At-risk students' failure within the system and the failure of the system to stimulate and interest them leads to a cycle of disengagement: since they lack competence, these students avoid reading. The term "at-risk" is ambiguous because of the evolution of its meaning and the different loci of blame for how people "become at risk" or are "placed at risk." A literacy lab, replacing a traditional remedial reading program at Lafayette (Indiana) Jefferson High School, was based on 3 characteristics of innovative secondary literacy programs: (1) viewing students as unique individuals; (2) providing students with tasks that are challenging, interesting, and "do-able"; and (3) allowing students choice in topic and method of completing activities. Text-based activities are integrated with other media, including a variety of computer-based, multimedia activities. Academic history interviews of 10 students and 3 case studies provide insight about the students' current family and work lives, future aspirations, experiences in school, and the values and beliefs these individuals hold regarding life within and outside of school. All students in the Literacy Lab but one found the activities to be enjoyable and helpful in their development as readers and writers. Students especially liked the computer activities in which they could read and write stories. The Literacy Lab maintains students' engagement from day to day by capitalizing on their free choice and balancing their daily challenges and success by using technology tools typically reserved for high track, more privileged students. PERSPECTIVES IN READING RESEARCH NO. 12
Winter 1997

The work reported herein is a National Reading Research Center Project of the University of Georgia and University of Maryland. It was supported under the Educational Research and Development Centers Program (PR/ Award No. 117A20007) as administered by the Office of Educational Research and Improvement, U.S. Department of Education. The findings and opinions expressed here do not necessarily reflect the position or policies of the National Reading Research Center, the Office of Educational Research and Improvement, or the U.S. Department of Education.
The National Reading Research Center (NRRC) is funded by the Office of Educational Research and Improvement of the U.S. Department of Education to conduct research on reading and reading instruction. The NRRC is operated by a consortium of the University of Georgia and the University of Maryland College Park in collaboration with researchers at several institutions nationwide.

The NRRC’s mission is to discover and document those conditions in homes, schools, and communities that encourage children to become skilled, enthusiastic, lifelong readers. NRRC researchers are committed to advancing the development of instructional programs sensitive to the cognitive, sociocultural, and motivational factors that affect children’s success in reading. NRRC researchers from a variety of disciplines conduct studies with teachers and students from widely diverse cultural and socioeconomic backgrounds in pre-kindergarten through grade 12 classrooms. Research projects deal with the influence of family and family-school interactions on the development of literacy; the interaction of sociocultural factors and motivation to read; the impact of literature-based reading programs on reading achievement; the effects of reading strategies instruction on comprehension and critical thinking in literature, science, and history; the influence of innovative group participation structures on motivation and learning; the potential of computer technology to enhance literacy; and the development of methods and standards for alternative literacy assessments.

The NRRC is further committed to the participation of teachers as full partners in its research. A better understanding of how teachers view the development of literacy, how they use knowledge from research, and how they approach change in the classroom is crucial to improving instruction. To further this understanding, the NRRC conducts school-based research in which teachers explore their own philosophical and pedagogical orientations and trace their professional growth.

Dissemination is an important feature of NRRC activities. Information on NRRC research appears in several formats. Research Reports communicate the results of original research or synthesize the findings of several lines of inquiry. They are written primarily for researchers studying various areas of reading and reading instruction. The Perspective Series presents a wide range of publications, from calls for research and commentary on research and practice to first-person accounts of experiences in schools. Instructional Resources include curriculum materials, instructional guides, and materials for professional growth, designed primarily for teachers.

For more information about the NRRC’s research projects and other activities, or to have your name added to the mailing list, please contact:

About the Authors

**David O'Brien** received a Ph.D. in Reading Education at the University of Georgia in 1984. He is currently Associate Professor of Literacy and Language at Purdue University where he teaches courses in secondary literacy and qualitative research methods. His research interests are content literacy, particularly from a school cultural perspective. During the past four years he has collaborated with school-based colleagues to design an innovative program for at-risk learners and to study the students’ literacy engagement within that program.

**Deborah Dillon** is Associate Professor of Literacy and Language and Associate Dean for Research and Development in the School of Education, Purdue University. She received her Ph.D. in Reading Education from the University of Georgia in 1985. Her primary research interest is studying teaching, learning, and assessment as they are embedded in the social and political contexts of schooling. Most recently, she has worked as part of the collaborative team of literacy faculty members and school based colleagues to construct and study a new literacy curriculum for preservice teachers.

**Stephen Wellinski** recently received a master’s degree in Curriculum and Instruction at Purdue University and is continuing graduate work in secondary literacy. He is particularly interested in transitions from school to work and designing secondary programs that accommodate the interests of students entering vocational-technical programs or the workplace after high school graduation.

**Rebecca Springs** is a high school English teacher at Lafayette Jefferson High School, Lafayette, Indiana. She co-ordinates the Literacy Lab program for at-risk high students. She received a master’s degree from Purdue University with a focus on reading and has taught reading and speech at Jefferson High for 12 years. Rebecca also teaches preservice teachers at Purdue University as an adjunct instructor for the secondary literacy course.

