**Discussion**

Studies published to date do not consistently support or refute the basic hypothesis that the presence of scars, knotholes, broken branches, or leafless trees are indicators of traumatic experience. Nor has research proven that the absence of these indicators means that an individual has never experienced unusual levels of trauma. However, both the current study and that of Torem, Gilbertson, and Light (1990) strongly suggest that the presence of multiple tree injury markings on one individual’s tree drawing is related to past traumatic
experience in the life of that individual. The majority of studies do not support the idea that the date of the trauma can be determined by the placement of a scar on a tree drawing. Tree-trauma research also indicates that a tree without foliage may be drawn as a response to seasonal factors, and not necessarily be representative of the aftereffects of trauma. The presence of one or two knotholes in a tree drawing did not prove to be suggestive of past trauma in this current study.

The acceptance of tree drawings as a valid and helpful tool in the assessment of trauma is based on the assumption that a tree drawing is a representation of self. It is important to acknowledge that not all tree drawings are self-images. A tree may symbolize someone the individual has known in the past or present, or a mythical figure. A drawing may also depict a tree which a person has actually seen at some time during his life. In this case, it may be argued that the tree an individual remembers and portrays was chosen due to projection identification; however, this hypothesis has not been validated through research. A tree drawing may reflect a person’s feelings, needs, or wants in the specific moment that the tree image is being created. This tree image would be representative of self, but would not necessarily include historical information. In any random sample of tree drawings, some will be self-images, others may represent someone other than the imagemaker; some will reflect the individual process of the person, some will not; some will include representation of past and present experiences with future possibilities, others will depict only a single timeframe. The statistical probability that a tree image represents the life experience of the individual is unknown; this should be considered when tree drawings are being used for trauma assessment.

Finally, although it is interesting and potentially productive to attempt to identify patterns in tree drawings, it must be remembered that each drawing is produced by a complex individual, and the imagery used is a product of that individual’s biological make-up, history, and response to that history. The meaning of any image is in many respects unique to that individual.

Suggestions for Further Study

The tree drawings collected in the DDS archive provide an excellent resource for future study of the tree-trauma relationship and its potential use in assessment as well as measuring treatment outcome. Possibilities for further DDS research in the tree-trauma debate include continuing and broadening this study, examining the hypothesis that knotholes are not trauma indicators and that they may represent conventional tree schemas. A comparison of tree drawings created by patients and outpatients diagnosed with Posttraumatic Stress Disorder (PTSD) might help distinguish between trauma indicators related to crises resulting in hospitalization and indicators related to chronic PTSD symptoms. A more in-depth study of seasonal influences on tree drawings could be conducted that compares diagnostic groups and control subjects. A cross-cultural comparison of differences in tree drawings created by control subjects and individuals within diagnostic categories which are suggestive of trauma would be helpful to diminish false diagnostic indicators which might be specific to particular cultural and/or geographic groups. Observations of the tree drawings of patients known to engage in self-injurious behavior would be interesting to see if they differ in any way from individuals who do not inflict self-harm. Longitudinal studies of patients’ tree drawings over the course of several years of treatment are also a possibility through the use of the DDS archive. It would be interesting to see if the effects of treatment are reflected by specific changes in the tree drawings over time.

Other possible indicators of trauma have been suggested by Mills and Cohen (1993) through the study of tree drawings from the DDS. These include “chaotic branches, unrecognizable trees and trees with trunks of minimal length” (p. 46) as well as tilted trees. Further study and observations of these possible indicators in additional tree drawings may prove to reinforce the idea that there are additional indicators of trauma which have not been previously identified.

Research with Diagnostic Drawings for Normal and Alzheimer's Subjects

Nancy M. Knapp, PhD, A.T.R., Emporia, KS

Abstract

This study designed and tested a battery of drawing techniques with a scoring methodology appropriate for investigation of Alzheimer's disease (AD). The battery was adapted from previous experience in the field of projective drawings and the scoring was developed from characteristics hypothesized to be present in an Alzheimer's population. The variables as a whole and most of the hypothesized drawing features provided significant discrimination between the age-matched controls and Alzheimer subjects (p < 0.0001). The relative importance of individual variables were interpreted as those that might describe AD deficits. Capability to discriminate was also provided at p < 0.0001 by objective measures of use of space and size of the drawn objects. This might suggest a possible graphic process analogous to micrographia. The interrater reliability as measured by the Kappa Coefficient was in excess of 90%.

Introduction

A blank paper is virgin territory on which people leave their marks in individual ways with seemingly infinite variety. However, if researchers use a structured format to collect drawings under controlled circumstances, they may detect a pattern of variables between certain patient/client groups. If the differences in such a pattern are statistically significant, the drawing procedure has potential for use in diagnosis and treatment.

Art tasks are commonly used in medical settings to assess functional and physical impairment. Three basic paradigms have dominated the use of art for these purposes: (a) art presented as a stimulus to be observed, described, or responded to by the subject, (b) visual images or tangible objects to be copied by the subject, and (c) verbal or written requests given to the subject to draw a particular picture. Each model challenges different skills and sensory responses, and the results of each require different evaluation or scoring systems.

The use of drawing tasks for diagnosis and research in medical settings support the premise that a person's drawings relate to his or her general intellectual and cognitive functioning. Drawings have been linked closely with studies of perception and brain dysfunction since the mid-19th century.

In 1985, Benton reviewed what he called the "huge literature" on hemispheric inattention and injuries with brain patients. He listed art tasks for performance discrimination in brain diseases of visuoperceptual, visuospatial, and visuoconstructive disorders. Although the consensus of the authors Benton reviewed seems to be that the value of art tasks is uneven, neurologists continue to use a variety of drawing techniques and exercises in their examinations. Similarly, Boeltegen (1985) cited effects of agraphia during clinical evaluations. He included art tasks to explore the subtleties of specific deficits with combined linguistic and motor components.

Heilman, Watson, and Valenstein (1985) cited spontaneous drawings as useful because they do not require alternate stimuli, and Sacks (1985) stated that he nearly always asks a patient to draw, "partly as a rough and ready index of various competencies, but also as an expression of their 'character' or 'style.'" (1985, p. 215). Bogen (1985) used art tasks for assessing callosal syndromes. He suggests using felt pens rather than pencils, starting with simple figures, and progressing to more complex.

Kramer and Lager (1984) concluded their review of art used in the assessment of psychosis by summarizing advances in neurobiology, including complex neuropsychological and standardized psychometric tests, the computerized axial tomography (CT scan), brain electrical activity mapping (BEAM) and other brain imaging techniques, positron emission tomography (PET scan), cerebral blood flow and progress in neuropathology and psychopharmacology; they claimed that these techniques "are changing perspectives about the phenomenology of psychosis. It is not unlikely that there may exist artistic correlates of new diagnostic categories" (1984, p. 198).

Major portions of research on brain dysfunctions have focused on patients with Alzheimer's disease (AD), a progressive brain disease which is the diagnosis of one-half of all demented adults. Early phase AD may include memory and attention defects, general confusion and disorientation, apraxia, and gait and movement disturbances due to cephalic weakness and rigidity of muscles. Second stage patients may demonstrate complete disorientation, purposeless hyperactivity with perplexity and agitation, spastic contractures, disrupted speech, dullness, and apathy. The terminal phase includes profound dementia and vegetative existence. Traditionally, AD has been seen as progressive, irreversible, and untreatable because of generalized brain atrophy, especially in the frontal and occipital lobes.

Hollinder, Mohn, and Davis (1985), Reisberg, Ferris, and Franssen (1985), Cummings and Benson (1986), and the Diagnostic and Statistical Manual of Mental Disorders III-R (1987) have detailed criteria for the diagnosis of AD. Because symptoms of constructional apraxia, dyspraxia, or difficulties of visual spatial integration have long been identified as part of the clinical presentation with AD: diagnosing physicians frequently request patients to copy geometric figures or to draw cubes or clocks. Additionally, tasks such as the Rey-Osterrieth Complex Figure Test (Peck, Stephens, & Martelli, 1987) are part of a complete neuropsychological evaluation and might be included in a diagnostic work-up for AD.
Research with projective drawings for this population is sparse. There is none dealing exclusively with AD patients although two published studies (Plutchik, Conte, Weiner, & Teresi, 1978; Moore & Wyke, 1984) used variations on the D-A-P and house drawing techniques with subjects including demented patients who would probably be currently diagnosed as having AD. In 1978, Plutchick, et al. cited the lack of data on the use of projective drawings with the elderly population as a whole when they addressed several measures of body image for the geriatric population. They found that drawings could distinguish significant differences between young adults and a geriatric population but not between normal elderly and psychotic elderly or psychotic young adults. They also found a tendency in older people to draw simpler, smaller, and less sex differentiated or integrated figures.

Moore and Wyke (1984) used house and cube drawing tasks to test patients with senile dementia. They found that, when compared to drawings by elderly controls and patients with focal brain lesions, spontaneous drawings by demented patients were grossly impoverished, missing in essential features, small, cramped, perseverative across items, and randomly labeled. In copies of drawings they included more details although they were often wrongly placed.

AD patients are frequently evaluated with traditional intelligence and neuropsychological tests, which include art tasks. The results are characteristically uneven. Selective sensory deficits among the AD population, the erratic but progressive course of the disease, and the fact that it affects a wide variety of people with a wide range of prior functioning, all complicate research measures and contribute to complex findings. To illustrate the clinical and biological heterogeneity of AD, Friedland (1988) presented six very different house drawings from six patients with probable AD. Houses drawn by patients with left temporoparietal hypometabolism were vastly better integrated than those by patients matched in severity of dementia but with right temporoparietal hypometabolism.

Wald (1983, 1984, 1986) presented specific case histories, treatment, techniques, and characteristics of the art from patients with AD. She found that art reflected the progressive course of the disease and deterioration in neuropsychological abilities.

Cummings and Zarit (1987) described similar impairment in a drawing series by a semiprofessional artist with probable AD. These drawings of windmills from the artist’s homeland track the sequential impairment of the artist, even though he was performing a familiar task with a familiar subject.

Method

The purpose of this study was twofold, to test a battery of projective drawings under highly controlled circumstances and to test whether such a drawing battery can differentiate a population of patients with diagnosis of early stage AD from an age-matched control group. The first goal was prompted by the simultaneous existence of sustained, enthusiastic use of projective drawing techniques and equally sustained, well-founded doubt and criticism. The second goal seemed supported by the fact that the list of identified symptoms common to AD includes constructional difficulties which have been observed in drawings of AD patients. Several facts contribute to the press to investigate the use of drawing with an AD population. There is a paucity of research with either spontaneous or directed drawings with this group despite long-term recognition of constructional difficulties in this population. Simultaneously, there now exists technology which allows more reliable diagnosis of AD.

The methodology grew from my earlier experience as a clinical art therapist and an amalgamation of ideas and work from other theoreticians, clinicians, and others with interest in quantification of artistic expression for the understanding of emotion and behavior. The research design was a Static-Group Comparison Design, technically a preexperimental model according to Campbell and Stanley’s definition (1966).

Subjects

Subjects were recruited primarily from an ongoing treatment and research population from Harbor/UCLA Research and Education Institute, Inc. They represented two independent groups: the first, healthy controls without major psychiatric or medical disorders or head trauma; the second group, Alzheimer’s patients, relatively early in the course of illness but with documented pathology, manifested in behavioral change, or evident in brain imaging studies. Inclusion criteria for the second group required a diagnosis of AD, made and confirmed by a psychiatrist and a neurologist in accordance with the Diagnostic and Statistical Manual III-R (1987). A total of 84 subjects were assigned random code numbers and administered protocols. Of 35 control subjects, aged 45 to 83, three were eliminated after pathology was discovered during preliminary testing. Eleven of the 42 AD patients included, aged 51 to 89, were eliminated because they presented additional diagnostic questions or confounding additional diagnoses such as schizophrenia and alcoholism. Subjects in each group were matched by age, to yield 5 pairs of the closest range for analysis: this required eliminating the youngest of the controls and the eldest of the AD subjects. Of the 50 age-matched subjects, the mean age for controls was 68.0 with nine males and 16 females, the mean age for AD subjects was 71.2 with 10 males and 15 females.

Instrumentation

The core of the design consists of a systematic drawing test protocol which can be replicated readily. Projective techniques were chosen to provide a range of stimuli embracing both ambiguity and structure. The battery is based upon the most apparently useful parts of traditional drawing techniques and related research. The four drawing tests have been used as a series since 1982 by art therapists at Harbor/UCLA Department of Psychiatry. These techniques were: Name Embellishment (NE); a modification of the House-Tree-Person (H-T-P-M); a modification of the Kinetic Family Drawing (K-F-D-M); and a Free Choice, Titled (FC-T). Each technique seeks different information and was arranged sequentially to complement other procedures.

The researcher designed a 14-page Instruction Manual and Protocol for the Projective Drawing Test Battery to guide methodological administration. A booklet Define It Before You Count It provided operational definition for critical terms. A
Response and Inquiry Form was designed to be attached to each of the four drawings, and score sheets were designed based upon a graphic indicator list of 39 variables which were hypothesized as more likely to appear in drawings by AD subjects than drawings by nondemented elderly. These 39 variables were extrapolated from DSM III-R for AD and from published descriptions of art from AD patients. This form, the Graphic Indicator List, is included as Figure 1 and comprised the major hypothetical construct for differentiating the control from AD subjects in this study. Scores of graphic indicators may be examined as a total, separately according to the four tasks, #1 NE, #2 H-T-P-M, #3 K-F-D-M, or #4 FC-T, or

Figure 1. Graphic Indicator List
separately according to four subcategories of the measures: A. Approach to Drawing, B. Drawing Organization, C. Drawing Quality, or D. Drawing Content. This form was modified to compare independent scoring by the three judges. A supplementary mental status form was also designed. Each segment of this procedure sought to ensure accurate and standardized administration in order to assess the utility of the battery in distinguishing drawings from the two populations.

Other Tests

Prior to and in addition to the procedure for this study, the following tests were administered to the research staff at Harbor/UCLA to all control subjects: Structured Clinical Interviews for DSM III-R, Hamilton Depression Rating Scale (HAM-D), Brief Psychiatric Rating Scale (BPRS), Thought Disorder Rating Scale (TDRS), Mini Mental State Examination (MMSE), Hachinski Scale (HS), as well as a complete physical exam and standard laboratory tests. A neuropsychological battery included Wechsler Adult Intelligence Scale-Revised (WAIS-R), Wechsler Memory Scale, Rey-Osterrieth Complex Figure Test, Wisconsin Card Sorting Test, Stroop Test, Consonant Trigrams, Thurstone Controlled Oral Word Association Test, and the Recognition Memory Test. Neuroimaging and brain mapping were also done with the following techniques: Computerized Axial Tomography (CAT), Magnetic Resonance Imaging (MRI), Computerized Electroencephalogram (EEG), and Single Photon Emission Computerized Tomography (SPECT). The purpose of these procedures was to assure that the control subjects had no abnormalities which might contaminate research or confound comparative studies.

Procedure

Before the administration of the drawing procedures, all subjects or their legal conservators signed the Human Subjects Consent Form; also, they were given a copy of Experimental Subject’s Bill of Rights and a question and answer sheet which described the nature and purpose of the research. The researcher emphasized the voluntary nature of participation and the option of being unable or unwilling to complete the series of drawings. This procedure also guaranteed confidential and anonymous handling of results. Subjects were informed that people who do not draw regularly sometimes feel awkward or uncomfortable with the process and that drawings may stir up feelings or memories. It was established that it was appropriate to express any reservations or discomfort experienced. All informed consent papers are part of the author’s permanent file.

Administration of the Battery

The drawing battery was administered with uniform procedure to all subjects as specified in the Instruction Manual and Protocol for Projective Drawing Test Battery with standardized arrangement of identical materials. At the time of administration specific diagnostic information about individual subjects was not available to the examiner who also was blind to the results of the additional tests listed above. Drawing performance and behavioral observations from the research sessions were recorded on the Response and Inquiry Forms which were attached to the drawings as stipulated in the protocol. Each series was then coded with a random number so that the age, gender, and code number were the only identifying information on the forms throughout scoring and statistical analysis.

Validity

A panel of three independent judges with established expertise in the field of art therapy and no other connection with the project scored the drawing protocols. Although all three were professionally experienced in using art with diagnosis, they were oriented to the operational definitions of terms used for the 39 variables in the Graphic Indicator List as part of the process to provide a uniform base for terminology and to control reliability of categories. Any terminology with which there was not 100% agreement of meaning was rephrased, discarded, or put into a separate category for independent analysis.

For initial scoring, the three judges chose a random sample of nine drawing batteries from the 50 study protocols. To test both interrater reliability and the validity of the system, they scored these nine samples individually on single Graphic Indicator Lists without knowledge of the results from other judges. Following this, the individual scores were tallied on a three-way sheet so that percentage of agreement could be checked. For the 39 variables judged this way, point by point unanimity was sought for what was scored and for what was not scored 90% of the time. For the 50 age-matched subjects included in the study, a total of 195 drawings were scored; an overall 90% criterion of agreement was required for a scoring to be retained.

All variables were counted individually for four drawings from each subject, therefore, the maximum possible total was 4 × 39 or 156 scorable points. For a 90% agreement, judgment had to coincide on 140 of the 156 points. It was considered a disagreement if one judge only marked any given variable or if one judge did not mark a variable when the other two did. Agreement or disagreement was counted point by point with each variable. In the initial scoring all three judges agreed in excess of the 90% criterion. Therefore, scoring was divided among them for the remainder of the drawing to be evaluated by one judge. The research had every sixth protocol scored by two judges without sharing prior scores as an additional check. The Kappa Coefficient was used to provide a measure of agreement among the three judges. This statistical process accounts for frequency of positive and negative scores to eliminate the chance of random agreement, thereby avoiding artificial inflation of results.

Criterion-related validity was provided by establishing the 39 variables in the Graphic Indicator List from diagnostic criteria from the DSM III-R for Primary Degenerative Dementia of the Alzheimer Type, since that constellation of symptoms distinguished the AD group of subjects from the control subjects.

Characteristics initially hypothesized from the literature on AD were analyzed and subjected to theoretical scrutiny as part of the content validity to establish which if any of the characteristics occur more frequently in the drawings from
AD patients than controls. Further analysis also searched for patterns and clusters of related characteristics to aid in future exploration of graphic indicators of AD.

Results

Findings from the study are presented in the following order: first, analysis of the scoring process by three independent judges for 50 comparable protocols; second, presentation and statistical analysis of the scores from the judgment of graphic indicators hypothesized as potentially differentiating the drawings of AD and control subjects; and third, presentation and analysis of additional objective measures from the general protocol.

Scores from the judgment of the pictures can be accessed from the graphic indicator total, separately according to the four tasks, # NE, #2 H-T-P-M, #3 K-F-D-M, or #4 FC-T, or separately according to the subcategories of the measures: A. Approach to Drawing, B. Drawing Organization, C. Drawing Quality, or D. Drawing Content. For judgment criterion, this study sought 100% agreement, 90% of the time. To meet that target, unanimity had to occur in 420 of the potential 468 points for each protocol scored in common.

The mean point disagreement in the process of judging the drawings was 29.8 (±11.7). This can also be expressed as a percentage of agreement of (100% - 6.4%) = 93.6% so that the goal of 90% unanimous agreement was exceeded. Because some of these scores represented a count of absence or presence of an item, the scores were also corrected to the level of agreement which can be assigned to chance by using the Kappa Coefficient. In this study the three judges each making a two-valued judgment would be expected to reach random agreement 25% of the time, agreement for these judges with the Kappa Coefficient was 0.915, thereby exceeding chance. Throughout the judging process, interrater reliability was maintained at over 90%.

Graphic indicator scores for 50 AD and control subjects exhibit similar variances and their skewness and kurtosis fall within the range expected for normal distributions for 95% confidence levels. There was a significant difference between the mean score for control subjects (M = 16.84 ± 6.71) and that for AD subjects (M = 42.12 ± 7.42), t(24) = 12.6, p ≤ .0001. The scattergram in Figure 2 illustrates these results. The scores show a separation of performance in which none of the control subjects scored above 29 and none of the AD subjects scored below 33.

Table 1 displays score data for each separate drawing task. Differences were noted in responses to different elements of the battery and from different subjects. Although no control subject refused any of the four tasks, three AD subjects declined #3, the family drawing, and two declined #4, the free choice.

Student's t tests performed for all four of the individual tasks show significant differences between the two groups of subjects. Although all tasks produced significant results, the strongest raw score difference was from task #2 (t = 12.57, p ≤ 0.0001) which asks the subjects to draw a picture including a house, a tree, and a person, whereas task #1, the request for name embellishment, elicited the smallest difference in raw score. (t = 5.69, p ≤ 0.0001)
Table 2 shows the subtotals of subject's scores according to drawings categories, A, B, C, and D. Although AD subjects were significantly higher than control subjects in all general categories shown in both Tables 1 and 2, the greatest overlap of individual scores occurred in Category C of Table 2, a finding confirmed in the results of t-tests performed according to categories. Variables in Category C measured drawing quality.

Possible interplay between scores and the ages of the subjects was explored by evaluating ranked ages and graphic indicator scores for both of the study groups. Figure 3 provides the configuration of the scores and ages for control subjects; Figure 4, contains the same information for AD subjects. For control subjects, there was a positive relation between age and high scores; an F-test shows a large ratio of the Means Squared for controls (212.449), the probability of this being a random occurrence is .0257. For AD subjects, the results were different; no relation was apparent. Means Squared was much smaller (5.19), and there was a .7511 probability that the effects of age on scores is random.

Results were also analyzed according to the individual variables from the Graphic Indicator List. There were several differences in response patterns between control and AD groups. No single variable was scored for all control subjects, but two variables, Minimal response and Pauvity in content appeared at least once for all AD subjects. Six variables were scored in more than 60% of the batteries from Control subjects; 16 variables were scored for 60% or more AD subjects. Frequency by percentage of responses to the 39 variables was tabulated. Clusters and divergences in the incidence of individual variables was also examined for analysis by stepwise regression.

The 11 variables identified as the strongest by stepwise regression were compared to the 11 variables with the greatest raw frequency. They overlap in seven variables: Concrete response; Confused response; Specific neglect/dominance; Omission of essentials; Evidence of faulty recall; Bizarre content; and Perseveration in theme.

Objective measures of findings included several features in addition to the graphic indicators. They include the use of time and material.

The mean time for control subjects to complete the battery of four drawings was 42.2 minutes while AD subjects took an average of 30 minutes. Within the measures of each group there were sizable variances, the SD for controls was 17.3, for AD subjects it was 9.6. Control subjects took one-half minute lag time before starting each drawing while AD subjects took slightly more than one minute for each. The actual drawing time for separate tasks was close for the two groups, control subjects spent 4.6 minutes per drawing and the AD subjects spent 4.2 minutes. Neither difference was significant when subjected to a t-test.

**Drawing Materials**

All subjects had identical opportunity to choose from the same materials which were displayed in a consistent position. The materials included thick and fine markers, oil pastels, a #2 pencil with an eraser, and a pen. Results appeared to indicate that many of the subjects were indifferent or at least casual about materials. Ten control subjects (40%) and 11 AD subjects (44%) chose to use the same single tool throughout for all four drawings. One subject from each group elected to use his personal pocket pen. A larger disparity was evident in
the way the remainder of the two groups responded to choices of materials; only 10 of the 95 drawings from AD subjects had two to four colors and none had more than four. Control pictures which had more than one color usually had many; more drawings included five more colors than the medium range of two to four.

Three categories were used to gauge individual use of material: (a) use of a single implement or color, (b) use of two to four colors or materials, (c) use of five or more colors. One hundred drawings from control subjects were rated and 95 from AD subjects. Table 3 illustrates the results.

Use of Space

All subjects used white 8" × 10" paper, presented horizontally. Nineteen control subjects drew on the paper as it was presented, three vertically and three mixed positions throughout the four drawings. Among AD subjects, 17 drew horizontally, five vertically, and three mixed the positions. These findings indicated that for this measure the two groups of subjects were comparable.

The amount of space used by the drawings was measured by a transparent template according to whether the drawing used less than one-third of the page, between one-third and two-thirds of the page, or more than two-thirds of the page. Again, 100 samples from the control subjects and 95 samples from the AD subjects were measured showing clear differences in the use of space between the two groups: 7% of control subjects used less than one-third of the space compared to 24% of the AD subjects. At the opposite end of the spectrum, 79% of control subjects used more than two-thirds of the page compared to 22% of AD subjects. These data are also presented in Table 4 and the difference between control and AD subjects is significant ($\chi^2(2) = 70.3, p \leq 0.0001$).

House Drawings

For research purposes, house drawings were the most common configuration which could be readily quantified for statistical analysis. To facilitate comparison, a linear measure of the area of the house picture was developed. First, the gross area covered by a house was calculated by multiplying the overall vertical and horizontal dimensions. The house was then quantified as the length of a side of the equivalent square. A total of 25 houses drawn by control subjects were measured; the mean length of the side of an equivalent square was 3.77 ± 1.43 inches. Nineteen house drawings by AD subjects were measured; the mean length of a side of an equivalent square was 1.94 ± 1.00 in. The t statistic measuring the significance of the difference between these data is $t = -4.76, p < 0.0001$, a value clearly indicating a significant difference. These data provided a simple example of the projective drawing analog of micrographia.

Discussion

Two current and widely publicized concerns are the "graying of America" and the high cost of healthcare. These well-documented phenomena heighten the potential usefulness of a relatively simple method of differentiation among the aging population. Results from the drawing battery were consistent throughout with test results for the same population of standardized psychological tests and high-tech medical procedures.

Replication of the procedure with other populations and with larger numbers would be potentially useful. The same procedure might be tested with a different assortment of graphic indicators designed for the anticipated characteristics of any clinical population. Levin and Benton (1988) discussed the relative merits of fixed batteries versus flexible or adjuvant strategy in neuropsychological assessment. Their conclusions are useful in any work with a clinical population. The contrasting needs of research and treatment can be addressed starting from a similar battery of techniques if the clinician is flexible. During the course of the above research, several potential subjects demonstrated needs beyond the boundaries of the study. Such individuals were responded to in a supportive, therapeutic way and were not included as subjects. Provisions for appropriate response in similar contingencies should be incorporated in all research design.

The attempts by art therapists to understand people, their strengths, and their pathology by way of their art processes and products will continue to be a challenge. For research, many models and the admixture of many resources is demanded. The rewards of crisp and useful results are possible and certainly within the purview of well-trained art therapists.

THE 5TH ANNUAL CONFERENCE ON TRAUMA AND DISSOCIATION
SEPTEMBER 22 - 25, 1994 - DALLAS TEXAS

Sponsored by the Texas Society for Study of Trauma and Dissociation

CONFERENCE THEME: The conference will focus on intervention techniques and clinical issues concerning trauma and dissociation. Topics will include ritual abuse, childhood abuse, dissociative disorders, symbolic ventilation, creative arts therapies, hypnosis, "false memory" syndrome, male victims, and integration and post-integration techniques. Also featured:

✔ Pre-conference Institute on Art Therapy and Family Violence
✔ Sessions on "Using Drawings in the Assessment of Children from Violent Homes" & "Forensic Art Therapy"

For a conference brochure, please contact: Family Violence and Sexual Assault Institute, 1310 Clinic Drive, Tyler, TX 75701 (903) 595-6600.
Brief Reports

The Imagery and Expression of Anger: An Initial Study

Abstract

This study, the first in a projected series, investigated the relationship between anger and anger imagery and between anger and positive action. In addition, the colors, themes, and formal elements used to depict anger were explored. Forty-six college students completed a social action questionnaire, a drawing representing anger, and Spielberger's State-Trait Anger Expression Inventory. A significant positive correlation (p < .05) was found between intensity of anger imagery and State Anger, and the correlation between Anger Expression scores and social action tended toward significance (p < .10). A qualitative analysis of the drawings indicated that there are common signs and symbols used to express anger in drawings and suggested a therapeutic technique for further development. Overall, the results support clinical experience in art therapy.

Introduction

Our ideas about anger are changing. We view it as both more positive and more complicated than we once did. Advice columns in the newspaper tell us that it can be a positive force. Popular self-help books have alerted us to the dangers of the denial of anger, on the one hand, and its inappropriate expression, on the other (Lerner, 1985; Tavris, 1989). Turning to the professional literature reveals studies that cast doubt on earlier conceptions of the psychology of anger. For example, watching aggressive sports has been shown to increase hostility rather than to reduce it through catharsis (Goldstein & Arms, 1971). Further, there is evidence that verbal expression of anger is ineffective in ameliorating aggression—unless it is combined with a reinterpretation of the stimulating event (Green & Murray, 1975).

Our changing viewpoint has had implications for the practice of therapy. The realization that there are optimum levels of experiencing anger and preferred modes of expressing it has led to the development of anger management programs to assist clients in recognizing and harnessing anger. The techniques for this process are still evolving, but relevant findings suggest that visual modalities have a role to play.

Consider research in the areas of imagery and color. Imagery interventions have been shown to have potent therapeutic utility (Korn & Johnson, 1983; Sheikh, 1984). More to the point, imagery has been found to enhance the effectiveness of verbal cognitions in altering unpleasant moods (Means, Wilson, & Dlugokinski, 1986–87). In regard to color, art therapy research (Ley, 1980) has provided support for one of the field's primary assumptions: that a consistent relationship exists between color and emotion. These developments suggest that art therapy can make an important contribution to the process of anger management—either as part of a specialized program or within the context of a more comprehensive course of treatment.

Finally, there are indications that anger, social activism, and optimum psychological functioning are linked. In their work on moral commitment, developmental psychologists Colby and Damon (1992) speculate that "people . . . who spend their lives fighting for social justice, need the harder edge that anger provides" (p. 128). A previous study supports this conjecture. As part of an investigation of imagery and nuclear attitudes (Kaplan, 1988–89), antinuclear activists produced more vivid images of anger. Similarly, a connection between activism and healthy functioning can be inferred from current formulations of ego development (Loevinger, 1976). In these, concern for social problems is generally a characteristic of the higher developmental stages.

The larger purpose of this study, then, was to increase our understanding of how art expression relates to anger so that it can be more effectively used for dealing with this complex emotion. More precisely, this study was designed to investigate the relationships between anger, imagery, and positive social action and to explore typical themes, colors, and formal elements used to express anger in drawings.

Method

Research Participants

The sample consisted of 46 undergraduate students. The participating students—37 women and nine men—were members of an introductory course in art therapy and two sections of a course in educational psychology. They had a mean age of 21.3 years and reported their ethnic origins as white (39), Hispanic (4), and black (2); one person did not indicate ethnic group.

Frances F. Kaplan, DA, A.T.R., is coordinator of the Creative Arts therapy program at Hofstra University, NY.
Measures

The research tools were an activity questionnaire, an anger imagery drawing procedure, and Form HS of the State-Trait Anger Expression Inventory (Spielberger, 1988). The activity questionnaire, considered a measure of positive action, and the anger imagery drawing procedure were developed for the purposes of this study. As mentioned above, previous research (Kaplan, 1985–89) had found a relationship between anger imagery and social activism. Thus, I devised a brief questionnaire to determine whether participants had ever been involved in or financially supported the work of any social action groups (see Table 1). The imagery drawing procedure was a modified version of one used in the same study. Participants were instructed as follows: "If anger were something you could see, what would it look like? Draw a picture and give it a descriptive title."

The State-Trait Anger Expression Inventory (STAXI) is a research instrument that measures the experience and expression of anger. It contains six scales that assess amount of current anger (State Anger), propensity toward anger (Trait Anger), tendency to turn anger inward (Anger-in), tendency to direct anger outward (Anger-out), degree to which anger is prevented (Anger Control), and a general index of the frequency with which anger is expressed (Anger Expression). Individuals rate themselves on four-point Likert-style scales for each of the 44 STAXI items. Examples of these items are "I am quick tempered" and "I control my angry feelings." Studies reported in the STAXI manual (Spielberger, 1988) indicate good concurrent validity and internal consistency reliability. Normative data is available for the college population used in this investigation.

Procedure

The participants were administered the research instruments during one of their regularly scheduled class sessions. They were given self-rating research packets containing a demographic data sheet, the social action questionnaire, a sheet for the anger imagery drawing, and the STAXI item booklet. Each participant was also supplied with a pencil, a small box of cray-pas, and a packet of assorted markers. So that the anger imagery would be as spontaneous as possible, participants were directed to complete the drawing before responding to the anger inventory. No time limit was imposed for completion of the research measures.

Drawing Analysis

The drawings were subjected to both a quantitative and qualitative analysis. For the quantitative analysis, the drawings were ranked in regard to anger intensity. An independent rater scored the drawings on a three-point scale based on a global assessment of expressed anger. As a reliability check, I also rated the drawings. Comparison of the two sets of scores resulted in a satisfactory interrater correlation of .75. However, in order to minimize bias, only the other rater’s scores were used in the calculations.

The qualitative analysis involved a careful examination of the artwork to determine typical colors, themes, and formal elements. This analysis was conducted by myself with the assistance of an art therapist in training. First, I sorted the drawings to derive categories of themes and colors. The student then sorted the drawings using my categories. This resulted in 98% and 80% agreement, respectively, for color scheme and content classification. Again, to minimize bias, the student’s ratings were the ones used. The analysis of formal elements focused on the characteristics of the "angriest" drawings. The student and I independently noted our impressions. Because there was a general concurrence on characteristics, those reported represent a summary of the two responses.

Results

Quantitative Findings

As an indicator of the relationship between anger and positive action, Anger Expression (AX/EX) was statistically compared with social action. Since the scores for the STAXI scales are considered to be in the normal range if they fall between the 25th and 75th percentiles (Spielberger, 1988), AX/EX scores were sorted into three categories—low, average, and high—based on their percentile rankings. Social action was treated as a dichotomous variable reflecting whether or not participants reported involvement in social action groups.
(The remainder of the information on the social action questionnaire served as confirmation of this involvement.) A frequency distribution for AX/EX categories versus social action is presented in Table 2. Inspection of this distribution suggests a curvilinear relationship between the two variables. Although the chi-square value was nonsignificant ($\chi^2 = 2.25, p > .10$), combining the high and low AX/EX category scores and computing a Pearson correlation coefficient produced a marginally significant result ($r = .21, p < .10$, one-tailed test) in the predicted direction. This provides some tentative support for the notion that moderate levels of anger facilitate actions leading to change.

A similar analysis of the relationship between image intensity and social action was conducted. (See Table 3 for a frequency distribution of these variables.) Calculations yielded a larger but still nonsignificant chi-square ($\chi^2 = 4.33, p > .10$) and a significant correlation ($r = -.29, p < .05$, one-tailed test). The negative direction of the correlation seems to contradict the results of the preceding analysis. However, calculation of correlation coefficients for image intensity ratings and the raw scores for the six STAXI scales produced only one significant result—the value for the correlation between State Anger and image intensity ($r = .26, p < .05$, one-tailed test). This suggests that image intensity reflects current angry feelings rather than a general tendency to experience anger. Nevertheless, it is of interest that those expressing a moderate amount of angry feelings were less likely to have engaged in social action. (A possible explanation for this is offered in the Discussion section of this article.)

peared more dynamic, and had heavier line pressure. When faces were the theme, their expressions seemed decidedly angry.

**Discussion**

The results of this study offer varying degrees of support for the following conclusions:

1. There is a relationship between normal levels of anger and action to promote change. Although this conclusion received only tentative support, it is in line with both clinical and everyday experience. Stronger findings might have resulted if another action variable, such as assertive behavior, had been used. Indeed, there are indications that this would be the case. Doyle and Biaggio (1981) found that asserters expressed more anger than nonasserters. However, they used
different measures of anger and, hence, somewhat different constructs than those used in this study.

2. There is a relationship between how angry a drawing looks and how angry the artist feels. The evidence suggests that this applies more to trait than to state anger. However, in regard to the latter, the qualitative results point to drawing content as a promising area for further investigation.

3. There are certain colors, themes, and formal elements that are commonly used in depicting anger. The qualitative findings that lead to this conclusion could be considered "soft" evidence. But these findings are reinforced by a particular aspect of the quantitative analysis. The rater for the drawings was not an art therapist; yet he readily differentiated drawings in respect to anger intensity and received validation of his rating through the significant correlation with the State Anger scale. This suggests a degree of universality, at least within our culture, for the graphic signs and symbols of anger.

4. Individuals producing moderately intense images of anger are less likely to engage in social action. Although the evidence is insufficient to rule out the possibility that this conclusion results from error, a plausible explanation can be offered. Perhaps those who experience anger unequivocally are more likely to have it available for constructive use. If this is so, another dimension is added to the relationship between anger and positive action. That is, for the two to be strongly linked, it may be necessary to have a moderate propensity to express anger along with a strong tendency to experience it fully when it occurs.

As a final point, the therapeutic implications of this study deserve attention. It is no revelation to art therapists that drawings can be used to deal with anger. However, the possible relationship between drawing content and trait anger suggests a novel approach to anger management. Should the association between drawing content and trait anger prove strong, those who experience too much or too little anger
might be guided toward moderation through gradual changes in their anger imagery.

Art Therapy and Alexithymia

Abstract

This study investigated the effect of alexithymia upon a person's art production. Subjects were 100 patients, 24 men and 76 women, hospitalized on an inpatient psychiatric unit. The Toronto Alexithymia Scale and 100-mm analog scales for depression and anxiety were administered. Each subject was asked to draw, then identify his/her illness. Verbatim associations were recorded. Artwork was rated as concrete, abstract, combination of the two, or symbolic. Number of colors used and presence or absence of body parts were noted. No significant correlations were found. All subjects, even those quantified as alexithymic, were able to graphically communicate their illness using these instructions. These results suggest the possibility for art therapy to contribute significantly to the multidisciplinary milieu.

Introduction

This paper reports a study done by art therapists in collaboration with the chairman of the department of psychiatry at a community-based teaching hospital. It was conducted on the 34-bed inpatient psychiatric unit, which is unlocked and treats voluntary adults and adolescents. All patients are managed by private psychiatrists who refer patients to creative arts and group therapies.

The study investigates the effect of alexithymia, an empirically measurable personality trait, on a patient's diagnostic art production done in response to the direction, "draw your illness." It, therefore, combines an objective instrument with artwork, which is subjective and less quantifiable. Past art therapy research that combines empirical measures with artwork includes authors Cohen, Hammer, and Singer (1988); Gantt (1990); Miller (1989); and Silver (1976, 1982, 1988).

Alexithymia

The term alexithymia was coined by Sifnico (1973) from Greek origins meaning absence of words for emotions. Bagby, Taylor, and Parker (1991) include the following features in defining alexithymia: (a) difficulty in identifying and discussing feelings, (b) difficulty in distinguishing between feelings and the bodily sensations of emotional arousal, (c) constricted imaginative processes as evidenced by a paucity of fantasies, and (d) an externally oriented cognitive style" (p. 155).

Because of these characteristics, the presence of alexithymia has been shown to reliably predict difficulty using verbal psychotherapy (Bagby et al., 1991). It can be identified and measured through a variety of instruments; for the pur-
pose of this study, the Toronto Alexithymia Scale (TAS) was used. The present study investigates the relationship of alexithymia to an individual's ability to utilize art therapy.

We hypothesized that patients who score high on their TAS will: (a) respond to “draw your illness” with concrete imagery, (b) use three or fewer colors, and (c) somatize their illness by depicting human figures or parts of figures (somatize defined as mental illness manifested in the human body, excluding brain/mind). We further hypothesized that patients who score low on their TAS will: (a) respond to “draw your illness” with abstract imagery, (b) use more than three colors, (c) not depict the body, and (d) likely combine abstract and concrete imagery.

Method

Subjects

The subjects for this study were 100 patients hospitalized within a community-based, open inpatient psychiatric unit. Patients excluded from participation included those too psychotically disorganized to cooperate with the protocol as well as those with significant cognitive impairments due to delirium or dementia.

Measures

Alexithymia was measured dimensionally utilizing the TAS. The TAS is a 26-item self-report instrument demonstrated to have internal consistency, good reliability, and construct and criterion validity that measures alexithymia characteristics. A global score based upon the method reported by Bagby, Taylor, and Atkinson (1988) was used.

Depressed and anxious affects were individually assessed utilizing a 100-mm visual analog scale with greater values indicating more dysphoric affects. These scales have been demonstrated to provide a valid and reliable assessment of global affect (Morrison, 1990). The subject also was asked if he/she was color blind.

Each subject was asked to draw a graphic representation of his/her own illness. The materials used were 18” x 24” paper and a 24-color box of pastels.

It was decided to minimize the number of measurable variables by using only one drawing. Drawing the patient’s illness was used because it:

1. Required the patient to conceptualize and graphically communicate his/her view of the illness;
2. Helped bypass defenses such as avoidance, intellectualization, and denial by acknowledging the reason for hospitalization;
3. Elicited whether the patient viewed his/her illness as psychiatric or somatic;
4. Served as a symbol which could be modified as the patient progressed in treatment.

After completing the drawings, each subject was asked to identify the illness drawn. Verbatim associations were recorded by the art therapist. This art production was scored as to whether it was abstract, concrete, combination of abstract and concrete, or symbolic. We defined these terms as follows:

Concrete: A literal response reflected in representational or realistic imagery (Figure 1).

Abstract: “The reducing of the visual statement down to the basic elements, bearing no connection to any representational information drawn from experience of the environment.” (Dondis, 1971) (Figure 2)

Symbolic: “A simplified image that represents an idea or concept known to many, such as musical notes, numbers and words.” (Dondis, 1971) (Figure 3)

Other considerations included the number of colors used and the presence or absence of actual body parts. Each of these parameters was judged independently by three of the authors. In cases where there were differences, a consensus was reached. Statistical analysis was performed using the SPSS Statistical package. Both demographic and inferential statistics were utilized. As the data distributed in a normal
ments, abstract elements, number of colors, body parts, or presence or absence of both concrete and abstract elements.

Due to the lack of significant correlations, the drawings were rescored for the presence or absence of symbolism. This did not yield significant association with the designation of alexithymic characteristics. Similar lack of significant association was found between the presence or absence of depression and anxiety utilizing the median split. Similar analyses were run by partitioning patients into very alexithymic subsets above 72, and very nonalexithymic below 62.

**Discussion**

The majority of patients in this study are suffering from major mood disorders. Given the high incidence of this diagnosis on psychiatric units (approximately 60%), the findings from this study are useful. No significant correlations were found among the TAS, 100-mm lines for depression and anxiety, and variables measured in the artwork. Thus the findings refute our hypothesis. Also, patients with high TAS scores sometimes were able to abstract and use three or more colors. One reason for this may be the use of the TAS versus other instruments which measure alexithymia. Concern was raised about the validity of the TAS because some patients who clinically appeared alexithymic scored low on the TAS. However, this may be related to the state effect of depression (Wise, Mann, & Sudy, 1992). Other considerations that may affect the use of abstraction and colors include diagnosis, talent, IQ, or past exposure to art therapy.

The "draw your illness" picture combined with the TAS and 100-mm line proved a useful assessment with psychiatric patients. When obtained early in a patient’s stay, the drawing helped establish a therapeutic alliance. It provided an understanding of the patient, which was useful when formulating art therapy interventions. The data of the research package has been well-received at multidisciplinary staff conferences and clinical rounds since it offers a blend of quantifiable data with artwork. Although no correlations were found, it is nonetheless significant that all patients, even those clearly alexithymic, were able to graphically communicate their illness with these instructions.

Future research might include examining color preferences, measuring primary or secondary alexithymia, rating size of self when drawn, and perhaps requesting a second drawing of health. This research series also could be compared with 100 drawings from medically hospitalized, nonpsychiatric patients.

We believe that art therapy can be used successfully with alexithymics to promote exploration of emotions. The merits of “concurrent group and individual psychotherapy” for such patients is addressed by Swiller (1988), and we suggest that group art therapy can offer yet another therapeutic dimension. Art therapy offers a richly symbolic visual means for alexithymics to begin to express, recognize, and discuss feelings within a supportive setting.

Report on the National Art Therapy Practice Analysis Survey

Joan E. Knapp, PhD, Lenora G. Knapp, PhD, and Joan Phillips, MA, MS, LMFT, LPC, A.T.R.

Introduction

In 1993, the American Art Therapy Association, Inc. established the Art Therapy Credentials Board, Inc. (ATCB) to oversee the development and administration of a certification program for art therapists. As the first step in this process, the ATCB contracted with Knapp & Associates of Princeton, New Jersey, to conduct a practice analysis of the art therapy profession to identify the tasks entry-level art therapists must perform in practice and the knowledge necessary for competent performance. The definition of the field, provided by the practice analysis, lays the foundation for developing examination specifications and content and guides the examination development process. Linking the examination to practice analysis data establishes the content validity of the examination and helps to ensure that the examination accurately reflects the profession of art therapy as it is performed in actual practice settings.

Method

The first phase of the practice analysis consisted of a review of literature and documents related to the profession of art therapy. This review included membership reports, journal articles from Art Therapy: Journal of the American Art Therapy Association, AATA Code of Ethics and General Standards of Practice Document, art therapy competency lists developed by educators and academic curriculums and course descriptions from art therapy graduate programs across the country.

Based on information obtained during the literature/document review, a semistructured telephone interview was designed to identify the responsibilities, techniques, procedures, and knowledge essential for competent performance in the practice setting. Interviews were conducted with 11 art therapists representing diverse geographic locations, theoretical orientations, and practice settings.

Data from the practitioner interviews and literature/document review were used to develop preliminary lists of the major responsibilities of the profession of art therapy, the tasks subsumed within these responsibilities, the major knowledge areas required for competent performance of the responsibilities and tasks and the specific knowledge included in these areas. These lists were formatted into a draft practice analysis survey. For the responsibilities section, each task was accompanied by a five-point Likert scale with which to rate the importance of competence in the task for an entry-level art therapist. Each specific knowledge area was accompanied by two 5-point rating scales: importance (how important is an understanding of the knowledge area in order for the art therapist to adequately serve and protect clients?) and the extent of knowledge that is necessary to adequately serve and protect clients (i.e., basic concepts, application, in-depth mastery).

After review and revision by the Certification Committee, the draft survey was piloted on a small sample of art therapists (N = 12) to determine whether the directions, rating scales, and items were clear and if the survey and content were both accurate and complete. Feedback was discussed with the Certification Committee and revisions to the survey...
were made. The final list of major responsibility areas is presented in Table 1. Table 2 shows the major and specific knowledge areas included in the survey. The survey was mailed to all current Registered Art Therapists (A.T.R.s) (N = 2500).

   K. Federal, state, and local laws regarding educational rights
   W. Universal precautions regarding body fluids

Results

The practice analysis survey was completed by 1,125 A.T.R.s for a return rate of 45%. Based on experience with similar surveys, Knapp & Associates considered this to be an excellent return rate for a practice analysis survey and an indication of the strong commitment of A.T.R.s to the advancement of the art therapy profession.

Demographics

As can be seen from Figure 1, the survey sample included representation from all major geographic regions of the United States. The overwhelming majority of respondents were female (94%) and Caucasian, non-Hispanic (91%) (see Table 3 for further detail on racial/ethnic representation in sample). Eighty-two percent of the sample was age 35 years or older (see Figure 2).

With respect to education and professional experience, the majority of survey respondents were graduates of Master’s degree programs in art therapy (66%) (see Figure 3) and had

been practicing art therapy for six or more years (77%) (see Figure 4). As shown in Figure 5, on average, the therapists surveyed reported spending nearly half of their professional time engaged in direct client service. Survey respondents practiced in one or more of a variety of settings, with the largest percentage of professional time spent working in psychiatric hospitals (25%) (see Table 4).

**Practice Dimensions**

Table 5 presents the rank order of mean importance ratings for the major responsibility areas. The rankings indicate that the A.T.R.s sampled rated “creating a therapeutic environment” as the most important major responsibility of entry-level art therapists. Other major responsibilities that lay a

foundation for competent practice, such as professionalism and ethics (e.g., recognizing professional limitations, participating in continuing professional education) and documentation, were rated as the most important. Finally, the responsibilities determined to be the least important for entry-level art therapists were those related to specific forms of art therapy services (e.g., client assessment).

The rank order of mean importance ratings of the major knowledge areas suggests that the areas rated as most crucial to adequately serving and protecting clients are those that most directly determine how the entry-level art therapist will conduct and plan treatment (e.g., art therapy theory and practice, psychotherapeutic practices, client populations) (see Table 6). Knowledge less relevant to day-to-day practice (e.g., research methods) were perceived as less important.

As shown in Table 7, the rank order of mean extent of knowledge ratings closely parallels the mean importance ratings, indicating that the A.T.R.S surveyed believe the knowledge areas most directly related to the delivery of client services must be mastered at a greater depth than areas that have a less direct impact on the provision of art therapy services.

### Conclusions

Demographic data from the practice analysis survey was consistent with that of the 1990–1991 Membership Survey Report (Gordon & Manning, 1991), confirming that the survey sample was representative of the population of registered art therapists. In addition, the responsibilities and knowledge derived from the practice analysis project were similar to art therapy competencies developed by art therapy educators (Lusebrink & McNeill, 1979; Lusebrink, 1979, 1981; Lusebrink, Nuehn, Riley, & Ault, 1980). Given the excellent return rate for the survey, the representativeness of the sample, and the consistency of the data with previous studies of the art therapy profession, it is believed that the survey captured the diverse perspectives that exist with respect to art therapy and provided accurate information with which to define the profession as it is actually practiced in the field.

### Implications for Examination Development

Data obtained from the practice analysis survey will assist the ATCB in determining the content of the art therapy certification examination and ensuring that the content is consistent with professional practice. A panel consisting of ATCB Certification Committee members and other subject matter experts will link each specific knowledge (e.g., confidentiality regarding client records and artwork) to appropriate knowledge area(s) (e.g., client assessment, provision of art therapy services), thereby producing a matrix of examination specifications. This is accomplished by determining, through group consensus, whether the knowledge is crucial to competent performance of the responsibility. Next, operational definitions will be developed for the responsibilities and knowledge in the examination specifications matrix.

These definitions expand upon the specifications by citing the actual situations and knowledge to be tested. Thus, the operational definition for confidentiality of records and its limits might include reference to how the reporting of child abuse impacts confidentiality. Operational definitions serve as detailed guidelines for writing examination questions and assembling the examination. The process outlined above conforms with professional standards and legal requirements for the development of professional certification examinations and will enable the ATCB to link the examination to actual practice by relating its content to the definition of the profession provided by the practice analysis survey.

Commentary on the Assessment Portion of the Art Therapy Practice Analysis Survey

Joan Phillips, MA, MS, LMFT, LPC, A.T.R., Chair, Certification Committee, Art Therapy Credentials Board, Inc.

Art Therapists and Assessment

It is ironic that the general public often views art therapy as dealing with the use of drawings in a diagnostic manner, while within the field of art therapy little consensus has developed over the years as to what types of assessments are legitimate and which ones (if any) should be taught to students of art therapy. In summarizing and presenting the findings of the Art Therapy Practice Analysis Survey, assessment emerged as an area of ambiguity. Assessment was rated as "very important" by a majority of art therapists, yet little agreement was found on what specific techniques and methods are necessary for the entry level art therapist to have working knowledge of. Discussions surrounding this issue have raised perennial questions that our field continues to give lip service to; the need for rigorous research to validate assessment methods, as well as questions about the overall validity of assessing. Not surprisingly, in the context of examining who we are as a profession, we find out we have a wide range of views about how we assess others.

In reviewing the research literature on projective drawing techniques used with children, Neale and Rosal also reviewed the major positions and questions raised by art therapists in relation to using drawings in assessment: "The question of using drawings for diagnosis has always divided art therapists into two camps—one fears that objectivity is lost if art is used for diagnosis and the other fears that the richness of art is lost if specific indicators are examined" (Neale & Rosal, 1993). Responses to the task analysis survey point to far more than two camps, and much complexity and "fear" does surround the issue of assessment and using drawings diagnostically.

Another survey of child art therapy assessments found that art therapists surveyed cited use of many different techniques—some were modifications of existing projective techniques and others self-developed. "A question that is begged by the proliferation of assessments...is the difference between subjects or themes for drawings, and evaluations or assessments." They also note that "The presence of a number of assessments with which the authors were unfamiliar seems evidence of an 'oral tradition' operating in the field of art therapy" (Goodwin & Mills, 1991). Several art therapists have worked hard in developing and studying specific assessment tools. However, the current availability of information in published format about these assessments is limited, as is the range of expertise reflected in research done on these tools. Most art therapists appear to train themselves in assessment as they grow professionally and do not enter the field with a very wide working knowledge of specific assessment tools and studies.

The General Standards of Practice Document prepared by the Clinical Committee of AATA defines assessment as "the use of any combination of verbal, written, and art tasks chosen by the professional art therapist to assess the individual's level of functioning, problem areas, strengths, and treatment objectives" (1989). The problem, from a certification viewpoint, is what particular "verbal, written and art tasks" should an entry-level art therapist have knowledge of and be able to apply in a practice setting. Consumers of art therapy should be able to expect some basic level of competency in assessment from an art therapist—yet how are we to define this competency?

Given that assessments involve the use of art, will we ever have fully validated instruments utilizing standard scientific and quantitative methods of establishing validity and reliability? There is a precedent with such work, e.g., Exner's scoring system for the Rorschach. However, such a comprehensive system is not currently available for most art therapy assessments.

Practice Analysis Survey Development and Results Regarding Assessment

Even before the initial draft of the survey instrument was finished, the Certification Committee of the ATCB had debated which, if any, particular assessments to include on the survey. Many committee members felt they had been out of school a long time and thus were not familiar with particular assessments; however, the feeling was that "new" art therapists probably know a lot about these. Talking with "new" art therapists later I found they held assumptions that "other" art therapists might know specific assessment tools, but they frequently commented that "my school didn't teach that." Another discussion in the committee had to do with whether we could ask about projective drawings such as the K-F-D or D-A-P since these projective techniques were more solely the province of psychologists or other professionals and we might be legally liable somehow if we even implied (via a question on the survey) that art therapists administer these projective devices. It is true that specific training in the use of standardized projectives is a prerequisite to using them; indeed, however, no one profession can lay sole claim to this territory and an art therapist trained to administer them is not limited by the test itself. (Apparently some states have tried to limit who uses such techniques through specific licensure and scope of
practice language; but it is not the technique itself that "belongs" to any one profession at this point.) Related to this issue is the ethical issue of art therapists using tests or techniques for which they have only gone to one workshop. This latter issue may really be the area where we should focus our concern.

In facing what specific assessments we might include on the survey, Knapp and Associates commented that it appeared our field had many assessments bearing the names of their creators. Goodwin and Mills in discussing this trend of individually developed or modified techniques note that, "This may be testimony to our professional identity as artists and innovators. It may also indicate widespread unfamiliarity with or rejection of published assessments."

When the actual survey went out and was answered by almost 50% of the current A.T.R.s, the main trend was that "free art assessment" (which the survey did not define) was important along with "standardized projective drawings" such as the House-Tree-Person or Draw-a-Person. The highest area rated in the assessment section was the "analysis and interpretation of process, form and content in art." The latter suggests that we as art therapists do a lot of assessment, but the other data indicate we all do it in our own way at this point. Thus, we noted that the responses to the survey items about assessment agreed in the main that art therapy assessment is an important area, yet when specific assessment "tools" were listed, the importance ratings dropped and no one or two assessments were agreed upon as applicable knowledge or skills we should expect of an entry level art therapist.

As professional art therapists we often tout the diversity of our field as an asset and indeed the assessment portion of the survey was quite diverse and yielded the least consensus of any area on the survey. Comments fell into three major areas: (a) "I never do assessments" (either out of choice or the setting doesn't require them); (b) "I am always doing assessment, I just don't separate it out as such"; and, most frequently, (c) "I use my own assessment." Comments from a variety of art therapists indicated they felt alarmed to see art therapy assessments and/or projective assessments listed that they either were not taught in school, don't feel are being taught now, or don't feel should be taught. Conversely, others commented that particular assessments (such as the DDS) were of paramount importance and should be part of any assessment issues tested in a national exam for art therapists.

Implications of the Survey Results in Exam Development

Do any of the currently available assessment methods developed by art therapists have sufficient research to support their use by the entry level art therapist? What art therapy assessment methods are and should be taught to graduate students of art therapy? Lacking answers to these questions: What does all this mean in relation to the development of a certification exam? It means that for now, any test items about assessment will reflect general knowledge of projective techniques and of assessment issues—not knowledge and application of specific assessment tools. While this relieves some and disappoints others, it is the only defensible action that will reflect our profession's current position regarding assessment. The absence of a lot of items about specific assessments on the certification exam is not a statement that specific assessments are not important; it reflects the lack of consensus about assessment and to what extent assessment is viewed as an essential part of the repertoire of the entry level art therapist.

As the dialogue deepens regarding assessment, and as educators consider the utility and empirical validity of particular assessments, future certification examinations will reflect more focus on this area. Until then, it is my opinion that much more discussion, research and dialogue needs to take place, and as professionals we must all address individually and then collectively our position regarding assessment. We must also realize pragmatically the importance of assessment in this era of "gatekeepers," managed care and the like. Most, if not all, clinical settings mandate "assessment" as the basis of and justification for specific treatment plans. On a meta-level as well, we are being "mandated" into licensure as a basis for inclusion of art therapy as a valid service. One can quite reasonably argue the utility and humanity of these trends; yet we must respond in some manner to this context. The development of the certification exam from within our own field is one response to these mandates.

"We attempt to confirm, moderate and predict the outcome of our treatment process through the fervent study of client artwork. Yet we must do so cautiously and in reverence to the artwork, which tells us so much more than we can describe" (Henley, 1987). Similarly, in our move toward certification and study of ourselves as art therapists, we must realize that who we are is much more than what can be described and tested for, yet we proceed cautiously toward validating our profession through describing the essential tasks that link us in our valued diversity.

Diving and Snorkeling: The Depths and Shallows of Therapy

Harriet Wadeson, PhD, A.T.R., HLM, Evanston, IL

Many years ago when I first glimpsed the under water world through my snorkel mask, I felt I had traveled to a different planet. That watery world that had been all around me as I saw it from the land, suddenly revealed itself in a dazzling brilliance of colors, exotic formations, muffled sounds, and movement that rocked me in its rhythm. Entering a client's world is like that. The sights, the sounds, and the rhythms sway differently from my own.

But diving into the wreck goes far beyond snorkeling. It is dark and foreboding down there. Vestiges of destruction are everywhere, the safety of air more distant. No wonder clients, and sometimes therapists, prefer to stay just below the sunlit surface.

Surface swimming sometimes makes me feel that I am not doing my job. A psychotherapist, and especially an art therapist, should dive deep into the wrecks of psychic disasters, not merely skim the surface to look down from a distance at the barnacled, dismembered vessels on the bottom of the sea. Often, however, I find myself splashing the surface with clients as they wrestle with their daily antagonists—spouses, bosses, co-workers. I will be reminded of their repeated patterns and childhood ghosts, but the clients may be too besieged by their current encounters to pay much heed to my reminders.

For example, Jane, a survivor of incest by older brothers and cousins, feels used by her supervisor and co-workers. Together, we develop strategies. They work. She has learned to reflect instead of immediately agreeing to extra work which previously left her feeling resentful and used. I remind her that her family life had trained her to be a passive victim (victim is her word); her childhood depended upon it. But now she can stand up for herself. I do not know whether she hears me or not. What is important is that she is changing her life.

Some years ago, I worked with Janet, a patient with ulcerative colitis. Frequently her pain, nausea, and diarrhea made it impossible for her to go to work. After seeing several physicians and undergoing a number of tests, she was told her problems were completely emotionally based. I saw her once a week for nine months in outpatient therapy. This was her only treatment. She dealt very little with her past except to inform me that she had been adopted and that whenever she was bad, her parents threatened to send her back to the orphanage. In therapy she focused on her current work situation, where she was a perfectionist, and friendships, most of which revolved around the workplace. At the end of nine months she had learned to relax her work efforts, had received a promotion, and made friends elsewhere. But of most significance, her colitis symptoms had vanished. At our last session I asked her what she thought had helped. She said this was the first time in her life she had a relationship in which she did not feel judged. She never explored her past.

I am reminded of yet another client, Marcia, a middle-aged woman who I began seeing six years ago, and now see only every several months. She was referred to me after her second serious suicide attempt. While hospitalized, she expressed her feelings for the first time in response to a drawing she made. It took a long time in our work together for her to get in touch with her anger and sadness and to express them. For the first several years, it often seemed nothing was happening in our sessions. Looking back to that period, she said, to my surprise, that if I had moved to another part of the country at that time, she would have had to follow me. Unfortunately, twice while I was on vacations she became quite depressed, and her husband worried about suicide. During one of these vacations, she hospitalized herself. Eventually, her artwork began to show her sadness and anger, the latter especially in relation to her husband. Her focus was her marriage, her children, and her current care of her parents. Like Jane and Janet, little attention was given to her childhood. Nevertheless, Marcia changed her life. She relates to her husband differently and is content with her marriage and values herself more. She is generally happy and has been for several years. Once again, snorkeling, not diving. Still, Marcia has become a strong swimmer.

Psychoanalyst Hilde Bruch writes:

I have observed over and over again that therapists who focus on their patient's daily lives, and how they feel about and get along with people, have better treatment results. . . . For uncovering and correcting underlying causes, it is more helpful to begin with the immediate relevant aspects of a patient's malfunctioning. . . . (1974, p. 38)

Connie, another incest survivor, does dive deeply into the wreck and surfaces with paintings of fury, despair, and imprisonment. Sometimes she cries insubordinately. Yet, the
movement in her life is more of a surface water swim than an underwater plunge. Like Marcia and Janet, she is learning to become aware of her current feelings, especially her interpersonal reactions, to assert herself, and to set limits. Once again, my attempts to draw connections between the past and the present receive polite attention. I do not know if they help Connie to feel understood or enhance insight.

I have borrowed the phrase "diving into the wreck" from a poem by Adrienne Rich (1984). Its imagery and meaning speak to me of the delicate and dangerous work I do with clients:

the thing I came for . . .
the drowned face always staring
 toward the sun
 the evidence of damage
 worn by salt and sway into this threadbare beauty
 the ribs of the disaster
 carving their assertion
 among the tentative hauntings . . .
 We circle silently
 about the wreck
 we dive into the hold.
 I am she: I am he
 whose drowned face sleeps with open eyes . . .
 we are the half-destroyed instruments
 that once held to the course . . .
 We are, I am, you are
 by cowardice or courage
 the ones who find our way
 back to this scene . . . (p. 164)

I have written elsewhere of the lure such wreckage holds for me (Wadeson, 1990), and I must confess the barnacled treasures that Connie salvages from her deep dives into the shipwreck of her childhood intrigue me more than the life she explores just beneath the surface. Her paintings dredge up images of the ghoulish faces of her fears, the iron bars of her prison, the unutterable loneliness of her burial place, and the helplessness and vulnerability of a tiny baby in a ragged world. Sometimes she gives the baby a voice and dissolves in tears as its feelings wash over her. But she cannot stay in that dark and treacherous place for long and rises to the surface to say in her adult voice, "The boss responded to my memo."

So, I have had to learn to become agile in the water. Sometimes I try to dive, but find I have left the client on the surface. Sometimes the client dives, and I cannot find her. More often, we swim together, varying our depths. I have come to see that the currents of therapy are unpredictable. Some clients sweep the ocean bottom. Others barely touch it. Its dark mystery is so frightening to some, they do not even acknowledge there may be personal detritus there. Perhaps the point is not how deep they dive or how thorough the salvage, but rather that a strong swimmer is near.

A Review of Two Art Assessment Tools in an Adult Day Treatment Center

Piyachot Ruengvisesh Finney, MA, A.T.R., CP, Cambridge, MA

Introduction

Several articles by art therapists describe, review, and evaluate various assessment tools (Hiscox, 1995; Neale & Rosal, 1993; O’Neill, 1991; Rubin, 1991; Silver & Carrion, 1991; and Wadeson, 1992). Based on my experience, it is important that: (a) the clinician consider the client’s mental status when selecting an art assessment tool, (b) evaluation tools are periodically evaluated, (c) the tool’s effectiveness with the specific population is evaluated, and (d) the timing is appropriate for each tool.

One of the most important factors when working with any population within the mental health field is the clinician’s sensitivity to a client’s emotional fragility, defenses, and needs. In most settings, an art therapist takes various roles. One is that of an evaluator, meeting with a client when she or he is first admitted to a program and implementing an initial art intake, either for diagnostic purposes or for gathering therapeutic information. Thereafter, she or he may administer a periodic art assessment to evaluate a client’s psychological progress. Here the clinician’s sensitivity lies in selecting an art assessment tool for use with the client. She or he needs to take into consideration the appropriateness of the tool, the purpose, and the timing of the evaluation process, in the treatment beginning phase (pretest), middle phase (periodic review), and end phase (posttest). My experience in a day treatment center demonstrates this point.
Setting

The Lawrence F. Schiff Day Treatment Center serves adults who have chronic major mental illnesses. Diagnoses include Affective Disorder, Schizophrenia, Dual Diagnosis, and Post Traumatic Stress Disorder. Ages range from early 20s to late 50s. The program consists of traditional verbal psychotherapy groups and both verbal and nonverbal expressive therapy groups. The Center is well staffed, with five social workers, a psychiatrist, a mental health worker, four trainees, and one expressive therapist. The expressive therapist assumes various roles: an evaluator who implements an initial art evaluation and periodic art evaluations; a group leader, leading expressive art therapy groups; a supervisor, training a graduate level art therapy intern; a consultant, offering in-service training to a staff group as well as sharing pertinent information that arises during an expressive art therapy group or from an individual session; and a case coordinator for five clients.

During my four years at the Center, I have used two art therapy assessment tools, the House-Tree-Person Technique (Buck, 1966), and the Stimulus Drawing and Techniques (Silver, 1981). One is used for an initial evaluation and the other as part of a case conference, periodic review.

An initial art evaluation is done to assess the client’s cognitive ability and to gather presenting therapeutic issues for appropriate group art therapy placement. The art evaluation for a case conference periodic review is to reassess the client's psychological progress and changes in her or his coping skills, affect management, therapeutic issues, and treatment progress.

House-Tree-Person Technique

The House-Tree-Person (H-T-P) is "...a technique designed to aid the clinician in obtaining information concerning an individual’s sensitivity, maturity, flexibility, efficiency, degree of personality integration, and interaction with the environment, specifically and generally" (Buck, 1966, p. 1). Results of the assessment provide the clinician "with diagnostically and prognostically significant data concerning Ss [the subjects] which otherwise might take much more time to acquire" (Ibid., p. 2).

A subject is provided with an H-T-P drawing form (white paper, each page 7” x 8½”) and a Number 2 pencil. Each page is consecutively labeled at the top “House,” “Tree,” “Person.” The evaluator says:

I want you to draw me as good a picture of a house as you can. You may draw any kind of house you wish; it’s entirely up to you. You may erase as much as you like; it will not be counted against you. And you may take as long as you wish. (Ibid., p. 18)

Using the same format, the client is asked to draw a picture of a tree and a picture of a person. After each drawing is finished, the client is asked questions about details and representational meanings. Buck states, “Each drawn whole—the House, the Tree, and the Person—is regarded as a psychological self-portrait of the S (subject) ...” (Ibid., p. 3). The House represents associations of home and the interpersonal relationships with those who live with the subject. The Tree represents associations of the person’s “life-role” and his ability to obtain satisfactions in and from his environment. The Person represents associations of different interpersonal relationships, whether in the past, the present, or the future. The assessment provides part of an in-depth psychological profile of the client. The technique can be administered by a trained, licensed psychologist, a certified projective techniques administrator, or an art therapist under supervision by a licensed psychologist.

Originally, the H-T-P was designed to assess level of intellectual functioning and to detect personality maladjustment. A sample of 120 adults at six intelligence levels were selected (imbecile, moron, borderline, dull average, average, and above average). Later, a group of 20 superior intelligence subjects was added. In looking at these 140 sets of drawings, researchers identified and listed the items which might serve to differentiate subjects on the basis of intelligence. These included both the presence and the absence of the listed items. "As a result of this analysis it was found that items of detail, proportion, and perspective appeared best to differentiate between the Ss at the various levels" (Ibid., p. 10). An attempt was made to identify items which would differentiate between drawings by people who did not exhibit major personality maladjustment and drawings by people who were maladjusted, psychopathic, psychoneurotic, psychopathic, or psychotic (Ibid.). "[D]etails, proportion, perspective, time, comments (spontaneous and induced), associations, line quality, self-criticism, attitude, drive, and concept" best differentiated between the two groups of drawings (Ibid., p. 14).

In administering the H-T-P to adults who suffer from mental illnesses, I have found results from this assessment tool to concur with other psychological tests used to measure the client’s personality adjustment and level of intellectual functioning.

Stimulus Drawings and Techniques

Stimulus Drawings and Techniques/The Silver Drawing Test (SDT) was developed by Rawley Silver in the early 1970s. It was copyrighted in 1974, and published as an abridged manual in 1981 (Rubin, 1991, p. 118). A revised, fourth edition was published in 1989. The test evolved from Silver’s work with deaf children. Although evidence of cognitive skills was apparent, she noticed that traditionally language-oriented intelligence tests did not measure these skills (Silver & Carrion, 1991).

When administering the test, the client is asked to select four pictures from 50 picture cards, categorized by people, places, animals, and things. Then, she or he is asked to draw:

Try to think of something happening between the drawings you choose. Then when you are ready, draw a picture of your own. Make your drawing tell a story. Show what is happening. Feel free to change these drawings and to use your own ideas. (Silver, 1981, p. 2)

Silver states, “These 50 drawings can be used as a therapeutic technique, a developmental technique, or as an assessment technique for evaluating emotional needs, cognitive skills, and progress in therapeutic or educational programs” (Ibid., p. 1). She postulates, “The emotional content of the projective component offers clues to the emotional state of the indi-
vidual” (Hiscox, 1993, p. 47). O’Neill (1991) suggests that in therapy, “SDs (Stimulus Drawings) are valuable for gaining access to fantasies and clues to self-image or interpersonal relationships. . . . In assessment, SDs can be effective for evaluating emotional, cognitive, and creative skills” (p. 87). In most cases, I have found the client’s pictures and stories accurately reflect his struggles and life issues and are consistent with his history.

Discussion of the H-T-P and SDT

When I first began working at the Center, I used the House-Tree-Person Technique for the initial evaluation. At the time, I felt the tool gave me brief but essential therapeutic information on a client in the first session. After a year, I had tested about 25 to 30 clients. From this experience I learned a valuable lesson. Some clients had difficulties with the assessment process; all, however, completed the session. Two major difficulties were apparent: (a) a few clients became overwhelmed by the issues that emerged and were flooded with affect; (b) some clients attempted to use the initial assessment session as a therapy session. They needed to be refocused, provided with containment, and, because this session was not intended to be a therapy hour, helped to bring closure to their issues. The assessment was usually administered on the first day of a client’s arrival, before the client had developed a therapeutic alliance with the clinician. I needed to rethink my selection of assessment techniques. Clients are potentially fragile on the first day, material raised by the H-T-P resulted in clients becoming overwhelmed by their issues. This was counterproductive. I decided to use the Silver Drawing Test for the initial assessment.

The Silver Drawing Test evaluates a client’s cognitive ability (abilities to select, combine, and integrate pieces to make a whole), therapeutic themes in the client’s life, and her or his use of fantasy and creativity. Newly admitted clients usually feel safe with this assessment tool. The task is semi-structured; they choose from predrawn cards. For some clients, these cards decrease performance anxiety and few clients say “I hate art. I don’t know how to draw. I only draw stick figures.” Sometimes, the cards help them tap into underlying issues. When the client is asked to tell stories after completing the drawings, she or he can choose to disclose at a personal level, or project her or his feelings onto the picture card characters chosen. In the latter case, the client does not have to fully own the issues and feelings she or he describes. A client who is vulnerable can regulate distance and closeness and maintain defenses during this first meeting. It is crucial to respect a client’s defenses especially in the first phase of a therapeutic relationship; defenses serve a purpose.

In the middle phase of treatment, I implement the House-Tree-Person Technique. It can give an in-depth picture of a client’s intrapsychic issues, and symbols can reflect coping skills. It is appropriate to evaluate the client’s progress just before the periodic case conference. Trust and a therapeutic alliance have been established between the client and me and, in most cases, clients are willing to discuss their pictures openly on both projective and personal levels. They often make references to pertinent life issues and show some insight into their behavior and interaction with others. They also appear to enjoy the postinterview interrogation that includes talking about their pictures on an abstract level, and may make an attempt to address their conflicts via metaphor.

Both the SDT and H-T-P can also be administered near the end phase of treatment. The purpose of a posttest is to evaluate changes that occurred as a result of therapy. This is an opportunity for the client to review coping skills mastered and issues addressed. The session also provides a closure to treatment. By comparing the pretest and the posttest, the client may see concrete evidence of progress in the pictures. This last session is often quite touching. Clients feel sad about leaving and good about the changes they have made.

Over time I have found these two tools to be appropriate in work with adults with chronic mental illnesses. The Silver Drawing Test is suitable for use as an initial assessment and as a posttest, whereas the House-Tree-Person Technique is appropriate for the middle or end phase of treatment to evaluate progress made by the client.

Conclusion

This paper has discussed two art assessment tools and the importance of making a periodic review of assessment tools. A tool may appear to be suitable at one point in your practice, but it is recommended that you periodically review the benefits and possible counterproductive effects of the assessment tool. An art therapist needs to be sensitive to her or his client’s mental status and symbolic language. These serve as guides in her or his selection of assessment tools that are integral to her or his work.

Instant Images: A Guide to Using Photography in Therapy

Reviewed by Julia Gentleman Byers, A.T.R., Montreal, Quebec, Canada

Instant Images is the first manual to use only Polaroid 600 instant “snapshot” images for specific sequential psychotherapeutic assignments. It is not a book about the therapeutic value of using photographic methodologies in therapy and does not offer specific therapeutic interventions to address clinical issues for various client populations. Given these limitations, the reader can readily pursue its contents with appropriate expectations.

This outwardly simple recipe book provides a well thought out series of therapeutic tasks that aim to aid in therapy and personal growth. The authors assume the reader is knowledgeable about therapy and personality theory. They borrow many ideas from Jungian concepts, such as the Shadow and the Persona. Familiar art therapeutic directives are used from theories and practices of contemporary art therapy authors and practitioners.

Two clients, Sandra and Irene, provide examples for each assignment. Their verbatim commentaries are frequently quoted after they have gone through processes of reflection and interaction and production of their final collage. Although many black and white illustrations of the artwork are provided, the authors do not give interpretations of the clients’ metaphors.

In the first section, a therapy format is used to present an overview of the complete program. The manual is intended to be used in “...logical progression and the later assignments are built on earlier ones” (p. 7). The issue of confidentiality is raised. A commitment to the 16-week program is expected. Supplies include multimedia arts and crafts materials. One assumes that color Polaroid film is used, although this is not stated. Enough film for at least 35 snapshots per client, with 10 exposures per pack, is recommended.

The sequence begins with a rhetorical question, “Who am I?” (p. 19). It is explored through exercises with themes of nature and other people. In keeping with the building development of the psychological journey, partners are encouraged to explore ways to let go of personal blocks. Ideally, this leads to depicting and resolving immediate conflicts within brief therapy. Towards closure, the partners are encouraged to define their relationship and develop an awareness of their present needs and future goals. The final assignment integrates a review and summary of the project.

The authors clarify their use of directed themes and issues. They begin by attempting to answer, “Why photo therapy?” (p. 3). It may be more apt to ask, “Why Polaroid art therapy?” At this point, the book would have benefited from a theoretical debate. The authors could have discussed how Polaroid images differ from magazine photo collage or experimental photography in multimedia collages used by authors and practitioners such as Helen Landgarten (1980, 1993), Harriet Wadeson (1980), and Judy Weisler (1993). Instead, the authors encourage us to use art media, taking into consideration limitations of instant images, since the format, size, and structure of the first task of each assignment is constant. Fryrear, Corbit, and Mason-Taylor caution, “[t]he Polaroid corporation advises against cutting apart the photographs because the developing chemicals within the layers of the photograph are mildly irritating to the skin” (p. 22). The metaphoric implication here is very powerful. However, the book does not explore this or other metaphors, such as attaching filters, looking at different perspectives, focusing brightness or contrast, time of exposure, soft focus, outdoor or indoor lighting effects, and distorted elements. These are tools of the photographic trade. The instant image process could also be explored. Because this is a manual, the authors should specify that the therapist/reader needs artistic knowledge about the properties of the photographic medium itself. Landgarten (1990) stated that photo pictures can initially lend structure, assisting expression for the client whose defense mechanisms are strong. In Polaroid instant images, is this more or less apparent? When setting up a scene for exposure of the snapshot, does it overlap with principles of drama therapy?

During the initial intense and challenging period of brief therapy, visual images and/or collages can be used to acknowledge that change is very difficult. In addition to using photo media to work through initial resistances, this is an optimum time to integrate the media itself as a communication tool, thereby giving credibility to the modality of “photo art therapy.” The photographer’s palette is different than the painter’s: color plasticity changes according to the hold focal position. The sense of using a camera as equipment to express emotions is fundamentally different than wet paint and the immediacy of blending and reblending.

