This study selected 28 illustrative examples of the visual culture in comparative education used since the 1960s. Journals examined are the "Comparative Education Review"; "Comparative Education"; "Compare"; and others. From visual analysis of these sources, four scopic regimes or visual subcultures are identified. The paper is organized in three parts. Part 1 illustrates how the three scopic regimes of modernity (the technical rationalist, the critical rationalist, and the hermeneutical constructivist) each has its own favored rhetoric and forms of representation, as well as utilities and limitations. Part 2 presents a personal narrative of how the social cartography project has sought to elaborate and implement a new social mapping rationale and methodology. Part 3 notes possible implications of this study and the new social cartography project for current theoretical debates, representational practice, and new opportunities to reposition the field with the human sciences in the coming millennium. Contains 50 notes and a list of sources for 29 figures. (EH)
Mapping Visual Culture in Comparative Education Discourse

Mapping Visual Culture in Comparative Education Discourse

It would be fascinating to map out the political implications of scopic regimes, but it can’t be done too reductively. The perspectivalist regime is not necessarily complicitous only with oppressive political practices. Under certain circumstances it may be emancipatory; it really depends on how it is used.¹

Introduction

In this paper, I respond to Martin Jay’s imaginative proposal to "map ... scopic regimes." While, to my knowledge, Jay has yet to undertake this ambitious task, it does make sense here in light of recent work on social cartographic methods carried out at the University of Pittsburgh since about 1992. At that time, I helped to initiate this project with a theory-mapping paper presented at the 8th World Congress of Comparative Education Societies in Prague. That study interrogated some sixty exemplary comparative education texts, and mapped the theoretical relations discovered onto a two dimensional field. My intent was to demonstrate how such a "social cartography," or heuristic device, might serve to identify and visualize difference within and between disputatious communities in a way that would open space for all perspectives discovered, privilege none--yet problematize all, and promote a useful visual and verbal dialogue.

This "map," included as Figure 22 below, demonstrates how postmodern figuration in the form of perceptual fields offers the eye a continuous and asymmetrical terrain of unhindered mobility, as first proposed in Merleau-Ponty's work on the phenomenology of perception. Language being more bound than mobile does not have this unhindered mobility. Lyotard has proposed that postmodern sensibility is primarily visual and breaks this colonization of the unconscious by verbal discourse. Instead, it allows a new visual aesthetics based on a paradigm of cultural de-differentiation.² Does this view of figural aesthetics free the image from the dictates of narrative meaning and rule-bound formalisms that have predominated under modernity’s sway? How might an examination of changes in the visual culture of our field before and after the postmodern turn increase our understanding of the emergence of social mapping as a kind of cognitive art or play of figuration? Does this visual turn in representing the multiple realities of our field today result in, as claimed, a new distinct mode of visual representation where space is used to represent a spatial dispersion that offers, when combined with discourse analysis, a system of possibility for new knowledge?

In pursuit of some at least provisional answers, I have selected twenty-eight illustrative examples of the visual culture in comparative education discource since the 1960’s. Sources examined are the Comparative Education Review, Comparative Education, Compare and others. From visual analysis of these sources, four scopic regimes, or visual subcultures, are identified and presented in Figure 1. This effort to identify how
comparative educators have chosen to visually represent our field is but a first step in the need to historicize our vision as we struggle with the representational dilemmas and opportunities of late modernity, and perhaps, very early postmodernity.

(Figure 1 about here)

The paper is organized in three parts. Part one illustrates how the three scopic regimes of modernity, i.e., the technical rationalist (TR), the critical rationalist (CR) and the hermeneutical constructivist (HC) each have their own favored rhetoric and forms of representation, as well as utilities and limitations. Part two presents a personal narrative of how the social cartography project has sought to elaborate and implement a new social mapping rational and methodology. It presents, a personal narrative of one comparative educator’s attempt to contribute to the liberation of the discursive field so that the task of imagining alternatives can be commenced (or perceived by researchers in a new light) in those spaces where the production of scholarly and expert knowledge for theoretical and development purposes continues to take place. This section presents general principles for a non-innocent social cartography project elaborated to remap comparative education as we move into a fragmented late modernity, and beyond.

In part three, I note some possible implications of this study and the social cartography project for current theoretical debates, representational practice, and new opportunities to reposition our field vis-a-vis the human sciences in the coming millennium. Examples of how social cartography might help to construct new ways of representing and seeing are assessed. My goal here is to suggest something of the utility of heuristic social maps as new ways to both situate and open representational practice. But before the "picture show" begins, I will situate the mapper in this cartographic work with three quotes chosen to illustrate my present worldview and scholarly ambition:

The first is from the Australian poet Judith Wright:

All things I focus in the crystal of my sense. I give them breath and life and set them free in the dance.³

The second is from the German philosopher Friedrich Nietzsche:

There is only a perspective seeing, only a perspective 'knowing,' the more affects we allow to speak about a thing, the more eyes, various eyes we are able to use for the same thing, the more complete will be our 'concept' of the thing, our 'objectivity.'⁴

The third is from the Mexican anthropologist Arturo Escobar:

Regimes of discourse and representation can be analyzed as places of encounter where identities are constructed . . . where violence is originated,
symbolized, and managed. Charting regimes of representation...attempts to draw the ‘cartographies’ or maps of knowledge and power...and of struggle.\textsuperscript{5}

These three extracts will help me share with the reader my view on what might be called "the crisis of representation" in our field, and in the human sciences. The first quote celebrates an embodied view of knowledge construction. Wright and I align ourselves with those who oppose excessive reliance on the scientific rationality and objectivity espoused in the name of Enlightenment. We see the proper end of human learning not in a reconciliation of opposing principles, but in the play of opposites and in their interpretation. It is for us in this 'play of opposites' rather than in their reconciliation that life finds its source of energy.