**David Stith** is a high school English teacher at Lafayette Jefferson High School. He received a master’s degree from Purdue University and has spent most of his teaching career working with students who are behind in reading. Dave is currently co-coordinator of the Jefferson High Literacy Lab and serves as an adjunct instructor in the secondary literacy program at Purdue.
Abstract. High school students often lack the literacy skills needed to succeed in school (Alvermann & Guthrie, 1993; Alvermann & Moore, 1991) or to contribute as productive citizens in the workplace beyond high school (Mikulecky & Drew, 1991). The subset of so-called “at-risk” students face even more challenges. Because they lack competence, these students avoid reading. Even the more competent readers who can read choose not to (Foertsch, 1992; Guthrie, Bennett, & McGough, 1994). Hence, students seldom engage in reading for the variety of purposes for which it could serve them. This cycle of disinterest and lack of competence costs the U.S. billions of dollars in lost productivity, social programs, and incarceration, particularly when students become disenfranchised with school and drop out (Garcia & de Felix, 1995). Ironically, students’ disenfranchisement from school is often attributed to the inadequacies they bring to school rather than the inadequacies of the school in meeting their needs. Below, we will explore perspectives on the relation between at-riskness and literacy engagement.

Perspectives on At-Riskness and Literacy Engagement

In high school classrooms, reading and writing are tied to teacher-directed content coverage of material in bland textbooks (Boyer, 1983; Tyson-Bernstein, 1988). Instruction with textbooks often takes the form of teacher lecture of the text content or as recitation sessions (Alvermann & Moore, 1991; Alvermann, O’Brien, & Dillon, 1990; O’Brien, Stewart, & Moje, 1995). Textbooks, which students seldom view as interesting, include selected knowledge framed as legitimate and presented in ways that restrict how the knowledge is taught, presented, or discussed (Apple, 1988; Apple & Christian-Smith, 1991). For average or above average achievers, literacy skills represent avenues to achieve tightly structured goals of various subject area classrooms. For at-risk students, the typical literacy
tasks represent an inflexible system in which they have failed for many years.

At-risk students' failure within the system and the failure of the system to stimulate and interest them leads to a cycle of disengagement: Since they lack competence, these students avoid reading. Even the more competent readers who do not read are convinced that it is not useful in their daily lives and seldom engage in reading for the variety of purposes for which it could serve them.

Schools unwittingly contribute to this problem by failing to attend to the needs of students with low literacy attainment or aliteracy. Instead, schools assign categorical classifications and put students in special programs that fail to help them (Allington, 1994). For example, elementary-grade students who fail in reading in early grades are likely to remain behind in reading throughout school (Juel, 1988). Low achievers, who often initially struggle with reading and are placed in special programs, are not only unlikely to improve in their achievement but remedial programs may actually exacerbate the problem (Allington & McGill-Franzen, 1993).

At-risk learners are often persons who have been identified because of low literacy attainment. This identification is made because literacy ability influences a range of school performances. Once identified, however, it is apparent to most educators that high school students who have trouble with literacy tasks evidence a range of other problems tied to complex factors. The concept of at-riskness is a vague catch-all of such complex factors.

The term at-risk is ambiguous because of the evolution of its meaning and the different loci of blame for how people "become at risk" or are "placed at risk." Some perspectives on "at-riskness" suggest that students have characteristics that predispose them to being at risk. Other definitions suggest that the settings in which students are schooled place them at risk (Allington & McGill-Franzen, 1993; Waxman, 1992). We explain each of these below.

Perspectives That Target the Students and Their Families

Since the beginning of compulsory education, parents and families of low achieving students (today's at-risk students) have been blamed for failing to provide their children with adequate motivation, character, and ability for school success (Cuban, 1989). This simplistic, severe position has evolved into one in which parents are not always blamed directly. Nevertheless, schools excuse themselves by assigning labels for categories and etiologies that focus on predisposed problems at-risk students have inherited, developed, or acquired outside of school (Donmoyer & Kos, 1993; Ralph, 1989).

For example, at-risk students have been defined as persons predisposed to failure in school and at risk of dropping out of school because they (a) are educationally disadvantaged, exhibit low achievement, and have trouble adapting to school; (b) show outward signs of distress and failure due to alcohol and drug abuse, unwed pregnancy, attempted suicide, crime, delinquency or truancy; (c) are children of urban poor backgrounds or persons who belong to racial minorities which have been recognized historically as problematic to
the larger society and particularly needy in terms of education and special resources (Cuban, 1989); and (d) have genetic or psychological inadequacies in their preschool lives that predispose them to failure in school (Bitting, Cordeiro, & Baptiste, 1992). If students, because of any of the above factors, are predisposed to failure and eventually fail, they may drop out of school because of low achievement, particularly in literacy (Allington & McGill-Franzen, 1993; Ralph, 1989).

The perception that “at-riskness” resides within students serves to narrowly define a problem that is often addressed through special program placements and labels that stigmatize students (Bitting et al., 1992). A more optimistic definition is one that looks at at-riskness in terms of factors in school that educators can control. One way to focus this optimism is to locate the problems of at-risk students in the school culture.

**Perspectives That Target Schools**

In order to help at-risk students, educators must be willing to entertain the notion of at-risk school environments (Waxman, 1993). Schools with such environments can be characterized by a host of factors that alienate students, the most significant being educators and programs that are unresponsive to students’ current needs in school as well as their future needs beyond high school. Furthermore, in order to define at-riskness in a way that prompts change, educators need to consciously avoid being deluded by the labels assigned to at-risk students and special programs. Instead, educators need to look at each student as unique within the school context (Donmoyer & Kos, 1993).