A Polaroid color photo is a prisoner of the moment of exposure. Delicate tone differences are generally lost, because
of the greatly reduced size of the picture and the accuracy ratio of the equipment itself. In "instant" Polaroid, there is one chance for one image. The issue of duplication or imitation is avoided. The media itself provides enormous opportunities for self-exploration through metaphor.

Within the brief treatment approach of this book, there are opportunities for clients to explore issues of intimacy and trust through individual or group processes. Given the protective vehicle of the photographic medium, clients can explore various levels of psychological awareness because the modality itself holds symbolic content. This is apparent as Sandra and Irene express their immediate reactions to the exercises.

A strength of Fryrear, Corbit, and Mason-Taylor's book is the closure they provide for assignments and exercises that explore the role of expectations in relationships. Irene, the business partner of Sandra, states that the complete program was "... voyage ... a celebration of life. ... This real journey has been full of joy, beauty, excitement and sometimes pain and frustration" (p. 101). This brings Hillman's words to mind:

[I]t is not the conceptual tool or specific language that makes soul, but the manner and purpose with which the tool is employed. Psychological faith begins in the love of images and its flow mainly through shapes of persons in reveries, fantasies, reflections and imaginations. Their increasing vividness gives one an increasing conviction of having and then of being an interior reality of deep significance transcending one's personal life. (p. 150)

The potential depth and use of "instant images" demonstrates the need to review patterns of meaningful relationships. This short-term therapeutic program can provide enrichment beginning from the instant the client absorbs the photo, and attaches personal meaning to it. Some of us think of photography as a fisherman would; we get caught up in the ideal of having to go out and get an image. In having that very strong goal, some of us lose sight of the experience—the most important part.

Instant Images, although too recipe-like in wording and precise application, is an innovative contribution to the few available manuals on creative media for therapy and personal growth. It integrates Jerry Fryrear, Irene Corbit, and Sandra Mason-Taylor's areas of expertise and practice. Still, I remain perplexed about the fundamental differences, in the final productions, between magazine photo collage and instant images, using photography in therapy. Both can be beneficial additions to the therapeutic armament.

References

hot” sun, and a “cool” sun. “The sun is important to this young boy from Ethiopia, and it is definitely personal” (p. 183).

How do you demonstrate the flight of a bird on a page, using only touch? The principle is the same as the old 1920s flicker movies, or the little books you thumb quickly. Repetition of the same picture, or form, with slight variations, depicts the object in movement. The child pulls his fingers down the column of repeated bird images and feels the movement of wings in flight. Edman’s solutions to such problems are ingenious, simple, and inspirational. In the sensory receptive area of the brain, more area is dedicated to the fingers and tongue than to any other part of the body. The crawling infant explores the world using this sensory channel, gathering memories and impressions. As adults, we have been trained to look and not touch. The blind child must touch; so must many of our clients. In this art therapy, touch is an essential part of the healing process.

Edman’s ideas can easily be adapted for clients with learning disabilities or cerebral palsy. If we remember our senses are paths to pleasure and paths of expression, we will find ways to use the sensory channel in psychodrama, music, dance, and poetry. We know how essential “warm fuzzies” are to infant development; this book reintroduces us to the experience of soothing memories associated with silk, satin, and downy softness.

Glimpsing how the blind child perceives has raised questions about art produced by my clients. When is a transparency not a transparency? Blind children draw smoke starting way down inside the chimney (p. 176): this is logical. The sighted child knows the source of the smoke, but only “sees” it after it leaves the chimney. The blind child draws what he knows, rather than what is visually perceived. Is he drawing a transparency without boundaries, or is he expressing a deeper knowledge? Edman gives very concrete (tactile) forms and methods of reaching one specific population, yet her book is broadly philosophical and stimulates self-examination.

It is difficult to justify spending a lot of money on one book, unless the book is one of a kind in its field, comprehensively covers the subject, contains numerous practical applications, and will contribute significantly to the field. Tactile Graphics does all of the above. This book is literally an art instructor’s manual, a creative thinker’s touchstone, and a therapist’s bible. It is an encyclopedia on the subject of tactile information gathering.

Chemical dependency, co-dependency, and recovery are popular topics. Spirituality is an important dimension in the recovery process for those in recovery and those professionals who work with them. This is especially so for those who use the 12 Steps of Alcoholics Anonymous. Much has been written on these topics. What is unique about Nancy Barrett Chickerneo’s book is her focus on the use of art to facilitate spiritual growth in recovery. Chickerneo states, “Very little research is currently available which interfaces these areas, and spirituality is an important component in the process of recovery. Therefore, knowledge about the contribution of art to recovery is valuable” (p. viii).

Chickerneo’s thesis, “New Images, Ancient Paradigm: A Study of the Contribution of Art to Spirituality in Addiction Recovery” (1990), provided the basis for this book. She noticed themes and similarities in her own life and work with clients, and became interested in “a more formal exploration of the experience of the contribution of art to spirituality in recovery” (p. viii). Divided into three parts. Part I: Introduction to the Problem and the Method of Study; Part II: Stories of the Co-Researchers; and Part III: Themes, Literature, and Realizations, the book has the sound and feel of formal research. At the same time, it contains personal accounts of the effect of art making on the lives of the “co-researchers,” (her term for subjects), and herself. By choosing “Heuristic Inquiry” as her method of study, she can include personal, subjective material.

Unlike the “scientific method” of quantitative research involving objective, reductive reasoning, heuristic inquiry is a qualitative method that “offers opportunities to study both subjective and objective data in a deductive manner” (p. 15). Her choice of the heuristic method is bold and controversial. In Beyond Science, Beyond Therapy: A New Model for Healing the Whole Person (1992), Anne Wilson Schaef argues extensively and vehemently against the quantitative scientific method as a product of a dysfunctional, control-addicted society. Unlike Schaef, Chickerneo does not defend her choice of heuristic inquiry by denigrating the scientific method. Rather, she explains and defends heuristic inquiry by tracing its existential roots, outlining its humanistic evolution, and explaining the phases of the heuristic process. By explaining and defending her choice of method she adds a substantial argument to the debate. However, those who have difficulty accepting heuristic inquiry as a valid research methodology will probably have trouble accepting this book.

The data for this study comes from nine “stories” (or case studies), of her co-researchers and her own life. The stories fill the bulk of the book. Largely verbatim, they are generously illustrated with photographs of artwork. These interviews were non directive and unstructured with two exceptions, when each co-researcher was asked to give “a brief personal and family history including any memory of childhood spirituality as well as an addition history,” and an answer to the question, “How has art contributed to the spiritual part of your recovery?” Sifting through the answers, Chickerneo notes the “possible themes and generalizations” that emerged (p. 31).

In the book’s last section, Chickerneo charts and discusses the themes, surveys the literature on art, spirituality, and addiction, discusses how her study relates to earlier published literature, and then attempts a synthesis of all that has
gone before. She attempts to see the experience of spirituality through art "in a new way," and concludes, "For the co-researchers of this study, art, which was accessed on the interior of their being, has proven to be a way back home to them and their higher power" (sic) (p. 236).

Chickernoe says, "the book is designed to be enjoyed by general readers, professionals, and/or researchers in the fields of study" (p. vii). In a way, this is true. For general readers in recovery, reading the stories is similar to going to a 12-step meeting. Professionals and researchers who can accept heuristic inquiry, or at least be open to it, can benefit and learn from the wealth of information provided. However, as an art therapist, I was hoping to find useful information and ideas about, as the subtitle implies, the use of art with clients in recovery from co-dependency and/or chemical dependency. Since this is an area I have researched (1990), I am always looking for more ideas. Practical suggestions which an art therapist can use in daily practice are not available in this book.

The heuristic method allows for the biases of the researcher. Her bias is evident in the religious flavor of her work, which at times, takes on a righteous tone. For example, she asserts, "addiction counseling professionals and art therapists working in the field of addiction need to take seriously a holistic approach to recovery that honors spirituality" (p. 235). In my opinion, counseling professionals and art therapists do not need to be told what they need to do. When I closed the cover of Chickernoe's book, I was left with the impression that she had spent a lot of energy trying to persuade readers to her way of thinking. In her discussion, "Ancient Paradigm," she points out how the themes in her study relate to the beatitudes in the Bible. Even though she states that this "paradigm" is "just one ancient source which comes out of my own reflections and tradition," (p. 232), the fact that she adds these personal reflections to her study, no matter how interesting, raises a question about her real intent.

Chickernoe has obviously given much time and thought to topics she knows and cares about. Her book is rich with ideas, her research is extensive, and the stories are fascinating. However, in her efforts to prove the value of art to facilitate the growth of spirituality in recovery, Chickernoe has pinned the butterfly to the board. The formal style of her language and the structure of the research format are ponderous and weighty. The religious bias and righteous tone detract, and it is doubtful that research will convince skeptics of the value of art and spirituality. Perhaps the problem with the book stems from trying to do too much. Instead of designing her book "to be enjoyed by general readers, professionals, and/or researchers in the fields of study," writing for a delimited audience might have provided focus.

Art Therapy with a Group of Latency Age Girls

VHS ½" and ¼", 55 minutes, black and white. $80, purchase only from Mildred Lachman-Chaplin, 903A Waukegan Road, Deerfield, IL 60015; 708-940-8134, or to Fax an order, phone number plus #1.
Reviewed by Gussie Klorer, MA, A.T.R., LCSW, St. Louis, MO.

Art Therapy with a Group of Latency Age Girls offers an inside look at five girls and three therapists over the course of one year. The setting is a school for emotionally disturbed girls.

The children are introduced through their artwork and the viewer quickly senses each girl's individual personality. Over the year, changes within each child and the group allow the viewer to watch group dynamics unfold. For example, scapegoating is seen when a Caucasian child is rejected because of her skin color. She attempts to physically escape only to have her movement blocked by a therapist. Pairing is seen when an older child takes on a protective, bossy role with a smaller child, effectively excluding a third child. The therapist responds by alloying herself with the third child. Triangulation is noted when three children team up, excluding a fourth child. In each situation the viewer is able to observe the therapists' not-always-successful interventions.

Therapists demonstrate a highly structured, theme-centered style that is obviously necessary with this population. Group boundaries are established early and the importance of establishing group rituals is demonstrated through songs that begin and end each group. Therapists are interactive in their approaches to the children, recognizing the girls' mothering issues; physical touch and holding are part of the group process. When a child becomes confused and asks the therapist, "Are you her mama?", the therapist establishes an important boundary for the child.

The therapists' approaches to the children and interaction with the artwork will stimulate discussion and controversy among art therapists-in-training. Students may wonder about the therapists' quickness to draw on the children's artwork or may question some of the interventions. There are many points where I, as an instructor, would want to stop the film and invite students to discuss possible alternative interventions. For example, when three girls begin name-calling and are extremely disruptive, one of the therapists attempts to talk about the problem with this extremely resistant group. This provides an opportunity to invite students to think of appropriate consequences for the behavior, in contrast to allowing it to escalate.

The video offers a view of child group art therapy that is strikingly different from what can be achieved through the printed word where behaviors are described but not experienced. The video format brings to life problems inherent to
this population, giving a realistic portrayal. When the children mutiny and escape, laughing and screaming, from the art room to the playground, the therapists are challenged to quickly find an appropriate therapeutic response. I cringed when I saw this scene; these are the groups we all like to forget. By including it in the film we can observe the calm response of the therapists. This is a useful teaching tool for students who too easily feel they have failed when group behavior is erratic. Lachman-Chapin is honest about the errors therapists make. When three children team up against a fourth, she admits that aligning herself with the fourth child "turned out to be a bad mistake." The viewer is privy to what happens next and observes the therapist’s struggle with the resulting behavior. It is a valuable lesson.

For all its useful points the video falls short at the technical end of production. It is, at times, disjointed, jumpy, and difficult to hear, suggesting that distribution of the film for teaching purposes was an afterthought. The age of the video and technical flaws distract from the content. Nevertheless it can evoke group discussion in a child art therapy course and certainly paints a realistic picture of latency-aged, emotionally disturbed girls.

Noteworthy

The Saint Dymphna Altarpiece

Cover by Randy Vick, MS, A.T.R., Chicago, IL

(28" × 19" × 3", painted wood construction with acrylic painting on masonite)

The legend of Saint Dymphna states that she was the daughter of a 7th century Celtic chieftain and his devout Christian wife. When she was 14 her mother died and her father Damon, driven mad with grief, sent envoys to find a noblewoman resembling his late wife for him to marry. When none was found, his advisors suggested he marry his daughter. Upon hearing of her father’s plan Dymphna fled with her friends, the court jester and his wife, and her confessor, Saint Gerebernus.

Damon was able to follow them by tracing their use of foreign coins. His men killed her companions, and when she refused to return with him he cut off Dymphna’s head with his own sword. Their bodies were buried at the site near the town of Gheel, Belgium. Many miraculous cures of persons afflicted with epilepsy, mental illness, and demonic possession are reported to have occurred at the shrine (Hoever, 1989).

Eventually a church was built nearby and later an asylum known for its humane care and tradition of integrating patients into the community. Saint Dymphna is the patroness of sufferers of nervous and mental disorders. Her feast day is May 15th (White, 1991).

This altarpiece was part of a larger environmental installation entitled, "The Saint Dymphna Allegory" produced in collaboration with Isabel Rafferty, MAAT, A.T.R. and was presented at the opening of the Illinois Art Therapy Association’s annual conference on St. Dymphna’s Eve, 1993. Also included were the story of the saint’s life, eight small votive paintings dealing with mental illness, music, candles, flowers, and incense in an environment which evoked a medieval church. The work was conceived as a performance/experiential which invited viewers into another place and time in order to gain a new perspective on their current time and place. After viewing the objects the participants created artwork in response to the experience and to the clients they serve.

ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to your manuscript:

Name: ________________________________

Degrees/Credentials: ________________________________

Address: ________________________________

Phone #s: ________________________________ work ________________________________ home

Type of Submission (check one):

___ Article

___ Brief Report

___ Viewpoints

___ Book Review

___ Film/Video Review

Title of Submission: ________________________________

________________________________________

Checklist:

___ Five copies, typewritten on 8½” × 11” paper.

___ Black and white photos of original artwork plus 4 photocopies of each.

___ Abstract of 75-125 words (for articles and brief reports only).

___ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

___ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

Author's signature ________________________________ Date ________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.

___/___/___
Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy uses a blind peer review procedure for full-length articles and brief reports. Final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor, and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

Manuscript Categories

1. Full-length Articles. Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.

2. Brief Reports. Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.

3. Viewpoints. Short articles focusing on personal experiences, poetry or original art may be submitted to this section.

4. Book Reviews. Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

5. Film/Video Reviews. Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

6. Comments. Brief comments on articles published in Art Therapy, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

Other Requirements

1. Send five (5) clear copies of each manuscript to Cathy A. Malchiodi, A.T.R., Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.

2. All original articles that are not under consideration by another periodical or publisher are acceptable.

3. Manuscripts must be typewritten on 8½” × 11” white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.

5. An abstract of 75-125 words must be included with full-length articles and brief reports.

6. Please avoid footnotes wherever possible.

7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.

8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.

9. Photographs must be at least 5” × 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.

10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author’s responsibility to secure such permissions; a copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.

11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.

12. It is expected that any manuscript accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5” diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
Makin, Susan R. — A CONSUMER'S GUIDE TO ART THERAPY — For Prospective Employers, Clients and Students. '94, 116 pp. (7 x 10).

The author has written a most interesting guide for those who are curious about art therapy. The book provides information and references which she wishes she had been familiar with before embarking on a new career in art therapy. It discusses art therapy theory, practice and instruction from a variety of perspectives, and will be just as useful for prospective employers and clients of art therapists as it will be for art therapy students and new art therapists. In addition to providing background history and information, the author focuses on the major questions she has wrestled with, and the answers she has found. She offers a unique perspective on the process of learning to be a clinician since she has had the rare opportunity to study in rather different kinds of training programs — she comes from Great Britain and has studied in both Canada and the United States, providing a distinctive view of the history, development and present state of the profession in these three areas.

THE AMERICAN ART THERAPY ASSOCIATION INC.

25th ANNIVERSARY CONFERENCE
REFLECTING ON THE PAST, ENVISIONING THE FUTURE

NOVEMBER 16-20, 1994
THE PALMER HOUSE
CHICAGO, ILLINOIS

This year's conference will feature:

- Day long pre-conference courses
- Keynote speaker ELLEN DISSANAYAKE, author of Homo aestheticus and What is Art For?
- Experiential workshops, oral presentations and networking forums
- General sessions on ethics and highlights from the history of the Association
- Public exhibit of artwork by area art therapists and other special events

AATA members will receive additional information and full registration packages by mail. Other interested parties should contact:

AATA, Inc.
1202 Allanson Rd.
Mundelein, IL 60060
708-949-6064
Fax: 708-566-4580

(The next AATA Conference will be held November 8-12, 1996 in San Diego). Contact AATA for information regarding the submission of proposals.

STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allison Road, Mundelein, Illinois 60060. Telephone (708) 949-6064; FAX (708) 566-4580. Non-members may subscribe at the following annual rates: $40 (U.S.) and $64 (Foreign); institutions: $57 (U.S.) and $80 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allison Road, Mundelein, IL 60060 (708) 949-6064.

This journal is abstracted in: Psychological Abstracts, INNOVATIONS & RESEARCH, Art Bibliographies Current Titles and Art Bibliographies Modern.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

About the Cover: “Swiss Soldier II,” 12" × 8" × 4" by Mariagnese Cattaneo, PhD, A.T.R., Professor, Lesley College. “The day the Gulf war broke out I was travelling from Switzerland to Boston. The plane was half empty, the airports in Europe deserted; people avoided travelling. I felt angry and disappointed. The following day I went to my studio. I remembered a series of Swiss crosses I had formed a year earlier from newspaper, cheesecloth, and gesso. At that time I had put them aside because, after the initial inspiration, I did not know how to continue with these forms. Now I started painting them, one layer of paint after the other, adding sticks; slowly the crosses became soldiers, faceless mercenaries. ‘Swiss Soldier II’ is one of a series of seven.”
Editorial

Certification: In Search of Accountability

Cathy A. Malchiodi, MA, A.T.R., Editor

As the AATA approaches its 25th anniversary celebration this fall, the efforts to implement a national certification program for art therapists continue to solidify, becoming an issue of conversation by both those inside and outside the professional ranks. In a recent issue of Common Boundary, an article titled "Art Therapy's Growing Pains" (Baker, 1994) described our profession's current struggle with developing and implementing a certification program for art therapists, bringing the debate into the public eye. Through a variety of interviews and viewpoints, the article presented the pros and cons of the AATA's move toward certification of art therapists, highlighting both the hopes and fears of prominent art therapists in our field concerning the long-range effects of certification on the profession.

The development of a certification program for art therapists has been a long and often difficult venture (Malchiodi, 1994). Whether or not to implement certification in addition to the current registration process has included a great deal of impassioned discussion and debate, criticism as well as support, and even confusion and ambiguity among our most noted clinicians, educators, and scholars. In contrast to the complexity of the profession's struggle, the Common Boundary article portrays the AATA's move toward certification as a more-or-less black and white issue, with diagnostic-type art psychotherapists who support certification in one camp, and creative or expressive arts therapists who support the arts and art process in the other. Certainly, it is not that easy to pigeonhole the parties in question and most see the development and implementation of certification as a much more complex issue. Many art therapists and expressive arts therapists feel that certification deserves their support, but simultaneously want to protect the multidimensional aspects of the profession that differentiate it from other related fields. On the whole, we generally agree that certification for art therapists is important, but also deeply value our rich connections to visual arts as well as our interface with related creative arts therapies.

Concurrent to the Common Boundary article, the summer issue of the Art Therapy Credentials Board Review (1994) was published and additional details of the actual certification process were made public. A "Bulletin of Information" describing the purpose, scope, and application procedures is now available and all A.T.R.s will have received this material by the time this editorial goes to press. A separate study guide for an additional fee is also offered; the intent of this guide is to give more specific information on the details of the areas of knowledge as determined by the National Practice Survey. Other important decisions have been made by the ATCB, including the grandparenting of the current Honorary Life Members of the AATA and the tightening of eligibility requirements for certification after the year 2000 (see the bulletin for specific details).

The bulletin provides the first real opportunity for art therapists to review the aspect of certification that they have been most curious about: the contents of the examination and the resources that were used to develop the test. The publication offers some eye-opening information in that respect, particularly in the area of references. With regard to the reference list, the ATCB states that these "references may be helpful in reviewing for the examination. This list is intended for use as a study guide only. (The ATCB does not intend the list to imply endorsement of these specific references, nor are the test questions taken from these sources" (p. 13, 1994). That statement is noticeably ambiguous concerning what actual references will be used within the examination, leaving the reader to assume that the list provided in some way covers the material on the test. Although actual endorsement is denied, it still leaves one with the feeling that the materials listed were specifically selected by someone or some group (one assumes that the list did not generate itself), thus implying some sort of "endorsement" on an unofficial level.

Within the published reference list, the book list provided is particularly worrisome for several reasons. First, the amount of titles written before 1975 is astounding—29 of the 49 titles—with many written during the 1950s and 1960s. I was personally shocked to see titles such as Machover's Personality Projection in the Drawing of the Human Figure (1949) and Hamner's Clinical Application of Projective Drawings (1958). It is common knowledge that the information published in these types of publications has come under severe criticism over the last decade (Cummings, 1986; Gittelman, 1980; Golumb, 1992; Kamphaus & Pleiss, 1991; Martin, 1983; Palmer, 1983, to name a very few). Another example is the listing of Blos (1962, 1970, 1979) who has written several texts on adolescence; however, numerous texts and articles exist that describe more contemporary societal issues and influences in adolescence. Other surprises were the inclusion of Bender's Child Psychiatric Techniques (1952) and books by Anna Freud (1965, 1966), in contrast to the lack of listing any of the many current texts on childhood disorders, intervention strategies, and the DSM that might be more relative to today's short-term clinical practices of art therapy with children.

At any rate, even if one wanted to study the writings of
the authors on the book list, in many cases it would be extremely difficult or impossible to obtain some of these titles, due to the fact that they are either out of print or only available through large university libraries. This may also hold true for some of the journal articles listed, as the standard art therapy journals are not always available even in the best library systems; older issues (pre-1980) are even more difficult to find. One wonders why the Certification Committee was not advised by the testing firm to locate more current, edited texts or journal articles that highlight the works they wanted to emphasize, rather than list the original publications. This is a standard practice in other fields to include the materials of authors whose work is more foundational than contemporary. For example, a seminal text such as Family Therapy (Goldenberg & Goldenberg, 1991) might be referred to in lieu of citing an original Minuchin (1981), or an edited text such as Psychiatric Disorders of Children and Adolescents (Garfinkel, Carlson, & Weller, 1990) might be used to cover a variety of basic theories on childhood pathology. (These are obviously just a few suggestions, since there are many other titles that could be considered.) This major oversight has resulted in a book list that makes the field of art therapy look, at the very least, out of touch and archaic. As one art therapy colleague observed, "I would be laughed out of a graduate course or professional seminar if I used these [out-dated] references in a scholarly paper."

Another interesting aspect of the book list is that most of the titles were written by non-art therapists—33 of the 49 titles, which is roughly more than two-thirds of the published list. Granted, titles of works such as those by Lowenfeld and Brittain (1957) and Gardner (1980) on the developmental levels of artistic expression, as well as those on art, counseling, etc., would come from outside the field of art therapy. However, when more than two-thirds of the book titles are by authors from outside the field of art therapy, one is left to wonder exactly what is going on.

So what is going on? It is interesting to speculate on how the Certification Committee arrived at this reference list. Supposedly, these resources were derived from consultation with art therapy educators and other experts in the field, with final decisions made by the Certification Committee members. A real concern is that this antiquated list is what educators are teaching their students, the publication of such a list implies, at least on some level, that this is the case. The low percentage of books authored by art therapists also was baffling. This brings me back to my previous question: Is it because our own literature does not hold up to scrutiny (Malchiodi, 1994)? Another question also comes to mind: Are we as educators and clinicians resistant to using the works of our own authors in the training of students? At any rate, in the Certification Committee's review of the reference list, it may have been wise to do some additional cross-checking with experts in the field as to the final contents.

These observations take me back to the Common Boundary article (Baker, 1994) that portrayed those in favor of certification as mostly in the psychoanalytic, diagnostic camp of art therapists. In some respects, the article may have been more accurate than I had originally wished to believe. When reading the reference list provided in the ATCB document, I am left with the impression of a field basically embedded in psychoanalysis and diagnosticians, and, unfortunately, not even reliable diagnostics. I still have hope that the actual examination will be more broadly based, contemporary, and multidimensional; however, the psychoanalytic sway of the literature list certainly has dampened that spirit.

Finally, it is interesting to note that in the summer issue of the ATCB Review (1994), the "Certification Committee News" report suggests that the entire profession has been an influence on the evolution of certification, answering the self-reflective question:

WHO is preparing this exam for art therapists anyway?...from the inception of the move toward certification, art therapists have been the sole driving force in this project. This exam is not written by other professionals, state regulators or outside "testing experts." It is developed and written by art therapists. By now close to 100 art therapists have participated in some aspect of development or writing of the exam. even more are...[currently] working to write questions for use on the exam. (p. 2)

While it is true that a large group of art therapists was consulted through the National Practice Survey and a smaller group was asked to write questions for possible inclusion in the examination, that part of the process is over and the final version rests in the hands of the Certification Committee (with advice from the firm Knapp & Associates). At this point there is not a lot of consultation with the larger group of professionals, partly due to reasons of confidentiality in the development of the exam and partly due to apparent deadlines for publication of a candidate bulletin and study guide.

So, who is really accountable for the certification examination—the ATCB, the Certification Committee, the consultants, or the entire professional population of art therapists? I can only respond to this question from my own experience as the editor of the Association's journal, a position which entails a great deal of accountability to my peers professionals. The Editorial Board and I are accountable to not only the authors who submit material for possible publication, but we also bear a more serious accountability to the entire field of art therapy. We regularly make important decisions to accept, revise, or reject papers through the process of peer review. We also copy edit, proofread, and finally verify content of accepted papers to the best of the journal staff's ability. Our decisions result in the publication of what we hope represents not only the best of our scholarly endeavors, but also the diversity of art therapy practice, methodology, and theory.

The journal's accountability to the field of art therapy is to conduct the process of peer review with an openness that results in the publication of a variety of philosophical and methodological approaches. Our prime directive is to honor all ways of thinking and to encourage and protect the freedom of writers in our field to express diverse opinions. To do this we call on the very best experts we have on hand to contribute to the process and to protect the diversity of the profession. However, the protection of the tremendous diversity of this profession does have its limits: we can only address what is received to be reviewed by this publication and we can only eventually publish what we receive from the members and other professionals through due process and according to procedures of peer review.

The Certification Committee has a similar and equally serious accountability to the field of art therapy in developing
a test which will conceivably measure a level of basic competency among art therapists, and that will support our credibility as providers of mental health services. Like the journal, the Certification Committee also bears the weighty responsibility for the representation of the field to the larger public and for the future direction and growth of the profession of art therapy. They have been empowered with tasks of soliciting, editing, revising, rejecting, accepting, and verifying the material that has been submitted to them through the National Practice Survey and the potential examination questions submitted by the pool of experts. Like the journal, the committee has endeavored to encourage many art therapists to participate in the process and to have a voice. However, also like the journal, the committee is a relatively small group of individuals who must attempt to accurately represent and reflect the larger profession. And like the journal, they can only process the material that they receive from the larger profession, whether it be test questions, input on surveys, or letters of suggestions or advice.

As many who have been in this profession for a while, I am still sorting out my feelings about this tremendous undertaking to create and implement a certification program. I see reality on one side: a movement toward health care plans that may exclude or at the very least severely limit the ability of art therapists to practice. Competency and credentials are a reality for those who work in clinics, hospitals, and other agencies, with licensure becoming a standard requirement. Whether or not one is for or against certification, it is important to note that the first art therapy licensure in New Mexico would not be in existence if the profession had not undertaken to create a certification exam. After June 30, 1994, according to the Counselor and Therapist Practice Act, all art therapists who apply for art therapy licensure will have to take the examination (p. 145, 1994). This was not a choice, but was a necessary component of the proposal to license art therapists. It is a standard practice that all professions which achieve licensure on the state level have an examination in place to use for testing the competency of those who apply for licensure.

On the other hand, my idealistic side worries about our knowledge base, our roots in visual art, and our collective strength in our diversity. These are potential areas on which a misguided certification program might have serious ramifications, ramifications that could have long-lasting effects on education, training practices, and development of the field. Certification, on one hand, is necessary to our survival in a precarious job market and health care arena; on the other hand, like the journal, our publications, our professional conferences, and educational standards, it must be inclusive of the entire field and feel comfortable to the members of this association or we as art therapists will professionally wither and die. We are a small and struggling group of individuals, and each and every effort, decision, and direction we take is important to our ultimate survival.

What this all boils down to is accountability. Each professional who undertakes the responsibility of working on an AATA or ATCB Committee or Board is accountable for the profession’s growth rather than limitation, continued achievements rather than restrictiveness, and inclusiveness rather than exclusiveness. These concepts are at the root of our continued survival as a profession. Certification may be one avenue to the protection and advancement of the profession, but art therapy’s future will always be embedded in our collective ability to encourage continued growth, openness, and intellectual advancement, while remaining inclusive of the many dimensions that have enriched this field. These are ideals to which each and every one of us must remain accountable.

Letters to the Editor

I read your editorial, “Sorting Out Certification,” with considerable interest as I have been involved with the process of developing a certification program for art therapists for nearly 10 years. Most of the activity in support of certification has taken place in the past three years, beginning with the AATA Certification Committee’s search for a testing agency to help us develop our examination and culminating in the formation of the Art Therapy Credentials Board (ATCB) and the administration of our first exam.

With all that has been written about why we need certification, there is one question which has not been given enough consideration. That is the question of accountability.

The reason we feel compelled to fortify our credentials is that we are being asked to be accountable for the quality of the work we do. Clients, employers, insurance companies, and regulators are the ones doing the asking. If we fail to respond, it will become increasingly difficult to find anyone willing to allow us to practice or to pay us to be art therapists.

In order to be accountable, we must establish standards of competence and devise a means for measuring compliance with these standards. This is the purpose, and the only purpose, of the certification examination. Our Registration program has served us well for many years, but it is no longer enough. Registration requires review of credentials, not a demonstration of competence. At the moment, formal testing is the most widely accepted measure of competence and will, therefore, be the most useful. Registration of art therapists will remain an essential part of our credentialing program, but it will be supplemented with a certification exam and a recertification program.

The relationship between certification and licensing is confusing to many art therapists, and we have received quite a few letters, many rather irate in tone, asking why we are wasting our time developing a certification program when licensing is what we really need.

It is essential to keep in mind that licensing is mandatory, government-imposed regulation of a trade or profession. When a state licenses members of a profession, it may become impossible for an unlicensed individual to practice. In some cases, it may be illegal. We have no control over how states regulate professional activity, although we are free to lobby in support of legislation we view as favorable.

Certification programs are developed by professional groups for the purpose of assessing the competence of those practitioners who choose to become certified. The current trend in the state licensing of counselors and therapists is to require candidates for licensing to pass the national certification exam for their profession. This is happening because the state licensing boards want to see evidence of competence before they will issue a license to an individual, but they will not undertake exam development when there is little chance that revenue from licensing fees will be sufficient to allow them to recoup costs.

Licensing is imposed as a consumer protection measure, but it may also benefit members of the licensed profession because it implies that those who earn their licenses have demonstrated competence in the process. This has become important to us because insurance companies generally accept a license as proof of competence and are more likely to reimburse payments to a therapist who is licensed than they are to one who is not.

The advantage to developing our own program is that we set the standards for measuring an art therapist’s competence ourselves and the resulting credentialing program will give us something tangible to bring to legislators or licensing boards when they are considering licensing art therapists. If we do not have a certification program of our own to offer, we are likely to find that we are either unable to achieve favorable legislation or that the bodies wishing to regulate our practice will establish their own standards to evaluate what we do. We cannot afford to let this happen.

Returning to the question of accountability, I would like to say that the most disturbing undercurrent in much of what I have read on the subject of the certification of art therapists is the suggestion that we are either so hopelessly confused about what it is that we do that we cannot be held accountable, or that because creativity and spontaneity are the hallmarks of our work, we cannot be expected to be accountable. What does this say about our sense of responsibility to those we profess to serve?

Regardless of our individual philosophies and techniques, we are representing ourselves as experts in the application of artmaking as a vehicle for healing and personal growth. How can we expect people to trust us to do this with competence and sensitivity when we do not believe ourselves, that we can define what we do, how we do it, and what the outcome should be.

Having made these observations and asked these questions, I would like to add that I do not agree that finding the commonality in our profession and devising a way to measure it is an impossible task. The Certification Committee of the ATCB set about doing this three years ago and you are about to see the result. I believe that they have succeeded and that this exam, developed for art therapists by art therapists, will reassure most, if not all, of you that it is a true reflection of who we are and what we do.

Nancy Hall, A.T.R.
President
Art Therapy Credentials Board (ATCB)

I am writing in regard to your Editorial in the most recent Art Therapy regarding the process of certification, specifically as it pertains to "grandfathering."

Throughout the discussions about certification, I assumed that experienced art therapists would be given an opportunity to be grandfathered. This is a process I have ob-
served in psychologists, physicians, and social workers and was certain ATCB would follow suit.

When I first found out there would be no grandfathering, I wrote to the credentials board asking for an explanation. In response I recently received a letter from Nancy Hall, President, stating that grandfathering would weaken the credential. She did not explain how. Then she stated that because all A.T.R's would be able to sit for the exam during the first five years "without further qualification" a form of grandfathering is occurring to "allow those whose professional preparation predated today's training programs." Finally, she explained that only Honorary Life Members would be grandfathered.

I still cannot imagine how grandfathering will weaken the credential. The idea is based upon the belief that experience deserves respect and that much of what we learn as clinicians occurs in the professional work occurring after graduate school through practice and the assimilation of theory. If such procedures weaken credentials, why have other mental health professionals embraced grandfathering as their credentialing processes became more stringent?

I thought that the A.T.R. after my name demonstrated that I have documented to AATA's satisfaction that my training and experience are at least adequate. Now it seems ATCB is questioning the qualifications of those already registered as art therapists. I find I can only respond to this personally; my own professional organization appears to question the standards by which I have been registered and won't consider my experience and years of support to the field of art therapy in creating a new level of art therapist.

I was pleased to learn that our pioneers of art therapy will be respectfully grandfathered. I was expecting that practitioners such as myself with substantial experience would also be shown similar professional respect.

I recently read the article in the journal Common Boundary about art therapy and certification. From that article, I understand that a result of certification, for better or worse, will be a more homogenous organization of art therapists who are more clinical in orientation and less art-based. It is a sad comment on our organization if we are finding it necessary to weed out the more art-based art therapists now rather than waiting for the certification process to achieve that end over the next 20 years or so. Those A.T.R.'s whose backgrounds are more art-based and less clinical have long been a part of the financial and membership base of A'TTA. I do not want those A.T.R.'s to be treated disrespectfully, nor do I want experienced clinical art therapists treated in a similar manner.

I write this letter respectfully, but with significant concerns about the current direction we appear to be taking.

Rebecca Thomas, A.T.R.
Mountain Lakes, NJ

Letter to the Associate Editor

The author of the journal article seems to refer to both as though they were a single instrument. She seems to have used only #1, however, because she refers to 50 stimulus drawings and a date of publication. On the other hand, the author also refers to #1 as the SDT, which is the acronym for #2, and cites reviews and an article concerned with #2 (Rubin, 199; Hiscox, 1993; O'Neill, 1991; Silver & Carrion, 1991).

This confusion, shared by others, is understandable because both instruments begin with the same initials. Nevertheless, the instruments are quite different. The Silver Drawing Test (#2) includes three tasks: Predictive Drawing, Drawing from Observation, and Drawing from Imagination—a stimulus drawing task in which examinees are asked to select two from a set of 15 stimulus drawings, imagine something happening between them, then draw what is happening. They are encouraged to change the subjects they chose and add their own, then write a title or story. The test manual includes normative data so that a particular individual may be compared with others, as well as seven studies of test-retest and interrater reliability. In addition, scores on the Silver Drawing Test are correlated with scores on 12 traditional tests of intelligence or achievement. This instrument is being translated into Portuguese by art therapists in Brazil. First published by Special Child Publications in 1983, a revised edition was published by Ablin Press in 1990.

Stimulus Drawings and Techniques (#1) consists of a single drawing task and includes 50 stimulus drawings. Although it reports several studies, it is concerned primarily with techniques for access to fantasies and cognitive skills, as well as with findings about individual differences, consistency of selections, the use of humor, and the range of emotional content. First published by Trillium Press in 1981, and reprinted in 1982 and 1986, revised editions were published by Ablin Press in 1989 and 1991.

Adding to the confusion is a third stimulus drawing instrument: Draw a Story: Screening for Depression and Age or Gender Differences. Fortunately, it begins with different initials.

The Formation of the American Art Therapy Association

Maxine B. Junge, PhD, A.T.R., Los Angeles, CA

The details about the formation of the American Art Therapy Association are presented in this excerpt from the forthcoming publication A History of Art Therapy in the United States by Maxine Borowsky Junge, PhD, A.T.R. with Paige Patevski Assaua, MA. The events which led up to the organization's founding, the primary organizers, and the controversies surrounding the development of professional standards for art therapists are discussed.

This monograph will be published later this year by the American Art Therapy Association in conjunction with its 25th anniversary.

Introduction

By the mid-1960s, the formation of a professional organization for art therapists was an idea whose time had come. In the early 1960s, Don Jones and Robert Ault, a young art therapist from Texas, were working at the Menninger Clinic, dreaming together over endless cups of coffee about a national society. As early as 1966, art therapists attended the meeting of the International Society for Psychopathology of Expression in Washington, D.C., and talked about forming a group. These art therapists included Sandra Kagin, then living in Oklahoma and working with retarded children; Marge Howard, also from Oklahoma, who had worked in mental health for some years and had done studies on sexually abused children and their artwork. Elinor Ulman, the founder and editor of the Bulletin of Art Therapy,1 and Tarmo Pasto, a psychologist from California.

The International Society for Psychopathology of Expression focused its scholarly interests on the pathology evident in artwork. It had been formed in 1959 and included a wide variety of disciplines related to psychopathology and psychology of the arts, although it tended to be dominated by psychiatrists. The American Society had been incorporated in 1966 in Topeka, Kansas. Some of the conference papers from these two groups were published in books edited by Irene Jakab (Jakab 1971, 1969, 1968).

The art therapists who talked together about the possibility of their own group envisioned an organization that would be responsive to their needs and would address questions of treatment as well as pathology and diagnosis. However, it is clear from reading the tables of contents of Jakab's publications that art therapists were regular presenters and involved participants. One volume (Jakab, 1969) includes papers by Margaret Howard, Elise Muller, Bernard Stone, Donald Uhlin, Tarmo Pasto, and Harriet Wadeson. At one time or another, Pasto, Howard, and Muller were officers in the Society. All became active in the new professional organization for art therapists.

One must wonder why the need for a separate organization was so strongly felt. The 1960s in America was an era of tremendous civil rights activity led by Martin Luther King Jr. It may be speculated that in an organization such as the International Society of Psychopathology of Expression dominated by psychiatrists and in a mental health community still hierarchical and based on the medical model, art therapists had the political foresight to recognize that in order to achieve acknowledgement as respected mental health professionals, they would have to separate themselves out. They needed to band together to set up principles of practice and, most essentially, to establish a sense of professional identity. This kind of separation from a minority group is sometimes an unwanted result of prejudice, but is also a much-practiced strategy and a recognizable first step of minority groups of all kinds in their efforts to achieve equality.

Don Jones described the Society as having something of a "caste system" in which the art therapists were "invited guests." The art therapists wanted to talk about using art as treatment, rather than just a measure of pathology, and this was a reason for another organization (D. Jones, telephone call with Linda Gant, September 9, 1993).

When Margaret Naumburg's book Dynamically Oriented Art Therapy was published in 1966, it provided an important impetus to the new movement. In it, she formally defined the theoretical assumptions that had been presented in her previous books and which she had discussed in presentations throughout the country. In May, 1968, a group of East Coast art therapists coincidentally exhibited artwork of hospitalized psychiatric patients at the meetings of the American Psychiatric Association (APA) in Boston. Later, a panel was presented on art therapy, organized and moderated by Mardi J. Horowitz, MD, at the American Psychiatric Association meetings in Miami Beach. Naumburg, Ulman, Edith Kramer, Hanna Taya Kwiatkowska, Carolyn Kniazczek, and Myra Levick made presentations which were discussed by Paul Jay Fink, MD, and Lyman C. Wynn, MD. This event proved to be extremely significant. Myra Levick writes:

The separate exhibits were impressive, professional, and reflected different approaches within a relatively new modality for the diagnosis and treatment of mentally ill populations—art therapy. . . . During this conference we were all invited to lunch by Paul J. Fink, MD, then coordinator of Education and Training at Hahmemann Medical College, now Hahmemann University. . . . Over lunch we agreed that in order to define this discipline as a recognized profession, a national art therapy association needed to be established. (Levick, 1985, p. 25)
The First Organizational Meeting

The first formal attempt to form a national organization for art therapists took place in 1968, under the auspices of Hahnemann Hospital in Philadelphia. Dr. Fink was tremendously interested in art therapy and, along with Morris Goldman, MD, Director of Hahnemann's Community Mental Health Center, began what was the first graduate-level art therapy training program (called "Psychiatric Art Therapy") since an earlier art therapy program in the 1890s at the University of Louisville had become inactive. Myra Levick was hired as Director. Levick, Fink, and Goldman (1967) published an article in the Bulletin of Art Therapy called "Training for Art Therapists." Elinor Ulman acknowledged Levick as "the founding spirit of the association" (Ulman, in Jordan, 1988, p. 108).

Levick had attended Moore College of Art in Philadelphia and later earned her doctorate from Bryn Mawr College:

I was trained as a professional artist—having gone back to school after marriage and children. . . . I have painted all my life. . . . At the time I graduated Moore College, I had been considering going on for a Master's degree in the history of art. In fact, I had been accepted and there was a little notice on the bulletin board that a psychiatrist was looking for an artist to work with emotionally disturbed patients in the first inpatient unit in a general hospital in Philadelphia. I was absolutely fascinated. He said that he thought an artist had a great deal to offer in working with emotionally disturbed patients and if I would bring my art skills, he would teach me how. He told me there were art therapists in the country about which I knew nothing. I gave up the History of Art master's and he took me on. (Levick, 1975)

So, in 1963, she:

. . . had the opportunity to utilize my talent and training as a painter in a 29-bed inpatient unit for adults suffering from moderate neurosis to severe psychosis. . . . My job title was "art therapist" and one of my first tasks was to learn what that implied. (Levick, 1993, p. 11)

Although many had talked of the need for a national association, it was Myra Levick's energy (along with Paul Fink's encouragement) which brought about the necessary steps to create the organization. Levick's role in the formation of the American Art Therapy Association irrevocably changed the course of art therapy in the United States by emphasizing art therapy as a separate discipline (as had been defined by Naumburg) and thereby fostering the emerging sense of the art therapist's identity as a special kind of mental health practitioner. Levick was the American Art Therapy Association's first president5 and has been actively involved with its progress since then. She eventually became Director of the Creative Arts in Therapy Program at Hahnemann, which included dance and music therapies as well. She published widely and became the editor of the second journal in the field, The Arts in Psychotherapy (originally called Art Psychotherapy). In 1983, Levick published They Call Not and So They Drew, which dealt with defense mechanisms as they were expressed in art. She wrote:

My own particular interest and expertise evolved around ego mechanisms of defense . . . how these elements are manifested in drawings of children and adults in a therapeutic milieu (Levick, 1983, p. viii).

She is now retired and living in Florida while continuing to consult as an art therapist.

In December, 1968, Myra Levick and Paul Fink hosted an organizational meeting and invited as many art therapists as they could find. About 85 people (including 50 art therapists) attended, and an ad hoc steering committee was elected. The committee consisted of Elinor Ulman, Don Jones, Felice Cohen, Robert Ault, and Myra Levick. (Robert Ault was hired by Don Jones at the Menninger Foundation in 1960 and had been trained by Jones.) The steering committee was given the task of developing a constitution for the new organization.

From the beginning, there was considerable and sometimes acrimonious controversy over whether to form an organization at all. Although many art therapists saw the need for a forum to bring people together for the purposes of education and identity and to achieve recognition as a new profession, a few, such as Elinor Ulman, felt that it was too soon and that art therapy should develop further on its own. She and Edith Kramer urged that a broader territory be carved out for the field, one which went beyond psychiatric settings.

While some were trying to slow what they felt to be a premature definition of the field, others were convinced that forming a national association was urgent. Don Jones remembers:

I went to Philadelphia with a sense of frustration. Having written about art therapy, people and others saying we must get together . . . at that time my impression from them was that we can't form an organization. This is a very special kind of thing. It can only be taught by selected practitioners. Myra Levick . . . told me her impression of my coming to Philadelphia which was: I walked into her office, thumped my fist on her table . . . and said either we get it together now or forget it! I felt the urgent need. If we were going to grow at all we needed to get together. (Jones, 1975)

Of the meeting in Philadelphia, Robert Ault says:

Don Jones and I spent years working together and sitting in a back room drinking coffee and talking about someday maybe creating a national organization. We had dreamed about that and shared [that dream] for a long time. . . . Don left Menninger's very shortly before the first meeting. If Don had still been at Menninger's, one of us would have had to stay home to cover at the hospital. As it was, we both went to Philadelphia to work on a project that we had both wanted as our big life project. (Ault, 1975)

Ault continues about the Philadelphia meeting:

[That first meeting was] very heated. Margaret Naumburg was there. She was a very old woman with a hearing loss. She would sit with her cane and every time someone said something she didn't want to hear, she would knock her cane on the floor. She was nominated [to the steering committee] but lost and stomped out saying "I'm not through with you!" I had several warm pleasant letters from her later, but those initial days, they were something else! (Ault, 1975)

Rawley Silver from New Rochelle, New York, attended the Philadelphia organizational meeting; her feeling about it was shared by a number of others. "As someone working in an isolated situation," she said, "I was delighted to meet others who shared my interests and concerns" (Silver, 1985).

The steering committee worked for several months and then set up a meeting at the University of Louisville, Kentucky, on June 27, 1969. Naumburg was unable to attend.
and there were several disagreements on key issues. There were opposing opinions on the form the association should take. In Washington, Ulman worked on a constitution for the new organization, while in Kansas, Robert Ault consulted with Bill Sears of the Music Therapy Department at the University of Kansas. In 1954, Sears had helped create the National Association for Music Therapy. Ault also collected constitutions from the American Speech and Hearing Association, the American Occupational Therapy Association, and the Wisconsin Art Therapy Association, a state art therapy organization:

I concluded the best structure to follow was one emphasizing a strong federal organization with the possibility of eventual state or local chapters or units. The day before attending the committee meeting in Louisville, I drafted a constitution and had copies made to take along. As it turned out, Elmor had also brought copies of a constitutional model she had put together.... that of a rather weak national alliance composed of strong state units. The discussions of the committee were long and difficult, ending at 4 a.m. The next day a constitution was read to the assembled group and adopted. (Ault, 1975)

The First Executive Board

Having adopted a constitution based on the model of a strong national body, the members of the new organization elected officers and committee chairs: Myra Levick, President; Robert Ault, President-Elect; Margaret Howard (Oklahoma), Treasurer; Felice Cohen (Texas), Secretary; Elsie Muller (Missouri), Constitution; Sandra Kagan (Kentucky), Education; Helen Landgarten (California), Public Information; Don Jones (Ohio), Publications; Ben Ploger (Louisiana), Professional Standards; Bernard Stone (Ohio), Membership, and Hanna Yaxa Kwiatkowska (Washington, D.C.), Research.

Many on the original Executive Board such as Levick, Kagan, and Landgarten went on to contribute to the field as authors and/or as directors of training programs. However, in an evolving clinical discipline it is natural that many would put their primary energies into clinical work. Ben Ploger had begun teaching art in Houston in 1935. He became professor and chair of the Department of Fine Arts at Delgado College in New Orleans. There, according to Levick, he was asked to "volunteer time to teach art to mentally disturbed nuns cloistered in the religious unit of the De Paul Hospital" (Levick, 1981, p. 5). He began to practice art therapy throughout the hospital and became director of art psychotherapy there in 1966. Margaret Howard was also treasurer of the American Society of the Psychopathology of Expression. Having studied with Naumburg, she was the art therapist at the Children's Medical Center in Tulsa for many years. Sandra Kagan trained with Howard. Elsie Muller, a social worker by training, had also studied with Naumburg; she worked at the Gillis Home for Children and later the Ozanam Home for Disturbed Adolescent Boys in Kansas City, Missouri, and published a ground-breaking article, "Family Group Art Therapy: Treatment of Choice for a Specific Case" (Muller, 1969).

Robert Ault is now retired from the Menninger Foundation. He initiated the undergraduate and graduate art therapy programs at Emporia State University in Emporia, Kansas, and has been a tireless presenter. He is fond of talking of what he calls "the art therapy movement." In recent years, he has helped bring to light the artwork of Elizabeth Layton and pioneered the use of art therapy with corporations and organizations. His contributions to AATA have been numerous. In 1985, he was chosen Kansas State Educator of the Year. Felice Cohen later became a President of AATA and continued to work as an art therapist and researcher in Houston.

Because of the efforts of Marge Howard, the American Association of Art Therapy was charter in Oklahoma in 1969, which was also the site of the first Executive Board meeting. Dues were set at $15.00. A roster dated in 1969 showed 20 members in good standing. Robert Ault, with the help of a graphic artist, designed AATA's logo.

The first Newsletter of the American Art Therapy Association, edited by Don Jones, contained the following "President's Message" from Myra Levick:

For the past twenty years artists have been involved in using their skills to aid in the diagnosis and treatment of psychiatric patients and in more recent years have not only begun to speak and write about their experiences, but have been recognized for their contributions. It is an established fact that an organization must be formed in order to attain professional recognition. And it is with great pleasure that we announce that the AATA was voted into being on June 27, 1969, in Louisville, Kentucky by a representative group of art therapists from all over the country and Canada. The goals of this new group go far beyond merely formalizing that which has already been achieved. It is hoped that Art Therapy and its relation to mental health and education will be more clearly defined and further developed. (Levick, 1970, p. 1)

The First Conference

One hundred people attended AATA's first conference, held at Airline House in Warrenton, Virginia, September, 1970. Margaret Naumburg was unanimously designated as the first recipient of an Honorary Life Membership by the new AATA Executive Board. According to Ault, this was an effort to say: "We honor you. We respect you. We want you to be a part of us, but you cannot have control of us. We want you to join us" (Ault, 1975).

Even though she had walked out of the organizational meeting in Philadelphia, Naumburg's warm acceptance of the Honorary Life Membership implied an endorsement of the new organization. Levick said:

The highlight of the meeting [at Airline] was Ms. Naumburg's memorable acceptance speech... it was especially meaningful to many of us who knew this was the first and only professional group Ms. Naumburg openly supported. Her words were insightful, professional, and inspiring. I treasure personal letters from her (sent to me as President of AATA) in which she stated how pleased she was with the directions we were taking to establish a field she had been committed to for many, many years. (Levick, 1975)

From its inception, the American Art Therapy Association has been an organization of vital individualists with strong opinions and loud voices. The arguments through the years have been substantive, vocal, and, at times, difficult and divisive. Judith Rubin, a past President of the Association, has written: "The early meetings were so full of passion and discord that I wondered whether I really wanted to be a part of this noisy group" (Rubin, 1985, p. 30). Harriet Wadeson put it this way:

I attended the preliminary meeting in Philadelphia and the first conference at Airline House outside Washington in 1970. I recall...
disagreeing with Margaret Naumburg on both occasions. . . . From the outset, I could see that we are certainly a group of "characters." (Wadsworth, 1985, p. 31)

Elonor Ulman's account of that first annual meeting in the American Journal of Art Therapy (Volume 10, No. 1, 1970) elicited a number of angry letters from board members such as Felice Cohen (1970a) and Bob Ault (1970) who felt that she presented a distorted view of what transpired. Myra Levick's letter was printed in the Journal:

I have read your [EU's] account of the first annual conference . . . and must say that I am appalled by your biased subjectivity and gross distortions . . . I cannot begin to comprehend what your editor's note, "The Association is 14 years ahead of its time" means. I do know that for many years the possibility of forming a national art therapy organization has been discussed to no avail. Now, thanks to many people too numerous to list here, who are dedicated, involved, and energetic, this organization has finally come about.

I hope this organization will continue to welcome constructive criticism and diversified viewpoints. However, your particular criticism of the organization and its officers has been destructive in its attempt to delay progress. (Levick, 1971)

There were, however, letters taking Ulman's side. Wayne Ramirez, president of the Wisconsin Art Therapy Association, wrote to agree with her reporting (Ramirez, 1971a, p. 74; 1971b, p. 130). Herschel Stroyman (1971, pp. 143-144) said he "Found Miss Ulman's impressions . . . free of sycophancy, to the point, and unanswered."

Developing Professional Standards

After the stormy sessions surrounding the formation of AATA, one of its first major battles concerned the question of registration. Social workers, with no available licensing in many states, had long awarded a national certification of competency by examination designated by the letters ACSW (Academy of Certified Social Workers). Many other organizations also certified practitioners. At Warrenston, AATA voted to begin awarding registration to those art therapists who could prove they met certain standards. The service mark would be A. R. for "Art Therapist, Registered." As President, Myra Levick wrote in the AATA Newsletter:

The American Art Therapy Association took a giant step forward at its very first meeting in Warrenston, Virginia. The decision to certify art therapists under the Grandfather's Clause, who have been working in psychiatric settings for five years, was passed and the first registry will be published this year.

An organization is recognized by the professional standards it maintains and aspires to. The decision to establish certification lays the groundwork for the development of these professional standards. It need not follow that every person using art in either education or psychiatric milieu would want to be certified. It is, however, important that the organization identify itself with specific goals. (Levick, 1970, p. 1)

But the requirement of having worked in a psychiatric setting was one of the sticking points with some members who saw it as a premature narrowing of the field. In a letter to the editor in the Journal, Arthur Bobbins stated that the Pratt Institute art therapy staff "recognized[d] the problems inherent in drawing up a certification for a discipline that has not yet crystallized" (Bobbins, 1971, p. 100). By the time of the publication of the 1970 AATA Newsletter, 52 of the 61 art therapists who qualified had written and accepted. However, Edith Kramer wrote to say she did not want certification. In a letter published in the Newsletter, Kramer stated her objections:

There seem to be several reasons why certification is being sought. Important before all is the hope of enhancing the art therapist's bargaining power on the labor market. However, it seems to me unlikely that certification of art therapists by other art therapists would carry much weight in any struggle for better pay or for respect and recognition on the job. Attempts at obtaining certification from the outside, on the other hand, would entail a great deal of preparatory work on our part in defining the profession. It seems to me that any ill-prepared moves in this direction would be likely to jeopardize our ultimate goal

I therefore see no other reason to rush to certification other than the desire to quickly establish standards of excellence among art therapists. Certification, however, seems to me to be apt to induce premature rigidity within a field that must remain flexible and open to experimentation if it is to grow and to prove its worth.

As a member of the editorial board of the American Journal of Art Therapy, I have had the often painful duty to read manuscripts written by persons without academic titles as well as by others who had obtained the right to add all kinds of letters to their names, including "PhD" and "MD." This experience has taught me that the possession of degrees of any kind constitutes no guarantee whatever of the ability to think clearly or to write grammatically.

To summarize, I am of the opinion that in order to obtain the right to establish standards and to invent titles, art therapists must give themselves more time to discuss, experiment, and learn. (Kramer, 1970)

In her argument, Kramer neglected to recognize the model of most professional groups, including doctors and lawyers, which set up their own qualifying exams and enforce quality control. Felice Cohen, AATA's Secretary, answered Kramer's letter by stating:

The rationale behind certification and registration was precisely to remove rigidity within the field. Up to this time, art therapy has been quite rigid. There have been so few who were included into what was a rather small group of art therapists. Those art therapists were mostly located in the East. There has been only one publication for art therapists, the American Journal of Art Therapy. Now, there is another publication, the AATA Newsletter. . . . there is now diversification in the field. . . . more people can be heard. Since the formation of AATA, we have qualified art therapists from practically every state in the country and Canada. This can be construed as flexibility. (Cohen, 1970a, p. 2)

Not only had there been a tremendous battle at the conference on the question of having professional standards for registration, but there were also major differences in what kind of standards to have and how to determine them. The two groups collided with each other philosophically and with vehemence. Judith Rubin remembers:

[Kramer and Ulman] were worried that what they (and Naumburg) had conceptualized would be prematurely narrowed. There were no villains or heroes, but everyone was very passionate and wanted to insure the survival of the profession to which they had given their life's blood. But they had different ideas of how to get there. Somewhat later, in Houston at a meeting of the American Society for Psychopathology of Expression, a group of us had lunch and Sandra Graves (Karin) came up with a wonderful compromise, which made it possible for people pursuing alternative avenues in art therapy, education and experience to be considered to meet standards for registration and the argument was resolved. (J. Rubin, personal communication, January 14, 1994)
SPECIAL 25TH ANNIVERSARY SECTION

What has held the organization together during its wars and its relatively short life has been the overriding commitment on the part of the pioneers to the development of art therapy as a therapeutic discipline. Like a vital, opinionated, competitive family, the members argued. But like a family, they pulled their covered wagons into a protective circle to fight the important battles necessary to carry the profession forward. Whatever else might be said about the American Art Therapy Association, it could never be called dull!

Endnotes

1. The Bulletin of Art Therapy was first published in 1961 and was the only professional journal in the field until 1973. In 1969, Ulman changed the name to the American Journal of Art Therapy.

2. Those art therapists included Naumhurz, Jane Gilbert, Lynn Berger, Carolyn Refenes Kniiazeh, Hanna Yaza Kwiatkowska, Miryam Dergalis, and Myra Levick.

5. Levick served in that capacity from 1969 to 1971.

6. Much of the following information has been collected from the archives of the American Art Therapy Association housed at the Menninger Foundation, Topeka, Kansas.

7. To further his argument, Ulman published an article by Stern and Honore (1968) on the problems and questions entailed in the formation of an association entitled, “The Problem of National Organization: Make haste slowly.”

8. In addition to being AATA’s second President (1971-1973), Ault was the Chair of the Education and Training Board.

9. Later recipients of the Honorary Life Membership Award honoring significant contributions to the field were Edith Kramer, Myra Levick, Elinor Ulman, Bernard Levy, Helen Landgarten, Elsie Muller, Hanna Yaza Kwiatkowska, Rosley Silver, Judith Rohn, Jane Rhyne, Gladys Aggel, Robert Ault, Don Jones, Frederick Cohen, Frances Anderson, Gay Drachnik, Harriet Wadeson, and Gwen Gibson.

10. Registration is one of the lower levels of professional credentialing since it is based on education and experience but not on demonstrated competencies. A more stringent level of credentialing is based on a national examination. In all professional organizations, the requirements for credentialing are gradually tightened as the discipline develops.

11. Others who were offered registration under a grandparenting arrangement but originally refused were Jane Rhyne and Arthur Robbins.

12. Graves’ suggestion was to award applicants for registration Professional Quality Credits (PQCs) based on their education and training, with different experiences being given a different number of points. One had to amass a total of 12 PQCs in order to be granted registration.

An Informal Interview with Edith Kramer

Bardi Koodrin, BA, Gail Caulfield, MA, and Annette McGarr, MA

In June, 1993, C.A.T.S.A., the graduate art therapy student association of the College of Notre Dame (CND) hosted a month long exhibit of Edith Kramer's paintings and sculptures. On May 31, when Miss Kramer arrived at CND's Wiegand Gallery to install her artwork, several students requested an interview.

Born in Austria in 1916, Kramer emigrated to the United States in 1938 to escape Nazi persecution. She made her way first to Prague, Czechoslovakia in 1934, where an American friend on the Jewish rescue committee eventually was able to get her an affidavit to travel via Poland to America. She remembered the years spent with Friedl Dicker who later died in Auschwitz.

E. K.: . . . what I did in Prague . . . between 1934–38 tied in [with art therapy] because my teacher, Friedl, also did some art teaching with some of the refugee children. Czechoslovakia, at that time, was still a liberal state in which the government accepted refugees from Germany; some of them were political refugees, some of them were workers, some were Communists, some were Social Democrats—working families that fled Hitler but weren't allowed to work because of the Depression. They were not given a permit to work and were put into camps that were not anything like concentration camps, but still places to hold this influx of families, people for whom there wasn't any space in the world. They waited there to emigrate somewhere else, to South America, to various places. And there were children there who were uprooted and traumatized by this change and by what happened to their parents, though not traumatized in the way that children would be traumatized during the war and in the concentration camps. There was no war yet. But we worked with these kids, and I got to know a little bit about disturbed and traumatized children.

B. K.: Did you learn how to read their art, in the process of teaching them?

E. K.: Well, a little bit. How to see, particularly, the identification with the aggressor. We saw drawings of Hitler and people . . . who identified with Hitler, who was, after all, the most powerful person; he was evil and powerful, and the way to bind the anxiety was to be like him. We saw some of the rigidity, the messiness, and the . . . that you see in traumatized children. I got to know a little bit of that . . . I arranged an art exhibition at a Montessori nursery school that one of the refugee people started, and I figured out, let's put all the houses together, all the people together, and all the different subjects together, and we did something that was much more educational than just hanging up kids' nice work. And, so I was, I think, already somehow systematically thinking about things with a bit more organization and more thought. At that time already there were lots of psychoanalysts in Prague . . . coming from Germany, some from Austria later on, refugee Jewish psychoanalysts. You could get psychoanalysis for very little money, and they were also offering many courses, and since I was in those circles, I was allowed to sit in on some courses in child development.

G. C.: Was your training in psychoanalytical art therapy?

E. K.: Well, eventually, I had psychoanalysis in this country. I started in Prague, and then everybody had to leave Prague; after the anachloss we knew our time was very limited and you had better get out of Europe as fast as you could, at least out of the German area of Europe. . . . So I started in analysis there [in Prague], but it was just a few months, and then we decided we'd better meet in America, if we got there. They got to America; the analysts, if they had good connections they could leave. So, I had kind of a promise that this would continue if I got there. . . . That was a clinical analysis, not a training analysis . . . for three years and then I took off for eight years of living. Then I went back for two more years of analysis.

Miss Kramer remembered her early years in America and the beginnings of her career as an art therapist.

E. K.: . . . I did some teaching and I supported myself and it was a good moment, I think, for a person my age in my situation to come to the United States, . . . for me as a painter, it was the right moment and actually probably easier to somehow live on a part-time job in the United States than it would have been in Austria. . . .

B. K.: What was your emphasis and subject matter in your paintings?

E. K.: I was always a representational painter, never anything else. I was always somehow in opposition against what was going on in art at this time. Even my friend Friedl, who started as a Bauhaus person with a lot of experimentation, went somehow back to nature during the time I knew her, and while I still use a great deal of the Bauhaus methods of teaching and of separating various elements in art, I was always representational. I've always really liked the world and what I see in the world, but I certainly found here a new world that was very fascinating, very wonderful to try to make some statements about it. So, I did. I could always support myself somehow.

B. K.: Weren't you hired to be a shop teacher, more of a carpenter and jack of all trades?

E. K.: Yes, I had to learn a lot more about carpentry than I knew, but I learned it on the job, and after all, you taught kids from 6 to 12, not grown-ups or adolescents and at that time there was no machinery; you had hand tools only and kids learned to use a cross-cut saw, hand-drill and things like that, and so you worked really, everything by hand . . . It was much simpler then, you could let kids build benches and tables, bookshelves, anything . . .

A. McG.: Could you talk about the beginning of art therapy and what you encountered in New York?

E. K.: What I encountered in New York about art therapy? Well, there wasn't such a thing. There was Margaret Kaumberg whose books I did read eventually! But otherwise there was really no such thing. But there was of course progressive art teaching . . . in 1938 the Walden school already existed and the art teaching that was done at the Little Red School House where I was a shop teacher. I also did some art teaching and did some clay work with the kids that was already the kind of art teaching that was influenced by Florence Cane and Victor Lowenfeld. It was very free and respected the children's developmental stage and worked within that stage, and I think it was very good art that was given at the Little Red School House.
G. C.: When you work with children and they make drawings or sculptures, do you then talk with them about what they have done?

E. K.: No!

G. C.: So, what is your feeling about that?

E. K.: I think sometimes there might be a conversation, but I certainly don’t formalize. First you draw and then you talk about it. I think that’s all wrong. I think one of the wonderful things is that you needn’t talk. You could talk, you’re allowed to talk, nobody is going to say, “Shut up because I’m not your talk therapist.” But, there is a door opened to a kind of communication with yourself and others that is, indeed, non-verbal and is symbolic and need not be necessarily translated into words. And, after all, any good work that anybody does, the image tells you more than words could tell, and this is after all the hallmark of good art—that it says more than you could say about it.

G. C.: My feeling has always been that art is in itself a healing process. In your book, *Art as Therapy with Children* (p. 219), you wrote: “Art cannot remove the cause of tension or directly help resolve conflict, it serves as a model of ego functioning.” Are you saying there that art in and of itself does not heal?

E. K.: I would say, if you are really a very sick person and you just have nothing but art therapy, it probably won’t be enough. It might be the central thing; it might be the thing that prepares you for talk therapy; it might be the thing that you can continue by yourself after your therapy is over, but it is certainly something different. I don’t know how much I’ve changed my opinions about this since I wrote this book in ’71, but I would say that there are certain people who profit much more from doing art than from any kind of talk you could do with them, no doubt. But, in general, we sustain, support, and help the sick and we cure the healthy. It’s very seldom we have the wonderful chance of curing a healthy person, right? So, in this sustaining work, you work on many, or most, people who need that kind of support from many different directions. One person alone, or one access to man alone will not do; it really always needs a team. What our own part in this team will be will differ greatly. It might be the most important element of this team. Here, I’m the one person whom this man does not assault and for whom he even produces something. Right? It might be if he’d done some art, he may be more ready to talk to me; or he has talked, and now he wants to do a picture about what he has talked about. What’s going to happen will be very different, and one has to take it as it comes and not insist. “I am the big person who can do it all” or “I am the underdog who is only the helper of the big shots, the eggheads who do the talk therapy.” It’s neither one nor the other.

A. McG.: What about doing both, for the art therapist to be well-versed in both art and talk therapy?

E. K.: Somebody like Judy Rubin, who is a trained analyst, or my friend Laurie Wilson, who also has gone through real psychoanalytic training, can do certain things in art therapy that I would not dare to do because I’m not trained. Nor do I have a healthy desire to be so trained, because I’m perfectly happy with my status and my function in this field, and I don’t want another function added to it because it takes still more away from my own art. . . . and neither Judy nor Laurie do art anymore.

G. C.: Exactly! I wonder about that, because people who are both psychotherapists and art therapists talk longingly about the art they used to do, that they have no time to do anymore.

E. K.: That they no longer do. Right! I want to take three or four months vacation. If you are somebody’s primary therapist you can’t do that, that person is going to commit suicide during that time. So, I want to have a position in which I can write this kid a postcard while I’m away, and when I used to work I wrote special postcards and really selected them for each kid. When I got back they said, “Oh, I got your card; . . . I still have your card,” and they’re glad now they’re going to have art again. That’s fine. If you had been the primary therapist, and the person said, “I nearly committed suicide and where have you been and you’ve destroyed me by being away.” I don’t want to be in that position because I’m an artist. On the other hand, I think because I’m an artist I can get something from these people in art that those people who have abandoned their art don’t get.

B. K.: I’ve read when you write a book, your art seems to get put aside because you have to focus on your writing; that’s something you don’t seem to like very much, in the sense that it takes you away from your art.

E. K.: No! That’s a sacrifice. For those 30 years [of Kramer’s professional book writing period], every 10 years, I’d have enough to say and I figured I should spend some time doing that. So then in the summer I would always paint, but in the winter I’d say, “You’re not allowed to paint, you have to write this book!” Then I would lock myself in and write the book. . . . I said, “I can’t do three things. I can’t paint and work and write a book” so then I would get a little money (from grants) so I could write a book. But I found that if I painted I wasn’t going to write, so I would stop painting in order to make myself have only the satisfaction of finding the right words rather than the right colors or shapes. But this was not easy for me to do and it was a sacrifice, but had great compensations because it both gave me status in the world of art therapy and also because I wrote certain things that I felt. . . . Art does not require much intellectual work; . . . if you have a fairly good mind, you need to exercise that mind also, from time to time.

A. McG.: It’s interesting that you say your art is not an intellectual pursuit.

E. K.: No, it isn’t. . . . If you’re a painter, I think that it does not exercise your conceptual mind in the way in which writing a book exercises your conceptual verbal mind. And if you have a good mind that is quite well-equipped, you want to use it from time to time.

B. K.: I know what you’re saying, because when I’m in my writing mode, my art gets put aside, and vice-versa. When you were writing your books and felt you had to sacrifice your art, did you find that you needed to use psychoanalysis?

E. K.: No, no. The analysis helped me very much. I don’t think you can understand what’s going on unless you have some personal therapy, and you also have to learn what you should stay away from because that’s where your unresolved conflicts will get into the way of what you’re supposed to be doing. I think you learn where you have inclinations for countertransference, mistakes, and disturbances, and either control it or stay away from it. For all of that you need to be in analysis. But I needed the analysis much more in my personal life than in my professional life, except for understanding. But for con-
ducting my personal life, I needed the analysis. That was a private thing.

G. C.: In your book, *Art as Therapy with Children*, you addressed the meaning of art, and what art is in relation to what art therapy is. I haven’t found much in the professional writings that addresses those concerns, the importance of art and what makes something art or not art—"anti-art" or "pseudo-art."

E. K.: *Childhood and Art Therapy*, the next book I wrote, addresses that also. . . . *Art as Therapy with Children* addresses the whole problem of transference in art therapy.

B. K.: You said you worked very little with adults. What about the parents of the children you worked with. Did you ever get involved with the family?

E. K.: Well, no. You see, the places [where] I worked were all places the parents were not accessible. In the Wilts- wyck School for Boys, the parents were not accessible, and at the Jacobi Hospital, I sat in on some interviews with parents and children together, and in the rounds I got to know some of the parents and what they were like. I think you can do wonderful work with parents and children together. I know some who do it and I supervised or observed some of this, but I really never have done it myself.

G. C.: There’s a wonderful story about you working with the blind boy who made that bird.

E. K.: Yes, he’s now 40 years old and I still see him. There’s a very interesting story about him. . . . He became a Pentecost preacher. He had periods of great violence. He did some beautiful sculpture with me; I continue to work with him. He still comes from time to time; he works still with wax. He is highly gifted, and that is someone who ran out of every therapy, and could not be in therapy. I think that the stabilizing factor of religion is one of the things that he certainly needs. He has really done very little art; he does art when he comes to me, but the gift is there, and it was very important in his adolescence and his young adulthood.

M. H.: Have you stayed in touch with Angel?

E. K.: Yes, he is in the Navy. He still does art. He has sold a few pictures and got a price. He’s still interested in art, but he no longer needs to be a famous artist. He’s married, a stable marriage; there’s a teenage daughter and a little boy now, and he writes to me.

G. C.: Do you think that cultural differences made any difference in your ability to work with American children?

E. K.: . . . I was very lucky because if you land in Green- vich Village among a parents group who send the children to a progressive school . . . they probably are more similar to you than a group of farmers or business people in Austria if you come from a Bohemian environment. I landed again in a Bohemian environment, so it was not that much of a culture shock. I mean, certain things shocked me terribly. . . . In Austria swearing is anal or by sacrilege, but not by anything sexual. . . . that anybody could use [a word for] lovemaking as an ugly assault, that shocked me. So there were certain cultural things that were different. . . . it wasn’t that different except more liberal. . . . Mr. and Mrs. Roosevelt were the father and mother of the country. . . . it was a very different atmosphere than it is today, . . . it was a very wonderful time in America. It was a time that was much more open, there was much more generosity.

B. K.: You started as an art therapist 50 years ago. Now in the ’90s, we as therapists certainly have different issues to deal with, such as gangs, drugs, and guns.

E. K.: Gangs and guns were there, but there weren’t that many drugs, and that makes a great difference. It was easier then; I was young, I lived on streets and in tenement buildings that today would be dangerous for a young woman. And when it was hot, I . . . slept on the roof. You wouldn’t dare to sleep on the roof now.

B. K.: Yes, I have to say it is different. That women in particular can’t be as free.

E. K.: You can’t! I could go home at 2 o’clock in the morning. I wasn’t afraid; there was no need to be afraid.

B. K.: When you were working back in the ’50s and ’60s, did you find the issue of sexual abuse as prevalent as it is now?

E. K.: No, it wasn’t. Now, maybe there was hidden sexual abuse which we didn’t know about. I think also there really is an increase because people [are getting] more and more infantile. If you need an infant to sexually satisfy you, that means that you yourself are so frightened of adult sex that you have to get somebody who is totally helpless. And what you do are fantasies that every 3- or 4-year-old develops, but gets over. I think the lack of maturity is increasing, that makes for more sexual abuse. Adults are like 4-year-olds. There are more of them now, I think, than there used to be. Adults were more like ages 6 or 7 in the Oedipal stage. rather than in the anal stage.

M. H.: But I wonder also, how come incest tabous are common?

E. K.: It’s very often the stepfathers who seduce their stepdaughters, right? I think before there was certainly emotional seduction, there always was, but it was not acted out physically. There is a difference between the father of Elizabeth Barrett Browning, who made her into an hyster, and the father today who really puts his penis into his daughter’s mouth. . . . In both cases the father is possessive of the daughter and destroys, somehow devours, the daughter. But it is a much worse devouring when it’s so physical. For a little child to unchain that sexual passion, the physical sexual passion of an adult, that is just absolutely intolerable.

B. K.: Now we have the wide-scale ritualistic abuse stories that are apparently coming to the surface.

E. K.: In the *New Yorker* . . . there was this rampant fantasy that really wasn’t true.

B. K.: That’s a good question right now. Is it true or is it not true?

E. K.: I think that probably both occur. There are real things happening. I know of such horrible [stories], and then also, there really are fantasies that become a kind of reality. . . . And this type of fantasy is universal. Every child at some point develops those fantasies; that is something which Freud found out—the power of fantasy, which is also an enormous power. Those hysterics that Freud worked with probably did have fantasies of a seduction that didn’t occur. Among them probably there were also some psychotics indeed [with whom] sexual seduction had occurred. And we’ll never know which one was which.

M. H.: There’s a natural stage in development, at age 4 or 5, where children want to possess their parent in that certain way, but it seems these are [adults] who never grew up emotionally, and so they’re still at that stage.

E. K.: But then again, you’ve got those who continue to
have these wild fantasies, and they might be pushed to act out that fantasy. Still two different people. You'll encounter both.

G. C.: How do you see the place of the spiritual in terms of art and art therapy?

E. K.: Well, I am not a spiritual person. I really don't know. I'm still sustained by the secularized Judeo-Christian moral code and it suffices me. I think people need something of that sort. . . . Whatever we get now is so jerry-built—it's not cooked by a culture, so usually it is really very frail and has not much substance. I don't know what to do about that. . . . I know there is a need for some sense of right and wrong, and some sense of virtue and evil in the world, and that there is retribution for sin against the holy spirit. . . . But there is no system today for all that since the churches . . . no longer have power, and the secularized element seems not sufficient for many people. So I really don't know what to say to young people about that. . . . where to find that kind of moral gyator, the moral thing that keeps you from going in all directions and doing any old thing, and having no sense of self and no sense of what you're doing in the world. . . . I think really what we need is new sins—new sins against the environment.

A. McG.: Or a new moral code for new sins?

E. K.: Right!

M. H.: How about the role of spirituality in relation to death? It seems like religion plays a very big role in helping people.

E. K.: Helping people to die or cope with death. Certainly, denial of death is the worst you can do—which our culture does. You have to figure that life is not forever and that eventually you'll die and you better make good use of the time you have on this earth because it's the only time you're going to have. There are some people who think there is life after death. This to me seems absurd, but it's not absurd to everybody and I certainly wouldn't stop anybody from such a belief if that belief sustains him. I don't know for sure whether I'm right, or who is right, but prepare yourself to live as good a life as you can because it's not forever. I think that's necessary. Because if you die and you feel you've wasted your time, that's about the worst thing that could happen to you. How short, or how long that time is, nobody can foresee, so every day you must live as if it were the last day, in a sense, not to do the unspeakable.

B. K.: So every day is just a process in itself; it could be your last day.

E. K.: You have to do what you can do to be a mensch [Yiddish word for a good person], and hope for the best. No?

G. C.: I guess I see the spiritual and the creative as one, and if somebody is experiencing a creative process, then he or she is also experiencing some essential truth in some way, and that this is somehow connected.

E. K.: Art is certainly concerned with truth. The lie is the deadly sin in art; there's no doubt about it. So if you call truth spirituality, then yes. To me, it's foreign, this way of thinking, but then I'm an old woman. We were all agnostic, and very assimilated . . . but on the other hand, we knew the Bible. . . . I know the Bible better than any one of you probably.

