Chapter Twenty-Seven

Psychology in Education as Developmental Healthcare: A Proposal for Fundamental Change and Survival

Stephen J. Bagnato

The survival of psychologists and psychological services in public education is a pressing concern of critical importance to children, families, and school systems. Nevertheless, the stated theme of this APA publication, “Making Psychologists in Schools Indispensable,” is both a revelation and an indictment. This theme, itself, poses and tacitly acknowledges two serious propositions: (a) that psychologists and psychological services in schools are in grave jeopardy; and (b) that school psychology, the identified school-based psychology subspecialty, has failed in its mission to make psychology an indispensable part of public education. This position paper agrees reluctantly with both obulous and long-ignored propositions, but offers guideposts that will contribute to a broader reconceptualization of psychology in education and to its rebirth and viability.

Psychologists advocate that the critical first step for clients to change behavior and personality is to define the problem and to accept its validity. The main problem facing psychology in education is that school psychology is committing suicide; its narrowness of vision and compulsive resistance to change is causing its demise. School psychology has failed to convince its primary consumers of its value. People and organizations fail to survive and become irrelevant when they do not recognize the irrefutable signs of change and fail to adapt; unfortunately, the obituary of school psychology will read that it failed to heed 20 years of harbingers about the clear need for fundamental change. Moreover, school psychology as a field is individually responsible, not only for failure to fulfill its own primary mission, but also the jeopardy to which it has exposed its professionals. It is time for psychologists in schools and for trainers of school psychologists to conduct a reality check and to accept the above propositions.

Notwithstanding, psychology in education can survive and actually thrive, but only if it heeds the failure of the past and charts three major new directions: (a) reintegration and reidentification with mainstream psychology; (b) demonstration and promotion of its value to all aspects of public education within the larger community; and (c) formation of partnerships with the emerging healthcare sector by establishing school-based developmental healthcare initiatives.

Reintegrate with Mainstream Psychology

It is debatable whether a separate subspecialty of psychology in education should continue to exist. At a time when regular education, special education, and healthcare fields are advocating
relentlessly for generalist services that are high quality, efficient, and effective, psychology as a profession is expanding its increasingly narrow subspecialist disciplines in which doctoral training is promoted as entry level. It is understandable that managed healthcare licensing panels are making it more difficult for psychologists in education to qualify as a sanctioned provider given the restricted focus on testing and learning disability, primarily; the highly variable training programs; and the myriad of end degrees (e.g., Ed.S., M.S., M.Ed., Psy.D., Ed.D., D.Ed., Ph.D.). It is also to be expected that other more creative providers are stealing our turf. For example, educational diagnosticians perform the major testing responsibilities in many school districts and states. Licensed social workers (LSW) have developed highly effective and economical behavioral consultation as well as individual and family therapy practices connected with both the schools and community agencies, but in partnership with managed healthcare purchasing groups. Moreover, school psychology training has focused too much on the mechanics (i.e., administering tests) of the professional while giving too little emphasis to the dynamics of the profession (i.e., team building in schools, nurturing family-professional collaboration, problem-solving around system-wide issues). Yes, these are emphasized topics in some training programs, but of secondary emphasis in general; furthermore, employers have learned to expect the traditional testing functions to be primary. It seems timely that we as a subspecialty reconsider the benefits of reintegrating with mainstream psychology.

The American Psychological Association (APA) needs to convene a task force to study seriously the benefits of consolidating subspecialties within psychology and psychology training. The continued fragmenting of psychology through relentless subspecialization or guilding of the association at a time when professional colleagues in education and medicine are pursuing generalist preparation and practice seems unwise. It is timely to consider a merger, for example, between clinical, school, developmental, and mental retardation and perhaps other subspecialties and subdivisions within APA in order to produce psychologists with uniform but expanded and comprehensive expertise. Numerous icons in the field of school psychology, for instance, have called for a retitling of this subspecialist as, for example, an applied developmental psychologist. Consolidation could have numerous benefits including systematizing training priorities for all students across university programs; reintegrating the identity of trainees as generalist psychologists with some identified specialty preparation; expanding the arena of practice for all psychologists; and promoting psychology to the public and to the healthcare sector as a unified allied health specialty with uniform training, degrees, and credentials. In the process, the viability of masters level training in the emerging economic environment needs to be reconsidered. As a result of such consolidation, comprehensively trained generalist psychologists with expertise in educational applications of psychology to meet social, learning, and health needs can be ensured.