The quote from Nietzsche (1887) flags my concerns to elaborate a wide-visioned or perspectivist way of seeing and knowing capable of scoping difference, and a social constructivist methodology as, perhaps, most suitable for comparative research today.

In Escobar's quote, I share his concern to situate and visualize knowledge construction and representation efforts, to question and critically engage all discourse, including our own, and show the connections between power and who is allowed to speak and to represent reality. While this set of positions would seem to favor notions of embodied, situated, and polyvocal knowledge, ideas that some have identified with a postmodern sensibility, I see my point of view also coinciding with a critical pragmatic perspective that seeks to understand practice and outcomes by showing connections between choices of forms of representation and positions in the debate.

Part One Visual Representations in Modernity

In this section, I focus on the conventions and codes that underly nonlinguistic symbol systems, what Nelson Goodman has called "languages of art." I begin to explore the gap between the seeable and the sayable, and question Mitchell's contention that the human sciences are presently undergoing a "pictorial turn" where society can be represented as both verbal and visual text. Mitchell sees this turn as moving us beyond...

...naive mimeses, copy or correspondence theories of representation: it is rather a postlinguistic, postsemiotic rediscovery of the picture as a complex interplay between visuality, apparatus, institutions, discourse, bodies, and figurality.\textsuperscript{6}

The picture now becomes a kind of model or figure for "other things (including figuration itself)... an unsolved problem" (p. 13). Attention to this "problem" may help make comparative educators more aware of their infatuation with scientism, positivism, and epistemology, and with their near hegemonic view of the image as a figure of representational transparency and realism.
How then may the scopic regimes of modernity and postmodernity discovered (i.e., the TR, CR, HC, and DP) be described and compared? To this end I create in Figure 1 a field of four visual cultures laid out using the axes of mimetic-heuristic and differentiation-dedifferentiation. In the lower half of the field are the three scopic regimes using modern sensibility. The upper field, in contrast, provides space for a deconstructive perspectivist (DP), or a postmodern view of representation as multiple mappings of "simulated worlds." This fourth scopic subculture is examined in Part Three.

In comparative education discourse, the technical rationalist figuration of educational reality has dominated since at least the 1960s, easily surviving some competition with critical rationalist (CR) and hermeneutical constructionist (HC) forms during the 1970s and 1980s, and with postmodern cartography after 1992.

Defining characteristics of the TR tradition can be seen in Figures 1-8 below. It most often displays a mimetic representation of reality where the observer is independent of the phenomena observed. According to Jay, the TR view (what he calls Cartesian Perspectivism) favors a geometrized, rationalized, essentially intellectual concept of space. It is characteristically much concerned with hierarchy, proportion, and analogical resemblances. It seeks--by presenting an abstract and quantitatively conceptualized space--to de-eroticize the visual order, to foster de-narrativization, de-textualization and de-contextualization. It is gendered male. Richard Rorty sees this scopic regime attempting "to mirror nature," to insist on the literality of realism. Without the observer "in the picture," realism presents a representation by resemblance that says how things are in a real world. Figure 2 for example, patterns spatial relationships into vertical and horizontal lines delineating levels and stages. It presents a matrix representing a reality of objective, universal and progressive systemic differentiation. Figure 3 expands this structural-functional logic to visually frame how levels of structural differentiation correlate with levels of educational "specialization in form and function." The implication is that modernity and progress closely track the importation of western educational ideas and forms. Turned on its left side, the figure presents a stair-like Parsonian progression from the traditional (Nepal) to the modern (Japan) and a picture of modernization theory.

(Figures 2 and 3 about here)

Figure 4 shifts the eye from the differentiation to the mimetic node, or pole, with a mathematical configuration of reality at the classroom, not the system level. This move to statistical modeling gained considerable impetus during the decade or so after 1974 witnessed widespread efforts to make comparative education "more scientific" and "rigorous."

In Figure 5, Clark Kerr provides a variety of interesting iconic representations of educational systems that allows for greater variation of configuration than found in, for
example, Figures 1 and 2. Figure 5 presents pure geometric forms as best representing the complex reality of situated variations in national higher education systems and policies around the world, yet it retains a strong TR logocentric/mimetic style.

(Figure 4 and 5 about here)

Figure 6 introduces a meta-theoretical and highly differentiated systems model for comparing "functional subsystems of society" and "styles of ... comparative ... thinking." This monumental figuration introduces for the first time in our TR representations "the observer's point of view" but only in a fixed either/or, stop/go, relay circuit that privileges the appearance of order and binary logic over any possibility for observer (or actor) subjectivity or intersubjectivity in social life. How this totalizing theoretical model of "self-referential systems" might find utility in practice remains to be seen.

