The study explored the relationship between mothers' and fathers' pre-kindergarten reports of family cohesion and children's academic and social competence in kindergarten and first grade, to assess the role of family level processes in children's adjustment to school. The family cohesion factor was divided into "disengaged," "cohesive," and "enmeshed" for the 84 families participating. Results showed no significant relationship between mothers' and fathers' reports of family cohesion and children's academic competence. However, in kindergarten, families rated by mothers as cohesive had children who were described by teachers as socially competent, and families rated by mothers as disengaged had children who were described by teachers as more aggressive. In first grade, families rated by mothers as enmeshed had children who were described by teachers as less socially isolated. Post hoc ANOVAs showed that in all cases, parents' perception of family cohesion were predictive of children's social adjustment to school. (AS)
FAMILY LEVEL PROCESSES IN CHILDREN'S ADAPTATION TO SCHOOL

Vanessa J. Kahen Johnson
University of California, Berkeley

Poster presented at the Biennial Meeting of the Society for Research in Child Development, Washington DC (April, 1997)
Family Cohesion = The emotional bonding that family members have toward one another (Olson, 1993). Olson's (1993) circumplex model of family systems suggests that family cohesion has a curvilinear relationship to childhood adjustment. Thus, moderate levels of family cohesion are seen as optimal for family functioning and the extremes as problematic.

Research investigating the relationship between family functioning and children's adjustment has focused primarily on examining the relationship between parenting styles assessed in parent-child dyads and children's externalizing behavior. A few researchers have begun to move 'beyond the dyad', examining the relationship between family level variables, such as family cohesion, and children's academic (Nelson, 1984) and social competence (Cumsille & Epstein, 1994).

The overwhelming majority of investigations examining the relationship between family cohesion and children's adjustment have focused on depressed adolescents' perceptions of family functioning. Repeatedly, studies have found depressed adolescents to report having less cohesive families than non-depressed adolescents (Cumsille & Epstein, 1994). The relationship between parent perceptions of family cohesion and young school-age children's adjustment has yet to be fully illuminated.

The present study explores the role of family level processes in children's adaptation to school by examining the relationship between mothers' and fathers' pre-kindergarten reports of family cohesion and children's academic and social competence in kindergarten and first grade.
METHOD

Participants
- 84 families participating in the larger Schoolchildren and their Families (SAF) Project
- Income: 75% of the participants are above the median Bay Area income
- 85% Caucasian, 15% African-American, Latino-American, Asian-American

Procedure
Prior to their child entering kindergarten, each parent completed a shortened version of the Family Environment Scale (FES) (Moos & Moos, 1981). In addition, families participated in a laboratory visit which included 3 sessions of approximately 40 minutes each: (1) mother-child alone, (2) father-child alone, and (3) the entire family (mother, father, and child). Ratings of children's adaptation to school were obtained using the Child Adaptive Behavior Inventory (CABI) (Cowan, Cohn, Cowan, & Pearson, 1996) from kindergarten and grade 1 teachers.

Measures

Family Cohesion. The cohesion, expressiveness, and conflict scales on the FES were combined to create a family cohesion factor (i.e., family relatedness, Moos & Moos, 1981). The family cohesion factor was then divided into three equivalent groups:

<table>
<thead>
<tr>
<th>Disengaged Families (Low ratings on Family Cohesion):</th>
<th>Families promote limited intimacy and connection among family members</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cohesive Families (Moderate ratings on Family Cohesion):</td>
<td>Family members often help and support one another, rarely keep their feelings to themselves or fight amongst themselves.</td>
</tr>
<tr>
<td>Enmeshed Families (High ratings on Family Cohesion):</td>
<td>Families encourage excessive identification with family members.</td>
</tr>
</tbody>
</table>
Parenting Style. Mothers’ and fathers’ parenting styles were assessed using observers’ ratings of live dyadic parent-child interaction sessions during the pre-kindergarten year (see Cowan et al., 1996). Factor analysis yielded 4 parenting style factors: (1) negative affect, (2) warmth/responsiveness, (3) engagement, and (4) structure.

Child Adaptive Behavior Inventory (CABI). Schaefer and Hunter’s (1984) Child Adaptive Behavior Inventory (CABI) was adapted by Cowan and Cowan to assess the behavior of the child in the study relative to that of the other children in the classroom of the same gender (see Cowan et al., 1996). Factor analysis yielded 6 factors: (1) academic competence, (2) social competence, (3) hyperactive externalizing behavior, (4) aggressive externalizing behavior, (5) socially isolated internalizing behavior, and (6) anxious-depressed internalizing behavior.

RESULTS

Each dependent measure was analyzed using a 3 (low, medium, high family cohesion) X 2 (child gender) ANOVA with treatment condition¹ (treatment, no treatment) as a covariate. Separate but identical ANOVAs were computed for mothers’ and fathers’ reports of family cohesion.

Children’s Academic Adaptation to School

No main effects were found for either mothers’ or fathers’ reports of family cohesion and children’s academic competence.

