This paper explores the challenges facing educators to incorporate "informatics"—computer education in the broad context of information technology—into the curriculum for K-12 students, and "capacitation" for teachers, the continuing professional education which enables and empowers teachers to face these demands. The computer education program based on this pedagogy of informatics has been used in more than 20 elementary and middle schools in Brazil for 3 years. The program objectives are to: provide students with access to systematic knowledge about computers and information technology; use computers and information technology as an educational resource for students and school; and assist teachers to become users and teachers of informatics through understanding the philosophy, ideas, and skills on which the program is based. The program, "Introductory Informatics Course for Children and Adolescents," was designed around three themes: (1) foundations of informatics (history, functioning, and use of computers); (2) informatics and society (social impact and vocational and work market analysis); and (3) interest centers (workshops on many topics, including, but not limited to, arts, games, literature, mathematics, pedagogical support, library). The program includes textbooks for students and teachers, family activities, Learning Activity Books for Teachers (methodological orientation and educational programs), and educational software. The ongoing teacher capacitation program includes coursework, monthly teachers meetings, and end of semester workshops. (Contains 11 references.) (ND)
TOWARDS A PEDAGOGY OF INFORMATICS;
PREPARING EDUCATORS TO FACE THE CHALLENGE

Towards a Pedagogy of Informatics¹: Preparing educators to face the challenge.

Through this presentation, we will discuss the challenges facing educators to incorporate informatics into the curriculum, the capacitation² of teachers to face these challenges, and review a new educational program in Northeast Brazil. We will present a package of teaching and student materials which formed the basis of a course in informatics for K-12 students. These materials, which were developed in Portuguese, are currently being translated into English at the University of Oregon.

In Brazil (as in the USA), computers were introduced into educational programs for children with the "promise" or "belief" that through the computer students would learn more, read better, and work more creatively and cooperatively. However, the computer, reified in this way, has not corresponded to people's expectations of its potential in the learning and teaching situation. Recent research in the US, Japan, Israel and some countries in the European community shows the main focus of computer education in schools has been on computer skills, e.g. word processing or information management, and little attention has been given to developing a pedagogy which integrates the teaching of computer skills with an understanding of informatics and its place in our society. Little or no attention has been given to a Pedagogy of Informatics which takes into consideration learning and teaching processes, organization of curriculum, and reflection on people/machine relationships in learning and in the wider community, as well as developing children's ability to use computers competently. In addition, the responsibility for computer education and use in schools has been left in the hands of technical experts working from computer labs, rather than incorporated by classroom teachers into the curriculum (Pelgrum & Plumb, 1991; Anderson, 1993; Lund & Wild, 1993; VISION TEST, 1990; Office of Technology Assessment, 1995).

The challenge facing educators today is not just to use computers at school, but to use computer education and informatics to mediate improved social and learning relations in schools. The introduction of informatics into the curriculum can assist schools to change from a traditional way of teaching and learning, to one that provides students with an ever more cooperative apprenticeship in the learning and teaching process. One that prepares them to be lifelong learners, explorers and integrators of learning and experience. Key factors in assisting schools to respond to these challenges, are (1) the production of resource materials which express didactically the basic educational concepts that will facilitate the processes of working, teaching, communicating, and learning, and (2) the capacitation of teachers (Costa Lima & Jurema, 1993).

Foundational premises for developing a program based on the Pedagogy of Informatics include:

- The interdisciplinary nature of informatics knowledge involves a range of subject areas and processes, including but not limited to, mathematics, history, linguistics, logic, concepts, and graphics.
- Learners are active participants, who in the course of their learning, structure their experience and knowledge (Piaget).
- The cooperative work of students and teachers creates a new cultural resource which is greater than the knowledge and understanding any of the individuals possessed before (Vygotsky).
- Approaches which are based on the social and cognitive reality of students will develop learning experiences that are challenging and open-ended, enjoyable and playful, cooperative and socializing.
- Computers are a means not an end. In the educative process they do not replace people, but assist them, in reorganizing interactions, thus reorganizing the teaching and learning process (and the play).
- The content of knowledge and its daily application are intrinsically related. Therefore teaching and learning programs in addition to providing information about computers and information technology, must be functionally constructed (authentic learning), and also challenge learners to reflect on social impacts and implications (i.e. the relations of people with the machine and with one another).
- Informatics in schools are not an appendix to the educative process, but an integrated element of the school curriculum which must enrich the teaching and learning situation.
- The capacitation of teachers is essential. An approach based on the pedagogy of informatics requires teachers to develop their own knowledge and understanding of informatics in our society, to rethink their roles and practices, and base their teaching on their students' curiosity and active involvement in learning.

Developing a Pedagogy of Informatics involves collaboration in learning at a number of levels, i.e. the collaboration of educators as they work together on the conceptual and operational changes required if they are to teach both about the computer and with the computer, the collaboration of students as they learn together through activity-based and challenging learning opportunities, the collaboration of schools and communities as they come to terms with the role of education and schooling in the information society, and

---

¹ We have used the term Informatics (Information + automatics), because it places computer education in the broader context of information and technology.

² Neologism for continuing professional development which enables and empowers teachers to action.
interdisciplinary collaboration in the development of curricula and educational programs.