B. K.: Edith, what advice would you give new art therapists who are about to go out into the world?

E. K.: Fight for part-time work! [There was much laughter at this point from the students. Kramer smiled broadly, and pointed to the collection of her paintings stacked in neat piles on the gallery floor.] Because if you're full-time, you really don't have time to do your art. You need a part-time job. It's as simple as that. You need time for everything else! Try to get into places where there's not this total short-time revolving-door work with patients, so that you have time to do art therapy. . . . I think you should try to get into long-term work. . . . There are tremendous opportunities working with the physically ill and the handicapped, and all such people that are not psychiatric patients. . . . I think you can do a tremendous amount with people who are physically ill in hospitals and in hospices, and in old age homes, and in many places where the rejects or the temporarily confined people are kept. It's very satisfying work because you may be working with someone who is dying but is emotionally intact. There is more hope there in every session than with someone who is maybe physically very, very healthy, but emotionally a permanent cripple. So, I think you have more satisfying work very often if you can work with people who are more intact and very much in need of symbolic living, because direct living is for some reason or other cut off and impossible. . . . And the prisons! . . . I worked a little with prisoners. Actually, those were adults I worked with for two semesters at Riker's Island, and it was very interesting and very satisfying, and they were just like grown up little boys. . . . So, there is a very wide field. Try not to stay only in psychiatry. Figure how broad this could be.

B. K.: I guess that goes back to what you said earlier about how art therapy doesn't always heal the mentally ill versus the people who are emotionally stuck in developmental stages.

E. K.: Mmm. There are others. There are the blind, there are the deaf. There is an enormous amount of people who really need symbolic living and need to feel that there is a door open where they can feel like a human being even if in some way or another something is missing. Art can make you feel like you're a mensch, and maybe that's the most important thing. . . . It can reassure you and confirm to you that you're a human being.

B. K.: Have you found that a lot of people really are afraid to start the art therapy process; they might say, "I'm not an artist" or "I don't know how to be creative"?

E. K.: Yes, but I think that's overcome fairly quickly, usually, because you find out that you surprise yourself. I think that is one thing where treatment plans are wrong, because there are surprises, and if you have already a plan. . . . you're going to shut off this possibility that it might be something completely different. You must be open for it and ready to pick it up. If you have your treatment plan all cut up and sealed, you're not going to see it.

M. H.: That sounds like the artist in you talking because that's what we learn from painting.

E. K.: Right! You don't know. You can't foresee. You must be open to the unexpected. If you, as a practitioner are no longer surprised, you know something is wrong with what you are doing. Be open to surprises!
Addressing Culture and Values in the Training of Art Therapists

Mariagnese Cattaneo, PhD, A.T.R., LMHC, Cambridge, MA

Abstract

This article discusses the importance of addressing culture, values, and aesthetics in the training of art therapists. It illustrates how students can be guided to discover and examine the influence which culture has on their own and on others' perceptions of different modes of artistic expression. Students should be given the opportunity to gain an awareness of their personal and cultural backgrounds with their attendant values and biases. Also, they should explore culturally based differences in aesthetics which deemphasize the role of universality in artistic expression. This newly gained sensibility can give direction to their therapeutic work with clients.

Culture and Values

Culture defines the life of a specific group of people: its history, its adaptation to the physical environment, its artistic expression and appreciation, its verbal and nonverbal expression and means of communication. It refers to a shared pattern of beliefs, feelings, and knowledge. "Culture is the collective expression of the group's personality—its wishes, values, and ideology. It is the sum total of knowledge and attitudes, a vast accumulation of ways of thought, of action, and of emotional expression" (Tseng & McDermott, 1981, p. 6).

Although people in different societies and cultures may share similar basic needs, emotions, feelings, and perceptions of the world, how they express themselves and interact with each other may be very different. These differences are the product of both individual development and cultural dynamics. Cultural values and beliefs guide individual communication, behavior, and action. Any deviation from the cultural norms is not sanctioned by the dominant cultural group and, therefore, is often labeled as inappropriate. Also, each culture has its own value system which supports the cultural beliefs and acts as a guardian of culture. "The very nature of culture is that it establishes and defines certain patterns of behavior that exist in, and are unique to, one group but are different between groups. The customs are shared and sanctioned by the group" (Tseng & McDermott, 1981, p. 6).

While the dominant culture in this country is defined by middle and upper class white male values, the reality is that our society consists of a multitude of cultures and subcultures. These subcultures can vary considerably. They can be defined by characteristics such as race, ethnicity, religion, class, gender, sexual orientation, education, and age. They can be more or less organized. Each one can have specific norms of behaviors—ways of living and use of language, both verbal and nonverbal. Their values can vary and be substantially different from the dominant culture.

As art therapists, we never work in a culturally homogeneous situation. Rather, we are constantly confronted with a vast variety of cultures and subcultures. It is important to be aware of a clients' personal and cultural backgrounds and their attitudes toward their values. To understand the relevance of what a client brings into therapy, it is important for the therapist to be aware of her or his own cultural background and personal value system and to understand how one's own attitudes can interfere with constructive interactions. These understandings are important prerequisites for becoming an effective art therapist—one who is respectful and considerate of the differences clients bring to the therapeutic process.
Art Expression, Aesthetics, and Culture

As therapists we must be aware of issues of oppression and power differentials based on class, race, ethnicity, gender, and sexual orientation. As art therapists we must also be aware of internalized cultural imperialism as it may be expressed in the different arts and media. We must be alert to our culturally bound aesthetic values and tastes.

In art therapy, the creative process and its expression are integral parts of the therapeutic work. Visual expression is part of everybody's life, although it may not be recognized as a conventional "art form." This expression takes many forms and can be seen in various ways, such as how we decorate our homes and gardens, how we dress, the colors we choose to wear. These everyday choices are all part of our visual expression. Through our visual expression, we communicate who we are, how we feel, and how we identify with our particular culture, subculture, or group. This visual expression is part of our identity.

Expression through visual images, artifacts, music, and dance is common to all cultures and is an integral part of life and living. Because we are shaped by our culture and its values, expression through art and its subsequent meaning are intertwined with cultural attitudes. Therefore, the basic attitude of the artist and of the beholder are determined not only by personal taste, but also by the culturally conditioned situation in which an individual's aesthetics develop.

I still remember when I was in fourth grade and the knitting teacher brought yarn of different colors for us to choose from knitting a small bag. A girl who lived on one of the poorest streets chose blue and green. The teacher scolded the girl, saying, "Your choice of color really shows where you come from!" This remark strongly influenced my future aesthetics by affecting how I reacted to certain color combinations. I internalized that blue and green together were "vulgar," and it has taken me a long time to overcome this indoctrinated value judgment.

Diverse Versus Universal Expression

Art therapists often emphasize the universality of artistic expression and use this as an argument for its effectiveness in working with various populations. But we must be very cautious in applying the term "universal" to artistic expression and communication. We must critically examine what we mean by the term "universalism." The universal may be defined as that which fits into the framework of the dominant culture. This is a Eurocentric approach of Western culture through which the universal is defined. But art is not value free. We must acknowledge that how we see the world and its cultural expression derives from our cultural contexts, which shape our values and aesthetics. In art therapy, both the therapist and the client bring their subjective aesthetic experiences to the therapeutic encounter.

Cultural expression is common to all people. But how and what is expressed is very specific to cultural background class, race, ethnicity, gender, beliefs, and value systems. We are shaped by our culture and its values. Expression through the arts and its subsequent meaning are intertwined with cultural attitudes. The basic attitude of the artist and of the beholder are not only a matter of personal taste, but also come from a culturally conditioned situation in which individual aesthetics and taste develop. We are conditioned by historical frameworks of education that are both formal and informal as well as the controlling cultural industry (Adorno, 1975), that mandates its own criteria in formulating what is cultural, "universal," and appropriate. This ethnocentrism in the arts is balanced on a notion of quality that "transcends boundaries—and is identifiable only by those in power" (Lippard, 1990, p. 7). It is this idea of quality that guides education in the arts. "The conventional notion of good taste with which many of us were raised and educated was based on the illusion of social order that is no longer possible (or desirable) to believe in" (Lippard, 1990, p. 7).

Personal taste is so determined by these conditions that it is often very hard to see beyond one's own limited viewpoint. It can be difficult to appreciate and respect what does not conform to our personal experience, except for its novelty and excitement. In our society every age, social, and ethnic group has its own tendencies in taste. It is essential for art therapists to develop insight into the cultural complexities that we encounter in our work with clients. Like any mental health worker and psychotherapist, we must have a cultural awareness and knowledge. However, we must also be aware of the personal and culturally bound aesthetic frameworks and taste that we bring to the therapeutic work as well as our clients' cultural expression through the arts. This brings an additional important dimension to the training of a culturally aware art therapist. Unfortunately, this essential aspect of our work often does not receive enough attention.

By abandoning the stance of universality of artistic expression, the art therapist must abandon old values, beliefs, and judgments in the arts. One must instead learn to value the subjective experience and aesthetics of each individual. This learning can enable honest communication and interaction.

Implication for the Training of Art Therapists

Lofgren (1981) says, "In order to be able to work with culturally different clients in a spirit of well-informed cooperation, the art therapist must take responsibility for becoming culturally aware. This means learning all one can about the client's lifestyle outside of the therapy session. What one learns directly from the clients is not enough. Culturally different clients cannot be expected to be conversant enough with another culture to impart to therapists all they need to know of cultures foreign to them" (pp. 29–30). It is essential for art therapy students to have the opportunity to gain insight into the cultural complexities that they will encounter in their work as therapists. Campanelli (1991) suggests that "art therapists need to examine issues of ethnocultural diversity and learn how they apply to art therapy theory and practice" (pp. 34–35).

As mentioned earlier, we are influenced by the cultures in which we were raised with their values, aesthetics, norms, and taste. We are all part of larger systems such as family, community, and the larger society. In our work as art therapists, we encounter not only our own cultural system and subsystem, but also the cultural systems of our clients with their norms and values as well as the cultural norms and the values of the dominant culture. We interact with these sys-
tems, and it is in these interactions that cultural conflicts can arise.

Students are often personally confronted with these conflicts. In the process of becoming art therapists, they are faced with their own cultural system with its values and beliefs, their peers, their teachers, their supervisors, their practical and internship placements, as well as those of their clients. Being surrounded by all these different value systems forces students to examine and question their own. This examination is often painful, especially during the beginning phase of training, when old values start to erode and new ones are still vague and underdeveloped. Because it is such a vulnerable time, students require much support and understanding from teachers, supervisors, peers, and others. As educators, we need to provide a safe environment in which students can examine their personal and cultural identities, their values and beliefs, and their biases and assumptions. Students should be encouraged to explore how these cultural factors have impacted their individual development.

The college at which I teach emphasizes diversity in its training of teachers and therapists. Cultural issues and diversity are addressed in the context of the seminar topics. In the core seminar in art therapy, gaining awareness of multiplicity and diversity starts with students sharing their cultural background, their values, and their belief systems. For the students, this becomes a discovery of the vast spectrum of differences that exist within a group which, at a superficial look, might seem homogeneous. We draw from a wealth of experience within the group of students. This often is a painful process in which internalized societal messages, bruising experiences, a sense of powerlessness, fear, anger, and guilt are externalized. Through storytelling and art making, students reconnect with their own history and the feelings it arouses. For example, students are asked to represent in an artwork how they see that their personal development was shaped by race, ethnicity, class, religion, gender, and sexual orientation. At the same time, they consider how each of these influences has shaped them into who they are today. Historical, societal, and cultural biases become contextualized through readings, discussions of their personal experience, and artwork.

Pinderhughes (1989) suggests teaching methods for training clinicians through an experiential groups model. This understanding of the multifaceted complexities involved in intercultural and intracultural work is “developed by exploring within a group format the participants’ own feelings, perceptions, and experiences vis-à-vis ethnicity, race, and power. As they identify and acknowledge their predispositions and biases in these areas, grappling with them privately and within the group, they discover the origin of the feelings and perceptions that influence their behavior with culturally different others” (p. 211). Important to this process of critical learning is accepting and embracing one’s own revisited traditions that can provide a source of strength as well as a sense of pride and beauty. It is the esteem and love for one’s own cultural background and identity which form an important base for valuing the diversity in other people’s experiences. Diversity and multiculturalism can be celebrated and promoted, not feared, resisted, or rejected.

Since all expression—visual, verbal, nonverbal, formal and informal—reflects a complexity unique to each person but fashioned by cultural influences and values, the art therapist needs to be aware of the impact culture has on images, colors, forms, and symbols. “Personal associations, education, political and environmental contexts, class and ethnic backgrounds, value systems and market value, all exert their pressure on the interaction between eye, mind, and image (Lippard, 1990). To understand the impact of this socially internalized perception, I encourage students to explore their experience to the different arts, the meaning they had for them as they were growing up, and how art influenced their present sense of aesthetics. This leads to an examination of their criteria for acceptance or rejection of certain works of art. For this experience, the students bring to class reproductions of their favorite works of art. Using an existing piece of art is a safer way of looking at one’s aesthetics than trying to elicit culturally different reactions to personal works. Students share their personal responses to specific works of art, which refer to previous personal experiences and the feelings they provoke. They are also encouraged to look for the cultural content and context of the artworks. Students begin to realize how diverse reactions to specific works of art can be, and they begin to develop an understanding of culturally based differences in visual communication, aesthetics, and taste.

Conclusion

Through personal exposure to differences in culture, values, and aesthetics, students gain a broader understanding of differences that clients bring to the therapeutic relationship. This awareness of the client’s history, lifestyle, and experience with art, and the role the client’s culture has within the dominant culture, helps to prevent misunderstanding and misdiagnosis. With this awareness, the art therapy student starts to develop an understanding of the roles that culture, subculture, values, beliefs, and aesthetics have in the therapeutic relationship and is prepared to identify existing cultural differences and respect them. With this understanding of the cultural complexities that both client and therapist bring to the therapeutic relationship, the art therapist can hopefully prevent the misinterpretations and misunderstanding that could be detrimental to the therapeutic process. These understandings can also aid in mobilizing all possible resources toward a positive outcome for the well-being of the client.

Art Therapy with Culturally Different Clients

Cynthia A. Westrich, MA, Edwardsville, IL

Abstract

To create a therapeutic alliance with a client, the art therapist needs to be sensitive to the cultural differences which can bias the relationship. The purpose of this paper is to present a literature review of specific cross-cultural therapeutic principles to be considered during treatment. Furthermore, it defines how barriers such as language, diagnostic errors, and others may influence the treatment and possibly contribute to a client's early termination from therapy. The author also considers the use of art materials and gives attention to products and/or to processes during art therapy with the client. It is by exploring these issues that art therapists can possibly discover an individualized technique which will best benefit their clients who may have different cultural values, beliefs, and traditions.

Introduction

Art therapists should pay particular attention to populations with cultural differences and how these differences may affect the therapeutic relationship. By understanding elements of cross-cultural therapy, art therapists may prevent projection of their own ideas and beliefs onto clients. This is essential in preventing problems which can occur when the art therapist may apply a western clinical approach to people from other cultures. Also, imagery can serve as a useful aid to communicate and to integrate feelings for the culturally different client (Wadson, Durkin, & Perach, 1989). Therefore, art therapy, more so than traditional verbal therapy, may have the potential to transcend some of the more dangerous barriers in cross-cultural communication in an innovative way because it may adapt itself strikingly well to divergent values (Lofgren, 1981, p. 29).

Characteristics of Cross-Cultural Therapy

To better serve the client whose ideas, beliefs, and/or cultural traditions may seem unfamiliar, art therapists should become aware of the field of cross-cultural therapy. Cross-cultural therapy refers to therapy in which the therapist and the client are "culturally different because of socialization acquired in distinct cultural, subcultural, racial-ethnic, or socioeconomic environments" (Jackson, 1987, p. 66). It is important for art therapists to acknowledge that cross-cultural therapy depends on both real and perceived cultural differences and similarities in the therapeutic relationship. Even if the therapist and the client are culturally similar, but perceive each other as culturally different, then the relationship may be considered cross-cultural (Jackson, 1986). McNiff (1984) notes in his cross-cultural art therapy experiences that cultural differences are perceived within age groups, genders, races, people of different sexual preferences, and within political and religious values.

Cultural differences can best be understood by examining four of the following characteristics of cross-cultural therapy: degree of fit, existential therapy, transcultural care, and pluralistic therapy. The degree of fit between cultures may be across lines of social class, region, race, and ethnic background. It may also be associated with similarities and differences in cultural history and economic development. Thus, when there are more cultural characteristics that the therapist and the client share, then there will be a closer degree of fit. However, if the therapist and the client share few cultural characteristics, cross-cultural psychotherapy may require two collaborating therapists and consultation with specialists in the language and customs of the client's country (Bolman, 1968).

Because of the ambiguities and the degrees of fit which may occur between the client and the art therapist, the art therapist may also want to rely on an existential approach to therapy. "Existential therapists relate to clients, whoever they are, as members of the human species sharing the universal culture. This is based on the principle that all individuals are worthy of respect and appreciation because they are human beings" (Vontress, 1988, p. 76). If art therapists can discover the universals which they share with clients through existential therapy, there is a common ground on which clients and art therapists can communicate (Golsh, 1989).

After finding a common ground, the art therapist can begin to "transcultural care" for his/her client. Transcultural caring refers to knowing the client's cultural beliefs, values, and lifestyles. This approach can be used to assist culturally different clients in helping them live in a changing or foreign environment (Leiningen, 1985). The model of transcultural care does not "seek to replace any valid method for practice; it encourages [art therapy] practitioners to be aware of ethnicity and to begin to incorporate that awareness into practice" (Devore, 1985, p. 97). Art therapy can and should be provided to people in ways which are culturally acceptable and familiar to them.

Transcultural care may also include assistance from others who are familiar with the cultural practices of the client. "A model for cross-cultural therapy suggests that at least two therapists, one representing each culture, be used to 'bridge' people. This may include peasant-scientists, traditional native healers, and even so-called witch doctors" (Bolman, 1968, p. 1240). In this dual-therapist role, "components of folk healing . . . [can be] integrated with accepted psychological or psychiatric treatment. This method does not fuse two belief systems, but rather uses them in tandem" (Leffley, 1984, p. 159).
The use of folk healing has been discussed as an adjunct to art therapy (Golub, 1989; Schmais, 1988). For example, in Golub's use of art therapy with Cambodian survivors of war, Kroeu Khmers, traditional healers, are sought for common somatic complaints. The healer performs "caming," a system of rubbing a smooth coin with oil along the outside lines of the body, related to the specific complaint. Golub feels that, as an art therapist, her "interest and respect for traditional healing practices . . . [seems] important to the clients, who in many cases . . . [feel] that they . . . [have] to hide traditional beliefs from Americans in order to be accepted" (Golub, 1989, p. 19). Furthermore, her clients report their dreams to her as another form of healing. Understanding that the Cambodians believe that their missing parents come to them in dreams, Golub further views these "dream spirits" as "primary therapists to whom she and the clients listen as guides for treatment" (Golub, 1989, p. 19).

Golub (1989) also reports using outside resources in the community as healing agents for her refugee clients. "A Khmer Institute is held twice a year in which surviving Khmer artists, musicians, dramatists, dancers, writers, and historians teach intensive courses" (p. 19). This institute also provides a reunion for the refugees. Furthermore, "American staff . . . [participate] as co-learners . . . or as assistants to the teachers. On the request of the Cambodian organizers of the institute, the art therapist also . . . [provides] an open group for . . . [refugees] to engage in the spontaneous use of art materials" (Golub, 1989, p. 19).

Lastly, art therapists must consider their roles as "pluralistic" therapists. "The pluralistic therapist's goal is to help clients clarify their personal and cultural standards." (Diaz, 1988, p. 339). To accomplish this, "the pluralistic therapist needs to understand both the patients' ethnic group and the dominant group's culture and to know the points of contact between the two cultures and the process by which the cultural standards of each influence the patient" (Diaz & Griffith, 1988, p. 339).

According to Diaz and Griffith (1988), the pluralistic therapist actively fosters patient identification with his or her ethnocultural origin through three major therapeutic functions: reflection, education, and mediation. Furthermore, culturally effective pluralistic therapists have at least five characteristics: they recognize their own values and assumptions; they are aware of generic characteristics of therapy that influence the therapeutic process; they understand the socio-political forces that influence the attitudes of culturally different minorities; and they are truly eclectic in their own therapeutic style (Marsella, 1982, p. 341).

These characteristics may result in rapport, empathy, interest, and appreciation of the culturally different client (Marsella, 1982). "What one learns directly from his/her client is not enough. Culturally different clients cannot be expected to be conversant enough with another culture to impart to therapists all they need to know of cultures foreign to them" (Lofgren, 1981, p. 30). Therefore, the "pluralistic" art therapist "must become more [culturally] aware of the history, art experiences, cultural values, and of the life styles of . . . [his/her] culturally different client" (Lofgren, 1981, p. 129). This means that art therapists should be dedicated to learning all they can about the client's lifestyle outside of the therapy sessions. "The deeper the art therapist's knowledge of one cultural group in particular and the wider the range of groups about whom the art therapist has some special knowledge, the more effective he or she can be" (Lofgren, 1981, p. 29).

**Barriers in Cross-Cultural Therapy**

Even the most knowledgeable art therapist may be confronted with several barriers in his/her therapeutic relationship with the culturally different client. If these barriers are not addressed, the client may terminate art therapy early (Marsella, 1982). Some of the cultural barriers that may hinder the formation of a good therapeutic relationship may include language, incorrect assessment of the client, emphasis on individualism, neglect of the client's support system, and dependency on linear thinking.

The use of standard English to communicate with a client may be discriminatory (Sue & Sue, 1977). The heavy reliance by therapists on verbal interaction to build rapport "presupposes that the participants in a [therapeutic] dialogue are capable of understanding each other. Yet . . . [therapists] fail to understand the client's language and its nuances sufficiently so as to make rapport building possible" (Atkinson, Sue, & Morten, 1979, p. 14).

While verbal language obviously presents cultural differences, the visual arts, because of their universal elements and principles, are more interchangeable. For instance, Moreno and Wadeson (1986) observe that in offering art therapy to Hispanic immigrants, art expression acts as a useful modality in addressing images and feelings for the population when verbalization could pose a problem. Thus, art therapy has a "unique potential to construct a cross-cultural theory of psychotherapy based on universal properties of the creative process . . . because common qualities consistently present themselves in imagery and in the process of making art" (McNiff, 1994, p. 126).

Another barrier of cross-cultural therapy can occur when diagnostic errors when "using definitions of normality generated from the perspective of one culture with people of a different culture" (Usher, 1989, p. 63). Thus, normality and abnormality must be considered within a cultural context especially during an art therapy assessment.

It is obvious that art therapists should not conclude that behavior patterns, which may appear strange, unfamiliar, and different, fit into the category of pathology. However, one cannot avoid evaluating the 'appropriateness of a client's behavior, but he or she should always do it from within the client's cultural or social frame of reference" (Draguns, 1985, p. 60). Thus, art therapists must 'develop a standard of normality with reference to the culture itself, as a means of controlling an uncritical application of the criteria, that . . . [her] she brings with . . . [him/her] from . . . [his/her] civilization" (Marsella, 1982, p. 363).

Many art therapists have observed that the use of art therapy assessment may be beneficial when there is a language barrier. For instance, Burch and Powell (1980) were successful using Silver's art therapy assessment to assess the mental status and progress of a Vietnamese refugee who cannot speak English. They conclude that since the Silver assessment demonstrates the value of using art therapy in the evaluation and development of cognitive skills in children with organic disorders of communication and learning, the same
rationale may apply to patients with cross-cultural language difficulties.

On the other hand, Lofgren (1981) presents an example of a Navajo Indian client who was diagnosed as schizophrenic based on assumptions that do not take into account her cultural background. She was admitted to an inpatient psychiatric unit for evaluation of acute schizophrenia because a doctor, giving her a physical examination as required by her employer, became alarmed when she sat in his office for 45 minutes without speaking to him. He in turn notified a psychiatrist who had her hospitalized for two-and-one-half weeks.

Silence plays an important role in all facets of Native American life, especially with authority figures: the doctors did not take this into consideration. Instead, this Navajo Indian woman was hospitalized based on a false assumption and was diagnosed as "schizophrenic." As Lofgren learned more about her art therapy client's Native American culture, her behavior first seen as bizarre became more reasonable. Lofgren notes her initial mistake in evaluating the client's drawing. After the client drew a sandpainting of a woman, Lofgren concluded that she represented her inability to integrate mind and body. Yet, after learning of the significance of sandpainting as it relates to the Navajo Indian culture, Lofgren learned that her client communicated a great deal through what she omitted as well as through what she included. By further review of her artwork through her client's eyes and culture, Lofgren was able to understand her client's feelings, symbols, and expressions of spirituality.

Considering the client's acculturation process may further prevent diagnostic errors. Moreno and Wadeson (1986) describe the use of acculturation in their art therapy assessment with Hispanic immigrant clients.

The acculturation process has two major variables: the antecedent, having to do with the level of the individual's functioning in his or her country of origin, and the intervening variables... having to do with how well the individual can integrate his or her previous level of functioning into the host culture. The sensitivity to the acculturation process enables a more accurate diagnosis, identification of significant issues, and an appropriate treatment planning and therapist assignment. Furthermore, through the use of art and themes, related to the process of acculturation, many relevant feelings and memories can be disclosed... and explored in ongoing art therapy. (p. 126)

Art therapists must also give consideration to their stance on individualism while working with culturally different clients. For example, Waller (1989), after teaching art therapy in Bulgaria, found that art education tended not to be about self-expression. She found self-expression was alien to Marxist-Leninist philosophy and to Bulgarian traditions in art. This is in contrast to the Western concept of self-expression which implies individualism. Instead, art in Bulgaria arises from the folk arts where families and villages can be identified by their traditional art expressions (Waller, 1989, p. 181).

The importance of family and its effect on individualism is also noted in Moreno and Wadeson's (1986) study of Hispanic clients in art therapy. The images of family and friends appear as a predominant motif in the client population studied. They noted that in their art therapy Hispanic clients reveal a cultural value that the family is a source of support and acceptance. They state, "for this reason, it is not uncommon for an Hispanic individual faced with a problem first to seek help or advice from a family member, and only in extreme
cases turn to a mental health professional" (Moreno & Wadeson, 1986, p. 123).

Art therapists should consider their clients' natural support systems, such as families, in an effective treatment plan for therapy. In many cultures the notion of formal therapy is preferred less than nonformal or informal alternatives available to a client. The idea of sharing "intimate family secrets to a stranger is not allowed in many, if not most, of the world's cultures. These problems are dealt with inside the family or in a group context with little or no outside involvement" (Pedersen, 1987, p. 21). Thus, wherever possible, the natural support systems surrounding a client should be utilized.

A final cultural barrier which deserves consideration is the client's thought process. It is important for art therapists, who may be used to thinking in a linear fashion, to understand that their clients' thinking may be in a nonlinear format. While psychotherapy tends to be distinctly analytical, rational, and verbal, this logic may contrast with other cultures that may also view the world with holistic thinking (Sue & Sue, 1977). Because not all persons are socialized to think in the same way, it is important "to change not just the content of a message for... [therapy], but also the way of thinking through which that message is being expressed" (Pedersen, 1987, p. 22).

An example is presented by Lofgren (1981) whose client divides a large sheet into quarters and begins drawing scenes of her life history. While Lofgren is expecting her to work in a left to right fashion on a long piece of butcher paper, she is surprised at her client's attempt to depict a time line in a different format. Unsure if her client understands, she repeats the directive. However, by allowing her client to work in her own fashion, she learns the Navajo way of depicting one's life history in quadrants in a clockwise direction to represent the orderly movement of the earth around the sun. The four quadrants are symbolic of the four ages of man: infancy, youth, maturity, and the transition of age. More importantly, as the art therapist begins to overcome cultural barriers and begins to understand the dynamics between herself and the client, she discovers a way to communicate that will benefit her client.

Consideration of Process, Product, and Structure in Cross-Cultural Art Therapy

Art therapists should identify materials, processes, and the use of structure that will lead to a constructive therapeutic art session. For example, to better understand their Hispanic clients, Moreno and Wadeson needed to regain a sense of unity which was important to their culture; they used collage in a group format. The task involved a series of steps appropriate to the Hispanic way of socializing. Art therapists may also want to learn more about the traditional art and traditional art materials which their culturally different clients use. For example, Golub (1989) offered Cambodian refugee materials similar to those used in their culture: wood-carving tools, clay, markers, oil and water pastels, colored pencils, inks, charcoal, tempera, and watercolor wash bamboo pens and assorted brushes.

Regarding product and process, art therapists may also want to consider their clients' traditional use of the art media. For instance, in Golub's work with Cambodian refugees, she
noted that the refugees preferred to work in miniatures, filling in the detail in the entire space and adding poetry as seen in traditional Cambodian art. The refugees adhered to tradition by following the sequence of first drawing the picture in pencil, then applying paint sequentially from the background to the foreground. "This process is reinforced at the Khmer Institute where refugees relearned the traditional drawing process from some of the few surviving Cambodian artists" (Golub, 1989, p. 28). Lofgren's client also relied on her traditional background by making a sandpainting image which is ritually significant to her (Lofgren, 1981).

Art therapists should consider the use of structured or unstructured tasks as intervention with culturally different clients. For instance, by allowing their Hispanic immigrant clients to work in an unstructured fashion while making collages, Moreno and Wadson noted that their clients spontaneously discussed their own work or commented on the work of others. "This appears to facilitate communication and set a very relaxed atmosphere where a variety of topics can be discussed" (Moreno and Wadson, 1986, p. 127). On the other hand, Lofgren discovered that her usual open-ended, unstructured approach to the art therapy session was not appropriate for her Native American client whose class-value system showed a preference for a "concrete, tangible, and structured approach" (Lofgren, 1981, p. 29).

Conclusion

Overall, once art therapists understand the characteristics of cross-cultural therapy, they will gain a better awareness of their clients. Culturally sensitive art therapists consider the degree of fit between themselves and their clients and acknowledge that clients do indeed share basic human universal drives. Art therapists can transculturally care for a client by understanding cultural beliefs and values from the client's perspective: if necessary, they seek assistance from an alternative therapist who may be knowledgeable in traditions used in the client's culture. Finally, art therapists may act as pluralistic therapists who help clients clarify their personal and cultural standards, and are aware of how these standards relate to the more dominant culture's standard. By taking the time to educate themselves about their clients' cultures and backgrounds, art therapists may also avoid, or at least be aware of, some potential cultural barriers that may contribute to a client's possible early termination of therapy.

By becoming more familiar with a client's culture the art therapist may also discover new ideas on how to utilize materials, products, and processes in an individualized format that best meets a client's needs. The client may present traditional uses of media and art products to work through issues in therapy that may only be evident to the art therapist who is willing to explore the client's culture. These may lead to motivation, curiosity, and sincere humanistic interest between therapist and client.

Art Therapy with Native American Clients: Ethical and Professional Issues

Phoebe M. Dufrene, PhD, A.T.R. and Victoria D. Coleman, EdD, NCC, West Lafayette, IN

Abstract

This article briefly discusses how art therapists can best serve Native American populations. Contemporary Native Americans are a product of both the dominant culture and their indigenous culture. History, coupled with racial biases, has led the authors to identify ethical and professional issues that should be addressed with Native American clients. Traditional healing, ethical and professional considerations, and implications for art therapists are highlighted in order to introduce professionals to the specific needs of this population.

Introduction

For art therapists working with Native American clients, a knowledge of some of the basic elements in the Indian philosophy of health and medicine may help to overcome cultural barriers between therapists and clients. With mutual respect for both cultures, art therapists and Native American clients can facilitate a therapeutic relationship.

Sometimes therapists who work with multicultural populations encounter barriers. Consequently, to overcome these barriers, therapists must recognize that values differ significantly from one culture to another. For example, the Eurocentric or American concept of success includes individualism, hard work, and perseverance. However, Native American clients may have difficulty fitting into this “winner” stereotype. These values may also be antagonistic to the values of their own cultures, i.e., those valuing cooperation over individualism (Coleman & Barker, 1991).

Background

The revival of Indian customs and traditions began between the mid-1930s and the late 1960s, an era of global decolonization and geopolitical retreat by Western powers. In this changing climate, Native Americans turned to their own heritage, and Eurocentric-trained health professionals came to recognize the value of Native American therapeutic resources (Dufrene, 1991). After many decades of suppression, religious ceremonies such as ritual dancing, sweat bath purification, peyotism, and vision quests re-emerged during the 1950s. Native Americans began to rediscover their own culture, and since that time tremendous interest in tribal religion has manifested itself. Activist movements in recent years are attempts to recoup lost ground and return to the culture, outlook, and values of the old days.

Before the passage of the 1978 Freedom of Religion Act, many Native Americans had difficulty obtaining access to Native American healers due to laws prohibiting the practice of traditional religion and medicine. Indian healers were generally considered to be superstitious magicians by missionaries and government officials, and segments of the healing arts were lost to many of the tribes (Halifax, 1981).

Traditional methods of healing continue to remain a major strength of tribal religion. This approach is currently being recognized by organizations such as the Public Health Service and the National Institutes of Health. Special grants have been awarded to provide training of more medicine men/women, and to have them work closely with health professionals (Meyers, 1987).

Relationships with the federal government continue to affect Native American tribes tremendously. Art therapists need to be aware of the impact of the government on tribes and on mental health care. During the colonization of the United States, the government signed treaties with tribes that were recognized as sovereign nations. However, most of these treaties were ignored during U.S. expansionism, and many tribes were either exterminated or forced onto reservations. As a result, Native Americans became dependent on the federal government through agencies such as the Bureau of Indian Affairs (BIA) and the Indian Health Service (IHS). Most Native American experiences with Eurocentric mental health care originated with the IHS. Native Americans seeking mental health services are frequently forced into the position of trusting health care providers employed by the same federal agencies that are responsible for some of their psychological stress (Sage, 1991).

Geographical and Racial Issues

Art therapists need to be aware of the geographical and regional differences among Native Americans. These differences affect ceremonial beliefs and practices. Indian language use or nonuse, the degree of acceptance or rejection of mixed-blood Indians, urban versus rural environments, and reservation versus nonreservation status. The above differences all impact Native Americans’ mental health and well-being (Sage, 1991).

With the migration from reservations to urban communities, there has been an increase in intertribal and interracial marriages. Today, more than 90% of all Native Americans are of mixed heritage, the result of interracial marriages with African Americans, Hispanic Americans, Asian Americans, and Caucasians. These recent demographics refute the stereotype...
that all Native Americans live on isolated reservations (Peregoy, 1993). Often, the mixed-blood urban Indian is in a position to be the most vulnerable to mental illness and alcohol/drug abuse. These individuals are often asked to accept the culture of one parent and reject the culture of the other parent (Dufrene, 1990). Depending on tribal matrilineal/patrilineal descent, Native Americans may be denied tribal enrollment and be ineligible for IHS benefits. Although rejected for tribal status, they are still not fully accepted into the dominant culture because of physical appearance. Indians whose mixed ancestry is Hispanic-American or African-American are the victims of double discrimination as a "double minority."

The authors (a Native American art therapist and an African American psychologist) have collaborated on several cases with urban Native Americans with binacial backgrounds. It is their observation that minority therapists have a more comprehensive understanding of cross-cultural issues. For example, one of their male clients, a product of an interracial marriage and in the process of divorcing a non-Indian woman, had previously received counseling from a white therapist. He had difficulty expressing himself verbally and was reticent with respect to identifying his feelings. Having minority therapists as role models was instrumental in facilitating his self-actualization. Minority therapists, because of their experiences with racism and discrimination, may have a unique understanding of the idiosyncrasies and nuances of American life.

The federal government has established several criteria for determining the eligibility of Native Americans for educational, mental health, housing, and other services. In most cases, in order to receive mental health or other health-related services, a Native American must have a minimum of one-quarter Indian heritage. This undoubtedly prevents many mixed-blood Indians from receiving free- or low-cost mental health services (Peregoy, 1993). Thus, art therapists may find themselves in an ethical dilemma with respect to providing therapeutic services in federally funded facilities.

Ethical Considerations

Some important ethical considerations for art therapists to remember when working with Native Americans are the extenuating nature of minority status and the less advantageous social conditions faced by many in this population. Most Native Americans must choose between two paths, Native or non-Native. Those who are most likely to avoid societal deviance are well-grounded in both cultures. The question facing therapists is how to encourage and enhance such development in both traditional and modern societies.

Art Therapy and Native American Healing

Native Americans encounter frustrations in their daily lives as they are forced to interact with non-Native individuals. There is a general suspicion of the non-Native population by Native Americans; consequently, any therapeutic orientation or approach will be recognized as an intrusion. Native Americans prefer not to disclose personal or family matters with outsiders.

Some contemporary Western therapeutic techniques have similarities with traditional Native American healing. For example, the role of the group leader or facilitator can be compared to an elder, clan leader, or medicine person leading a Native American group. In the Native American culture, group discussions are held in a circle with each person having an opportunity to participate. Assuming that the art therapist or psychotherapist has examined his or her own value system with respect to the Native American culture, the use of a variety of mechanisms, including traditional techniques, may be helpful in resolving psychological concerns.

As a result of the historical experience, contemporary racial biases, and frustrations discussed above, the authors have identified specific ethical and professional issues that they recommend should be followed when providing therapeutic services to the Native American population.

Ethical and Professional Considerations for Native American Clients

1. Art therapy for Native Americans must respect the spiritual dimensions of the Native American culture.

   While it is acknowledged that spirituality in the Native American culture is prominent, specific practices are determined by individual tribal values, beliefs, and customs.

2. Sessions may begin and end with a prayer that would be acceptable to the Native American individual.

   A prayer indicates acknowledgment of higher powers that play a role in our physical and mental well-being. Native Americans believe that healers can be successful only if they seek the aid of spiritual forces.

3. It is preferable that art therapy be conducted by a Native American mental health professional.

   Native American counselors will probably better understand the issues, needs, and concerns of this population.

4. In circumstances where a Native American mental health professional is unavailable, the non-Indian therapist should have background knowledge of the particular tribe that will be served.

   Non-Indian art therapists should be familiar with the values, beliefs, customs, and traditions, and have an overall appreciation and understanding of the idiosyncrasies and nuances peculiar to Native Americans.

5. In the pursuit of understanding the Native American culture, persons outside of the culture must not be excluded by profit-making enterprises in shamanism, vision quest, sweat lodge bathing, etc. These commercial attempts to train instant medicine healers are damaging to participants as well as to Native Americans.

   There is no expedient way to acquire information about the Native American culture, and involvement in "quick fix" activities will only have a deleterious effect on the therapist and the client.

6. Western therapeutic techniques may or may not be appropriate; however, the art therapist must determine the efficacy of a given approach based on consultation with the individual.

   Art therapists must critically examine the philosophy of Eurocentric therapeutic techniques, i.e., purpose of counseling, role of therapist, function of individual or group.
members, etc., to assess if there is (in)congruence with the values and beliefs of the Native American culture.

7. To facilitate the optimum therapeutic process, a blend of traditional and Eurocentric approaches to mental health may be the best solution for Native Americans interacting in two worlds (Indian and non-Indian).

Based on the information presented, art therapists must determine, in consultation with Native American clients, what approaches (Eurocentric and/or Native American) will be appropriate.

8. Non-Indian therapists need to be aware of their own cultural biases when counseling transculturally.

When counseling individuals from different cultures, it is imperative initially that individuals understand their own values, beliefs, attitudes, and biases, etc.

9. Art therapists working in Native American communities must actively seek opportunities for interaction with this population.

Therapists must make special efforts to become involved with family, community, and social activities involving Native Americans in order to facilitate an understanding of the culture.

Implications

There are significant implications for art therapists who want to affect the success of Native American clients. Implications related to training, research, and program development are discussed below.

Training: Higher education must train mental health professionals to provide mental health services for Native Americans. Courses in anthropology, history, sociology, and political science, as they relate to Native Americans, are needed. In some instances, Native American therapists can more adequately understand and address the needs of their constituency. The recruitment and retention of Native Americans into art therapy and other human development training programs will help to alleviate this difficulty. Consultation with tribal and other community leaders will encourage Native Americans to pursue careers in this field.

Research: Most of the literature and research conducted on Native American mental health has been done by non-Native Americans. This will be rectified as more Native Americans acquire training in research methodology and enter professions in the social sciences.

Program Development: Most of the health care for Native Americans is provided by the federal government. Given the negative historical experiences of Native Americans with the federal government, it is imperative that more Native Americans design and implement their own mental health programs. Mental health professionals must carefully examine their role in designing counseling programs for Native Americans.

Summary

Art therapists and other mental health professionals should be cognizant of the skills and knowledge necessary to work effectively with Native American clients. As the 21st century approaches and multicultural and diverse populations increase, we will be required to adapt to several roles. One of these roles will be assuming responsibility for the success of equitable mental health opportunities for Native American clients.

Editor's note: Phoebe M. Dufrene, PhD, A.T.R., is an assistant professor of visual and performing arts at Purdue University, West Lafayette, Indiana, and maintains a private practice as an art therapist. She is a member of the Powhatan Nation.

Victoria D. Coleman, EdD, NCC, is an associate professor of vocational education at Purdue University. She maintains a management consulting firm and private practice as a counseling psychologist.

Transcultural Responses to Aesthetic and Therapeutic Experience: An Ethological Approach

David R. Henley, MA, A.T.R., Clinton, New Jersey

Introduction

In keeping with the current emphasis on multiculturalism in contemporary society, the approaches explored in this article call for the recognition of the common artistic and therapeutic needs of minority clients. Given the current political climate which supports the tenet of “separate but equal,” art therapists are well-positioned to appreciate and foster a client’s self-esteem through cultural identification. However, those who support an emphasis on separatism should consider Lippard’s (1990) statement that “understanding the intercultural process is perhaps evenly divided between understanding differences and sameness” (p. 20). She points out also that although solidarity, coalition building, and social pride were building in the ’80s, the multicultural art movement failed to develop a theory of multiplicity that was either assimilative or separative, or, above all, relational. Although Lippard sees no advantage in advancing “one more universalist concept,” the position of this paper considers that multiplicity might best be understood by exploring those forces which bind us as a common species: that it is by first acknowledging the kindness of the world’s peoples that we may come to appreciate our differences.

The transcultural view in this paper makes use of the concepts of ethology and phenomenology. Ethology is the study of animal behavior, which considers animal characteristics that have evolved over millennia in dynamic interaction with their environment (Lorenz, 1963). Human ethology attempts to understand our species by making comparative analogies between species as a method of understanding the underpinnings of both innate and cultural behavior (Berger, 1974). Phenomenology is a philosophical method that bases knowledge on the perception of phenomena. Applied to ethological practice, it specifies those perceptions which may confuse the organism’s self-world. The concept of “self-world” assumes that the organism is both creator and judge of its own private universe by virtue of its sensory systems that filter the flow of ideas and affects.

As techniques of observation and interpretation, both ethology and phenomenology mesh with psychoanalytic theory because all three emphasize significant events in early mental development—events which may become fixed and thereby influence the future course of one’s personality (Caudill, 1993). As with archetypal psychology, both ethology and phenomenological systems draw upon those forces which function beyond the realm of consciousness and which may find expression in imagoes that could be considered collective in nature. The collective psyche may be viewed ethologically as a form of soliverte or innate (evolved) template which guides sensory experience in ways that maximize our adaptation to the environment (Wilson, 1973).

Such soliverte are routinely encountered during art therapy as they are given form through the art process in such manifestations as early attachment behavior, motivational ambivalence, control of instinctual drives, and the quality of play or exploratory behavior. These dynamics can be viewed as forming the essential building blocks of art making behavior which Dissanayake (1989) has termed “making special.” She views art making as a universal desire to transform aspects of one’s world, by virtue of the aforementioned dynamics, into a realm that is different from the everyday—an alternative reality where the senses and drives become shaped, ritualized, elaborated, and symbolized. Dissanayake claims that “making special” in humans is a universal behavior that possesses adaptive value and, as such, has contributed to the survival of our species.

In previous studies I have explored the dynamics of “making special” with nonhuman populations including several species of captive animals. I found that through facilitated play, ritual, and sensory stimulation, proto-artistic activity could develop (Henley, 1992). In this article the analogy will be reversed. Rather than discuss the early psychodynamic processes of animals or special child populations, I will focus instead upon the group dynamics of multietnic peoples who are interacting with an installation sculpture by Jean Dubuffet. I will endeavor to identify those dynamics that become activated when responding to an aesthetic stimulus. The resulting behaviors will then be considered within an ethological/phenomenological framework and eventually applied to the practice of art therapy.

Literature Review: Ethology and Art Therapy

The application of ethological constructs to art therapy has been explored by Edith Kramer. In her article “Play and Art Therapy” (1977), she discusses early attachment behavior, relating it to Leyhausen’s observations of captive felines who become intensely possessive of certain objects in their environments. Highly prized, resistant to change, and defended as a kind of personal territory in both animals and humans, “transitional objects” (Winnicott, 1965) foreshadow the evolution of artistic motivation and investment. Kramer writes:

Thus we could venture to suggest that even art has some roots in prehuman behavior. It seems that the human infant’s propensity to endow inanimate objects with a wealth of emotional significance that endures over a considerable length of time stands in a precursory relationship to the capacity to create new objects that lastingly embody meaning to their creator and to his audience up 5.

At the root of transitional phenomena is the cementing of attachments between mother and infant. It was Bowlby (1953) who drew upon attachment dynamics in both human and ani-
nal species, acknowledging its adaptive value. Bowlby posits the behavior's origin as being a protective measure from predators: those who are isolated and without attachments would be more vulnerable to attack. Kramer (1992) discusses how the attachment process develops through sensory experience, with first tactile, then visual incorporation of the mother's face and breast schema. Hence, the earliest precursor of aesthetic experience is perhaps the infant's capacity to search out protection and sustenance by the visual recognition of these significant forms. The infant's powerful response to visual configuration also applies to other creatures in nature. Kramer cites Lorenz (1962) who pointed out that prey animals must quickly and unerringly recognize the essential characteristics of predators or the results could be fatal. The prey must possess in its collective memory a schema of the predator—one that allows for quick, accurate recognition and elicits a powerful response, purely on the basis of its visual elements and composition. Such configurations are termed by ethologists "super-normal objects." These abstract, abbreviated configurations combine simple elements (such as two exaggerated circles for eyes) in order to elicit strong measures which are adaptive in that they further an organism's chances for survival.

Aside from fostering attachment responses or predator identification, super-normal objects can trigger sexual receptivity, such as displaying breeding plumage in birds, or, in the case of humans, through suggestive clothing or body painting that accentuates sexually significant features. Defensive measures occur in moths whose wing design patterns take the form of frightening predatory facial schema. Kramer has found parallels to moth markings in the designs of certain tribal masks which use moth-like abstractions and ominous features to prompt magical powers of defense, fertility, death rites, etc. Feeding responses are also stimulated by super-normal configuration, such as the nestling birds who trigger parental feeding by the triangular, colorful targets of their gaping mouths. Indeed, certain parasitic birds exploit super-normal attraction by placing their own offspring into the nests of lesser birds. With their larger, more powerful targets, they receive a major share of the food, insuring their own survival at the expense of others.

Edwards (1987) theorizes that such innate responses to form may constitute the evolutionary forerunner of archetypes, giving particular style to the basic instinct. It was Gombrich (1951), however, who first made connections between Lorenz's observations of super-normal phenomenon and proto-artistic behavior. For example, when a child's ordinary broomstick is transformed into an object of play, the resulting "hobby horse" exists mainly through one's imagination. According to Gombrich, the capacity to transform and symbolize is based on responses to "biologically significant form" which includes two components: the first is the "real" or manifest motif, the second, and perhaps even more crucial, is that which is absent from form but is provided by the viewer. He refers to this as the "Et Cetera" principle:

"for those "privileged" objects which play their part in the earliest layers of image-making never—as was to be expected—in that of image-reading. The more vital the feature that is indicated by the context but not omitted, the more intense seems to be the process that is started off..." (p. 166).

Gombrich's (1992) seminal theory of art as "illusion" is in line with Dissanayake's requirement for an "alternative" reality and Kramer's belief in the magical effectiveness of certain signs, gestures, and rituals that are projections rooted in experience.

A second major dynamic of human behavior applicable to ethological and art therapy theory is rooted in play or exploration, a process which is involved in both the creating and experiencing of aesthetic experience. Morris (1957) explains that the drive toward exploration is based on the quality of novelty that is promised by the stimulus. During play, the process of "investigation-reward" usually dictates that a substantial payoff (of novelty) is obtained from a disproportionate expenditure of comparatively little engery—which he terms "magnified reward." However, as play leads to more goal-oriented exploration (such as aesthetic experience), these proportions change as greater rewards require greater risks. Kramer writes:

"We see that behavior motivated by curiosity is akin to play in being energized by an urge for pure experimentation rather than by any immediate physical need. It is, however, more stressful than play, for it has the power to propel the animal into dangerous situations." (1977, p. 5)

It is this drive toward novelty which co-exists with the need for caution when taking risks that creates a state of motivational conflict which is negotiated both in art and life.

Approach/avoidance dynamics were first articulated by Tinbergen (1961), who observed the ambivalence of gulls during mating when pairing intimacy generated much anxiety and conflict. He subsequently applied approach-avoidance dynamics to autistic individuals or others with delicate dispositions, pointing out that the task of exploring the world and establishing relationships are occasions for both curiosity and inhibition (1983). For clients for whom sensory perception is distorted or reality testing is impaired, inhibition over exploration, or indeed, autistic withdrawal, may constitute an adaptive response which favors the autistic person's survival.

As Tinbergen found with gulls and Fossey (1983) and Goodall (1971) found with primates, it is often the process of ritualization which may lessen or bind the anxiety that arises when confronting a stimulating yet potentially harmful stimulus. One such ritualized behavior is "redirection" (Tinbergen, 1983). Goodall (1971) observed chimps whose display behaviors made use of throwing feces, leaves, tree branches, and other raucous behaviors when they felt threatened. Rather than striking out or potentially harming someone, the chimps unloaded their affects upon inanimate material so as to absorb frustration and redirect aggression. Tinbergen also identifies "displacement" behavior which differs from redirection in that it implies further transformative measures in which tension or aggression gain release without overt reference to the conflict. Tinbergen gives the example of sipping cocktails at a party—such behavior has little to do with gaining liquid nourishment though it does absorb and express tension in ways that are socially appropriate. The "formalization" or "regularization" (Dissimayake, 1984) of these rituals is the individual variant or repertoire of different displacement behaviors, e.g., beard stroking, key juggling, nail biting, etc. Applied to visual expression, formalization often takes the form of stereotypy or other inflexible schema that may characterize inhibited responses to artistic expression. For although the arts stimulate much curiosity, exploration, and sensory
arousal, they also require boldness and risk-taking which sometimes result in defensive postures that strive to maintain a balance between these conflicts (Henley, 1989).

To illustrate these dynamics further, I now turn to a case account in which super-normal response, exploratory behavior, and approach/avoidance conflict are analyzed in ethological terms.

The Case: “The Jardin d’Email” by Jean Dubuffet

Dubuffet’s monumental sculpture appears as an apparition among the misty woods in the garden of the Kroller-Muller Rijksmuseum in the Netherlands. Its massive presence is strangely offset by an encircling, featureless high wall which guards any hint of the sculpture’s internal features. For those approaching this work, the curiosity displayed among a range of international patrons appeared consistent—all seemed aroused by the presence of this mysterious colossus. However, Dubuffet deftly tapped this curiosity as the pilgrims are forced to walk almost completely around the bare exterior before finally arriving at a discernable feature: a nondescript slit-like opening in the otherwise white concrete wall. When one observed patrons negotiating this entrance, it became immediately apparent that in concert with their curiosity, discernable caution and ambivalence were also being displayed. And while almost everyone overcame this ambivalence (having placed their trust in the hands of the Rijksmuseum as well as some pragmatism “we walked all this way we might as well…”), there were some who opted to pass up the experience on several park benches probably set out for the purpose.

Upon entering Dubuffet once again raises the anxiety levels, as the tunnel is narrow and convoluted, requiring uncomfortably close contact with the counterecurrent of exiting patrons. Finally, one passes up and through another slit-like doorway which is part of the sculpture’s main element—a towering, whimsical affair which most patrons interpreted in organic terms (i.e., a tree, toadstool, etc.) (Figure 1). This and another lesser protuberance on the far side constitute the most dominant stylistic elements in the work. The rest of the internal composition was essentially featureless with understated contours and elevations that were delineated by a network of painted black lines (Figure 2). This linear work forms cellular patterns that either interlocked like jigsaw puzzle pieces or meander about the plateaus like river currents.

Interviews were conducted with approximately 40 American, German, Dutch, Italian, Nigerian, Belgian, Japanese, Greek, British, Czech, Kuwaiti, and other patrons who could describe to me their experiences in English. Most evoked associations from childhood, of having secret hideaways or imaginary kingdoms similar to those imagined by Lewis Carroll. For some, ethnic customs involving meeting grounds, English gardens, Italian piazzas, or Greek coffeehouses were evoked; where interactions with others were enriched and mediated by architectural elements. Carl Sandburg came to mind for one Japanese man who recited his “Mending Wall,” where “fences make good neighbors”—again alluding to boundary issues and territoriality.

However ethnically diverse their responses were, patrons more often reacted in decidedly consistent patterns of behavior. First, the two dominant phallic objects generated the strongest responses among both children and adults. This was perhaps due to the paucity of other arousing elements in the pictorial field. As a “stimulus pattern,” the two protruding elements were related to as focal points of orientation as well as centers of congregation in the rest of the space. This dynamic is consistent with other stimulus response investigations, such as those involving chimpanzees (Morris, 1962), gorillas (Reitz, 1992), and elephants (Henley, 1992), whereby pictorial fields that included preprinted circles always seemed to precipitate an interaction with these elements. They were often drawn upon, mirrored, or continued, much in the same way the patrons used the towers to dialogue with the rest of Dubuffet’s sculpture.

As patrons set out to walk the sculpture, several other patterns of exploration emerged. First, Dubuffet’s use of static, jigsaw forms, together with his modeling of small plateaus, appeared to trigger mild territorial responses particularly within family or adolescent peer groups. These elements were often utilized as tables or benches for group activities such as eating, playing, and other behaviors that cemented and reinforced group bonds. Although these personal territories weren’t actually defended, they were clearly claimed for
the duration of the visit. Others sought out less prominent spaces as they migrated to the outer edge to walk the perimeter of the work, then situated themselves on the wall (usually in couples) allowing an overview perspective of the entire sculpture (Figure 2). Here they often discussed and reflected upon the work. Eventually, however, verbal exchanges gave way to resting, sleeping, c. on occasion, using the perimeter wall to become physically intimate, as their interest in the space yielded to interest in one another.

Among children, however, activity levels were vigorous throughout their visit. Novelty was sought at every turn as they investigated every aspect of the work. There was evidence that the children fell into the two categories proposed by Gardner (1980). The “patterners” seemed taken up with the formal elements of the piece, responding to the configurations of lines, for instance, through games of hop-scotch or hide-and-seek. Most of these children reacted to manifest patterns and 3-D elements without a great need to involve others in their introspection. Sharply contrasted to the “patterners” were the “dramatists” who displayed a marked preference for pretend play, acting out, storytelling, and social exchanges that thrived upon vigorous action, adventure, and conflict. Storr (1988) views these two characterizations as being transcultural in nature and being closely aligned with Jung’s system of introverted/extroverted personality types. In any event, among both types of children, incidents involving overstimulation were noted, with arousal levels escalating until parents were compelled to set limits. Here the greatest extent of culturally diverse responses were noted, as one could make fairly informed generalizations as to the ways in which tantrum or overheated behaviors were dealt with depending upon nationality—from hushed urgings to be calm, to raucous shouts and threat displays. Younger children displayed only minor variations of attachment, exploratory, and “checking back” behavior. For most young children, the parents remained the dominant object of stimulus response and orientation rather than any elements Dubuffet offered. Again, cultural orientation appeared to play a part as to the degree to which parents would permit independent exploration in their children. Concerns ranged over the dirtiness of the sculpture, its crowdedness, the harshness of its surface, its limitlessness, and other considerations that modulated child interaction with the space.

Stimulation levels among all participants appeared to be linked to the density of population. When several tour buses emptied, simultaneously flooding the Jardin with tourists of every nationality, there seemed a marked escalation of tension. Displacement behavior increased as people pushed back to the perimeters became increasingly agitated; while some vaulted over the walls to escape the crush, others laughed nervously, paced, groomed, and engaged in other behaviors that vented tension. A decrease in exploratory behavior meant an escalation of territoriality, particularly in adolescents, as groups staked out areas with several male members visibly posturing in subtle threat displays to preserve their space. Incidents of overcrowding were short-lived, however, as most tour groups appeared to be so overstimulated that they tended to march in, take a perfunctory look around, pose for pictures, and then, seemingly, exit in relief. Their visits were shorter than unorganized tours or individuals. Some tour group members displayed high levels of displacement behaviors as well (perhaps because they realized the effects of their intrusion upon the ecology of the space). Their brief attending behavior, distracted concentration, and lack of exploratory or animated behavior supported Lorenz’s (1962) tenet that identical stimuli can arouse markedly different responses if the quantity of stimulation reaches saturated levels.

Habitation to the space also prompted a decrease in play and exploration. Once the possibilities for novelty were seemingly exhausted, most participants utilized the space to relax, reflect, and, most commonly, “people watch.” Only when it came time to exit did the specter of traveling the constricted tunnel-way again arouse a degree of animation or tension in the participants. It was noteworthy that while most took the expected route, a number of patrons (particularly males) opted to jump the wall. The many black scuff marks on the white exterior wall indicated that this was a popular means of avoiding the forced intimacies of the tunnel exitway.

Discussion

Within its guarded walls, Dubuffet’s sculpture has given form to a landscape “made special.” By modulating levels of stimulation, suspending rules of perception, and dissolving familiar approaches to structure, he succeeds in transporting us into Dissanayake’s “other realm.” Amadie (1976), writing for the Pace catalogue, considered it a “premeditated attack on our senses that occurs in a field specifically to continue action.” This critical observation implies that Dubuffet intentionally limited the elaboration and embellishment of his ideas so as to force the viewer into closer proximity with his or her own perceptions. Dubuffet seems intent upon supplying only enough visual information so as to stimulate an intensely personal phenomenological experience. One recalls the “significant form” of Gombrich’s “Hobby Horse,” where only the barest essential elements are needed to transform the mundane into the magical. As a work of phenomenology, it is up to the participant to contribute imagination, fantasy, or perceptual impressions to activate this otherwise inanimate environment. Dubuffet skillfully sets these perceptual and imaginative processes into motion by his careful introduction of elements—from the intriguing first view of its colossal form, to its sparse interior where a patchwork of random, perhaps unconscious, doodles provides what little structure there is to guide our interactions. The limited color and its erratic, “nervously delineated” (Glimcher, 1969) lines, tend to flatten, rather than describe, the forms. The breaking up of interior space into plateaus and depressions creates maps to nowhere, inviting random exploratory interactions that seem most akin to play. Here Dubuffet’s contempt for the conventions of “high art” is most evident as his affinity for the playful vocabularies of child or naive artmakers is clearly referenced. Dubuffet also makes clear his wish that we approach his work without informed aesthetic preconception, disarming us to be co-creator and judge of this world of our own making.

He presents us with a magnificent “hobby horse,” which frees us to exercise our own capacities for play, ritual, and associations that maximize personal response. That Dubuffet aims for a depth of phenomenological response is apparent in his statement, quoted from the Pace Gallery catalogue, which first showed the maquette for this sculpture: “We are invited to attend the sinking of cultures as wreckers of our own boat.
in order to reconquer those instinctual values long since lost" (Glimcher, 1969).

Here Dubuffet seems taken up with what Winnicott (1965) terms the “authentic self.” For those patrons conditioned to compliance and mannerly appreciation of aesthetic objects, Dubuffet invites subversion and action, providing an arena where the conventions of culture yield to more authentic yearnings which Dubuffet views as requisite for “pure” aesthetic experience. Yet, in his largely successful bid for a potent phenomenological, even therapeutic experience, it can be argued that Dubuffet sabotages the work’s potential as a powerful object of art. This is due not to the scarcity of elements as much as to their failure to evoke super-normal responses from a majority of viewers. While the towers certainly influenced patron orientation and congregation, they seemed not to trigger responses of intense attachment: few seemed mesmerized by these objects’ power—most in fact seemed only to be amused by their tilting and squatting postures, like “drunk old men—one listing ready to topple, the other already down and snoring,” as one clever German put it. This decidedly masculine association regarding the two main elements was consistent among those polled—few found the element’s phallic nature sensually inviting as they might a Henry Moore or Isamu Noguchi sculpture (both of whom make dominant use of circular mandala motifs). There seemed little magnetic “holding” to these two elements, and thus, viewers were left to extract meaning in objects that essentially held little totemic power. The “maximum reward” called for by Morris during acts of play seems also not to have been achieved. The two elements’ lack of novelty in terms of texture, form, theme, etc. seemed to explain their incapacity to sustain any extended viewer exploration.

Although the Jardin may fall short as a compelling work of art, its value perhaps applies more significantly to the realm of therapeutic discourse, which art therapists may attempt to emulate in their own clinical practice. For instance, Dubuffet’s debt balance between providing a powerful motivational stimulus while also cultivating a therapeutic “blank slate” is not unlike Winnicott’s (1971) use of squiggles or Cane’s (1983) use of scribbling exercises. Each of these provides the viewer/participant with a vigorous open-ended guide from which associations are aroused and given spontaneous form through facilitated expression.

In concert with environmental artist James Pruznick, 1 have made use of interactive designs for prompting both aesthetic and therapeutic response. Figures 3 and 4 depict large-scale interactive sculptures that were created to evoke responsivity in clients within a range of racial, socioeconomic circumstances.

Clients were invited to interact with the work from both inside and outside. From inside, facilitators encouraged them to recognize extra awareness to their senses and perceptions in a phenomenological sense. With greater “intent” (Betensky 1987), clients noted subtle fluctuations of billowing movements caused by changes in air pressure as more clients entered and exited. They touched the internal elements which hung and draped against their faces and bodies, noting textures and forms. Different kinds of movement were pointed out, as some sat meditatively still while others had brisk “run-throughs.” Once outside, clients observed the shadowy movements of others inside and how their forms and movements created a composition.

Conceptually, the work drew upon architectonic form to invite interaction and evoke associations of both “inner and outer” approaches to home territory. This “dwelling” association opens the way for clients to tap into their needs for exploration, habitation, and interaction—processes that are naturally occurring in most environmental installations and are both conducive to universal and cultural identification. The works make use of Kramer’s (1986) “Third Hand” mode of intervention, whereby clients engage their clinical issues mainly through the art media and technique rather than through verbal analysis—essentially an “art as therapy” experience. This implies that materials are chosen for their propensity to elicit maximum therapeutic and aesthetic response. For instance, where Dubuffet uses concrete, Pruznick chose cotton muslin, gauze, parachute silk, and polished aluminum—materials closer in spirit to original transitional objects in which the intensity of attachment is most often prompted by tactile responsivity. Hence, the most basic need for sensory stimulation and attachment were met much in the same way that Harlow’s Rhesus monkeys found solace in terry cloth clad surrogate mothers (far more so than their cold and hardened realistically modeled counterparts). Since the material were both soft and translucent the more insecure clients were able to see their support staff through the sculpture’s walls—thus bridging inner and outer through a sheer stimulus barrier.
Pruzink’s structural designs took into account the need for different levels of relating and activity. His use of a cotton cloth “track” in Figure 3 induced both directed and robust interaction while reducing instances of ambivalence or anxiety through the balanced use of directive and open-ended structuring. The internal forms invited both vigorous and reflective interaction, with draping, woven tunnels of material and hanging strips, all lending sensory stimulation and novelty; yet their open compositions seemed to minimize tactile or sensory inhibition. The large, visible tunnels aroused participation and minimized stress by presenting the child with an archetypal experience in which instances of regression were accommodated and supported. Client associations to the works: caves, tornados, a mother’s scarf, a bird’s nest, ocean waves, billowing clouds, etc., all speak to the work’s universal sensibility. That even the most resistant blind child entered these forms speaks to the need to stimulate without threatening, where opportunities for risk-taking are rewarded by judicious portions of novelty, nurturance, sensuality, and security.

While the prospect of being engulfed by these works was perhaps daunting to some (as “Jonah was engulfed by the whale” remarked one archetypal enthusiast), it was perhaps these works’ super-normal qualities: larger than life, softened mandala formats, that in the end, signaled to the client that the rewards of exploration were well worth the risk.

In conclusion, this article suggests that ethological techniques of observation can provide the artist, critic, and clinician with a valuable tool for discerning the most basic and profound aspects of psyche. Ethology contributes theoretical and practical insight that may enhance aesthetic and therapeutic effectiveness. In no way does it suggest a biological “determinism” which undermines the power of a free will, nor does it overshadow cultural identification or diversity. For it is generally accepted, even by those of a sociological orientation, that cultural evolution has far surpassed biological evolution as a force of change. However, the endless debates over nature vs. nurture (or in this case, culture) need not be viewed as a dichotomy or mutually exclusive. The hostility with which the multiculturalist Lipard views universality of expression seems to be more a matter of political or civil pride than of professional criticism. For the ubiquity of drive energy, of motivational conflict, and transitional or Gestalt phenomena provide a firm footing upon which one can begin to lay the myriad of cultural variations that define the full dimensions of the artist and his/her art.

Editor’s note: The author gratefully acknowledges Ellen Dissanyake and Edith Kramer for their helpful comments in preparing this manuscript.

An Interview with Joan Kellogg

John Alden Thayer, New York, NY

Abstract

Joan Kellogg is probably best known to art therapists for her investigation of the mandala and her development of the concept of the Great Round. As a result of this work, she has published the book Mandala: Path of Beauty and numerous articles on mandala symbolism. Kellogg’s other accomplishments include the establishment of the Mandala Assessment Research Institute (MARI) and collaboration with Dr. Stanislav Grof. In this special interview Joan Kellogg discusses her thoughts on the theory and practice of art therapy, the mandala, and her life.

Joan Kellogg has become somewhat of a legend in her own time. And, like most legends, she is surrounded by myths and rumors which lend her an aura that both exalts and obfuscates her. Perhaps no one will ever know the real Joan Kellogg, but it was certainly worth making an attempt by spending a memorable day during the summer of 1993.

As the cicadas revved up and wound down in the late summer heat, Joan switched on the recorder and began her story. A woman in her early seventies, she still has eyes that sparkle and grow round with awe at the pure excitement of ideas. They can also narrow to slits that scorn naiveté or plain old ignorance. Not a person to put up with fools gladly (or to educate interviewers not yet up to speed), she can vacillate in a heartbeat from ecstatic poet of the transcendental to tough realpolitik critic. Some of her more scathing observations are reserved for the fields of psychology and art therapy in particular. Unaware of the roller coaster ride that awaited me, I was lulled by the deceptively calm banality of the setting, an expansive kitchen in a suburban Virginia home, her patient husband, Russ, pouring the coffee. Joan began in a biographic mode.

“Although I showed professionally in the mid-sixties, I considered myself more a student of art rather than an artist. While living in Wyckoff, New Jersey, I had one woman show at Franklin Lakes Gallery, a three woman show in Paterson, N.J. and exhibited in several juried shows in the Northeast, but I had grown disenchanted with my peers in art circles. One tends to think of artists in an ideal sort of way, and I assumed because I was thrilled when other artists won an award or sold a picture or when they showed in a prestigious show that the same feelings would be projected from them to me. I found that not to be true. Since that generosity was not shown, I decided I would rather not pursue working in my own art and showing my own work. I began to think of teaching, and I read a lot of Carl Jung’s work—those beautiful books that came out of Princeton in the Bollinger Press series. And—I began to paint in the form of mandalas.”

As she spoke I had to remind myself that in 1969 very few people even knew who Carl Jung was, no less read his works. And even still, at least in the West, were painting in mandala form. (Mandala is the Sanskrit word for circle, and a mandala is what results when using the circle as the primary frame of reference in a painting.) What rendered her casual statement even more extraordinary was the fact that Joan Kellogg had graduated from high school in St. Petersburg, Florida and joined the WAVES during World War II. Hating married Russ in 1946 just after the war, she began a family like so many other veterans and, following her husband’s corporate transfers through six different cities, her family grew by six children. Joan Kellogg was a very busy suburban housewife and mother. Not the sort of matrix one would expect to produce the remarkable discoveries to come.

Joan continued, her large dark eyes twinkling with the recollection. “I read a newspaper article about Hahneman Hospital in Philadelphia and how they were using art in psychiatry. Suddenly it all came together and I thought, that’s what I want to do! I didn’t even have a name for it. It was simply that THAT was what I wanted to do! So I bundled up my portfolio, newspaper articles and such, and I went to the Christian Sanatorium in Wyckoff, met with the director, Richard Rosendale, MD, told him about Hahneman, asked him who is doing that kind of work here, and where can I go to learn?

“And he said, ‘You’re not going anywhere. You’re going to stay right here. I’ll introduce you to people who will be helpful, and you’ll get all the information you need. You just come here. You will not work with the auxiliary volunteers, but in the occupational therapy department directly under me.

“So I began my own educational process in familiarizing myself with how various disorders were mirrored in the art process. It was here that art therapy with mandala began for me.”

“What was it like to be doing art therapy without knowing that this was what you were doing?” I asked.

“These were long-term patients. I didn’t know anything. After each art session I would write up a formal report on each patient. And I would relate the art done that day to the previous time and maybe to the time previous to that, and I would look for a continuum. It became apparent that this form of communication was very direct. Some of the nurses began to think I was getting into the files because the intuition that resulted was like ESP and it would be very frightening to some people. ‘How is she getting this information?’ She has no access to any of these files!’ And I didn’t know anything, I just knew I was connecting with the artwork. And it was teaching me. I wasn’t imposing anything on it. It was a nonverbal form of communication and a gestalt about the total well-being of that person.”
"And at that time you probably did not even know what the word 'gestalt' meant."

"No, but I learned later. My umbrella is art therapy, but I don’t perceive myself as a therapist. I’m interested in the product and always have been. And what the product will do. You don’t learn a lot about developmental stages from working with the product of chronic patients. For many patients merely to participate in art or occupational therapy may require various medications which may, in turn, interfere with expressed creativity. The highs are blunted. The lows are prevented. The patients are kept suspended. Again, I’m not a therapist. What I’m saying is that I’m interested in the product. If the medication interferes with the telephone through which I am communicating, it interferes with the product.

"Unfortunately, institutions may not encourage or even allow staff art therapists access or an even input to the treatment team, which usually consists of physicians and psychotherapists. The skilled sensitivity to nuances and subtleties in both color and form which the art therapist could bring to interpreting the state of a patient is thus often totally lost to the treatment team.

"To make matters worse the art therapist may not even be informed of the medication being used, and thus may find it hard to discriminate how medication may affect the art product. My interest is primarily in product, so this exclusion from the treatment team seriously impeded my own work.

"So I accepted an offer from the Psychiatric Department of St. Joseph’s hospital in Paterson, N.J., where I could work with short-term patients who were not heavily medicated and who showed some progression and change in their continuum. It was during these three years in New Jersey hospitals that I began to amass the vast number of mandala drawings which would result in the concept of The Great Round.

"I would continue to gather many more after moving to Maryland where I was invited by Dr. Stanislav Grof to work as a consultant in the Art Therapy Research Project in the Catonsville, Maryland Psychiatric Research Center. But it was during those early years that I stayed away at night for hours. I still have all the old scratch pads that I’d fool around with in the middle of the night trying to figure things out. By 1977, I had seen enough to know that I could divide all these people’s drawings up into only 12 categories.

"My heart skipped a beat. "You did what? Wait a minute! Run that past me again," I thought.

"When did it come to you that it was even possible to do such a thing? And what gave you the inspiration to divide up the vast myriad of possible pictures into groups?" I asked breathlessly. The cicadas droned their intertwining tales into the oppressive summer haze. A storm lurked somewhere down the Tidewater.

Joan paused and looked at me. Then she said, simply. "I could not imagine there not being order."

"I thought of other great minds faced with the numbing enormity of new raw data, such as Mendeleev who, out of the vast morass of chemical facts, dreamed forth the genius of the Periodic Table of Elements, by which our understanding of nature at the atomic level is still interpreted. Or Newton who insisted on there being a law to explain the seemingly unrelated vicissitudes of gravity. Here I was in the steamy vintage sixties kitchen of an elderly woman whose husband was beginning to think about lunch and whose work could easily turn out to be of similar magnitude.

If what Joan Kellogg had discovered about human idea- tion was true, she may well have stumbled upon the schema for the hard wiring of the human mind. If this is so, and the 12 piles into which she originally divided the thousands of mandalas she had seen over the years bring forth and encapsulate all the attributes of the human brain, then every emanation of our brains, from childhood play to schemes for city planning, coming as it would from the same hardware, will bear unmistakable characteristics which can be traced back to the same mainframe architecture. Joan Kellogg, in her suburban kitchen, may well have given us a new way to understand the world, and us in the world.

The enormity of her discovery cannot be explained by the mere search for order, noble as that rational scientific trait is. After all, accountants search for order. Bean counters usually do not change mankind’s understanding of the world. So I pressed Joan further by chiding her about her claim to an ostensibly nonlinear mind, when she evinced such a heroic urge to order. She ignored my comment. But her eyes blazed as she unexpectedly launched into an extraordinary free association discourse on the nature of the categories, which she later came to refer to as the Stages of the Great Round. Thunder rolled in the distance as a storm approached, and the closer it came, the faster Joan talked. Her voice lost the detached and almost military clip it had when discussing chronological events, and took on a broader register of tonality that ranged freely from rapture to chortle.

"Look here! Stage Two! [represented in Joan Kellogg’s iconology by a Jackson Pollock-like plethora of floating bloblets]. This is where the Fertility Goddess lives. She is very busy there. That’s where you have seeds. In other words we fructify ourselves mentally. I mean, that’s a difficult concept to understand, but we do. This [Stage 12, depicted by a fountainlike image or a Fourth of July sparkler] is the Male Organism, and this [Stage 2] is the Female Organism. Between them lies Stage 1 at the bottom of the Great Round. It’s the Beginning, the Void [represented by an empty black circle]. We fertilize ourselves in the deep unconscious, of course. We fertilize ourselves in the mind, the mind! So Stage 2 can be represented, for example, by pollen, as in the American Indian tradition, the Golden Seeds. Rice at a wedding, winnow-
ing wheat. See how many images the symbol I have chosen for Stage 2 can show you? It’s the Blissful Receptive, the Ocean. Or the pagan goddess who loves frogs and snakes. In other words it doesn’t say no, it just says, Yes! Yes! Yes! More! More! More of living this, of being this! More. There’s no judgment, as there is in stages on the upper side of the Great Round.

"Then this [Stage 12, represented by a gushing sparkler fountain] is an eruption of the mind, a new idea. Stage 11, immediately preceding this one [and represented by a symbol that looks like subway graffiti] is a terrible time of disintegration and chaos. Things have fallen apart. Writers and poets experience this particularly. ’Who am I? It’s over. The book’s done and now who am I? And they go down and down and down and suddenly what happens? Miraculously they become inspired again. Look here, in Stage 12, in antiquity the creator god’ was envisioned as a phallus who ejaculated his essence, emptying himself to create worlds of beings, and things. And the space of his activity was seen as a womb. That’s how the world was made. And I think it’s sort of basic, these two fructifying elements [in Stage 12 and Stage 2] on either side of Stage 1, the Void. There are many cultural images which sanctify the rejuvenating power of stage 12. Fountains, or for that matter, the Resurrection. Even that is basically physiological. Death and Resurrection may reflect physiological events—thus the early pagan worship of the phallus and at its spontaneous tumescence."

Joan looked out the window at the softly falling rain and mused, "What appears as closure in Stage 12, the explosion of new insight and inspiration, yields the seed of what is to come, a seed pod that travels its night sea journey to the emptiness of Stage 1 where it readies itself for insemination in Stage 2.

"So those are all metaphors for the way our consciousness works. They are true at a certain mundane level. Or taken as true in early attempts to explain how things happen. But they are still very, very much active in the mind. And nobody knows death and resurrection like an artist. They die daily. Have you ever met an artist on the street and said, 'Oh, Jim I just loved that painting!' and he looks at you like you’re crazy and says, 'You haven’t seen what I’m doing now!' He has died to his progeny. That’s dying well. Saying, ‘I did it. It’s gone. It’s walking. It’s in school. I don’t have an umbilical cord on it. This one—the Now! That’s what I think is important.’ And he’ll die to that one too. Just as gracelessly as he died to the other one. So I think our role model for a healthy mind is the creative mind. Creativity, if conceived of as an emotional or mental pursuit rather than physical reproduction, could be described in terms of the seminal gland—an anatomical representation of the phallic impulse, inseminating the pituitary gland as womb. Thus creativity can be accomplished in one mind. This reverberates in the present exploration of the collaborating hemispheres of the brain. I think the Great Round of Stages is a fair reflection of the healthy life process."

"Religions have always said, ‘Go forth and multiply.’ Catholicism has taken that rather literally, but in the abstract perhaps they were on to what you were talking about.” I offered.

"Of course you have probably not even read Mandala: Path of Beauty,” she glared.