Educators, who represent dominant middle-class values, sometimes single out children who are not of the predominant class and stifle their self-esteem while neglecting the strengths that these students bring to school (Cuban, 1989). Indeed, schools have institutionalized such a low level of tolerance for differences among students that even minor deviations result in students being labeled as having personal deficits (Pugach, 1995). In addition, educators need to look at schools within the context of the communities in which they reside. When schools are viewed within community contexts, it is clear that social groups in school are, in part, established by social class differences in the larger community (Eckert, 1989). These differences are cemented in the social structure and reward system of schools.

In sum, schools cannot shoulder the blame because some students come to school ill-equipped to succeed. Nevertheless, schools can creatively solve problems related to how they perpetuate at-riskness and work to make fundamental changes that ensure the success of at-risk students. Unfortunately, institutionalized values and practices make change very difficult. In constructing a program for at-risk high school students, we focused on what a school can do to accommodate these students and ensure their success.

**Constructing an Innovative Program**

As a precursor to constructing a new program, we reviewed literature on traditional and exemplary secondary literacy programs, work
critiquing current programs for at-risk students, and work informing literacy engagement with a focus on achievement motivation, self-efficacy, attribution and goal theory, and constructivist perspectives on learning. The findings from that corpus, along with our own research over the last three years in which we have been testing ongoing assumptions, lead to the identification of three characteristics of innovative secondary literacy programs.

1. Students must be understood as unique individuals who live in the broader community. In order to teach at-risk students, it is imperative that educators know who these students are (Brause & Mayher, 1991; Dillon, 1989). Instead of labeling students or assigning blame to the students or their families for students’ literacy challenges, we need to better understand the school, family, and community contexts associated with students at risk of failing or dropping out of school. This understanding helps educators understand students’ lives and why they fail (Edwards & Young, 1992; Stevens & Price, 1992).

2. Instructional tasks must be challenging enough to be interesting, yet flexible enough to provide students leverage in controlling the level of difficulty (Covington, 1992). Tasks should be flexible, leading to systematic rewards for process and creativity over product. These tasks are antithetical to the low-incentive, high-risk, competitive, ability-based tasks valued in the predominant school culture (e.g., Nicholls, 1989). On the flexible tasks, students should work at their ability levels, be consistently challenged, and allowed to succeed daily.

3. Students should be given more autonomy in choosing what they work on and how they approach tasks. Changing the basic school cultural values that stress content coverage and teacher control to more student choice and autonomy can lead to increased engagement (Kohn, 1993; McCombs, 1996). A constructivist perspective on learning recognizes the importance of student autonomy and control (e.g., von Glasersfeld, 1991) and social constructivist research shows the importance of classroom agendas jointly constructed by students and teachers (Dillon, O’Brien, & Ruhl, 1989). Curiosity and interest should provide motivation to practice literacy processes that lead to efficacy, aesthetic enjoyment, and success. Ultimately, if students can exercise choice, the control they feel from being successful will lead to increased achievement and more active involvement in their schooling (Paris, Wasik, & Turner, 1991 [Turner, 1995 #34]). Additionally, students should have an authentic purpose for engaging in literacy tasks. Providing students an opportunity to discuss why they are learning the things they do is crucial to establishing the relevance of school (Nicholls & Hazzard, 1993).

The purpose of our ongoing project is to create a motivating and intellectually challenging curriculum for at-risk adolescents and identify components of the innovative program that are most effective in enhancing literacy engagement. The focus of this paper is to (a) discuss how the three characteristics previously outlined have been articulated in the innovative program, using examples of students’ actions and products within the program; and (b) present students’ perspectives on the program...
activities and how they see these activities contributing to their literacy development.

Lafayette Jefferson High School Literacy Lab

The Lafayette Jefferson High School Literacy Lab, the site of the innovative program, is located in Jefferson High School, a large, comprehensive school that enrolls about 2,200 students. The students come from families representing a range of socioeconomic levels and working backgrounds. The community, with a population of about 50,000, is economically stable due to a diversity of small- to medium-sized manufacturing plants. The community also includes a considerable number of white-collar jobs associated with various service professions and businesses.

The Literacy Lab was created by a team of high school and university teacher-researchers who decided to replace a traditional remedial reading program. The staffing resources in the Literacy Lab determine the number of students enrolled. There is room for a maximum of 120 students (about 15 students per class period in a block-8 schedule) to maintain the current teacher-student ratio of about one teacher per eight students. The staffing includes one teacher, Rebecca, who works full-time in the lab and a second teacher, Dave, who works two class periods a day in the lab. Typically, two special education inclusion teachers work in the lab one class period every six days and one of the university teacher-researchers, David, teaches and does research in the lab an average of three periods per day, three days per week. A second university teacher-researcher, Deborah, and three research assistants have focused on the collection and analysis of various types of data, most recently on constructing academic and life histories of students enrolled in the lab.

Sixteen networked computers and several other stand-alone machines are set up as multimedia workstations. The computers are set up around the perimeter of the room with a shared laser printer in one corner. Tables that seat 4 to 6 students are arranged in the inner portion of the room where students can work in small groups or on individual projects. Classes meet for 92 min each day in a block-8 configuration (each student is in the lab every other day). The atmosphere of the lab reflects mutual respect among teachers and students and genuine desire on the part of teachers for students to succeed. Nevertheless, there is also a business-like tone; students come in and begin their work after brief socializing. As teachers, we move around the room helping students on computers or guiding small groupwork. Once the students are engaged in their tasks, they perceive that class periods pass quickly.

