the community, (2) an emphasis on improving student learning and instruction because teaching is the main purpose of the school, and (3) action research making a problem solving orientation the normal method of operation in the school.
Procedure

A total of 1379 teachers from 43 public schools in Georgia, 29 elementary, and 7 each middle and high schools, were surveyed to determine their sense of efficacy about teaching effectiveness and their degree of participation in activities advocated by the League of Professional Schools, a school restructuring program of which their schools were members, and their overall involvement in that program. The sense of efficacy portion of the survey was adapted from Guskey and Passaro (1994). Factor analyses were performed separately on participation variables and sense of efficacy, with four participation factors and two sense of efficacy factors being identified. The four participation factors were School Involvement, Involving Students, Outside Involvement, and Action Research, while the two factors derived from the sense of efficacy instrument were The Power of External Forces, and The Power of Teaching in affecting student achievement. The relationships among these variables were investigated through multiple correlation and analysis of variance procedures.

Specific Research Questions Addressed

Utilizing a Likert scale format with the Guskey and Passaro (1994) instrument, do the same two factors of internal and external loci of control emerge as being predominant?

The same two factors emerge, although they are not really locus of control. The factors are correlated rather than on a continuum, and the items are more specific than locus of control. The item most exemplifying the first factor, The Power of External Influences, is “I am very limited in what I can achieve because a student’s home environment is a large influence on his/her achievement.” The item most exemplifying the second factor, The Power of Teaching, is “When the grades of students improve, it is usually because their teachers found more effective teaching approaches.”

Is there a significant relationship between gender and sense of efficacy?

Previous research has found female teachers to have a higher sense of efficacy than their male counterparts (e.g., G. Garrett, 1977; Ross, 1994). Is this the case with the sample chosen for this study? What was found was that females have a higher sense of efficacy with respect to the Power of External Influences, while there were no gender differences on the Power of Teaching factor.

Is there a significant relationship between grade taught and sense of efficacy?

Previous research has found a higher sense of efficacy among elementary school teachers than among teachers of higher grade levels (Ross, 1994). This was found to be the case in this study as well.
Is there a significant relationship between a combination of gender and grade taught and sense of efficacy?

Previous studies have had difficulty answering this question because of the small number of male teachers at lower grade levels. This study found no significant interactions between gender and grade taught.

What correlations are there between measures of League involvement and sense of efficacy?

Involvement in school-wide activities and in action research have a decided relationship to the teachers' beliefs about the power of external forces over teaching, going from low insignificant correlations in the first year of League involvement to moderate but significant correlations in the sixth year of League involvement. This same trend held for the Power of Teaching factor, with all League involvement factors moderately, but significantly, correlating with each efficacy factor.

Are there any gender differences in the correlations between measures of League involvement and sense of efficacy?

Gender did not significantly interact in the correlations between involvement and sense of efficacy.

Are any of these relationships mediated by grade level taught?

Involvement and efficacy measures varied significantly by grade level, although Action Research differences were significant at only the $p = .040$ level. Both involvement and efficacy decreased with advancing grade level.

What correlation is there between length of time at a League school and sense of efficacy?

No significant correlation was found between length of time at a League school and sense of efficacy, however there was a generally higher relationship between involvement and efficacy the longer the individual has been in the League.

What correlation is there between length of time a school has been a member of the League and sense of efficacy?

When correlated with the Power of External Forces, a low but significant correlation was found, but no significant correlation was found between the school's length of time in the League and the Power of Teaching efficacy factor.

Summary of Results

Consistent with previous research on sense of efficacy, teachers' sense of efficacy was lowest in high schools, and highest in elementary schools. All participation factors except Action Research differed significantly according to school level (elementary, middle, high) in correspondence with sense of efficacy. Also in accord with previous research, female teachers were found to have a higher sense of
efficacy than their male counterparts, but only with regard to their beliefs in the power of external, uncontrollable factors that influence student achievement. The participation factors of School Involvement and Student Involvement varied significantly by gender, while the other participation factors did not. Participation generally increased with length of time in the League, while sense of efficacy was not significantly related to time in the League. Results of an open-ended question included on the survey indicate there to be great variance both in school climate and in the level of implementation of League principles from school to school.

In general, involvement decreased as grade level advanced. The highest involvement measures overall were school-wide involvement and involving students, while the lowest involvement measured was in action research.

An open-ended question on how involvement in the League had affected the individual's teaching revealed large differences between schools, probably due to the personalities of the teachers involved and especially of the principal. One teacher wrote that involvement in the League had been wonderful until they changed principals.

Discussion

Implications for researchers into teachers' sense of efficacy include a redefinition of that construct from the factors studied by most researchers to date, personal and general senses of efficacy, to a multi-dimensional construct matrix including the newly-identified factors of The Power of External Forces, and The Power of Teaching itself. For educators in general as well as those in school restructuring programs, implications are derived from the high relationship between teachers' sense of efficacy and the involvement factors measured, as well as from the relative levels of involvement. The highest involvement measured was the factor of involving students, while the lowest was action research, indicating a possible need on the part of administrators and other school leaders to do even more to encourage teachers to involve themselves in that way.

The lower involvement scores among high school teachers could be explained through the reasons that an individual might choose that level. Whereas teachers at lower levels may go into their field because of a love for education itself, high school teachers frequently choose that profession because they "enjoy" their subject (Wysocki, 1996).

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

Check here for Level 1 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

The sample sticker shown below will be affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

Check here for Level 2 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

The sample sticker shown below will be affixed to all Level 2 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."