"I was surprised at this sudden turn. In fact I had read her thesis submitted to Antioch for her Master’s degree in Art and Psychology in Counseling in 1978, which was published in 1981. This was the seminal work in which her initial concept of The Great Round with its 12 stages was first presented. I sensed a resentful frustration at being broadly misunderstood, a theme I wanted to follow up on later, although I was sure it would surface again. But for the moment I was still under the spell of her lusty grasp of metaphor, a spell I did not want to break. So I assured her I had indeed read it and went on as if nothing had happened.

"It’s interesting that Stage 2 could also be viewed as inchoate matter, space gas, the raw material of the universe, while in Stage 3 [represented by a pinched-like icon] there begins a swirling such as one finds in galaxies, and in Stage 4 [represented by a homuncular form] the swirling has condensed into an actual planetary body.” I offered.

"If you are into energies, which I never got into, you can very easily connect these Stages to a theory of matter. This is not my field. I’m not a physicist. I don’t pretend to be one,” she snapped, apparently not satisfied with my dodge. But she couldn’t resist adding, ”But in Stage 1, the Void, you can connect the heaviness, the inertness, the density of the condensed matter..."

"Like the Black Hole, where matter is so dense that gravity falls in upon itself?" I added.

"And in catatonia, where you take up the least space, rigid. All that feeling of metal, lead. And then in Stage 2 you have the spilling forth of all these stars..."

"Like the Big Bang?"

"Yes, absolutely, absolutely, it’s the same. Incidentally, on a cellular level certain shining bodies which manifest themselves in the multiplication process are called asters, stars."

"Is it true that every Stage has a flip side, so to speak, a negative aspect for a positive aspect? Is there a kind of yin/yang dualism in the universe which your Stages reflect?" I asked. I had already been warned that Joan does not always
answer questions in so many words, and so it was with her response.

"Take Stage 1 [the Void, represented variously in Joan's iconology by a black circle or a weeblike structure.] You're talking about the egg, about insemination. The egg is coming down a thread, just like a spider, and it's going to latch onto the uterine wall. Now if there's any problem there—the uterine world is a participatory universethat when that egg comes down, the wall also reaches out and grabs it, and if it doesn't, if it does not welcome the egg in some way and the egg is left—'Oh my God! I don't belong in this world. I have been cast out. I have been orphaned!' Such people dream dreams, they read children's fairy stories, and they are always the abandoned one. The roots go back that far. It's a biological memory of not being wanted. Of hanging on for nine months by your fingernail. It's a terrible burden. It has nothing to do with your father or your mother and who hit whom. It's your biological memory of not being enveloped with universal warmth—a wonderful place—but of hanging there like a clock! And nothing's coming up. Nobody is meeting your train. It's a horrible experience. So many alienated people have had an experience like that."

"I think I know about the flip side of Stage 2. Maybe it's the imp of the perverse in me, but when you were talking about the multiplicity of stars in Stage 2, I was thinking about a box of dead fish I saw at the South Street Seaport. As I walked past I noticed that the entire cardboard box was seething with maggots..."

"That's right. Mangots are also very much Stage 2. Even death is fertile. Oh, it's so fertile! And then you have the disassociation of 2. When you're just falling all over the place, you have no boundaries, and you're fearful of engulfment. That's a negative 2, the one you run into with the fecundity of swamps and flies, and all these voices. Every culture has figured out how to correct the worst of it by exorcism. That's pretty incredible, you know, that no one has ever taken this seriously. The doctors will say, 'Well, they're just real bad schizophrenics.' Guess what! They get exorcised and they're back at work and their marriage is working and everything is fine a week later. What happened to the schizophrenia? Nobody ever asks."

"They don't dare." I ventured.

"That's right; their whole world view would change. We're dealing here with the transpersonal. Transpersonal, of course, is in the world of archetypal realities. It's a world of shamans and holy men, and some women have been privileged to know about it. And what little I know about it would convince me that it is a totally different level we're talking about. Our mistake is in our inability to address both worlds in treatment. They should be integrated because they were artificially sliced apart anyway—at one time the medicine man was also the spiritual director. Well we started to professionalize things and we split them apart."

"The witch doctor was both a priest and a doctor."

"Absolutely. Just as Einstein said, 'Energy and Matter are the same thing. When you slice them apart you've got a whole new can of worms.'"

Joan suddenly pulled back, perhaps afraid that our free floating conversation would look ridiculous in print, and added, "Remember, I'm not too smart. I'm not an intellectual. I was just working from what I know. There's so much you can't talk about. This is a very mundane, practical subject. This art therapy stuff. Art therapists don't get into this, because they work for the Recreation Department. They're not supposed to develop ways of looking at the world. They're not supposed to think. Which is pretty limiting. And if an art therapist does discover something new about the world, she's not allowed to talk about it. There's a masculine initiative we don't have. We don't go into the hospital and say, 'This is what I want to do. Sign here and please see that all the schizophrenics are sent to my office.' Instead we stand and salute. Meanwhile the other professions are dividing up the spoils. This one is getting funding for this, and that one for that, and the art therapist is left standing in the hall wondering what happened because no one taught her what to do. And, alas, many of us are not Nancy Drew. No curiosity."

"We had returned to her dissatisfaction with a vengeance. I knew we would have to deal with it, but I was not ready yet. I wanted more poetry, more amazing connections, more of that versatile mind that could jump from idea to idea like a little young boy crossing a rocky stream. I hoped I could defeat her into her funny rapturous reveries again."

"When you first developed the concept of The Great Round, you posited 12 Stages. And with one glaring exception, you have never varied from that number," I said. "What made you designate the 13th Stage? And why?"

"I found that all the mandalas I saw over the years could be classified as reflective of one of the 12 Stages. Sometimes a mandala incorporated aspects from two or even three Stages, but there were never any surprises, except for Stage 1. Certain mandalas which initially appeared as Stage 1 evinced a luminous quality which was beyond the concerns of Stage 1. Beyond and yet before. So I created Stage Zero, and placed it at the center of The Great Round. Stage Zero dealt with something that was not personal. It transcended the personal. Psychology didn't really hit it. It hits the others. But when you get to Stage Zero psychology has nothing to do with what's going on there. It's more like that's a place from which you witness your own life. Part of you lives there anyway and witnesses you going around The Great Round again. And it kind of makes jokes every now and then, like 'Oh God! You're doing it again! Kind of cosmic-y jokes.' This is the part of us that is transcendental, that knows life is a game, but that is not really caught up in the game. And to us it's home. And people who have been imprinted very hard in Stage Zero are forever homesick. You can't fix it. And you just gotta tell them, look, you're just homesick! Do you 'remember' a place the expectation of which nothing in this world has ever come up to? Yeah? Well, you're homesick for it."

"A kind of cosmic home," I suggested.

"Yes, exactly. And it's the part of you that says everything is okay. I mean, my teeth are rotting, I have b.o., I caught cancer yesterday, and my hair is all turning white, but you know, it's really all okay. And mean it. It's from that kind of place that this comes. I added Stage Zero in 1984, and called it Clear Light. For a while I did not want to call it a Stage at all, since it represents the ultimate mystery and because, in a sense, it represents no mandala at all. However, it symbolizes an absolute point, mind, or state of consciousness which we take to be the origin and end of all form. It is the empty void, or the Plenum, the Nirvana principle of Eastern psychology, the state of pure mind beyond every conceivable
duality. Beyond light and darkness, form or no form, beyond time and space, beyond concepts a: logic. It has no beginning and no end. It is conceived as the very ground of all existence. It is the ultimate aim, psychologically and experientially of both the Western and Eastern mystics.

"I can see why the average art therapist finds you a bit hard to take," I said. "What the hell, I thought. We might as well get it over with. "In fact," I added, "from a scientific point of view, Stage Zero is a hard pill to swallow. Let's face it. This is pretty controversial stuff."

"That's why I rarely discuss it. Stage Zero is the most controversial, but it is also the most important. Yet, except for one paper I wrote with Dr. Francesco Di Leo, I never mention Stage Zero. Not one word. Because it doesn't have its place in an art therapy course. If it were a conference on religious and scientific interfacing, it would be another story, depending, of course, on the maturation of the crowd. Most of the art therapists are so young, I am not a saint or something to the young art therapists. I don't even know them. I don't go to the conferences. I don't have a great deal in common with them. I am no model. I am a maverick. I was always just slightly beyond the pale. I was not academic. I was strictly clinical. I came up through the hospital, sanitarium, drug research center, not the Ivory Tower. I'm like a flyer who learned to fly by the seat of his pants. I never went to school for it."

Joan Kellogg was granted membership in the AATA via a grandfathering clause in 1974, since she had already been doing in the field predated the founding of the AATA by quite a few years.

"Then I committed the ultimate crime of going to Antioch and getting an MA in Psychology rather than in Art Therapy. I was neither fish nor fowl. I had no sorority. It was all experience. Run by me. I didn't have any boss over my head. I was the boss and also the cleaning lady. I was independent and I did what I wanted. At Antioch we attacked all the taboos. We played hardball. There was passion, interest, enthusiasm. Passion is usually bled out of graduate school. Art therapists have their own agenda; I don't know, sticking silver foil on paper or something. It's a great tool. We will show you how to do it. You cut it up and you glue it. Oh, it's wonderful and you get the whole family involved. And I think, 'OH GOD! DELIVER ME!!!!'

"It strikes me that in this field what you are faced with is that you are a mystic who is being shot down by a bunch of clerics."

"Hah! That's cute! I like that. But there is no use putting them down. This mandala thing was born in the wrong building. Not that it will be accepted anywhere else either. I mean, I don't think the average linear psychologist could have dealt with it any better. Study of The Great Round involves symbols which have to do not only with culture but with profound psychosocial and emotional issues. I deal with them in an irreverent yet passionate way. Ultimately, I salute reverence. This stuff is genuinely transcendent. Talk about the Grail! I mean, man, you are there! People can catch that! They can get a glimpse! They want more of this because they know it is of ultimate importance. That is very upsetting to academics. Our academic world is interested in technique. They remind me of missionaries who want to cure the natives without loving them. People are whole beings, with a spiritual side as real as their material side. But don't for one minute assume I'm just some New Age nut. You asked me what inspired me or what kept me on the trail, so to speak, of trying to develop Order out of Chaos. I didn't believe it was my magical insightfulness without there being an underlying order that I just happened to trip over. If I was right, then it needed to be researched. And I realized that it's very difficult to do research with mandalas. They are too soft. By that I mean they are too subjective. There has to be a better way to do this, more scientific. And that's why I developed the MARI cards."

MARI stands for Mandala Assessment Research Institute, a legal entity which Joan established to encompass the development, production, and appropriate use of the MARI cards as a testing tool. They currently consist of three translucent plastic symbol cards for each Stage, for a total of 39, as well as 38 color cards and two foil cards. The subjects are asked to choose five symbol cards and place them on color or foil cards in descending order of preference. They are often asked to draw a mandala at the same time, but it is this constellation of card/color combinations which represent the raw test result data. Since the cards and colors are standardized, the subject's choices can be accurately compared to the choices of other subjects and compared to the results of other standardized tests. The MARI cards constitute a method of rationally organizing and representing the information and connections embodied in The Great Round.

"What is the primary function of the MARI Card Test in today's world?" I naively asked.

"It has two major uses. Personality assessment in therapy and use as a standardized test in group studies intended to advance a particular scientific theory or proposition. The MARI Card Test is a superb research tool."

"So despite the discomfort some may feel in dealing with The Great Round, the MARI Card Test offers something beyond a belief system. It's eminently quantifiable." I suggested.

"Everything is numbered or initialed so it can be easily stored in a computer. We're not talking about subjective or impressionistic kinds of things. When we use the cards we're using scientific methods. I did what I set out to do, which was to find the order in what appeared to be randomness. And I've developed the instrument to measure that order. I found that I could teach it to others. I developed the instrument as a research tool and as a tool for use in therapy, an effective means of communication between client and therapist. There will be something beyond this. Everything transforms itself, including card tests. It may be around for fifty years—that's likely—but it will transform itself into something else, just as the mandalas transformed themselves into cards. But I do think we have an instrument that is worthy of being offered to scientific study and research. And I think it will add something to what is already there. I don't think it is the universal test. No test is the universal test. But it comes close because of its nonverbal nature. You can take it into any culture or subculture. I think that is very attractive."

"What does one discover or measure about someone else in administering the MARI Card Test? Can you spot suicidal tendencies? Can you spot a compulsive personality, the traces of multiple personality disorder, manic depression, schizophrenia, the evidence of child abuse?"

"Mandalas done by subjects with specific disorders are
frequently consistent with these disorders, as perceived by art therapists, but diagnosis is more likely to be accurate when performed by a therapist familiar with a particular disorder. Of course, diagnosis of specific emotional disorders is dependent on the competency of physicians or licensed professionals, based on interviews, history, and behavior, plus tests of one kind or another. Our knowledge of the use of the MARI Card Test has expanded exponentially since its inception. What we lack is independent research to verify what we have already observed and publications to spread the word. We also lack a spectrum of observations on the MARI Card Test results with healthy populations. We all have repertoires of card choices. Unless you have a roaring headache, there are some card/color combinations you would never pick outside your normal repertoire of states and experiences. We all have our repertoire of states of consciousness which we visit often, and maybe only one or two which we would choose to visit voluntarily only under the direst of circumstances. The sick, on the other hand, have a very small repertoire, depending on the illness.

"Can I assume, then, that the healthy person travels The Great Round many times during his life and perhaps..."

"During the year, during the week! But in different octaves, if you will."

I added, "For example, the coming to the end of something, evinced by Stage 11. Disintegration, could be the end of a love affair, the completion of a project, coming to the last page of a great book, the closing night of a play, or even the presaging of your own death—the same note but in different octaves, right? Maybe that is what is meant by saying, 'We die a thousand deaths.'"

"Yes, and your choice of MARI Cards will reflect each of those in slightly different ways depending on what colors you choose with Stage 11 and what other Stage/Color combinations you choose at the same time."

"It strikes me that to read the results of a MARI Card Test takes a certain amount of training. How do you insure that inept neophytes such as myself don't misuse the instrument?"

"That's where ATMA comes in. The Association for Teachers of Mandala Assessment. In 1989 I signed a contract with a group of nine people who had taken a number of my courses and wished to spread the word about MARI Cards. I gave the new group the power to accept and set requirements for new teachers. I gave them the power to structure the content of the course. They still teach the course in a 30-hour format over an intensive four-day weekend, designed to create a kind of sensory, experiential, and intellectual overload."

"I understand that your life has centered around the research, the development, and the teaching of your theories. Which area has given you the most satisfaction and in which have you experienced the most success?"

"I guess the ability to teach what I have learned. Without the exhaustive research necessary to document statistically the correlations and significance we have discovered in our practices, we must learn to trust our intuition more. That is often an anathema to psychologists, but it is like asking mother, 'How do you know the stew's ready?' She's been making stew since year one and she knows when it's ready. If you ask a linear person he'll give you an answer in hours and minutes, but mother will say, 'Well, it's just going to feel a certain way when you stick the fork in.' It's process orientation as opposed to 50-minute hours. Not only does the factual information have to be transmitted from the teacher art therapist to the student art therapist, but this change in attitude also has to be conveyed to make this work."

"Have you ever considered yourself a healer?"

"No, not at all. My goal is understanding, not healing. I'll leave that to those nurturing souls who deal directly with patients. I only interact with art products. If in teaching about this any healing happens, it is due to personal insight gained by the student. Of course I am interested in the personality related to the product. That is central. I think, as a matter of curiosity, I am more of the mediumistic receptive personality, which is different from someone who sends rays out. I'm just a bowl who takes it in."

"Where is mandala theory and the MARI Test going now?"

"Training, practice, and research must all go on simultaneously. It's not enough to say that you are doing something. You have to know if it's working, and only research will show you if you are really accomplishing something or if you are just whistling Dixie. Art therapists have to tell the institutions we are working for that we want to do a particular project. We are perfectly empowered to do that; it's just that a lot of us have not grasped that if you work for an institution, that is the umbrella under which you thrive, and if it means that you will thrive by doing necessary research you will, in turn, help the institution. So apply! Why not? If it is not a profession, then we might as well pack up our things and go home!"

The sun sloped in through the early evening window and glistened on the storm-soaked leaves. "I don't have to climb another mountain. I've climbed this one. I've done the best I could, and I am quite ready to leave the Teachers of Mandala Assessment with my work. I've taken it as far as I can take it. They must take it from here. That requires that they really begin to start thinking in terms of grants, funding, and serious scientific studies which will document what we have already found out and what we are still continuing to discover. Seventy years! Enough already! I am ready to say, 'Here's what I've done. I'm proud of it. Take it from here!' As the sun began to sink through the swirling lowland mists, Joan Kellogg looked at me and said, 'I'm happy.'
Brief Reports

Gwynne La Brie, BA, Emporia, KS, and Cindy Rosa, MA, A.T.R., LPC, CAC III, AATA Membership Chair, Denver, CO

Abstract

Since 1988, AATA has sent out a biannual survey every other year to all its members along with annual membership dues. The survey consists of a variety of questions dealing with different aspects within the field of art therapy and AATA membership. Over the past years, changes have been made within the survey, but the overall information requested has remained the same. The survey asks that members provide information regarding their areas of specialization, populations, major activities, salary, and optional demographic information. The information collected from the returned 1992–93 survey is presented in this article, and a general graphic picture of the field of art therapy and AATA membership is provided.

Since the American Art Therapy Association's development 25 years ago, the field of art therapy has continued to change and grow. It has become an increasingly recognized field in the area of mental health, and there are now more art therapists employed not only in the United States, but in the entire world. Also, more art therapists are employed in a variety of settings, and overall AATA membership continues to grow.

In 1992–93, AATA mailed out a demographic survey to all members along with a billing for annual membership dues. The survey included questions pertaining to employment, specialization, types of populations, and optional demographic information. Over 3,000 surveys were sent out, and a total of 1,988 surveys were returned. The information collected from these surveys is presented in this report with a summary of both the practice of art therapy as well as the status of AATA members.

As seen in Table 1, there has been an increase in total AATA membership from 1991 to 1993. These statistics show an 18.4% increase in membership from the last survey in 1990–1991. The most notable increase occurred in the number of Professional A.T.R.s. This membership category was the only group that increased significantly, while the majority of the other membership groups decreased or did not change at all.

In looking at the educational level of survey respondents, Table 2 shows that the Master’s degree continues to be the most often reported level of education; however, those who responded with Bachelor’s degrees often stated that they were currently working on their Master’s degree, and a small majority of respondents with Master’s degrees indicated that they were currently candidates for a PhD program.

Areas of Specialization: As noted in the 1988–89 and 1990–91 survey, the specialties listed by AATA members reflect current trends in mental health as well as other areas where art therapists are employed. The first three areas reported as specializations are included in Figure 1, however,
these figures may be an underestimation of actual specialization. Many respondents selected anywhere from 3 to 10 or more areas, but survey instructions indicated that they list them in order of most frequent to least frequent. Therefore, Figure 1 shows the first three most often selected.

In selecting area of specialization, many respondents chose the category of “other.” The most frequently listed areas written in were women’s issues, depression, hearing impaired, intercultural, education, sexual offenders, children at risk, homeless, oncology, and juvenile detention.

**Primary and Secondary Work Settings:** Figures 2 and 3 show only the first setting selected for both primary and secondary jobs. As illustrated by the figures, there appears to be a diversity within job interests as well as employment.

**Population Types:** In Figures 4 and 5, only the first two populations listed by respondents are displayed. Respondents, however, often listed anywhere from three to seven different populations.

**Age of Population:** Figure 6 shows the age ranges of clients with whom respondents work within their primary and secondary jobs.

**Major Job Activities:** Figures 7 and 8 illustrate the major activities that respondents perform within their primary and secondary jobs; and only the respondents’ top three major job activities are displayed.

**Salary by Job Title:** This question was answered by 1,510 for a primary job and 594 for a secondary job. Often those who did not respond indicated that it was a personal question and, therefore, left it blank. Tables 3 and 4 show the breakdown of salary into $5,000 increments for primary and secondary job titles.

Figures 9 and 9a represent the respondents’ salary ranges broken down into hours worked each week for primary jobs and Figures 10 and 10a show the ranges for secondary jobs. So that the information can be clearly represented and understood, two figures are presented for both primary (9 and 9a) and secondary (10 and 10a) jobs. The two figures for each job category show the same information broken down in two ways.

A Note on Ethnicity in Humor and Art Therapy

In an earlier study (Mango & Richman, 1990), we describe the therapeutic effect of humor assignments during art therapy with a heterogeneous group of psychiatric inpatients. Both the art and humor productions expressed the patients' isolation, impaired interpersonal relationships, and the pain of mental illness. The participants valued the group because they could share these difficulties and problems and because the combination of modalities amplified the social cohesiveness of the group.

Art Therapy Group

Art therapy group treatment with African American or Hispanic patients was conducted by the senior author, a Caucasian woman. The patients were in the discharge phase of treatment and remained in this group for up to six months. The average group size was six patients. All patients had been treated in a variety of different groups, including open-ended art therapy where they could create whatever they chose. In this study, topical (theme-based) art therapy was used; the therapist presents a theme and patients respond with a drawing. Meetings were held once a week and every other week the topic was humor.

In the humor group, patients first tell jokes as a warm-up procedure. Provided with pencil and 9 × 12 white drawing paper, they are asked to draw something funny that happened to them or to someone else, or to make up something funny. Following the task, they display and share their work through discussion. The therapist never tells jokes nor directs the content of the patient's humor. "Ethnic" humor emerges spontaneously from the patients.

A 27-year-old African American dual-diagnosed schizophrenic and polysubstance abuser spontaneously told the following joke.

There was a white guy, an Oriental guy, a black guy and a haunted house with a room for rent. The white guy goes to see the room and hears, "I got you, now I'm going to eat you." He runs away. Next, the Oriental guy goes to the haunted house to see the room and hears the same thing, "I got you, now I'm going to eat you." He becomes afraid and runs away. The black guy goes to see the room and hears, "I got you, now I'm going to eat you." He says, "Let me investigate," then turns on the light and sees a little boy sitting in the corner, picking his nose, saying, "I got you, now I'm going to eat you!"

In contrast to the white and Asian, the black man is depicted as superior because he does not run away. By over-

coming fear he shows there is nothing really to fear. This is a counterphobic joke pointing to the joke teller's desire to master the situations she fears. The joke also depicts an oral fantasy of taking in bad food or "snort."

The personal implications behind this joke are striking. The patient had been abandoned by her mother, who also was a substance abuser, and raised by her grandmother. During a chaotic childhood, the patient became prematurely autonomous, feeding herself. Following in her mother's path, she is also a substance abuser. The patient abuses coke, "feeding" her head by snorting cocaine through her "nose."

The good organization of the joke indicates ego strength and positive resources for recovery. The content suggests the severe anxiety behind her psychiatric illness and substance abuse which can be dealt with fruitfully in treatment.

The next example illustrates how ethnic jokes tap identity and social role problems and conflicts. A 48-year-old African American man spontaneously drew the following picture during one of the sessions (Figure 1).

The patient said his picture, which he titled "Ajax Messenger," is about a "black typical messenger, who is really a con artist, and not in college." The picture shows a black man, riding a bicycle, listening to a "ghetto blaster" playing a popular black group on the radio. The man has a menial job, which (as the sign reads) requires no experience, no high school, no brains, no polygraph test. He speaks black slang, is unable to spell, and lies to his viewer about being in college.

This drawing is a complex, condensed creation, depicting the life situation prevailing among many inner-city inhabitants in general, and the members of the therapy group in particu-
lar. His image portrays a caricature of black inferiority that is so extreme as to reduce it to absurdity. First, the patient is laughing at the stereotype of blacks as stupid and dishonest. Second, he addresses how blacks have historically held low-paying jobs and have been unable to attend college. Third, he depicts the status needs that are frustrated. Fourth, he presents the development of covert, manipulative, "coman" behavior, characteristic of oppressed minorities.

The patient was a very bright man who never finished high school, but planned to obtain his GED and attend college one day. The picture, on a personal level, shows the patient's ambivalence and anxiety concerning his ability to succeed in his schooling and job goals. The hesitant line quality of the drawing and the thin man with an erect penis suggest problems in self-identity especially about maleness and potency. These problems in self-identity may directly contribute to ambivalence around achievement. Once again, the patient's ethnic humor offered the therapist a greater understanding and contributed to accurate empathy.

In another case, a 20-year-old African American group member shared a series of "playing the Dozens" (Abrahams, 1964), as told by one rap singer he had heard:

"Your mother's so poor, she went to McDonald's and put a shake on lay away."
"Your mother's hair is so nappy she needs to take pain killers to comb her hair."
"Your mother's so old she was around when they planted Central Park."

These expressions are part of the folk culture of the black community, presenting African Americans in their historical position as poor and deprived. On a more personal level, the patient grew up in a single parent family with his mother, with sporadic contact with his father. The themes of his "Dozens" include a mother's lack of attractiveness, her age, and her poverty. These can be understood as his efforts to distance himself as young men do in their striving to individuate.

Discussion

These spontaneous examples of ethnic humor told during therapy depicted the patient's struggle to establish his or her own identity and to be confirmed as a worthwhile and separate person. They condensed a great deal that was helpful in understanding the individual, whatever the cultural background, and provided important personal information.

Creative art therapies engage the patient and touch upon deep and often unconscious thoughts, fantasies, and life tasks in an accepting and relatively nonthreatening manner. Humor is one such form of self expression, and the graphic arts another. When used in combination, they help patients feel free to bring up ethnic material, which otherwise might remain unexpressed. The ethnic humor which emerged offered opportunity for the therapist to understand and make contact with the patients.

We conclude that whatever the content of the therapy, humor can be a unifying force when it brings out similarities in culture, problems, experiences, and areas of stress. As Freud (1905), and Zwerling (1955) emphasize, humor expresses the needs, striving, attitudes, and life situations of the person telling the joke and the person who laughs.

A cohesive outcome was particularly true of the humor therapy group where social bonding develops because people who laugh together form a community of good will. As Goodchilds (1972) said, "Humor is a phenomenon preeminently interactive, immanent, impromptu" (p. 176).

Our clinical observations suggest that ethnic material surfaces in the patients' art and humor especially when there are unresolved issues of identity. Ethnic humor provides an opportunity to explore the patient's self-esteem and self-identity.

Native American Experience of Healing through Art

Nadja Ferrara, MA, A.T.R., Montreal, Quebec

While working in Northern Quebec, a Native American Cree elder shared with me his belief that art therapy was actually created for Natives. In my attempts to pioneer the development of crosscultural art therapy, I have witnessed a high rate of success because Native clients respond positively to art therapy (Ferrara, 1991). Expression through art is closely linked to the Native American culture. They believe that through this process thoughts and emotions are more naturally accessible, as compared to a talking-out process. They speak in images, their oral traditions are filled with metaphor, and the shamans and medicine people use imagery and metaphorical language for the purpose of healing (Young, Ingram, & Swartz, 1989).

I have been working with various tribes, among them the Cree, Mohawk, and Ojibwa. My services include assessment, brief and long-term therapy in hospitals, residential treatment and social service centers. The arts, spirituality, and healing are so closely linked that they naturally come together during therapy with these Native American groups.

Very little has been written about working with these groups. In 1989, when I was working with a Cree Indian boy, I desperately sought art therapy literature about this population. I found only one article addressing cultural differences and art therapy (Lofgren, 1981), and her case illustration was with a Navaho girl. The need for research on crosscultural issues is apparent.

My work with Native Americans has been aided by their acceptance of me, based on the fact that I look Native. In my frequent travels to different villages across Quebec and Ontario, I am always faced with Natives greeting me in their mother tongue. My dark skin, dark-brown hair, and almond-shaped eyes have helped me go beyond barricades and checkpoints on certain reserves. My physical presence has aided in developing a positive therapeutic alliance, since clients usually perceive me as a member of their cultural group. In some cases, when they discovered that I am not Native, they felt empowered to teach me some Native words. In one community I was given some caribou meat, which is viewed as a spiritual gift from the Creator. When offered to another, the meat symbolizes acceptance and a strong sense of trust. Clear boundaries exist regarding what is acceptable behavior within and outside of the reserve. The non-Native game warden enforces the rule that non-Natives may not bring any meat outside of the Cree villages.

Working with Native Americans requires a significant amount of patience and cultural understanding. Crosscultural art therapists must be aware of not imposing their own values which may be antagonistic to those held by the client (Campanelli, 1991). Often I need to talk slowly, be more articulate, and accept one hour sessions filled with silence. If the therapist shows a capacity to be silent with Native American clients, the clients will understand this as validation of who they are and their view of the healing process.

When I speak of silence I do not mean that the therapist becomes stoic and stonefaced. It is during "silent sessions" that body language is used, or, in specific cases, the therapist engages in the art-making process. In other words, the only language used in such sessions is nonverbal. This helps to bridge the gap between the therapist as a "white person" and the Native American client, because "white" people are viewed as "babblers" by Natives. In the Cree's eyes, the white man's personality is superficial (Preston, 1976). By our silence and reticence, we demonstrate that we accept their style of communication.

Reticence plays a significant role in healing, for example in sweat lodge rituals. Also, it has a positive facilitating function and meaning in the Cree's cultural milieu (Preston, 1976). My work with 15-year-old Jay, an Ojibwa, illustrates the use of silence and reticence in art therapy. Jay was sexually abused when he was a young child. Although he was referred for therapy for acting out behavior, during our first six sessions he was silent and did not engage in the art-making process. Validating his silence by just being present and occasionally making eye contact helped to establish a strong therapeutic relationship.

One of Jay's first drawings (Figure 1) was a portrait of his stepfather, a Vietnam War veteran. Jay was experiencing great difficulties in his relationship with his stepfather and often expressed his anger by defying house rules. This drawing suggested Jay's guardedness. Pressured lines on the jaw area indicate his need to be reticent and contain his emotions.

In Figure 2, depicting his own cartoon creation, "Fire- star," Jay's anger and aggressive instincts are more apparent. In later sessions Jay became more comfortable and involved in art making and interpretive processes which allowed him to address his inner conflicts and unresolved issues. In most of his pictures, he had difficulty drawing the full figure. This
indicates his anxiety around the genital area related to his past experience of abuse. Jay’s long-term goal in art therapy was to develop an alternative form of communication and move towards sublimating his thoughts and feelings.

Some of the art therapy techniques I use include reading from the cultural legends and asking the client to draw, paint, or sculpt, using the legend as a theme. Native American music and guided imagery are introduced to help establish a relaxed atmosphere and encourage reconnection to their culture.

Working with dreams through art by recreating or recording them is a significant aspect of the Native American culture and its traditions (Speck, 1977). In Figure 3, Tom, a 38-year-old deaf Cree, shows how the night spirit protects the sleeping bush people and their prey. This drawing was motivated by a dream Tom had while living in the bush camp.

My work with Native counselors has resulted in methodological changes and a better understanding of the culture. I bring cultural symbols and metaphors into sessions to promote the formation of a cultural identity. The therapist also needs to create a repertoire of the symbolic cultural rituals that are prevalent in traditional communities.

Although my work has focused on Native Americans, I believe all art therapists are involved in crosscultural psychotherapy because our pluralistic society demands it. The idea of one culture, the Western-cosmopolitan culture, may be on the verge of annihilation. Native elders have taught me that we all have different origins, and these should be respected and maintained. The concept of an ethnocentric Western culture does not exist; the reality is that North America is a cultural mosaic.

Although Native Americans have been forced to assimilate and, in the past, tribes were decimated, they and their cultures continue to survive. The Natives have begun to look towards the values and beliefs of their own culture and traditions, taking into consideration their ability to survive. In addressing their conflicts and issues, Natives are reconsidering and incorporating the healing power of art that inherently stems from their roots and way of life.

Magazine Photo Collage as a Multicultural Treatment and Assessment Technique

Helen B. Landgarten, MA, A.T.R., HLM, Los Angeles, CA

Crosscultural counseling is in a state of crisis. A large influx of immigrants is now treated by a small number of therapists who can converse with them in their native languages. To address this discrepancy, better methods of crosscultural treatment must be considered.

I began seeking resolutions to this problem in 1967, when working with clients from Asian, African American, and Hispanic cultures. At Cedars-Sinai Thalians outpatient Mental Health Center, I found that involving these clients in art therapy was not always an easy task.

African Americans often were angry that they were assigned for treatment by a Caucasian, middle-class therapist. Perhaps they thought I would lack empathy or could not understand them. A number of these clients were overtly resentful and/or prejudiced against white people.

Hispanic clients did not object to me for those reasons. They generally worried about the language barriers and problems with communication. Asian clients tended to be polite, and if they had objections to being assigned to me, it was never voiced. Their resistance usually was to revealing personal information.

To improve my work with minority clients, I introduced collage into treatment, making a point to use pictures that matched my clients' cultures. Collage was integrated with other art therapy methods, as drawings, paintings, construction paper art, and plasticine sculpture always remained the primary media.

Magazine photo collage often triggered comments and free associations that would not have happened otherwise. It was particularly valuable with clients who were resistant to art therapy. The photographs served as a warm-up and eased them into involvement with the usual art therapy materials.

Because the self-identifying magazine images were so effective, I began a serious search for pictures of women and men from numerous cultures that depicted men in a variety of ages, emotions, and situations. During the 1960s and 1970s, this was difficult to manage because magazine advertisements almost never used minority individuals as models. By the 1980s, positive messages, such as “black is beautiful,” were well-known and advertisements began to include African Americans in catalogues, magazines, and newspapers. Also during that period, the number of African American magazines had increased. However, for my purposes, a new problem arose. The images appropriately represented upwardly mobile role models, but, in doing so, they failed to show anything other than pictures of smiling black people.

Magazines such as Business Week and Money contained many images of Asian men, but seldom women. Only recently Asian women have began to appear in some advertisements. To resolve the Asian picture shortage in our United States publications, I went into the Asian communities. There, on newsstands and in book stores were a large number of daily and weekly magazines sent over from Japan. In Korean and Vietnamese shopping areas, free advertising newspapers were available with pictures of Asian people.

The photographs of Hispanics were, and still are, more difficult to find. A large number of magazines printed in Spanish are found on the international newsstands and in the Mexican, Central American, South American, and Cuban communities in Los Angeles. Unfortunately, they are translations of American publications such as Life, Redbook, Cosmopolitan, Newsweek, etc. They carry no Hispanic advertisements or articles. Again, I found pictures in the free advertising community newspapers only in Spanish-speaking shopping areas.

National Geographic, Time, Life, and Newsweek carry photographs of people from around the world. They provide an excellent source of photographs for clinicians. No work with clients of almost any ethnic group.

The use of the multicultural people images had a positive therapeutic payoff. Therapy progressed at a faster pace because this approach was a means to bridge the gap between my clients and me. Hastening a positive transference. My clients saw that I cared enough about them to provide a personal visual language that aided communication. For example, African American clients were more comfortable with images that were like themselves and often portrayed how they felt. On some level they understood this as a symbolic gesture. It indicated my wish to assist them in the context of their culture, rather than implying that therapy was coming from a position that was white, middle class, and, therefore, de-nigrating.

Asian clients who used images from their cultural group found it easier to divulge their secrets. Their reticence was lessened because they directed their therapy by selecting pictures. The short time it took to complete a collage delayed the humility of having to share their problems with a stranger; the imagery clarified issues and aided them to stay focused.

Hispanics found that magazine pictures of their own people made it easier to communicate difficulties. They were impressed by all the photographs that expressed their own concerns. At times, explicitly so. Spanish-speaking clients learned that any problem was appropriate to bring into the session.

In the last six or seven years mental health funding has been cut noticeably, insurance companies now allot a briefer time for assessment and treatment, and it is imperative that we reach clients within a shorter period of time. Multicultural photo collage can be used in assessment as well as treatment, especially since it is not unusual for assessment and treatment to occur simultaneously.
It is questionable to assess minority children's intelligence quotients using tests standardized on middle-class, Caucasian Americans. Similarly is the current use of projective tests as the basis for diagnosing immigrant clients, especially when these tests have not been standardized for these cultural groups. In my work, it appears that these assessment methods may not be valid for cultures other than middle-class Caucasian Americans. To address this discrepancy, I examined collages made by my multicultural clients and developed a systematic four-task assessment method (Landgarten, 1993).

Crosstural therapy is now a popular subject. Art therapists have a decided advantage when working with a variety of people. Magazine photo collage has a place in treatment. It compliments, but does not replace, the drawings, paintings, and sculptures that we request of our clients. It is particularly useful when we use "people" pictures that match our clients' cultural group. As ethical practitioners, we owe our clients opportunities for the most positive therapeutic results. Multicultural magazine photo collage is an effective technique for attaining multicultural goals with ethnically diverse clients.

Psychopathology of Expression and the Therapeutic Value of Exhibiting Chronic Clients' Art: A Case Study

*L'art brut*, literally translated "raw art" or "The Art of Outsiders," refers to the "Art of the Insane" (Phyllis Kind Gallery, 1993) (MacGregor, 1989). Included in this group are the thousands of artworks found in closets of art therapists, hospital records, or personal portfolios of the mentally ill. Rejected by the art establishment, it is condescendingly called, "the art of children, primitives and the insane" (Dubuffet, 1967).

Seventy years ago, in *Ein Geisteskranker als Kunstler, (A Mental Patient as Artist),* Swiss psychiatrist Morgenthaler presented the copious work of Adolfo Woelfli. Woelfli's alleged explosive and dangerous temper was treated through harshly controlled isolation. He had few opportunities to use paper and pencil until his psychiatrist directed the hospital to supply art materials. For 50 of his 35 years of psychiatric hospitalization, Woelfli documented his experience in an elaborate series of compulsive drawings, writings, collages, and paintings, developing a system to survive the threat of escalating depersonalization and fragmentation. During his lifetime, Woelfli's art was exhibited, and he became the first schizophrenic artist to achieve fame in the mainstream art culture.

For 70 years the art world has given increasing attention to "The Art of Outsiders." Although most art therapists resonate deeply with this interest, publishing the art of mentally ill clients outside of professional journals is restrained and limited. While restraint is sometimes warranted, if carefully handled, clients can have therapeutic value, especially when exhibition is part of a talented client's therapeutic plan.

Exhibitions of art by psychiatric patients are not much more original, more inventive, or more interesting than artwork commonly produced by "normal" people. Yet, while mental illness does not preclude talent in art, a client's innate potential or a genuine, intense drive to create art is not always apparent early in treatment. Genuine artists are almost as rare among the mentally ill as in the general population (Dubuffet, 1967).

We are faced with questions: What contributes to the amazing talent and deeply touching expressiveness of those few talented clients? What allows imagery to arise from a few mentally ill clients? Artistic training and exposure to art appreciation do not appear to play a major role.

The Case of Mr. Q.

Mr. Q., diagnosed with chronic schizophrenia, was hospitalized for 23 of his 44 years. He was considered one of the most regressed patients on the wards of three major psychiatric hospitals. As his artistic expressiveness developed, he recovered the ability to make social connections and resumed work within the community. During the three years I worked with Mr. Q., he was able to channel his aggressive impulses into highly original and productive artwork that yielded several exhibits. At first, exhibiting his art induced a period of regression, but later he recovered and reached a higher level of personality organization. His case demonstrates the use of exhibiting artwork as part of the therapeutic plan.

Mr. Q. was first hospitalized at age 20 when he attempted to leave his family home after a fight with his older brother. Clinicians at the community mental health center had met him the week before when he had thrown objects from a window and run naked in the street. He insisted he heard the Pope's voice. Six months earlier, his family reported he was found in a confused state wandering in the streets and sleeping in junkyards and churches.

Mr. Q.'s parents were strict Catholics, born in Ireland, and educated through the elementary level. His mother's work as a scrub woman for the hospital supported the family. His father, a retired railroad worker, died from the physical effects of alcoholism. Mr. Q. developed a close relationship with his father and often accompanied him to church.
times each day. The family consisted of seven children; Mr. Q. was the youngest. Several of his siblings had physical or mental illnesses, and three died in childhood. Mr. Q. was close to one of his brothers who was placed in a state school for the developmentally delayed. Family life was marked by tension and fighting, particularly between his father and oldest brother.

Hospital records show that Mr. Q. performed poorly in elementary school. At age 10 he was described as moody and withdrawn, refusing to play with other children. At 12 he expressed an interest in the priesthood, but was discouraged from joining. At 15, while in a violent rage, he assaulted his mother and was sent to a Youth Detention Center. He completed the first year of high school then left school to work, intermittently, at various jobs. Employment never lasted more than 2 months.

**Treatment History**

Mr. Q. was diagnosed with Schizophrenic Reaction, Acute Undifferentiated Type, and admitted to a state hospital. His condition remained unimproved, and after one year he was transferred to a second and third state hospital. After 2 years he was discharged and sent home where he was able to obtain a job, but was fired after several months. For the next 2 years he lived at home. His family reports he paced the floors and fought with his oldest brother. At their request he was rehospitalized and remained institutionalized from age 22 to 37.

His treatment plan consisted of chemotherapy and psychotherapy. For 3 months he participated in group therapy sessions with his mother, but he assaulted her during a session and the therapy was discontinued. After this episode, he stopped talking in sentences, became incontinent, and, for hours, would lie under a piano. He hallucinated and had delusions of being a high religious figure, the Pope. Jesus Christ, Saint Francis, Moses, God, Krishna, and Buddha. He was quite flirtatious with women patients and nursing staff. After he was treated for syphilis, he expressed fears of being homosexual and was nearly mute for long periods.

When he was 37, plans were made for him to move to a group home to comply with major administrative changes in the state hospital system. His older brother sabotaged these plans. As acting head of family, he requested that Mr. Q. be transferred to a psychiatric hospital. After 3 years of hospitalization, Mr. Q.'s behavior was more socially acceptable; he appeared more aware of his environment and spoke in coherent full sentences. But, his difficulties with personal hygiene and religious delusions continued. Auditory hallucinations stemmed from voices he heard on radio and television. However, he was improved enough to be transferred to an unlocked milieu therapy unit.

The milieu therapy unit was designed to treat chronic schizophrenic clients in residential and day treatment rehabilitation programs. It was located in a large hospital ward. To prepare for community reintegration in half-way house placements and part-time jobs, clients were taught independent living skills through role models and practice. The therapeutic program was divided into three components: activities of daily living, recreation and prevocational skills, and intra/interpersonal therapy, which included art therapy.

**Art Therapy Sessions**

During transition from the ward to milieu therapy, Mr. Q.'s case administrator referred him for art therapy. Mr. Q. was very angry and resistant to staff; he exhibited poor social skills, uncontrollable outbursts of anger, and self-destructive behavior. His odor was offensive due to poor personal hygiene. He often would sexually harass staff. Despite this, staff often described him as "a charming personality."

From his first sessions, Mr. Q. appeared to be interested in art. In group art therapy he avoided the group. He used his own ideas for artwork, and preferred religious themes and the Renaissance. His art was fragmented, a characteristic in work by chronic schizophrenic and day treatment clients (Figure 1). Landgarten (1981) distinguishes between the art of acutely psychotic, hospitalized patients, and the art of day treatment clients. She suggests that day treatment clients tend to produce pictures depicting complete, realistic illustrations. Mr. Q.'s fragmented, but illustrative imagery could be found in art by clients in both day treatment and hospital settings.

Mr. Q. rejected assistance with art materials and he refused to talk about his art. This was not unusual. Schizo-
phrenic clients may regress from verbal to nonverbal communication when attempting to establish a relationship in therapy through their drawings (Jakob, 1969; & Amos, 1982).

A humanistic-oriented art therapy treatment plan, designed to assist with reality issues by focusing on current themes, was successful only a few times. Mr. Q. typically chose his own subject matter, even when structured art experiences were suggested. After several individual sessions, he appeared to trust the art therapist, and began to describe his pictures. Amos (1982) explains: "At least a part of the schizophrenic's motivation for producing art lies in the establishment (sic) of some kind of communicative tie with others" (p. 132).

The Art Exhibits

During 3 years of art therapy, Mr. Q. came to view himself as an artist. When he drew himself as the Pope, Jesus, Moses, and Krishna, his acting out behavior diminished markedly. The art therapist assisted him in presenting his work in several art exhibits. These ranged from a random sampling of art on the program's walls to an exhibition in the hospital lobby, and a show in a large public municipal building where hundreds of viewers passed daily.

When his artistic talent was appreciated and admired, Mr. Q. gained a sense of importance and his self-image as an artist grew. He stopped relying on the delusional sense of mastery and grandeur, and no longer needed to claim to be God.

Perhaps the most important outcome of art therapy was his trusting relationship with the art therapist. He also increased his level of verbal communication and formed relationships with staff members. In art therapy sessions, he was able to use visual images to deal with unconscious thoughts and conflicts (Figure 5).

Making visual images can increase the ability to differentiate reality from fantasy (Wilson, 1987). According to Cohen (1981), mentally ill clients can use their art as a point of equilibrium and balance between the world of fantasy and reality.

Mr. Q.'s artistic style and artistic approach are innovative and unusual. With no formal training he would draw and integrate a few random lines to make a distinguishable figure. This brings to mind Jakob's cases where the art of the schizophrenic was directed by the images in the art itself (1969). Luscher (1990), Arieti (1976), Weiner (1966), and Maio (1949) described the typical favor of schizophrenic art: floating images, symbolic imagery, stylization, heavy ornamentation, repetitiveness, and static faces with few gender differences. These features can be seen in Figures 1, 2, and 3. Mr. Q.'s paranoid delusions may be observed in his emphasis on the figure's eyes. His tendency to overwork resulted in muddy colors, and he crossed out figures in drawings that con-
tained beautiful images (Figures 6 and 8). His work includes "word salad calligraphy," but it does not show what Landgarten (1981), Cohen (1981), and others describe as "art salad." Unlike many artists with schizophrenia, Mr. Q.'s symbolic images remain whole.

Mr. Q. enjoyed the process of creating art. He often created a rapid succession of works, repeating the same theme. When creating art every day his assaultive behavior decreased, suggesting, on some level, sublimation of aggressive impulses (Kramer, 1971).

Despite his recovery, he experienced major setbacks along the way. Just before the opening of his first exhibit, his hygiene began to deteriorate. Although he appeared interested in the show, his offensive odor allowed him to keep his distance from staff and clients. In staff meetings, the issue of Mr. Q. enjoying his odor was debated. His odor made him more aware of his physical presence and isolated him from others. He did not want to examine his behavior. When staff pressed the issue of his hygiene, his artwork regressed (Figure 7).

This outcome is consistent with the observations of Lascherink (1980), Landgarten (1981), and Cohen (1981)—that acutely psychotic clients reveal disintegration through their poignant artwork. On the day of the exhibition we discovered that most of the art had been destroyed by urine. Mr. Q. explained he had to spray them with "holy water." Art done during sessions now contained abstract phallic symbols. Mr. Q. became physically assaultive and sexually abusive to staff. He was transferred to the hospital back ward.

Once stabilized, Mr. Q. reentered the milieu program and resumed art therapy sessions. We discussed the issue of exhibiting art during individual art therapy. Six months later, he said he wanted to show his work to others, and was given permission to hang it in various rooms on the unit. Staff and clients admired his work, and he asked the art therapist to help him get an exhibit. Over the next 3 months, he discussed the process, feelings, and reality of having an art exhibit with his psychiatrist and during individual art therapy. The process took time because Mr. Q. fluctuated in his commitment; he was not always lucid. Eventually, all parties agreed to launch the exhibit, and it was held at a large public facility for state services.

The exhibit was announced only within the hospital and an invitation was sent to Mr. Q.'s family. On the day of the opening Mr. Q. appeared slightly nervous; supportive staff were available to take Mr. Q. back to the hospital or administer additional medication, if necessary. At the opening, his delusions changed from a religious figure to a far aus artist, and he introduced himself as Michelangelo. Mr. Q.'s mother and sister attended the opening. He approached his mother in a positive manner, and inquired about her health and the house. After the exhibit, she visited him almost every Sunday.

Not only was Mr. Q. able to remain at the exhibit without regressing to psychotic behavior, he was also able to accept positive feedback. Acknowledgment of his strengths allowed Mr. Q. to relate more appropriately to the staff. After the exhibit his behavior improved and his lucidity increased. He spent more time on his art, and he was given permission to use the art room during the evening. Gradually, hospital staff became interested in his work, and he sold some pieces to social workers and psychiatrists.

Following this period of marked improvement, Mr. Q. became more attached to the art therapist; he followed her as often as possible. His references to his mother and fantasy relationships with women increased, and his romantic transference to the art therapist intensified. Unfortunately, the art therapist announced her upcoming 3-week vacation. In response, Mr. Q. became increasingly more tense over the next few weeks, and finally, assaulted the art therapist. Again, he was hospitalized. After 4 months he returned to the milieu program where his attendance in art therapy sessions diminished, and he rarely created art at his leisure.

Three months later, Mr. Q. again began creating art and attending individual art therapy sessions. When he learned that the Pope was scheduled to visit Boston, Mr. Q. entered a phase of enormous struggle; he believed himself to be the Pope. He produced several artworks depicting his struggle.
In Figure 8, an Italian boat is lost in an Irish sea. As the struggle intensified, he was hospitalized for another violent episode. During this hospitalization, his regression was temporary but identity issues intensified and continued to provide the material for his artwork. Eventually, he again returned to the milieu program and art therapy treatment.

**Summary of Treatment**

The focus of work with Mr. Q. took two directions. To encourage Mr. Q. to nourish his creativity as a means of self-expression (Figures 9 and 10), the art therapist assured him that his art was an appropriate way to receive positive attention. The finished art product provided the means to build his sense of self-worth, self-confidence, and identity as an artist. As Mr. Q. began to view himself as an artist, his delusional thoughts of being a religious figure decreased.

The other direction of treatment regarded relationships. Mr. Q. continued to have difficulties behaving appropriately with people he liked. He did not know the difference between friend, lover, staff member, or therapist. Although relational issues were explored in his artwork, his behavior continued to require staff to place strict limits.

Mr. Q. had shown definite improvement during art therapy treatment. His increased ability to view himself as an artist rather than a delusional religious figure indicated increased self-esteem. He saw people appreciate, praise, and purchase his artwork. His psychological growth, however fragile, parallels the unfolding of his artistic talent. Eventually, he was able to work and more appropriately interact with others in the community.

**Exhibiting Client Artwork**

The issue of exhibiting client artwork is raised by Mr. Q.'s case. Exhibiting art is not appropriate for all clients. The risks of unknown reactions to something as personal as one’s artistic expression can be a major setback in treatment. Ethical issues of continuing the process toward an art exhibit after a major regression must be discussed with the primary therapist and treatment staff. Galleries must understand that an exhibit may be canceled if the client is unable to manage the experience, and hospital staff should be on hand should the opening be too stressful. The exhibit should not be widely publicized. Ethical questions arise in the labeling of the artist as mentally ill. Haase (1987) and Spaniol (1990) address the importance of protecting both the dignity and confidentiality of clients.

This raises the issue of public reaction. Is the art accepted because it is fascinating to explore the myth of the "crazy" artist? L. M. Q. a Van Gogh for our times? Is this recent resurgence of interest in exhibitions of client art a fad (Johnson, 1993)? Is it politically correct? Or is it an integral step in an art therapist's treatment plan?
Sass (1990) and Plokker (1965) have posited that the artistic styles of people with mental illnesses might be compared with trends and styles of modern art. But, as is evident in this case study, the art of the mentally ill can be considered valid in its own right. The Musee de l’Art Brut in Lausanne, Switzerland, opened its doors to the public in 1976 to display thousands of artwork by people with mental illnesses and artwork by so-called "outsiders." Inspired by Dubuffet (1976), this collection has become a landmark in the movement to allow the public to share in the intensity and originality of art by the mentally ill. This museum also allows artists to benefit from public interest without being stigmatized by their illnesses. Similar collections, small museums, and exhibits across Europe are increasingly gaining public appreciation (MacGregor, 1977). In the United States, ample room exists for progress in exhibiting, validating, and publicizing L’Art Brut—"The Art of Outsiders," or, simply, art by people with mental illness (MacGregor, 1989; Spaniol, 1990). The time has come for the art therapy community to consider integrating exhibition of artwork within the treatment plan. This can be an important expansion of the intrapsychic and interpersonal course of development, healing, and growth of clients.

Being Different: A Theoretical Perspective

Judy Weiser, R.Psych., A.T.R. Vancouver, British Columbia, Canada

"You're Jewish, aren't you?" asked the friendly secretary from the office next door. "Yes, at least culturally, though not very religiously," I replied, trying to explain that I definitely was Jewish, although I had not set foot into a synagogue to worship in the 20-plus years since I moved here. "Oh, good," she responded. "I need a Jewish minister to say grace at our interfaith banquet next month, and there aren't any Jewish churches here in town."

I told her that although I had not been in any of them, I was sure there were several synagogues in town. When I suggested she try the yellow pages, she said she had already looked: "That's how I knew there weren't any," she said smugly. I borrowed her telephone book and looked up "synagogues" and found a listing for five. I gently suggested that perhaps the spelling had proven difficult.

She complained that she had looked under "churches" ("where they all should be") and demanded to know why "Jewish churches" weren't in there among all the others.

When I tried to explain that churches were for Christians and that Jews were not Christians, at least not any more(), she said it made no sense, and seemed dismayed, pouted, "Why couldn't they put their list in with all the others rather than confusing people by keeping apart?" She, the friendly secretary from next door, who I truly like and who I am certain meant me no personal harm, had absolutely no idea what her words precipitated in me, based on my own childhood years of suffering and later adult anger in reaction to taunts, caution, fears, and, at times, physical pain based on living in Ku Klux Klan territory, where Jews were considered Blacks-with-white-faces, and treated just as horribly. She of prejudice-by-innocence, ignorance-by-default, and "attitude"-by-accident, had no idea how I had suddenly grown chilled inside and was quickly jolted back to early survival patterns of feeling that I had to be cautious and "on-guard" and other feelings that she, the nice Christian lady who really, honestly, means no harm to Jews, had un-
k...owingly caused to surface in me. She who was trying to be liberal in the first place.

Our actual conversation continued without any break. All the above happened in the microsecond it took for me to feel pushed to the outside edge of her boundary of what was usual, normal, and expected, regardless of her not intending this, while she never knew it had happened. This exclusion-through-dominant-group-marginalization often happens without the "do-er" knowing they have done anything at all. They think they are just having a conversation, but if you, the reader, are "different" in any way; (i.e., not part of the mainstream culture), you know exactly what I am talking about, and you know exactly how it feels.

Ordinary conversations, which can appear to one party to be a mutually shared communication (while the other party may be recoiling in horror), may sometimes result in just such consequences. For those of us who use verbal interactions as our means of helping others, it is crucial to understand what it means to be different in ways that we may not be sensitive to, as well as the kind of feelings that arise outside our awareness in response to our innocently delivered words. These reactive feelings are part of the therapeutic reality, whether or not we are aware of them.

Being "different" means simply that one is different from others, somehow. Sometimes both parties agree that actual difference is there and has differential meaning and thus consequence. Sometimes one person knows it and the other remains oblivious; and, even more difficult, sometimes significant difference is causing dissonance at unconscious levels without either party being aware that it is an activating part of a problem. Whether this difference automatically signals a "right-versus-wrong" bipolar forced choice, or whether this difference makes something better or worse, resides within each perceiver and his or her underlying values. These values are by no means universal or conscious.

But regardless, it is perception itself upon which reality is based. Reality is consensus of agreement about experiences and their meaning, shared understandings upon which further interactions occur. Basic existential theory teaches that as you perceive, you literally bring into existence that which you believe to be real. Differences you perceive will be those you notice and pay attention to (consciously or unconsciously), while those differences which do not make any difference to you will not be noticed, and thus are not accepted as existing in the first place. Very simply, those differences that don't matter, don't.

Differences which selectively make a difference can have a powerful impact on those forced to the margins of mainstream society (Hall, 1969, 1973; Henley, 1977; Mayo & Henley, 1981; Weitz, 1976). Many recent postmodernist theorists have addressed how the deconstruction of meaning from a stimulus event or person, or category of being, mandates consequences beyond mere behavior (Burgin, 1989; Carr-Harris, 1984; Watney, 1987).

Both postmodernist and phenomenological theory deal with how meaning is constructed into that which we think we are seeing "as it already is." We encounter something, and what we "get" is not just there on its own, rather, we contribute a great deal to the meaning which we think we are getting from that stimulus object or person; we actually "construct" its meaning. As we discover something new we try to make sense of it; we mentally take it apart, "deconstructing" it to see how it makes sense to us. This is a human trait embedded in all of us.

One particular application of these theories has appeared in numerous writings about the construction of gender, the meaning of what it is to be a woman or man, and expectations about what males or females can or should do. From the moment of birth, boys and girls are enucleated into roles that society defines as appropriate for them, based on their genital configuration. It only gets worse as they grow older. Several current feminist-based theorists discuss the construction of gender and sex-based roles (Benjamin, 1984; Frieze & Ramsey, 1976; Gilligan, 1982; Hare-Mustin & Marecek, 1988). They consider women and homosexuals from the contexts of power and family dynamics that have grown out of cultural, religious, and societal assumptions, which themselves may have evolved from basic fear or threat of that which is unfamiliar or uncommon. Being and acting are not the same thing. Holding beliefs and attitudes based on underlying values can mandate behaviors which may not be acceptable in mainstream society simply because they are uncommon ones rather than right or wrong ones.

We often notice differences and do not quite know how to evaluate it. If we have already preestablished framework within which to examine it for meaning and value, we use that framework. But if there is something new encountered with which we have no previous experience, human instinct warns us to be careful, to be suspicious, and to find out if this new thing is some sort of threat or danger. Anthropologists say this is a primal instinct for protection or survival. The same theorists also discuss how primal habits, such as urinating on others' territory or fighting to the death over mating rights, have evolved into more civilized and socialized habits which mask those earlier drives into more socially acceptable behaviors (Hall, 1969, 1973; Morris, 1967).

Those whose values are in the majority usually dominate the rules by which society is run; those who write the rules usually win the arguments. If something new or unexpected appears, it is always examined from the viewpoint of what already exists. What already exists serves as the current standard for evaluation. If it is different, and therefore thought to be a threat, it is usually ostracized, disempowered, excluded, deemed wrong/bad/immoral, or even worse.

An excellent example of this in North America is the routine murder by Christian explorers of those "two-spirited" native peoples whose identities did not fit with what they knew about how people "ought to be" (Tafoy, 1993; Williams, 1986). It is interesting to note that today some of those same cultures still include the possibility of seven separate genders instead of what most of us have been raised to believe. It is just that they have learned not to discuss this with outsiders who would not understand—for example, that "two-spirited" is not the same as the non-Native convenient label of "bisexual." Rather, it is something completely different, a lot more complex, and worthy of understanding for its own value (especially by those individuals who find themselves not quite fitting the current triumvirate of being either "gay," "straight," or "bisexual," as the only choices available).

Who one is inside (identify, self-concept) is also partially defined externally by social guidelines that assign values to that identity based on surrounding societal and cultural
norms. Whether or not we fit into these norms, our identity is also partially formed in response to these externalized attitudes. Some of the earliest writings about stigma (Goffman, 1963) suggest that people who are "invisibly different" may be able to "pass" without being known to be different. However, they nevertheless encounter stereotyping and prejudicial reactions much the same as those who are visibly different minorities, such as racially or physically challenged people.

Growing up Jewish in Texas was a quick lesson in being different, knowing I was definitely different, yet not necessarily looking or acting different from those around me. I had a privileged difference, one which could be kept invisible unless I trusted enough to let it out to those who I knew would judge me for myself, rather than preconceived prejudices. This "passing" made life easier in many ways, but left me baffled about consequent complications such as how I then should react when hearing others' anti-Semitic remarks.

Inner beliefs, values, attitudes, and assumptions form the definition of who we are inside. If these are different from those held by the surrounding society, the "norm," they are seen as not normal. But being different from the majority does not automatically equal abnormal, whether we are talking about homosexuals being hated by others or whether we are referring to those others being judged by their own victims via reverse stigmatization.

Being marginalized (pushed out of the mainstream) usually means also being disempowered from rightful participation in society. Becoming the "other" who has been sectioned off into a category of difference also forces a generalization syndrome whereby all in that category are reduced to stereotypes and simplistic reductionistic characterisation. In the case of racial minorities or physically challenged people, such differences are visible. But, for those who can pass if they choose (such as Texan Jews, especially my red-haired, blue-eyed cousin, who always confounded the Klan), there is a complicating factor of self-hate, which is internalized from outsiders, that can also result in shame and disgrace.

I have explained above my viewpoint that all facts exist only in cultural and situational contexts; all truth is relative to the reality filters used by each person perceiving it. This becomes significant when trying to figure out how it is that people do happen to voluntarily change their minds. It is even more relevant for those of us whose work occasionally involves trying to get them to do so, assuming we have the right to decide they should! The following example illustrates such a situation.

To this day, my father thinks that African Americans are a separate race halfway between humans and apes. No amount of logical reasoning, scientific fact-producing, or first-hand introductions to my Black friends, who obviously do not fit his stereotype, has managed to change his mind one bit, though he has learned not to express those views out loud when I am around. What do I do with him? Do I try to force him to change his mind, to overpower his will by greater force? As a psychotherapist, I do not believe in trying to force mind-changes. I learned long ago that this does not work. Instead, it only produces resistance equal to the force being externally inflicted.

Cognitive dissonance theory (Festinger, 1957) repositions personal change from behavioral to cognitive and value-based contexts. It suggests that in order to change internally, people must come to that change through natural process. This can happen by encountering internal, and usually initially unconscious, dissonance between two simultaneously held conflicting views. More often, it happens by encountering new behaviors which then produce new perceptions that alter inner beliefs and the deeply unconscious, nonverbal values which underlie them.

People often react to others who are significantly different by feeling threatened by something which is simply new and out of the ordinary to them. But this does not automatically mean that the person who appears to be different actually intends to signal any threat by their presence (Moustakas, 1972).

Phenomenological theory suggests that meaning is created within each perceiver in response to a sensory catalyst and that different people can have radically different interpretations of an identical stimulus. For example, the value of a photograph lies not in the visual "facts" inside its borders, but rather in what these mean in the mind of each viewer. Its value lies more in what it is a photograph of what it is a photograph of (Weiser, 1993). Similarly, what a word signals (for example: "suitcase," "AIDS," "bald," "dog," "menopause") is much more than its specific physical parameters. Regarding a phenomenological perspective about any kind of difference, including, and especially, homosexuality, it is not being and acting physically or culturally different that seems to be the issue, but rather what this difference means in the minds of both that person and those others encountering her or him.

From this it is simple to grasp that, objectively, being different does not automatically mean being wrong or being bad. Being different is not the issue, but rather how that difference affects others. Far too often we forget that the responsibility for our reactions lies in ourselves, not the person to whom we are reacting. There is a difference between significant and insignificant differences (i.e., differences that matter and those that do not). Therein lie the roots of stigma, phobia, prejudice, marginalization, and, ultimately, disempowerment and hatred. For example, does it matter to you that a "homophobe" does not appear as a legitimate word in the dictionary of Microsoft Word's spelling-checker? Should it? Why or why not?

It is sometimes easier and more acceptable for those in the mainstream of society to be liberal about demanding full human rights for those who are visibly handicapped or racially different from themselves. This is because their view of "those people" is from an outside, privileged, and "safe" perspective. Not coincidentally, this position is also one from which they can clearly be seen as not belonging to that group of marginalized/excluded "others" (outsiders) because they do not look like those people.

However, if there are "invisible" groups who are perceived as possibly threatening (Jews, gays, lesbians, Nazi sympathizers, Mennoites, non-Caucasian people who happen to look Caucasian, Northern Irish, whatever)—i.e., those people who are different in personally significant, yet invisible ways, then the mainstream may not be quite so strident in its willingness to publicly support these "others." Why? Simply because there is less clear distinction between themselves and those others, and, hence forbid, someone hearing about it might think the new supporter has just self-declared as being one of "those."
Weiser

Associating with those deemed less desirable, or supporting their rights as invisible minorities, can "taint" the helper-with-good-intentions. It can be an interesting shift for them to suddenly be perceived by their own dominant culture as being one of those outsiders they are trying to help. When the difference matters and they are suddenly shifted in perceived identity, liberal intentions are quickly tested for their strength.

If we are suddenly perceived to be a part of the very group we have been trying to help from the outside, things can become much different from the inside looking back out. For gay men and lesbians, for example, this is another type of homophobia, albeit of the liberal kind ("I think they are okay, but I don't want to be perceived as one; it's fine to be that way, but, oh god, don't let my kid turn out that way"). It is a different situation to be tolerant when people of your own kind suddenly move you into the "invisible outsider" group, thinking that you must be one and it just does not show, that you just must be covering it up by "passing."

It is extremely important for all therapists, of any sexual orientation and any culture, to work from operational perspectives based on understanding of complexities such as those mentioned above. It is particularly interesting to add these concepts to our already-complicated travels through issues of transference and countertransference, particularly when it is the therapist who is part of the minority group.

At some time all of us will be involved in multicultural therapy situations. Therefore, it becomes imperative to have a basic grounding in humanistic, phenomenological, and existential theories which regard the perception of difference from a model of perception-based construction of reality (Moustakas, 1992). Similarly, it is equally essential to have a thorough grasp of the basic concepts of systems/cybernetics theory. Particularly important are those components of it which provide a framework for difference and difference to be regarded as enriching and empowering rather than threatening or destructive, and thus necessary to the healthy balance of human interaction (Bowen, 1966, 1972; Jackson, 1957; McGoldrick, Anderson, & Walsh, 1989; Weiser, 1990).

A better understanding of these concepts can help us become more sensitive to nuances which previously might have passed unnoticed and to become more tolerant of other colleagues and clients who are different from ourselves. I think the therapeutic goal is not necessarily one of changing the inner beliefs of people, but rather to arrive at a position from which they can permit others to be different without that difference automatically signaling threat. I do not think any of us would take away others' rights to hold personal beliefs, that is itself unethical. Rather, this paper attempts to re-position personal opinion, and even personal prejudice, into a state of having-a-right-to-exist-inside-a-person (if for some reason necessary) but clearly acknowledged as being just one of many alternate attitudes possible—and definitely disempowered from any right to inflict pain and injustice on others who may not share that belief.

I want to close by way of a personal anecdote which I think encompasses all the above into a real-life situation that can be reconsidered from the conceptual framework just described.

Two years ago I joined a local community choir with a friend of mine. He and I had sung Christmas carols together for several years, and I really enjoyed how I felt after an evening of singing. So when he said he’d decided to join this choir, and that I was welcome to join with him (the choir took anyone interested who was willing to be a part of their group), I gladly agreed, knowing we would have fun. Perhaps I should clarify here that it is the Vancouver Lesbian and Gay Choir we joined. That did not matter to me, most of my friends are gay and lesbian (it just evolved that way, much the same as you have friends whose hobby or work interests parallel your own). I went with him to the first rehearsal and had a great time.

Now, I have been careful thus far in this paper to not give readers any clues about my sexual orientation (a lot of people live this way all the time). Obviously with the first name of Judy, I am female, but was I always? Yes. I am happily married, but have I said yet to which a partner of which gender? I have a husband, so “of course” I am not lesbian (or am I? Is this a marriage of convenience?). If I tell you I am not lesbian, is it then a simple, “Well then, she is straight (heterosexual)”? But what if I am “bi” (bisexual), or “two-spirited”? By this point do readers care about what I am in my private life? Is it all relevant to authoring this paper? To doing art therapy? Does the sexual orientation of the professional matter to their nonbed life? This is one of those yes-and-no kinds of answers.

But, back to me. For the record, I am straight (or, as my friends prefer to label me, “slightly bent”). I do not often go out harner-waving or shouting forceful demands, but neither will I silently witness injustices without making public statement when I encounter something I believe to be wrong. I will not hide, though I may not flaunt; and thus, we return to me and my choir. I joined the Vancouver Lesbian and Gay Choir because I wanted to sing and because my friend Terry, who is gay, wanted to, and because we wanted to sing together. I joined this group whose motto is “For people who like to sing; gay, lesbian, and straight friends or relatives thereof who are gay-supportive.” This seemed fine to me. I saw no reason to need to label my sexual identity in order to prove I could sing well. Since there was no question on the membership application asking who I had sex with, I saw no reason to offer comments that were unnecessary. I was there; I wanted to sing; obviously, I was gay-supportive. So, I sang, and it gave me great enjoyment.

During the first few months I realized that although who I “really” was did not need to be kept a big secret, neither was it relevant to what we were doing. I was a bit concerned that those who found out my secret heterosexuality might pre-judge me as an outsider who could never really truly fit in and belong, and so I thought it best not to mention it unless asked directly. (I will not lie.) I was asked out by a couple of the women, who I turned down because I was “married”; but since this is a term also used among the group for commitment of two same-sex partners, this gave nothing away. I occasionally went out socially with the group, and went on retreats where the dorm housing was quite rowdy and playful. During all of this, I was just myself, me, my own way of being, without hiding or faking, but just being me, at ease with the jokes and banter. This was not new to me and my medium-radical feminist values.

As our first concert approached and formal evaluations drew near, I checked the constitution to make sure I was still
legally "okay" for membership. Reassured, I auditioned. I passed. Then, I asked the director if it was true that straight people were welcome. He nodded agreement and asked me, "Why? Do you know of any who want to join? They're quite welcome, you know!" I giggled and waved a "hello" to him. His reaction was one of total shock, "But you can't be—you don't look it and certainly don't act it!" followed immediately by, "Oh my god. Look what I've just said—generalized just like those people who stereotype us. Sorry . . . ."

I asked him to keep it a secret, to let me stay in the closet until my identity became known naturally. Slowly, as one event or another came to pass, my "passing" came out. I was not "outed" (which would not have mattered, except, it might have). I simply was a person who was slightly different from the others and I noticed that, yes, I had been watching my gender pronouns, neutering them or turning them plural. I was being careful to not give things away unless I was certain the person would not think I had some other agenda for being in the choir.

For me, all this was rather lighthearted, and there would have been no terrible consequence had I been discovered and "outed" at the very first rehearsal. It would have either mattered or not. I could have easily gone on with my life without this choir had they decided there was something perverse about me. But, there is no way I ever would have wanted to have to live all my life with these safeguards and protections and worries and "what ifs."

There is absolutely no way I would ever want to be part of a society that makes anyone who is different, in whatever way, have to live their lives under those unnatural conditions. I support homosexuals not because I am a "wanna-be." (in this case, if I wanted to be, I easily could be!) but because I cannot conceive of living a life where they, or any other people, do not have an equal right to exist even while being different from my way.

Standing by in silence while injustices are done to others not like me is not part of my reality. As systems theory so clearly explains, an advanced system or society is one where difference and differences are seen as enriching and adding complexity rather than threatening or to be denied.

An old Doonesbury cartoon shows an African American man telling a gay Caucasian colleague that he is not sure he can continue working with him because he heard the colleague is gay. The colleague replies, "Yeah, and I hear you're black." When the man responds, "Yeah, but that's different," the colleague reminds him, "Yeah, but it didn't used to be. . . ."

Writing this paper as both a woman and a Jew, both of which seem to be acceptable because you are still reading this, I want to close by reminding you that these may be okay today, but they sure didn't used to be! Let us consider a future where other invisibly different people face such previous prejudices equally outdated.

Understanding Race, Ethnicity, & Power: The Key to Efficacy in Clinical Practice.

Reviewed by Martha P. Haeseler, MA, A.T.R., Guilford, CT

While the recent focus on cultural and racial diversity in our profession has been sorely needed and useful, no one has asked us to take a look at ourselves as thoroughly as does Elaine Pinderhughes, an African-American professor of Social Work. She not only raises our awareness about cultural diversity and teaches us new ways of working with clients who are different from ourselves, she also asks us to take a hard look at issues such as racism in the United States and power in the therapy relationship.

Although many therapists try to be sensitive to whatever biases they may unwittingly bring to the therapeutic relationship, issues such as racism and the dynamics of power are frequently overlooked or addressed only with pain and a sense of disorientation. When the author reminds us that these issues inevitably touch all our lives, however privileged, well-meaning, diversified, or monocultural, scales fall from our eyes.

She points out that differences between people frequently give rise to feelings of anxiety, fear, and discomfort. She attributes the origin of these feelings to the earliest experiences between mother and infant, to the narcissistic injury that occurs when the infant experiences self as imperfectly mirrored by mother, and comes to the painful realization that self is separate (different) from mother. The remnants of infantile narcissism in all of us might lead to fear of difference or fear of sameness, as a defense against the wish to merge. Typical defenses against such fears and discomfort include distancing via cultural or racial stereotyping, projecting onto the other the powerlessness and rage we feel, and denial of differences.

For us to become more aware of our fears, biases, and projections, Pinderhughes asks us to look at our experiences with differences. How did our families and culture teach us to view differences between people? Which of these teachings fit with our current experiences and conceptions of ourselves? What typical defenses do we erect to ease the discomfort produced by differences?

To help clients explore feelings about ethnic and racial identity, she asks us to look at and sort out our own possibly conflicted feelings towards the values and customs of the culture(s) which shaped us and within which we now live. As we become more comfortable with our cultural identities we can help clients become more comfortable with theirs. If we acknowledge racism, we can better understand the projections and assumptions we and our clients make.

To fully empower our clients, she asks us to acknowledge our own feelings of pain and powerlessness, understand our own power needs and responses, and become aware of the dynamics of power in the clinical process. We can then help clients focus on strengths and successes without feeling our power is threatened.

This book is full of wisdom. Here are a few points worth emphasizing:

1. "Cultural differences are not deviances" [sic] (p. 17). People from minority cultures demonstrate enormous strength in negotiating two sometimes opposing cultures.

2. Symptomatic behavior may be adaptive to a disadvantaged client. For example, a client’s manipulative or aggressive behavior may be seen not as a personality disorder but as a strength developed to use an oppressive system to advantage. Such strength should be acknowledged while therapists teach clients to empower themselves in proactive, rather than reactive ways.

3. Be careful not to attribute all symptomatic behaviors to cultural problems. Developmental problems and psychodynamic conflict must also be taken into consideration.

4. While finding commonalities in cultures, beware of stereotyping or making assumptions. Each individual’s adaptation to culture, race, and ethnicity is unique.

Pinderhughes has conducted workshops and ongoing groups in schools and health-care facilities to promote awareness of these issues. The book is enriched by quotes from participants. In an appendix on the author’s teaching methods, she stresses that her approach is educational: "... the goal centers on growth in terms of self-understanding and development of attitudes and ways of thinking that will enhance functioning as a service-provider" (p. 235).

In reading this book, I found myself reacting to some generalizations made about white middle-class Anglo-American culture (my cultural background). For example, Pinderhughes contrasts “American values [which] emphasize competition, winning, and being number one” (p. 22), with “autonomy and independence” (pp. 160–161), with values of “pre-American cultures, [such as] ... affiliativeness, collectivity in relationships, and interdependence” (p. 160). I ask, “Whose America is she referring to?” Recent literature has suggested that there are differences in psychological development between men and women. Men’s development is characterized by competitiveness, separateness, and independence, while women’s is characterized by relationships and connection (Gilligan, 1982; Belenky, Clinchy, Goldberger & Tarule, 1986). As a white middle-class American woman, I felt that Pinderhughes’ generalizations did not relate to me. I then realized that Pinderhughes would probably ask me to ponder my identity as a woman in a society which displays...
values different from my own, and another scale fell from my eyes.

Creative Art in Groupwork

Reviewed by Erika Cleveland, MA, A.T.R., LMHC, Boston, MA

In the United States, managed care has resulted in shorter and shorter time periods for patient treatment. Thus, the arrival from the United Kingdom of Jean Campbell's Creative Art in Groupwork is a refreshing addition to the art therapists' armament of short-term work.

The book is divided into four parts: two brief introductory areas covering background and theory, an extended activities section, and a short conclusion that includes lists of art materials and resources. While the book is aimed at beginners and more experienced clinicians, additional background information would have provided a more meaningful text for those with limited art therapy experience. For example, although references are made to theorists such as D. W. Winnicott and Herbert Read in a section entitled Art as Therapy, no mention is made of any art therapists. I would have liked to have read about pioneers such as Edith Kramer or contemporaries such as Judith Rubin, particularly since the book is aimed, as it appears to be, at a broad audience that includes art educators, social workers, and all those in the field of health care. This book may be their only exposure to the field of art therapy.

Campbell presents her background material in a positive tone, clearly grounded in a belief in the importance of creativity and expression for encouraging therapeutic progress in clients. Examples come from her experiences with an African American senior citizen's group and a fertility support group. She makes a distinction between art as therapy and art as healing and touches very briefly on some clinical issues in groups such as transference, boundaries (physical and emotional), and confidentiality. Care in selecting a group leader is also mentioned as a concern, and she emphasizes the importance of clinical training, stating, "This is definitely one of those careers where you can never learn too much" (p. 23).

The handbook style of the book offers 142 art activities for use with a wide variety of populations. Campbell acknowledges that there are drawbacks to structured art tasks. She prefers her description of prestructured group work with the comment, "It can limit the creative life of the group... the needs of the individual may get lost... (and it)... can limit the development of the group leader's skills" (p. 27). However, I would have appreciated more discussion about the necessity for preplanned art activity groups with particular populations and settings. As Mermin (1993) states, there is clearly a need for a more structured approach within short-term hospital stays which demand that "We must prevent regression, avoid uncovering repressed material, and raise no issues that cannot be dealt with in a two week or less hospitalization" (p. 35).