The Literacy Lab Curriculum

In the lab, text-based activities are integrated with other media, including a variety of computer-based, multimedia activities. These activities are designed to foster student engagement. Students select activities from a generic menu and contract to complete each activity selected over a period of time compatible with the difficulty of the task; we also offer more latitude in completing work than students typically receive in other classes. Students may choose to work on tasks in small groups with members of their choice or individually. At
least once a week students engage in lessons structured around lesson organizers like DR-TAs (Stauffer, 1969), REQUEST (Manzo, 1968), K-W-L (Ogle, 1986), and Guided Reading Procedure (Manzo, 1975). Thus, students are provided choice with some structure. These lessons typically focus on broad discussions about the topics based on the students’ experiences, interspersed with reading segments of texts. Often groups are facilitated by preservice teachers from Purdue University who are engaged in a field experience related to their content literacy course.

Many of the topics students choose to read come from periodicals such as Current Events, Newsweek, U.S. News and World Report, and the Journal and Courier [local newspaper]. During the sustained silent reading/writing time that marks the first 20 minutes of each 92-min class period, students read Literacy Lab materials but also bring in trade books, magazines, textbooks, and class assignments.

In small group and individual work students respond in writing to narrative or expository texts teachers or their peers have written. They write predictions and endings of stories or segments of branched fiction stories started by other students or teachers. All of these activities foster individual creativity. Some of the activities can be completed in a class period and others may take several class periods to complete. Students select assignments in which they write and illustrate reports about people or events important to them using computer graphics and drawing tools. At times they develop narratives or informational texts after reading similar texts. For example, after reading about topics in Current Events or Newsweek students have written about teen pregnancy, smoking, crime, gangs, and the impact on adolescents of violence in television. Students also write stories about themselves, their friends, or family members; for example, Deanna, an African American student, wrote a piece of historical fiction in which she cast her mother as a slave on a plantation.

A set of assignment guidelines specify the development of multimedia productions to be shown to the class upon completion. Within this category Tom and Ernie, following extensive research, designed a “home page” on football quarterback Jim Harbaugh in which the user could read about his career, see pictures of key plays, and even access motion video clips of plays with narration. Their example led to a flurry of home pages about a wide range of topics students were interested in researching. David chose to write about a student clique of skateboarders. He planned his project to reflect skaters’ perspectives about the way they were viewed by peers and adults and integrated text with video clips from a documentary about skaters. As a break from work on these longer projects, students often select short assignments. For example, in “Get the Picture” they access a file we compiled of a wide range of digitized photos and they write about their feelings or reflections cued by each picture.

These examples reflect only a small portion of the range of activities. Each day we require that the students do the best they can on the activity they choose. At the end of each day, we check each student contract sheet to see what they proposed and what they actually accomplished. We initial each contract for that
day, noting the work completed. It is almost impossible for students to fail. The emphasis on a wide range of flexible tasks, coupled with a focus on process—completing the work contracted for the day rather than focusing on relative ability—instills confidence. The students know they can succeed and that we expect success as routine. Most important, they know that we care that they succeed.

In the first year of the project, we constructed more tightly structured assignments based on our belief that the students would lose track of their progress unless assignments were laid out in a linear order with clearly articulated steps. In addition to the structure or outlined assignments, we wrote branched fiction stories in which a story we had started would be completed by individual students, pairs of students, or students moving from one computer to another. As more computer equipment became available, we moved more toward multimedia projects that permitted much more freedom in terms of choice of topics and the form the products would take. As students explored various assignments and produced products from them, we encouraged them to publish their work in “Class Library,” a location on the file server in which the completed work could be saved where peers can access and respond to one another’s work.

Below is a brief synopsis of some of the assignments that we used during the 1995–1996 academic year. Following the synopsis are student examples produced from some of the assignments.

Youth Forum. This was a production of the Indianapolis Star newspaper in which students were to write letters of about 200 words to the newspaper commenting on current issues important to adolescents. Before writing on a topic, we usually asked the students to plan an argument to support their opinions and develop facets of the argument. Some of the topics the students chose to write about were teen pregnancy, gangs and gang violence, living with divorced parents, violence in the media, cheating in school, smoking, premarital sex, and song lyrics. Tom wrote a Youth Forum piece about song lyrics:

Many songs that appeal to teens contain bad words and references to violence and sex. Most people listen to music with bad words because they are gang members, skaters, cool people. The reason they talk about their life in the hood is because that’s their life. Lyrics do not affect people’s behavior. I grew up in a bad neighborhood downtown in Detroit, Now there are drive by shootings about 15 minutes in my old neighborhood. Parents should be able to let their kids listen to any kind of music.