(Figure 6 about here)

Figure 7 would seem to indicate something of a return to the naive realism of the 1960s with its arbitrary levels, frozen boxes and suggestion of an ordered, knowable--and manageable--educational and social world. While the authors' verbal text claims that their figure can "help identify perspectives" and open research to "alternative perspectives," their rigid visual model would seem to privilege geometric order at the expense of possibilities for a more open exchange of interpretations, or a representation of the other in her voice. They claim that their "... framework for multilevel analysis ... can help identify the perspectives from which educational phenomena have and have not been investigated" (p. 488). How can this be when the representation--in contrast to Figure 1--would seem blind (and closed) to all scopic regimes but its own TR view?

(Figure 7 about here)

In Figure 8, we find as in Figure 5, idealized models of a situated educational reform practice. While these so-called "qualitative models" seek to represent qualitative, or heuristic attributes, they seem to me more essentialist, arbitrary, and geometric in their ambition to imitate a real world. As such I would place them closer to the HC tradition, yet they are still essentially rationalist in style. The author's goal of "... coalescing ... different realities into a truly functional, unified model" (p. 13) also suggests the application, conscious or not, of an TR visual code.

(Figure 8 about here)

With the polarized figure presented in Figure 9, the first example of a critical rationalist visual subculture appeared in 1971. This scopic regime has much in common with TR style representations--i.e., it is realist, it is usually framed with vertical and horizontal lines, it is also materialist (historical materialist, not scientific materialist).
logocentric, (albeit with ideology dominant), Eurocentric, male gendered, configured in stages, and infused with a belief in Enlightenment meliorism and a promise of progress through historical and developmental stages.

(Figure 9 about here)

The critical rationalist figuration differs significantly from the TR view, however, with a proclivity to visually polarize social groups, to represent a commitment to dialectical analysis, and to present a visualization of structured subordination. Where the TR view sees and accepts hierarchy in a real world, the CR view problematizes that hierarchy, with notions of correspondence and reproduction, and seeks to overturn it in favor of more equalitarian structures.9 Social relations most often are configured as a negative correspondence, as in Figure 5, between social status and educational provision and outcomes. This negative dialectic drives the visual reality of CR presentation, as in a flagrant bi-polarization of paradigms (Figure 10); or in a typology of different strategies to overcome structured educational inequality, (Figure 11); or as a cool and rationally ordered figuration of superordinate and subordinate positions (Figure 12) that completely avoids any critical terminology in the verbal text.

(Figures 10-12 about here)

In Figure 13, CR representation reaches a higher level of critical sophistication. Beginning with a "real world" map of Disneyland, Marin charts his way with semantic and semiological analysis to a visual "ideological representation" that deconstructs both the real Disneyland and the capitalist myth constructing the United States. To support his contention that a degenerate utopia is ideology mapped into the form of a myth, Marin illustrates structuralist--and critical rationalist--figuration practice in creating meaning out of space. Here, his three-part representation of the original Disneyland reveals the interplay--and "deep structure"--of mapped geographical, semiotic, and ideological space. Marin argues that "... by acting out Disney's utopia, the visitor realizes the ideology of America's dominant groups as a mythic founding narrative for their own society" (p. 241). Thus, Marin provides a picture of the United States as an "evil empire" at about the same time that President Reagan using narration constructed the USSR as his "evil empire."

(Figure 13 about here)

Figure 14 also privileges a CR world view and idealizes this view into what might be seen as an "Emancipatory Disneyland" portraying and corresponding with the mythic space of a real ideological world. Where Figure 13 is a critique, Figure 14 radiates the energy and idealism of a somewhat late (i.e., highly differentiated) Freirian utopia.

(Figure 14 about here)
With a shift from the critical rational and towards the hermeneutical way of seeing, our eye moves to the left, and a bit up on the map in Figure 1. Work in the hermeneutical constructivist tradition seeks to pattern the process of intersubjective world-making. It is open to narrative art and indeterminacy. It prizes insight and understanding and, while demanding a credible story, it refuses to be fixed, boxed, or theoretically overdetermined. Most of all, the HC view stoutly defends the centrality of desire, and the possibility for joy. It rejects the notion of Cartesian detachment where the observer, (as in Figures 2-8) is claimed to be free of all emotional involvement in that which is represented. It is a world view where stories and image are believed to possess the power to change minds and bodies, where metaphor is seen to be the last magic on earth. With the emergence of feminist scholarship in the 1970s this embodied scopic regime has flourished in cultural studies and the human sciences, but it is, rarely, if ever, found in comparative education discourse.

Figure 15 presents paradigmatic worlds discovered through discourse analysis and may be seen as a marginal example of the HC subculture. But it is constrained by the closed boxes and seeming fear of intersubjective messiness, attributes more akin to the TR genre. It retains the "regulation--radical change" polarity of CR-type figures, but is constructed using discourse analysis and would seem to have no more than heuristic ambition. In sum, Figure 15 encompasses aspects of all the scopic regimes of modernity.