The core of this book is the activities section in which group art activities are 'warm ups', 'core exercises', 'linkage' (for various ways in which art activities can be combined with other modalities), 'discussion and feedback,' and 'closure and endings.' Core exercises are further differentiated into general themes, relating and relationships, celebration and ritual, professional and experiential learning, and focus on issues.

Each activity is presented on a separate page with specific parameters such as recommended age group, time, and group size clearly spelled out. The activity is described and warnings are given about emotionally provocative themes. Ideas for further development including follow-up activities or ways in which the material can be enriched by expanded discussion are also suggested. Most of the ideas presented here will be familiar, in some form, to art therapists who have worked in the field for a longer period of time. However, because the material is presented in a clear, organized way it can provoke thought about how these ideas can be implemented.

Activities are presented for use with a wide range of populations with more extended focus on particular areas. Work with couples, families, and senior citizens are given a special focus, with specific issues devoted to these populations. Gender and sexuality and racial issues are also explored in a series of exercises that could theoretically be presented as a sequence in a short-term workshop. Alternative approaches to each task are thought-provoking and the relevance to particular populations is outlined. A section on "professional and experiential learning" could be used with a variety of professional populations to promote reflection and learning about aspects of career and personal development. For a "well" population, a series on "celebration and ritual" provides exercises to promote self-reflection and enjoyment.

There are not many books about art therapy that present such simple, direct, and easily applicable ideas for use with groups. Among those that do suggest specific ideas for groups, as part of a larger context, are Robbins and Sibley (1976), Paraskeas (1979), and Landgarten (1981). Rubin (1984), advocates a more open-ended approach while recognizing the need, at times, for structured activities. In comparison with books that offer more lengthy rationales for use with particular populations or theoretical background, Campbell offers limited theory and rationale. Her book is most useful as a stimulus to generate ideas for approaches to groups.

With this in mind, Creative Art in Groupwork can clearly be helpful to art therapists who use it as a springboard for developing their own approaches to groups. It may be particularly relevant to those who work in short-term settings and those who offer training and workshops to "well" populations.

Video Review Response

A response by Karen L. Wakeley, MPS, to James Consoli’s review of The Box. Reviewed in Art Therapy: Journal of the American Art Therapy Association, Volume 11, Number 1

"I say," mumbled Horton. "I've never heard of a small speck of dust that is able to yell. So you know what I think? . . .
Why, I think that there must be someone on top of that small speck of dust!"

(Dr. Seuss, 1954)

I ask from The Box, in the voice of Who, "Hey, Horton! How's this? [Are our images] coming through?"

In the last paragraph of his review of The Box, Consoli compares the video to Dr. Seuss’ film Horton Hears a Who (1970), asking if,

... in contrast to The Box, does the completeness of Horton put the viewer too much at ease? Does the incompleteness and abstract quality of The Box succeed in encouraging viewers to become active, get up from their recliners (or boxes), and find sense in The Box? (pp. 60)

While Horton Hears a Who is an excellent metaphoric story with great potential for therapeutic use, The Box is markedly different in that it is devoid of any verbal utterances. The creation of dialogue, internal dialogue, and verbal narrative reference is left to the viewer’s projection. He may project his own scenario or associate it with an actual situation or memory. He can alter the story to fit his conscious and unconscious needs. Even those who do not consciously imagine dialogue fill in the sensory information they need to be able to relate to the story by identifying or denying identification.

The characters’ actions and facial expressions reveal loneliness, anger, fear, curiosity, and anticipation without verbal explanation or labeling, thus allowing and encouraging identification on a preverbal, gut level. The verbal fairy tale uses distancing through character formation and setting, and includes conflict and an outcome. The visual story of The Box also contains these elements but during processing, the facilitator and client(s) may work with conflicts on a metaphorical level, or bring the story closer through conscious identification. The vagueness of the story line enhances opportunities for identification. While conflict is presented and explored, it is left to the viewer to accept it at face value or to further define it. Even taken at face value, the viewer makes the situation his own by providing the narrative to accompany it.

Who Does The Box Serve?

Anyone with the capacity to watch and respond to a short video story can benefit from The Box. People who have intrapsychic or interpersonal difficulties and can identify with the character can be guided to explore their situations through The Box. Although children as young as 5 years can use this tool to learn to name and describe feelings, we recommend a mental age of at least 8 years for in-depth use.

The Box is well-suited for work with substance abusers. Its short segments, flexibility, distancing properties, and capacity to provoke interaction make it appropriate for use in short-term treatment centers. Two of its four seasonal segments suggest "gaining control" and "breaking out of ruts."

Psychiatric treatment centers can find many uses for The Box. The video has short segments and varied follow-up activities which allow it to be continually used as the client population rapidly turns over. Groups can be completed in under one hour. Further exploration of one segment may be contained with different follow-up activities to intrigue both new members and provide continuity to clients who attended the previous group. In long-term settings, issues may be explored in depth, with the distancing factors altered to fit the treatment situation.

Children and adolescents in well-health groups can use The Box to explore feelings, actions, reactions, and changes in their lives. Children and adults, including those who are withdrawn or resistant to treatment, respond to the visual images in The Box. This makes the video an ideal tool for exploring feelings and situations for those who are medically ailing or experiencing emotional difficulties. The video is a tool to help people identify and share feelings and situations, work creatively alone and with others to solve problems, and become aware of ways in which they can gain control of difficult aspects of their lives.

Students in the helping professions may use The Box both as an instrument for learning to adapt a therapeutic tool for various populations, and as a tool for enhancing self-awareness and sensitivity. The video can be a tool for corporate sensitivity training programs, to encourage employees to be more empathic, self-aware, and improve their abilities to work with others.

By including archetypal symbols and eliminating verbal narrative, The Box can reach a greater audience, including persons who are deaf or speak languages other than English. This therapeutic tool is used primarily with groups, but it is also used with individuals.

What Qualifications Are Necessary for Group Facilitators?

Leadership is a pivotal factor in determining the benefits a group can derive from the use of The Box. Group facilitators should be creative therapists, psychologists, social workers, or
other professionals with strong backgrounds in psychology and human development. A skilled teacher can use The Box as long as a psychologist is available for consultation, if needed. The facilitators should have good group leadership skills. They must be active listeners of word, body language, and picture, and be accepting of all responses. They must not pressure or seek a desired response but be able to judge when a client needs more distance or more in-depth follow-up work. It is essential that the leader be able to facilitate discussion of any material that may come up for the student or client, since The Box may reach people on a deep unconscious level as well as on a superficial level. It may bring up material that is both repressed and frightening.

Introduction: How Can the Facilitator Frame The Box for a Group?

Consoli states that "glaringly missing is how a group facilitator can frame an introduction to this film" (p. 69). Although some guidelines are given within the text of the User’s Manual, we agree with the need for conspicuous guide to introducing the video, and have added one to the manual. It can be summarized as follows:

You are about to see a short story about a girl and a box. Everyone has different reactions to this film and there are no right or wrong impressions. As you watch, pick one or two feelings, images, or ideas that have meaning for you and we will discuss them after we see the film.

Short, introductory videotapes showing The Box in use with children, adolescents, and adults are available for free 10-day viewings.

Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy* uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

**Manuscript Categories**

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.

2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.

3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.

4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

5. **Film, Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

6. **Comments.** Brief comments on articles published in *Art Therapy*, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each manuscript to Cathy A. Malchiodi, A.T.R., Editor, *Art Therapy: Journal of the American Art Therapy Association*, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.

2. Only original articles that are not under consideration by another periodical or publisher are acceptable.

3. Manuscripts must be typewritten on 8½" x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.

5. An abstract of 75-125 words must be included with full-length articles and brief reports.

6. Please avoid footnotes wherever possible.

7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.

8. Use tables sparingly and type them on separate pages. Refer to the APA *Publication Manual* for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.

9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Photographs of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs, captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.

10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the **author’s responsibility to secure such permissions**; a copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.

11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.

12. It is expected that any manuscript accepted for publication in *Art Therapy* will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

**Note:** Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
THE AMERICAN ART THERAPY ASSOCIATION INC.

25th ANNIVERSARY CONFERENCE
REFLECTING ON THE PAST, ENVISIONING THE FUTURE

NOVEMBER 16-20, 1994
THE PALMER HOUSE
CHICAGO, ILLINOIS

This year's conference will feature:

- Day-long pre-conference courses
- Keynote speaker ELLEN DISSANAYAKE, author of *Homo aestheticus* and *What is Art For?*
- Experiential workshops, oral presentations, and networking forums
- General sessions on ethics and highlights from the history of the Association
- Public exhibit of artwork by area art therapists and other special events

AATA members will receive additional information and full registration packages by mail. Other interested parties should contact:

AATA, Inc.
1202 Allanson Rd.
Mundelein, IL 60060
708-949-6064
Fax: 708-566-4580

The next AATA Conference will be held November 8-12, 1995 in San Diego. Contact AATA or see the Fall Newsletter for information regarding the submission of proposals.
Horovitz-Darby, Ellen G.—SPIRITUAL ART THERAPY: An Alternate Path. '94, 206 pp. (7 x 10), 33 il.

In Spiritual Art Therapy: An Alternate Path, the author proposes that, on one level or another, each person is a seeker of spiritual transcendence although most hide this need even from themselves. She perceives this search to be a critical element in attempts to cope with life's traumas, specifically loss and grief, when people face the emotional work of accepting the inevitable. In this book, therapists are urged to take into account the existence of spiritual aspects of personality, both in terms of making proper assessments and more focused treatment plans for the people under their care. Although addressing itself chiefly to art therapists, the thrust of the opus is an attempt to sensitize all clinical practitioners to the spiritual dimensions of art therapy. By drawing on sources in the literature of religion, psychodynamics, systems theory, sociology, art and ethics, the author lays a foundation for her mission, namely, to find a way of discovering and, if possible, measuring clients' spiritual sensibilities and search for personal meaning of their relationship to God. In addition to art therapists, it will be useful to mental health workers, social workers, educational therapists, pastoral counselors, psychologists, psychiatrists, and other creative arts therapists.

Call for Papers

Art Therapy is seeking submissions for the following special issue:

Gender Issues in Art Therapy

Art Therapy is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to gender issues in the theory and practice of art therapy. Submissions may focus on any topic or population related to this theme; of particular interest are: the effect of gender on clinical practice, professionalism, ethics and/or training, feminist theory and its relationship to art therapy, and gay and lesbian issues in clinical practice.

Deadline for submission for “Gender Issues and Art Therapy” is December 1, 1994.
Please see “Guidelines for Authors” in the Journal for specific requirements in terms of style and format. Please send five copies of all submissions to:

Cathy A. Malchiodi, A.T.R., Editor
Art Therapy, c/o AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060

Errata:

On pages 157 and 158 of Volume 11, Number 2, Judy Weiser's name and reference to her work are incorrect. The corrected reference should read:
PhotoTherapy techniques: Exploring the secrets of personal snapshots and family albums. San Francisco, CA: Jossey-Bass, Inc. We apologize for this error.

May 5, 6, & 7

Attention Art Therapists, Creative Art Therapists, Mental Health Professionals, Allied Professionals and Educators: CALLING ALL PAPERS, PRESENTATIONS, PANELS, WORKSHOPS

Please submit an abstract of three hundred words, double spaced and typed.

Mail three copies to:

Lin Carte-Anderson M. Ed., A.T.R.
123 E. Tarpon Avenue
Tarpon Springs, Florida, 34689

Due: October 10, 1994

Qualifying Materials needed from each presenter:
Resume, course synopsis, bibliography, goals/objectives, and means of evaluating participation;
CEUs for psychologists, medical professionals, social workers and mental health counselors are being arranged.
Magnolia Street Publishers

Integrative Approaches to
FAMILY ART THERAPY

By Shirley Riley, MFCC, A.T.R.
with observations by Cathy A. Malchiodi, MA, A.T.R.

This important new book by noted family art therapist Shirley Riley is designed for both the beginning practitioner as well as the advanced family therapist. An important source of ideas, this text provides not only examples of integrative approaches to family art therapy, but also offers practical ways to utilize art therapy with individuals, families, and couples. The volume emphasizes the integration of current thinking in family therapy and the application of art therapy in family treatment. Chapters cover a wide range of theoretical viewpoints, including structural, systemic, narrative, family of origin and social constructionism. Riley brings these theories to life through case examples as well as commentaries on contemporary socio-economic and cultural aspects of family art therapy in the '90s.

This will be an invaluable resource in both art therapy and family therapy courses. Suggestions for utilizing the material in the classroom as well as in clinical settings are included, making this book a practical guide for students, educators and therapists.

available in November — pa. $29.95

A creative and timely collection of essays and exercises by more than 30 California art therapists. pa. $29.95

One of the most widely read textbooks by a pioneer in the field. Now updated and back in print. pa. $19.95

A unique treatment model for sexual trauma victims incorporating art therapy, testing, imagery and hypnosis. pa. $36.00

STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development, and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois, U.S.A. 60060. Telephone (708) 949-6064; FAX (708) 566-4580. Non-members may subscribe at the following annual rates: $40 (U.S.) and $64 (Foreign); Institutions: $57 (U.S.) and $80 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060 (708) 949-6064.

This journal is abstracted in: Psychological Abstracts, Innovations & Research, Art Bibliographies: Current Titles and Bibliographies: Modern.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

Introduction to Special Issue on Ethics and Professional Issues: ProfessionalCourtesy

Cathy A. Malchiodi, MA, A.T.R., LAT, LPCC, Editor

This issue of Art Therapy features several articles focusing on the broad topic of ethics and professional practice. Contributions include a review of the role of the art therapist as expert witness in child sexual abuse litigation (Cohen-Liebman); an exploration of the impact of language in art therapy (Spaniol & Cattaneo); information on art materials that every art therapist should know (Jacobs & Milton); legal and ethical issues impacting unlicensed art therapists (Webster); and several viewpoints including two on politics and professional issues (Spring, Junge), legal issues in private practice (Wirtz), and photography and confidentiality (Jacobs).

As editor of this journal one ethical issue that has intrigued me is the concept of professional courtesy. Professional courtesy is the respect extended to colleagues, peers, teachers, and supervisors when utilizing their original work in one's written publication or oral presentation. In publications, it may be in the form of citing the work of another in a reference list or it may be as simple as making an acknowledgement in a footnote of a person's contribution to the development of the work.

A very common instance where professional courtesy is extended is in the preface to a master's thesis or doctoral dissertation. It is a tradition for the author to note the people who contributed to development of the work, particularly teachers, supervisors, committee chairs and members, and mentors. This is a formal and effective way of acknowledging the information conveyed throughout the student's program of study as well as the time teachers, committee members, and others have put into the student's learning experience. In oral theses or dissertation presentations, the acknowledgement may be less formal, with the speaker briefly noting any individuals who inspired, provided professional communications, or helped to develop the ideas presented in the talk.

Unfortunately, lack of professional courtesy in publications and presentations in our field is a fairly common occurrence. Earlier this year I was stunned to see my exact words and original ideas from a graduate class I had taught at the local university in print in a magazine and credited to a former student, but with no reference to me included as the source for these concepts. It gave me pause to think how often I have heard art therapy educators observe that former students or supervisees used the original materials they have so carefully provided them in the classroom without acknowledging them as the source for these ideas. I think part of the reason for this is that students see their professors with consumers' eyes; they may believe what they receive in the classroom is something that they have purchased through tuition, and therefore becomes theirs to utilize in any manner. They are often naive in their understanding of what their mentors have put into their lectures, experientials, and course outlines in terms of time and research. Therefore, they may assume that they do not need to give reference to original material that is conveyed to them in an educational or supervisory setting. In the same vein, they may also usurp the ideas of fellow students, neglecting to acknowledge them as the source of inspiration, collegial advice, or communication.

Educators and supervisors also need to be wary of their inappropriate use of student work accomplished under their tutelage. It is not news that professors have used graduate students' work as their own in both publications and professional presentations. Therefore, the same courtesy must be considered when including the work of students within a paper or other scholarly presentation.

Professionals in our field are often guilty of not giving appropriate credit to others. Many papers are submitted to the journal with inadequate references to the original ideas developed by other art therapists. Some of this is due to lack of library research on the topic of the paper and certainly, the author has the choice to reference or not reference another author within the development of his/her topic. However, when ideas are presented that approximate the original work of another individual, then credit in some form must be given, either in the reference list (when cited within the text of the article or presentation) or in an acknowledgement (when a mentor, teacher, supervisor, or colleague has significantly contributed to paper/talk or advised the author/presenter).

As this journal goes to press the Ethics Committee of the American Art Therapy Association has developed a revised Code of Ethics for art therapists, to be presented at a general session of the 25th Annual Conference. Related to the topic of professional courtesy with regard to publications and other printed materials, "Responsibility to the Profession," Section 7, states:

7.2 Art therapists shall attribute publication credit to those who have contributed to a publication in proportion to their contributions and in accordance with customary professional publication practices.
7.3 Art therapists who author books or other materials which are published or distributed shall appropriately cite persons to whom credit for original ideas is due. (AATA, 1994)

Others in the field of art therapy have examined this issue as well. In the document, *The Diagnostic Drawing Series Style Guide*, Mills (1994) suggests the following courtesy concerning citation of work derived from the DDS:

When presenting work which derives from the DDS Archive, it is good form to acknowledge by name (verbally if presenting; in a footnote or author's note if publishing) the contributions of those who assisted by collecting the Series or by helping you on site. Extensive consultation with others about your work should also be acknowledged in this manner.

Professional courtesy in the field of art therapy is a subject that should be discussed with our students in their graduate training and with interns we supervise. It is also a practice that professionals should be cognizant of in their own writing and conference presentations. Aside from the obvious ethical aspects of the professional courtesy, there is an added benefit involving respect and affirmation of others' work. These are concepts that support art therapists in continuing to share their work either through publication or presentation, and affirm the value of one's original contributions to the field.

**Editor's note:** In the spirit of professional courtesy, I would like to thank Cay Drachnik, A.T.R., HLM, for her communication on the revised *Code of Ethics*: Anne Mills, A.T.R., for sharing *The DDS Style Guide* and her cogent thoughts on authorship; and Jeanne Carriagan, A.T.R., for many stimulating conversations on ethics in general, that contributed to the formulation of this editorial.

**Art Therapy**

is seeking submissions for the following special issues:

1. **Gender Issues in Art Therapy**

*Art Therapy* is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to gender issues in the theory and practice of art therapy. Submissions may focus on any topic or population related to this theme. Of particular interest are: the effect of gender on clinical practice, professionalism, ethics, and/or training, feminist theory and its relationship to art therapy; and gay and lesbian issues in clinical practice.

2. **Art Therapy & Addictions**

*Art Therapy* is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to the use of art therapy in the treatment of addictions. Submissions may focus on any aspect of art therapy or population related to this theme; of particular interest are specific applications of art therapy to clients with addictions, research in the area of art therapy and addictions, and issues in clinical practice with clients with addictions.

3. **Art Therapy in the Schools**

*Art Therapy* is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to the use of art therapy within schools. Submissions may focus on any aspect of art therapy or population related to this theme; of particular interest are specific applications of art therapy to clients/students in school settings, research, ethical and professional issues, and issues in providing art therapy services within an educational milieu.

**Deadline for submissions for “Gender Issues in Art Therapy”, “Art Therapy & Addictions” and “Art Therapy in the Schools” is March 15th, 1995.** Please see “Guidelines for Authors” in the Journal for specific requirements in terms of style and format; submissions which do not follow these requirements will be returned without review. Please send five (5) copies of all submissions to:

Letters to the Editor

Protecting the Integrity of Art Therapy

Since its formation in 1971, the American Art Therapy Association, Inc. (AATA) has moved steadily toward its goal of achieving consistently high standards in the mental health profession. This has been accomplished through the adoption of standards for the practice of art therapy, implementation of a registration process to signify attainment of high professional status, and continual education and information sharing among members. Moreover, with our firm's assistance as legal counsel, AATA has adopted a code of ethics and a grievance procedure to enforce those ethical precepts available to both members and their patients.

Despite the enormous growth in the art therapy profession and widespread use of art therapy, not all mental health professionals who incorporate the discipline of art therapy into their practice are knowledgeable about the standards adopted by AATA. As AATA's legal counsel, we have encountered an increasing number of general mental health professionals who incorporate art therapy into their practice. Many of these individuals refer to themselves in their letterhead, business cards, and other materials as "art therapists." A significant number of these mental health professionals are believed to have very minimal art therapy background, perhaps as little as having completed a one- or two-day seminar focusing on art therapy. The growing use of the term art therapy among general mental health professionals has created some confusion among AATA members and the general public as to precisely who is entitled to hold himself or herself out as an "art therapist."

For several years, AATA had the exclusive right to enable qualified art therapists to hold themselves out as being a Registered Art Therapist and to use the designation A.T.R. in connection with their professional practice, thereby signifying that they meet the high standards established by AATA. That registration process is now the responsibility of AATA's sister organization, the Art Therapy Credentials Board, Inc. As counsel, we actively assisted AATA in protecting the integrity of the A.T.R. title and of the term Registered Art Therapist when others have attempted to use or confer those designations without authority. We have even obtained judicial enforcement of AATA's rights when challenged.

The right to control the use of the terms A.T.R. and Registered Art Therapist is not, however, to be confused with the ability to regulate use of the broader terms art therapy and art therapist in conjunction with the general practice of therapy. Simply stated, AATA has no right to regulate or impose conditions on the use of those general terms, and very few states regulate the use of those terms. The practice, the use of art therapy by a generalist is a matter of competency to be determined by patient and therapist. Regarding professional credentials, holding oneself out as an art therapist may approach the level of misrepresentation, but absent state regulation, it is also a matter between patient and therapist.

The question here is what may AATA do directly and through its members to address the need for clarity and to maintain high professional standards in this area. As an association, AATA has contacted nonmember therapists identified as using the term art therapist and/or art therapy to inform them of AATA's organizational concerns about art therapy as a discipline, as well as to introduce AATA to them and encourage membership. By promoting AATA membership and participation in professional conferences and programs sponsored by AATA, the association hopes to encourage adherence to its professional standards and ethical guidelines while facilitating continuing education within the art therapy profession. As members, you can help work toward these objectives by spreading the word about AATA and working within your local chapters to better inform your fellow mental health professionals of the importance of maintaining uniformly high standards in the art therapy field. It is equally important, however, to work within your own communities to educate the general public about the unique benefits of art therapy and the high professional standards which AATA members are required to meet. In this way, you will be promoting the organization and what it stands for, the art therapy profession as a whole, and the competency of you and your fellow members as indicated by your participation in AATA and adherence to its high standards in your professional field.

Jonathan Braverman.
Rivkind, Baker & Braverman, P.C.,
Braintree, MA

It is always a pleasure to find the techniques of PhotoTherapy receiving attention through various articles or book reviews in professional journals, and thus I am delighted that Julia Byers took the time in a recent issue of Art Therapy: Journal of the American Art Therapy Association (Vol. 11, No. 2) to provide a detailed evaluation and comprehensive discussion of Fryrear and Corbit's 1992 book, Instant Images—A Guide to Using Photography in Therapy.

However, there were a few small errors made in that review, and I write today to ask you to print the correct information. Both in the text of the review, when Fryrear and Corbit's book was contrasted with others written on similar topics, as well as in its reference section, mistakes were made regarding the title of a recent book about various PhotoTherapy techniques, as well as the name of its author and publisher.

I am Judy Weiser, not Weisler, and the title of my book, published in 1993 by Jossey-Bass in San Francisco not Brun-
nner/Mazel in New York City!) is: *PhotoTherapy techniques—Exploring the secrets of personal snapshots and family albums*. Since Ms. Byers has also recently written a lovely review of my book for the Canadian Art Therapy Association Journal without making these rather basic errors, I doubt that she was responsible for making those noted above in the Fryrear and Corbit review. Therefore, I can only assume it was a typesetting error through the editing process, and thus I'm expecting that you will not mind printing these corrections.

I might add that the incorrect title listed in the review's reference section does sound really interesting! It is, in fact, actually the title of one of my presentations at a past AATA conference(!), and although this is not the title of anything I have yet published, perhaps I will someday!

Thank you in advance for correcting these mistakes—and I'm looking forward now to seeing reviews of other books dealing with using client snapshots and albums as helpful adjuncts for art therapy practice, or, perhaps a special issue some day on this topic?

Judy Weiser, R Psych, MScEd, A.T.R.,
Vancouver, BC, Canada

---

*Editor's note: An errata appeared in the previous issue of Art Therapy, Volume 11, No. 3.*

Cathy Malchiodi's editorial (1994) and Rebecca Thomas' letter to the editor (1994) inspired me to voice my concerns about credentialing, especially "grandfathering." Grandfathering is a method of certifying professionals who have been working in the field without requiring them to be tested.

According to the State of Arizona Board of Behavioral Health Examiners, the object of certification is "To protect the public by maintaining and enforcing certification standards for behavioral health professionals in the fields of social work, counseling, marriage and family therapy, and substance abuse counseling" (Rules and Laws, State of Arizona, 1993). As the Governmental Affairs chairman of the Kachina Art Therapy Association, I investigated state certification and was informed that the potential for harm would need to be established before any consideration of certification/licensure would be looked into. There were two areas of concern. First, was it harmful or potentially harmful for counselors, and other mental health providers to use art therapy if they have not had the proper training? This could lead to the need for licensure, because licensure can make it impossible for other professionals to use art therapy without proper training. I have been concerned about this practice since 1989 when, as a volunteer at a psychiatric hospital, I saw counselors (untrained in art therapy) using art therapy with patients. The counselors utilized art directives that were contraindicated, they interpreted patients' artwork, they had no art training, and were not familiar with art media. Today, I am still concerned when I hear counselors, who are untrained in art therapy, say they use art therapy in school settings, private practices, and mental health agencies. There is no licensure to prevent this dangerous practice.

Secondly, does art therapy pose a potential danger? In my opinion, art therapy has the same risks as other mental health professions, so the answer is yes.

The object of certification is NOT so that art therapists can be accountable to insurance companies, or so that art therapists have more job opportunities. As a professional, those reasons are quite appalling to me. It is apparent that the profession of art therapy is growing and we will need the government's help to make sure the public is protected. In the past our Ethics, Education, and Standards Committees, and our own policing policies were in effect. Our A.T.R. status was an indication of our professional training.

Grandfathering is a respected, valuable and utilized method of certifying professionals who have been following all ethical practices, who had the required training at the time, and who wish to become certified. Are there others of you who think grandfathering should be utilized for all A.T.R.'s? What might we do to have an impact on this decision?

Lola Hickert, MEd., A.T.R., CPC
Litchfield Park, AZ

Special 25th Anniversary Section

Interview with Felice W. Cohen, A.T.R., HLM
Irene Corbit, PhD, A.T.R., Houston, TX

Felice W. Cohen was one of the founders of the American Art Therapy Association. She served as its first Secretary, third President, and on the committee that wrote the original association bylaws. She also served on numerous AATA committees, both as Chairperson and member.

Felice has been honored as a Distinguished Fellow with the American Society of Psychopathology of Expression, and as an Honorary Life Member of the Buckeye (Ohio) Art Therapy Association, the South Texas Art Therapy Association, and the AATA in 1989. She is retired from clinical practice and from the University of Texas Mental Sciences Institute where she worked as a clinician and served as Chief of Art Psychotherapy.

Felice has written numerous articles and given countless presentations on the clinical applications of art therapy. She is best known for her research on graphic indicators of child sexual abuse, publishing a paper on this topic in 1985. She has also developed video presentations of her work with abused populations. They include: Child at Risk, which won an Emmy Award, and Breaking Silence.

The following interview of Felice Cohen, A.T.R., HLM, was conducted by Irene Corbit, PhD, A.T.R., student and friend of Felice, during April 1994. Videotaped by Jerry L. Fryrear, PhD, A.T.R.

Irene Corbit (IC): I'm here today with Felice Cohen, you have been an important person in my life—a mentor, a teacher, and a colleague. You were the first secretary of the American Art Therapy Association, and . . .

Felice Cohen (FC): President-elect.

IC: . . . president-elect, and then the third president of the American Art Therapy Association. So you go way back; you are one of the pioneers in the field.

FC: As I said to you earlier, I think I need a wagon. It's time for a wagon for the pioneers.

IC: To begin with, why don't you let us know how you started as an art therapist.

FC: Alright. I really started as a Sunday artist and a psychologist. That was my start. And I knew that the two together were important. And so I found a place through Baylor Medical School, the College of Psychiatry here in Houston, that would let me come and work for free and study for free. And I did that for about 2 or 3 years. Then we moved into what is now one of the largest medical centers in the country, and I was an associate at a place called TRIMS which means Texas Research Institute of Mental Sciences.

I wasn't paid for any of this, but one of the psychiatry residents who graduated received a job as medical director of the Houston Child Guidance Center, so she asked me if I would come over and start a program there. How much? For free—it's the same story. So, I did, and then one day she said, why don't you write a proposal to get a grant.

A well-known woman philanthropist in Houston by the name of Miss Hogg started the Child Guidance Center. I wrote to the Hogg Foundation at the University of Texas, but in those days, people were not writing grants. So, I said how will I do this? And my mentor, Dr. Pierce, said, "Well, just start off saying what you want." So my papers started—here come the judge, literally, here come the judge. And then I said, "I need money. I want to start a program here, and I can't continue to do it for free. I'd appreciate anything you could do." And the next day the letter was received by the Hogg Foundation, and I had a phone call inviting me up that day. They gave me a check right then and there. It lasted for 3 years, and that started my being paid.

In the meantime, I would speak for free anywhere and to anyone who asked, trying to spread the word about what art therapy was. There were only two art therapists in the city spreading the word, but before long, people knew what art therapy was about. We received calls from schools and churches—people wanted to learn about art therapy.

Then I received a job at TRIMS after the grants ran out, and I was there for 20+ years as Chief of Art Psychotherapy. When TRIMS was no longer funded by the state of Texas, the University of Texas took it over, and I was invited to continue my work. I stayed for 2 more years, but the bureaucracy was more than I could tolerate so I left. They gave me a farewell party which I thought would backfire because you're not supposed to drink on state property and they served mixed drinks. I thought this is one way of getting rid of me! Anyway, that's how it started, and I've been in private practice ever since.
IC: Now, I know you’ve worked with a number of interns, art therapy interns.

FC: Yes, I worked with a number of art therapy interns, however, I really worked with more psychiatry residents than I did with art therapy interns.

IC: I know one thing about you that maybe the rest of the audience, or not too many of them, know—you were the first Honorary Member of the South Texas Art Therapy Association.

FC: I was also the first Honorary Life Member of the Buckeye Association.

IC: And also an Honorary Life Member of the American Art Therapy Association.

FC: That’s right. Thank you. So I have three, and I consider that a real honor. To have your peers think this of you is just really great.

IC: How about the future of art therapy? How do you feel about licensure? How do you feel about ongoing training and further education in the field? What are your thoughts about that?

FC: Well, as you said, I’m a pioneer, so I did very well for my time. But like all things, times change, and I would probably have a very difficult time getting a job now, even with the amount of background I have, the amount of work I’ve done, and the amount of publications I’ve contributed to.

I think licensure is the most important issue. In fact, 10 years ago I wrote a proposal for licensure for art therapists, and Linda Gantt, who at that time was the Head of Governmental Affairs, came to Houston so that we could present it to the Senate. That was at the time that an organization called the “Killer Bees”...

IC: I remember them well...

FC: Just skipped town...

IC: That was all the legislators.

FC: All the legislators went down to the border and played poker. And Linda and I were left there.

I knew licensure was very important to have and I hoped that with luck I’d get it under the grandfather clause. But, nevertheless, it’s not new to me. I think art therapists need to broaden our field and need to train much longer than 2 years. I think they should certainly get LPCs (Licensed Professional Counselors) in Texas; I don’t know what the rules are in other places.

IC: They’re different in other places.

FC: But here in Texas, I think they definitely should. They can’t have too much education as far as I’m concerned.

IC: How about your thoughts for the future? Say into the 21st century?

FC: Well, as a pioneer, I think you might leave this question to someone much younger than I who could answer it much better. I’ll pass on that one.

IC: Going back to you being a pioneer, I know that you were very instrumental in the beginning of the AATA. Please tell us a little bit about that first meeting. How did it come about and who was involved?

FC: Oh, I’d be delighted. I think this is something that I hope the people who see this interview enjoy reading it as much as I do telling it. Dr. Paul Fink, who was Chief of Psychiatry at Hahnemann Medical College in Philadelphia, was very interested in starting an art therapy program. As a matter of fact, one of the first ones in the country was there.

While I was at the Child Guidance Center. I received a letter from Myra Levick saying that she was inviting some people to Philadelphia as guests of Hahnemann for the purpose of determining whether or not we should have an association. Just that simple.

IC: How do you think she got your name?

FC: I don’t know. But I do know at that time we were on a “Mrs.” basis—Mrs. Levick and Mrs. Cohen. It’s no longer that way at all. Anyhow, she not only got my name, but other names. I did a lot of speaking in Houston—perhaps Paul may have heard of me—I really don’t know how it happened.

It was a very cold day in February in 1967, and this Houstonian had never been to Philadelphia. The occasion started with Elinor Ulman giving a presentation. When the presentation was over, there was nothing formal written anywhere about anything. Then we went into another room and met.

Now, I didn’t know anyone there, not anyone. That’s where I met Bob Ault, Don Jones, Myra, and Elinor Ulman. There were 40 or 50 people from all over the United States who were all interested in art therapy. You see, Don Jones had been doing something called art therapy; we’d all been doing something called art therapy, but we didn’t know it. And Don Jones had been working at the Xenninger Foundation with Bob Ault; they knew each other. Anyhow, Elinor Ulman was there, Hana Kwiatkowska, the founder of family art evaluation, Margaret Naumburg, whose name does not have to be explained, I think. Edith Kramer was there—and I felt like I was sitting between my bookends. Those were the only books I had, the only articles I possessed had been written by these women.

IC: By Kramer and Naumburg, right?

FC: No, Kwiatkowska had already published her book. All of them had published.

So, to make a long story short, we had a discussion, a lively discussion. It seems that Elinor Ulman, Margaret Naumburg, and Edith Kramer thought that there was no need for any art therapy association because they were the art therapists of the United States. And there was no problem with that because they were. Well...

IC: So they had already carved their niche in the field of art therapy.

FC: Yes. I couldn’t tolerate that. Those who know me know I sometimes do something called “running off at the mouth.” And I did it there. I stood up and I talked a lot about how I felt. The outcome of this whole thing was that we took a vote to elect five people to help found an art therapy association, including the original founders that I’ve already named.

Now this did not sit well with Edith, Hana, and Margaret. Didn’t sit well with them at all...

IC: It really impressed you, didn’t it?

FC: So then in 1968, we founded the American Art Therapy Association.

IC: Who was the first president?

FC: Myra (Levick).

IC: Myra was the first president.

FC: Let me say this to you. The more things change, the more they stay the same. There was a terrible fight at that first meeting in Louisville. If it hadn’t been for several important people, there would never be an American Art Therapy
Association, because false names were brought in as proxies to vote against it. It was an incredible situation. The anger was everywhere. And I saw that when I was active in AATA and throughout my presidency. The only thing that changed were the faces.

IC: There certainly has been a division in the Association.

FC: Absolute split. Real fracture there, and it was at that first meeting that Marge Howard became Treasurer. I would like to add at this point that I received a call last night from the Director of the Children's Hospital in Tulsa, where Marge had one of the first art therapy programs in the country. One of her students, Sandra (Kagan) Graves, called to say that Marge had died. She lived a full life; she was 90 years old.

When I was President and Marge was Treasurer we had about 1500 maybe, in the treasury, and Marge counted every postage stamp that we paid for ourselves. We all had our jobs; we had no help. I wrote 40 to 50 letters a week to answer inquiries, because so many people wanted to become art therapists at that time. This also happened to everybody else who was on the board. We did it all. And there were no Xerox machines to think of it, so we had to use carbon paper. A lot of things come to mind as I think about it. It never got to be too much because we always knew that there would be an American Art Therapy Association, and it would work. And I also think that because there was this faction that was fighting so diligently to keep it from happening that we worked harder and harder to make it happen.

I can recall one more thing. I felt that we were in such bad shape when board meetings lasted until 2, 3, or 4 o'clock in the morning. I said we have (and I think he was the vice president then) Don Jones, a nondenominational minister, and I would like him to lead us in a prayer so that we can do this beautifully. And I want you to know that the action on this side vetoed prayer, and we had no prayer because they were the majority, and that was very significant to me.

I recall the experience of a funny kind of thing, but then a not so funny kind of thing. When I was Secretary, we knew that Margaret Naumburg would receive the first Honorary Life Membership. And as Secretary it was my job to have the plaque made. The first plaque that I had made, I spelled her name wrong, so I had to have another one made. I took it to Philadelphia, and my husband and I and Myra Levick and her husband went together to Airlie House, which is where we had our meeting.

IC: Was this the first conference?

FC: First conference. So anyhow, we had been driving about 3 hours I suppose when I asked Myra, "You have the plaque?"

IC: You do have the plaque?

FC: Myra said to me "You do have the plaque, don't you?" And I said, "What are we going to do?" And she said "We're going to get off this turnpike and turn around and go back and get the plaque." Then, when we got the plaque, and it was my duty to present it to Margaret Naumburg, I couldn't remember her name and I just said, "Here, this is yours." That's it!

IC: How about any other memories? I know you have loads of memories of those times.

FC: I remember newsletters that Don Jones used to write. They would come out on one piece of paper.

IC: And those were the first newsletters.

FC: First newsletters. I remember how hard we worked to make this thing work, really, and there was, I can't explain, still this friction always, always. I can remember in New York, when I was President once more, we had a large stack of names voting against an amendment that we wanted passed, but they were not legal (votes).

IC: They were proxy votes?

FC: Proxy votes—not legal. So it didn't change at all, and as I say, the names have changed.

Today, unfortunately, I can't make many of the meetings. I do regret that we can't have more cohesion. However, I suppose that having competition is a very good thing. It makes us stop and think. The only thing that I regret is that it makes us stop and fight, and we could use that energy more productively.

IC: The AATA has really grown in spite of the fact that there have been differences of opinion throughout the years. Any other old memories?

FC: All of my memories are old! I have a nickname, "Buzz." And I remember that at the last meeting that I chaired, which was in Louisville, we went out to the Kentucky Derby. I bet on a horse called "The Nutty Bee" and I won!

Looking back there was a wonderful man, but I can't think of his name. He hand-carved a gavel for me; I have it here, and I know I'll keep it here forever.

IC: So that's what you brought the meetings to order with, I'm sure.

FC: Absolutely, I brought my own gavel. As we grew, we knew we had to have licensure 10 years ago. We saw it then—it had to be done. Oh, I'll tell you one other thing I did that I'm quite proud of. I started having a parliamentarian at the meetings.

IC: Oh, you're the one who did that.

FC: And the reason I did that, and I don't want to sound like I'm bragging, was because of the constant friction. It got to the point where some of the people were complaining about Robert's Rules of Order, saying that we were not following that. I said I would have none of that—we'll have somebody who will make sure we follow Robert's Rules of Order. So, during my term in office, we had our first parliamentarian, and I feel quite proud of that.

IC: And that's been carried on since then.

FC: That's been carried on. We needed it because we couldn't fight each other anymore. But that cut down on an awful lot of the fun.

IC: How about memories with Myra (Levick). I know you two became very close.

FC: Oh, gosh. I remember we always shared a room, and we always had...merderful times. She came to Houston and presented, and I went up to Philadelphia at Hahnemann and presented. We had great times together, and we learned a lot, I think, from each other. Through her I met Paul Pink, and that's been a high spot in my life. Myra continued on teaching, as you know, in Florida, and now she's retired from the profession. We have some pretty fine memories and fond memories. We miss the old people like ourselves, who don't
come to the meetings anymore. Ever wonder why that is? It can't be because we're old, or maybe it is, but the subject matter never changes.

IC: No, it's still art therapy.

FC: Still art therapy and the papers are amazingly alike—same subjects, primarily. There are some differences—gender subjects that we didn't touch on—but otherwise, there's really no difference, and I kind of wish we could get together again. I remember Gwen Gibson who just received Honorary Life Membership. She worked so hard for the organization. If I start naming people, I'm going to leave people out, and I don't want that to happen.

IC: There have been a lot of people who have worked very hard.

FC: They all worked very hard. Elsie Muller is a wonderful, wonderful woman who was a social worker as well as an art therapist and was in charge of a school for boys in Kansas City. I'm troubled that so many people don't know about such important people who started in our organization.

Herb Rosenberg, who is now completely an artist, was an incredible art therapist, incredible.

IC: I know you did some special research while you were at TRIMS. Maybe you'd like to tell us about the research?

FC: Well, if you have a little luck doing something in particular, you become an authority on a subject. You understand that. The world calls you an authority. I had two, three, or four children who had been victims of incest. I was working quite closely with the Children's Protective Services, so, a psychologist named Dr. Randy Phelps and I did this research together and it was the first research of its kind. As a matter of fact, the word "incest" was not being used at that time and Randy and I were asked to go on a lot of TV shows, including Public Broadcasting. We were very frightened that people would misunderstand.

Now, I mentioned Public Broadcasting. I would like to get something to read to you, if I might do that. I should tell you that I participated in a film called "Child at Risk."

IC: I recall that film.

FC: I worked very closely with the staff at the local PBS for this show. It dealt with the children that I deal with in "Child at Risk" and I'd like to share it with you.

IC: This is dated September 16, 1986 [sic] and it's to Mrs. Felice Cohen at UTMSI, 1300 Morrison, Houston, Texas 77030.

Dear Felice: Just to let you know that "Child at Risk" has won an Emmy Award. The ceremony was held in New York on August 25, and out of 187 entries and 16 national finalists, the National Academy of Television Arts and Sciences selected our program as the one to receive its highest honor in community service for the year. The show wouldn't have been the same without your help; your professional advice and forthright explanations of child sex abuse provided viewers a close look at a child's perspective after being sexually abused. The case histories you offered testified to the emotional struggles faced by the entire family. And for many, your interview was an introduction to the help a child may receive in the professional community. Thank you for speaking up on behalf of the children who cannot speak for themselves about an all too common problem. An Emmy Award is a rare honor. Ours is the first presented to a Texas station in the local community service category and one of only three in Public Television. The honor is shared by you. Thank you for helping increase awareness about this sensitive subject. Most sincerely, Carla C. Reed, Associate Producer.

IC: That's quite an honor.

FC: Thank you, I really treasure this. All our names are on the Emmy.

IC: So, do you ever go to visit it?

FC: I went to see it once. I just wanted to see it once and that was enough. But I'm very proud of it.

IC: I'm sure you are. We're proud of it, too.

FC: I think someplace in the house I might have an extra copy of the film that may be of value for the American Art Therapy Association library.

IC: Good idea. Well, anything else? Any closing remarks? Any words of wisdom for young art therapists?

FC: I think we need to have, if I had my way, more cohesion among the schools that are teaching art therapy. I think there needs to be a clarification of the courses that are necessary. I'd like to see the American Art Therapy Association have an examination for registration.

IC: Well, you know that certification will be coming into effect before too long, and there will be an examination.

FC: But I think that it's been the most rewarding experience for me in my life, besides my children, husband, and grandchildren. But really, it's been my life.

IC: Well, you know one thing I need to tell you is those of us in the art therapy profession in Houston really look at you as the wise old woman of the art therapy field here in Houston.

FC: Thank you, thank you very much.

———

Editor's note: This is an edited version of the actual interview.
How Will the Profession of Art Therapy Change in the Next 25 Years? Responses by Past Award Winners

The Future of Art Therapy: In What Context?

Janie Rhyne, PhD, A.T.R., HLM

In private practice, my clientele came with all sorts of hopes and fears—both pragmatic and mystical. In 1973 I returned to academia at the University of California, Santa Cruz. I taught courses as a teaching fellow in Aesthetics, led training groups, and maintained a private practice. In 1979 I received a PhD in Academic Psychology.

From 1978–1980 I was Assistant Professor, Institute of the Expressive Therapies, University of Louisville. Since 1980 I have taught Visual Language Communications to graduate students in the School of Social Work at the University of Iowa as Adjunct Associate Professor. From 1979 to 1992, I was visiting faculty in the Vermont College Graduate Art Therapy Program. I teach yearly courses in the Marylhurst Art Therapy Program and the British Columbia School of Art Therapy. I joined AATA in 1969 as an A.T.R. and was awarded Honorary Life Membership in 1980. I have served on a number of committees: Honors, Professional Standards, consultant to Education and Training, and as Chair, Research Committee from 1981 to 1985.

I have led more training groups than I can remember, including those for the Association of Humanistic Psychology, Gestalt Therapy, and many art therapy groups in the U.S.A., Canada, and Europe. I am currently conducting a series of small workshops for personal and professional development here in Iowa City. I have published one book, The Gestalt Art Experience (recently revised), numerous chapters in edited books, and articles in the American Journal of Art Therapy.

The Future of Art Therapy

I view the question asked as requiring two answers, related certainly, but separable. The first part of the question concerns future changes in the profession of art therapy, and implies the involvement of our American Art Therapy Association in a context of an existent entity: an organization determining qualifications, standards, boundaries, and approval for the legitimacy of practitioners of art therapy. The second part of the question concerns the 21st century art therapist in a context of individual options and choices of those who practice art therapy with various orientations and affiliations: personal beliefs, preferences, education, and goals would direct selections of how, when, and where art therapy would be a legitimate practice.

Within AATA, diversification has multiplied exponentially in the last 25 years. We ask, "How far can diversity expand within any association before the organization comes apart at the seams?" And then, there is the question of our vocabularies and descriptions of perceptions and performances in the context of art therapy. How far apart can our ideation move before the distances among us become too wide to bridge our gaps in understanding? Have varied concepts already moved us into dissociations too disparate to allow for
honest conversations, recognizing and respecting differences and disagreements? Twenty-five years ago art therapists differed and disagreed, but there was an accepted vocabulary for discussion of most of our issues. Can we go back and establish that vocabulary? I think not. Can we, instead, construct and accept a definition of the art therapists' roles whose boundaries include each of us, from psychoanalysts through shamans? I don't see how.

I know there are some people in our field with whom I can't even imagine conversing in mutual appreciation. One of those is James Hillman, keynote speaker for our 1993 National Conference. Through the years I have read a good bit of his writings because good friends thought he had something to say. He did—about 20 years ago. But his writing has changed, and in his recent books and articles I find little of interest to me. His kind of spirituality seems too abstract and conceptual, enticing us away from experiencing our human nature—more provocative than evocative. As I listened to him speak, I admired his presentation and his erudition. But, as he continued I became aware, to my bemusement, that images of Ross Perot lecturing on the TV screen were drifting around in my mind. Hillman's and Perot's subject matter is very different, of course. But, I was seeing the professorial role each man adopted to teach us what we ought to know with surety of their knowledge and of our ignorance. They do it with dedication, and I am impressed, but do I want to learn what they want to teach? For many people the answer is "yes." Obviously my answer is "no," or my mind would not have wandered away from the content of Hillman's lecture as it does from those of Perot. They are each human beings, dedicated to their causes. But, their causes are not my causes, so I tune them out. I also tune out would-be, self-selected shamans' claims to all-knowingness and power and recounted dramas of soul retrieval just as I do TV Evangelists. They profess to know all the answers, while I am still living with the questions. I can't imagine tuning out our 1994 conference speaker, Ellen Dissanayake, who speaks in an inclusive language that makes sense to me.

I am only one art therapist among our 4,000. Yet, we all live and work in the mid-1990s in our era of ideational overload. TV talk shows chat about therapy and sometimes they claim to "do it." Even if we tune out TV's dramas, there are hundreds of self-help books loading shelves in bookstores and filling the minds of troubled people. There are journals, arriving monthly, telling us the latest techniques for dealing with patients and brochures advertising curative sessions and the addiction groups . . . and so on, and so on. Psychiatrists, psychologists, social workers, counselors, and educators are all assailed by this overload of new knowledge of how-to-do-it in the mental health field. As art therapists we are not alone. Perhaps we are pressed too closely in the crowding; maybe there are too few art therapists to get the benefits we want. If so, we should encourage affiliations with larger organizations. On the other hand, we are in the process of credentialing registered members of our present association. How many art therapists want to or even can pass the certification exam? Will we lose members as we gain quality in our national standards? In aiming for standardization, we shall certainly lose some of our diversity. Is that what most of us want?

I don't know—and I know that I don't know—any right answers to these questions. I do know for sure we cannot go back to where we were in 1969. We must live and work in this era, from the mid-1990s and into the 2000s. In the midst of ideational overload, we must reach for wisdom in deciding which ideas to attend and which not to. Tuning out TV programs is easy; it's harder to do in real, life experiences. When we speak of the future, I can't see any details that far away; my eyes are myopic. Yet, in my mind, I know that whatever art therapists may be doing will be in a context of ever-shifting configurations of parts within the whole of our multicultural society. I know, too, that whatever we do now, as individuals and as an association, is and will be a part of patterns that connect our past, present, and future.

In Search of the Wisdom of a Vision

Robert E. Ault, MFA, A.T.R., HLM

Robert Ault, born and raised in Corpus Christi, Texas, was voted into the South Texas Art League at the age of 14, the youngest artist ever admitted into the group. He went on to Texas University where he earned his BFA in painting and a fellowship to Wichita University in Kansas, where he completed an MFA in art. His introduction to art therapy was in organizing an art therapy program for handicapped children while in graduate school. Upon graduation in 1960, he became a staff member at Menninger's in Topeka, where he continued his training, receiving advanced training in psychotherapy and psychoanalysis. He worked as an art therapist, a psychotherapist, and as a faculty member of the Menninger Management Institute for 32 years. Following early retirement in 1993, he is currently in private practice, runs the Ault's Academy of Art, and works half time as an assistant professor at Emporia State University, where he organized a Master of Science in Art Therapy degree program in 1973 and has continued to teach.

He served on the Organizing Committee for the American Art Therapy Association, was elected its first President-
Elect, and served as its second President. He also has served as Chair of the Standards Committee, two terms on the Education and Training Board, on the Editorial Board, and through the years, in many other capacities with the organization. In 1980 he helped organize the Kansas Art Therapy Association and has served that association in many capacities.

He was awarded the 10th Honorary Life Membership by AATA in 1986, was named the outstanding faculty in the College of Education at Emporia State in the area of scholarship in 1985, and again in the area of service in 1986. In 1983 he was appointed by the Governor of Kansas to serve a term on the Kansas Arts commission, and in 1985 he was named the Kansas Outstanding Educator of the Year.

Through the years, he has published many articles on art therapy and co-authored and helped produce Art Therapy: A Healing Vision, a videotape that has received widespread distribution. He continues to present and teach throughout the country. He represented the AATA before the United States Senate in 1992 regarding the Older Americans Authorization Act and served on a granting committee for the Department of Aging after the act was passed. He continues to be active as a professional artist, having over 45 one-man shows, and his work is in collections throughout the Midwest.

Wisdom

I thought wisdom came with age, like arthritis or nearsightedness, but I haven’t found that to happen. Maybe it did and I just can’t remember where I put it. As one of the elders invited to write a piece for the Journal, I have procrastinated in hope that wisdom or inspiration would shine its light but have decided now the wisest thing to do is reflect out loud on where we have been and where I hope and/or fear we might collectively go. As I think of these matters here in Kansas, an image forms in my mind. It is as follows.

Standing on the crest of a rise in the prairie, the scout would peer in all directions for signs he had learned from experience. He knew a lot rode on his readings, and he felt the responsibility keenly. Knowing the capabilities of the wagons and people, the changeable and violent weather, or hostile forces, all went into his thoughts and he acted at last on his feelings and gave advice. He did not order the direction as that was the job of the trailmaster. His job was to look back as well as ahead and know what was both wise and possible.

Wisdom descends to us from the Anglo-Saxon word which means: “the irreversible process of becoming from within.” It’s not such a bad definition of art therapy, since it is of prime concern if life is to have meaning and is the “stuff” we try to teach our children, our students, our patients, and ourselves.

What was it like in the early 1960s when several of us around the country began to identify ourselves as art therapists? I remember well the joy and pain that went into the birth and early years of the AATA. I also remember the bonding of people joining in a creative act that was far greater than any of us alone could muster. I reflect back on the extreme tension and division we endured and our need for each other’s understanding and support as we felt our way along, attempting to do what was wise at the moment. None of us had been trained in organizational matters and as the old saying goes, “Experience is something you get right after you need it.” We did find common ground though and shared the fever and a common vision about this thing we called art therapy.

The “vision” we shared that allowed us to work and create together was composed of several ingredients. Coming from our experience as artists and treaters, the first and foremost ingredient was our absolute belief in the value and importance of using art making and imagery in the treatment of patients. It was understood that one also needed a foundation of psychology and clinical skills, but the art was central to the process, not an adjunct technique. Regardless of what it was called, we knew it worked when other traditional forms of treatment or rehabilitation didn’t. In those days we usually worked successfully with people whose treatment from highly trained psychologists and psychiatrists failed. As art therapists, we often differed on the how’s, but never the should’s.

Second, was our conviction that this belief should be acted upon, expanded, and made available to as many people as possible, and it was worth the energy and sacrifices required.

Third, was our recognition that we had brothers and sisters of like mind and heart that understood what we were about. This recognition helped us deal with the professional isolation most of us felt at that time, and to have respected colleagues was a blessing. Can you imagine being an art therapist today without a national organization, conferences, a newsletter and journal, or other art therapists you could talk to?

Fourth, was our determination that in spite of our differences in orientation, we would proceed with an organization and trust that a structure for the exchange of ideas would pay great dividends and bring peace among our own ranks. Finally, we wanted art therapy to be recognized, available, and the treatment of first choice rather than last choice—a reality that is now beginning to occur across our country.

I have never envisioned art therapy as a profession but rather as a set of ideas. Of course there are professional concerns and things that need to be done, but thinking of it only in terms of our professional needs was too limiting. Like all ideas that are worth their salt though, they would be utilized by others in related professions and even by amateurs at times. Standards of practice, education, and all the ins and outs of the association’s business would preoccupy us for years, and it has been hard to keep to our vision and to our primary responsibility—that of helping people. Maybe our real wisdom is in the balance of ideals and the practical realities of life.

For generations people have used religion to help come to grips with life and its problems and mysteries. Finally, we discovered the scientific method, and it brought not only a revolution of change, but often compounded our problems and led us to even greater mysteries. It is my belief that the next great change will be the rediscovery of the arts as a primary civilizing and healing agent. There is no group of people better equipped to lead this way than those of us in the creative arts therapies.

What have we done with the first 25 years of the AATA? First, we learned we could not achieve our vision alone, but rather needed each other and were strengthened by both our
similarities and differences. We put together a viable organizational structure that has made these connections possible via conferences and publications. As these connections were made we developed a much clearer identity as legitimate professional art therapists. Our role models changed from those outside our profession to those within our ranks and there occurred an internalization of that process. Now it is easier for us to say with clarity, meaning, and pride that we are indeed art therapists.

We also took steps to identify and organize a body of knowledge that could be taught, insuring future generations of art therapists better trained than ourselves. In so doing we took a dangerous step in introducing into our "vision" the institutional demands of higher education. This added an element of business, demands for systematizing and organizing information so it could be taught, the promotional needs of the teachers, research skills, publishing, regulating, etc. All of this may be necessary, but it goes against the natural grain of many of us identified as art therapists, and it had little relevance to our daily clinical interactions. In so doing we tended to psychologize the art therapy process since it was easier to research and teach and fit with the institutional model. As academies we could really sink our teeth into it and search for truth as we had the tools of science and the models of psychology and psychiatry. In these first 25 years we were highly successful in developing our knowledge base and the profession, but what about the art side of the equation? In that area the "vision" often blurred and our faith in the art process was shaken. I have never met an art therapy professor who didn't proclaim the therapeutic need for making art. I have also never met one who didn't wish they had more time for their art. The folks in clinical-based training seem to have been more successful with this than the academies, I believe, because it was a part of their daily creative interactions.

Where will we go during the next 25 years? We do have choices but we have to get past our philosophical crisis to make them wisely. We must not lose our understanding of and faith in the art process. We can't go off into some hocus pocus of spirituality, or the rigidity of scientific research, or be swallowed up in some larger political organization, but must continue to focus on what brings meaning and joy to life and address the issue of human suffering, of which there is plenty to go around. We must remind ourselves again and again of our "vision" and make plans accordingly. Certainly we must all deal with the realities of political power, integration into health care packages, the need to be a part of the university systems, and the desire to have an identity as art therapists. But my dream is that the insights, the understandings, and the healing that takes place in all our studios and offices will be embraced by the art world and find application not only in health care, but in health promotion. As therapists we still deal with only a small fragment of the population. It is the general population that can benefit greatly from adaptations of the art therapy experience. We know that all children can find and honor themselves through making art and music or dance. Families can learn to deal with each other with respect and without violence. Communities can also come to understand each other's differences and find commonalities for connecting and exchange as we return to the widespread use of the oldest civilizing agent of all, the arts.

It is also my dream that our government can lead the way in redesigning our offensive budget into a true peacemaking machine using the power of the arts rather than guns and explosives. It certainly would be cheaper and easier to make peace through the arts than to settle our differences with war. There is evidence of this already as the cold war ends and the military is being used to help fight famine or forest fires rather than to fight people. Maybe art therapists can also have a significant role in teaching how it is possible to make peace between peoples through understanding and acceptance.

Perhaps some of these dreams can come about if we can see and feel and hold to the "vision." Art therapy is worthy of our love, energy, and dedication, and we should never underestimate its value or lose faith in the healing it brings about.

My Wishful Vision of Art Therapy in the Next 25 Years

Judith A. Rubin, PhD, A.T.R., HLM

I was born during a "Great Depression," ironically also a time of tremendous hope. My recently unearthed teenage diaries are full of words like "swell" and "neat" and, though hopefully more realistic, I remain an optimist. I had always wanted to be an artist, but since my talent wasn't spectacular, I shifted to another love—working with children. First art teacher, then art therapist—a discovery made serendipitously, but like the duckling and the swans, once I knew it "fit."

I feel fortunate having had to design my own training—psychoanalysis with children and adults plus a doctorate in counseling. Entering the field during its beginnings also provided an opportunity to create procedures and programs in many settings with various populations. Working in a university-affiliated child guidance center and psychiatric hospital enabled me to grow as a psychotherapist, supervisor, teacher.
researcher, consultant, and program developer. By 1985 I realized I preferred doing therapy and went into full-time private practice, a daily delight and constant challenge.

It is gratifying to have started programs in different places which have survived and even grown, and to have written books and made films that others find useful. Even being president of AATA with no central office was worth the work, especially helping to shape the direction of the profession and its organization.

Now I plan to gradually decrease my clinical work and increase time for writing books, making videos, working in the community, and traveling. My tolerant, supportive family—husband and three children—has expanded to include two in-laws and one grandchild, with whom I anticipate more time as well.

The loveliest fringe benefit of involvement with AATA has been the friendship of colleagues I like and respect. Art therapy has been a marvellous matrix for me, both personally and professionally, and I feel extremely fortunate.

My Vision

I anticipate that the profession of art therapy will continue to expand and to grow in ever-new directions during the next 25 years, as it has in the past. Art itself is so versatile that it can be therapeutic for an even wider range of people than those already served. Because it is also cost-effective, I expect the field to continue to develop in breadth as well as in depth.

From the most to the least restrictive setting, art therapy is one of the most powerful tools available for those with mentally disabling conditions of all kinds, both chronic and acute. One of my wishful visions is that by the next quarter of a century, there will be one or more art therapists in every psychiatric setting, including long-term, short-term, and partial hospitals, as well as all kinds of outpatient clinics.

In addition, there is tremendous room for growth in the role of art therapy in rehabilitation, care, and education. Hopefully, there will someday be an art therapist in every setting where people can be helped to get back on a functional track. This would include all kinds of rehabilitation centers, corrective facilities, nonpsychiatric hospitals and clinics, and shelters of every sort. For those whose ills cannot be cured, but must be borne, art therapy can provide relief and solace—whether the loss is of a limb, a life, or a loved one. Another of my fondest wishes is that there will be an art therapist in every school, day care center, and residential institution—not only for those who are "exceptional" but also for those who are "normal"—and at every age level, from the toddler to the elderly.

By the time the next 25 years have passed, I expect that most people will have heard of the profession of art therapy and of the therapeutic potential of art. If we are open to sharing and collaborating with other disciplines, we can facilitate an amazing expansion of opportunities for therapeutic involvement in art and other expressive modalities. If we pursue alliances and communication abroad as well as at home, we may also assist in the growth of art therapy around the world. I hope that we have reached a more mature stage of development as a group, and that we need no longer be suspicious or stingy with others. If we are able to engage in genuine dialogue, the benefits will be as much professional as political. We have nothing to lose and everything to gain, in spite of the anxieties of some. Energies devoted to cooperation must be more productive and constructive than those spent on competition. We don't "own" either art or therapy. We surely have much to learn as well as to teach.

My deepest wish is that more and more people will receive the benefits of art in, for, and as therapy. In order for that to happen, the profession would do well to deepen as well as to broaden and above all, to avoid the twin traps of restrictiveness and rigidity. It is my hope that the deepening will occur as we become ever more thoughtful and reflective about our work. Theories that are less often borrowed and more often isomorphic with art are one likely outcome. Research, too, can become more sophisticated, as well as more relevant and applicable. The development of doctoral programs in art therapy will probably be a stimulus in both areas, as well as for the creation of more tools for training students in our own and related fields.

The technological miracles that are rapidly transforming our world have yet to be fully harnessed by art therapy. Not only can there be more and better teaching tapes of the traditional kind, there also can be more creative uses of computers and video, especially the exciting new interactive modalities. As a technological illiterate, I can hardly imagine the possibilities, except to sense that they already offer a dazzling array of potential applications by the next generation of art therapists. At the very least, we should be able to greatly expand the repertoire of visual creativity for the most severely impaired and immobilized among us. At best, it should be possible to widen and extend artistic horizons for everyone.

Perhaps most vital to the survival of our civilization and our world, art therapy can play a central role in enlivening the spiritually barren desert in which we now wander. The social and environmental ills of our time are awesome, and require immediate "treatment" if there is to be a future at all for our children and the planet. Art therapists can and must help to channel energies now wasted on violence and destruction into healthy and constructive creativity. I envision therapeutic art activities being made available in such places as malls, libraries, churches, community centers, and other settings where the disillusioned of all ages might (re)discover a vision of life and themselves as hopeful and worthwhile. We have a most valuable resource to share. We can and should contribute to healing the soul of the community, as well as the psyche of the individual. Perhaps another way of expressing my most heartfelt wish is to pray that swords may not only be beaten into plowshares, but into paintbrushes, pastels, and pottery as well.
Expanding the Role of Art Therapy

Rawley Silver, EdD, A.T.R., HLM

Education: Cornell University, BA, 1939; Columbia University, MA, 1964; EdD, 1966 (Fine Arts and Fine Arts Education); Smith School of Social Work, 1940; Art Students’ League, 1961.

Publications: 51 journal articles, assessment instruments, research reports, book chapters, reviews, art catalogues, and a book.

The Next 25 Years

Before offering some thoughts on how art therapy may change during the next 25 years, I would like to mention an issue of great concern when the AATA was being formed 25 years ago. There were two divergent points of view: that art therapy should lean toward psychiatry, or that art therapy should lean toward education and rehabilitation. As I recall, Myra Levick and Felicia Cohen were leaders of the “art psychotherapy” position while Elinor Ulmann and Edith Kramer were leaders of the “art as therapy” position.

We seem to be returning to this issue. To celebrate our 25th anniversary, Art Therapy: Journal of the American Art Therapy Association, has asked some of us how we see the future. The first to respond, Harriet Wadson (1994), has warned that health care reform may have a disastrous effect, and suggested that growth and perhaps the survival of art therapy may depend on moving toward social rather than psychiatric needs. The second respondent, Gladys Agell (1994) warned against making talk central to the art therapy session.

“In the interest of encroaching on psychiatric prestige, the artwork is disregarded.” These observations by directors of two education programs suggest that in the future, art therapists are less likely to work in psychiatric hospitals than in schools, rehabilitation centers, and other agencies that address social needs.

If so, training and skills could be expanded in several ways. Art therapists might become qualified to administer, score, and analyze assessment instruments like the WISC and WAIS which, I believe, are still restricted to qualified psychologists.

In addition, training might expand to include the biological bases of psychology. With our special access to normal populations of all ages and both genders, as well as those with diseases of the mind, we are in a unique position to study abilities and disabilities, similarities and differences. We have access to the unconscious as well as the conscious mind—which Edelman (1992) calls “the remembered present”—and are in a unique position to contribute to the discoveries that have emerged from neuroscience, such as diseases of consciousness that accompany changes in intentionality.

We might also explore the brain functions that underlie the ability to perceive and interpret nonverbal messages expressed through art forms. In discussing the healing process, Louis Tinnin (1990, 1993, 1994) has examined the role of unconscious mimicry. As he observes, mimicry uses ancient brain functions inherited from reptiles and early mammals and underlies the cooperation seen in schools of fish, flocks of birds, and herds of animals. Mimicry belongs to the realm of “primary process” thinking and is inaccessible to consciousness. Furthermore, aesthetic sensibility, empathy, and emotion are rooted in mimicry. The special capacities of the nonverbal brain are generally unknown to the dominant verbal mind which adopts them as its own. The nonverbal therapies give us access to these mechanisms that consciousness is blind to.

Does mimicry function in assessment as well as treatment? As artists with psychological training, we may be using mimicry unconsciously, identifying with others who draw, paint, or model clay. Through empathy, we may receive graphic messages that are inaccessible to the conscious mind, but claimed by conscious assessments of fantasies, moods, and attitudes toward self and others. We start with the particularities of an individual’s graphic expression, then analyze, abstract, generalize, and assess changes that occur over periods of time.

Co-Chairperson for the Four Corners Expressive Therapy Conference, NMATA Board of Directors, NMATA president, and the Biopsychosocial Task Force for JCAHO. Debbie was also elected to the AATA Board of Directors from 1989–1992, where she served as AATA Board liaison for the Clinical and Governmental Affairs committees. She was elected to the AATA Nominating Committee in 1992 and served as chair of that committee for the past two years.

Last year, Debbie received the 1993 AATA Distinguished Service Award for her work on art therapy licensure legislation. She has also been honored with "The 1993 Outstanding Faculty Award" from Southwestern College, "Extraordinary Support Award" from Webster College, Distinguished Service Award from NMATA, "A Friend of Music Therapy Award" from the Southwestern Region of NAMT and the "Outstanding Teacher" recognition from the University of New Mexico.

Debbie has been a speaker for the AATA Regional Symposium on sexual abuse and Post Traumatic Stress Disorder (PTSD), and is currently the head of that team. Her list of presentations are extensive, ranging from clinical issues to legislative concerns.

Art Therapy

Recently, during my doctoral comprehensive exams, I was asked to explain my philosophy of counseling and art therapy. My answer became more of a self-questioning process than I anticipated. I know that in this field we are required to be constantly changing our views, our approaches to the therapeutic arena, and our acquisition of knowledge. Without this constant change and growth we become stagnant, ineffective, focused on the past, and lose our sense of the true nature of our work and passion... the art.

Many art therapists have been forced to fit into standards of other helping professions, job titles other than art therapist, and mold to the requirements of the employing institution rather than follow their training as an art therapist. Art therapists have become licensed in many states by names other than art therapist. I hold two licenses: one as an art therapist (LAT) and one as a clinical counselor (LPCC). My doctoral studies are in counseling with a minor in art therapy. I view this as an expansion of my skills, rather than a compromise. It became very clear to me as I sat in front of my doctoral program committee, that I am, and always will be, an art therapist. It is my foundation and belief system. It doesn’t matter what other titles I may go by. I remain an art therapist in the way that I think and view the human experience.

We are trained how to interact, be still, dialogue, and live with the images that are created through art expression. Other helping professionals may use art material in therapeutic sessions, but they are not skilled in the ability to think and see as an art therapist. Being an art therapist is the development of a way of living in this world that sees things from an image and aesthetic point of view. There is a sense of being truly involved in life when in the midst of creative expression. What is developed is a way of looking at the world that cannot be re-created in any other way. I teach and believe that the becoming an art therapist a person must learn how to see: art and humanity in a different manner than the rest of the world.
Because we are art therapists, we have a definite advantage over verbal therapists. Through the process of art making and creativity, we have direct access to the soul. Isn't soul making what life is about? The art process cuts through verbal defenses and naturally awakens the true purpose of our being. We are action-oriented therapists and are able to witness personal transformation that occurs within the context of creating art. The world is craving the healing qualities inherent in art therapy. Society has talked itself sick of dealing with the superficial world of words. My clients are looking for a new way to communicate with themselves, others, and their environment. They are looking for a way to achieve deeper meaning out of their existence. Art therapy provides them with a reconnection to their purpose in life, and confronts them with personal images needed for growth.

While we work toward continuing to keep pace with other helping professions, we must not lose sight of the real goal. We are working through licensure, congressional hearings, art exhibits, and health care accreditation bodies to continue to have jobs where we are able to provide the services that we so deeply believe in. We cannot afford to verbally argue about the way things are, or should be. These are the trappings of futility. If we become distracted from our original goals of becoming art therapists, we enter into an inner organizational battleground of opinion bashing. This will keep us from growing within the world, due to lack of cohesiveness within. It is important for us to work together, support each other for the common goals that we share, and learn to disagree with respect in order to move on. We must continue to expand, keep up, and stay ahead professionally, maintaining our vision of the inherent healing powers in the process of making art.

Art therapy, because of its fundamental beliefs, can only become more valuable in the next 25 years. Time has taught us well the damage that humans create when they try to live through verbal communication only. We have become a disconnected community that lives in its head, cut off from the essential messages that the body and soul bear. We have learned to intellectualize our way through life and to value this above all other forms of self-evaluation. But, for the most part, it's not working any more. People are seeking other means of self-discovery and the yearnings of the soul are becoming louder. The creating of art answers this call. It is that basic, that simple.

As artists and art therapists, we know that we create to live. Creativity is essential to our life. We cannot afford to forget the power of our own creative being. We ask our clients to create art as a method of healing, but do we remember to continue to heal ourselves in the same manner? The survival of art therapists depends on their continued lives as artists. The creative spirit, the artistic connection, and the healing results will not go away in the future. But we must remember to nourish the source of our convictions. By living our lives through our passion we can bring compassion to the world.

There is a strong future and hope for art therapy, providing we believe in ourselves and in the ideals that we bring to this profession.

Looking Ahead

Cathy A. Malchiodi, MA, A.T.R., LAT, LPCC, recipient of the 1991 Distinguished Service Award

Cathy A. Malchiodi, MA, A.T.R., LAT, LPCC, is a graduate of the Boston Museum School/Tufts University and the College of Notre Dame. She is the Editor of Art Therapy: Journal of the American Art Therapy Association and author of Breaking the Silence: Art Therapy with Children from Violent Homes (Brunner/Mazel, 1990) and co-author of Integrative Approaches to Family Art Therapy (Magnolia Street Publishers, 1994). She served on the Executive Board of the American Art Therapy Association (AATA) for four years and as Chair of various AATA committees, including Membership, Ethics, Certification, and Publications. In 1991 she received the Distinguished Service Award for her work with the AATA and contributions to the field of art therapy; she has received additional honors from Very Special Arts, Kennedy Center; Hong Kong Association for Arts for the Handicapped; China Fund for the Handicapped; and the Art Therapy Pioneer Award, among others. She currently serves on the Editorial Boards of the International Journal of Arts Medicine, ONLINE Journal of Alternative Medicine and the Journal of Child Sexual Abuse. Ms. Malchiodi is widely published in professional journals, particularly in the use of art expression with trauma victims, multiple personality disorders, child physical and sexual abuse, and physical illness; she has served as an expert witness in legal cases, particularly those involving the use of drawings to identify physical and sexual abuse. Her private practice and consultation services spe-
cialize in forensic and medical art therapy with children, adults, and families.

Ms. Malchiodi has an international reputation as an educator and has taught at universities, colleges, and institutions throughout the United States, Canada, Europe, and Asia. She has worked as a Master Teacher for Very Special Arts International and was selected to represent them in China, the first educational exchange of its kind. She has served as the Interim Director of the Art Therapy/Marriage and Family Counseling Degree program at California State University, Sacramento and is the former Director of the Art Therapy Graduate Program at the University of Utah; she has been a visiting professor for the University of North Texas, Florida State University, Mount Mary College, University of Illinois, University of Oklahoma, Lesley College Department of Counseling Psychology and Expressive Therapies, and Southwestern College, among others. She is also the Director of the Institute for the Arts & Health, in Salt Lake City, UT, a national training and research institute devoted to the development of the expressive arts as an adjunct to a total wellness program. Currently, she is investigating the role of the arts in the comprehensive medical care of individuals with cancer and other illnesses, as well as continuing her clinical consultation and research with children and families from violent homes.

Art Therapy in the Future

Since I am both a dreamer and a pragmatist, I see the future of the profession of art therapy as having many possibilities for success, but equally as many for demise. Many things have been cited as intrinsic to the survival of art therapy into the 21st century—certification, licensure, alliance with other professional groups, recognition by state and federal governments, and research. But I think there are more basic factors and influences that will affect the viability of the profession over the next several decades.

As pragmatic and as boring as it sounds, what we are paid as art therapists will probably have an impact on the future of art therapy. Over the years I have seen many colleagues drop out from the field because they cannot find work or they simply cannot afford the luxury of being an art therapist. Since most of our profession is female (and still paid less than males in our current society) and either single and/or supporting a family, money is a definite factor and I believe, will be closely related to the vitality of the profession.

Being an art therapist, male or female, can also be an expensive venture, including the costly registration fees for annual conferences/symposia, increased expenses of maintaining of credentials (registration, certification, licensure, etc.), and additional costs of continuing education and malpractice insurance. The salary of the average art therapist (art therapist, as opposed to professionals who hold additional credentials in related fields) does not always rise to meet these expenses. The results may be: lower attendance at our conferences and therefore, less sharing of clinical observations, research, and programming, art therapists choosing licensure in an allied field over art therapy credentials, due to costs of keeping both and their comparative value in the job market; art therapists maintaining certification and/or registration, but dropping membership in the AATA and therefore, no longer receiving the journal, newsletter, and other materials that keep one abreast and involved in the field.

In a more academic vein, our ability to incorporate new paradigms within our field will also be related to our vitality as a profession. We often seem to be hung-up on some ideas that are outdated and archaic, even if these theories contradict both gender and multicultural issues and the movement toward short-term treatment. The 90s have shown us that multicultural and gender issues and brief therapy are obviously areas that we must be knowledgeable about. I don’t think that relying heavily on psychoanalytic theories, which have been a tradition in the field of art therapy, will continue to serve us much longer in light of these current trends. Also, utilizing outdated materials from 40-year-old tomes on projective testing does not effectively apply to our work as art therapists, particularly with women, gay and lesbian clients, and people of color, among others. The time is now to begin to dialogue and rework our ideas about art expression and art making to reflect these client populations in preparation for the next several decades.

I think the real test of our strength and future as a profession will come from our ability to really include art in what we do. The word “art” gets a lot of lip service in our field, but rarely truly gets addressed. Most of our training programs negate the importance of studio art experiences in their curricula. Educational standards require only the equivalent of a semester’s worth of art courses for those with no art background. The AATA itself has contributed to this trend; it was not that long ago that the portfolio was dropped from the AATA requirements for professional registration.

A constant lament of art therapists is the old saw that “I just don’t have enough time to make art.” often coupled with the excuse that “My creativity is reflected in how I do therapy, so I really don’t need to make art.” We seem to have come to the convenient conclusion that quick sketches of feelings and badly cut and pasted magazine pictures can approximate art, and that art making is a 50-minute process without much depth. I know well the realities of working with clients within short-term milieu, but we art therapists have reduced the scope of art therapy through the neglect of our own art making and our lack of knowledge of the field of visual art. This has resulted in our disregard for the importance of art in our training, our profession, and our lives. If we are not careful about this, the effects of it may be quite negative and detrimental to the profession as a whole.

The last idea I wish to present is that if we truly wish to grow into the next century, it is time to let go of the past. This is the year that we have celebrated our silver anniversary, honoring and remembering people who founded our field. But we sometimes get caught up in remembering the past and recalling the old days so much that what is going on in the here and now is lost or devalued. It is easy to understand because the past is easy to recall and as they say, hindsight is twenty-twenty. It is easy to do so because the tasks, decisions, and challenges we have ahead of us are often difficult to face and reminiscing is not.

The individuals we are honoring in this anniversary year are what might be called the first generation art therapists. By and large these are the people who made ready the way, formed training programs, and taught the next generation.
I'm part of that latter group, the second generation. We enjoyed the mentoring of the profession's founders, but no longer have the benefit of being perceived as something unique or novel as they did in their time. We have to prove our worth under much more critical conditions, under ever-tightening health care parameters, demonstrate the outcome of what we do, and grapple with the unanswered questions as well as the debatable aspects of the field of art therapy.