**Demonstrate the Value of Psychology to All of Public Education Within the Community**

A profession or business risks extinction when it severely restricts its market and its consumer base. Despite lip service and many years of genuinely creative initiatives to expand its reach within the public schools, school psychology has compulsively acted to protect its narrow role even within the narrow field of special education—namely, the testing, labelling, and placement functions for students with special needs. The elusive hope was that federal and state law would continue to underwrite a profession and give it ascribed value. Inexorable trends with federal
budget cuts ensure that the underwriting of the
testing role will end—witness the threat to related
services in the Senate version of the Individuals
with Disabilities Education Act (IDEA)
reauthorization bill. School psychology has
proved incapable of moving beyond this narrow
compulsion despite impassioned and clearly
defined strategies for change from many influential
individuals in the field.

Unfortunately, fundamental change requires
serious risk-taking which has not been a
distinguishing characteristic of traditional school
psychology. Consider a strategic plan for the future
of a profession or business which relegates its
professionals to discharge one activity 80 to 90 %
of the time to serve only five percent to, at best,
twenty percent of potential consumers within a
marketplace. Such a strategic plan courts
economic disaster and by its very form is
inefficient and inviable. School psychology has
continued to guard its cherished, but discredited
testing function even while special education
moved to abandon the need for categorical
placements, and regular education needed help on
more pressing social matters. Because of
fundamental changes in special education
philosophy and federal and state mandates, school
psychology, as it is currently configured, no longer
has anything of value to offer special education.
Special education has moved beyond school
psychology in terms of the effective integration
of students with disabilities into regular education
circumstances. The nearly exclusive testing and
diagnostic role, particularly intelligence testing,
has made school psychology irrelevant to modern
education and healthcare. Thus, school psychology
has become a sub specialty without a purpose and
without a venue.

The viability of psychologists and psychology
within public education depends fundamentally on
the capability of the field to demonstrate to
teachers, principals, parents, school boards, and
community partners and leaders that it can
spearhead the design and implementation of
effective solutions to the pressing social, learning,
and health problems faced by all students within
a school system. Thus, the consumer base for
psychology services within education will expand
and success will create the need for psychology
services in other areas.

Make no mistake, psychology can be also an
invaluable partner to special education and must
be available to teachers, parents, and students in a
full-service, school-wide program. The difference
is that psychologists should focus their role and
functions on strategies which they decide will have
the greatest value and impact and on activities
which consumers directly report (social validity)
that they need without dependence on the
presumed security of legally mandated activities.
The new psychology in education must become a
risk-taking and risk-sharing venture between the
school board, the psychologists, and managed
healthcare purchasing groups including other third
party funding mechanisms such as MA and
EPSDT Wrap-Around for as long as they continue
to exist.

Moreover, psychology can benefit regular
education and the entire public school system in
numerous ways. Some ideas include: (a) working
with principals and superintendents to implement
facile, but effective instructional evaluation
systems or new program monitoring systems; (b)
grant-writing and proposal development so as to
garner ongoing research and foundation support
for new programs or creative community-based
ventures; (c) sports psychology for the athletic
programs; (d) developing programs to foster
parent-school collaboration; (e) operating evening
groups for parents on issues of normal child and
adolescent development; (f) staff inservice
training; (g) developing interagency partnerships
with mental health and child welfare agencies and
healthcare entities to implement approaches to
address teenage pregnancy, school violence, drug/
alcohol abuse; (h) spearhead efforts to teach team
decision-making in schools and to chair pre-
intervention referral teams, school and district-
wide; and (i) help to champion entrepreneurial
efforts for school districts such as operating child
care centers or private tutoring business.

Establishing School-Based Transagency
Developmental Healthcare Programs

The future and viability of psychology in
education depends predominantly on the talent of
psychologists (both as individuals and groups) to
forge transagency partnerships with school
systems, hospitals, community mental health
centers, family health centers, primary care and
family physicians, and managed healthcare
organizations. In the future, it is likely that far
fewer psychologists will be directly employed by
the public schools solely, but will be semi-
independent professionals funded through
collaborative revenue pools from the partner
agencies and augmented by state and federal
monies to the extent that they exist. This risk-
sharing scenario is already occurring across the
U.S. and is being promoted as the most cost-
effective and potentially most effective way of
delivering comprehensive services within school
systems. This trend is underscored by the state and
federal funding cuts for school districts across the
U.S., the move toward external contracting for
psychology services, and the decreasing reliance
on property taxes as the principal revenue base
for school taxes.