Movie/TV reviews. For this assignment we included a sample review as a reference and asked the students to read the example looking for a summary, information about where the movie is playing (or network scheduling information for TV productions), and comments on the strengths and weaknesses of the production. They were then directed to follow the guidelines to review their own movie. Krista wrote a review of the film, Iron Will:

WILL AND I ARE ALIKE IN TWO WAYS. WE ARE BOTH ALIKE BECAUSE IN THE MOVIE WILL SHOWS HIS LOVE FOR THE DOGS BY CARING FOR THEM, FEEDING THEM, AND MOST IMPORTANT THING IS THAT HE GIVES
THEM LOVES O IN PART I LIKE DOG
BECAUSE THEY ARE REALLY CUTE
LOVEABLE FRIENDLY ALSO THEY
PROTECT YOU WHEN YOU ARE IN
THROUBLE AND HURT

Krista diverges greatly from the guidelines and
writes how she and the protagonist, Will, are
alike. She sees herself as a loving, caring
person like Will.

*Get the picture.* We created a thumbnail
sketch section of the assignment in which
students accessed a “People” file on the net-
work file server that included dramatic digi-
tized photos of people in various settings.
Students write about the person in the pic-
ture—where the person might be from, what
the person does for a living, what are the
person’s interests. We also included a “What’s
Happening” assignment in which students
accessed an “Events” file of digitized pictures
of events in various settings. Students write
about the context of the photo, what they think
was happening before the event in the picture,
and the story behind the picture. Finally, we
included a “Describe the Scene” file of digi-
tized pictures of interesting places. Students
describe the scene, talk about what happens in
each place, and discuss the sights and sounds at
the place. Darrell contributed the following
piece to the “People” file.

This is a picture of Mr. James Jackson. He is
an African American who is an actor. His on
TV shows, and he is in his late fifty’s. He is
a wealthy man and grew up in a family of 7.
Jackson’s most famous commercial is when
Jackson and Cosby were ever to do the first
commercial on Pepsi. Bill Cosby and James
Jackson are step cousins and he became a
movie star in 1964. In his spare time he likes
to play cards and he like’s to play Jazz. Mr.
Jackson had a heart attack when he was 83
years old.

*Guess who?* In this assignment students
choose a person to write about. They start with
notes representing what they already know
about the person and decide what else they
want to know about the person. They then
locate resources that include information about
the person (books, magazines, CD-ROM
references, World Wide Web) and write a
short synopsis about the person. When the
work is done, they get a peer or teacher to edit
it. In its final form, students save the “Guess
Who” file to the “Guess Who” folder on the
file server. Peers read the text and write their
guesses at the bottom of the file so authors can
see the range of guesses.

Benita starts off in the typical public literate
fashion by telling the reader what assignment
she is doing. But she sidesteps the guidelines of
writing about a well-known person using
reference tools and, like much of her writing
from the menu assignments, writes about her
love interest.

I’m writing a paper on a person. I’ll tell
you what’s so special about this person, but
first I’m going to describe this person. This
person is a male with light brown hair like
and he’s tall, with blue eyes, so yes he is a
white male. What makes this person so
special is he is very funny and also very
bright and very, very sweet. He makes me
laugh whenever I need it even when I don’t.
He’s a very good friend and I guess I do
trust him okay well maybe I do and I believe
in him too. Whenever this person needs a
friend I’ll always have his back. No, matter
what happens we will always be good best
friends! Just a reminder the reason why I’m writing this paper to prove to him I do care and that I do trust some certain people maybe not even that much but I still trust some certain people. But most of all I Luv him very much.

*Write a story.* This assignment has functioned as a sort of catch-all of expressive writing on topics of the students’ choosing. Within this category students have written poems, short stories, or ongoing narratives in which they have written for months.

Deanna used the genre of a sort of historical fiction to tell a story about herself and her family. She constructs her cultural heritage through the language she uses to tell the story. This is an excerpt from a longer narrative:

**ONE HOT AFTER NOON DAY IN MISSISSIPPI MA WAS WALKING HOME FROM WORK. SHE IS A MAID FOR THESE PEOPLE THAT LIVE IN THIS BIG WHITE HOUSE ACROSS TOWN. SHE WORK HARD FOR THEM REALLY SHE DOES, BUT THEM FOLKS JUST DON’T PAY HER THAT GOOD. WHY? I DON’T KNOW. SEE US FOLK NEEDS MONEY IT’S SIX CHILDREN COUNTEN ME. BUT ANYWAY. SOMETIMES I WISHED I WAS DEAD CAUSE MA DON’T GET PAID NO MONEY DADDY GOT CUZ HE WAS MESSEN WIT A WHITE LADY YOU AIN’T TREATED FAIR EITHER. IT STILL FEELS LIKE WE IN THE SLAVE DAYS AND WE NOT. US COLOR FOLK SUPPOSE TO BE FREE AND TREATED EQUAL, BUT THAT AIN’T THE CASE HERE.**

*Class post office.* Although the post office is not an assignment per se, it is an ongoing activity that students participate in. They can write notes to their peers in the Literacy Lab. We tell them that we monitor what they write but that they can write anything they want “within reason.” They save the files to a location on the file server called Post Office and we transfer the files to the appropriate mailbox of the student they are written for. Yolantha wrote this note to her friend Deanna:

Hey,

Deanna wuz up? well I’m just cillin. Anyways so who is carson? is he the boy we saw at the mall? the one that was talking to sara? Girl you know that sara is going with newatoo (sorry spelled wrong)? And kisha is going with Bart! isn’t that something? Girl remember chico the boy I went with well I broke up with him cause he was messing around he makes me so sick. Anyways when you do go to Nap I’ll ask my mom to visit you and see the fine men. Well I talk to you later cause the bell is about to ring.

see you later

Yolantha

*Integrated media projects.* These projects are the most involved assignments. Students select a topic they want someone to learn about, how something works, or how to do something. Depending on the primary product or presentation form, students sketch out storyboards (for example, with slide shows) of what each frame includes, outlines for text segments. Students then collect the various forms of media they have decided to use. We ask them to develop texts by using reference tools like printed materials, CD-ROMs, and on-line services. We also encourage them to use a variety of graphic media including existing graphics like clip art and to create graphics using draw tools. If they want to use pictures...
we encourage them to take pictures with a
digital camera or scan pictures using a flatbed
scanner. They have to set up a file management
system for the information. For example, they
may have a folder for scanned pictures, one for
motion videos, another for text files. The
bottom line on the projects is that they must
contain a variety of media of which text is one
type.