(Figure 15 about here)

Figure 16 also constructs a world of discourse relations (in comparative education) using textual analysis. While this visual representation now moves closer to the heuristic pole, it continues to pattern this world using vertical and horizontal dimensions in a Eurocentric style matrix that moves from left to right. Any binary compulsion, has, however, been left out and the verbal text now reflexively questions "Characteristics of textual relations" for the first time in comparative education discourse.

In Figure 17, the world of children's story making is visualized as a multicontextual and interconnected web of possible relations, contacts, and influences. This figure suggests the hum and buzz of human experience. Here reality is not mimed or mirrored but is constructed in situ as an ongoing process centered in the actor who is free to move without logocentric determinants or frozen spatial choices. For the first time an illustrative figure in comparative education discourse is strongly female gendered.

(Figure 16 and 17 about here)

But as Figure 18 demonstrates, the world of world-making can also be manipulated by power to produce self-serving Utopias that exist nowhere. Figure 18 patterns world-making in the service of ideology and serves as a warning that romantic
hermeneuticism can, as with any scopic regime, serve propagandistic ends. To quote Gottlieb regarding this figure.

The "Terra Incognita" of the professoriate was invented as much as discovered through a scientific instrument (i.e. the International questionnaire). Setting out to discover the professoriate worldwide entailed objectification of the real spaces professors occupy in their national context, much like the complex operation of a map, the art of inscribing and tying together places in a surface through networks of names and signs. By projecting the results of the International Survey onto a flat analogic model of the world, *The Chronicle of Higher Education* constructs the professoriate as a kind of "Leibniz's God" present everywhere. In contrast with reporting the results narratively, picturing them on a world map universalizes the International Survey. In other words, the utopic operation of the International Survey manifests itself in the relationship between the surveyor's gaze and the representation of this reality (i.e. the results collected by the survey). This map is nothing less than the visual Utopia of the professoriate (p. 264).

(Figure 18 about here)

The mythopoeic worlds constructed and communicated in Figure 19 privilege a humanistic scopic tradition begun in the Classical period and still highly effective, especially with non-literate viewers, as in many traditional settings. Here Narcissus is portrayed as gendered female, is reflexive and part of nature. Faust (and the devil) are in contrast stereotypically male and are locked in a compulsive, regimented confrontation with nature. Structural differentiation may be seen to move in linear progression from left to right, as do Faust the developer and his minions doing the work of "progress."

This figure is clearly critical of development compulsions found in both TR and CR world-views and their agendas for progress. The Phoenix myth, in contrast, gives space to and accepts the CR ambition for transformation via radical process. Together, Figures 19 and 20 create worlds grounded in the classical humanist and ecological mythopoeic forms.

(Figures 19 about here)

Based on an analysis of historical texts, Figure 21 charts a world of eras and "streams of thought" where historical cycles are depicted both textually and visually. Mouat explains how this figuration captures a historical world of his making:

It can be demonstrated that each phase of the cognitive cycle is manifest at the social level with sufficient distinction that historians give names to the phases. Hence, for western social development the terms Medieval, Renaissance, Baroque, Modern, and Postmodern refer to eras in
which a particular phase of the cognitive cycle dominated or dominates the social construction of knowledge. The validity of this observation is demonstrated when the hallmarks of differentiation, integration and synthesis--the phases comprising the cycle of human thought--are compared with the hallmarks of the eras in western development which have been previously identified by historians. When this is done it becomes apparent that the Medieval was primarily a differentiating era, the Renaissance was an integrating era, the Baroque was a synthesizing era, the Modern was a differentiating era once again, and the Postmodern is an integrating era.

Moreover, each complete cycle of synthesis, differentiation and integration forms a stage in social development which finds its direct analogue not only in the cognitive cycle but also in the pattern of individual cognitive development. (Note that I have now placed synthesis at the beginning of the cycle since it is the synthesis phase which provides the conceptual framework that is articulated during the following differentiating and integrating eras.) When western social history and the pattern of individual cognitive development are compared, the Medieval era and the Renaissance are found to parallel the differentiating and integrating phases of the second cycle in the pattern of cognitive development, while the Baroque synthesis introduces the third cycle which is developed in the Modern age and completed in the Postmodern era (pp. 92-93).

(Figures 20 and 21 about here)

Where Figure 19 recycles three images with a fatalistic regularity, Figure 21 identifies discrete historical eras and describes the rotation of their distinctive intellectual hallmarks with near clockwork precision. This work raises the level of heuristic representation in comparative education discourse to a new level, and boldly predicts that "mapping abstractions" will, by the logic of necessity, become our new scopic regime required to pattern the fragmentation and de-differentiation of today. But, as Baudrillard advises we must first invent a visual game able to render fixed positions reversible, able to help us see how the scopic regimes of modernity have sought to capture the strange and make it ordinary. Today it would seem visual representation is challenged to uncouple the real and provide space to figure the flood of simulated worlds that aggressively compete for our attention.

Today, we are challenged to map out the new objective order of things--its immanent logic and ironic form. In a time when electronic media generate hyperreal models of a real seemingly without origin or reality i.e., the world as Disneyland or the World-Wide Web, the territory no longer precedes the map. Now it is the map that engenders the territory. With the world of human culture constituted through the work
of signifying practices, our task today is to de-code and pattern this new reality of information networks and electronic communication without naive essentialism or undue nostalgia for the world we have lost. How one comparative educator has attempted to respond to this need to remap our field (and perhaps help to move it to the forefront of comparative studies) is presented in the following section.