**Methods and data sources**

A computer education program based on this emerging Pedagogy of Informatics has contributed to our knowledge about the use of computers and information technology in education. These materials were developed by a cooperative, multidisciplinary working team of professionals from the areas of informatics, cognitive psychology, education, visual programming (graphics), history, and production of didactic materials. They were trialed through an intensive course, and then successfully used for more than three years in over twenty elementary and middle schools with approximately 30,000 children and adolescents in the states of Pernambuco, Rio Grande do Norte, Ceará, Alagoas, and Sergipe. With some adaptations the course was also taught to a group of children with special needs (Jurema, Jurema & Longman, 1992). Our observations are based on the conceptual framework on which the program was based, the multidisciplinary and collaborative approach to the program development and implementation, and the follow-up evaluation of ITECI’s methodology and courses.

The program integrated three key objectives:

- Informatics education: to provide students with access to systemic knowledge about computers and information technology;
- Educative informatics: to use computers and information technology as an educational resource for students and schools;
- Capacitation of teachers: to assist teachers to become users and teachers of informatics, through understanding the philosophy, ideas and skills on which the program was based.

The program: The Introductory Informatics Course for Children and Adolescents (Jurema & Costa Lima, 1993) included both a methodology for teaching informatics to children and adolescents (K-12), and a series of teaching and learning programs across the age-range. It was designed (1) to assist children and adolescents develop the abilities, understandings and values necessary to participate effectively in a society impregnated by computers and information technology, and (2) to assist schools and teachers to develop informatics as an integrative element across the curriculum. The course was designed around three thematic nuclei:

- **Foundations of Informatics** (history, functioning and uses of the computer)
- **Informatics and Society** (social impact and vocational and work market analysis)

The program materials include a kit of didactic materials: textbooks (*reference books for students and teachers*), Family Activities (for students to share with their families at home), Learning Activity Books for Teachers (*methodological orientation and educational programs*), and an educational Software Support Kit. The software developed are simple, requiring the teacher to explore the ideas they represent and integrate them into the learning program. The teachers’ Learning Activity Books present, besides suggestions for activities, alternative suggestions about ways to work with students within each subject, and the integration of the program across the curriculum.

Collaborative processes are built into all activities of the program so that the cooperative and cognitive elements are intrinsically united, e.g. when children work in teams to create databases, they generate findings which have to be discussed, analyzed and communicated, and require their active involvement in the reasoning process.

**Capacitation of teachers:** The capacitation of teachers is the key to the success of the program. If informatics is to become an intrinsic component of schooling, it will not be enough for schools systems to merely “train computer experts”. All teachers must be given the opportunity and the encouragement to develop the conceptual understanding and technical skill necessary to integrate the computer into their educational programs. The teacher capacitation program developed by this project assisted teachers to develop their own knowledge and understanding of informatics in our society, to rethink their roles and practices, and base their teaching on their students’ curiosity and active involvement in their learning. It is an ongoing process, including a practical course of micro-informatics (40 hours), monthly teacher meetings (3 hours), and end of semester workshops (6 hours).

**Educational importance of the study**

As stated above (p.1), computer education in schools has not lived up to the high expectations with which it was introduced. In many cases, the speed with which the technology is developing simply means teachers and schools get left further behind. This program, developing a Pedagogy of Informatics, has been successful in both the capacitation of teachers and in assisting students to conceptually understand the structure and functioning of computers and software in both historical and contemporary contexts, and be able to infer, take risks and face new challenges creatively. It is important that educators are given many opportunities to discuss and contribute to the emerging Pedagogy of Informatics, and to learn from successful programs such as this one.

I. DOCUMENT IDENTIFICATION:

Title: Towards a Pedagogy of Informatics: Preparing Educators to face the Challenge

Author(s): Ana Cristina J. A. Súrema, Maria Edita C. Lima, Mary C. Dalimau, and Manual Súrema Jr.

Corporate Source: 49th Annual Meeting of the American Association of Colleges for Teacher Education – AACTE 1997

Publication Date: February 26 - March 1, 1997

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, Resources in Education (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

Check here for Level 1 Release: Permits reproduction in microfiche (4\(\times\) 6\(\) film) or other ERIC archival media (e.g., electronic or optical) and paper copy.

Check here for Level 2 Release: Permits reproduction in microfiche (4\(\times\) 6\(\) film) or other ERIC archival media (e.g., electronic or optical), but not in paper copy.

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.

Dear AACTE Presenter:

Congratulations on being selected as a presenter at the 49th Annual Meeting of the American Association of Colleges for Teacher Education (Phoenix, AZ, February 26-March 1, 1997). The ERIC Clearinghouse on Teaching and Teacher Education would like you to contribute to the ERIC database by providing us with a written copy of your paper. Abstracts of documents that are accepted by ERIC appear in the print volume, *Resources in Education* (RIE), and are available through computer in both on-line and CD-ROM versions. The ERIC database is accessed worldwide and is used by colleagues, researchers, students, policy makers, and others with an interest in education.

Inclusion of your work provides you with a permanent archive, and contributes to the overall development of materials in ERIC. The full text of your contribution will be accessible through the microfiche collections that are housed at libraries around the country and the world and through the ERIC Document Reproduction Service. Documents are accepted for their contribution to education, timeliness, relevance, methodology, effectiveness of presentation, and reproduction quality.

To disseminate your work through ERIC, you need to fill out and sign the reproduction release form on the back of this letter and include it with a letter-quality copy of your paper. Since our Clearinghouse will be exhibiting at the Conference, you can either drop the paper off at our booth, or mail the material to: The ERIC Clearinghouse on Teaching and Teacher Education, AACTE, One Dupont Circle, N.W., Suite 610, Washington, DC 20036-1186. Please feel free to photocopy the release form for future or additional submissions.

Should you have further questions, please contact me at 1-800-822-9229.

Sincerely,

Lois Lipson
Acquisitions/Outreach Coordinator