Generally, Mark spends little time reading
or writing in the lab. On a few occasions,
however, he wrote small pieces of text fash-
oned around pictures he scanned in from the
flatbed scanner. His end-of-the-year project
was on old cars, a topic he is constantly talking
about. He scanned in about fifteen images and
wrote an introduction.

CAR'S

I like to drive a lot of car's. I have spell-
soly the older car's just like the one I have in
the book that you will read and look at. I will
tell you a littel about them down the paper. so
read and hoffly you will like it so read it.
Mark struggled to write the introduction. He
spent the bulk of his time scanning images,
editing the images, and showing his peers and
us what the digitized pictures looked like.

The Literacy Lab Students

Students in the Literacy Lab are from grades
9 to 12 and have been administratively enrolled
in the innovative program rather than choosing
it as an elective. The students enrolled in the
program have been labeled as at-risk due to one
or more of the following criteria: (a) they are
within a range of the lowest 5 to 8% of reading
achievement in the school according to stan-
dardized achievement testing (the state mandat-
ed test); (b) they are incoming freshmen who
scored below frustration level in three subject
areas on content reading inventories we con-
structed of materials included in the freshman
curriculum; (c) they are currently placed in the
basic track (the lowest track) coming into the
high school; (d) they have been referred by
guidance counselors or teachers; (e) they have
been identified through special education
assessment as mildly handicapped (usually
Educationally Mentally Handicapped or Learn-
ing Disabled) with a particular deficit in lan-
guage skills. The proportion of minority stu-
dents and students from poor families (accord-
ing to federal eligibility requirements for free
and reduced lunches) included in the program
is proportional to the larger school population.
Hence, about 4% of the enrollees are African
American and Hispanic students and about
29% of the students are from poor families.

Based on our work at Jefferson High
School, we constructed a working definition of
the at-risk students we work with, which is as
follows: students who have been identified by
teachers and other school officials for special
treatment or placements due to low academic
performance, poor motivation, or social ac-
tions deemed inappropriate within the predomi-
nant school culture. We cannot, however,
broadly apply all facets of this definition to all
of the students. Some of our students with low
literacy performance are generally successful
in academics; some of the students are compe-
tent readers but are referred to special pro-
grams because they are different than the
mainstream social group; many reside outside of the mainstream academic culture and its associated social network. In discussing these students, we also acknowledge the complexity of social, emotional, socioeconomic, racial, ethnic, and medical definitions offered to explain "at-riskness" (O'Brien & Dillon, 1995). Most of the students have had negative experiences in school and many of them are not motivated to engage in many school tasks. About 20% of the students drop out of high school when they reach 16 years of age.

We constructed academic histories of ten students. The academic history interviews provided us with insights about the students’ current family and work lives, future aspirations, experiences in school, and the values and beliefs these individuals hold regarding life within and outside of school. The interviews also informed us about these students’ reactions to the Literacy Lab and activities. Of the ten students we interviewed, five are from two-parent homes, two live with a mom and a stepdad, two live with their mom, and one lives with his father. Seven of the students hold jobs (two in health care positions, three in food service, one in a flower shop, one baby-sitting); one student recently quit from a job at the Dairy Queen, and another works informally modeling cosmetics. Only one student was not working. The students indicated that work is a large part of their lives; their social life is centered around work and they spend an amount of time at work equal to or greater than the time they spend at school. We found that the students view work as more purposeful than school because it meets their goal of becoming adults and earning money to gain independence, particularly freedom from school and from their parents.

The vocations of the students’ parents strongly influence the students’ future job aspirations as well as their attitude toward and work ethic within the Literacy Lab. For example, four male students related that their dads are truck drivers or mechanics; these male students, in turn, value these activities. In fact, several of the students were serving in apprenticeship roles with their parents or other significant adults and planned to continue in these jobs as vocations (e.g., car mechanics). The fifth male student interviewed planned to go to nursing school because his mom is a nurse. Several of the males believe that learning to read and write could help them complete school or do well in future schooling; others noted that truck drivers do not need to do well in school to make a living. Four of the five girls interviewed were selecting vocations based on the popular media: model, actress, cop, fashion designer. One girl plans to open a day care center modeled after her aunt’s business where she works during the summers. Again, several students noted that reading and writing would not be central to their future work (actress, model), whereas others felt that they would need to be able to write but in limited ways (e.g., “a cop needs to be able to write out a traffic ticket”).