Within the past three years, leaders within the
psychology subspecialties and within the
American Psychological Association have
composed position papers on the role of
psychology in reforming America’s schools and
in promoting more comprehensive and cohesive
service delivery for children and families (Paavola
et al., 1995; Talley & Short, 1995; Witt, 1995).
Two trends and propositions are especially
noteworthy in these position papers: interagency
service coordination and integration and
comprehensive school-based service delivery
programs.

School-based or school-linked healthcare
clinics or programs are increasingly touted as the
future wave for ensuring comprehensive medical
and mental health services for children and
families in the natural community setting—the
school. Such comprehensive one-stop service
programs can ameliorate the high costs of a school
district employing several specialists by pooling
financial resources from cooperating partnership
agencies to create a type of convergent trans-
disciplinary program in which the collaborative
professionals work jointly to fulfill common
missions. Each of the partner agencies then arrive
at a business agreement in which each shares
equally in the revenues and possible specialty
referrals. In addition, some managed care
organizations (MCO) are organizing cooperatives
especially designed to serve children and families
with chronic illness and neurodevelopmental
disabilities, mental health problems, and other
complex needs.

One of the most unique examples of a
transagency school-linked developmental
healthcare partnership spearheaded by a
psychologist is Project CHILD: Collaborative
Health Interventions for Learners with
Disabilities—A Developmental Healthcare
Resource Partnership (Bagnato, Hamel, Belasco,
& Nash, 1994-1997). Project CHILD is a three
year model field-validation grant that this author
was awarded by the U.S. Department of Education,
Office of Special Education and Rehabilitative
Services—one of only four model efforts funded
nationally. Project CHILD is an innovative
transagency partnership among Pittsburgh Public
Schools, Children’s Hospital of Pittsburgh,
Western Psychiatric Institute and Clinic, and
primary care pediatricians and family physicians
that is based within inclusive early childhood
classrooms in the city schools of Pittsburgh,
Pennsylvania. The mission of Project CHILD is
to plan, deliver, and research the quality, efficacy, and cost-effectiveness of comprehensive developmental healthcare (i.e., physical and mental health) services to children 3 to 8 years of age who have three conditions: a chronic illness, behavior problem, and developmental delay or disability.

CHILD uses a transdisciplinary team of professionals who provide direct, consultative, training, and technical assistance support services to children, families, teachers, principals, and existing special education teams within the public schools. The core Developmental Healthcare Team consists of a psychologist, as team coordinator, parent, teacher, and pediatric nurse practitioner with specialty consultation as needed by a developmental pediatrician and child psychiatrist—all representatives of the transagency partner agencies. For instance, Project CHILD serves young children with seizure disorders, sickle cell disease, cancer, congenital and acquired brain insults, asthma, diabetes, and associated behavior and adjustment difficulties, and developmental learning differences and family coping problems. Project CHILD currently serves 45 children and is expanding its developmental healthcare services to offer weekly consultation to children and teachers in regular elementary school classrooms through a new service known as School HOUSE CALLS. One of the most tangible products of Project CHILD is the design of an Individualized Developmental Healthcare Plan for each target child and family which merges medical and mental healthcare goals and interventions with developmental/educational goals within the IEP/IFSP. The central missions of Project CHILD are to provide or implement:

1. pediatric medical and mental health consultation services linked and coordinated with the child’s developmental and educational program;
2. equal parent and family participation with professionals in reaching team decisions about the child’s comprehensive developmental healthcare needs;
3. an Individualized Developmental Healthcare Plan of healthcare goals and strategies that link to the child’s IEP/IFSP;
4. consultation and monitoring of medical treatments and their functional impact;
5. improved communication between the family physician or the hospital and the school staff and teachers;
6. ongoing staff inservice training to address the medical and mental health needs of children;
7. on-site classroom direct intervention, observations, assessments, and behavioral and environmental interventions;
8. improvements in child social-emotional behavior, coping skills, social communication, teacher and school staff response to complex child needs; and collaboration parent-professional team decision-making; and
9. field-validation as the overall effectiveness of a mobile transdisciplinary developmental healthcare team.

After its three year field-validation, Project CHILD will demonstrate the viability of a psychologist-directed interagency model for delivering comprehensive services to the public schools that can be replicated and creatively reapplied by other agencies in an effort to make psychology in education an indispensable service when partnered with other specialties in creative, community-based ways.