For this reason I think it is particularly important to honor and consider the achievements of this second generation, in addition to the first. Some names that come to my mind include: Pat Allen and her articulate observations on studio approaches to art therapy and the role of artist as therapist; David Henley and his work interfacing art therapy, art education, developmental theory, and visual art; the expertise, fortitude, and commitment of Carol Cox, Barry Cohen, and Anne Mills to doing long-term research studies on art expression; Michael Franklin and his explorations of the art process and commentaries on contemporary topics such as the AIDS crisis; Janet Bush and her tremendous achievement in developing a comprehensive and model program placing art therapists in the public schools; Debbie Good and her seminal work in envisioning and developing the first licensure act specifically for art therapists. There are other individuals who come to mind who have kept our art therapy training programs together with their own dedication, sacrifice, and initiative, contributions that are the backbone of our continued growth in numbers. There are many others who work in clinical settings and many whose names I don't know because they work in isolation and cannot afford to come to conferences to share their achievements or do not have the time to write for publication. These are individuals who have tackled some of the most difficult problems, both theoretical and practical, and created and implemented solutions that will pave the way for the continued growth of art therapy into the next century.

The 25th year of the AATA has been one of reflection on the achievements of the past, particularly the founders of the profession. In honor of them we have put our energy into making special attempts to commemorate these individuals. However, in doing so let's not forget the vital energy of the second, third, and upcoming generations of art therapists who are in hospitals, schools, and agencies doing the work, blazing trails, and still defining the field of art therapy. Perhaps we should be honoring and recording the efforts of these individuals, too, because what they are doing and saying now is just as important to the future of art therapy as the memories and foundations our pioneers have to share.
The Art Therapist as Expert Witness in Child Sexual Abuse Litigation

Marcia Sue Cohen-Liebman, MA, MCAT, Cherry Hill, NJ

Abstract

Basic judicial tenets regarding expert witness status and testimonial capacity are examined in an effort to educate the art therapist about the rules and regulations that govern participation in child sexual abuse litigation. Legal, mental health sciences, and art therapy literature as it pertains to the qualification of the art therapist as an expert witness and the admissibility of novel scientific evidence in the form of drawings is reviewed. The synthesis of this material is an attempt to ascertain and define how basic judicial tenets are applicable to and can be adhered to by the art therapist in the capacity of an expert witness in child sexual abuse litigation.

Introduction

The law in the area of child sexual abuse litigation is in a formative stage of development. It can take years for courts to achieve consensus regarding basic principles and applications when complex new subjects are introduced in the law of evidence (Myers et al., 1989). Expert testimony regarding child sexual abuse allegations falls into this category. Art therapists can support this newly emerging area of litigation by providing evidentiary material that is substantially validated. Drawings enable art therapists to offer information that is not otherwise accessible to the court. Since art therapy is not a precise science and in the eyes of the law it is not quantitative or experimentally verified, the art therapist involved in legal proceedings has to justify that the probative value of the use of art expressions outweighs the prejudicial effect. In the future the legal usefulness of art expressions will depend less on scientific precision than on the wisdom that is imparted by the art therapist in the guise of an expert witness.

The intent of this paper is to educate art therapists about basic judicial tenets that govern expert witness status, specifically in child sexual abuse litigation. Legal, mental health sciences, and art therapy literature as it pertains to the qualification of the art therapist as an expert witness and the admissibility of novel scientific evidence in the form of art expressions will also be reviewed. The synthesis of this material is an attempt to ascertain and define how basic judicial tenets are applicable to and can be adhered to by the art therapist in the capacity of an expert witness in child sexual abuse litigation.

The material presented in this paper was gathered from a variety of resources outside the field of art therapy due to the paucity of literature regarding the role of the art therapist within the judicial system. Expert mental health testimony is increasingly incorporated into judicial proceedings necessitating an awareness of basic courtroom policies and procedures by art therapists in anticipation of possible courtroom involvement.

This paper provides art therapists with a basic comprehension of judicial protocol and expert witness status including: a definition of expert witness status with an overview of basic judicial procedures, rules, and regulations; a brief historical overview highlighting the interface between the judicial and mental health professions; a discussion of how art therapists may qualify as expert witnesses; and consideration of a landmark case in which the field of art therapy was accepted as reliable and an art therapist was qualified as an expert witness.

The Adversary System

The modern use of expert testimony developed in the 18th century out of the adversary system of trial (Ladd, 1952). The witness in the adversary system provided the trier of fact with knowledge rather than opinion. Exercising opinions and conclusions to determine a verdict became the sole province of the jury. The function of the witness was to state the facts of which he or she had personal knowledge (Ladd, 1952). The adversary system is founded on the belief that the most effective way to arrive at just results in litigation is for each side of a controversy to present the evidence that is most favorable to its position and to let a neutral judge or jury sift through the conflicting evidence and decide where the truth lies (Myers, 1992).

The adversary system is not without criticism. It has been evaluated as not conducive to the fair evaluation of objective testimony. "The adversary system presupposes that the most effective means of determining the truth is to place upon a skilled advocate for each side the responsibility for investigating and presenting the facts from a partisan perspective" (Poynter, 1977, p. 216). Ideally, the adversary system insures informed, unbiased expert opinion. Invariably, the adversary system forces the expert witness to align himself or herself with the party that engages his or her testimony, thus allowing the testimony to be biased. An unbiased device known as cross-examination, which tests competency and credibility, exists within the adversarial system (Slovenko, 1987).

Interdisciplinary Interface

Psychiatrists and mental health professionals provide evidence in more than 1 million cases a year (Yvonne, 1989; Smith, 1989). Psychologists provide expert testimony on two
major types of evidence. The first is clinical evidence in which testimony focuses on some type of clinical assessment. The second is derived from social science research from which generalizations are made. This is referred to as research evidence (Yuille, 1989).

Psychiatric expert testimony consists of three distinct areas. The first is identification and reporting of suspected cases of sexual abuse. The second involves basic knowledge of child cognitive and psychosexual development, psycho-pathology, and interviewing skills to aid in the determination of competence as well as the assessment of reliability and consistency of allegations. The third consists of an evaluation of the psychiatric status of the complainant and recommendations for treatment (Abright, 1986).

Although mental health professionals testify on a multitude of issues related to both civil and criminal matters, the psychiatrist is often a preferred expert witness (Ferin, 1977). Medical expert testimony is weighed as more credible than nonmedical expert testimony even in mental health litigation (Bolocofsky, 1989). An implied hierarchy exists with regard to the credentials of a practitioner. A doctorate degree or a medical degree confer greater respect with regard to testimony than a master's or bachelor's degree. This is attributed to the belief that the more training and experience an individual has substantiates greater reliability and credibility. Currently, there is no empirical data to support this claim and mental health professionals continue to combat misperceptions about their testimonial capabilities. They have found it necessary to educate their legal counterparts about their unique skills and techniques which prepare them to testify in the legal system.

Basic Judicial Tenets

American courts are divided into criminal and civil cases. Civil litigation includes divorce, child custody proceedings, personal injury litigation, and proceedings in juvenile court to protect abused and neglected children (Myers, 1992). There are two distinct although sometimes overlapping court systems: federal courts and state courts. Every state has a system of trial and appellate courts. Laws vary in detail from state to state and between one law enforcement agency and another (Myers, 1992). Although federal rules and regulations are addressed in this article, it is important that mental health professionals be familiar with local and state legislation.

Court participation is often initiated through a subpoena. A subpoena is a command that is normally issued by a court at the request of an attorney (Myers, 1992). It mandates that the professional go to court; however, it does not mean that the individual has to disclose privileged information (Myers, 1992). It is prudent and wise to contact the attorney who signed the subpoena in an effort to ascertain the reason and rationale for being asked to appear and testify in court.

Child Sexual Abuse Litigation

Allegations of child sexual abuse may manifest in eight different types of proceedings: criminal prosecutions; juvenile delinquency litigation; juvenile court proceedings; child custody and visitation litigation; proceedings to terminate paren-

\[ \text{tal rights; civil suits brought by victims against the perpetrator; civil litigation against child protective service agencies for failure to protect children from sexual abuse; and administrative proceedings (Myers et al., 1989).} \]

Child sexual abuse cases may be handled through the child protective system or the criminal justice system. The former allows the state to intervene when parents are not protecting their children or if they are actively abusing them. The latter defines certain behaviors towards children as crimes. Cases in child protective services are handled in family or juvenile courts, whereas cases reported through the criminal justice system are routed through the criminal courts. In family courts, decisions may be based on a "preponderance of evidence" that the child has been abused. It is not necessary in these cases to identify the perpetrator. In criminal courts, the alleged abuse must be proved "beyond reasonable doubt." It must be proved that the alleged perpetrator committed the crime and that he or she did so with "unlawful intent" (Abright, 1988). In family courts, the aim is to protect the child while in criminal courts, the accused is found to be innocent or guilty. In the criminal system, witnesses are required to give their testimony in a public courtroom in the presence of a jury, the judge, and the defendant and be subjected to cross-examination by the defense attorney (Bulkey, 1989). In some cases, litigation will be pursued in both systems.

The right to cross-examine is not unlimited, and judges have the authority to impose limitations upon the examiner. Cross-examination has two purposes: to elicit favorable testimony and to undermine direct testimony by challenging its content by impeaching the witness's credibility (Myers, 1988).

The jury in a criminal proceeding does not determine if the accused is guilty or innocent but rather that the accused is guilty or not guilty (Everstine & Everstine, 1989). If found not guilty, it has not been proven beyond reasonable doubt that the accused committed the crime. A finding of not guilty indicates that a crime could not be proven as explicitly required by the law. It does not indicate that the jury could not believe that the defendant did the crime (Everstine & Everstine, 1989).

Expert Testimony

The basic principle governing admission of expert testimony is established in Rule 702 of the Federal Rules of Evidence. Rule 702 states:

If scientific, technical or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified as an expert by knowledge, skill, experience, training or education, may testify thereto in the form of an opinion or otherwise. (Myers et al., 1989, p. 6)

This rule establishes that testimony must be relevant to a matter that is in dispute. To be reliable the testimony must also have scientific or some other basis. Finally, it must not be otherwise available to the average juror. The probative value must be greater than the prejudicial effect (Smith, 1989).

Federal Rules of Evidence 703, 704, and 705 permit experts to base their opinion on information that would not or-
ordinarily be admissible as evidence, to testify to ultimate issues (eg., whether or not the abuse has occurred), and to express opinions without first having disclosed the underlying facts that gave rise to the opinion. With regard to the ultimate issue, many scholars believe that mental health experts should not be allowed to provide an opinion regarding ultimate legal issues. An opinion that a child has been sexually abused mirrors the legal issue that is before the court. It is not within the jurisdiction of the expert to speak to the ultimate issue that is before the court in the manner of an opinion.

An expert can also testify about the sexual abuse of the child through alternate means without resorting to an opinion. For instance, in child sexual abuse litigation, an expert can discuss inappropriate sexual knowledge possessed by the child. In most states experts are allowed to state their opinions as being of "reasonable certainty" due to the belief that the jurors will be able to weigh appropriately opinions and information entered as evidence.

The trial judge determines if the proffered testimony meets the requirements of Rule 702. Admissibility of the testimony is determined with regard to whether the testimony will assist the trier of fact. In cases without a jury, the judge is the trier of fact. In a jury trial, the jury assumes the role of the trier of fact. The jury is comprised of a body of ordinary people who provide judgment in determining the ultimate issue. Elimination of technical jargon and scientifically worded testimony or expressions is important if the jury is to use the testimony to decide the issue in question.

The federal rules allow that expert testimony need not be limited to subject matter that is beyond the knowledge of the average juror. Experts can offer depth and insight to subjects of familiarity, and their testimony can be admitted to refute misconceptions about commonly held subjects.

Rule 703 of the Federal Rules of Evidence stipulates the permissible basis for expert testimony:

The facts or data in the particular case upon which an expert bases an opinion or inference may be those perceived by or made known to the expert at or before the hearing. If of a type reasonably relied upon by experts in the particular field informing opinion or inferences upon the subject, the facts or data need not be admissible in evidence. (Myers et al., 1989, p. 8)

Child sexual abuse experts base their opinions on a variety of sources. Judges have the jurisdiction to determine what types of facts and data are "reasonably relied upon" by experts in the field of child sexual abuse in order to permit experts to formulate admissible opinions on the basis of inadmissible evidence (Myers et al., 1989).

To serve as an expert mental health witness, an individual must qualify under the rules of evidence and belong to a legally recognized mental health profession (Bolocofsky, 1989). These requirements in and of themselves do not ensure that an individual is a competent witness. Discretion resides with the court in determining the competency of a mental health professional as an expert. Three critical factors determine one's qualification as an expert on child sexual abuse: extensive firsthand experience with sexually and nonsexually abused children; a thorough and up-to-date knowledge of the professional literature on child sexual abuse; and objectivity and neutrality about individual cases (Myers et al., 1989). Techniques and skills employed by the expert are as important to consider as is admissibility.

The party that offers the testimony has the responsibility to establish the qualifications of the witness. The experience through which an expert has gained specialized knowledge is important to the weight of the testimony as well as for admissibility. Witnesses establishing expert qualification are questioned on the witness stand with regard to education, specialized training, and relevant experience. Advanced degrees, membership in professional organizations, and publications regarding child sexual abuse are additional areas that are explored. Previous expert status in prior cases of child sexual abuse litigation is another consideration in the qualification process as is current employment and past internships. Prior experience working with sexually abused children will be questioned as well. Expert witnesses are not required to be the foremost authority on a particular subject nor must they be knowledgeable about all aspects of the issue.

Mental health professionals may testify in two different capacities. The first is as a "fact" witness and the second is as an "expert" witness. The former does not garner special status while the latter is awarded certain privileges. Fact or lay witnesses may not testify as to matters of opinion while expert witnesses may testify in the form of an opinion. The testimony provided by a lay witness is based on personal knowledge rather than opinion or inference. Prior to the establishment of the Federal Rules of Evidence, neither type of witness was allowed to express an opinion on the matter before the court in order not to usurp the function of the jury.

Whenever the trier of fact is confronted with issues which cannot be determined intelligently on the basis of ordinary judgement and practical experience gained through the usual affairs of life, the benefit of scientific or specialized knowledge or experience may be provided by use of expert testimony (Ladd, 1952, pp. 418-419). The expert provides an opinion "that is a reasonable probability rather than conjecture or speculation" (Ladd, 1952, p. 419). A lay witness expresses his/her opinion as an expression of his/her observations which are otherwise difficult to state. The expert witness expresses his/her scientific knowledge through his/her opinion. However, only an expert witness may address a hypothetical question.

Another form of expert testimony that is utilized in child sexual abuse cases consists of a combination of lay and expert testimony. Behaviors observed in sexually abused children as a group are discussed by the expert in combination with lay testimony establishing that the complainant demonstrates such behaviors. This type of expert testimony does not focus specifically on the child involved in the case; rather, it speaks to sexually abused children as a group. Expert testimony that a child demonstrates behaviors commonly associated with sexually abused children is distinct from expert testimony that a particular child was sexually abused. In this capacity, the expert is not offering an opinion on the ultimate question of whether abuse occurred.

**Criticisms Associated with Mental Health Expert Testimony**

Disagreement about the legal value of mental health professionals in the judicial system has persisted since the introduction of mental health expert testimony (Yuille, 1989).
Criticism about the ethics and appropriateness of mental health testimony has been and still is prevalent. The inherent issues in this debate manifest in the following areas: weak scientific basis for psychology and psychiatry; the questionable measurement techniques employed by mental health professionals; and the absence of substantive requirements for those who may serve as an expert mental health witness (Bolocofsky, 1989).

Critics argue that the mental health profession has little to offer the judicial system. One particular area of difficulty is the lack of scientific data regarding human behavior. Some members of the legal profession contend that psychological assessments are not reliable or valid and that courts rely on inaccurate or unreliable data and thereby reach incorrect decisions (Smith, 1989). One of the chief areas of criticism rests with the assumption that the mental health expert derives his or her testimony from a theoretical base (Bolocofsky, 1989).

Criticism regarding psychological tests and techniques revolves around the methodology used to evaluate the data generated (Maryland Law Review, 1979); that is, the selection of the specific assessment techniques may alter accuracy and objectivity of results. Other criticisms focus on the following factors: inadequacy of standardization, low reliability or insufficient data on reliability; and low validity or insufficient data on validity (Maryland Law Review, 1979). In particular, projective techniques have been criticized for several reasons. These include questionable theoretical rationale foundation, evidence that alternative explanations may account as well or better for the individual’s responses to unstructured test stimuli, and inadequacy when evaluated in accordance with test standards (Maryland Law Review, 1979).

**Novel Scientific Evidence**

Drawings are considered to be novel scientific evidence in the court system. To be admitted as evidence, the admissibility of drawings or novel scientific evidence is determined through specific principles and is subjected to a special admissibility test. A hearing may be conducted to evaluate the admissibility of such evidence. The special admissibility test is applicable when expert testimony is judged by the court to be less accessible to lay analysis than other types of evidence. The special admissibility test is applicable when expert testimony is based on scientific principles of questionable reliability (Myers et al., 1989).

The court decides if evidence is novel or scientific. The issue of concern is reliability and there are different tests that can be used by the court to determine reliability. The Frye test is considered the general acceptance test. It requires that scientific evidence must be sufficiently established to have gained general acceptance in the field in which it belongs. Although it is increasingly criticized, a majority of courts continue to adhere to the Frye Rule. The Frye Rule has been the “dominant standard for determining admissibility of novel scientific evidence at trial” since its inception approximately 70 years ago (Daubert v. Merrell Dow Pharmaceutical, 1993, p. 46).

Most courts do not require scientific certainty of psychological data; however, they do insist upon some level of acceptance for new or novel psychological data. The Frye Rule has generated much debate and scholarship. In Daubert v. Merrell Dow Pharmaceutical (1993), the Supreme Court evaluated the continuing authority of the Frye Rule. An opinion was offered that the Frye Rule was superseded by the adoption of the Federal Rules of Evidence (Daubert v. Merrell Dow Pharmaceutical, 1993, p. 46). Federal Rule 702 does not advocate that general acceptance be established as a precondition to admissibility. Rule 702 does “assign to the trial judge the task of ensuring that an expert’s testimony both rests on a reliable foundation and is relevant to the task at hand” (Daubert v. Merrell Dow Pharmaceutical, 1993, p. 54).

Courts do not agree on the application of the Frye Rule with regard to psychological evidence. Critics cite four flaws inherent in the Frye test that deem it unsuitable for novel forms of psychological testimony (McCord, 1986). The first concerns the application of the rule. It is not always evident whether evidence is scientific or not. Another flaw is the determination of what constitutes general acceptance by the field of experts on the specific issue. This concept is difficult to define concretely. Some legal scholars suggest that the definition of general acceptance be “widespread, though less than universal acceptance premised on documentation in the relevant professional literature” (Myers et al., 1989, p. 26). This is criticized because general acceptance offers no assurance that the information is reliable and valid (Maryland Law Review, 1979). A final flaw relates to whether or not general acceptance of the underlying principle as well as the application should be established. Without proof of accuracy, scientific expert testimony is thought merely to reflect the personal opinions and beliefs of the expert (Maryland Law Review, 1979). The underlying principles of medicine and the mental health sciences are generally accepted and courts take notice of these foundations. Some advocates of the test feel that the Frye Rule should be invoked when expert testimony is based on novel applications of the accepted underlying foundations (Myers et al., 1989).

If the Frye Rule is invoked, four sources of evidence can be used to establish general acceptance. The first is informed testimony. Witnesses may be called to testify regarding general acceptance. The quality of the testimony rather than the number of witnesses aids in the establishment of acceptance. The witness should possess significant expertise regarding the scientific principle at issue. Knowledge about the status of the principle among other qualified professionals is important information for the witness to present. An informed witness will have comprehensive knowledge of published literature on the topic as well as materials presented at professional conferences including unpublished data. The informed witness will also be aware of the views of leading authorities in the field. The witness should not present as an advocate for the principle; rather, she or he should be neutral and provide information assessing the position of the scientific community.

The other three sources of evidence used in the establishment of general acceptance include the introduction of relevant literature, guidelines from professional organizations, and prior court decisions. Guidelines from professional organizations provide the court with a consensus of the members of an organization. Moreover, the status of the sponsoring organization may be a prominent factor in establishing general acceptance.

An alternate to the Frye Rule is relevance analysis. This
is a two-step process. Once reliability is assessed, the court balances the reliability and probative value of the evidence against mitigating factors including causing unfair prejudice to the opposing party or misleading the jury. Relevance analysis is considered well suited to expert behavioral science testimony regarding child sexual abuse (Myers et al., 1989).

Expert testimony can be presented in one of four ways in child sexual abuse cases: expert diagnosis to prove that abuse occurred; vouching for the child's credibility regarding the allegation; explanation of unusual behavior; and explaining the capabilities of children as witnesses (McCord, 1986).

Qualification of Art Therapists as Expert Witnesses

Federal Rule 702 states that an individual qualifies as an expert by virtue of knowledge, skill, experience, training, and education. To serve as an expert mental health witness, an individual must qualify under the Rules of Evidence and belong to a recognized, national mental health profession.

The field of art therapy is a recognized mental health profession. The field is regulated by a national organization, the American Art Therapy Association, Inc. (AATA) which is recognized by the American Psychiatric Association (APA). The AATA has developed guidelines for the training, membership, and practice of art therapists. The AATA designates and establishes professional standards and criteria for its membership regarding training and education. Specific goals govern the organization. These include the progressive development of the therapeutic use of art, the advancement of research, the improvement of standards of practice, the development of criteria for training art therapists, and the exchange of information and experience through publications, meetings, and seminars (Rubin, 1979, p. 14). Association documents include a Code of Ethics, Standards and Procedures for Registration, and Guidelines for Art Therapy Training. Professional qualification for entry into the field requires a master's degree from an accredited academic institution and completion of required course work from an accredited institute or clinical program (Levick, 1983: Lusebrink, 1989). Graduate training programs are required to include practicum experience in addition to didactic training.

Wilkerson v. Pearson

A precedent setting case in New Jersey in 1985 established the credibility of art therapists as expert witnesses as well as the validity of drawings as judiciary aids. The case Wilkerson v. Pearson (1985) involved a mother trying to stop supervised visitation between her daughter and the child's natural father due to allegations of sexual abuse. The child was being treated by a registered art therapist who was originally qualified as an expert. The art therapist's expert status and her testimony were later challenged on the basis that neither met the standards and criteria established in New Jersey rulings that govern the admissibility of expert testimony. Under New Jersey Rule 562(b)(1) expert testimony is admissible only if the expert has sufficient expertise to offer the intended testimony and the testimony itself is sufficiently reliable (State v. Cavallo, 1982). Relevant evidence is defined as evidence having any tendency in reason to prove any material fact (State v. Cavallo, 1982). It was noted that once the proper foundation is established, expert opinion testimony is admissible. Scientific evidence is admissible if the proposed technique or mode of analysis has sufficient scientific basis to produce uniform and reasonably reliable results and will contribute materially to the ascertainment of truth. Thus, New Jersey's standard of acceptability for scientific evidence was an important issue in Wilkerson v. Pearson (1985). In State v. Cavallo (1982) the following was included:

The Frye test recognizes that most judges are experts in few, if any, fields of scientific endeavor. Judges are not well suited to determine the inherent reliability of expert evidence, but they can decide whether the proffered evidence has gained "general acceptance" in the scientific community. The proponents of scientific evidence can prove its "general acceptance" and thereby its reliability by the three methods of proof that have been recognized by the courts: expert testimony, scientific and legal writings and judicial opinions. (State v. Cavallo, 1982, p. 921)

Through the utilization of these three methods of proof, general acceptance of art therapy within the scientific community and its reliability was established in this case. Before accepting the art therapist as an expert witness, experts in the fields of child psychiatry and art therapy were introduced to the court. These individuals, Dr. Allen Levine, a child psychiatrist, and Dr. Myra Levick were presented as duly qualified experts in their respective fields (Levick, Safran, & Levine, 1990). In their proffered testimony, each referred to relevant literature in his or her respective fields and relevant judicial opinions were consulted during the proceedings.

The judge, the Honorable Harvey Sorkow, followed the three basic requirements for the admission of expert testimony as established by Chief Justice Robert Wilelntz in State v. Kelley (1984). The Chief Justice wrote:

In effect, this Rule imposes three basic requirements for the admission of expert testimony: (1) the intended testimony must concern a subject matter that is beyond the ken of the average juror; (2) the field testified to must at a state of the art such that an expert's testimony could be sufficiently reliable; and (3) the witness must have sufficient expertise to offer intended testimony. (Levick, Safran, & Levine, 1990, p. 52).

The judge accepted the testimony provided by the art therapist in the guise of an expert witness and the art therapist was qualified as an expert in the field of art therapy. The opinion written by the judge set a precedent in the State of New Jersey, making it a landmark case in the state.

The judge discussed the acceptance of art therapy and its reliability in his opinion by stating:

This court is satisfied that art therapy has a sufficient scientific acceptance and basis. It is not a test such as a breathalyzer that establishes a result given certain facts. Rather, art therapy is a methodology of treatment that is subjective in nature but has within its discipline fundamental criteria that if found to exist lead to certain inferences and conclusions. To this extent such evidence is reliable. (Wilkerson v. Pearson, 1985, p. 338)

Conclusion

This paper is intended to serve as a reference for the art therapist who is or who may become involved in child sexual
abuse litigation. Salient information regarding expert witness status and testimonial capacity as well as the qualification of novel scientific evidence was presented. The purpose was to educate art therapists about basic judicial tenets that are pertinent to qualification and participation as expert witnesses in child sexual abuse litigation.

Mental health expert testimony is just emerging in the opinion of some researchers. In many cases expert testimony is helpful while in others it is essential and required. The prospect for the future is more rather than less expert testimony. The future promise for contributions from the field of art therapy is promising, particularly in the area of child sexual abuse litigation.

Editor's note: Marcia Sue Cohen-Liebman holds a Master of Arts in Art History from Rutgers University and a Master of Creative Arts in Therapy from Hahnemann University. She is an art therapist at the Children's Advocacy Center in Philadelphia, Pennsylvania and a trainer for the National Training Program on Effective Treatment Approaches in Child Sexual Abuse. The Power of Language in the Art Therapeutic Relationship

Abstract

This article examines language usage in art therapy and its impact on the art therapeutic relationship. It is intended to raise critical awareness of how biases become imbedded in language, how language usage maintains differences in power, and how to monitor language use in professional practice. The article begins by looking at the cognitive, social, and cultural roots of language development. It then explores the complexity of communication systems used by art therapists, which include clients' visual and verbal communications, the language of the treatment team, and art therapy terminology. It looks at how our verbal interactions with clients affect our relationships with them, and it raises awareness of the impact of language usage when talking and writing about their artworks. Finally, it offers specific suggestions for improving our written and verbal communications as art therapists.

As art therapists, we respect the power of the image. We guide our clients' use of that power so they can experience their lives more fully. We encourage their imaginative use of line and color to give form to their feelings and thoughts, to connect with others and to explore their relationships with their worlds. Although the use of images is the distinctive hallmark of our trade, words are also essential tools because language is the basic medium of everyday exchange between people. The purpose of this article is to examine the use of language in art therapy and its impact on the relationship between the art therapist and client.

This article views language as a dynamic social instrument that absorbs and reflects all aspects of human experience. Because language is molded by people's experiences, cultural characteristics of groups become imbedded in its sounds, syntax, and meaning. And since language reflects cultural differences, its standard, acceptable usage is determined by the language habits of the dominant culture. It is especially important for art therapists to be aware of the language they use when communicating with and about clients because the relationship between therapist and client is traditionally, and inherently, asymmetrical.

Language Development

Speech is a uniquely human social event. The development of speech helps children adapt to their social worlds because it enables them to communicate their feelings, needs, and thoughts to others. Infants' early cries, coos, and babblings motivate their caretakers to tend to their needs. Over time, young children gain control of their speech. Their vocabulary and grammar expand exponentially until, by around age 3 or 4, they have usually mastered the profoundly complex skill of language communication.

Despite the universals of human development, each child's use and understanding of language is also determined by his or her personal and cultural history. Language is dynamic, not static, changing its form over time and place. Similarly, word meaning is relative, not fixed, varying with individual circumstances. How children learn to speak and how they understand what they hear are influenced by their families, their neighborhoods, and their schools. Likewise, how adults comprehend and use language is affected by a complex mosaic of factors that include education, economics, class, occupation, age, gender, and politics.

Language usage is a critical issue because it shapes how we feel, think, and act. It is the basis for our sense of existence and identity because it is a tool for developing self-awareness and self-concepts. The words we use early in life become our first units of thoughts, and our structures of speech shape the patterns of our thoughts (Vygotsky, 1972). Language enables us to name, define, and organize our inner worlds of feelings, sensations, and thoughts. It allows us to externalize these interior phenomena by translating them into signs and symbols that communicate meaning to others. It also directs our actions because language is integral to anticipating, planning, and problem-solving.

Language and Culture

Power is a social fact that exists whenever a person's role allows him or her to exert control, influence, or authority over someone else. Language is a social instrument that is shaped by culture and also shapes culture. Its proper usage reflects the speech and writing of those in power. It is the domain of the dominant culture.

In the United States, for example, standard English reflects the speech and writing habits of educated people. White middle- and upper-class professionals shape, define, and name ideas, feelings, things, and people. People who are disenfranchised in our culture due to their race, ethnicity, class, or gender often have language habits that are not considered standard English. Therefore people in nondominant cultures are defined and named by the dominant culture; they are often silenced because they do not speak or write the language of privilege.

People in our society are seen and heard when they use the words and syntax of the dominant culture. If they do not use standard language, they remain silenced and invisible whether they speak or not. When Hegel (1964) examined the dialectic
relationship between the consciousness of the "master" who does the naming and that of the "oppressed" who is named, he wrote, "The one is independent, and its essential nature is to be for itself; the other is dependent, and its essence in life or existence is for another" (pp. 236–237). Members of a nondominant culture become trapped in their own silent world. If they choose to speak the language of the dominant culture, they risk disavowing their own identity in the process. According to Adrienne Rich (1977), "In a world where language and naming are power, silence is oppression, is violence" (p. xv).

Standard English is an idiom of the privileged class. It is inclusive of values of the dominant culture and exclusive of those outside the circle of power. It contains overt and subliminal messages that exclude those who are disenfranchised. This use of language can cause people in the disempowered group to feel unworthy, inadequate, and/or inferior. The growing awareness of the politics of language focuses attention on its latent sexism and racism.

While fine distinctions about language usage may sound blandly academic, their effects can be deep, tragic, and enraging. In her book, Lost in Translation (1989), Hoffman observes, "Linguistic dispossesson is a sufficient motive for violence, for it is close to the dispossesion of one's self. Blind rage, helpless rage or rage that has no words—rage that overwhelms one with darkness. And if one is perpetually without words, if one exists in the entropy of inarticulateness, that condition itself is bound to be an enraging frustration" (p. 124).

The Use of Language in Art Therapy Treatment

The foundation of any interaction is shared meaning. This is especially true in a therapeutic relationship because empathy, support, and trust are essential to building and maintaining an alliance. In our work as art therapists, we are required to mediate between a multitude of idioms, including the visual and verbal communication of our clients, the diagnostic categories of the clinical team, the vocabulary of the art world, and the terminology of art therapy. We are trained to respond to the subtleties of visual imagery, but we are not always attuned to the complexities of the many verbal systems we use as art therapists.

Like any therapeutic relationship, the art therapy relationship is an artificial construct that is based on an imbalance of power. As such, it is inherently unequal, even when clients come to us voluntarily. When clients are referred to us, it is not uncommon to assume that they have a mental illness and conduct initial interviews with the intention of identifying symptoms and diagnosing pathology. It is a human tendency to notice information that confirms initial assumptions and to ignore contradictory or paradoxical evidence.

Distinctions of roles are emphasized from the beginning of treatment in order to "set the therapeutic frame." Therapists are usually trained to be relatively reticent while encouraging their clients to disclose as much as possible. This imbalance in verbalization is designed to evoke powerful transference reactions which may manifest themselves in dependency or idealization of the therapist. It is not uncommon for clients to attribute their therapists with magical qualities such as omniscience and healing powers, or to feel strong regressive tugs in their presence. While transference feelings may be a useful and inevitable aspect of the therapeutic relationship, art therapists must sensitize themselves to how the quantity, as well as the quality, of the language they use creates an imbalance of power.

Talking and Writing About Mental Illness

Language also exerts power over the client when it includes technical terminology unfamiliar to laypersons. Technical and scientific expressions can be useful among professionals because they create an interdisciplinary vocabulary, but they are usually alienating in conversations with clients. Using exclusive language is a way of talking above clients, even while talking to them; it tends to make them feel anxious, intimidated, and inferior. Coleman (1983) observes, "At the heart of the matter lies a struggle for control—the use of symbols to guide, manage, dominate, direct or regulate the perceptions of others" (p. 401).

Art therapists should take care to remain sensitive to words that could "type" or label someone. Like scientific terminology, accurate diagnoses can advance treatment. They organize quantities of complex information into a form that can be understood by the various disciplines of a treatment team. They may help determine appropriate treatment goals and medication, and they are a "necessary evil" in applying for reimbursement from insurance companies. However, art therapists should remember that scientific terminology derives from a medical model that diagnoses pathology rather than describing functioning. Therefore, it should be reserved only for those occasions when it is required, and even then scientific terminology should be used sparingly.

Obviously, there is potential risk in labeling people. The risk is that we will identify people with their illnesses rather than view them as individuals. When we label people, we put them into categories and tend to interact with them on the basis of those categories instead of providing individualized care based on their particular needs. Rather than working with a person who happens to have a disorder called schizophrenia or post-traumatic stress, for example, we treat "a schizophrenic" or "a trauma victim."

Deegan (1993), a clinical psychologist and a former psychiatric patient, describes the perils of being labeled by an illness. She cautions that when people identify with their illnesses, they often give up control of their lives, passing the responsibility on to their therapists. Remembering when she was first labeled with chronic schizophrenia, she recalls her deep sense of loneliness and worthlessness. In an imaginary conversation with herself as a young woman, Deegan underscores the negative language used to reinterpret normal human behavior when someone is labeled with a mental illness.

Almost everything you do gets understood in reference to your illness. You used to have days when you had "ants in your pants" but now they say you are agitated. You used to feel sad sometimes but now you are said to be depressed. You used to disagree sometimes but now you are told you lack insight. You used to act independently but now you are told that your independence means you are uncooperative, noncompliant, and treatment resistant. You used to take risks. You learned from your failures as you were growing and learning. But now that you have been labeled with a mental illness the dignity of risk and right to failure have been taken from you. No wonder you get angry. Normal people get to make many stupid choices over and over again in their lives. Nobody tells them that they need a case manager. (p. 9)
Just as language is culturally relative, so are concepts of mental illness. People are most apt to label those they know least well. Szasz (1970) cautions against "manufacturing madness" and notes that what we identify as mental illness may actually be problems of everyday living. Giving psychiatric labels to those who are unconventional or different from the dominant culture may be a way of trying to control those we fear or do not understand.

In a pluralistic society, art therapists need to be aware that all aspects of their relationships with clients are influenced by cultural assumptions about wellness and illness. Before rushing to label a person's illness, we should remind ourselves that each society has different notions of the causes, diagnoses, course, and cures of mental illness. We should try to familiarize ourselves with their cultural beliefs, practices, and worldview so we can understand how they experience their worlds.

We might also consider the possibility that eagerness to label people with mental illness is a form of xenophobia. It is commonly accepted that everyone feels threatened by people who are different from them. However, it is also possible that what some professionals fear most about their clients are their similarities. Labeling clients may be a means by which some clinicians reassure themselves that they are indeed different from people who have a mental illness. It is important to remind ourselves that what separates us from our clients with mental illness are merely accidents of time, place, or circumstances.

Talking and Writing About Clients' Art

The familiar proverb, "A picture is worth a thousand words," suggests the complexities of translating visual imagery into spoken and written language. Art therapists face this dilemma when they encourage clients to explore and clarify the images they create in art therapy sessions. They face it again when they discuss their clients with other members of the treatment team, and also when they participate in professional activities such as teaching, presenting, and writing.

The language used by art therapists is a highly refined synthesis of their multidisciplinary education and training with their cultural backgrounds and experiences. In discussing artworks with clients, it can be tempting to use our own familiar art therapy discourse or the medical culture's convenient system of diagnostic categories. Hoping to facilitate their recovery, we encourage clients to translate their images into words and to decode the meaning of their creations. However, talking to clients about their art can be like conversing in different tongues. When we often describe art as a "universal language" accessible to all, many clients have not had opportunities to develop vocabularies or concepts related to art. We may have unrealistic expectations when we encourage clients to translate the visual into the verbal and to explore what their creations mean to them.

Similarly, significant nuances of clients' artwork may "get lost in the translation" when we write about it, interpret it, and discuss it with fellow professionals. In presenting clients' art, we usually edit or rephrase their words for the sake of clarity and brevity. In so doing, however, we may also dilute both the meaning of their products and the intensity of their subjective experiences. Even more troublesome, we may translate their creative expressions into symptoms of diseases, evaluating their images in terms of the medical culture's definition of what is appropriate and inappropriate, healthy and unhealthy, normal and deviant, or functional and dysfunctional.

Those of us who are members of the dominant Western culture are apt to make assumptions about client artworks based on Eurocentric definitions and standards we think are universal. It is only natural that these assumptions become imbedded in the language we use when talking and writing about our clients' images. All art therapists are expected to have a solid grounding in the history of art. However, the aesthetics of most were formed in white, middle-class households, nurtured by slides of art by Old Masters shown in darkened college classrooms, and cultivated through museum trips to contemplate masterpieces of Western civilization. Lippard (1990) notes, "Within the artworld, few cases of overt censorship due to racism are recorded or reported because personal taste and individual selection (called curating) rule for the most part unchallenged. The people doing 'he caring' for art are overwhelmingly white, middle-class, and—in the upper echelons—usually male" (1990, p. 7).

We all know that art, like language, is fashioned from the fabric of our lives, woven from the threads of our social, emotional, and intellectual beings. Yet we may not be fully aware of our cultural conditioning when we look at art by our clients. We may have difficulty separating which aspects of their images are determined by their unique personalities and which are affected by the "ways of seeing" of their particular cultural groups. As art therapists, we have the responsibility of developing awareness of our own subjective aesthetics that we bring to the therapeutic encounter. Awareness of our culture-bound aesthetic values and taste is necessary in order to comprehend the subjective aesthetics of another person. Once we recognize our own artistic sensibilities and their roots in our personal and cultural experiences, we can begin to see beyond the limits of our particular perspectives to appreciate the diverse aesthetics of our clients. This new understanding will naturally be incorporated into our verbal and written communications, providing a more accurate reflection of our clients and their art.

Suggestions and Recommendations

Before exploring and modifying our language usage as art therapists, we should take time to examine whether aspects of our personal biases, professional assumptions, and clinical theories interfere with our ability to perceive what our clients show and tell us.

In considering the "art" of art therapy, we can begin to look at our assumptions about artistic expression. We might ask ourselves questions such as: Do we assume that the arts are always therapeutic and universally accessible? Do we value spontaneity of expression over more cognitive approaches? Do we differentiate between self-expression and an authentic work of art? We can also examine our assumptions about mental illness. We can reflect on the influence of the medical profession's disease model of mental illness, which focuses on pathology rather than strengths and transformation. We can wonder under what conditions diagnoses advance treatment, and when they become stigmatizing, disenfranchising, or dehumanizing. And we can wonder if we ever make assumptions about chronicity, unemployment, and dangerousness based on our fears of our clients rather than our hopes for them.
A Phenomenological Approach to Language Usage

What people do, say, think, know, make, and use constitutes culture, and attempts to describe culture, or aspects of culture, are called ethnography (Bogdan & Biklen, 1982). Ethnographers believe that reality is a social construction. One way to avoid using culture-bound language is to adopt the attitude of an ethnographer, or anthropologist, who seeks a subjective understanding of the lives and behavior of other peoples. Before actually writing or talking about clients and their art, it is useful to try to gather a generous amount of data over an extended period of time. We can try to approach clients with as few preconceptions and judgments as possible, listening to them attentively, observing their art intently, and interacting with them respectfully. Like anthropologists studying an unfamiliar culture, we can try to spend time documenting observations of clients and recording their words as accurately as possible. Rather than using clinical terminology, we can create vivid descriptions by allowing our clients to “speak for themselves” by using their words in our verbal and written presentations.

Art therapy literature provides concrete guidelines for helping clients find words to describe the subjective meaning of their artworks. Based on their beliefs that the meaning of an artwork is constructed by its maker, Betensky (1987) describes a phenomenological approach to art therapy and Nucho (1987) describes what she calls “ipsomatic seeing.” Betensky’s phenomenological approach outlines a highly structured sequence of motivating, viewing, describing, and integrating artworks. Once an art piece is created, the art therapist guides the client in a process called “phenomenological intuiting,” which is a close examination of the work followed by an objective description of its formal elements. The key phrase repeated by the art therapist during the viewing process is simply, “What do you see?”—which prompts a detailed verbal description of the phenomenon, or artwork. Next, the art therapist guides the client in “unfolding” and integrating its private meanings. By emphasizing an unbiased understanding of artworks, this methodology can aid the art therapist in viewing clients’ art from their perspective and can also provide the language for talking and writing about it.

Nucho’s ipsomatic approach provides a similar structured process for helping clients describe and decode their artwork phenomenologically—without any preconceived notions. She details a structured dialogue phase which takes place when an artwork is completed. In talking about their art, clients are guided through a three-step inquiry based on an inventory of the shapes and/or objects in the artwork, an exploration of its affective components, and an intellectual elaboration of its meaning. As in Betensky’s method, the ipsomatic approach encourages clients to construct the meaning of their own art, giving us language that respects their experiences of their worlds.

An approach to using less biased language is to exercise our empathy by imagining what clients might say if they described themselves or their artworks. Another resource rarely used is our clients themselves. There may be cases when it is appropriate to consider consulting with them for corroboration or corrections of our written reports. When we write assessments, we can present our findings as tentative hypotheses rather than conclusive diagnoses. We can try to paint an expressive word-picture of their everyday experiences, portraying as closely as possible how it feels to inhabit their world, what their joys and sorrows are, and what gives their lives meaning.

Nonjudgmental Language

It takes vigilance to use language that conveys our meanings accurately and objectively. Many words and phrases commonly used in the mental health field imply judgment and too often become disparaging labels. When clinicians communicate about their clients, they frequently use terms that imply polarities, such as low-functioning and high-functioning, over-achieving and under-achieving, appropriate and inappropriate, and normal and abnormal. But human behavior is rarely so extreme. Rather than describe people in terms of black and white, it is often more accurate and less judgmental to use more specific words to represent the gray area that lies in between.

Another language habit that encourages labeling is the use of words that indicate facts rather than inferences. This occurs most often when the communicator uses a variation of the verb to be (Hatfield, 1986). Facts have objective reality that can be verified, while inferences are, at best, educated guesses. When we make statements about clients, it is important to use qualifying terms such as perhaps, might be, possibly, or seems to be. For example, consider the difference between stating, “He is obsessed,” and remarking, “He seems to be obsessed,” and then describing the client’s observed behavior.

Sometimes mental health professionals use language that has negative or fatalistic implications. For example, a term used frequently is the adjective chronic, which implies that a person can never recover. It is more accurate and less harmful to use words such as prolonged, persistent, serious, or severe because no one can predict the certain course for any individual. Several long-term studies of the course of psychiatric disorder show that one-half to two-thirds of people with severe mental illness recover sufficiently to function well in the community (Frances, 1990; Harding, Zubin, & Straus, 1987; Huber, Gross, Schuttler, & Linz, 1980). Similarly, when communicating about clients, we can choose to emphasize strengths rather than weaknesses and abilities rather than disabilities, because negative characterizations can become self-fulfilling prophecies.

One of the best resources for language describing a non-dominant culture is the group itself. Just as most of us try to identify racial and gender groups by names they prefer, we can also identify the people we treat by terms they choose. Chamberlain, a vocal advocate for people with mental illness, who has lectured worldwide and advised President Clinton, refers to “former patients, psychiatric survivors, mental clients and consumers. She asks her audience to note the multiplicity of terms . . . [as] there is no single term we are all comfortable with. We choose to call ourselves by many different names. I prefer to call myself a psychiatric survivor” (In Bachrach, 1992, p. 867). “Survivor” is the most radical term used by people in the mental health system. Writing for a publication called The Disability Rag (1991), Rosen describes the rationale for this term: “Those of us who are involved in the struggle to end our oppression are, simply, survivors. There is no better word to define the reality that belongs uniquely to us. . . . Until we define our existence, in a word we ourselves have chosen, we will never be free” (pp. 6–7).
“People First Language”

Although there is no universal agreement on terminology at this point in the evolution of mental health terminology, the consensus favors what is called “people first language.” Guidelines for Reporting and Writing about People with Disabilities (1993) is a pamphlet published by the University of Kansas to inform professionals from various fields about preferred language usage and to suggest straightforward terminology for portraying people with disabilities. These guidelines were endorsed by over 100 national disability organizations and are used by the Associated Press. The updated American Psychological Association’s Publication Manual (1994) has added a new chapter on language bias to help authors avoid “perpetuating demeaning attitudes that are biased assumptions about people.” It emphasizes the importance of using language that maintains the integrity of people as human beings.

As the term suggests, “people first language” puts people first, not their disability. For example, according to the guidelines we should refer to “a person with schizophrenia” or “a person who has experienced schizophrenia,” rather than give someone a generic label such as “a schizophrenic.” This way, the person, rather than his or her functional limitations, becomes the subject of the sentence and focus of the statement. Preferred terms for talking about people who are mentally ill include “people with emotional disorders, psychiatric illness, or psychiatric disabilities.” The guidelines also suggest that diagnostic terms, such as psychotic and schizophrenic, be used only when medically and legally accurate and should never be used out of context.

Conclusion

Using respectful but accurate language when speaking and writing about clients and their art can have a favorable impact on the outcome of art therapy treatment. Language can be empowering. Just as our attitudes are imbedded in the language we use, so the language we use can affect attitudinal change. It is possible that addressing and discussing clients in respectful terms will increase their self-esteem and help build a more positive sense of identity. It may be that hearing themselves talked about in respectful terms can help clients think about themselves in more respectful terms, causing a shift in self-perception from one who is stigmatized, disenfranchised, and disempowered to one who is valued, respected, and empowered.

A newsletter called Pathways to Promise: Interfaith Ministries and Prolonged Mental Illness (1994) recently published the poem “Beyond Programs: A Parable,” which gives voice to some of the sentiments this article seeks to convey:

I don’t want to be a client. I want to be a person.
I don’t want a label, I want a name.
I don’t want services, I want support and help.
I don’t want residential placement, I want a home.
I don’t want a day program, I want meaningful, productive things to do.

The Art of Art Therapy May Be Toxic

Abstract

Art therapists may or may not be aware of the potentially harmful ingredients that are found in art materials which are the tools of our trade. The purpose of this paper is to educate art therapists on the complexities in the process of toxicity warnings on materials. This is necessary so that we do not inadvertently endanger the health of our patients while striving to promote change, growth, and/or development. The inadequate government regulations and laws that dictate labeling of art materials are described to illustrate how art therapists must take it upon themselves to provide preventive measures in order to minimize potential hazards.

Introduction

What is the Materials Labeling Act? What does a warning label mean? What does it mean to art therapists when they see labels or do not see labels on art materials? As art therapists, we often are too busy thinking about a patient’s creations and the artistic process to give a second thought about the tools of our trade. When our art therapy department was approached by a safety inspector in the hospital, we looked into our cabinets and said, “What is really in here?” We found that most materials do not have the ingredients listed on the labels. So how are we to guarantee our patient’s safety when using these materials? What happens if a child eats a box of crayons or an adult stabs another person with a colored pencil? Does it make a difference if the pencil is yellow or blue? What is in these materials that we so blindly put into our patients’ hands?

LHAMA-Public Law 100-695

In November 1990 a federal law called the Labeling of Hazardous Art Materials Act (LHAMA-Public Law 100-695) went into effect. This law is an updated version of the 1988 Federal Hazardous Substance Act (FHSA) (United States Congress, 1988). LHAMA amends FHSA by addressing chronic health hazards. Its purpose is to protect users of art materials from unknowingly exposing themselves to potentially dangerous materials for appropriate and foreseeable uses related to art making. This 38-page law gives specific guidelines (in complex jargon) for determining when an art material may be a carcinogen, neurotoxicant, or development/reproductive toxicant when used in the making of art over a lifetime of use. The methods of exposure of the art material to the body explored in the guidelines are injection, inhalation, or skin contact.

These guidelines are applicable to materials intended for use by children or in a household. A toxic label not only means that the product should be handled with care, but also that children under Grade 6 should not even use it. Products marketed only to schools or businesses where only adults will use them, do not need to comply with this ruling. Therefore, if a professional silk screen shop donates some ink to your art program, the materials may be toxic and not labeled as such.

The concern about toxic ingredients in art materials was initially raised by the American Society for Testing and Materials (ASTM). The ASTM developed a standard for labeling, called Designation D-4236. Most art supplies, both toxic and non-toxic, refer to this designation with a quote, “Label conforms to ASTM D-4236 Standards.” While the ASTM brought the issue of toxicity to light, it did not define toxicity completely. The LHAMA developed a definition for toxicity and methods for testing for toxicity.

LHAMA’s guidelines are for determining a positive toxicity; they do not completely rule out toxicity. When there is no label, this means only that there is no evidence to prove a risk at the present time, or that the manufacturers have known about a material’s potential danger for under a year (the time allotted to properly label a product that has been found to be toxic). Art therapists, therefore, must remember that there is always a risk involved when using materials with unknown ingredients.

The law also distinguishes between a “hazard” and a “sensitization.” A hazard is a strong risk, whereas a sensitization is a risk of a risk. It is best to assume that all art materials are sensitive and need to be handled properly and with care. We must feel confident in our knowledge of the risks and dangers when using a particular material so that we can instruct and supervise our patients’ safe use of various materials.

As of November 1990, any art materials initially introduced into commerce on or after the day LHAMA went into effect are liable for proper warning labels. “If an art material producer or repackager becomes newly aware of any significant information regarding the hazards of an art material or ways to protect against the hazard, this new information must be incorporated into the label after 12 months from the date of discovery” (1991, p. 15710).

The LHAMA represents a big victory for safety when dealing with materials bought after November 1990, but what about that jar of paint that has been in your cabinet for as long as you have been employed? Prior to 1983, manufacturers did not have to tell anyone anything about the content or effects of their products. In 1983, several concerned groups advocating for artists’ safety, such as the Center for Safety in the Arts and the Committee for the American Society of Testing Materials, pressed for voluntary labeling of art materials. This was only mildly successful because manufacturers could choose whether or not to label their products. As a result, the manu-
facturers who labeled their products were punished unknowingly by the consumer. When given two labels on a shelf at an art store, the consumer often chose the unlabeled one over the labeled one, even though both contained the same ingredients. The government was finally persuaded to make labeling mandatory in 1988 under FSHA. This was then superseded by the LHAMA in 1990.

Federal regulations define toxic as "any substance which has the capacity to produce personal injury or illness to man through ingestion, inhalation, or absorption through any body surface" (1991, p. 15672). Carcinogens are defined as cancer-causing materials. Determining carcinogens is difficult because of the long latency period between exposure and appearance of tumors, as well as the multiple sources of carcinogenic exposure. Discrepancies due to lack of evidence or controversies are settled case by case by the Consumer Product Safety Commission.

Neurotoxicity is an adverse effect to the nervous system due to exposure to a toxin. The effects can be immediate, delayed, reversible, or irreversible. Characteristics of neurotoxicity are side effects due to overdose, functional or structural responses which render the nervous system unable to compensate and restore the normal functioning, or any alteration in one's normal functioning. Neurotoxicity damage happens in both the central and peripheral nervous systems. Chemicals enter the nervous system through nerve endings or the blood-brain barrier. Since neurotoxicity can produce a variety of symptoms, it is difficult to trace it to a specific cause. "Major difficulties encountered in studies in humans are the delayed neurotoxic effects, exposure to mixtures of chemicals, and the lack of information on the effects of acutely nontoxic low-dose levels of neurotoxins over a long period of time" (1991, p. 15680).

Reproductive and developmental toxicity addresses potential effects during the growth of children or hazards that may affect the ability of adults to reproduce healthy offspring. As with carcinogens and neurotoxicants, so many possible causes of defects besides a certain art material make it difficult to prove conclusively that one specific cause or art material is responsible. Although the law is worded to cover every little detail, in the end it is too vague to be effective.

Under the LHAMA, manufacturers or repackers are required to have any materials they market as art supplies tested by a board-certified toxicologist of their choice. (The term art supplies was never defined and seems to be a term placed on the product by the manufacturer.) If the product's ingredients are found to be toxic, the manufacturers or repackers must submit information regarding the criteria and findings to the Consumer Product Safety Commission (CPSC), and the proper labeling must be placed on the product within 12 months. If the product is found to be nontoxic by the toxicologist, the CPSC need not be notified. In either case, the CPSC does not see the actual recipe for the material unless the Commission requests to see it to settle a dispute. All recipes are confidential and kept by the toxicologist along with documentation of the procedure used to test the material, the criteria for a "toxic" determination, and the findings on that particular product. It is the responsibility of the manufacturer or repacker to check all art materials and notify the CPSC in the event of a toxic finding.

Proper labeling is checked at random with materials bought at retail by a certifying board made up of users or their representatives and manufacturers' chemists, and may be funded by manufacturers. The manufacturer is also required to have the recipe tested every time the ingredients are changed or once every 5 years. After a product has been deemed toxic, the manufacturer has one year to put a warning on its label. The law is geared to place the major burden of informing the public on the manufacturer or repacker.

The manufacturer or repacker does not have to obtain prior approval from the CPSC to market a new product, but all new products developed after the LHAMA went into effect must be tested and properly labeled within 12 months. Warning statements must be in bold capitals with the lettering size equal to or greater than other lettering on the box or bottle. The warning must also be in English and located prominently in legible type in contrast to other parts of the label. Toxic labels must include the name and address of the producer or repacker, a working telephone number in the United States, and a warning statement. If the product's size is one ounce or less, the package must contain an insert with warning information. Products that are found to be hazardous must be labeled and their marketing must be limited to adults or children above Grade 6.

Practical Application of the LHAMA

To test the law and the level of manufacturers' compliance, we took inventory in our supply cabinets. (Some materials in our cabinets were purchased prior to the law going into effect, so we estimate a ± 10% degree of error.) Regarding a complete address on the label, our inventory found 84% in compliance, 11% listing no address, and 5% having incomplete addresses. However, only 7% of the suppliers had a telephone number. Only 5% of our materials made no reference to the law or warnings of any kind. While manufacturers seem to follow the rules when it comes to a warning statement, they barely are in total compliance with the LHAMA guidelines. For example, we looked at Duco Cement packaging and found an incomplete address and no telephone number. On the other hand, Krylon Workable Fixatif did have a complete address and the verbiage even mentions calling poison control for more information; however, this product did not display the manufacturer's telephone number.

In our inventory gold stars went to Binney and Smith products (Crayola, Liquitex, Artista) and Weber Costello (Alphacolor Char-kole) for not only being in compliance with federal regulations, but also for having "800" numbers on some products and for being certified by the Arts and Crafts Materials Institute as nontoxic. We found the products that had nothing on their labels regarding toxic warnings, etc., tended to be manufactured in other countries and/or were old materials. Imports, to our knowledge, are not required to be in compliance with U.S. laws and are not checked by import agents.

Consumer Product Safety Commission

The Consumer Product Safety Commission (CPSC) places the responsibility for enforcing guidelines on interstate com-
merce agencies. The Commission’s responsibility is to make regulations and specify tests for determining toxicity. The Commission will also intervene in instances where there is uncertainty about a product and no solution can be determined. When we called the Commission, a representative vividly described the overwhelming task of monitoring the regulations, because of limited staff and the large geographical locations each person is assigned to monitor. An endless supply of products, each with its own recipe, makes the job of total awareness impossible. Another hurdle is toxic quantity. A product may contain toxic chemicals, but not enough to deem the art material toxic. So each ingredient that comprises the thousands of colors and types of art materials has to be analyzed, and the results read by employees of the Commission.

Considering that there is only a small staff of CPSC employees assigned to large parts of the United States, only a minimum number of products are actually monitored. The first page of the American Society of Testing and Materials standards practice for labeling says it best: “Since knowledge about chronic health hazards is incomplete and warnings cannot cover all uses of any product, it is not possible for precautionary labeling to ensure completely safe use of an art product” (1988, p. 1).

The Process of Labeling a Material as Toxic

The process of labeling a material toxic is important because it illustrates just how detailed and time-consuming testing is. To summarize, the LHAMA outlines three types of intake and two types of analysis. The types of intake are oral ingestion, inhalation, or skin contact. Studies are done using animals and humans (where available and permissible). Human data are obtained from studies of exposure and previous data. If positive information on humans is available, then the substance is considered toxic. If limited information on humans is available (which means all outside factors cannot be eliminated), along with sufficient evidence on animal studies, then a toxic ruling is also concluded. If animal studies alone generate conclusive information but no human data can be found, then the material will be determined nontoxic. “While it is not mandatory that persons (toxicologists) follow these guidelines in making their determination of chronic toxicity, the commission intends to bring individual enforces against improperly labeled products, or against manufacturers, distributors, or retailers of such products” (1991, p. 15674).

The toxicologist must first determine whether or not the substance is toxic. He or she then decides what risk is acceptable over a lifetime of use so that there is no effect on the individual. This testing process uses initial data from testing to guide testing of specific effects.

The Commission can also rule based on default, which assumes the product is dangerous by assuming the person will be exposed to the highest risk. This is needed in cases of suspected danger so an art material will have some kind of warning label. Later, the material may be thoroughly tested and the label will be adjusted accordingly. Not only can dangerous materials be unlabeled, but labels may incorrectly name a nontoxic material toxic.

In an attempt to be as complete as possible, the Art Materials Labeling Act has several types of warnings. One aspect that the guidelines address is bioavailability, which is defined as the “ability of a substance to be absorbed into the body” (1991, p. 15688). Manufacturers try to get around a toxic labeling by stating that a toxic material is not soluble and therefore cannot be absorbed into the body. However, a material may not be hazardous during one contact, but will become dangerous over time. Hazardous substances cannot simply be labeled toxic. Much depends on factors such as the amount of exposure, the chemical nature of the substance, the metabolism of the person exposed, the distribution through the body, and other unique factors that differ each time a substance is used. What makes bioavailability especially difficult is that it takes into account an individual’s physiology, which can vary according to age, sex, race, body build, etc. That is why, for example, some warnings may be specific to women or children. Bioavailability testing is complicated and time-consuming since bioavailability is adjusted as necessary to account for species, sex, and race.

Sensitization, another type of warning defined in the Art Materials Labeling Act, describes a product that has the potential to be dangerous but a definite ruling of toxicity cannot be made due to a lack of data. Sensitization means there is a potential for harm if the products are not handled carefully. Therefore, we must always be sure our patients are using materials in a properly ventilated room and are equipped with protective gear if necessary.

Conclusion

Are we, as art therapists, going to harm our patients and/or ourselves in treatment? To respond in the negative, we must be aware of the possible dangers of the materials which are essential to our work. The best possible way to keep our patients and ourselves safe is to keep our eyes open. We must carefully choose our art materials and keep the type of population with whom we work in mind when ordering supplies. We must become familiar with nontoxic substitutes (Art Hazard News publishes such a list) and use materials bought after 1990 (or know from where the older supplies come). When in doubt, we should refrain from using an unlabeled material. It is especially important to post the poison control center’s telephone number in our art rooms. When we are unsure of a material, we can also call the CPSC or any organization that researches art materials and their safety. We must keep in mind that there is always a risk, but that watchful art therapists will be able to prevent harm or injury by being knowledgeable about the materials we use with our clients.

Editor’s note: Jennifer Jacobs, MA, A.T.R., is an art therapist and child counselor in the Program for Adolescent Development at Kings County Hospital, Brooklyn, NY. Illo Milton, MPS, MSW, A.T.R., is in private practice and is the Acting Director of the Art Therapy Department in the Division of Child & Adolescent Psychiatry at the State University of New York Health Science Center at Brooklyn, NY.

1973
Waste Reduction

Artists and art students work with many materials to create art. Certain art materials can be hazardous both to the students and to the environment. The best way of eliminating waste art materials is through source reduction, the elimination of hazardous or nonhazardous wastes before they are created. Reuse and recycling are also good methods of reducing waste. Several ways that art students and teachers can address this issue are:

- Substitute art materials that are less toxic to the environment—and also less toxic to the students.
- Completely use up art materials. Purchase in container sizes that do not leave lots of residue.
- Reuse or recycle art materials whenever possible.
- Treat hazardous waste art materials by neutralization (see photography section) or other methods when possible to reduce the toxicity of the waste stream.

Understand that substitutions may involve using alternative art materials and techniques. It may take a little time getting used to these alterations. Also, remember that the safety of all recycled materials should be determined before use. This poster contains general recommendations and very specific ones for safer substitutes in art.

Elementary School Students

Some art materials are dangerous for young children to use. Basically, young children should only use art materials that are nontoxic. This poster recommends that young children use art materials that do not have any warning labels and carry the statement "Conforms to ASTM D-4236" or similar wording. Products that have been approved by a toxicologist and carry the Certified Product (CP) or Approved Product (AP) seal of the Arts & Crafts Materials Institute are generally approved for young children.

This poster shows safe art materials that can be SUBSTITUTED for the more hazardous ones in elementary school classes. Young children should not use any processes discussed under secondary schools unless also approved for elementary school students, at the top of each arts category.

Secondary School Students

Art materials that are used in the junior and senior high school levels are often more toxic. This poster shows safe and less toxic art materials that can be used to replace more hazardous materials. Please remember that sometimes the substitute materials can still be hazardous—just less so! Make sure that the label carries the statement "Conforms to ASTM D-4236" or similar wording, indicating that the warning label conforms to the requirements of the Labeling of Hazardous Art Materials Act of 1988.

Since many art materials recommended here still might be hazardous, although to a lesser degree, secondary school students and teachers may still need to take health and safety precautions while using art products. These precautions may include types of ventilation, gloves, respirators (face masks), and other safety precautions. Remember to take the right safety precautions!

CERAMICS

Elementary School Students

Clays

Use only wet, premixed clays.
White clays
Glazes
  Use only talc-free clays.
  Paint finished pieces with acrylics or tempera instead of glazing.
  Use CP/AP lead-free liquid glazes.

Secondary School Children Through Adult
Clays
  Use only talc-free, premixed clays.
Glazes
  Use only lead-free glazes.
  Use premixed liquid glazes, not powders.
Colorants
  Use glazes that do not contain carcinogenic nickel, cadmium, uranium, chromates, or talc.
Waste clay
  Cut into small pieces and place in barrel of water for recycling.
Waste glazes
  Combine residual glazes and reuse.

PAINTING AND DRAWING

Elementary School Students
Paints
  Use CP/AP water colors, tempera, and acrylic paints, not adult paints.
Scented markers
  Do not use because they teach children to smell and eat art materials.
Permanent markers
  Use CP/AP water-based markers.
Pastels, chalks
  Use CP/AP oil sticks, crayons, chalks, and colored pencils.
Spray fixatives
  Use CP/AP clear acrylic emulsion to fix drawings.
Rubber cement
  Use glue sticks or double-sided tape.

Secondary School Students
Painting
  Use pigments that do not contain lead, cadmium, mercury, arsenic, or chromates.

Drawing
  Use oil pastels instead of dry pastels.

COMMERCIAL ART

Elementary School Students
Scented markers
  Do not use because they teach children to smell and eat art materials.
Permanent markers
  Use CP/AP water-based markers.
Rubber cement
  Use glue sticks or double-sided tape.
Glues
  Use CP/AP glues for collage.

Secondary School Students
Paint/Drawing materials
  Use water-based paints and inks instead of solvent-based ones.
Airbrushing
  Use a tooth brush to spatter paint. Don’t airbrush solvent-based dyes or inks.
Permanent markers
  Use water or alcohol-based markers instead of markers based on toluene or methyl isobutyl ketone.
Rubber cement
  Use waxes or double-sided tape instead of rubber cement or spray adhesives.
  Use kneaded eraser to remove wax from mechanics.
  Use heptane-based adhesives instead of hexane-based types.

PHOTOGRAPHY

Elementary School Students
Photochemicals
  Use polaroid cameras, without transfer manipulation.
Photochemicals
  Send film out to be developed.
  Do sungrams with blueprint paper and sunlight.
  Do photocopier art.

Secondary School Students
Black and White Processing
Developers
  Use only metol/hydroquinone developers or the less toxic phenidone/hydroquinone developers.
  Use replenishment solutions to reuse chemicals.
  Neutralize with stop bath or critic acid before disposal.
Stop bath
  Use water only, instead of acetic acid.
Fixers
  Use low acid fixers instead of high sulfur dioxide rapid fixers.
  Recover silver from fixer if using large amounts.
Reducers
  Use only Farmer’s reducer (potassium ferricyanide).

**PRINTMAKING**

**Elementary School Students**
- Screen printing: Use CP/AP water-based inks.
- Relief printing: Use linoleum cuts instead of woodcuts. Use CP/AP water-based inks.

**Secondary School Students**

**General**
- Pigments: Use pigments that do not contain lead, cadmium, mercury, chromates, or arsenic.
- Use premixed inks.
- Cleaning solvents: Use odorless mineral spirits instead of turpentine, kerosene, or gasoline.

**Screen Printing**
- Inks: Use water-based inks instead of solvent-based inks.
- Stencils: Use cut paper, contact paper, etc., instead of lacquer stencils.
- Screen mounting: Use staples or tape instead of solvent-based glues.
- Photoemulsions: Use diazo photoemulsions or presensitized photo film.

**Intaglio**
- Acids: Use ferric chloride (iron perchloride) instead of Dutch mordant.
- Neutralize nitric acid baths with baking soda before pouring down sink. Test with pH paper.

**Cleaning solvents**
- Scrape inking slab and press with palette knife to reduce amount of ink, remove remaining ink with vegetable, baby, or mineral oil, and wipe oil film with cotton ball and rubbing alcohol for cleanup.

**Photoetching**
- Use presensitized plates or xerox transfer/screen process instead of techniques that use highly toxic solvents.
### Lithography

**Acids**  
Use premixed gum etches instead of using concentrated acids.

**Vinyl lacquers**  
Do not use because of high toxicity.

**Dichromates**  
Use fountain solutions based on water and gum arabic.  
Use citric acid as counteretch.

**Hydrofluoric acid**  
Do not use because of extreme toxicity.

**Talc**  
Use asbestos-free tals (e.g., baby powder).

**Phenol**  
Use mechanical cleaning of stones.

**Photolithography**  
Use positive/negative presensitized offset plates.

### WOODWORKING

**Elementary School Students**

**Woods**  
Use only common soft woods.

**Glues**  
Use CP/AP glues.

**Paints**  
Use CP/AP water-based paints.

**Secondary School Students**

**Preserved**  
Do not use woods treated with chromated wood copper arsenate (CCA), pentachlorophenol, or creosote.  
Use ordinary woods.

**Particle board and plywood**  
Use ordinary woods to avoid formaldehyde.

**Tropical woods**  
Use nonallergenic and nonirritating woods.

**Leftover wood**

**Glues**  
Recycle into new projects.

**Use** white glues, hide glues, and other water-based glues instead of epoxy, formaldehyde, or solvent-based glues.  
Use small containers to minimize drying out of glue.

**Paints and coatings**  
Use water-based products instead of solvent-based ones.  
Use lead and mercury-free paints.

**Shellac**  
Use shellacs containing denatured alcohol not methyl alcohol.

**Oil and solvent-soaked rags**  
Recycle by drying or sending to recycling laundry.

### SCULPTURE

**Elementary School Students**

**Modeling clays**  
Use premixed clay or CP/AP modeling materials.

**Papier maché**  
Use black and white newspaper with CP/AP pastes or CP/AP instant papier maché made from cellulose.

**Secondary School Students**

**Clay**  
See Ceramics.

**Plastics**  
Plastic resins  
Do not use polyester, epoxy, acrylic, or polyurethane resins because of high toxicity.

**Solid plastics**  
Use saws instead of hot wire or torches.

**Stone**  
Soapstone or steatite  
Carve alabaster or cast plaster.

**Wax**  
Use beeswax or petroleum waxes, not chlorinated waxes.

### TEXTILE AND FIBER ARTS

**Elementary School Students**

**Synthetic dyes**  
Use vegetable dyes (spinach, tea, onion skins, etc.) or food dyes.

**Synthetic fibers**  
Use fibers that have not been treated with formaldehyde sizings.

**Textile remnants**  
Left-over textile scraps can be used for stuffing pillows or soft sculpture projects.

**Secondary School Students**

**Fibers**  
Animal fibers  
Use hair and wool not imported from Mid or Far East because of anthrax.

**Dyeing**

**Mordants**  
Use nondichromate mordants.

**Fiber-reactives**  
Use liquid fiber-reactives, not powders.

**French dyes**  
Use water-based dyes.

**Vat and azoic dyes**  
Use other classes of dyes.

**Leather dyes**  
Use leather dyes containing denatured alcohol rather than other solvents.

**Batik**

**Wax**  
See Sculpture, wax.

**Dyes**  
See Dyeing.

**Solvents**  
Boil out or iron out wax instead of using solvents.

**Papermaking**

**Woods, plants**  
Use nonallergenic and nonirritating materials.

**Lye**  
Recycle used paper and cardboard, or use rotten or mulched plant materials to avoid boiling in alkali.  
Use soda ash (sodium carbonate) not lye.

**Dyes and pigments**  
Use liquid dyes and pigments instead of powders. See also Dyeing.

Brief Reports

Legal and Ethical Issues Impacting Unlicensed Art Therapists and Their Clients in California

Marybeth Webster, Grass Valley, CA

Abstract

A confusion about who and what is an art therapist is examined via the exclusionary California state licensing laws. Comparison of the training and job descriptions of art therapists with psychotherapeutic disciplines with licensed degrees reveals few discernable differences, yet the restriction prohibiting private practice to unlicensed art therapists limits full use of their skills. Ethical issues (such as advertising, expert witness, duty to warn and report, malpractice, etc.) are discussed as they affect the unlicensed art therapist. It is the purpose of this article to further efforts to legitimise the profession and to move toward removal of ethical and legal constraints on unlicensed art therapists via state-recognized certification, exemption, or formal licensure.

Introduction

In California art therapists who have qualified for registration (A.T.R.) with the American Art Therapy Association (AATA), and even persons who meet the California requirements for the job title of art therapist or art rehabilitation therapist, are barred from private practice by state licensing laws. Unless the art therapist holds a license as a social worker; psychologist; or marriage, family, or child counselor (MFCC), s/he may not practice privately in California.

The California State Personnel Board specifies art as one of the rehabilitation therapist specialties for state hospitals. The job description says . . . "assess individual needs. . . . determine objectives; . . . conduct various forms of group and individual therapy; . . . evaluate and document patient/resident responses and progress. . . ." Additionally, the description states that an art specialist "uses art media as a means of expression and communication to promote preceptive, intuitive, affective, and expressive experiences which lead to growth or reintegration of personality" (California State Personnel Board Specifications, 1972). I interpret this as giving unlicensed art rehabilitation specialists the right to do psychotherapy (which the Psychologist Licensing Law prohibits!) but only in a state rehabilitation setting under supervision.

Also, art therapists are used as clinicians in state licensed health facilities where they may serve on a treatment team. Art therapist is a job listing in the California Department of Health and Personnel Services and is currently defined in the California Administrative Code of Health Regulations as follows: "Art therapist means a person who has a master's degree in art therapy or in art with emphasis in art therapy, including an approved clinical internship from an accredited college or university; or a person who is registered or eligible for registration with the American Art Therapy Association." (Title 22, Division 5, 1973).

A legal memo written especially for this paper analyzes existing California state laws regarding licensure of psychologists, clinical social workers, MFCCs, and educational psychologists and finds that the differences among authorized functions may be in form, not substance. The memo goes on to say:

Under the existing licensing schemes, psychologists, clinical social workers and MFCCs all do counseling. Clinical social workers "explain psychosocial aspects" of situations to clients, whereas MFCCs "provide psychosocial explanations of relationships" to clients. Psychologists "modify behavior which is socially ineffectual," whereas clinical social workers "help people achieve more adequate social adjustments." Psychologists "diagnose and treat emotional disorders" whereas clinical social workers "modify behavior, emotions and thinking."

To avoid conflict with other professions, an art therapy licensing statute must set forth the art therapy methods that are distinguishable from the "psychological" methods used by a psychologist, the "psychosocial" methods used by a clinical social worker, and the "applied psychotherapeutic techniques" used by an MFCC. In addition, the art therapy licensing statute must describe the practice of art therapy in language that is different from the other professions—even if they may be doing substantially the same thing.

Discussion among art therapists would disclose a broader rationale for licensing art therapists and such reasons should be included in the legislative intent section of the statute.

However, it seems to me that art therapy's amenability to the diagnosis and treatment of child abuse victims may more readily distinguish it from the work of psychologists, clinical social workers and MFCCs, whose methods are ineffective if the client has not developed sufficient language ability to benefit from the treatment. Child abuse is no longer considered to be a private problem but a public problem affecting the public interest. Therefore the time may now be right to seek licensing for art therapists to serve a public interest in ameliorating a public problem. (Enright, 1992)
Public Protection

The public is not protected by law from the many who claim to be art therapists or who say they do art therapy but who do not have the proper academic background or necessary clinical experience to work with the people served by state-licensed health facilities (Drachnik, 1991). In defending certification and/or licensure of professionals, protection of the public is paramount, with the ideal being technical competence and professional accountability (Johnson, 1970).

Regional art therapy associations are receiving complaints from consumers and agencies about people claiming to be art therapists* who do not have appropriate education or supervised practical training. Some of these individuals are artists with no clinical education or supervision who work with severely disturbed adults and children. This kind of practice is potentially dangerous for patients and certainly not helpful for the reputation of the profession.

Quacks, defined as a "pretender to skill which he does not possess; one who practices as a licensed mental health professional," (Cohen, 1979) abound, perhaps especially in California. Alternative "therapies" are rampant. The popular inclination of Californians to seek improvement or repair in mental, emotional, and spiritual realms makes people vulnerable to these pseudo-therapists. Proving that art therapy is not just another form of quackery includes efforts to professionalize and regulate the discipline on a par with licensable mental health professions.

Art Therapy Licensure and Certification

Addressing professional and ethical concerns about protection of the public form unqualified or unscrupulous practitioners, as well as accountability for competence, is underway within the profession of art therapy with the creation of national certification requirements and an examination. It is hoped that certification will lead eventually to licensure in the State of California, thereby exempting licensed art therapists in the Psychology Licensing Law along with other exempted professionals such as MFCCs, MSWs, psychologists, etc. (Gregory & Paine, 1984).

The California Board of Behavioral Science Examiners oversees licensure, investigates ethical issues, and determines and enforces sanctions for those therapies comparable to art therapy. It is to that board that California art therapists might apply for regulation under a licensing bill.

The Board of Psychology under the Medical Board of California oversees clinical psychologists' licensure and, through its Central Complaints and Investigation Control Unit, investigates and disciplines ethical infractions by psychologists. This body would presumably have the power to exempt art therapists from legal restrictions prohibiting practice of what psychologists define as psychotherapy.

Definitions of Psychology vs. Art Therapy

The Psychology Licensing Law defines the practice of psychology as "rendering or offering to render for a fee to individuals, groups, organizations, or the public any psychological service involving the application of psychological principles, methods, and procedures of understanding, predicting, and influencing behavior, such as the principles pertaining to learning, perception, motivation, emotions, and interpersonal relationships; and the methods and procedures of interviewing, counseling, psychotherapy, behavior modification, and hypnosis; and of constructing, administering, and interpreting tests of mental abilities, aptitudes, interests, attitudes, personality characteristics, emotions, and motivations." including "but not restricted to: diagnosis, prevention, treatment, and amelioration of psychological problems and emotional and mental disorders of individuals and groups" (Business & Professions Code, 1990).

Language describing what art therapists do could include all of the above but with variations, since art therapy includes a wide variety of techniques and theoretical bases. Examples of possible definitions can be found throughout art therapy literature:

An art therapist uses the process of art expression and its exploration to effect her [or his] client's positive growth and the amelioration of [her or his] suffering" (and then writes many books about how this is done). (Wadson, 1980, 1987)

Art therapy is a human service profession providing opportunities to develop physical, emotional, and/or learning skills through art experiences. It provides for the exploration of personal problems and human potential through both verbal and nonverbal expression. . . . Through observation and analysis of art behaviors, art products, and the client's communications, the art therapist formulates diagnostic assessments and treatment plans as part of a total therapeutic program. The focus may be on growth experiences, rehabilitation, psychotherapy, prescriptive treatment, remediation, adaptation, and/or personality enhancement. . . . the art therapist creates a supportive environment by organizing the art materials and other resources; by inviting participation appropriate to the client's developmental stage of art expression; by accepting the client's willingness to share thoughts and feelings; and by encouraging the client to recognize and extend these insights beyond the art therapist's session. (Jungels, 1979)

What the creative arts therapist has brought to the mental health field in particular is the notion that psychodynamics and principles of aesthetics are intricately interwoven and that by tapping the artist within ourselves and our patients we have an invaluable treatment tool. . . . We need to develop our own language and theoretical framework, but we must also be conversant in the language of other professionals. We must seek legal protection for our unique skills while continuing to remain receptive to the contributions of our colleagues. Ultimately, if we are to grow as professionals, we must develop concepts and formulations to match the complexities and depths of our therapeutic experiences. (Robbins, 1987)

Who May Practice in California?