The information we gleaned from interviews allowed us to select materials for use in the Literacy Lab that tapped students’ interests (e.g., car and fashion magazines). We also encouraged students to talk about and bring in materials from work to read or write about. We began to understand why several of the
students find many traditional literacy activities irrelevant to their lives, primarily because these tasks seem unrelated to those students engage in at work or those they believe they will engage in in the future. These students are interested in exploring topics about their own culture or about kids like themselves. They also enjoy articles about popular culture and are drawn to materials that are typically viewed as unusual or bizarre. Students view computers and other forms of technology as novel, relevant ways to learn with software and other materials that allow them to connect their backgrounds and future aspirations with school work. Traditionally, at-risk students are rarely those individuals privy to using technology in school settings.

Three Cases Illustrating Program Characteristics

The following vignettes illustrate specific examples of the three program characteristics: viewing students as unique individuals; providing students with tasks that are challenging, interesting, and “do-able”; and allowing students choice in topic and method of completing activities. An example of providing students with a challenging yet interesting task is evident in the vignette below where two students, Lynn and Denise, work on a CD-ROM based mystery game, Magic Death (Gilligan, 1993). Lynn has shown little interest in reading. Denise reads to get school work done but hasn’t been really interested in it.

Denise liked the idea of solving a mystery and is interested in police work when she finishes high school. Lynn joined her in a collaborative effort because they are friends. The CD-ROM contains difficult text, but each day the two worked on it, they made progress toward solving the mystery by dividing up tasks. They prompted each other to look for information from the victim’s desk, phone records, the autopsy report, and non-testimonial evidence such as profiles of prospective suspects. Lynn became increasingly adept at recording the information in a notebook that is part of the game as well as on another sheet of paper. Denise continually prompted Lynn with questions they still had not answered from various sources of evidence. Although they found the game difficult at times, they experienced enough success because of the number of options to make consistent progress in solving the crime. The whole time they worked on the game they were reading, discussing events, and writing. (Vignette, October, 1995)

In this vignette Lynn and Denise show us what literacy engagement looks like when they become totally engrossed in solving the crime posed in the CD game. They talk about the clues and evidence, write copious notes, and read a large amount of text from the screen. Moreover, the two students want to engage in this activity over an extended period of time because they find the task fun and challenging, yet do-able.

In the Literacy Lab we place few limits on the topics students may select or the purposes for which they may read and write. We suggest to the students that they write about topics acceptable within the guidelines set by school. An example of students working together on a topic of their choosing, yet one which pushes the typical boundaries of acceptable topics for
writing, is evidenced in the following vignette. Joe and Greg are working on a character sketch. This is used as a precursor to a story. They discussed a few ideas and chose to develop some sort of female space alien as the protagonist in their story. While they discuss the possibilities, they explore how risqué they can be with the physical features of their character, and still get away with it.

Joe and Greg have selected a topic of interest to them and they work diligently to write a story. The thrill of writing about a taboo topic like the placement of tattoos is fun and actually leads them into the creation of a well-developed story that took several weeks of high quality work time to complete.

In the second nine weeks we provide a less structured menu of possible projects. Some of these activities can be completed in one or two class periods. However, students who become really interested tend to work on projects longer, dividing a project into manageable goals over a multiple-day contract. Many of the projects become complex, integrated media projects. For example, in the following vignette Kristy chose an option on the activity menu to write about a person. She chose this option because she was preoccupied with the death of Jerry Garcia, the former leader of the Grateful Dead rock band. She had been a fan for some time, listening to the band’s recordings, reading stories about them, and pasting their various symbols on her Broncho Board, a school calendar used to record school events and her weekly activities.

Kristy decided to write about the Grateful Dead using San Francisco font and she inserted digitized scans of the various symbols in her text. She interspersed pictures throughout the composition that chronicled some of the band’s history and ended the piece with a scanned photo of Garcia laying on his couch, smiling at the photographer and holding one of his guitars. When we asked her about why she picked the project she told us: “Jerry Garcia is my favorite singer. Since he passed away I think of him a lot. And I always wanted to write about him. This [activity] gave me a chance to write. The pictures [in the text] show the stages he’s been through until the day he died. Here’s one [picture] where he’s singing, and he’s kind of laid back and resting.” (Vignette, November, 1995)

In this vignette Kristy selected a topic and wrote about an issue she found authentic and meaningful. She noted that the activity gave
her a chance to write about something important. She was also able to flexibly choose how she would represent her ideas, both in text and pictorial form.

**Students' Perspectives on the Literacy Lab**

In the following section we present students' assessment of the Literacy Lab program. Students' comments, based on responses to interview questions about the lab, are used to continually refine the materials, activities, and general routines in the lab—all in an attempt to better meet students' needs.

**Question #1: What kinds of activities do you work on in the Literacy Lab?** The students identified the following as Literacy Lab activities: computer programs and games, group-work, sustained silent reading, and individual work. The list generated by students was inclusive of all activities designed especially for them. The students noted that they "type on computers," "mess around with CD-ROMs and games," "check out the computer and search things," and "do multimedia stuff and projects." The students mentioned computer activities most frequently, followed by group-work, when describing the new literacy program. Only two participants mentioned individual work or sustained silent reading. None of the interviewees commented on activities in which they work with teachers, either in a one-on-one format or in small groups, despite the daily occurrence of these activities.