**Part Two The Invention of A Social Cartography? A Personal Narrative/Journey**

I went to the University of British Columbia (UBC) in Vancouver as a visiting professor in the summer of 1991 with the hope that a trip to the "frontier" might provoke some new ideas about representing knowledge and visualizing difference. Given the collapse of the cold war with its polarizing stories, and the emergence of provocative new ways of seeing in poststructuralist, postmodern feminist and postcolonial studies, the time seemed alive with opportunities to rethink our world, to sail off our brutal old maps. UBC is situated in a setting of vast panoramas of sea, forest, city and sky. I had ample time to converse, to read and discover. Texts by the postmodern geographers, related studies by Bourdieu and the French poststructuralists and some illuminating feminist cartographers all helped me to understand better possibilities to remap my mind and my field. I also reflected on the failure of my conference paper of the year before, "Comparing Ways of Knowing across Inquiry Communities," to specify exactly how contradictory ideas and views of reality might be represented and compared in a more open or "free-form" manner.

On returning to the University of Pittsburgh that Fall, I had begun to understand how a spatial turn in comparative studies would focus less on formal theory and competing truth claims and more on how contingent knowledge may be seen as embodied, locally constructed and visually represented as oppositional yet complimentary positionings in shifting fields. As Bateson points out, maps not only emphasize spatial relations, they also help to recognize and pattern difference. By naming and classifying, maps help us "know" something so we "see" something different. The problem with getting comparativists to think more globally or locally, for example, may be that this task is difficult to map because there is nothing but difference. What a confused comparative thinker may need is patterns interspersed among the differences. This view would help me both to reconceptualize comparative studies as comparative mapping and to see it as situated, provisional and contested, i.e., as Donna Harraway advocates, as a non-innocent practice. With the opening up of our vision and representations to multiple perspectives, we might also better move beyond the two great modernisms of positivism and Marxism with their rigid categorical thinking and abhorrence of the Other.

My efforts then turned to the crafting of a ground-level social cartography project with critical potential, one that would build upon and extend earlier postmodern mapping contributions in cultural geography, and in feminist, literary and postcolonialist studies. Work in this new genre uses spatial tropes to map intertextual fields. It shares
the rejection of essentialism and scientism found in most feminist theory. It views the "ground" of our era as akin to a space of shifting sites and boundaries most credibly defined in relational terms. Where texts of modern geographers usually represented space as an innocent place of situated objects with fixed boundaries, coordinates and essences, texts of the postmodern cartographers mostly present an agonistic or contested space of continually shifting sites and boundaries perhaps best portrayed using "the transitory, temporal process of language." Soja and Hooper explain this growing fascination with spatial analysis:

We suggest that this spatialized discourse on simultaneously real and imagined geographies is an important part of a provocative and distinctly postmodern reconceptualization of spatiality that connects the social production of space to the cultural politics of difference in new and imaginative ways.

At about this time, Don Adams invited me to write an encyclopedia entry titled, "Comparative Education Paradigms and Theories." I accepted, but with the proviso that the entry would in fact be post-paradigmatic, that is, it would use a perspectivist approach to "map" my view of increasingly complex conceptual relationships between the major discourse communities that compose the field. I presented this study, viewing comparison as a juxtaposition of difference, in July 1992, at the VIII World Congress of Comparative Education Societies at Charles University in Prague with a title more to my liking, "Comparative Education Seen as an Intellectual Field: Mapping the Theoretical Landscape." The paper sought to demonstrate how comparative education "after objectivity" can now make good sense "in perspective" by portraying a ludic play of different theoretical perspectives within the art form of social cartography. This cartography avoids the rigidities of modernist social models and master narratives, as presented in Part One of this paper and shifts the research focus to current efforts by individuals and cultural groups seeking to be more self-defining in their sociospatial relations and in how they are represented. In this regard, Liebman has argued persuasively that while social mapping is open to all texts, it is a project of and for the postmodern era; it is a new method to identify changing perceptions of values, ideologies, and spatial relations. In social cartography he sees an alliance of education and cultural geography to develop a methodology consistent with the visualization of narratives in a time when people now realize their potential and place in the world quite differently than they did a few decades ago. In education, especially, he suggests that social mapping can assist students who desire to resolve personal questions of self in a world offering a multiplicity of truths and values. As in this paper, social maps are proposed as "a method of illustrating our vigorous social milieu composed of a profusion of narratives." This is done with an emphasis on layered, or imbricated, fields of perception and intertextual space, an approach which draws in part upon the technique of chorography, that is, the mapping of domains or regions.
Now, with the project of social cartography or free-form mapping well underway, it is fitting perhaps to recognize Joseph Seppi's admonition in his chapter in *Social Cartography* (forthcoming) that "an attempt at formalizing the technique must follow." The nineteen multidisciplinary chapters that this new book all, in various ways and from diverse perspectives, address this need to sketch in some "first principles" for a social cartography oriented toward charting the variable topography of social space and spatial practices today. In the opening section, Mapping Imagination, creative ideas from cultural geography, social history and comparative education, among others, are used to suggest how comparative studies and the human sciences might benefit from the use of a polyocular or perspectivist approach. This section examines challenges facing all knowledge fields today as postmodernist sensibility, with its rejection of universals and attention to multiplicity and difference, permeates the academy, the media and individual consciousness. The four chapters in this section use both modernist and postmodernist orientations to query how mapping imagination can help comparativists to better identify and compare both similarity and difference.