Recognized professional groups licensed to practice in the State of California include physicians; clinical social workers; educational psychologists; MFCCs; optometrists; psychiatric technicians; registered nurses; attorneys; persons utilizing hypnotic techniques by referral; persons licensed to practice medicine, dentistry or psychology; persons utilizing hypnotic techniques which offer avocational or vocational self-
improvement and do not offer therapy for emotional or mental disorders; duly ordained members of the recognized clergy; duly ordained religious practitioners doing work of a psychological nature consistent with the laws governing their respective professions provided they do not hold themselves out to the public by any title or description of services incorporating the words 'psychological,' "psychologist," "psychology," "psychometrist," "psychometrics," or "psychometry," or that they do not state or imply that they are licensed to practice psychology. Exempted persons are licensed under Article 5... i.e. educational psychologists, etc. (Business and Professions Codes, 1990).

**Current Status of Unlicensed Art Therapists**

In addition to work in agencies or hospitals, unlicensed art therapists in California report that they currently:

- teach art techniques, experiences, or art processes
- conduct expressive, communication, or self-esteem groups
- conduct in-service trainings
- lead expressive workshops
- do art assessments as a consultant to an agency or licensed therapist
- do art therapy under supervision of a licensed therapist in private practice
- use art therapy techniques as part of career guidance
- use art therapy as part of structured mediation
- act as personal consultants
- teach or supervise (with an A.T.R.) art therapy trainees

One art therapist advertises her individual and group work as "Gestalt Art Experiences"; another as "Art as a Second Language." Workshop titles I have used include "Self-esteem Through Self-expression" and "The Me Nobody Knows." In the opening orientation and/or on the informed consent forms given to new clients, care must be taken to state that the unlicensed art therapist who is not supervised is not doing psychotherapy.

**Ethical Issues**

Ethical issues faced by an unlicensed art therapist include but are not limited to: advertising and other representation to the public; privacy; privilege and confidentiality; serving as an expert witness; duty to warn; reporting abuse; supervisory liability as employee/consultant to a licensed therapist; malpractice; informed consent; and release of art materials for lectures, exhibit, or publication.

Advertising and other representation to the public. Art therapists may list their name, relevant academic degrees earned from accredited institutions, date, type and level of certification, AATA membership status, address, phone, office hours, services offered, and, if not otherwise prohibited, appropriate fee information (AATA, 1990).

Representation to the public in the form of fliers, brochures, listings in resource directories, newspaper interviews, etc., must follow the limitations listed above with special care not to give the appearance of being a psychologist or other licensed practitioner. One may not refer to oneself as a "therapist," "psychologist," "psychometrist," "psychometrics," or "psychometry," or that they do not state or imply that they are licensed to practice psychology. Exempted persons are licensed under Article 5... i.e. educational psychologists, etc. (Business and Professions Codes, 1990).

Privacy, privilege, and confidentiality. Clients need to know that what they share is always theirs to limit, and that all confidences will be vigorously protected from being revealed to any outsider. Since it is the client who holds privilege, he or she has the right to release his or her privilege to allow records or testimony in court. Exceptions to confidentiality include danger to self or others and abuse. Another exception is that parents have the legal right to information about their offspring under most circumstances (Rinas & Clynne-Jackson, 1988).

Serving as an expert witness. Clients must be made aware that an unlicensed art therapist qualifying in California as an expert witness will have less clout than would a licensed therapist. The possible exception to this is the growing respect of legal and law enforcement personnel for the revelations in artwork of children in abuse cases as interpreted by competent art therapists.

Duty to warn. Although not required of unlicensed persons in the Tarasoff ruling (Corey, Corey, & Callanan, 1992), it is morally and ethically necessary for the unlicensed art therapist to notify authorities and potential victims.

Reporting of abuse. Reporting abuse or suspected abuse to Child or Adult Protective Services is also ethically required. Although not specified, an unlicensed art therapist who works with minors or elders, like a dance teacher or anyone who deals professionally with children, is considered a mandated reporter.

Supervisory liability as employee/consultant to a licensed therapist. The law does not permit licensed practitioners to delegate their responsibilities in toto to an unlicensed person; also, the assistant, employee, or supervisee must be competent to perform the services she or he is delegated to perform. The unlicensed art therapist must not function in a way so as to get the "cloak" of being a licensed professional by reason of association with the supervisor/employer. Where a client could reasonably confuse the employee with being a licensed professional, the professional may be subject to disciplinary action for "lending out" his or her license. Usually the "master" is required to respond for, and is seen as responsible for, the "tortious conduct" of his or her employees. This would not absolve the unlicensed individual from the consequences of his or her actions, and the supervisor/employer might sue to recover damages (Cohen, 1979).

Likewise, participating in institutional teams may create added risk for the professional members of the team. As more persons participate in decision-making conferences concerning patients, the risk of suit for breach of confidentiality and/or defamation becomes greater. It is possible, lacking specific law, that an unlicensed art therapist could be seen as an "un-
Conclusion

It is hoped that within the foreseeable future the issue of ethical and legal constraints on unlicensed art therapists will be moot via state-recognized certification and exemption or by formal licensure. Until then, art therapists who are not licensed in their respective states must be cognizant of laws and regulations governing their professional practice.

Progress or Politics

Dee Spring, PhD, A.T.R., MFCC, Ventura, CA

“To rise out of suffering is to view the past from another angle” (Spring, 1993).

Recently, as I toured England, I became overwhelmed with its antiquity and the years of struggle for control by various countries. The history of sacrifice and sabotage is written on the faces of the buildings and monuments, such as Stonehenge, which date to 3000 BC. I was in awe of the many historical statements preserved in the visual arts, the collection of artifacts, and the strong differing opinions of the people I encountered and engaged in conversation. Regardless of the differences in opinion or the variance in tales about historical figures and incidents, I observed one element which was constant—a continuous thread of respect and acceptance for historical contributions.

During my wanderings, I realized how powerful the components of respect and acceptance are for uniting people whether it concerns a country or an association such as the American Art Therapy Association. Upon my return, as I began to write this article, I became aware that these two elements are missing from AATA’s history. The original civil war created by Naumburg and Kramer is still very much alive and carried on by followers of each grande dame. Most members have forgotten what created the war in the first place. It is this piece of history that underlies the adversarial position of many art therapists and continues to be stored in the “suitcase of the past” (Spring, 1993).

Civil War and the Sacrifice-Sabotage Principle

The war was predicated on the sacrifice-sabotage principle. Both Naumburg and Kramer were saying the same thing about the results of art therapy and benefits to the patient, but argued which was most important, psychotherapy or art expression. It was as though one had to be sacrificed for the other rather than accepting the value of blending both elements. However, both discussed the phenomenological occurrence of conflict being reexperienced, resolved, and integrated in artwork as well as the idea that inner experience must be retranslated from an image to verbal communication. Yet, they were unable to resolve their own conflicts, thus providing the original environment for AATA.

In the beginning, along with the argument about what made art therapy a discipline, was the idea of sacrifice: Art therapists were considered economically deprived. Today, belief in this monetary deprivation continues to invade the classroom and conferences. Rather than preparing art therapy students to earn a living, they are led to believe that choosing art therapy is a sacrifice. Thus, “poor art therapists” adopt the ancient philosophy and develop a sense of entitlement rather than a drive to reframe the image. When professional members are forced to pay for students’ food at conferences through increased conference fees, it is evident that the principle is still operating. Older members must sacrifice to pay for the students. Are we once again sabotaging the natural process of struggle which builds character and breeds appreciation for personal and collective accomplishment? It seems this new “mothering” concept is providing students with the benefits that older members have earned by their own hard work and struggle. Such decisions lead to the type of conflict that sabotages the philosophic health of the Association and causes resentment within the membership.

If we are to consider the health and progress of AATA, our history cannot be dismissed. The history brings into focus our current behavior and attitudes, our response to each other, plus the lack of respect and adversarial contempt for the contributions of contemporaries. It seems that we continue to fight the same battles over again rather than adopting a new philosophy of what art therapy is and can become.

Naumburg and Kramer were both grand women in their era and we owe much to their pioneering efforts. Their argument was over method and process, not as related to what was most important, psychotherapy or art expression. However, their conflict should not continue to be our conflict in the 1990s. We have more challenging problems to confront.

After years of members participating in and evaluating the argument, without any research to prove which method works best, we can concede that all art is spontaneous, that there must be a direction for therapy, that treatment plans and the manner in which art expression is used to accomplish the goals of therapy is of utmost importance. It seems that art therapists are so busy attempting to convince each other that their way is the best, depending upon which ancient leader they are following, that the major point of our professional existence has been missed. The major point is to prove what it is that we do. I am not sure we know what we do as we have no outcome studies and have a serious deficiency in empirical research.
The Concept of Terminal Uniqueness

Perhaps our deficiencies are directly related to the concept of terminal uniqueness. Art therapists refer to themselves as "unique" but are unable to define what that means. If it means waving feathers, dangling crystals, and chanting, then we are unique! It seems we are more interested in the verbal definition of "uniqueness" than what we do that moves therapy along in a unique manner. Being defined as unique will not bring us favor in the professional community. We can no longer afford the luxury of just being unique and creative; we must also be qualified to be licensed so that we can make money. Yet, the political environment is such that there are those who defy changing their educational programs to prepare the student for licensure or making money. There are those who want art therapy to stand alone in its uniqueness rather than piggy back as a specialization on another license. This attitude is another article in the "suitcase of the past."

Education

I remember while teaching some years ago that I was asked what changes I thought the program should make. At that time, this program had one 3-week course in group therapy which was supposed to qualify the art therapist to do therapy. I suggested that in the future, as the field moved toward certification and licensure, art therapists would be called upon to know more psychopathology and have more training in psychotherapy techniques. My response met with an avalanche of contempt for my suggestions and several reasons why such change would not be tolerated. I was firmly told there was no need to do anything different since this school was primarily concerned with art expression, not therapeutic skill. Most students who graduate from that program do not work in the field of art therapy. In order to maintain the field of art therapy, such archaic attitudes cannot continue in our educational programs.

It is now recognized that our educational programs must be drastically changed to meet the current educational demands. The sacrifice-sabotage principle has been at work in our education approval process as in other areas. The idealistic values and antique methods of evaluation used in the past by the Educational and Training Board (ETB) are finally being streamlined and simplified by a new generation of art therapists. Hopefully, the proposed changes will attract more universities that have an interest in promoting an art therapy program. Old art therapy programs cannot continue to be rubber stamped, nor allowed to take the students' money without making the required programmatic changes. Until about 6 years ago, the policies, procedures, and inner workings of the ETB were kept secret, even from the Board of Directors. While I served on the AATA Board, the first meeting between the ETB and the AATA Board was held. This meeting began the process to implement needed changes and lift some of the secrecy that had existed for many years. Such elitist philosophy prevented educational programs from moving forward, and the past idealistic philosophy of the ETB prevented us from attracting colleges and universities that could offer art therapy programs to a wider audience at less expense to students. Recently (November, 1993), I received feedback on the approval process from a major university. This is a program that I have worked on for 8 years, one class at a time. They let me know that "the AATA approval process was idealistic and crazy"; that they could "inaugurate a medical program easier than seek approval for an art therapy program." The new Education Standards were recently published in the AATA Newsletter (Staff, Summer, 1994). However, this publication does not address the approval process, nor the policies and procedures used by the ETB. Members are not privy to this information. The rationale for the secrecy in the past was to keep the approval process out of the political arena. Did this happen?

In terms of education and professional status, we cannot stand alone as "unique" creatures. We have to comply with the rules of other professional entities which are involved with up-to-date educational programs and approval, along with continuous involvement in empirical research and outcome studies. We need to define what professional traits are rather than just throwing the word "professionalism" around and pretending that we have it. The "suitcase of the past" contains many articles about education and what constitutes professionalism.

Professional Traits

Professional traits which breed respect are connected with sharing knowledge. This appears to be very threatening to those art therapists who want to maintain the status quo of the 1960s. Sharing knowledge is professional; keeping knowledge to one's self or one's own group is a betrayal. Praise and respect of one's contemporaries is honorable; disrespect for professional contributions is an injustice. Openness and truthfulness builds trust; secrecy and underhandedness is abusive. Rigidity and insecurity breed defensiveness. These primary elements separate professionalism from destructiveness.

Being professional does not include attempting to undermine or characterologically assassinate those members who have made contributions that are worthy of acknowledgment. When I served on the Honors Committee, a few members of the Executive Board underhandedly attempted to overturn a decision made by the Honors Committee. Why? Because someone outside their group, who did not like the choice of the Committee, made an outstanding contribution to the field of art therapy. There is no question in such instances that the sacrifice-sabotage principle is alive and well. Such tactics also indicate that the sacrifice-sabotage principle is more important than respect or progress. I was first infuriated, then embarrassed, that such a maneuver had been considered. What does this say about our leadership?

It seems that the members of AATA are stingy and withholding when it comes to awards. What a shame! From 1970-1993, 19 Honorary Life Memberships and nine other awards were bestowed. There seems to be pressure to give a yearly HLM award, which is very competitive and political. It takes only one nomination for an individual to be considered for any award. There have been five Distinguished Service Awards and two Clinical Awards. There were two posthumous awards. This makes a total of 28 awards in 23 years (Malchiodi, 1994). Out of 4,000 members, we must have more than 28 outstanding members over a period of 23 years. To reward one's fellows brings positive energy, health, competi-
tion, praise, and acknowledgment for achievements and hard work. Everyone gets to share in the excitement. Giving awards is a special communication of gratitude, respect, and acknowledgment of dedication to the field. This is part of building a gracious and respectful community.

If we look at our history in this area, we find that the Clinical Award is seldom given. Is this part of the civil war fallout? Does clinical mean psychotherapy versus art expression, thus the awarding of this distinction is to be avoided? Are we so threatened, so jealous, and so fearful that to reward others makes us less than the recipients? Awards are given every year; many members can be recipients. The awards are not going to disappear because they are given. Do we withhold our appreciation because that would mean sharing the power? Or is it that the sacrifice-sabotage principle is so ingrained that we must not acknowledge efforts because of our own insecurities? Perhaps such positive endeavors are too anxiety provoking, most of us will do anything to avoid anxiety and use denial as the antidote. Since sharing and acknowledging contributions is another element of being a professional, I think we are seriously lacking in this area. Are we professionals, or do we throw the word around in hopes that it will light on us and we will be magically transformed? Perhaps our concept of professionalism is another one of our quiet crises. I have begun to realize that the negative side of what we refer to as professionalism creates a crisis cycle to which AATA is addicted.

The Crisis Cycle

During my long affiliation with AATA, I have watched the sacrifice-sabotage principle and the push to power and control by particular individuals operate to create ongoing crises within AATA. A good example of such a destructive crisis and the creation of invisible wounds is the 1982 AATA Conference in Chicago, which I attended. At the business meeting, a fight occurred between proponents of the American Journal of Art Therapy, published by Elinor Ulman, and supporters of a new journal, to be published by AATA. The management of this professional problem was devastating to many members because of its personal nature. It was a drama of both intrigue and horror, centered around control issues. The membership voted to publish a new journal titled Art Therapy. The first edition was published in October 1983, and continues today as the major trade journal in the field. The American Journal of Art Therapy is published by Norwich University in Vermont. The invisible wounds from that crisis have not healed. Instead the wounds have continued to fuel present crises. Most members are unaware of the provoking history, thus do not understand some of the nonsensical crises about power, control, and politics that erupt from time to time.

At times I have been disgust and discouraged with the political mechanics that continue to operate out of a civil war environment. At other times my passion for fairness and respect for others has engaged me in controversy as a means to quell the destructive energy that seems to be ever present when a new idea or concept is presented. At times I wonder if we have achieved progress, or just more sophisticated politics based on the status quo of ancient leaders. I have attempted to decipher whether AATA operates from a base of jealousy or graciousness, and if the need for control by some individuals is so important that the sacrifice-sabotage principle cannot be comprehended.

It is apparent that AATA has many invisible wounds. These wounds may be healed by moving out of a 25-year-old pattern of crisis based on the abuse model. I believe that respectful controversy over professional problems is educational and healthy, but the need to control defines the insecurity and narcissism of members who want power. As long as there is an adversarial environment, unity cannot be established, nor can advancement to earning respect as professionals by other fields be attained. As long as there is disrespect for the contributions of all members, art therapy will continue to be disregarded rather than embraced by other professional groups. Since history infiltrates both present and future, we need to view it from a different angle and re-form our philosophy. Our history cannot be changed, but we can use the historical learning experiences to manage the future and discontinue the addiction to the crisis cycle. We do not need to reinvent the wheel.

If we look at the "crisis-violence cycle" (Spring, 1993), we can begin to understand how we need to change for the future. The crisis-violence cycle is an unusual system with particular phases and components which operate together, overlap, and co-mingle. The pattern is kept operational both

by passivity and aggression. The components of the cycle are adversarial and conflictual. Feeling powerless, placing blame, and lacking respect starts the cycle and the "loving stage" recycles it. Adversarial roles, lack of boundaries, and control issues keep the cycle operational. During the building of the crisis there is an emotional disturbance resulting from a clash of opposing impulses, or the inability to reconcile impulses with realistic or moral considerations. The "explosion" follows, coupled with pain for the participants. These elements are a part of the addiction carried in "the suitcase of the past" and apply to the crises in AATA.

In order for this system to be ongoing, nine elements must be present: passivity, aggression, frustration, a feeling of powerlessness, loss of control and the desire to regain it, spontaneous rage, relief gained through the use of force (emotional or physical), a search for intimacy, and the hope of change which couples with magical thinking about the outcome. The cycle begins and ends in the "loving stage." In AATA’s case, the loving stage is the annual conference in which the casual observer thinks that everything is wonderful. The undertow of the cycle is seldom recognized by the general membership since in any abusive situation, there is the public appearance and the hidden reality. The fuel for the crisis-violence cycle is the metaphorical roles which are adversarial in nature and can be observed within the membership. We can all find ourselves among the list of characters in the drama of the civil war.

**CIVIL WAR AND ADVERSARIAL ROLES**

![Diagram of Civil War and Adversarial Roles](image)

Fig. 2. Civil War and Adversarial Roles. From Shattered Images: Phenomenological Language of Sexual Trauma (p. 122) by D. Spring. 1993. Chicago: Magnolia Street Publishers. Copyright 1993 by Magnolia Street Publishers. Adapted by permission.

1. The Innocent Member who is naive but willing versus the Secret Keeper who only tells the member bits and pieces to get the Innocent Member involved in the push to power. The conflict is honesty versus secrecy.

2. The Warrior who fights for justice and fairness versus the Saboteur who wants to keep the status quo and fights in underhanded ways to maintain it. The conflict is good versus evil.

3. The Superworker who is concerned with acceptance through defensive competence versus the Sickey who exaggerates problems, complains, and has little motivation. The conflict is success versus failure.

4. The Fixer who is constantly involved with fixing many members, many projects, and many problems and jumps to the rescue in a crisis versus the Wimp who is indecisive and has learned how to be helpless to gain control. The conflict is control versus lack of control.

5. The Survivor who endures no matter what happens and acquires a martyr-like philosophy versus the Abuser who creates crises where non exists through impulsive behavior and irresponsible acts and strives to keep others in a confused crazy-making situation as a means of control. The conflict is emotional life versus death in terms of gaining attention to feel powerful.

These roles represent the political behavior that creates invisible wounds. They are historical, along with the original civil war and the ongoing crisis-violence cycle. These historical elements are contained in the "suitcase of the past." As we move into the next 25 years, it seems reasonable to clean out the suitcase in order to gain a new perspective for the future. We are now at the age of 25 ready to move away from parents. It is time to stop our adolescent crisis-oriented behavior as we ready for mating. It is time to make wedding preparations for uniting history and current events with the prospect of a new life. Will the new family manage the next 25 years by the rules inaugurated by the ancient leaders to continue the civil war, or will they use the knowledge of past mistakes to create a new environment? Will the new family roles incorporate a philosophy that art expression and therapeutic skill must be an equal blend to create the synthesis which is art therapy?

**A Model for Change**

Instead of carrying on the civil war, we need to cherish what Naumburg and Kramer stood for and extract the knowledge they gave us as a birthright. We do not need to continue their argument; we have too many vital challenges to address and too many important matters to resolve. Opposing views can be combined into a single strength that can unify AATA regardless of the argument over method and what is more important, art expression or therapeutic skill. Both elements have to be present if art therapy is to advance. Both Naumburg and Kramer were dedicated to the patient's therapeutic success. Does it matter whether therapy skills are more prominent than art expression? If art expression and clinical skills are not integrated and used simultaneously then we just have one or the other, but not art therapy.

Since all art is spontaneous (how can it be otherwise?), it seems that the importance is the use of art therapy for the
power it exhibits in healing, the effect that it has on the patient, and how the patient incorporates the insight and awareness gained from the combination of art and psychotherapeutic skills. How the patient manages life after art therapy determines whether the tool was used successfully. I surmise that if we had outcome studies this would strengthen the idea that method is not the real argument. The real argument is about power and control disguised by opposing claims of how to do art therapy. We must move from verbal claim to written proof.

Resolution Is Connecting the Past to Current Events

As we move toward the year 2000, attitudes and performance need to be adjusted to meet the challenges of a technological world, more crowded space, and less personal expression. The demand for art therapy services should increase as people will thirst for individual expression. As we enter the next phase of a more mechanized and technological environment that swiftly engulfs an international community, we must consider scripts for success, common goals, and healthy controversy rather than continuing the sacrifice-sabotage principle.

Viewing the past from a different angle means cleaning out "the suitcase of the past," rearranging some articles, and deleting others. It means incorporating a change in roles to diminish destructive conflict. Rather than continuing the adversarial nature of the AATA, we might consider establishing roles that flow and complement each other rather than separating and fighting. Real power and control is always within the individual. Collective power and control can only be acquired through teamwork, equality, and respect within a resonating community. We have to give up something to get something. In the context of this article, this means giving up the old destructive ways and creating a new drama that leaves the audience feeling good about AATA. The drama is about us, each of us, not some phantom-like presence. We must own the role we play. We must own our participation in the sacrifice-sabotage principle and our own addiction to the communal crisis-violence cycle which reverberates with a distorted excitement.

The new drama is a rewrite, not a rerun, of the adversarial roles. The metaphorical roles can be modified to flow and compliment each other as conflict resolution is achieved.
1. The Innocent Member becomes the well-informed, involved member.
2. The Secret Keeper becomes the teacher and shares knowledge.
3. The Warrior becomes the protector and guard honesty and justice.
4. The Superworker becomes the worker who does a competent job.
5. The Survivor becomes the victor who meets challenge with knowledge.
6. The Saboteur becomes the negotiator who listens and compromises.
7. The Sticky becomes the doctor who promotes a healthy community.
8. The Fixer becomes the caretaker of advancement and achievements.
9. The Wimp becomes the creator who can design or create opportunities.
10. The Abuser becomes the decision maker who negotiates and looks for logical solutions to problems.

The new drama incorporates a new backdrop, the same actors with different roles, and the plot is about a group of people who rescued their community. The final act is a community celebration involving all the inhabitants in a folk dance where all move to the same rhythm.

Reflections

From the time I began studying art therapy, I could not understand the reasons for an either-or approach to the field. I have not been able to understand why being a good clinician and a good artist, which includes exhibition, are not compatible; why psychotherapy seems to be tainted in some way that takes away from art expression and vice versa. Yet, this argument continues in full force as presented by Lachman-Chapman (1993).

The inquiry begins with questions arising from an attempt to integrate the identities of the art therapist and the exhibiting artist. Are they fundamentally opposite: the art therapist functioning to serve others and the exhibiting artist functioning to serve or express himself/herself (p. 141)

Perhaps it is not so much the either-or concept, but rather the fallout from the civil war in which each side pur-

Fig. 3. Victory and Reorganized Roles. From Shattered Images: Phenomenological Language of Sexual Trauma (p. 194) by D. Spring. 1993, Chicago: Magnolia Street Publishers. Copyright 1993 by Magnolia Street Publishers. Adapted by permission.
ported to be right rather than blending and synthesizing art expression and psychological theory. I believe that at some point in our maturation we must accept that there is no either-or approach. Art therapists are multifaceted. They are a composite of clinical skills and artiste talents who use both art expression and psychotherapy to bring forth unconscious material. Their work is a unique combination of skills and creative thinking that other modalities cannot claim. Art therapy cannot exist if one or the other element is missing from the process. This is the terminal uniqueness!

I found the composite of skills and creativity to be very important when I began making a living in the art therapy field. My art therapy degree did not qualify me for a job, nor did it qualify me for any type of licensure. It took a second Master’s degree in Clinical Psychology to gain employment in the field and to qualify for licensure. The combination of two Master’s degrees in differing fields did not diminish my composite of skills nor my creative abilities. In fact, my knowledge, skills, and expertise were intensified and embellished. However, in order to conduct empirical research in art therapy, I had to complete a PhD in clinical psychology. The terminal degree broadened my skills and my theoretical base, enhanced my creativity, and generally increased my investment in the art therapy field because of the results of my research.

Following the completion of the research, I felt hostility from some of my colleagues that I did not understand. It became evident that there were those who chose to assassinate the research rather than accepting it as a contribution to the field or conducting follow-up research to disprove my findings. Without any foundation or proof that the research was not valid, verbal attacks and one written denouncement ensued. Most of the attacks come from colleagues who had not pursued a PhD and who had never done empirical research in any field, certainly not in art therapy. In addition, my education was attacked and denounced as not being legitimate, that my sample was too small, and my pursuit of a specialization in art therapy was dishonorable. Today, Educational Standards state there must be “opportunities for specialization” (Staff, Summer 1994).

It took five years of answering the Call for Papers for the annual AATA conference to be permitted to present my work. During this time, I presented my work across the nation and taught it in universities. It was as though my research in the field of art therapy was alien to the Association who had previously rewarded me for the concept. The mixed message that I received about the research still rings in my ears. I was given the research award in 1978 for material that became the dissertation, but was not allowed to present any of the material for 5 years. I was told that the topic was “not appropriate conference material.” It took another 5 years to be allowed to present the final outcome of the research.

Such stories are the invisible wounds that I alluded to earlier. Such stories are rampant within the Association, but the stories are kept secret as members suffer in silence or withdraw from participation. Since research on trauma resolution was a completely new area of art therapy at that time, who were the judges? The shame and ego destruction that such political maneuvers perpetrate cause deep scars. Such unprofessional response to contributions of members breeds distrust, resentment, and a withdrawal from the mainstream of the business of AATA. We have lost talented members’ expertise and vision because of the same type of professional abuse.

Would I manage this political situation which revolved around the sacrifice-sabotage principle differently? Yes. I would tell the story in a written forum where it could be addressed in a professional manner and perhaps censored. At
that time I was so shocked by the response that I succumbed to being another victim of AATA’s political system. I resigned myself to accept that my work was not worthy, and I had wasted my time. Professionally, I was devastated with shame. Later, I was angry.

It was at the Denver Conference in 1991 that I gained final resolution on whether my research was vital to the field of art therapy. At that conference two-thirds of the presentations were related to trauma resolution. I finally felt rewarded for my pioneering efforts in the specialization in art therapy that had so many years ago been discredited. Obviously, it took me several years to recognize that my contributions were worthwhile, that other art therapists and professionals from all over the country were seeing the same thing within a specialized population that I saw.

I continue to try to understand the dynamics that operate in similar situations that occur too frequently within the AATA political system. Was the discrediting of my work an act of professional jealousy, a threat to the old guard, or a political maneuver to squelch a new dimension of art therapy? What are the motives for annihilating new knowledge? Who takes it upon themselves to be the demolition squad? It is this type of behavior that must be curtailed if art therapy is to prosper in the professional community. We must allow innovative empirical research and outcome studies to define what it is that we do or do not do. Our response to contemporaries must be respectful rather than destructive if we expect to collect a body of knowledge that includes proof, not just words or case studies. We must be supportive of fragile attempts to promote art therapy as a viable modality that other professionals can acknowledge as grounded in accepted and proven methodology. We must nurture the creative and analytical minds that can bring respect to the field of art therapy by moving out of the 1960s mentality.

Would I become an art therapist if I had to do it over again? Yes, but with a different approach. Following my degree in Art I would pursue a Master’s degree in Clinical Psychology, then attend a post-graduate program in art therapy. Why? Because I now know the value of having strong underpinning in art expression and psychological theory in order to comprehend the powerful tool that is defined as art therapy. Without respect for the fine blending of theory, psychotherapy, and art expression, I believe we miss the target. It is this balance which is the most vital aspect of art therapy along with being the artists we were trained to be. Our art, however, cannot be confined to the visual arts; it must include research and proof of what it is that we do, not just a claim to fame because we are unique.

Alvarez (Junge, 1993, p. 154) sums up my thoughts and intention for writing this controversial article: "...the time is now to move away from individualism toward community, to break through and look at the world we and our clients live in, and to work to change it." It is possible to gain inspiration from each other, give up secrecy and denial, recover from the addiction of the crisis cycle, and resort to positive behavior rather than the negativity of the sacrifice-sabotage principle.

As we clean out our "suitecase of the past," we become more authentic and intrigued with what we can accomplish as a community in the next 25 years. The challenge to myself and my colleagues is that we acknowledge and respect each other's fragile attempts to light the darkness with a magic flashlight and gain in the ability to distinguish image from mirage.

Politics and Poetics: The Acquired Wisdom of the Art Therapist

Maxine Junge, PhD, A.T.R., Los Angeles, CA

The poet T. S. Eliot wrote:

*Where is the life we have lost in living?*

*Where is the wisdom we have lost in knowledge?*

*Where is the knowledge we have lost in "information"?*

Choruses from "The Rock"

Art therapists bring gifts of imagery and symbol making and ritual. They help meaning to be made and understood because through the art media we see the hidden chambers of inner worlds we inhabit and which inhabit us. Making visible the invisible is a first step toward change. From the magician's empty, dark, and even dangerous top hat of the unconscious, art therapists help us to pull the bouquets of multicolored flowers we have created. These flowers are symbols offering dreams and realities of nurturing, sustenance, con-
tinuity in the face of despair and tragedy—of permanence in
the face of whirlwinds, of transformations and, above all, of
hope. The magic wand is created of art materials, of the art
therapist’s sensitive consciousness and intelligence, her/his
compassion with her/his sustaining presence which lights
the client’s journey. The wand is shaped by the art therapist’s
heart and put into clients’ hands so they may create the colors
that are the shape and magic of meaning and of change. Vis-
ual metaphor and symbol are the flowers of transformation
and, remarkably, the means to reform one’s world.

Howard Gruber (1989) writes:

Creative work must be in some ways kindred to the world, if not
the world as it is, then the world, as it will or might be. It flows
out of the world back into it. Thus the creative person, to carry
out the responsibility to self, the responsibility for inner integ-
ity, must also in some way be responsive to the world. (pp.
280-281)

I want to speak to you about ideas and questions that
have been preoccupying me for a long time. More than ever
in our history as art therapists the questions seem unanswer-
able. The easier ones are over. Perhaps it has to be enough
that we continue to ask the questions, to challenge the as-
sumptions, to seek truth and meaning.

I speak to you with the heart of an art therapist actively
engaged in the development of the profession for more than
20 years. I am an educator, clinician, organizational consult-
ant, writer, and painter. I am someone who after all those
years still thinks that art therapy is the most fascinating work
there is. I am currently finishing a history of art therapy in
the United States, to be published in the next few months by
the American Art Therapy Association. So, I also speak to you
as an historian of our field and one convinced that while
the past cannot always define our vision of the future, under-
standing its meaning can help us give the future shape.

To situate where we are today, it is useful to look back at
the historical cultural tides of this century which helped
create and propel the new profession of art therapy forward
and from which it gained imagination and energy. These par-
ticular tides are the Great Depression and the Works Pro-
gress Administration (WPA). Freud and Dewey, Psycho-
analysis and Progressive Education, Art Therapy as a
Women’s Movement, and the Mental Health Climate.²

The Great Depression and WPA

Art therapy was born into a climate in which, for the first
time in this country, the arts and artists interfaced with social
and economic purposes in an important way.

On April 8, 1935, during the despair of the severe eco-
nomic depression, one of the most remarkable social experi-
ments of our national history was born. This was the Works
Progress Administration, created by Henry Hopkins under
Roosevelt’s New Deal. The WPA was a relief project through
which people of various skills were salaried. The visionary
Hopkins insisted that artists were as deserving of help as
other indigent people; it was assumed that poverty-level art-
ists, including actors, would be pleased to work for a subsidy,
and that the American people would be happy to enjoy the
results of their labor if it was at a price they could afford. Less
than 1% of the WPA budget was devoted to the arts, but the
WPA arts project, which included the Federal Theater, Fed-
eral Music Project, Federal Art Project, and Federal Writers
Project, employed 40,000 artists by the end of 1935.³ Al-
though, as one congressman said, “The object of the WPA is
to relieve distress and prevent suffering by providing work.
The purpose is not the culture of the population”—develop
culture it did. For example, many playwrights, actors, and
technicians, later central to the American theater, received
their initiation and vital experience in the Federal Theater.
Orson Welles was one of these.

From 1934–1938, Mary Huntton was director of the
Kansas Federal Art Project. She had returned to her Topeka,
Kansas home in 1931 after 10 years as an artist in Europe. In
1946, at Karl Menninger’s invitation, Huntton established
the Department of Art, Physical Medicine, and Rehabilitation
at Winter Veteran’s Hospital and began her practice, re-
search, and writing in art therapy. We can safely speculate
that Huntton’s experience and background in the arts which
was integrally wedded to the necessities and realities of the
social milieu, had a deep impact on her. She brought this to
her work at Winter Hospital. Her own history as an early-day
artist/social activist in the Federal Art Project provided Hunt-
on a model from which to develop her art therapy. This cru-
ical formative discovery and experience of social applications
of the arts and their profound possibilities for change is a
touchstone echoed by many art therapists. It often motivates
others to join the profession. We hear it repeated today by a
new generation of students in art therapy programs who pro-
claim, “I want to develop my art to help people.”

Freud and Dewey: Psychoanalysis and Progressive Education

The emergence and evolution of psychoanalysis in the
United States in the beginning years of the 20th century pro-
vided fertile ground for the therapy which offered a remark-
able method for contacting the unconscious and an imagistic
picture of that internal and often deeply hidden landscape. In
1909, Freud was invited to the United States to speak at
Clark University. His writings, translated by A. A. Brill,
began to be published and the first translation of The Inter-
pretation of Dreams appeared in 1913. Freud’s conviction
that the images and symbols of our dreams had meaning and
were the disguised messages of the unconscious provided a
powerful conceptual raison d’etre for art therapy. Moreover,
as interest in psychoanalysis spread in this country and its ad-
vocates in the intellectual community increased, more peo-
ples, including artists, became convinced of its usefulness and
intrigued with the products elicited through the method of
free association. Margaret Naumburg, known as the mother
of art therapy, was born in 1882, 26 years after Freud’s birth.
In 1914, one year after the publication of The Interpretation
of Dreams in the United States, Naumburg founded the Chil-
dren’s School, later called the Walden School, in New York
City. The school espoused a progressive educational philos-
ophy based on psychoanalytic principles. Naumburg under-
went Freudian and Jungian analyses, and many New York
analysts, including A. A. Brill, sent their children to the
school.
Through Naumburg and others, progressive education, based on John Dewey’s philosophy, was another important touchstone for early art therapy. Dewey believed that the problems of education are interconnected with social, political, economic, and cultural problems. He believed in a relationship between school and society where school becomes not a place pupils go to acquire knowledge, but to carry on a way of life. He saw school as an ideal democratic community in which students practice cooperative interaction and self-government and intelligence is applied to problems that arise. A progressive school is viewed as a working model of democracy. Eschewing the Cartesian mind/body split and favoring a total person approach, Dewey postulated an education based on meaningful experience and creative expression rather than rigid intellectual methods. Its form was pragmatic, related to life, and process oriented. Dewey’s philosophy remains an important educational thrust in the national educational armament of philosophies and most recently appeared prominently in the widespread education movements of the late 1960s and 1970s stressing the “whole child” in “the open classroom” and the pragmatic relevance of education. Education as related to society and as experiential and process based became relevant to art therapy.

Art Therapy as a Women’s Movement

While there is little, if any, direct acknowledgment in the literature or research that the field understands itself as such, I believe that art therapy’s evolution has shadowed a centrally important movement of this century, the Women’s Movement. It has been largely created and developed by women and has suffered from many of the oppressive external and internal constraints inherent to sexist conditions. Art therapy has a relevant predecessor in the Social Work profession with its commitment to solving social problems of the individual and society and by development primarily by women. When the question arises why there are so few men in the field, the answer typically offered is that men do not tend to venture into low-paying professions with relatively low prestige. It is also suggested that the large numbers of women in the art therapy profession serve to keep away men who might enter it. They perceive a “women’s profession” as less powerful and important. Surely there is truth in those ideas, but I believe the reality to be more complex and more interesting. If women are the relational creatures that writers and researchers would have us believe, it stands to reason that women quite naturally (and perhaps inherently) understand the connection of all they do with the social and relational worlds around them and are driven to use their talents and skills in this way. Whether this is genetically or culturally determined, women are in the nurturing business and, as a matter of course, use their talents toward that end. It is not surprising, therefore, that women artists or women with an artistic bent should choose to use their skills working with people.

The early art therapists had their own nurturers, mentors who were male psychiatrists fascinated with visual art and with the potential of imagery within therapeutic work. Mary Hunton had Karl Menninger, Margaret Naumburg had Nolan D. G. Lewis, Myra LeVick had Paul Fink, and Helen Landgarten had Saul Brown. The men “discovered” them, taught them, and helped them attain positions of importance and prominence. It is not surprising that in the male medical hierarchy of mental health, art therapists would have a long, hard struggle to establish a level of equality of practice standards, education, and pay scale with other mental health professions. The struggle to be perceived as equal professional colleagues is certain to continue in a social and political climate in which the arts are discounted and in which women and their nurturing roles are devalued.

The formation of the American Art Therapy Association (AATA) was characterized by ongoing arguments built on deep and passionate ideological convictions. But it should not be overlooked that, without a doubt, AATA gave the creative, energetic women who began it an arena in which to test themselves and to gain organizational skills and experience which would hold them in good stead as they initiated educational and clinical programs across the country.

While the originators of the American Art Therapy Association often battled each other strenuously, they also served as an important source of support and connection for each other. Therefore, another way in which the development of art therapy should be viewed as part of the evolution of women in this country is through the important role models who have emerged and who have been mentors to new generations of art therapists who are predominantly women. Second generation art therapists often have had the privilege of women mentors. Art therapist writers courageously presented their work openly in professional communities and wrote about their ideas in books and articles. In their roles as educational program developers, teachers, supervisors, and clinical colleagues, art therapists in all regions of the country have offered fledglings the support and encouragement necessary to grow. They also have provided a compelling model of competent, successful, and creative professionals seeking to develop themselves and to establish themselves and their profession in an important way.

Women in our society, even today, often remain invisible. But precisely because they are ignored and hidden outsiders, they may be uniquely free to find their own voices. They are also intrinsically linked through their experience of difference with the marginal outsiders of the culture. To a great extent, art therapists still remain the outsider at the gate of mental health professionals. They share this outsider position with artists. But for the women art therapist, the evolution of the practice and profession of art therapy provides confirmation of the essential meaning of the struggle. As she sought to change herself, she changed the world around her. As she demanded more respect for herself and her work, she gained more respect within the systems around her. As she establishes her work as a visible and visual force, to be reckoned with she can be threatening and threatened. She can also prevail. It has been said that the personal is the political; there is no one for whom this must be more clearly in the forefront of her consciousness than the women art therapist.

Evolving Mental Health Climate

Beneath all these influences during the second half of the 20th century, a central motivating factor giving impetus and
drive to the new profession was the changing national climate in mental health philosophies and treatment. With the notable exception of Margaret Naumburg, most early art therapists found work in psychiatric hospitals as part of a treatment team or as a special kind of art teacher with children. Freud's ideas, imported from Europe and associated with the past in the transplanted new life, took on an American pragmatism in the psychotherapies which evolved after World War II. These new therapies, including group therapy, were developed to treat returning veterans. From this treatment more and varied forms were developed.

With the stunning advent of the major tranquilizers in 1954, a whole new perception of psychiatric illness and treatment became possible. Psychiatric patients who had spent years warehoused in institutions were rehabilitated and able to return to their home communities. In those communities outpatient services were to be established to provide humane and cost-effective forms of psychotherapy and treatment. The Mental Health Act of 1963 was the federal government's action to establish community centers and storefronts for services, most of which were short-term and crisis oriented. Often funding was withdrawn from long-term treatment programs.

Another idea that developed and began to grow in the 1960s was that of systems theory. Family therapy was first discussed at a national meeting in 1957. The individual was no longer the only unit of treatment; the defining importance of the social context and interpersonal relationships gained increasing prominence.

From the beginning of the release of patients from the hospitals into the community, even in the halcyon days of the new philosophy and what seemed like sufficient funds, there were never enough relevant services. However, the air was filled with remarkable helpfulness and optimism that a new day had dawned. Staffing the centers created employment for many newly trained therapists, including art therapists, and a ready and expansive job market. These developments gave art therapists of the 1960s and 1970s important clinical experience and the impetus to start the first academic training programs.

Today, in many areas of the United States, we are in an era of economic despair, a country rife with problems emerging from our great Democratic experiment. Cutbacks, mental health budget slashings, low morale, increasing violence in the lives of many Americans and in what remains of mental health systems, portend the worst. While we face the uncertainties of managed care, a mental health philosophy which focuses on the etiology of biological determinism of mental illness and tends to discount psychotherapy may well threaten art therapy's survival. At a time of such economic and moral challenge, there is the tendency to become rigid and to overstructure in an effort to ward off chaos and maintain balance. This threat can come from outside and or within. In its history, organized art therapy has had to be ever mindful of its relationship to other mental health professions and outside accrediting bodies and commissions. As a "new kid on the block," it has needed to find a way to be accepted and acceptable while retaining its heart and spirit. This has never been an easy marriage. For example, for many years there has been encouragement to establish professional credibility through quantitative behavioral research, resembling the behaviorism of academic psychology which, in itself, is a discipline striving to establish itself as a science. This has been done at the same time we have discounted and underappreciated our core as therapeutic artists and our more natural proclivities toward imaginative interpretive work and research.

On the other side of the coin, a few years ago, when art therapy educational programs in California found it necessary to address themselves to the vastly changing and more rigidly structured state licensing laws to stay viable in the job market, the cries within the profession were loud about how the California programs had abandoned their art. Closer examination showed this not to be the case. Where is our community? I believe we need to redefine and redevelop our sense of an art therapy community.

Having taken an historical look at the profession, I would like to share with you some thoughts about the state of art therapy today.

The State of Art Therapy Today

I am concerned that not enough art therapists are pursuing doctoral programs. Academic institutions increasingly require the doctoral degree, and this lack of doctorates means that we may not be producing new generations of art therapists. We must have the necessary union cards to enter the system and, in this case, the halls of academe. Art therapy training not attached to accredited institutions can be valuable and of high quality, but it does not give the graduate art therapist nor the evolving profession the stamp of legitimacy that I believe we must achieve.

In academic institutions across the country, even with long-time art therapy training programs, there are few tenure track or tenured positions and those few have seldom reached the rank of full professor. When an instructor is an "adjunct" or "visiting" professor, this means the job is not institutionalized and the academic institution is not visibly committed to maintaining the job, and perhaps the program. When the adjunct instructor goes, the program may go. Over time have we not paid enough attention to internal and institutional politics and situating our programs within the accepted academic framework? I think not. In the last few years, three American Art Therapy "Approved" programs have closed.

I also worry that many art therapist do not consider their education a lifelong endeavor. I have seen too many master's level art therapists who, in the understandable struggle to survive and make ends meet, do not continue learning in any consistent and rigorous way. I do not mean an occasional workshop here and there, but a thoughtful in-depth course of study providing a structure through which their work can be understood and expanded leading to increased skills, new insights, and a deepening of individual meaning.

I am deeply concerned about the numbers of art therapy certificate programs springing up. A year or so ago a young woman, a friend of a friend, thrilled with her discovery of the new world of art therapy, called me to ask what I knew about a particular certificate program. I was surprised to hear that, although the program advertised that it took only people with Master's degrees in Mental Health, in reality it admitted just about anybody, such as this woman who had a Master of Fine Arts (MFA) degree. However fine the quality of education provided might have been, I am worried about two issues.
First is the "false advertising" problem. A person with an MFA and a Certificate in Art Therapy has spent much money, time, and effort acquiring a credential which, in today's mental health marketplace and in managed care of the future, is all but worthless. Secondly, the more we credential other mental health professionals, the more we do ourselves in. Having worked long and hard to develop quality educational programs of 48 units, or more, AATA now is willing to say that an art therapy education of 21 units is sufficient. Many already consider that art therapy is merely a string of techniques or recipes easily learned and applied, an idea which we as professionals support as we minimize what is necessary to become an art therapist. Why should I, as an employer, hire an art therapist if I can send the mental health worker I already have on staff to take a crash course and learn the techniques?

As for the art therapists who direct and staff these programs, they say, "Well if I don't do it somebody else will. Why shouldn't I make a living too?" This dilemma speaks to the important moral question that each of us must ask and answer over and over again: How am I contributing to the strength and life of my profession?

There is no question, however, that we must spread the word to other mental health professionals. Too many art therapists are satisfied never to present their work or to publish except for other art therapists. If each one of you presented one time this year to a conference or a group which was not predominantly art therapists, the word would continue to spread. We are our own best public relations experts and the power of the visual image continues to present a compelling case for what we do.

Interactive with the above issues, I am concerned about art therapists remaining viable in the job market. This year a survey was conducted of job experiences of the last 5 years of graduates of a particular program. The data was compared with experiences from 5 years ago with the expectation that things were a lot worse. The results were surprisingly hopeful. The numbers of graduates working in fulfilling jobs had not diminished. What had changed was that there were fewer full-time jobs. The bad news was that the pay was still dismal. In the current (May 1994) graduating class, half had jobs before graduation. How well art therapists are trained will have an impact on the life course of the profession.

As educators, we must also look to the numbers of art therapists trained; there is the potential to flood a changeable market. Not too long ago, at a Board of Behavioral Science Examiners meeting, I met a man who was director of a California MFCT program that graduated 250 people a year! I was astounded. "How do they find jobs?", I asked. "We're not responsible for that. Most of them don't", he said. "The cream rises to the top." I find this position reprehensible and immoral. Art therapy education is only as good as its graduates' future. I believe that no matter how fine a program, if graduates cannot put their skills into practice, it does not matter. As educators we are responsible. We must face the moral imperative that we cannot merely teach in isolated ivory towers, but must strive to develop a mental health system that is enhancing to clients and to workers. The students we help grow must learn about how to create growth in themselves, their clients, and in the institutions and organizations of which they are a part, including the art therapy profession.

You will, of course, notice the systematic implications and linkages of these issues. They are irrevocable, intertwined, and interrelated. As one changes, they all change. You can never do just one thing. But something is abundantly clear: We can no longer indulge ourselves in micro-level, individualistic thinking; it is simply not sufficient nor powerful enough to address the complex questions we face today.

I would like to close by talking to you about wisdom. Wisdom is not a word commonly bandied about at art therapy conferences nor among art therapists. But I think it essential that we consider it, for, I believe, above all, we will need wise leadership as we shape the vision and actuality of our future together as art therapists. Sievers (1994) writes:

Instead of regarding wisdom as a human quality which, similar to maturity, potentially all human beings are capable of and which as such can be applied to our social life and work in organizations (cf. Winnicott, 1950), we more and more tend to put wisdom into the wheelchairs of those people who because of their age and their social role, no longer are supposed to have a reasonable impact on our lives. (p. 323)

Wisdom in this sense is the learning that comes through experience; it is the crucial dimension ... through which a life and life experience finally obtain quality for a mature adult... [Wisdom is] a qualifying process which reflects one's individual and collective experience in order to provide [him or her] with meaning. (p. 287)

I believe that life is inevitably tragic. It is bounded by the frame of birth and death. Within this frame, mortality must be squarely faced to create individual and societal meaning. At the same time, we must maintain and acknowledge the dialectical relationship that every person, every art therapist, is inevitably mortal and that the institution of art therapy itself is supposed to survive and is, therefore, hopefully, immortal. Sievers (1994) writes:

The management of wisdom could also be perceived as the explicit attempt to face inevitable tragedy in life... that life and work necessarily have to include tragic experiences; if life is to be taken seriously. (p. 279)

In the context of leadership, wisdom can be conceptualized as the mature quality of the process through which individual and collective meaning is given to the human experience. (p. 280)

[We must not] relinquish the hope that wisdom may finally contribute to the exploration of more mature solutions for overcoming the battle and facing the future. (p. 280)

As we approach the new century, in the years to come, art therapists will need to be particularly nimble contortionists to continue to be players in the mental health arena, and yet, also, retain enough of their defining freedom which gives spirit and heart to the endeavor of therapy.

In a time when the walls often seem to be closing in or crumbling down altogether, art therapy needs wise visionary leaders to lead the way. I speculate that although they may appear radically different from the pioneering visionaries of art therapy's history, they will hold dear, as did their forebears, the qualities of creativity, innovation, and commitment to the bettering of the human condition in a time of profound difficulties.

In conclusion, I want to leave some wise words with you. When he was Secretary of Health, Education, and Welfare, John Gardner said:

Life is full of golden opportunities hidden underneath seemingly insolvable problems. (Unknown source)
And, the educator Horace Mann declared:

Refuse to die until you can leave some gifts for humanity. (Unknown source)

Elie Wiesel, writer and Nobel Prize winner, imagines therapy as a "moral quest," not the process of objectively weighing moral factors, but actively taking sides on behalf of those who suffer. Although there will never be any final answers to the quest for moral certainty, it is the search itself which gives human life both its meaning and its unfathomable mystery.

We are all in a quest—all partners in a quest for truth, for friendship, for meaning, for hope, for humanity. . . . The moment the question stops, our humanity stops. (Unknown source)

I wish us all good luck and courage!

Essential Legal Issues for Art Therapists in Private Practice

Gail Wirtz, MAT, MPA, A.T.R., Chicago, IL

An art therapist in private practice today is faced with the possibility of being sued for malpractice. Although an art therapist merely wants to conduct art therapy with a client, it is prudent to consider carefully the legal implications of practice in each case we accept. This article reflects my own experience in facing the reality of litigation and proposes ways to manage the risk.

Art Therapists and Courts

Given the current litigious climate throughout the United States, every art therapist should be aware of potential legal issues because they affect insurance, licensing, and American Art Therapy Association (AATA) guidelines. Only one state, New Mexico, has specifically licensed art therapists. It is clear that laws are changing rapidly and that art therapists must understand state and federal laws regulating their profession.

Three years ago I noticed a marked change: I realized that I could find myself involved in litigation, and the reality has altered my practice. I believe that in order for art therapists to practice safely today, they must take proactive steps to manage the risk of being sued. This article will focus on two specific questions and the conclusions to be drawn from their answers: Why would an art therapist ever be called to court? And, what is an art therapist's best defense?

Why Would an Art Therapist Ever Be Called to Court?

I am an art therapist holding Master's degrees in Education and in Art Therapy. I have 18 years of art therapy experience, and, for the past 10 years, I have been in private practice. Several years ago I was served a subpoena in a case involving one of the children in my practice. The subpoena required my presence at a deposition because I was the child's art therapist and had supported the finding that the child had been sexually abused.

It is important to note that in this case no one was suing me. Rather, the defendant's attorney wanted to undermine the process by which I had concluded that the child had been abused. On the other hand, the plaintiff's attorney wanted me to testify as an expert on the evaluation of abuse. An expert witness is someone with special knowledge of the subject about which s/he is to testify. An expert witness is needed to aid the jury members in their understanding. This contrasts with a fact witness who testifies merely to what s/he witnessed.

When I was subpoenaed, I had no idea what an expert witness was, let alone the fact that, as an art therapist, I could be called as one. Moreover, I was unaware of the unpaid time commitment this process would entail.

Art therapists need to be prepared to be expert witness-
es. When I speak of an art therapist, I am referring to a person registered with an A.T.R., but not necessarily certified by the state as a social worker, clinical psychologist, or counselor. Legally, psychiatrists (MDs), psychologists (PhDs), and social workers (MSWs) have been viewed by our society as experts on issues of mental health and have been called to give expert testimony. (Turkat, 1993, p. 36). However, my experience suggests this is already changing.

A witness qualifies as an expert by virtue of any of the following factors: knowledge, skill, experience, training, or education. As art therapists become more qualified, their testimony is also being accepted as that of expert (Wirtz, 1993, p. 169). When I was subpoenaed to testify by deposition, I answered questions for 2 days about my qualifications. The questions were as specific as, "How many children between the ages of two and two-and-a-half did you work with before 1983 who had been sexually abused?" During questioning, there was a great deal of exploration about the courses I had taken which were relevant to the case as well as questions about qualifications needed to become an art therapist. Essentially, the lawyers wanted to know, "Can you legally do what you are doing?" This further confirmed for me that to act professionally was not enough; I had to be certain of my legal status.

Levick, Safran, and Levine (1990) noted that once the questions about the art therapist's qualifications have been answered, the "witness [art therapist] must be prepared to present documentation of [his/her] statements with published literature or clinical data that can be submitted as evidence" (p. 49). The battle between lawyers is always whether the art therapist is an expert or a lay person. Ultimately, the trial judge decides whether a witness qualifies as an expert, but the battle between the lawyers sometimes perpetuates even through appeals.

The lawyer, advocating for her/his client who does not want the art therapist's testimony to be considered expert, can be very tough in cross-examination. It is important for the art therapist to know "the basics of cross-examining an expert, addressing credentials, reviewing facts that the expert has relied upon, challenging sources of authority, and questioning the expert's grasp of the operative facts of your case" (Mulroy, 1993, p. 27). When lawyers talk about the basics, this can mean: "How can I make the professional sound like s/he doesn't know what s/he is talking about, or sound unprofessional?" The article "How to Cross-Examine a Psychologist in a Custody Case" (Mulroy, 1993) is evidence of this. I found the article to be very realistic. Lawyers spend considerable time on the therapist's "credentials, licensing, experience, specific courses/specific training in a particular area" (p. 68). In my own case, I was questioned over a 2-day period for 14 hours of unpaid time.

The case of the abused child involved the issue of whether an art therapist qualified as an expert, but there is another way an art therapist may become involved in a lawsuit. The art therapist may be a defendant accused of malpractice.

While most clinicians believe that they practice within legal guidelines, they then also believe they are at no legal or liable risk. It is truly unfortunate when some clinicians learn that this is not the case and find themselves in a lawsuit. (Stout, 1993, p. 1)

Malpractice is the legal term to denote the negligent or unskilled performance of professional duties (Giffs, 1984). Negligence is cited when the therapist has omitted something s/he should have done, or by doing something s/he should not have done. Lawsuit "causes of action reflect acts of negligence or substandard care for which any health care provider could be found liable" (Manisses Communications Group, 1993, p. 5). The areas specifically cited include abandonment, breach of confidentiality, failure to obtain informed consent, and certain intentional torts, such as assault and battery (Manisses Communications Group, 1993).

The question of malpractice is important to a jury. The jury determines whether someone performed malpractice by comparing the defendant's performance with that of the profession's standard of care. The standard of care varies, of course, depending on the profession. For example, a doctor's standard is different from a nurse's standard. If a state actually licenses a professional, the standard is outlined to some extent by the licensing or practice act passed by the state's legislature. If a profession is not licensed in a particular state, the standard is obtained from another source, most often the profession's highest national organization's practice guidelines and codes of ethics. The more unclear the standard, the broader the battleground for the lawyers involved.

Lawyers, in their advocacy, will discuss the standard of care; the less well-defined, the more room for interpretation. They want to know if your testimony is credible and how it compares to that of your colleagues (both other art therapists and other mental health professionals). "Codes of ethics provide a standard of practice that invariably underlines the importance of protecting confidences. However, they do not have the force of law. But in litigation they may be used to define the standard of care." (Manisses Communications Group, 1993, p. 22).

It is no surprise, then, that the most common question for an art therapist in a legal proceeding is, "Do you have guidelines for your profession, and do you follow these?" A clear concurrence of guidelines for our profession was never as important as at this moment.

The Art Therapist's Best Defense

Whether art therapists are called as experts or charged with malpractice, specific tools can aid them in presenting their expertise or presenting their defense. These tools include, but are not limited to, a clear, well-articulated standard of practice, knowledge of the laws within the state, and adequate record keeping. The standard of care was identified above as the point of departure for an expert witness and first in the line of defense for an art therapist.

With the frequency of litigation today, art therapists must be informed about licensing laws and must maintain a working knowledge of the laws that apply in the state in which they practice. Practicing without a license can be malpractice, depending on the requirement of the specific state. And even if a state does not specifically license, certify, or register art therapists, it is not safe to assume that no law can be violated.

The language of other professional licensing acts can impinge on whether an art therapist can be accused of practicing a licensed profession other than art therapy. In Illinois there
has been concern recently regarding the exclusionary language in the Clinical Psychologist Licensing Act of 1989, as amended, and how it may have an impact on art therapists and their practice.

Art therapists who want to practice safely must maintain adequate records. Consistent, reliable record keeping aids the art therapist in managing the risk of a lawsuit. But, what constitutes adequate record keeping? The American Art Therapy Association’s General Standards of Practice (1989) defined the record keeping procedure needed when working with clients, noting “Registered Art Therapists are expected to follow these guidelines.” The standard is shown in Table 1. However, based on experience and on further reading, I believe these guidelines are too narrow for art therapists in private practice and need to require a greater breadth of documentation.

A *Legal Primer for Psychologists and Counselors* (Manisses Communications Group, 1993) cites a study by John Paddock, Robert Remar, and Patricia Maykuth of the record keeping practices of psychotherapists. Most psychotherapists in the study believed that “thorough clinical records can provide an excellent defense against malpractice claims” (p. 39), yet about two-thirds did not have sufficient records to afford them even minimal legal protection. The researchers made the following recommendations:

... organize and standardize records; organize client information into the following categories: intake sheet; history; psychosexual/developmental; evaluations (mental status examination, psychological tests, etc.); diagnosis; specific treatment objectives and methods used to reach these goals; progress notes; termination summary; supervision consultation notes; medication record (current/historical); correspondence, billing record; legal documents (e.g., release of information); (pp. 39-40)

The researchers also recommended that the therapist

... be concise; self-monitor; document treatment in a timely manner; never, ever forge a clinical record; know the psychotherapist’s risk areas; have a standard procedure for evaluating suicide/homicide risk; base interventions on well-established theory; use clear behavioral descriptions; and keep records secure. (pp. 40-42)

**Table 1**

*Standard V: Documentation from the American Art Therapy Association Guidelines*

| 2.5.0 | The frequency of documentation shall be established so that the most recent art therapy progress notes reflect accurately:
|       | a. Current level of functioning.
|       | b. Current goals and treatment plan.
|       | c. Content and graphic features related to problem.
|       | d. New changes in affect, thought process, behavior.

| 2.5.1 | Art therapy discharge/transfer summary of progress note shall be written, including response to treatment and recommendations.

| 2.5.2 | Each art therapy service unit follows an established policy for the retention and disposition of record.

The American Psychological Association (APA) Committee on Professional Standards and Practice (1993) stated that professionals should keep at least the following information:

- (a) identifying data; (b) dates of service; (c) types of service; (d) fees; (e) any assessment, plan or testing reports and supporting data as may be appropriate; and (f) any release of information obtained” (p. 985).

I propose that at a minimum the recommendations above be adapted as necessary and incorporated into AATA’s Guidelines for Private Practice. However, art therapists should consider other factors regarding record keeping. First, because art therapists—unlike other mental health professionals—use art media, the art therapist’s patient records should include facsimiles or copies of clients’ art. Second, there are some things that therapists should never write down or include in a patient’s record: “Hunches, value judgments, emotional statements, personal opinions, illegal behavior (that is not homicidal in nature), sexual practices (irrelevant to clinical picture), ‘sensitive information’ that holds little clinical utility and could embarrass or harm the patient or others” (Stout, 1993, p. 3).

It is noteworthy that the Illinois Mental Health and Developmental Disabilities Confidentiality Act makes a distinction between personal notes kept by a therapist (740 I.L.C.S. 110/3) and record keeping. Personal notes may be data, for example, which the art therapist catalogues for professional case presentations or drawings which help the art therapist with difficult countertransference material. Specifically, the Act states:

- a) All records and communications shall be confidential and shall not be disclosed except as provided in this Act.
- b) A therapist is not required to but may, to the extent that he determines it necessary and appropriate, keep personal notes regarding the recipient. Such personal notes are the work product and the personal property of the therapist and shall not be subject to discovery in any judicial, administrative or legislative proceeding preliminary thereto. (740 I.L.C.S. 110/2)

Other states may also distinguish between personal notes and record keeping. Stout (1993) recommends that personal notes be placed under a separate code and stored in a different location from case notes. This distinction allows therapists to use notes to separate out personal thoughts and feelings from the clients’ records. Because it is not legal to go back to change records, records must be completely accurate from the beginning.

Another example of a documentation problem surfaced when a client’s father asked me to tape and transcribe the session I had with his child. Before I taped the session, I sought legal advice from two lawyers and found their advice contradictory. One lawyer commented that he did not see how it could hurt; the other lawyer felt it was better not to transcribe a session because, in his opinion, it could complicate the evidence.

In the case I described, I was the therapist who had been paid by the state to work with the child who was suspected of having been abused. I transcribed notes I had taken on each session and had them typed. There were 52 sessions and approximately 200 pages of notes. After 3 days of deposition, we had completed an examination of only the first three sessions. Most statements the client made and the therapeutic responses were examined. At times I regretted having taped the ses...
sions; it felt like every response I made was questioned, and I was asked why I responded the way I did. Other times I was pleased to have transcribed the sessions because I could identify which statements made by the client and acted out with art materials led to my conclusion that the child had been abused.

Conclusion

As an art therapist, my goal is to provide an opportunity for clients to express nonverbally what may be difficult to express verbally and to provide the therapeutic environment for patients to grow from that expression. It is not my goal to prove or disprove abuse allegations.

It is not enough for art therapists to depend upon statements and comments from colleagues or art therapy associations regarding our practice. We must be sure that the information we are receiving about our rights to practice is legally correct. It also seems imperative that art therapists working with high-risk clients (identified as suicide, child abuse, and child custody by Caudill, 1992) be especially careful. When trying to help a client, a therapist may be exposed to considerable risk which can jeopardize the therapist’s own family.

I keep reminding myself that my therapeutic responsibility is to help the client in therapy, not to help prove or disprove allegations of abuse. My responsibility is also to myself. The more information a therapist gives the prosecution, the more the therapist is questioned and potentially made less credible.

I am pleased to see ethics retained as a requirement under the new AATA core curriculum (Approved Educational Guidelines, 1994, p. 11). I also am pleased that we are beginning to see the need to learn legal procedures as part of the practice of art therapy. I hope guidelines for art therapists in private practice can also be established to help art therapists practice safely within the legal system. It is my belief that, in order to practice privately, an art therapist should have a minimum of 5 years of experience and a state license.

It is incorrect for art therapists to feel they are at no legal risk. The AATA is trying to stay informed legally, but the job is too great for one organization to track all local, state, and federal legal requirements. It takes each of us, researching and writing about our own experiences and informing each other as to the potential dangers of liability. It is imperative that we keep abreast of changes regarding our risk. What we learned yesterday about our rights may change tomorrow.

Note: The author wishes to acknowledge the assistance of Susan L. Kennedy, attorney, for her legal advice in preparing this article.

Photography and Confidentiality

In recent years art therapy has included photography as a tool in therapy. Since photography can be a very precise and revealing art form, it raises new questions about confidentiality. It is difficult to hide our clients' identity when their pictures are part of the artwork. Staff can be wary of cameras on the unit and often are hesitant to encourage taking photographs on site. How can we, as art therapists and clinicians, use this form of expression without breaching confidentiality rules?

In my work with emotionally disturbed children and adolescents, I find that both black and white and instant photography is a valid form of expression. It can be beneficial in building self-esteem, encouraging planning skills, teaching mastery of step-by-step processes, and strengthening the ego.
Photography enables my clients to plan and manipulate their artwork without starting from scratch or relying on prefabricated materials such as magazines. Phototherapy allows the client access to ready made subject matter and enables direct manipulation of images.

Working with children and adolescents in a hospital setting limits subject matter to the hospital grounds. At first, in an effort to expand opportunities for other images, I encouraged clients to take film home. I discovered that, because of their family’s economic status, many did not own 35mm cameras. Clients who did own photography equipment rarely returned the film. Most often they said, “I lost it.”

Clients often find the most exciting subject for their pictures are themselves. Latency children compete to be, simultaneously, the photographer and the photographed—to make faces for the camera. Adolescents are concerned with their appearance and identity. They enjoy posing and critiquing their images; this has relevance to identity formation, a task of adolescence.

The best way to enforce ethical standards is to obtain release forms from clients before they enter the group. However, this often is difficult when working with minors. Parents or guardians are often unavailable or hard to reach. This raises a second ethical question: Is it fair to exclude a client who may greatly benefit from photography because a parent is rarely available? To allow a child to attend sessions, I make the rule that the client who is photographed, who is the subject of the photograph, owns the picture. Secondly, pictures cannot include more than one client, unless, of course, consents are signed for all clients in the photographs. Any artwork that uses the photographs is the property of the client and cannot be given to anyone without consent from the parent or guardian.

Displaying artwork containing photographs is another issue. An important part of art therapy is the pride and pride a client receives when his or her artwork is displayed. It imports a sense of importance many clients have never felt. When proposing to show artwork that includes photographs, staff often balks, as well they should. Concern for the clients’ rights to confidentiality is paramount. In lieu of a consent, displaying artwork is still possible, but must be restricted to the art room or the ward, places not readily accessible to the general public, but where the client and staff can view it. The client can reap the benefits of displaying artwork while treatment remains confidential.

Since photography is an exact image of the client, and may reveal his or her identity, special consent forms should be signed if the artwork ever is to be used for presentations, lectures, or papers. The consent must be fully explained to the client’s parent or guardian and specify that photographs that identify the client are being used. For presentations, avoid using artwork with photographs of clients, even when consents are signed. If this is unavoidable, make a loose sketch of the photograph and superimpose it on the slide reproduction. The audience will still get a flavor of the artwork but the identity of the client will not be exposed. I believe that even with consents, photographs should not be shown outside the hospital.

Art therapy’s success is increased when we are very cautious about confidentiality issues. Art is a tangible record of a client’s treatment issues, it is as unique to each individual as a signature. It is our responsibility to ensure that anonymity be preserved.

Patterns

Mildred Lachmann-Chapin, A.T.R., Deerfield, IL

Geometric
To make boundaries, borders.
To reassure me about the order of things. I can expect the repetition, know the rhythm, feel safe.
To tell me I feel stifled, rigid. That I must change the order. Shake up what is expected of me.
Break the pattern of my life.
Small, sneaky breaks. Until the music shifts gently to a new key while harmony continues. Suddenly they notice.
Or sudden breaks. A noisy clatter. Dishes drop and break, households split. Departure with no comforting goodbyes.

Biomorphic
The curve takes over.
Flowers and growing forms prevail.

Fig. 1. Pattern & Destruction. Monoprint and pastel. 18" x 22".
Sky, earth and water lend me their cadences, their ideas to draw.
I have space to breathe.
I can pleasure in their moving adventures, flowing this way and that, making me feel wet, warm, sleepy.
Sometimes confused, disordered, lost in the profusion of possibility.

Representational
I make the world's forms mine.
Control and describe them.
They are my signs.
Sign language, symbol,
Infinity of meaning locked in each. I see the world, hold it in my power and keep all my secrets.
Except the ones that leak out.
Sometimes I want some leaks.
Sometimes I don't know I want some leaks, but I do. A secret hope that the leaks will find reverberations.
Which ones leak out?

Some secrets stay shut in . . . but maybe they send promising vibrations, mysteries to be unfolded.

Reviews

Stories for Children with Problems and Wishes: A Therapeutic Workbook for Turning Problems into Gifts

Reviewed by J. D. Ball, PhD, Norfolk, VA

Burt Wasserman's therapeutic workbook for child psychotherapists provides clinicians with creative and helpful interactive aids. In a series of separate exercises, Wasserman introduces first a therapeutic cartoon and then some probing questions to elicit children's art. This insightful path to children's imagery is based in Neurolinguistic Programming (NLP), and Wasserman's intervention tools combine aspects of Richard Gardner's "Therapeutic Communication with Children: The Mutual Storytelling Technique" (1971) with time-tested art therapy approaches. There is a significant cognitive therapy focus that is apt to be better recognized and more easily employed by most readers than are the principles of NLP. Many of the cartoon stories in the workbook are the products of Wasserman's own clinical use of children's art. With this approach, he has reported elsewhere (Wasserman, 1992; 1993) on how his patients visualize effective solutions and shift visual imagery of life problems. Part II of the workbook illustrates how therapists might teach clients to set goals, shift feelings, change behavior, and rethink a problem.

This workbook offers creative tools for helping children express and reason through life problems from within a psychotherapeutic relationship that is responsive to the individual needs and creativity of specific children. I agree with Wasserman's view that this approach is most effective for 6 to 12 year old children, as it uses stories and directive art therapy to introduce cognitive concepts that are often essential to ego supportive psychotherapy. The reader is encouraged to become familiar with underlying theory through references in the workbook's bibliography. The wise child therapist can derive much help from Wasserman's workbook by selectively choosing exercises that are best suited to a particular child's personal needs. This will enhance the treatment plan and provide helpful structure to the child therapist's work. For example, using just one of Wasserman's suggested exercises, children who are struggling with feelings of helplessness might be encouraged to draw a picture showing what they have done or might do to change a problem.

Art therapists are particularly likely to find Wasserman's workbook synergetic with their own training and talents, but this is a good reference source for child therapists of all persuasions.

The Way of the Journal: A Journal Therapy Workbook for Healing

79 pp. $15.95 paper. ISBN 0-9629164-2-0.
Reviewed by Susan E. Cheyne-King, MS, LPC, A.T.R., Providence Forge, VA

Journaling can be a healing and empowering experience and a way to nurture oneself. After discovering that most clients with Post Traumatic Stress Disorder wrote in journals but that most of them had negative feelings or experiences associated with their journals, Kathleen Adams decided to develop a system that incorporates structure into journal writing. The Way of the Journal consists of exercises to be done each day at a time (less than 30 minutes each) for 10 days in addition to dialogues with the journal, feelings worksheets, and various images worksheets. The exercises move from short and highly structured to more open-ended and loosely structured. The design of the workbook is to "minimize the risk of overstimulation or flooding" (p. 4).

Adams begins by describing what she calls "the developmental continuum of journal therapy" or her "Quick and Easy method" (p. 2), then addresses therapists briefly. She goes on to describe how to use the workbook, how to prepare to write, and how to reward yourself for writing. The bulk of her book (51 pages) consists of worksheets. These begin with sentence completions and move on to exercises such as clustering and, finally, free writing. The end of the book offers suggested readings, tells why to use the journal writing as an adjunct to therapy, and explains how it can be used as an intervention with various populations.

This workbook is similar to Capaccione's books, The Creative Journal: The Art of Finding Yourself and The Creative Journal: A Handbook for Teens. Both review methods and use and provide space to complete exercises. Unlike Capaccione's book, Adams' book does not utilize art expression. The Way of the Journal is fairly intense and obviously more for therapeutic use, although some exercises such as the poetry exercise could be used for more casual self-exploration.
According to Adams, this book provides a "quick and easy" method of journal writing. The format of the exercises, however, makes it appear less quick and easy and more cumbersome and annoying. Each exercise begins with "So, how was it?" but the directions for the exercise are on the following page(s), thus making it necessary to flip back and forth between the entry and recording feelings. Artwork could have been suggested for some of the exercises such as "Create a Shield" and "Bridging Back to the Present." These minor criticisms should not detract from what could be a fundamental part of healing, particularly for individuals who have survived trauma.

Beyond the Drawing Room: The Art of Mary Huntoon

Almost 25 years after her death, the story of Mary Huntoon's life, art, and work as an art therapist was publicly chronicled for the first time in an exhibit at the Salina Art Center, September 12th through October 28th. This exhibition of 49 paintings, drawings, and prints traces the life of Kansas artist Mary Huntoon from her entry into the Art Student's League of New York in 1920, to Paris in 1926, through four marriages and a 16-year career as a pioneering art therapist at Winter Veterans Hospital in Topeka, Kansas, under the guidance of Dr. Karl Menninger.

Curator Joyce Fent pulled together prints, drawings, and paintings from five decades of the artist's work. Huntoon was born in 1896 into one of the first families of Topeka, Kansas. Her odyssey from the prairies of the Midwest to New York, the salons of Europe, and back to Kansas where she capped a career as an artist with a second career as a pioneer in the field of art therapy is traced in this exhibition. Organized for the Kansas Reciprocal Art Touring Exhibit Service (known as KRATES), the show will travel to the Spencer Museum of Art at the University of Kansas, the Menninger Archives in Topeka, the Carnegie Arts Center in Goodland, and the Topeka and Shawnee County Public Library after its debut in Salina, and it will be available to galleries and arts groups throughout the region. Fent spent 2 years collecting works for the exhibit, which have been borrowed from four important Kansas institutions and three individuals, and researching Huntoon's life through archival sources and numerous interviews across the country.

Huntoon's prints—lithographs, etchings, aquatints, engravings—display a remarkable spontaneity and versatility. During post-graduate work at the Art Student's League in New York, she was a student of Joseph Pennell, and Robert Henri. Her paintings also won awards and were shown in important exhibitions in the United States and Europe. But perhaps her greatest contribution was to the early development of art therapy. Huntoon was invited to teach drawing at the Menninger Clinic in 1934, an association that would result in the 1946 announcement by Dr. Karl Menninger that she would join the staff at Winter General Hospital, where she worked as an art therapist for the next 12 years. Doctors sought her advice, and copies of her first paper about her work in the creative arts as therapy were interna...ty reprinted and distributed widely.

A catalogue containing Fent's essay about Huntoon's life and work (the first comprehensive piece ever produced) and reproductions of 50 works of art will accompany the exhibition. For more information, or to arrange tours or KRATES venues for this exhibition, contact the Salina Art Center, 242 S. Santa Fe, Salinas, KS, (913) 927-1431.

THE ORGANIZATION

The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,500 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films, and awards.

PURPOSE

- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education, and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

CHAPTERS

Affiliated chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive:

Publications
- *Art Therapy*, the official journal of AATA
- *The Quarterly AATA Newsletter*
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- AATA Literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest.

Services
- Insurance, including professional liability, major medical, life and disability through Maginisi & Associates.
- Access to national experts in art therapy.

AATA Conferences
- Discounts on registration fees to AATA national and regional conferences.
- Nationwide Advocacy
- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payors.
- National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
- Development of model job description and recommendations for licensing standards.
- Development and implementation of national guidelines for approval of Master's Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

MEMBERSHIP APPLICATIONS

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application: Applications received between:
   - Jan. 1st - May 31st - Full dues payment; membership expires Dec. 31st of same year.
   - June 1st - Sept. 30th - Half year dues plus $3.00 payment; membership expires Dec. 31st of same year.
   - Oct. 1st - Dec. 31st - Full dues payment; membership for the remainder of current year and the next full year.
3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to Membership Chair for Approval.
4. AATA Memberships and AATA Registration (A.T.R.) each have a separate application procedure. Registration is bestowed only by the Standards Committee.
5. NATIONAL AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL - By application only; such members may vote, hold office and serve on committees.
- Creditied Professional Member:
  - Individuals who have been duly approved for Professional Membership and Registration (A.T.R.) by the AATA; dues are $95 per year.
- Professional Member:
  - Individuals who have completed professional training in art therapy; dues are $85 per year.

CONTRIBUTING - Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $120 per year.

ASSOCIATE - Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $85 per year.

STUDENT - Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Members may note vote or hold office, but may serve on the Student Sub-Committee of Membership. Dues are $35 per year.

SEXUAL ABUSE
Presenters: Deborah Good (two presenters to be added at a later date)
Description of this symposia will be announced at a later date.

ADDICTIONS
Presenters: Lynn Jones, Holly Feen and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley and James Consoli
The Kwaikowska Family Art Evaluation is a procedure for interviewing and assessing families which have been carefully developed and researched which can readily be taught to professionals, particularly those with training in other art therapy evaluation procedures. The Family Art Evaluation provides an efficient means of introducing family therapy and systemic thinking into treatment settings. The intensive workshop will present family systems theory emphasizing the family life cycle and family system as seen in the Kwaikowska Family Art Evaluation. Participants will be trained in the administration and interpretation of the evaluation and in modification of the procedure.