**Question #2: What activities do you enjoy the most in the Literacy Lab?** When noting activities they like, students place the most value on those activities that allow them the widest variety of choice. Students favor activities that are fun and purposeful, and those that are achievable and promote understanding. They also prefer tasks that they view as helping them learn to read and write more proficiently. With reference to the importance of choice and variety in activities students stated, "You get the choice to work on computers or in groups." "We get to pick our own projects." "We learn different things everyday." The students also noted that they enjoy class and find the activities purposeful and achievable. They commented, "Class is fun." "I like it—it’s easy." "I love to read and write." "On the computer you read and write—I like writing stories. I like ‘Beyond the Wall of Stars’ [a CD-ROM game] and story endings."

The students also appreciate the opportunity to work on literacy skills while simultaneously completing an assignment for another class. One student noted: "I can do a report for another class and get credit for working on it." He views the Literacy Lab activities, particularly reading and writing on the computer, to be purposeful in relation to his work in other classes. From these comments it appears that students view computer activities as motivating, meaningful, fun, and intellectually stimulating. The students are more willing to spend time working on the computers, thus reading and writing more than when they were working with more traditional paper and pencil activities. Even though the students identified individual tasks or sustained silent reading as salient activities, they did not describe these as their favorite activities.

**Question #3: Do you have any suggestions for improving the Literacy Lab?** Despite stating
that they liked computer work, small group activities, and other reading and writing tasks, the students disliked these activities when the class climate was not conducive to such work or on days when they weren't in the mood to work. One student responded, "Some of the projects we have to do I have a hard time with . . . we only have certain class periods to do them in. Sometimes they can be boring." Another student protested, "Groupwork—I hate it because we have to read—it gets boring and we talk about stupid stuff." A third student noted, "Silent reading . . . gets kinda boring." Another student said, "I don’t like the groupwork unless I like the person having us do it." And yet another student admitted, "Some days I like it [Literacy Lab activities], some days I don’t."

We believe that the students’ responses were typical of many adolescents who refer to any school work as boring. Further, patterns in students’ responses indicated that the answers to this question were idiosyncratic, depending on whether the student was successful at an activity or liked the other students with whom they worked. However, we took many comments to heart when revising activities.

**Question #4:** Do you think you are improving your reading and writing because of the Literacy Lab and if so, how? The students stated that the Literacy Lab activities help them become better readers and writers. One student noted, “The pictures and searches [on the computer] help you understand it [the text]—it is more interesting.” Another student commented on how groupwork contributed to her reading ability: “In groups you read—it helps to hear other people’s opinions.” Another noted that class activities “help you get prepared for what’s going on in the world,” and yet another boasted “now I am able to go home and actually read a book and be proud of myself.” Students also related: [I am] “taking more time and reading stuff instead of going through it and trying to get answers.” Another student believes that she is “improving in comprehension a little bit—I’m understanding more of what I read.” Several students noted that they were reading and writing more and thus “the more practice, the better you get.” Only one student commented that the Literacy Lab was not helpful to her literacy development. She noted, “It didn’t improve my reading and writing—all we did was work on computers.”

We interpret the last comment above to mean that some students may view reading and writing in a more traditional sense (reading textbooks or skill sheets and writing answers to questions). Thus, the applied projects students engaged in, in which texts were read and written using computers, may have masked the tasks of reading and writing.

In sum, when looking across the responses to the four interview questions, all students except one found the Literacy Lab activities to be enjoyable and helpful in their development as readers and writers. Students especially like the computer activities in which they can read and write stories. They like the small groupwork if members of the group are people they like and if the teacher-leader is acceptable. Activities that are perceived as too hard, or where time runs out before the activity can be completed, can result in students labeling the task as “boring,” “difficult,” or “stupid.”
Conclusions

The perspective we have taken on engaging at-risk high school students is, we believe, more valid than the historically grounded practice of labeling marginalized students and placing them in special programs in which they follow specific education plans based on psychometric tests. Instead, we work to maintain their engagement from day to day by capitalizing on their free choice and balancing their daily challenges and success through the use of tasks that are possible by using technology tools typically reserved for high track, more privileged students.

Our work thus far in developing academic histories of students illustrates how traditional programs marking their years of schooling have diminished the students' self-worth as they face tasks they believe they are incompetent to attain (Covington, 1992). By high school, the result can be devastating. The data also indicate how as educators we forget about students' lives outside of school and how much more tangible those lives are than the curricula we offer them. The same data, however, show the efficacy of enhancing literacy engagement by shifting the students’ attribution of success from ability-based goals to flexibly designed task goals and choice. Our work at Jefferson High also accentuates the advantage of getting to know the students, realizing the false security we have in labeling them, and designing a program based on their lives outside of school grounded in their popular culture.

Through the development of an innovative literacy program we continue to critique traditional notions of “at-riskness” that place blame on students or their families (e.g., environment predisposes students to failure in school) and focus more on the culture of schools—a culture that unintentionally through its institutionalized curriculum and organizational structures places students at risk (Kos, 1991). Further, we believe that classroom teachers and administrators typically view at-risk students as incapable of regulating their efforts in class or working on challenging materials. Using data from studies like ours we can show teachers and administrators what at-risk students can accomplish if provided the resources and nurturing environment. We do not intend our program to be an oasis of success in a desert of traditional instruction. Rather, we have started with a manageable program that we intend to integrate into a schoolwide program by continuing to provide extra support for students in danger of failing or dropping out of school and working with their regular teachers and administrators to integrate some of our insights into curricula across the disciplines.