Imagination can also be seen to work through spatial representation at the individual level. Said, for example, suggests that space may acquire emotional and even rational sense through a poetic process where empty reaches of space and distance are converted into meaning in the here and now:

> There is no doubt that imaginative geography or history help the mind to intensify its own sense of itself by dramatizing the distance and difference between what is close . . . and what is far away.²⁶

The concept of spatial imagination seen as an ability to reveal multiple intersections,²⁷ to resist disciplinary enclosures and cross borders,²⁸ and come into critical dialogue with other imaginations²⁹ is a guiding principle of the social cartography project.

The book's second section, Mapping Perspectives, demonstrates how ways of seeing portray relationships--in this case from the viewpoints of the positivist, humanist, cognitive and literary traditions. Four chapters examine how the application of spatial ideas and techniques have elaborated mapping in specialized areas, such as scientific geographical information systems (GIS) and land use planning, humanistic and environmental studies, management and business studies, and comparative literature, where maps are increasingly seen as rhetorical strategies that variously facilitate processes of learning and unlearning, resistance and transformation or, perhaps, serve as agendas for coercion and containment. The principle illustrated is that disciplinary theory and practice continually interact in a process of mutual referral. Theory is not detached from the realities of everyday life. It is a construct with semantic content, "and it is the responsibility of analysis (and mapping) to return it there."³⁰

Mapping Pragmatics, the third section of the book, provides an invitation to social cartography with case study reports of mapping in practice and mapping as practice--i.e.,
studies that facilitate a spatial understanding of power relations and transitions. Here, contributors variously map ways of seeing the organizational space of third world educational interventions, a textual utopia-building effort, local perceptions of a rural development project, the expanding representational space of international corporations, intercultural communication problems in educational consultancies, the intertextual field of environmental education, and innovative social mapping techniques. While these reports on mapping practice evidence something of the indeterminate and incomplete aspects of provisional cartographic representation, they also suggest how maps can open space for present difference, represent conflicting visions of the future (as with Escobar's "maps . . . of struggle"), and enhance our ability "to ironize our own claims to truth" vis-a-vis competing claims.31

In the closing section, Mapping Debates, chapter authors use critical perspectives to engage and question a good deal of what is argued in the preceding three sections. Here we find the project's critical reflexive principle that interrogates all knowledge, and especially my contention that a ludic mapping practice can help to subvert mapping's colonizing role under modernity--as suggested by Martin Jay at the outset--and open a site of resistance in postmodernity, all the while seeking to undermine its own authority as a new discourse of power.

These chapters strongly suggest that comparative education, as with the related fields of comparative literature, comparative politics and the like, now shares a common interdisciplinary pursuit of cultural theory and situated knowledge generation processes, as well as the more traditional cross-cultural comparison of national practices. Huggan argues that this new agenda moves alterity, or awareness of the Other, to the center of comparative studies:

Comparativists are not syncretists. That they choose to outline similarities among works deriving from different cultures or disciplines, or written in different languages does not imply the erasure or compromise of their differences . . . Comparativists are best seen as mediators moving among texts without seeking to 'reconcile' or 'unify' them. What is needed . . . is a flexible cross-cultural model [i.e., a map] that allows the nature of each country's [or actor's] vision of itself to be redefined as a source of creative power. . . . The map should be seen as a symbolic battleground for competing heterodoxies . . . [maps] may attempt to regulate these 'territorial disputes,' but they cannot resolve them.32

From this postmodern view, objectivity is no longer about unproblematic objects, but about always partial translations and how to portray and compare imbricated local knowledge.33

Because social cartography allows the comparisons of multiple realities and contested codes in a representational construct, it will also have potential to serve as a
metaphorical device for the provisional representation, if not for the iconographic unification, of warring cultures and disputatious communities. Every social map is the product of its makers and open to continuous revision and interrogation. In the process of mapping meaning, the subject is seen to be mobile and constituted in the shifting space where multiple and competing discourses intersect. This view advances neither the self-sufficient Cartesian subject of modern western humanism nor the radically de-centered Baudrillardian subject seen by extreme poststructuralism. Instead, the mapper is articulated around a core self that is nonetheless differentiated locally and historically. Social mapping, in this view, makes possible a way of understanding how sliding identities are created, and how the multiple connections between spatiality and subjectivity are grounded in the contested terrain between intellectual communities.

Feminist writers have effectively used social cartographic imagery and spatial metaphors in this manner to expose and challenge what they see as patriarchal representations and to chart new social relations grounded in feminist knowledge and experience. Kolodny, for example, explains the strategic role of spatial metaphors in the engineering of social change in American history. The land-as-woman metaphor was central, while the map served both as a metaphor of male control and domestication of the continent (i.e., the virgin land) and for the continuing domesticity of women. Feminist metaphors and use of an empowering spatial language invert and counter this story. Feminist cartographers—and especially those using postcolonial perspectives—have effectively subverted the complicity of maps in attempts to maintain what they see as an oppressive status quo, and have much to offer a critical social cartography practice.