Children’s Social Adaptation to School

Kindergarten. Main effects for mothers’ reports of cohesion in the family were found for the following measures of children’s school adaptation, as assessed by the teachers:

¹ As part of the larger SAF project, 52% of the study couples participated in a 16 week couples group intervention before their eldest child entered kindergarten (see Cowan et al., 1996 for details).
- Social Competence, F(2,66) = 5.06, p < .01

- Anxious-Depressed Internalizing Behavior, F(2,66) = 9.26, p < .001
• Hyperactive Externalizing Behavior, $F(2,66) = 4.97, p < .01$

• Aggressive Externalizing Behavior, $F(2,66) = 6.75, p < .001$
• Compared to families rated by mothers as either disengaged or enmeshed, families rated by mothers as **cohesive** had children who were seen by kindergarten teachers as more **socially competent** \( F(1,79) = 9.49; p < .01 \), **less hyperactive** \( F(1,79) = 5.76; p < .05 \), and **less likely to display anxious-depressed internalizing behaviors** \( F(1,79) = 7.24; p < .01 \).

• Families rated by mothers as **disengaged** had children who were seen by their kindergarten teachers as displaying **more aggressive externalizing behavior** than children from cohesive or enmeshed families \( F(1,79) = 4.00; p < .05 \).

• No main effects were found for fathers' reports of family cohesion and children's social competence in kindergarten.
Grade 1. Family environment was also found to be associated with teacher reports of children’s social behavior in grade 1. Main effects for mothers’ reports of family cohesion were found for children’s socially isolated internalizing behavior:

- **Socially Isolated Internalizing Behavior**, $F(2,49) = 6.27, p < .001

![Diagram showing Grade 1 CABI Railings: Socially Isolated Internalizing Behavior]

- Families rated by mothers as *enmeshed* had children who were seen by their first grade teachers as displaying **less socially isolating internalizing behavior** than children from disengaged or cohesive families ($F(1,62) = 7.34, p < .01$).

In order to determine whether parent ratings of whole family environment were accounting for unique variance in children’s social adjustment to kindergarten and first grade over and above parenting styles assessed in dyadic parent-child interaction sessions, a second set of identical ANOVAs were calculated post-hoc, controlling for mothers’ and fathers’ pre-kindergarten parenting styles and for intervention condition. To conserve power, separate but identical ANOVAs were calculated for each of the four parenting style factors for both mothers
and fathers (i.e., 8 ANOVAs for each of dependent measure). Post hoc ANOVAs were computed only for the significant findings reported above. In all cases, parents’ perceptions of whole family environment accounted for a significant percentage of the variance in children’s social adjustment to school.

DISCUSSION

Conclusions:

- No significant relationship was found between parents’ reports of family cohesion and children’s academic adjustment to school.

- Mothers’ perceptions of family cohesion were related to children’s social adaptation to kindergarten and first grade even after dyadic assessments of parenting styles were accounted for.

- A curvilinear relationship was found between family cohesion and children’s social adaptation to kindergarten in which moderate levels of family cohesion were optimal.

Consistent with the family systems notion that whole family functioning is influential in individual development, results from the present study indicate that the effects of prekindergarten family environments are apparent in teacher reports of children’s social competence in both kindergarten and first grade. In kindergarten, children in families described as cohesive by their parents were seen by their teachers as more socially competent, and less hyperactive, aggressive, and anxious-depressed than children in disengaged or enmeshed families. These results support Olson’s (1993) position that moderate levels of family cohesion are optimal.
Despite this curvilinear trend during kindergarten, a linear relationship was found between mothers' reports of family cohesion and children's social isolation in first grade. Children in families rated by mothers as enmeshed (highest ratings of family cohesion) were seen by teachers as less socially isolated than their peers. Lastly, results from the present study indicate that family level processes as perceived by parents are predictive of children's social adjustment to kindergarten and first grade even after accounting for mothers' and fathers' parenting styles as observed in parent-child dyads.

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

Check here
For Level 1 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

The sample sticker shown below will be affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND DISSEminate THIS MATERIAL HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

Check here
For Level 2 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

The sample sticker shown below will be affixed to all Level 2 documents

PERMISSION TO REPRODUCE AND DISSEminate THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."

32nd BIENNIAL MEETING OF THE SOCIETY FOR RESEARCH IN CHILD DEVELOPMENT (April 3-6, 1997, Washington, D.C.)
March 25, 1997

Dear Colleague:

It has come to our attention that you will be participating in the **62nd BIENNIAL MEETING OF THE SOCIETY FOR RESEARCH IN CHILD DEVELOPMENT** to be held April 3-6, 1997, in Washington, D.C. We would like you to consider submitting your presentation, or any other recently written education-related papers or reports, for possible inclusion in the ERIC database.

As you may know, ERIC (the Educational Resources Information Center) is a federally-sponsored information system for the field of education. Its main product is the ERIC database, the world’s largest source of education information. The **Clearinghouse on Elementary and Early Childhood Education** is one of sixteen subject-specialized clearinghouses making up the ERIC system. We collect and disseminate information relating to all aspects of children’s development, care, and education.

Ideally, your paper should be at least eight pages long and not have been published elsewhere at the time of submission. It will be reviewed and we will let you know within six weeks if it has been accepted.

Please complete the reproduction release on the back of this letter and return it with two copies of your presentation to **Booth #25** at the conference or mail to ERIC/EECE. If you have any questions, please come and see us during the conference or call 1/800/583-4135 or e-mail <ksmith5@uiuc.edu>.

Sincerely,

Karen E. Smith
Acquisitions Coordinator
