This study used the Parenting Puppet Interview, an age-appropriate measure of the child's perspective of the mother-child relationship, as well as maternal report of the relationship, to predict teacher reports of behavioral and emotional problems. Forty-three children, ages 4 through 6 years, and their mothers and teachers participated in this study. The Teacher Report Form and the Parent Report on Preschoolers questionnaire were also used. The study found that child and maternal reports of the mother-child relationship differentially predicted externalizing, internalizing, social, and behavioral problems. Maternal report of high hostility, but not child report, was strongly related to internalizing behavior. Maternal and child reports coordinated in associating low maternal responsiveness and demanding behavior with externalizing behavior. Low responsiveness and high hostility as reported by both mothers and children were associated with overall behavior problems. The Parenting Puppet Interview and puppet methodology were found to be successful for examining how the child's perspective affects healthy development and adjustment. (JPB)
Child and Parental Report of the Parent-Child Relationship as Predictors of Behavior and Emotional Problems in Preschool Children

Abstract

Despite strong evidence that variations in the parent-child relationship predict emotional and behavioral problems in preschool children, the child’s perspective on this relationship has not been studied. This study used a newly developed age-appropriate measure of the child’s perspective of the mother-child relationship, as well as maternal report of the relationship, to predict teacher reports of behavioral and emotional problems. Forty-three children, ages 4-6, and their mothers and teachers participated in this study. Child and maternal reports of the mother-child relationship differentially predicted externalizing, internalizing, social problems, and behavioral problems.

Aims:
- To examine which specific dimensions of the parent-child relationship predict behavioral and emotional problems in preschool children.
- To examine how maternal versus child reports of the parent-child relationship differentially predict behavioral and emotional problems in preschool children.

Method

Sample:
Twenty-five male and eighteen female preschool children, ages 4-6, and their mothers and teachers participated in this study. The sample was primarily white middle-class children, all enrolled in a private preschool in a metropolitan area.

Measures:
- Teacher Report Form (TRF). Standardized questionnaire that measures internalizing and externalizing behaviors (Achenbach, 1986).
- Parent Report on Preschoolers (PROP). Questionnaire that assesses five dimensions of the mother-child relationship: structure, warmth and responsiveness, demandingness, positive affect, and hostility toward the child.
- Parenting Puppet Interview (PPI): Interactive interview that assesses five dimensions of the mother-child relationship: structure, warmth and responsiveness, demandingness, positive affect, and hostility toward the child. The methodology for the interview was adapted from the Berkeley Puppet Interview (Ablow & Measelle) and from Eder’s self-concept puppet methodology.
Parenting Puppet Interview Methodology:

During this interview, identical puppets say opposing statements about their family environment. For example, one puppet says, “My mommy lets me jump on the bed,” and the other says, “My mommy does not let me jump on the bed.” Children indicate which puppet is more like them.

Sample Items From the PROP and PPI, and Correlation Between Mother and Child Report:

Structure (r = -0.09)
PROP
There is a fixed routine for my child at bed-time that seldom changes.
Puppet
I get to go to bed whenever I want.
I go to bed when my mommy tells me to go to bed.

Responsiveness (r = -0.01)
PROP
I praise my child when he/she does something well.
Puppet
My mommy likes the things I make.
My mommy does not like the things I make.

Demandingness (r = 0.10)
PROP
How often do you expect your child to refrain from interrupting when you are on the phone?
Puppet
I do not have to be quiet when my mommy is on the telephone.
I have to be quiet when my mommy is on the telephone.

Positive Affect (r = -0.28)
PROP
My child and I don’t have much fun together.
Puppet
My mommy and I have fun together.
My mommy and I do not have fun together.

Hostility (r = -0.04)
PROP
I yell at my child at least once a day.
Puppet
My mommy yells a lot.
My mommy yells a little.
Plan of Analysis

Separate nonparametric correlations were computed between each of the five parenting dimensions (for the PROP and PPI) and the TRF outcomes of internalizing, externalizing, social problems, and overall behavior problems. Zun tests of correlational differences were computed to compare mother and child correlations of parenting dimensions and outcomes.

Results
(See tables in Appendix for actual correlations)

- **Internalizing**: Maternal report of high hostility, but not child report, was strongly related to internalizing behavior.

- **Externalizing**: Maternal report of low responsiveness and demandingness, and high report of hostility and structure was associated with externalizing behavior. Child report of low responsiveness, demandingness, and positive affect also was associated with externalizing behavior.

- **Social Problems**: Maternal report of low responsiveness and high hostility was associated with social problems. Child report of low physical affection was also associated with social problems.

- **Overall Behavior Problems**: Maternal report of low responsiveness and high hostility was strongly related to overall behavior problems. Child report of low demandingness, responsiveness, and positive affect was also related to overall behavior problems.

Discussion

Maternal and child reports of parenting dimensions differentially predicted emotional and behavioral problems. Researchers interested in the links between family experience and child psychopathology should assess the child’s perspective on the family. The Parenting Puppet Interview and puppet methodology provide a successful means for examining how the child’s perspective affects healthy development and adjustment.

II. REPRODUCTION RELEASE:
In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

For Level 1 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

The sample sticker shown below will be affixed to all Level 1 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 1

For Level 2 Release:
Permitting reproduction in microfiche (4" x 6" film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

The sample sticker shown below will be affixed to all Level 2 documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN OTHER THAN PAPER COPY HAS BEEN GRANTED BY

Sample

TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."

Date:
7-11-97

Biennial Mtg. of the Society for Research in Child Development (Wash., D.C., Apr. 3-6, 1997)
August 22, 1997

Dear Colleague:

After doing a blanket solicitation for papers at the 62nd Biennial Meeting of the Society for Research in Child Development held in Washington, D.C., April 3-6, 1997, I am now contacting individual presenters, particularly in our scope of early childhood through early adolescence, to consider sending two copies of your presentations for possible inclusion in the ERIC database. As you may know, ERIC (the Educational Resources Information Center) is a federally-sponsored information system for the field of education. Its main product is the ERIC database, the world's largest source of education information. The Clearinghouse on Elementary and Early Childhood Education is one of sixteen subject-specialized clearinghouses making up the ERIC system. We collect and disseminate information relating to all aspects of children's development, care, and education.

Ideally, your paper should be at least eight pages long and not have been published elsewhere at the time of submission. Announcement in ERIC does not prevent you from publishing your paper elsewhere because you still retain complete copyright. Your paper will be reviewed and we will let you know within six weeks if it has been accepted.

Please complete and sign the reproduction release on the back of this letter and return it with two copies of your presentation to ERIC/EECE. If you have any questions, please call me at (800) 583-4135 or by (e-mail at ksmith5@uiuc.edu). I look forward to hearing from you soon.

Sincerely,

Karen E. Smith
Acquisitions Coordinator