Ethnic, ecological and regional groups have also been active in creating alternative maps that disrupt or reject the truth claims of central authority. Such "resistance" maps—both on the left and the right—seek to avoid capture in established power grids, to create counter mapping that presents alternative world views, to open new rhetorical spaces, and to articulate postcolonial ambitions.

It would seem that the time is propitious for comparative educators to consider how a cartography of relations might help us move beyond our present Cartesian anxiety to a more open play of perspectives. I believe that social cartography, with its deconstructive view of all modes of representation and with its ludic tolerance of new ideas and diverse ways of seeing, can help us make this intellectual journey. In addition to its critical and demystification utility to make visible ideas and relations that otherwise might remain hidden, social cartography will also be useful to convert increasing flows of data into usable information. This will help comparativists recognize patterns and relationships in spatial contexts from the local to the global. In conceptual terms, cartographic visualization can also provide a link between what were once viewed as incommensurable epistemological paradigms or perspectives, now presented as nodes within shifting intertextual fields. Perhaps Norman Davies sensible and pragmatic advocacy puts the case for a turn to mapping multiple perspectives most succinctly:
By complementing the findings of one partial perspective with the findings of other approaches, we can hope to create an overall picture [map] which will be fairly comprehensive and reasonably accurate, and will maintain a sense of proportion.\textsuperscript{42}

I hope my accounting efforts in this section will better enable the reader to see utility in the practice of social mapping as it opens traditional cartographic representation to multiple perspectives and the play of difference. While mapping does not resolve the conflict of interpretations and sense of disorientation that would seem to be the defining characteristics of our era, our project contends--and seeks to illustrate--that social mapping will nevertheless be useful to construct, as Davies advocates, more "comprehensive and reasonably accurate" re-presentations of social and cultural phenomena. With the new conceptual tools of social cartography, comparative educators and other knowledge workers will be better able to visualize and re-present the simultaneity, diversity, and power inherent in all the social "scapes" that can be seen to constitute our challenging new world. I believe that this new way of seeing and figuring the "real" in all its complexity will give comparative educators--at the least--a useful alternative to the scopic regimes of modernity discussed in Part One. In Part Three some cartographic yield from the project is presented to support this claim and invite collaboration.

**Part Three** The Emergence of Social Cartography: More New Maps

If modernism expresses the desire to capture a sense of wholeness, postmodernism tries to create a picture with emphasis on all the parts where nothing is left out. While avoiding conflictual dualism, it collects and combines as much as possible into a new vision. It is a heterotopia of mixed places and themes that views utopia in terms of multiplicity and difference . . . and attempts to reformulate utopian desire in explicit opposition to binary organization and totalizing models.\textsuperscript{43}

With the advent of the social cartography project described in the preceding section, comparative education joins a variety of related efforts to remap theory in global, local and personal space.\textsuperscript{44} Figure 22, for example, maps the space of theories in comparative education as a heterotopic intertextual field constructed by difference. This postmodern space accepts (as mininarratives) all theories, codes, language games, simulations or visual forms. Its position in Figure 1 falls within the scopic regime of deconstructive perspectivism (DP) and rather close to the de-differentiation node. This theory map opens to all claimants space for inclusion in the intellectual field and social milieu. Situating the mapper in this representation suggests that

. . . by the act of attributing spirit to everything, giving every element of the landscape its own point of view, shows the [mapper] to be alive to the fact that there are other powers in the world, [that social cartography] is
not a fantasy of omnipotence. It is a matter of doing your best in a
difficult, hostile world . . . in which the spectator is alive to forces of a
complexity we can barely grasp.\(^{45}\)

(Figures 22 and 23 about here)

Figures 23 and 24 elaborate possibilities to remap or interact with Figure 22. The
first does so with expanded attention to theoretical relations, and to borrowing, critique,
exchange, and flows. The second with great perceptive originality bisects and enters into
the space of Figure 22 to illustrate how the invisible (i.e., "previously hidden narratives")
can emerge and enter the horizontal plane of social cartographic vision in a manner
masked to view when seen from above, as in Figure 22. Liebman situates the viewer
inside the map (i.e., estrangement) and serves as tour guide:

Working with Paulston’s map, consider the possibility of viewing the map
in cross section, cut away where indicated by this dotted line. If we stand
in Figure 24 at the point marked "x" and look eastward, Paulston’s map
may appear as shown in the center: a world of both direction and
dimension.

This map also offers a hypothesis applicable to concerns regarding
mapping and its capacity for discovering, revealing and placing what
Susan Star calls ‘previously hidden narratives.’ We can make the map
reader aware of unheard voices, represented here by the blank circles
embedded under the surface of the map. Viewing the map this way is
similar to standing on the north wall of the Grand Canyon, gazing across
at people standing on the far wall while being aware that there are hidden
stories under the surface, embedded in the stone of the canyon’s wall just
under where these people we see are standing. These hidden narratives
await not discovery, but a recognition that places them on the map, that
seems to make them "spring up" and take their place among the
developing, moving and growing theories already placed within the social
map’s parameters (p. 210).

(Figure 24 about here)

While Figures 25 and 26 break new ground in visualizing relations--here in
exchanges among key actors in education and gender issues--a situating of the mapper
in these fields of relations would help to make the representations more insightfully
ironic and problematic. They are nevertheless notable for retention of a CR problematic
within a field of multiple perspectives.

(Figures 25 and 26 about here)
The same may be said for Figures 27 and 28 where fields of educational practice are figurated as fields of difference encompassing perspectives that modern vision saw—if at all—as incommensurate and subversive to reason. The contrast here with technical rationalist representations of different views in practice—as in Figures 5 and 8 for example—could not be greater. Or could they? I will let the reader examine the figures and decide for herself.

(Figures 27 and 28 about here)

Figure 29 is, in the words of several colleagues, "a mess." Here modernist logic of linking the subject (that is, the author) with the object (that is, the work) is replaced with a poststructuralist preference for seeing practices (writing) as sites in constructing an intertextual field. Authors are, ironically, sent packing and the multiple perspectives I identified in context construct an acentered yet situated "reality" akin to Haraway's characterization of postmodern multiplicity as "a powerful infidel heteroglossia." As in Lefebvre's view, language new becomes our "instrument of veracity" with which freeform mapping seeks to "decode [to] bring forth from the depths not what is there but what is sayable, what is susceptible to figuration." In this rizomatic elaboration of textual relations is the acknowledged presence of a "fiduciary subject," or embodied "mapper," who as a socially articulated self is the true site of agency. Here the overlapping of discursive and physical space reveals the body as the primary site of political authentication and political action. From the DP view, social mapping escapes the violence of logocentric enclosure and instead elicits an embodied discourse system or set of readings that are frequently disrupted and in need of reordering. Social cartography provides a visual means to facilitate reordering and subject reconstruction within a physical field and a system of symbolic exchange. Identity is seen to be largely discursive and produced through the interaction of verbal and visual texts. This "legible social body" presents a set of cultural codes that "organize the way the body is apprehended and that determine the range of socially appropriate responses." Accordingly, Figure 29 represents my provisional and local structuring of "comparative education" as both an intertextual field, and as a set or assemblage of contradictory yet complimentary cultural codes.

(Figure 29 about here)

And so we return to Judith Wright et al with some ideas and illustrations of how comparative educators and others have sought to claim their space in ongoing efforts to map the intersections of theory, space, and identity in a time of fantastic intermingling.
NOTES

11. For a pioneering textual portrayal of the Faust myth and its relevance for our time, see M. Berman, All That Is Solid Melts Into Air: The Experience of Modernity (London: Verson, 1982). Here the World Bank and its ilk are seen to be in the vanguard of Faustian development mania.

22. P. K. Moser. Philosophy After Objectivity: Making Sense in Perspective (Oxford: Oxford University Press, 1993), p. 227. See also R. Usher and R. Edwards, Postmodernism and Education (London: Routledge, 1994) where the authors contend that "because postmodernism presents no foundational standpoint and no new theory, . . . it teaches us to be skeptical of all systematic theorists" (p. 29). They focus instead on the ludic or playful practices of postmodernism as "a means of challenging the power of representation and totalizing discourses (discourses that present themselves as the final 'truth' which explain everything) without falling into another equally oppressive power discourse" (p. 15). To deny the ludic they argue is to deny desire: "It is a reaffirmation of a universal reason and a formal computational rationality as the primary focus of discourse and practice. In revaluing the ludic, we can at least provide the opportunity for people to desire alternatives" (p. 224).

29. See E. Epstein. "Comparative Education in North America: The Search for the Other Through the Escape from Self?" Compare 25 (1995): 5-16 where these aims are also addressed.

41. See, for example, E. H. Epstein’s stern warning that "certain dissenting positions in Comparative Education represent not simply alternative interpretations of phenomena, but challenge the field’s viability"(p. 5) in his "The Problematic Meaning of Comparison in Comparative Education" in *Theories and Methods in Comparative Education*, eds. J. Schriewer and B. Holmes, (Frankfort am Main: Peter Lang, 1988), pp. 3-24.

44. For a highly original analysis comparing arguments (largely from S. Sontag and J.-F. Lyotard) that modernity favors a "discursive" sensibility giving priority to words over images while post modern sensibility gives priority to the "figural," see S. Lash, "Discourse or Figure? Postmodernism as a Regime of Signification,* Theory, Culture and Society, 5(1988), pp. 311-336.

49. Stone, p. 41.
In E. Chaplin's advocacy of visual representation in anthropology and sociology, no mention is made of recent advances in comparative postmodern social cartography. See her rather disappointing *Sociology of Visual Representation* (London: Routledge, 1994).

I. DOCUMENT IDENTIFICATION:

| Title: Mapping Visual Culture in Comparative Education |
| Author(s): Paulston, Rolland R. |
| Corporate Source: |

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

Check here for Level 1 Release:

- Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

The sample sticker shown below will be affixed to all Level 1 documents

| PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY |
| Sample |
| TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC) |

Check here for Level 2 Release:

- Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

The sample sticker shown below will be affixed to all Level 2 documents

| PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY |
| Sample |
| TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC) |

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

The sample sticker shown below will be affixed to Level 2 documents.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."