ART THERAPY IN THE SCHOOLS
Presenters: Janet Bush, Sarah Fite and Rebecca Taulbee
The objectives of this symposium will provide the participants with understanding the administrative procedures for implementing and art therapy program in a large, urban school system, become familiar with the uses of art therapy for students in a public school system, become aware of techniques and strategies used in the training and preparation of school personnel, utilize the information they have gained to initiate discussion on approaches and practices of art therapy in public schools; and to be prepared to transfer techniques and strategies for implementing art therapy services to other public schools systems.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Callanan and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues; and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

RESEARCH AND GRANTS IN ART THERAPY
Presenters: Frances Anderson, Vija Lusebrink and Doris Arrington
The participants of this symposium will be introduced to research concepts and will be assisted in the development of art therapy research proposals. Basic information about research will be covered including hypothesis formulation, choosing appropriate research designs, selection of measures, subject selection, data collection, processing and analysis, and how to critique research articles. The goal of the symposium will be to offer participants a solid foundation for building research projects in the field of art therapy.

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchiodzi, Julie Epperson and Deborah Good
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. "Children at risk" are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitation which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchiodzi and Anita Mester (third presenter to be added at later date)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterburg, Simonton, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life threatening illness will be addressed.

ADDRESSING DOMESTIC VIOLENCE THROUGH FAMILY ART THERAPY
Presenters: Cathy Malchiodzi and Shirley Riley (third presenter to be added at later date)
This symposium will focus on art intervention and treatment with families who have experienced domestic violence, with the notion that such intervention can be helpful in addressing a larger scope, including social violence. The first half of the symposium will address the use of art expression as intervention for the immediate effects of family violence, with an emphasis on what the art therapist can accomplish in a time-limited setting; focus will be on the unique role of the art therapist in crisis care in shelters, safe houses, and other short term, crisis-oriented facilities. The second half of the symposium will be devoted to how art therapy may be utilized in treatment, focusing on issues of family reconstruction, role adjustments, and post-traumatic separation and loss. The use of art tasks to assist the family in re-thinking gender roles and assigned relationships and to experiment with new modes of interpersonal and intrasocietal communication will be presented.

2600 South First Street Springfield, Illinois 62794-9265
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

• An Application of Art Therapy to the Trauma of Rape
• The Use of Art Therapy Following Perinatal Death
• The Children’s Diagnostic Drawing Series
• Art Therapy with Native American Clients: Ethical and Professional Issues
• Diagnosis or Dilemma: Drawings of Sexually Abused Children
ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to your manuscript:

Name: ________________________________________________________

Degrees/Credentials: ___________________________________________

Address: _______________________________________________________

Phone #: __________________________________ work ___________________ home

Type of Submission (check one):

___ Article
___ Brief Report
___ Viewpoints
___ Book Review
___ Film/Video Review

Title of Submission: _____________________________________________

______________________________________________________________

Checklist:

___ Five copies, typewritten on 8½" × 11" paper.
___ Black and white photos of original artwork plus 4 photocopies of each.
___ Abstract of 75-125 words (for articles and brief reports only).
___ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.
___ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

Author's signature _____________________________________________ Date ______________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.

Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

Manuscript Categories

1. Full-length Articles. Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.

2. Brief Reports. Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.

3. Viewpoints. Short articles focusing on personal experiences, poetry or original art may be submitted to this section.

4. Book Reviews. Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

5. Film/Video Reviews. Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

6. Comments. Brief comments on articles published in Art Therapy, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

Other Requirements

1. Send five (5) clear copies of each manuscript to Cathy A. Malchiodi, A.T.R., Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Alanson Road, Mundelein, Illinois 60060. Either AATA nor the Editor can be responsible for submissions sent to any other address.

2. Only original articles that are not under consideration by another periodical or publisher are acceptable.

3. Manuscripts must be typewritten on 8½” × 11” white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.

5. An abstract of 75-125 words must be included with full-length articles and brief reports.

6. Please avoid footnotes wherever possible.

7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.

8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.

9. Photographs must be at least 5” × 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs as; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.

10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author’s responsibility to secure such permissions; a copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.

11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.

12. It is expected that any manuscript accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5” diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
STATEMENT OF PURPOSE: Art Therapy is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development, and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy practice, professional issues, and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allison Road, Mundelein, Illinois, U.S.A. 60060. Telephone (708) 949-6064; FAX (708) 566-4580. Non-members may subscribe at the following annual rates: $40 (U.S.) and $54 (Foreign); Institutions: $57 (U.S.) and $80 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allison Road, Mundelein, IL 60060 (708) 949-6064.

This journal is abstracted in: Psychological Abstracts, Innovations & Research, Art Bibliographies Current Titles and Art Bibliographies Modern.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

Who Owns the Art?

Cathy A. Malchiodi, MA, A.T.R., LAT, LPCC, Editor

The 25th Annual AATA Conference not only marked the silver anniversary of the association, but also the introduction of a new ethics document for art therapists. The AATA Ethics Committee Chair Cay Drachnik, AATA Board member Jeanne Carrigan, and AATA legal counsel, Jonathan Braverman, presented an overview of the new document at a general session of the conference. Many of the topics presented were of no surprise: confidentiality and privacy, responsibility to patients, research subjects, students and supervisees, and professional integrity and competence. However, the issue of what to do with client art made in therapy was one topic which captured the interest of many who were in attendance and concerns began to emerge, some of which have been expressed by Spring (1994) and Neustadt (see Commentaries this issue, among others).

Possibly one of the most confusing and controversial aspects of the practice of art therapy has been the maintenance, storage, and disposition of client art expressions. AATA ethics documents have addressed this issue in different ways. The 1990 version of the Code of Ethics for Art Therapists, under the section titled "Confidentiality" states:

Art therapists make provisions for maintaining confidentiality in storage and disposal of records and art expressions. (AATA, 1990)

The latest draft of what is now referred to as Ethical Standards for Art Therapists (AATA, 1994) is somewhat more explicit, stating:

Art therapists shall maintain patient treatment records for a reasonable amount of time consistent with state regulations and sound clinical practice, but not less than seven-years from completion of treatment or termination of the therapeutic relationship. Records are stored or disposed of in ways that maintain confidentiality. (Section 2.6)

This more recent document uses the term "patient treatment records" and stipulates that such records must be retained for a period of seven years from termination. It is difficult to say from reading this statement whether art expressions are considered "treatment records" per se, or if they are, that they must be retained for the seven year period stipulated. The language seems noticeably vague, although it is reported to be compliant with laws that stipulate that records must be kept for a minimum amount of time (Braverman, 1995).

The issue of who "owns" client art expressions has come up in Ethics Committee discussions over the last several years. Legal counsel Braverman notes that the "recovery of art and treatment records, and the inability or refusal of therapists to return patient artwork... have been one of the more common areas of complaints to the committee on Ethics and Professional Practice (CEPP)" (p. 15, 1995). It seems that some art therapists have very definite feelings that the client owns the art created within art therapy, while others see the situation quite differently, preferring to retain the original work as a record of treatment. Braverman also notes, however, some art therapists feel strongly that the client owns the art made in therapy, "in many instances artwork constitutes a medical record" (p. 15, 1995). The legal implication seems to be that art therapists should keep records of art made in the course of therapy, preferably in a visual form.

Record-keeping involving art expressions (as opposed to descriptive notes on client art) in the form of slides, photographs, or photocopies or the actual artwork can be problematic. The difficulty with these strategies comes in determining not only how much photography or photocopying is legally required, but also how much is necessary and feasible. Consider, for example, those art therapists who see a great many clients; how to take and store photographs/slides of every piece that a client creates has boggled my mind on occasion, particularly when working with adults or children who have been abused, situations that necessitate accurate recordkeeping. But there are other situations that can create problems for maintenance of complete visual records of client art. Fautize if you will the hyperactive child who goes through a half-ream of computer paper, filling up an endless series of pages with scribbles. The groups I lead also give me pause in this regard, when there may be up to 15 people in a group, the physical machinations required to either photograph or store work for later photography is literally exhausting. In these cases, a real problem faced by art therapists is a cost-effective means of maintaining records of all art created in the therapeutic setting as well as the space to physically store such material.

Although the issue of ownership of client art may seem to be obvious to many art therapists, it is also fair to say that the issues of ownership are complex and that this is a topic that members should be actively encouraged to provide input on and be heard. Spring points out in a recent statement on ownership that what is legal is required may in fact be different from what is ethical as well as our individual ethical beliefs. In a recent issue of the AATA Newsletter, (1994) she notes the following:

I do not believe the storage, retrieval and disposal of the clinical art record has had sufficient debate to make, uninformed
The return of artwork to the patient, without any visual clinical record being kept by the therapist, has not been challenged in court. As art therapy becomes more widely used, and more artwork is brought into criminal and civil litigation, we will probably be forced to face the issue. A decision may be made for us by a judge or a jury. (p. 28)

The outcome of this dilemma may not only be rooted in medical regulations, but also may involve laws that affect artists and their works. (The latter is an area of law in and of itself; for more information see Duboff, 1993; Crawford, 1994.)

Additionally, in retaining client art in any form, we also have some more subtle aspects to consider. By definition, art therapists are characteristically more sensitive in how we view art expression and subsequently in how the client sees the art s/he creates. The latter is one of many ethical questions that we must ask ourselves with regard to the disposition of art made in therapy. A client’s perspective may depend on many variables: the type of art therapy, the agency/facility in which the therapy takes place, the style of the practitioner, as well as the client’s own view of art and art making. Children, for example, often have a difficult time perceiving art therapy as something other than an art class, although it has been explained to them that the purpose of the art activity is therapeutic (Malchiodi, 1990; 1991); this may hold true for some adult clients as well. Also, the type of task assigned to the client may have an impact on whether or not the art expression is important for the client to keep. When asked to do a projective drawing series such as drawings of a house, tree, and person, I have rarely seen a client who didn’t realize that I might be using these art expressions in evaluation; they often choose not to keep these drawings. On the other hand, my adult clients with AIDS or cancer who are working on issues involving life review, grief, and death are engaged in making personal, meaningful art that they want to keep, share with others, or leave to someone as a visual legacy. Other issues that relate to the topic of ethics and artwork, but are too numerous to mention, include cross-cultural perspectives on art expression (Cattaneo, 1994) client abandonment of art (Moon, 1994), and a regard for images in general (McNiff, 1991).

As a profession, art therapists are possibly the only group that makes reference to art expression in their ethics document. Many health professionals (social workers, counselors, psychologists, etc.) use art directives in their clinical work with patients; however, ethical codes governing these professionals do not, to my knowledge, have rules about the disposition of art expressions. As registered, certified and/or licensed art therapists, we have made a special commitment to follow the ethical standards as set forth by the AATA to respect the art of our clients. We also must remember that those of us who are members of the AATA are bound by whatever our association determines to be the guidelines for disposition of client art. Spring (1994) and Neustadt note that if a decision is going to be made on this vital question, it should be a decision made by the members after there has been sufficient published debate. However, unlike the previous 1990 ethical code for art therapists, this newest draft was not voted on by the membership and was adopted by the AATA Board of Directors with the advice of legal counsel*. Despite this decision, the importance of this topic is one that all art therapists must continue to examine. Granted, an ethical code must be compliant with existing laws and regulation; most art therapists are not well-versed in these areas. However, we as a profession are knowledgeable about and dedicated to the importance of art in the lives of people, and as such, must continue as a group to explore the significance, meaning and impact of art expression in the lives of our clients.

*Editor’s Note: The AATA Board of Directors recently decided to send a revised Ethical Standards for Art Therapists to the AATA membership for ratification during Spring 1995.

Letters to the Editor

I am writing out of deep concern for the profession art therapy. I survived the conference intact only because I made a commitment to myself to speak my truth, and add my voice to the growing chorus of concern.

I am quite alarmed by the new ethics code as well as the process in which it was presented. A summary of this document was presented to the membership at a general session. No one had a copy of the completed document, and members heard for the first time astonishing inclusions that have grave implications for art therapy practice. When individuals expressed concern at the general session and at the membership meeting, they were told the document had been voted on by the Board without membership even seeing it first! I am absolutely amazed that the AATA Board could vote on such a document, even a draft, without extensive membership input and discussion.

I am committed to follow an ethical code that serves my clients. However, I do not believe this ethical code is in the best interest of my clients. I work with people who have AIDS. I have facilitated an art therapy group for people with HIV and AIDS for four years. Many of my clients have died. They gave the artwork they created to family members and partners as a lasting gift from their soul to be held, touched, witnessed, and cherished. Who owns the art? It is an irrelevant question. Art is an expression of soul. It belongs to the maker. I am not a collector of souls. I will not incur yet another loss for my clients or the significant people in their lives, a loss of their very rich imagery.

It was also stated that practicing art therapy in public places is considered unethical. Clearly no one on this Board is aware of an agency called hospice. For 2 years I was the grief counselor and bereavement coordinator for a hospice. I traveled all over the country counseling people in their homes, helping them come to terms with their lives, say goodbye to their loved ones, and die in their own homes.

Often, I would use guided visualizations and supported breathing as well as extensive use of symbol and metaphor as clients faced their final hours. I would help family members communicate with their loved ones who slipped into symbolic language as death approached. By including a “no art therapy in the home” clause in our ethical code, we are denying therapy to populations art therapists can serve.

I believe decrees like keeping client artwork and not allowing art therapy in the home are unethical and not in the best interest of our clients. In the AATA Newsletter, Dec Spring stated, “Ethical standards are primarily based on legal ramifications of particular acts . . .” (Spring, 1994). I wholeheartedly disagree. Ethics and law are often in conflict. Martin Luther King in “Letter from Birmingham Jail” refers to ethics appealing to a moral law above the law of the state (King, 1968). The whole point of the civil rights movement is that ethics goes beyond the law of the state and is often in conflict with it. The entire civil rights movement was about a higher ethical code challenging immoral laws. Another chilling example of the conflict of ethics and law was elaborated by Hannah Arendt in Eichmann in Jerusalem. She stated, “Everything the Nazis did to the Jews was perfectly legal (according to German law at the time)” (Arendt, 1963).

The role of AATA is to protect the art and the diversity of our practice. We must protect the image from being a tool of litigation. As artists, we have the ability to envision a way beyond complying with the system.

I believe the AATA Board has lost a vital connection to the membership it serves. The business meeting could have been a rich opportunity to dialogue about these and other pressing concerns. I propose next year’s business meeting allows ample time for open discussion about whatever concerns the membership needs to voice. I propose the Board use its best listening skills to witness and understand its members. I propose that the ethics code needs a great deal of dialogue and reworking before it is voted on, and that it is voted on by the entire membership.

Laurie Ellen Neustadt, MS, A.T.R.
Madison, Wis.

References

I am writing this letter out of grave concern for what is happening to our association. Having attended every AATA business meeting since 1981, I have witnessed and experienced many heated, impassioned debates about policymaking. Our membership expressed itself, votes were taken, issues were decided, and the AATA Board of Directors, of course, implemented the policies which were passed.

Our business meeting in Chicago this past November was disturbingly different from past meetings. I left the meeting with a sense that the Board was being secretive, defensive, and not leveling with its members. Furthermore, the Board was exercising powers not granted to it.

I will be specific. A new ethics document was presented as a fait accompli. My recollection is that the previous ethics document was approved by a membership vote in 1990. The content of this new document, quite different from our previous one, was never presented to the membership for discussion because, it was explained, our legal counsel required ethics revisions to be made quickly. When Gladys Agell reminded the Board that at the 1993 business meeting the membership approved her resolution (Motion No. 11 passed
by the Board) that any changes in documents be published in two newsletters preceding a vote, our president informed her that the Board had rescinded that decision. This I find truly appalling!

A Board cannot rescind an action of its membership; it does not have veto power! The Board of Directors is elected as an agent of its members. It is not empowered to make policy changes without consulting the membership. Agell's resolution reflects the action of the membership and is still in effect which means that the new ethics document, which the Board presumed to adopt without any authority from the membership, is, in fact, void. I believe that the Board owes us an explanation and an apology.

We need to remind the Board of Directors that their job is not to make policy, but to implement policy made by the membership. Our members need to be aware that anything done by the Board of Directors can be rescinded or changed at a meeting of the members (but not vice-versa!).

Carol Thayer Cox, A.T.R., LAT
Fredricksburg, Va.

I have any concerns regarding the certification issue. First is the implied negation of the competency of the professional membership of AATA, those who have by training, practicum, supervision, and recommendation achieved A.T.R. status. That the A.T.R. membership should be examined further to prove competency is ludicrous. Isn't this like "biting the hand that feeds you"? Regarding the New Mexico licensure procedure, it reads that those applying after June 30th, 1994 will be required to take the exam. Not those before June, 1994. In California, when the Board of Behavioral Science Examiners added an oral exam to the requirements for licensure, all MFCCs were not required to take the oral exam to further prove competency. I have difficulty understanding why the ATCB has grandparented (excused) the Honor Life Members from the testing procedure. Are HLMs more competent as art therapists than A.T.R.s?

I also have a concern about the narrow scope of the reference list. The only Jungian text listed is the one written for the general public (of which Jung wrote little). His Archetypes and the Collective Unconscious, Two Essays on Analytical Psychology, The Structure and Dynamics of the Psyche, The Practice of Psychotherapy, Psychology, and Alchemy, to mention a few, are not listed, while Freud and Freudian works are generously represented. In Jung's volume on Archetypes and the Collective Unconscious, he has given our particular field the most extensive information on the Mandala as a symbol and its relationship to the process of individuation. In Memories, Dreams, Reflections, Jung reports on his extensive involvement in drawing mandalas and the insights he gained from that experience, resulting in the development of the process of individuation. Works by other Jungians are also omitted such as Marie-Louise von Franz on fairytales, von Franz and Hillman on Jungian typology, Hillman on archetypal psychology, Ann Ulanov on the feminine and Neumann on the great mother, to mention a few. Where is Joseph Campbell and his work on mythology? These works clearly relate to our field in imagery, graphics, art, and the process of art as therapy. Why are they not listed? I know some of these references were submitted. The analytical process and the process of individuation are represented in these texts and are as valid a healing process as that of psychoanalysis.

I know I am not alone in my concern and disappointment with the Certification Committee on its lack of recognition of the competency of Registered Art Therapists. Alienating the membership that supports AATA is not a good move. At this point in the game, it seems to me the only fair and correct action for the committee to take is to grandparent in all the professional members of the Association.

Lilliam M. Rhinehart, MA. A.T.R., MFCC
Santa Rosa, Calif.

After being in private practice for almost 20 years and a member of AATA since 1974, I feel betrayed. Suddenly, I find that A.T.R. is no longer sufficient for professional recognition and that the 20 years I worked in the field, pioneering acceptance of the tools of nonverbal and art therapy modalities, are not recognized as being sufficient to qualify me to be "grandfathered" into the credential program. Without examining the merits and propriety of "grandfathering," or the gross inequities and pernicious result of a politically selective and highly subjective application of the concept, one recent editorial (Malchiodi, 1994) stated the following: "...grandfathering will be limited to a very select group of therapists." That is the essence of my feelings of betrayal. I do not question the achievements of the so-called select group, but I do take issue with the fact that years of clinical experience and pioneering do not count for certification.

In fact, the dismissal of "grandfathering" and the endorsement of such an approach by the AATA contradicts the very ideals long espoused in the pages of Art Therapy. For example, in another editorial (Malchiodi, 1993) Paula Howie is quoted as saying that art therapy teaching should encompass more than interpretation and techniques. She advocates the position that "excellence, courage and vision are necessary, for without these qualities we are indeed empty as individuals and as professionals. "The editorial further states:

Although excellence requires high standards, energy, and perseverance, the question of courage is more difficult to address. Courage involves not only those qualities, but also added element of risk, honesty, and integrity... (p.3)

Indeed, these are the qualities needed when one leaves the nest of the learning program to enter the real world. It is the "courage" needed to be a pioneer art therapist in private practice in a somewhat unfriendly environment, to say the least, the "vision" in the future to sustain the lone art therapy practitioner; and the professional "excellence" necessary in order to prove not only the therapist but art therapy itself.

I seek no reward for courage and excellence, but merely recognition. I simply demand that my rights not be denied and that all I have accomplished for myself and for my profession not be stripped away by my own professional organization. As long as "honor for life" is an internal organization honor, it has plan and is quite appropriate. Certification, however, is the credentials presented to the outside world, the arena in which my professional activities, and those of others in private practice, take place. An internal organizational honor, by its very nature being somewhat political, is
certainly not a better indicator of worthiness for "grandfathering" status than 20 years of private practice experience.

While I was not active in the AATA, I consider myself as a pioneer in the field. I was the first art therapist in the Louisville area to open an independent private practice. Is this not comparable to those who were active in the political leadership arena or organizational level of AATA who are "honored for life" and are to get "grandfathered" into the credentials program? They well deserve the honor the recognition. However, they should not be excused when it comes to certification. It would not surprise me if most of them are, or were, affiliated with university teaching in one way or another where different criteria of excellence and performance are required. Research, publications, and conferences are not at the top of the list in private practice. It has a different set of priorities and requires a different kind of excellence and different courage. It also would not surprise me if those in our organization whose main work is in the academiteaching setting are among the most avid proponents of the certification by examination with as few "grandfathered" exceptions as possible. No doubt that they will be in the forefront in the provision of examination preparatory classes and continuing education.

Ironically, over the years I have been "grandfathered" into several credential programs or certification for other professional organizations that were more tangential to my practice. Instead AATA suggests (a) that certification based on test results should take precedence over years of clinical experience; (b) that certification which ignores years of experience can conceivably produce a higher level of art therapists, and (c) that certification which ignores years of clinical experience could conceivably result in better acceptance of the discipline. Hardly! Examinations may have some limited value, particularly as a foundation on the entry level, but they cannot be a substitute for years of clinical application and experience.

I seriously doubt that political leadership in a professional organization is more deserving of "grandfathering" status than years of clinical experience. I question the fairness to the rest of us, their colleagues. Those of us who worked in hospitals, in mental health centers, and in private practice and struggled day-to-day for acceptance and recognition. For AATA to totally disregard all this, and to declare that I, and those like me, are not good enough unless we pass an examination, is not just unfair, it is simply outrageous.

Response to "A Note on Ethnicity in Humor and Art therapy"

I found this article to be tasteless, insensitive, racist, and on the peripheral of ethical accountability. It is difficult to believe that supremacist ideologies remain in the clinical arena under the disguise of humor, art, and psychotherapy.

I am appalled that the authors utilized the artwork of psychiatric patients to define the cultural norms of African-Americans. If this article was statistically sound, Mango-Hurdman and Richman would have shoddy data because it is unimportant that their clients are African-American or Hispanic. The authors also have erroneously utilized psychodynamic theory and applied this hypothesis to the global cultural view of African-Americans.

Humor can be a good interventive tool as a motivating technique and an anxiety reducer when used constructively. The viewpoints made in this article are dangerous and exploitative examples of the worst type of therapy. Ethnic jokes perpetuate stereotypical, racist ideology and should not be mistaken for sound clinical judgment to increase group cohesiveness.

I am shocked and saddened that the journal found this article worthy of printing. Shame on you! It is mandatory to have the Mosaic Committee so that art therapists of color can correct, educate, and be our own advocates to protect against writers like Mango-Hurdman and Richman. Since these authors continue to write about rapping and cappin', language within the Bl'ck community, I suggest they read "Assertive Black, Puzzled White" by Cheek, D. (1976).

Anna Hiscox, MA, A.T.R., MFT Mosaic Committee, Chair

Responses to Anna Hiscox' Response to the Article, "A Note on Ethnicity in Humor and Art Therapy"

I was surprised to hear Ms. Hiscox' reaction to my article since it was written with the purpose of being more sensitive and empathic with culturally diverse groups. I would like to stress the point that the clinical examples presented in the article were all spontaneously generated by the group members. I in no way elicited the cultural material that was produced. Therefore, my clinical position was to utilize this material as important expressions of the client, which the client felt safe enough to draw or express within the group. Racial issues are potentially explosive issues in today's climate. However, they remain issues we must deal with in therapy if we are to treat the person in total.

It would be helpful for me to understand the "specifics" of Ms. Hiscox' viewpoints about the material presented. This could open a dialogue of communication to empower art therapists of diverse cultural backgrounds to work together with the good of the client our primary interest.

Christina Mango-Hurdman, MA, A.T.R.
New York, NY

I am happy to reply to the letter by Ms. Anna Hiscox, since the paper she is criticizing was not the one we wrote. In addition, we may have overlooked some of the salient features of the therapy. Chief among these is the fact that Christina Mango-Hurdman is a fantastically good therapist who is warm and caring and establishes excellent rapport with her patients. As a result, there was a firm therapeutic alliance in the group that she described. The patients felt free to express themselves openly, both in the art and humor assignments and in the discussions of the materials, knowing they would be understood and helped. The relationships between the different members of the group were positive and trusting. They felt comfortable with each other and with the therapist, and felt free to express their thoughts, needs, and wishes, as well as the roadblocks to their fulfillment.

The humor exercise, in which the participants were asked to tell a joke and to draw something funny, contained not the remotest hint of bias or direction, aside from the request to be humorous. Christina has many years of experience, and has included this integration of humor and art therapy with patients of every diagnostic category and every ethnic origin. There has never been any suggestion of prejudice in any of her work. She has demonstrated over and over again that the people she works with improve symptomatically and in their relationships with others.

It was not her idea or suggestion that the patients tell ethnic jokes. The patients told them spontaneously, in the same manner and therapeutic intent they told jokes dealing with work, sex, friendship, family relationships, and many other areas. These were discussed in our first paper on humor and art therapy and were not repeated in this one. Generally speaking, the most creative humor was offered by patients who were particularly bright, thoughtful, insightful, and mature. In many of the ethnic jokes and drawings, they were expressing the barriers in society that thwart their efforts to succeed and meet their goals. The humor and art therapy led to fruitful discussions of how to overcome these difficulties.

It is the nature of humor to expose the vices and ills of society. Clearly, to expose them is not to approve of them. The ethnic humor was an effective presentation of what is wrong with society, and the discussion that ensued centered around what the victims could do about it. They expressed the struggle against racism and bias, and there should be more presentations of such worthy efforts.

Therefore, Ms. Hiscox' statement that, "Ethnic jokes perpetuate stereotypical, racist ideology and should not be mistaken for sound clinical judgment to increase group cohesiveness," was irrelevant, since no one requested ethnic jokes and drawings. When they did appear, they were treated like all the other art and humorous materials—to increase understanding and, yes, group cohesiveness.

Joseph Richman, PhD
New York, NY

I am writing in response to your letter of October 17, 1994, regarding Christina Mango-Hurdman and Joseph Richman's Viewpoint, "A Note on Ethnicity in Humor and Art Therapy." There is much to be learned from your letter, your concerns are real. I had no idea, as I read the article, how a very subtle racism pervaded the text. Your letter opened my eyes to my blindness in this matter. Indeed, accepting this Viewpoint as presented does represent insensitivity toward the very cultural and ethnic stereotypes that the Mosaic Committee has worked so hard to change.

Neither the journal nor Mango-Hurdman and Richman intentionally, or consciously, presented damaging material. Nonetheless, because of our ingrained lack of racial perception, the damage was done. Your letter sensitizes us to the use of "the artwork [and jokes] of psychiatric patients to define the cultural norms of African-Americans." While Mango-Hurdman and Richman clearly state that the examples are taken from a culturally and ethnically heterogeneous group of patients, no inclusion is made of other patients' contributions. Further, a truly diverse presentation of humor and artwork would come from a representative sampling of patients from various cultural and ethnic groups, socioeconomic groups, professional groups, and so forth. If the focus is limited to African-Americans, it should include representatives from all levels of health and socioeconomic standing, and not the stereotypical disadvantaged blacks. At the least, the article needs to clearly state that this is not a representative sample, nor is it meant to represent the larger group in all its diversity and nuances.

We make mistakes, but can we learn from them? This Viewpoint may be a good starting point for discussion of racial issues in art therapy. Juxtaposed with the responses, students in training and art therapy professionals can learn much about our hidden prejudices, blind spots, and passive acceptance of the status quo. Multicultural training must become an imperative task for art therapy educators and supervision groups.

Patricia St. John, EdD, A.T.R.
Associate Editor, Art Therapy: Journal of the American Art Therapy Association

Response to "Art Therapy with Native American Clients: Ethical and Professional Issues"

I am writing to comment upon the article "Art Therapy with Native American Clients: Ethical and Professional Issues" that appeared in November's Art Therapy (Dufrene & Coleman, 1994). I have three years experience working with Native American clients; two were on-reservation in a tribal-run health center. I support the authors' comments that entreat art therapists to be aware of the differences among
Native American people. Differences appear in language, dress, customs, ceremonial practices, traditional and non-traditional spirituality, and the degree of each tribe’s acculturation. In my experience, there is often a nonexplored acceptance of the stereotypic depictions which the media have perpetrated upon us. Upon hearing that I worked with one Northeastern tribe, I received a number of comments from people who admitted that they, “didn’t think about Indians being in this part of the country,” and that most of their images or understanding came from Western tribes.

As we explore our assumptions and biases, I would point out that the art therapist may experience them in two ways: personal assumptions about Native American people that may be identified, and reverse-flowing assumptions that Native American people may have about non-Natives. I believe we must work diligently to uncover and uproot these assumptions, as they impede our progress in working together. Here I must take issue with the authors’ recommendation that, “It is preferable that art therapy be conducted by a Native American mental health professional.” (Dufrene & Coleman, 1994, p. 192). Such a claim is unsupported by any studies that I know of, which show that the treatment outcome of Native American clients seen by Native American therapists is better than those seen by non-Native therapists. While the point is well taken that art therapists must pursue an understanding of the tribe they are serving, suggesting that only Indians can best serve Indians appears to be a segregationist viewpoint that stresses our differences, while ignoring the possibility of a good fit between client and therapist of dissimilar backgrounds. My most honored moments were experienced on the reservation when clients commented that I seemed “so Indian-like.” This had to do with congruence, shared world view and empathic attunement; a color-blind perspective that celebrated our ability to understand one another despite dissimilar backgrounds. While on the reservation, I heard just as many clients express that they preferred not to see a Native American therapist, as those who did.

There is another important issue to consider. If Native American therapists see Native American clients of the same tribe, what about dual relationships? Many tribal communities are close-knit; often everyone is related somehow to everyone else. Can or should a therapist see a client who also is seen at pow wows, participates in the same sweat lodge, attends the same church or recovery group, and is one’s friend, neighbor, or relative? If the Native American therapist is seeing clients from a different tribe, then the fact that Native peoples are not a homogeneous group must again be considered.

In my experience, multicultural work is a stretching, growth-producing, painful process as personal assumptions are uncovered and explored, reverse-flowing assumptions are experienced and worked through, and common ground is sought. This requires and challenges all of us to open our hearts and our minds, and reaffirm why we became art therapists to begin with.

Where Do You Draw The (Border) Line? Art Therapy with Borderline Personality Disorder/Mary Belle Estman, Roberta Jonkers

Panels
Inclusion Project: Opening Doors for Art Therapy in Public Schools/Carmen Davce, Juniera P. Berges, Norma Castleberry, Susan Strickland
The Multidisciplinary Treatment of Attention Deficit Hyperactivity Disorder Includes Art Therapy Groups/Diane S. Safran, Frank M. Safran, Susan Finkelstein
Breaking Through Barriers: The Advantages of Art Therapy in Forensic Settings/David Gusak, Julie Concile, Reid Doran, Nancy Hall
The Professional Relationship: Ethics/Glady's Agell, Linda Gantt, Robin Goodman, Katherine Williams
Legal Issues: Can Art Therapists Stand Alone?/Gail Wirtz, Nancy Sidan, Jean Carrigan, Harriet Wadeson, Susan L. Kennedy, Rose Marano-Geiser

Workshops
The Box—A Versatile Video Tool to Increase Self-Esteem and Communication/Karen Wakeley
Hakomi and Art Therapy: New Paradigm Using Body, Imagination, and Mindfulness/Deborah Purdy, Barbara Cargill

1954
November 19

Keynote Address
Reflecting on the Past: Implications of Prehistory and Infancy for Art Therapy’s Future/Ellen Dissanayake

Poster Sessions
An Exploration of Women’s Body Image Through Phototherapy/Laura Faber
Art Therapy to Enhance Self Expression with the Abused, Handicapped Child: A Study with Two Children from Different Cultures/Do Hee Kim
Individual Versus Group Art Therapy in Attention Deficit Hypersactivity Treatment/Kate Cherrie Strassler
The Clothesline Project/Mary Hamilton

Focus Groups
AIDS-Related Study Group—Sharing and Networking About Helping HIV+ Clients/Families/Judy Weiner
Doctoral Programs for Art Therapists/Linda Gantt
Failures and Wrong Thinking: Living and Learning/Judith A. Rubin, Shirley Riley, Laurie Wilson
Matter over Mind: The Rhinoceros/Don Seiden

Open Forums
Public Relations and Art Therapy/Evelyn Virshup
Student Subcommittee on Education/Annell Etherington, Rebecca Wilkinson
Slidemaking—Photographing Your Artwork (Part II)/Alexandria Elliot-Pirso
Research Open Forum/Nancy Sidun
Ways of Elders/Letice Madoni

Papers
Research Curriculum: Evolution of Practical Applications for a Graduate Art Therapy Program/Trudy Manning, Sarah Hite, Lynne C. Rymann
Recipes for Success: New Programs in New Spaces/Mary Krebs Smyth, Diana Naurock
Humanity Behind the Offense: Group Art Therapy with Special Needs Sex Offenders/Marcia L. Rosal, Joy Ackerman-Hassel, Laura Johnson
Bump Wisdom: Drawing Out the Images of Pregnant Women/Nora Swan-Foster
HIV/AIDS: Artful Retrospective with Images for Tomorrow/Audrey Etkinson-Griff
Documenting Our Story: Art Therapy History/Joan Phillips
The Creativity Mobilization Technique: In a “Drive-Through” Environment/Roberta Toby Pashley
Creating Vacancy: Loss of Soul in the Workplace/Linney Wix, Josie Ablenante
The Severely Disturbed Highly Gifted Child as an Adult/Edith Kramer

Workshop
The Lion Roars and the Group Responds/Athony Robbins, Sandra Robbins

Closing Reception and Dance for Dollars

November 20

Art Therapy Credentials Board Certification Exam

Art Therapy Films from the Archives
Films presented will be: Art Therapy Beginnings, Brush with Life, Michael and Art Therapy

Papers
Art and the Brain/Don Seiden
The Bridge: A Metaphor of Connection, Transition, and Transformation/Julanne Heritz
Sexually Abused Children and Their Drawings: A Composite List of Indicators/Marica Sue Liebman
Infertility: A Silent Struggle Expressed Through Creativity/Sica Isenstadt-Grossman
The Open Art Studio as a Holding Environment for Adolescents in Day Treatment/Carol Kinds
Homosexual Adolescents: Building a Bridge Towards Autonomy/Susan Cydell Ombadykow
The Kid with the Long Arms: Image Communication with a Lost Woman/Trudy M. L. Maassant
Art Therapy with Adolescent Families/Christine Koenen, Sarah Larson
Finding the Hero-Heroine Within: Therapeutic Aspects of Inpatient Expressive Therapy Groups/Connie Liechler, Katie L. Voorhees
Computers and Chronically IIl Children: Communicating with Images/Kimberly Bush
The Wounds of Sexual Assault: How Art Therapy Can Help Children Heal/Marcia Marie Rock
Staying on Track—Using the Train as a Structuring and Healing Metaphor/Karen Wakely
Alchemy Images and the Vision Quest: Into the Hell-Issues of Adolescence/Inrid A. Von Brockendorf

Drawings As Judicial Aids/Marica Sue Liebman

Panel
The Clothesline Project: A Feminist Vision of Art Therapy Work/Katherine A. Meyer, Marian K. Lancaster, Suellen Hugan

Workshops
When Is a Splitting Defense a Bridge to Reparation?/Arthur Robbins
The Double-Edged Image: Exploring Conflict Through the Poetry and Dance/Movement Therapists/Laurene Moorman, Alma M. Ralls

AATA Future Conference Dates:
November 8–12, 1995
Town & Country Hotel
San Diego, CA

November 13–17, 1996
Adams Mark Hotel
Philadelphia, PA

November 12–16, 1997
Pfister Hotel
Milwaukee, WI
On the evening of Saturday, November 19, 1994 at the 25th Anniversary Conference of the American Art Therapy Association held at the Palmer House Hotel, Chicago, Honorary Life Members, Past Presidents, & other dignitaries placed items of historical importance in this Time Capsule as a gift to future generations of art therapists.

It is to be unsealed at the 50th Anniversary Conference in the year 2019.

"TIME CAPSULE" Contributions

Ulman Memorial Issue of American Journal of Art Therapy
Gladys Ager, HLM (Past President)

Video Tape: "Courage! Together We Heal: Mural Messages from Incest Survivors"
Frances Anderson, HLM

Early AATA Board documents (Organizational documents, constitution and bylaw drafts); Menninger report on AATA progress; Buckeye Art Therapy Association address "The Silver Circle"
Bob Ault, HLM (Past President)

State of California Personnel Board Art Therapist Job Description (1972); Title 22 California State Health Regulations art therapist definition; California Marriage & Family Licensing Law
Cay Drachnik, HLM (Past President)

1994 Conference Proceedings "Reflecting on the Past, Envisioning the Future"
Barbara Fish (Program Chair)

Collection of documents spanning nearly 20 years of governmental affairs involvement
Linda Gantt, HLM (Past President)

Egg Timer (used to limit excess discussions at Board Meetings)
Gwen Gibson, HLM (Past President)

Testimony for AATA to the Special Committee on Aging, U. S. Senate: "Aging Artfully: Health Benefits of Art & Dance Therapy"
Robin Goodman (Past President)

Newspaper Article on University of Louisville MA Art Therapy Program
Sandra Graves (Past President)

First Art Therapy Certification Exam Candidates' Bulletin and Study Guide
Nancy Hall (ATCB President)

1st AATA Newsletter and, Art Therapy, Journal of the American Art Therapy Association, 1(1), "An Art Therapist's Personal Record"
Don Jones, HLM (Past President)

A History of Art Therapy in the United States
Maxine Junge (Author)

Original "Art Therapy Beginnings" Film Flyer (1977) and AATA Library Guide (1978); Original AATA Poster (1980), Undeveloped film (for unfilmed/unpublished association contributors)
Georgianna Jungels (Past President)

Autographed 25th Anniversary Poster
Edith Kramer, HLM

Publishers flyers on her four books; Copies of historic photographs
Helen Landgarten, HLM

1st Art Therapy Graduate Training Brochure, (Hahnemann, 1967)
Myra Levick, HLM (Past President)

1994 issues of Art Therapy: Journal of the American Art Therapy Association
Cathy Malchiodi (Journal Editor)

"Art Therapy in the Schools" position paper; Distinguished Service Award article
Virginia Minor (President Elect)

1994 issues of the AATA Newsletter
Deb Paskind (Newsletter Editor)

Personal note to Judy Rubin from Janie Rhynes, HLM
Letter to Margaret Naumburg (1972); A video tape: "The Green Creature Within"; Button: "I Survived Artfully" (Received after 77-79 Presidency)
Judith Rubin, HLM (Past President)

1994 Local Arrangements items; Mayoral Proclamation
Suellen Semekas (Local Arrangements Chair)

Shouts in Silence, catalog of Smithsonian exhibit of art by hearing impaired children
Ravley Slicer, HLM

"Board Brush" autographed by the 1993-1994 AATA Board, AATA Policy & Procedure Manual (computer disc)
Bobbi Stoll (President)

1994 AATA Membership Directory (hard copy and computer disk)
Ed Stoyar (Executive Director)

Time Capsule inventory; Robert Mondavi Cabernet Sauvignon 1989 for a celebratory toast by the 50th Anniversary Conference Chairs
Randy Vick (Conference Chair)

Guide to Conducting Art Therapy Research
Harriet Wadeen, HLM
HLM Award Acceptance

Linda Gantt, PhD, A.T.R.
Honorary Life Member awarded at the 25th Annual Conference of the American Art Therapy Association, Chicago, IL

Dr. Gantt’s contributions to art therapy falls chiefly into three areas: teaching and scholarship, governmental affairs, and organizational work. She was an instructor at her art therapy alma mater (The George Washington University) for 2 years after her graduation besides being a field work and practicum supervisor for 5 years. For 13 years Linda was a visiting faculty member at Vermont College. She has lectured at a number of other graduate and undergraduate art therapy programs and at state and national art therapy conferences. Her first elected position in AATA was as the chair of the Publications Committee; when AATA launched its own journal in 1983, Linda was on the planning committee and served as the interim editor.

Art therapy literature has been a special interest for her. Most AATA members were introduced to Linda in 1974 when they received a copy of the annotated bibliography on art therapy that she and Marilyn Schaal compiled under the auspices of the National Institute of Mental Health. Linda was an editor for three Conference Proceedings, the report of the American Psychiatric Association Conference on The Use of the Creative Arts in Therapy published in 1980, and the report of the Task Panel on the Role of the Arts in Therapy and Environment for the President’s Commission on Mental Health in 1978. She has assisted with copy editing, layout, and desktop publishing for the AATA Research Manual, the Continuous Quality Improvement Manual, and the History of Art Therapy in the United States. Her original contributions include three chapters in the Research Manual, several articles in professional journals, and a rating scale to measure the correlation of formal elements in artwork with psychiatric diagnoses. She is currently serving on the Editorial Board of the American Journal of Art Therapy and was on the editorial board of Art Therapy: Journal of the American Art Therapy Association for 7 years.

After she completed her Master’s degree in art therapy, Linda was instrumental in organizing the Potomac Art Therapy Association and served as its first president. In this capacity, she also was the co-chair (with Susan Castelluccio Michal) of the 1979 AATA Conference that had 1,000 participants. (This was when AATA did not have a national office handling the conferences.) Later, when she moved to West Virginia, she helped to organize the Appalachian Art Therapy Association. She served in a number of offices for both local chapters and AATA including a total of five terms on the AATA Board, the most recent positions being that of President and President-Elect. Some of the committees she chaired included Publications, Research, Nominating, Long-Range Planning, and a Special Committee to Review the 1993 Budget.

At the 1976 Conference, Linda made a motion to establish a committee that was to become the precursor to the current Government Affairs Committee. When the motion passed she was appointed the chair. It was from this committee and its liaisons with dance/movement therapists, psychodramatists and music therapists in the Washington area that the Legislative Alliance of the Creative Arts Therapies (LACAT) evolved. The National Coalition for the Arts Therapies Associations (NCATA) grew out of these legislative efforts. In 1982, Linda was the coordinator for the art therapy part of the U.S. Senate hearing on art and dance during the reauthorization of the Older Americans Act. She has always been committed to collaborative work and in that spirit she has been serving as the chair of Federal legislative activities for NCATA.

Feeling she needed additional training for the research and theoretical work she wanted to do, Linda went back to school to earn her doctorate in interdisciplinary studies at the University of Pittsburgh. Since finishing her doctorate in 1990, Linda has been working with Carmello Tabone at West Virginia University to extend her research on the correlation of artwork and diagnosis.

Colleagues, former students, friends... my sincere thanks go to Cay Drachnik and Virginia Minar for nominating me, to the Honors Committee for selecting me, and to you, the AATA membership, for voting for me. I consider it especially symbolic to be given Honorary Life Membership this year as AATA celebrates its 25th anniversary, since this year I am two times 25 years old and celebrating my own personal milestone. But I think this award is also symbolic in that I believe that I am the first person to receive an HLM who has a Master’s degree specifically in art therapy. So, I represent those generations of art therapists who, instead of inventing art therapy on their own, have had someone else to blaze the path.

While I was not at the organizational meeting in Philadelphia or at the first conference, I did make it to the fourth conference held in Columbus, Ohio, in 1973, and to the Boston meeting of the American Society of Psychopathy of Expression in the same year. It was at the Boston meeting that I got my one and only glimpse of Margaret Naumburg as she received an award from that organization.

By my reckoning, I am a member of the third generation of art therapists. I count it my great, good fortune to have had as my teachers Elinor Ulman, Edith Kramer, and Hanna Yaca Kwiatkowska. But my getting into the first class of the Master’s program at The George Washington University was the end of a long chain of events which began at North Texas State University in Denton, Texas, when I was an undergraduate with a major in sociology and a minor in history, and bent on eventually becoming a social worker. A friend wanted
me to take a painting class. She said she needed psychological support and asked me to enroll with her. After fighting the long registration lines, I finally got the last place in the class. The next day, much to my distress, I learned my friend had been unable to get in and I found myself quite alone as one of only two students who were not art majors.

Having decided to get a second minor in psychology, I took a class in abnormal psychology under Dr. Meryl Bonney. Dr. Bonney stated categorically that one could learn more about the human psyche from the arts than from any psychology textbook. To support this contention, he permitted his students to substitute a wide variety of projects such as paintings and poems on psychological themes for the usual spate of library papers. Our textbook for the course had some drawings by psychiatric patients. The end papers were full-color reproductions of plates from one of Ainslie Meares' books. They showed paintings by a patient who was, at first, unable to speak to her therapist because she was so disturbed. But she communicated through the art she brought to their sessions.

On Dr. Bonney's reading list was an article by Elnor Ulman and a book by Margaret Naumburg. This was in 1966, mind you. (I confess I do not recall having read either of them then.) But the idea of combining art and psychology was planted in my mind. Three years later, while I was living in Washington, D.C., a friend suggested that we take a class in art therapy together, and I readily agreed. You might guess what happened—I signed up and my friend did not. Again, I was alone in a situation not of my own making. The Washington School of Psychiatry sponsored the class and Elnor Ulman taught it. The next year, I took another class with Elnor. She had a heart attack and Hanna served as a substitute instructor. During one session Bernie Levy walked in and asked how many of us wanted a Master's degree in art therapy. He said that if he could get enough people to convince the Dean that it would be viable, the university would start a program.

It was only a little while later that I realized how much work there was to be done in the Association and how easily one is roped into doing it. I started my work in publications as an apprentice to Millie Lachman (now Lachman-Chapin) who was then the editor of the AATA Newsletter. We had seen each other at a lecture at the Smithsonian Institute, and she called the next week to ask me to help her with the AATA Newsletter. At the 1977 conference in Virginia Beach, I made a motion to establish an ad hoc committee on lobbying and Federal job classification (which eventually turned into the permanent Governmental Affairs Committee). After the conference Don Jones, who was then President, called to ask me to chair it.

Being selected for this award has given me the opportunity to reflect on my past as well as the Association's and to think how the field has grown and I along with it. But I want to speak to you about the future. We will not have to wait another 25 years to see whether art therapy remains a vital enterprise and an independent discipline. I think our collective fate will be decided in the next 5 years. To ensure that our future is a relatively happy one, I make an earnest plea to the generations that follow mine. I have no doubt that the powerful idea of combining art and therapy will outlive us all. But I am speaking to the group from which future awardees will come—the Clinicians, the DSAs, and the HLMs. I am making an earnest appeal to you to apply your best efforts in those three areas in which I have had the greatest interest and have applied most of my energy—publications, research, and governmental affairs. Relatively speaking, not many of our members are involved in these pursuits, but I am convinced that this is how we will secure our future. Each of these areas requires considerable effort, but as a group, we are more visual than verbal, more emotionally attuned to our patients and clients than research-minded, and more interested in being alone in a studio absorbed in individual creative pursuits than in the tough and sometimes brutal world of political action. Our publications must meet the standards set by the other well-known and older disciplines; our research studies must be rigorous; and our advocacy work must represent us to policymakers at both the state and Federal level.

It is ironic that we live in a time when the amount of information available to us is unprecedented, and yet there seems to be a backlash against empirical research, rational thinking, and knowledge in general. Our hybrid discipline is both art and science, and we must keep it that way. Our task is paradoxical in that it is both easier and harder to be an art therapist in this generation than in the ones that preceded us. Do not be afraid of controversy and debate as long as it is centered on ideas and not personalities or factions, but strive for high standards in all that you do.

I have found art therapy to be intellectually challenging because there are so many unanswered questions and emotionally fulfilling because of the many friends and colleagues I have met so far. As my friend Paula Howie said on a panel at an earlier AATA Conference, I would not want to be anything other than an art therapist. So, my heartfelt thanks go to my teachers whose accomplishments paved the way, to my students whose questions prompted me to learn more, and to all of you for considering me worthy of this honor. I am very grateful.

**DS Award Acceptance**

Doris B. Arrington, EdD, A.T.R.-BC

Doris Arrington is a Professor and the Director of the Art Therapy Program at the College of Notre Dame in Belmont, California. In addition, she is a National Certified Counselor, a licensed clinical psychologist and a clinical mem-
member of the American Association of Marital & Family Therapy. She has a long history of working within the San Mateo County mental health system. She serves as a clinical consultant to a variety of agencies in the San Francisco Bay area.

Dr. Arrington has been a visiting professor at many colleges and universities. She has presented at AATA national conferences since 1979. In 1976, she co-created with Drs. Evelyn Virshup and SueAnne Eslinger Foster a major national art therapy exhibit. She has sponsored art exhibits by art therapists in the Bay area, students and alumni of the College of Notre Dame, and most recently, Edith Kramer, A.T.R., HLM, and Robert Ault, A.T.R., HLM. She continues to work as a sculptor and painter.

Dr. Arrington has published in The Arts in Psychotherapy and Art Therapy: Journal of the American Art Therapy Association. She has chapters in the Guide to Research in Art Therapy, California Art Therapy Trends, and Art for All the Children.

Dr. Arrington has served on many state and national committees and boards. On the state level she served as secretary in 1978 and president of the Northern California Art Therapy Association from 1979-1983 and was awarded the HLM in 1984. On the national level she served on the Standards Committee and later chaired the Western Division of the Registration Qualifying Board as well as the Nominating Committee. She was elected to the AATA Board of Directors in 1987 as Standards Chair. She was re-elected as a Director-at-Large in 1989 and 1991. She served until 1993 overseeing the Certification, Scholarship, Membership, Mosaic, and Publication committees. She was appointed as an interim board member of the Art Therapy Credentials Board. She has served on the Editorial Board for Art Therapy: Journal of the American Art Therapy Association, as a member of the AATA Regional Symposium Committee, and as Chair of the Publication Committee. In 1980, she received one of AATA's first research grants and since that time she has supervised art therapy grants in medical hospitals, state facilities, family service agencies, battered women's services, VA hospitals, and local school districts and colleges.

A decade or so ago, as President of the Northern California Art Therapy Association, I sent Standards Chair Shaun McNiff a letter, telling him that California was too big and too diverse to have just one Standards Representative. His response was to be my future managerial model. Ring. Ring. He appointed the complainant to the task. That was the beginning of my professional life with AATA.

I am deeply honored to be chosen in this 25th anniversary year as the recipient of the AATA Distinguished Service Award. Today, I want to thank the Honors Committee, the AATA Board, and you, the members of AATA, who have elected me or appointed me to Boards and Committees in AATA.

Next, I would like to thank my number one support, my lifetime friend and husband, Bob, who answers the p'tone when many of you call. Ring. Ring. He and I learned a long time ago that by serving each other and others we were actually taking care of ourselves and we believe our three sons have picked up that little gem. I would like to introduce you today to my youngest son Christian Arrington, a school psychologist in Oakland, California and a soon to be art therapist.

Service is all about getting and giving support from and to relatives, friends, staff and co-workers, students, and clients. In the College of Notre Dame Program we teach art therapy that builds on Trust, Cooperation, and Support. I have been blessed to live and work with people who adhere to those three principles, and I greatly appreciate our continuing associations. So thank you Dr. Arnell Etherington and Dr. Richard Carolan, Jeanne Weir, Cay Drachnik, Dr. Frances Anderson, Mari Fleming, and Sr. Mary Duffy, as well as our visiting faculty, many of whom are here today.

The good news is serving AATA means that you get and give support to new acquaintances throughout the country. The bad news is your phone rings all the time. Ring. Ring. The good news is your life is challenged and enriched by your new circle of friends and acquaintances. The bad news is you have no time to enjoy them. Ring. Ring.

Webster says service is the performance of labor for the benefit of another, a duty done, or even spiritual serving as shown by obedience, good work, and love, as dedicated to the service of God. I can buy into all of the above. The volunteers that I know who serve or have served AATA do so because they believe the work of our Association is important. They come together to engage in the beauty of, and the struggle to, the service of AATA, or as Harriet and Sandy said yesterday, Conflict vs. Cooperation. The volunteers bring portfolios of professional skills and experience to accomplish the goals set by our Association. They soon find that they must leave personal agendas, excess baggage, and inflated or fragile egos outside of the Committee or Board room and take in commitment and flexibility. When the job is completed they have collaborated, negotiated, shared, discussed, maybe cussed, but definitely sacrificed. If they are lucky, they have learned to let go and forgive so that they can celebrate their accomplishments and grow from their failures. The process itself often creates a sense of trust, cooperation, and support for those involved.

Those that risk also risk criticism. However, if we refuse to risk and grow, life loses its meaning and we get lost. About the time I was first becoming an art therapist, our family was transferred to San Francisco. After five generations and 30 years of living in Texas I felt like Dante wrote in the Divine Comedy: "Midway in life's journey I was made aware that I had strayed into a dark forest and the right path appeared not anywhere." I don't transplant well. During the next 4 or 5 years in California as my roots sunk deep into the environment, I drew, sketched, etched, and painted roots, branches, trunks of trees, perhaps 200 or more in all. At one of Jayne Rhyne's workshops in the Santa Cruz mountains, she had us make a lifeline, and it was no surprise that mine turned out to be a tree and I had a significant paradigm shift. My art had been caring for my soul by making a home for the tree images as they transformed my life.

Today, imaging provides me with the light I need to see the path so that I can go deeper into the forest and meet and make friends with creatures that live there. Using art therapy, I have been honored over the last 20 years to be able, on occasion, to light forest paths for both students and clients by providing, as Hillman notes, safe spaces to explore valid images and serious rituals for the sake of the soul.

Today, I am as excited about art therapy as I was when I first understood what it was all about. Serving AATA provides
me with the opportunity to give back to a profession that changed not only my direction, but possibly a few others.

*Ring, Ring, Whoops, there goes the phone again. Hello. Oh, this time the AATA wants you. Thank you again and carpe diem. (For this speech, the Ring, Ring was a tape recording that I played of my telephone ringing.)*

**Clinical Award Acceptance**

Dee Spring, PhD, MFCC, A.T.R.-BC

*Dr. Dee Spring, an art therapist for 20 years, is recognized internationally for her treatment of sexual abuse and dissociative disorders. In 1973, she designed, implemented, and operated the first rape crisis center to specialize in art therapy for crisis intervention and treatment of sexual trauma victims. She was presented with the American Art Therapy Association's Research Award in 1978 for her pioneering research in this area. She served on the Board of Directors from 1985 to 1989 as Treasurer, designed, implemented, and served as the first Chief Instructor for the Regional Symposia Program (1985–1993), and served on various committees from 1982 to 1994. She served as the Conference Program Chair (New Orleans) in 1985. In 1985, she presented the idea of Study Groups to meet at the annual conference on specific topics and hosted the first one on sexual trauma and symbolic language. She was the founding Treasurer of the Sierra-Pacific Affiliate Chapter of AATA in Central California. She completed empirical research on the artistic symbolic language of sexual trauma victims in 1987. In 1988, she founded the first study group in the United States on Art Therapy and Multiple Personality Disorder to be affiliated with the International Society for the Study of Multiple Personality and Dissociation. She served on the Board of Directors (1985–1987) of the California Society for the Study of Multiple Personality and Dissociation and presently serves as the Society's President (1993–1995).

Her history as an artist includes being a dancer and vocalist. She began focusing on the visual arts in 1966. From 1968 to 1978, Dr. Spring exhibited her artwork which included painting, sculpture, and weaving. Her specialization in the art field is batik. She won several awards for her paintings, sculpture, and batik. In recent years, she has focused on literary and oratory art rather than the performing or visual arts, but is currently renewing her interest in sculpture and design.*

*Dr. Spring currently conducts a busy private practice as the Executive Director of Earthwood Center which is a specialized treatment center for sexual trauma and dissociative disorders. She is also a part-time professor at the University of California, Santa Barbara (1988–1994) where she designed and instituted a post-Master's art therapy program in 1993. She has received many recognitions and awards over the years, recently being cited in the International Who's Who of Professional and Business Women. She is the author of Shattered Images: Phenomenological Language of Sexual Trauma and Image and Mirage: The Visual Language of Multiplicity. In addition to these publications and her dissertation, Sexual Abuse and Post-Traumatic Stress Reflected in Artistic Symbolic Language, she has authored two training manuals, articles and book chapters, as well as given oral presentations about her specialized work on the international level. She has been a presenter at AATA's annual conferences since 1982.*

For all of you who know me well, I must say this award was a shock! Quite frankly, I didn't know what to do with it, or what to say about it. I figured the Honors Committee had run out of names. Then I discovered that it only has been given twice before. Guess that makes it very special. I thank all of those who were involved in giving me this honor. Thanks for your consideration and respect. It has been a bit of a struggle to get to this place, and it's only taken 20 years. Now, I have 2 minutes to tell you about it!

I remember the other award I received from AATA in 1978. I was shocked then too. This award was for my research for treatment of sexual abuse using art therapy and the consistent forms which showed up in this population's art expression. Unfortunately, the Research Committee forgot to notify me and I didn't show up! During this conference in Los Angeles, I got a call from Gary Barlow wanting to know where I was. He was not happy with me. It was with this telephone call that I learned about the award. Gary met me in a dark little room in the basement of the hotel and gave me a $50.00 check. Today is very different, we have lights! I remember attending Myra Levick's presentation at this conference. She inspired me to teach what I had learned about this population's drawings.

The years have been filled with both wonderful and exasperating times in AATA. I learned to laugh often and much, and to win the respect of intelligent people. I learned about earning the appreciation of honest critics, and how to endure the betrayal of others. I remember being elected Treasurer and learning that we were $35,000 in the red and close to bankruptcy. I remember meeting Ed Stygar for the first time in Chicago in 1986 when I was attending another organization's conference. I found this strange man kneeling by my chair. We then had a meeting about AATA's finances in a dark restaurant! There must be something about lights and AATA! I got the job of being the heavy-handed treasurer, but we made it, and look at us today, a reserve account of half a million dollars.

Aside from the memories and business of AATA, what is important is what I've learned in the clinical realm of art therapy about being a pioneer in the area of traumatic and dissociative disorders since 1973. I have had extraordinary opportunities to observe this population and learn how to manage the most difficult of cases.
I learned about emotional pain, dramas of protection, memories forgotten, and fractured identities. I learned about living and re-living terrible moments, dealing with injustice, and managing incredible pain. I learned about trust and honesty, divided loyalties, deceptions, trickery, and nefarious people who harm the young. I learned about betrayals, ambushes, masquerades, and the fallacy of vision, both the patient's and mine. I learned about incredible journeys of the mind, and the nature of the human spirit to survive, adapt, grieve, and move on to the next stage. I learned about tragedy and triumph, war and peace, collapse and transformation. I learned about portraits of trauma, the reality, not the magical rescue. I learned about walking through shadows and dungeons that dampen the spirit and numb the psyche. But most of all, I learned about courage and determination to distinguish image from mirage.

I thank you.

1994 Keynote Address
Reflecting on the Past: Implications of Prehistory and Infancy for Art Therapy

Ellen Disanayake, Edinburgh, Scotland

Introduction

The past I intend to reexamine today is one that is much older than the past of the field of art therapy. In fact it goes back to the very beginnings of ourselves as a species. Such a long view is usually taken only by paleontologists or zoologists, and you may well wonder what it can contribute to your field, which is concerned with ancient fossils and dusty remains of dwelling sites but with flesh and blood humans and their warm, messy emotions, conflicts, and needs. I hope to suggest, however, how this 4 million year old past, as reconstituted today by evolutionary psychologists, does pervade and affect the present.

Another past I will refer to is much more short-term (and much more familiar to you as therapists and parents). That is the past we all share: infancy. Understanding something of these phylogenetic and ontogenetic pasts will, I hope, contribute to envisioning new ways to think about art therapy's future.

First, let me introduce myself. As some of you may know, my particular subject of interest is the arts and their place in human life. I began as a conventional student of Western art history, and accepted all the usual ideas of the field as it was in the 1960s—that art was a specialized activity of making “works of art,” practiced by a talented few (“artists”) who had responded to a kind of calling and thereby created an arena to transcendence and spiritual insight for the rest of us, who in our spare time went to look at their works in museums and learned to understand them from classes and books.

In 1970 I married a Sri Lankan and for the next decade and a half lived in several non-Western countries—Sri Lanka, Papua New Guinea, and Nigeria. As a result of this exposure to other ways of life, my ideas about art and indeed almost everything began to change. By the time I returned to the West in the mid-1980s, with a book that I hoped to find a publisher for, I discovered an art climate that was also very different from the one I had left some 15 years earlier. My book, What is Art For?, was published in 1985, and after it appeared I discovered that it had relevance to two new “isms” that I hadn’t even known about when I wrote it: multiculturalism and postmodernism.

Like adherents of these positions (which often overlap), I claimed that there was more to “art” than what was now referred to as the Western high art tradition. Also like them, I wished to broaden the concept of art to include process, performance, and relevance to life. Influenced by the non-Western societies I had lived in, I thought it was important to recognize and value the multiplicity and variety of other cultures' ways, including of course their arts.

In some important respects, however, my ideas varied from the postmodern, multicultural West, and it is in these differences that I think my ideas' relevance to art therapy lies. Unlike both multiculturalists and postmodernists, I claim that while human cultures may be many, or many, humans as a species are alike in a number of important underlying characteristics and are in this sense one. Thus, while multiculturalists and postmodernists stress relativism and difference, I stress universality and similarity.

My second book, Homo Aestheticus, maintains that humans are by their very nature aesthetic, and that as a species we deserve to be called “artistic” as much as sapient or “wise.” In other words, underlying all the manifold arts in the multiplicity of human cultures, humans are alike in making and valuing the arts.

Such a position requires a knowledge of evolutionary biology, and it is here that I part company with every postmodernist or multiculturalist that I have met. For there is a sort of reflex or "knee-jerk" antiscience bias, and especially an anti-Darwin bias, among almost everyone today, from the most politically correct to the most fundamentalist and bigoted right-wing fanatic. Science and evolution are blamed for everything from war, racism, and acid rain to abortion and godlessness. I will not defend Darwinism here today, but I do mean to show where I think an enlightened examination of our evolutionary past is the best way to begin to envision a humanly satisfying future for everyone, and that includes the field of art therapy.

Before going on to describe my view of art, I want to say a bit more about this evolutionary starting point.

Species-Centrism

Sometimes when I describe my general perspective I have used the term paleoanthropopsychobiological. It sounds flippant or pretentious, but really encapsulates what I mean. Another term, which sounds serious but dull, is species-centrism. It correctly suggests that my view is neither culture-centric (which most views are, derived from the individual's own culture with which he or she is familiar) nor self-centric (which is another frequent tendency, generalizing from one's own personal abilities or biases, that are of course culturally influenced).
A species-centric or paleoanthropological view regards humans from the vantage point of prehistory (paleo-, paleologically), as well as cross-culturally (anthro-, anthropologically), individually (psycho-, psychologically) and, embracing all these, from an ethological (biological) viewpoint. While such a position no doubt arises out of Western culture, it tries as far as possible to be aware of and to avoid parochialism.

The word ethology may be familiar to some of you already from the work of the pioneer art therapist Edith Kramer (e.g., 1977, 1979, 1992) and her former student, David Henley (e.g., 1992, 1994). It refers to the biology of behavior. Ethologists are concerned with the normal behavior of animals, including humans. A behavior is a species is an inherited predisposition to act in a certain way in certain circumstances. All members of the species have the tendency or the potential to perform that behavior—“it is part of their ‘species nature.’” For example, it is part of canine nature when meeting another dog to greet one another by sniffing head and rear, or to mark one’s territory if one is a male by lifting a rear leg—whether the dog is a St. Bernard or a chihuahua.

A human ethologist, like myself, then, wishes to discern what inherited behavioral tendencies and needs are universally present in humans by virtue of their common human nature, apart from (or “beneath”) their individual differences and particular cultures. For example, while African babies are carried on their mothers’ backs in wrappers, Navajo babies are swaddled on cradleboards, and North American babies are whisked around in strollers and car seats, all babies have the need for developing and sustaining a predictable social relationship with their caretakers and tendencies to behave in ways that will assure that these needs will be met (i.e., they cry, smile, and otherwise compel their elders to respond to and care for them). Crying, smiling, holding the arms out in order to be picked up, and so forth are evolved behaviors, and during human evolution babies who did those things survived better than babies who did not, thus passing on this trait to their offspring.

Similarly adolescent boys and young men may go out hunting together for game, or raid nearby villages for women and other booty, or be inducted into the armed forces and fight in wars, or play team sports, or form neighborhood gangs—but all seem to have an easily encouraged behavioral tendency to join and bond with other males in groups and perform dangerous and exciting physical activities together. This behavioral tendency was adaptive in hunting societies where young active males joined together to hunt and kill for the livelihood or defense of their group.

Obviously, many human adaptations that were valuable in our hunter-gatherer days (which was 39/40ths of human existence) are maladaptive today. We live in a world very different from that in which our behavior evolved, and our emotions—which are what motivate us to behave (or not behave) in certain ways. At the same time, many aspects of this present world are incongruent with our nature. As therapists who deal with people who are maladapted to modern society, it is a good idea to understand that people tend to behave in ways that would be more appropriate in small-scale, face-to-face societies, or they respond inappropriately to modern life because much of what they need is not found in the kind of world we live in today, or that world requires them to do things that many humans are not easily predisposed to do. I know of one book for general psychotherapy that is written from this viewpoint, *Exiles from Eden* by Glantz and Pearce. I recommend it for an introduction to what may be a new perspective for art therapy.

**Art and Human Nature**

My particular species-centric interest is not in infant attachment or male bonding, but rather in the arts, or art in general. Using paleo-, anthro-, psycho-, and biological evidence I want to show how we can consider art as a common universal human tendency or need. I’ll begin by looking first at making, using evidence from infancy and childhood, as well as paleontology.

**Homo faber**

It is well known that the earliest cultural artifacts of our hominid ancestors were stone and then bone tools—implements used for obtaining and preparing food and other needs of life’s necessities, such as scraping skins to use for shelter and clothing, fashioning utensils and vessels, and making weapons. It is now believed that among the advantages of walking upright is that the already dextrous and flexible primate hand was left free and could be used for other things—to carry, to make gestures, to make tools and, unlike other animals, to use tools to make tools.

This adaptation is quite evident in infant development. Both monkey and human fetuses make reaching and grasping movements in the womb, but the human baby is born with inexcipient hand movements that presuppose its future life as a tool user and communicator par excellence. Newborns can see much better than was earlier suspected, and they make pre-reaching movements in the direction of objects that their eyes track. Around 4 weeks, babies begin to be truly sociable, responding to others’ faces and sounds with social expressions and sounds of their own. Their hand movements become expressive, like conversational gestures, and pre-reaching towards a “target” temporarily declines. By 2 months these gestures have characteristics of speech: temporal patterning, emotional dynamism, and direction toward others.

But along with using its hands communicatively, a baby’s drive to master the skills of tool use reasserts itself, with increasing control and coordination. In the human brain there are different paths for perception (that is, for information coming in through the senses) and for acting on the world. The baby’s coordination of eye and hand (that is, his or her visual perception and motor activity) is developed first by practicing bringing his or her hands in contact with each other, then reaching out more successfully and precisely to things in the outside world, and ultimately truly grasping them.

Once babies can reach for, aim at, and grasp objects, they investigate them with mouth, tongue, and lips. Because of their importance to feeding, these have been the first action or motor areas to develop in the cerebral cortex. In fact there are twice as many nerve-endings there at this stage than in the fingertips. (It’s understandable that even as adults
when some of us are concentrating on a precise motor activity like threading a needle or writing. Our lips or tongue may make small movements.

Reaching, grasping, and investigating by eyes, hands, and mouth are repeated again and again, allowing us to learn not only about how things in the world look, taste, smell, sound, and feel, but also that our actions can have an effect on them. As I said, these sensory perceptions and motor skills from the very beginning have reciprocal beneficial effects on cognition. For example, at first we can only release our grip accidentally, but when we achieve the coordination to let go deliberately, dropping objects becomes as enjoyable as grasping them was earlier. Not only do we have an effect on the world, we can plan (to drop) and predict (someone will pick it up and hand it back), and these cognitive pathways in the brain become more developed. Subsequent developmental stages of motor activity include using the precision grip of opposable thumb and fingers (which is unique to humans, as is our rotating wrist) and our improved eye-hand coordination all together.

Manipulation (the word manus means “hand” in Latin) also is developed in person-person-object games, where babies and their partners hand objects back and forth and do things with them. Rhythmic hanging is synchronized with syllable babbling at 6 months, indicating the inherent coordination and pleasure in rhythm. It is important to realize that handling and using are inextricably connected with social interaction and communication-reaching out to others as well as to the inanimate world. Both persons and objects have meaning, and the imperative to have an effect on both is mediated with the hands.

Such special anatomical and cognitive abilities, and their emotional/social correlates, indicate that surely the use and making of things manually—that is, by our hands—is something we were born to do. And indeed, one could say that nothing recognizably human is achieved without hand use—building, cooking, sewing, painting, carving, molding, writing. If we haven’t realized this before it is only because in our lives machines do these things for us; but until very recently, human lives were made by human hands. Early anthropologists called us Homo faber—the making, or toolmaking animal. The earliest humans were the earliest handworkers: to be human was to make, to make things for life.

**Homo aestheticus**

What I am here to talk about today, however, is not just the universal need to handle and make things, but what I claim is also universal—a need to make them artfully, to “artify.” (It’s interesting that there’s no verb in English for doing what we do when we do art, whatever that is.) And what is it to make artfully? I won’t take you through all the steps of my search for the most inclusive way to characterize the human art impulse. The best way I have found to describe it is that art is a way of making ordinary experience, of whatever kind, extraordinary. When “artifying,” one shapes or elaborates everyday, mundane reality, thereby transforming it into something special, different from the everyday.

Another way that I have put it is that in its most fundamental sense art can be viewed as the activity of making things special: decorating the natural body, shaping and embellishing objects of daily or ritual use, and the natural surroundings to make visual arts: exaggerating and patterning ordinary bodily movements or the expressive features of the natural voice to make dance and song; molding, rearranging, and vivifying ordinary language to make poetry; or using all of these together in multimedia performances that excite and unify their participants. As an ethnologist, or Darwinist, I have suggested that individuals and societies who made special the things they cared about would have survived and prospered better than individuals and societies that did not, and hence the tendency to make special what one cares about—rather than the reverse: not to care and not to make special—gradually became an essential inherited feature of human nature.

An evolutionist, however, must be prepared to suggest why people ever started to do these things, and even more important, what was the reason that they persisted—what real benefits did they provide so that natural selection would allow people who made the ordinary extraordinary to survive better than people who didn’t bother and left the ordinary as it was.

One reason I have suggested is that if people took the trouble to make important tools special (that is, if they carefully added decorative or magical marks to their spears, shields, canoes, divining rods, firesticks, and other implements), this “special treatment” would extend to the care they took of these artifacts. The care or control required to fashion and embellish an important tool was like a metaphor for the care and control one wished to exercise in using it and the value one imbued it with. People who handled their tools sloppily would use them sloppily, and thus be less successful hunters, warriors, and curers. In this sense, art or craft can be assumed as being a necessary part of the technology that actually made it work better, not a superfluous addition.

This is plausible, and is borne out by the observation that in most societies people do make important things special, but I believe there is more to the behavior than enhancement of implements. Ethnologists point out that the germ of a non-ordinary or “special” dimension already exists in two behaviors that humans share with other animals. The first is play, and I know that you, as therapists, are well aware that art and play share certain similarities.

For example, both play and art are what psychologists call “self-rewarding,” i.e., done for its own sake rather than to achieve an external reward like real food (as at a doll’s tea party), or real adventure or travel (as in playing cops and robbers, or armchair escape reading). Even dogs when playing don’t bite each other hard, and cats sheathe their claws, as if they realize their fights aren’t “for real.” Theatre is a kind of play (as the word play tells us)—a world of “as if” or pretend, even when it treats of the real world. No wonder that play is a long-recognized means of dealing with uncomfortable as well as pleasurable subjects, and I am sure that some of the successes in art therapy are related to the “make believe” dimension it shares with play—allowing exploration and trying out without suffering the real-life consequences. Freud, of course, considered art to be a kind of play insofar as he saw both as substitutes for real life—“phantasy.” In this sense then, play is “special” in that it is extraordinary, outside ordinary day-to-day life.

Another artlike behavior is ritual, which is also “outside” ordinary life but deals differently than play with real life con-
cerns. (One can play at being married or being dead or graduating, but this is different from going through the ceremony.) In ritual ceremonies, everything—clothing, words, behavior, emotions—is "special" in some sense. In fact, if you think about it, a ceremony—every ceremony—is a one-word label for what is really a whole collection or assembly of arts: song, or special voice; dance, or special movement; poetic or special language, special visual display, spectacle, and performance.

But even apart from ceremonies being made up of arts, there are similarities between the characteristics of individual arts and of any ceremony. Both are stylized: there is a kind of formal structure within which a ceremony occurs just as temporal arts like music, dance, and poetry occur in a preordained order that shapes or molds or expresses feelings. Even everyday ritualized behaviors like greetings and partings use verbal formulas ("How do you do", "Have a nice day") and stylized gestures (handshakes, kisses, waves) much as arts use (or used to use) conventions of representation and technique. Whereas some rituals are empty and almost meaningless through familiarity and repetition, most, like the arts, have been fashioned with the express purpose of directing and affecting our emotions, of heightening them. Most of us cry at weddings and feel choked with corny (or meaningful) emotions we didn't know we had at solemn patriotic or religious occasions.

As other animals play, they also have ritualized behaviors—for example, greetings and territory marking, like the dog behavior I mentioned earlier. Like other animals, when you and I meet each other we each leave our circumscribed individual space (our "territory") and both enter into a joint shared encounter. This transition seems to call for a marking that establishes our relationship to each other, our reciprocity and willingness to merge boundaries, or the reverse. If there is an agreed-upon way to behave, a ritualized set of movements or words, the transition is made smoothly and we can conduct our business in mutual space until it is time to segue out of that and back into solitude, again with a ritual.

Why should people engage in the more complex rituals that we call ceremonies? For similar reasons. There is a large and rich literature about ritual that points out how it is liminal, limen being Latin for the word threshold, that is, a time of transition between one state and another. Think of the nuptial threshold that used to symbolize the borderline past which the bride and groom took up ordinary married life (the period of engagement, wedding, and honeymoon all being the special ceremonial time that is outside of ordinary life). The initiate, or ill person, or dead person, for the time of a ceremony, is between the old state and the new. Transitions are times of uncertainty and danger, where everyday rules do not apply. Things can become much better or much worse: therefore, these times are treated with respect and care.

Ceremonial rituals, in humans, like ritualized behaviors in humans and other animals, are performed in order to affect an uncertain situation—to restore or assure prosperity, health, victory, successful passage to a new state of being (adult, spouse, mother, warrior, graduate), or to avert misfortune, defeat, or bad vibes. Because people care about the results, rituals are not performed casually. Words, voices, actions, movements, bodies, surroundings, and paraphernalia are made as impressive or sacred or beautiful or extraordinary as they can possibly be. And, as is the case with tools or weapons, this makes the ceremonies work better, though in a communal as well as individual way.

Ritual, play, and art are all "bracketed"—set off from everyday life. In their own ways, and in overlapping ways, they are special kinds of behaviors that are unlike the mundane ordinary things we do most of the time, such as sleep, eat, shop, work, housekeep, drive. The fact that art shares features with ritual and play should help us to appreciate why it can be a powerful means of engaging attention and working through disorder and uncertainty.

Implications

In the remainder of my talk, I would like to draw out, examine, and elaborate on some of the implications of these brief reflections on our individual past as infants and our species' past in prehistory. These pasts have critical implications for understanding the role that the arts can play in contemporary life, which in so many respects we are ill-equipped by nature to deal with.

1. Importance of handling and making

Pleasure in handling is hardwired into human nature for a very good reason: It predisposes us to be tool users and makers. The infant drive to reach, grasp, investigate with mouthing, looking, and dropping has critical biological importance. And as a critically important biological drive, it is something all babies everywhere want to do. You can't stop them. Handling, like walking, talking, and playing, is pleasurable.

So what about making? In a premodern society the pleasure infants and children receive from handling and then using objects evolves naturally into making them—implements, vessels, houses, regalia. The important universal behavior of play provides opportunities for children to imitate the activities of adults and thereby learn the ways of their society. If the adults in a society make and use tools, children will too. If adults don't, then children won't either, and their natural drive to move seamlessly from handling to making will atrophy just as surely as the predisposition to smile or share will wither if not encouraged or mirrored by positive example. At best children may say "Mommy, let's make something," but in our society we do not make very much and certainly most people make little of what they use. We buy it, or consume it, as images presented by media. Not making can be considered a deprivation of a fundamental human proclivity.

2. Importance of making special

Humans not only want to handle and make, but they have a natural tendency to make special. Children, when given the opportunity to draw will first scribble randomly, but with time this scribbling becomes more controlled. Geometrical shapes such as circles, crosses, and rectangles are produced accidentally at first but seem naturally attractive to children who spontaneously go on to repeat and perfect them. Their first efforts are not copies of the world about them, but autonomous shapely forms that they may label, usually with adult prompting, as members of the family, flowers, suns, or animals, all of which look remarkably alike. Children similarly like to regularize their movements in dance, and their voices and words in song and wordplay; they like to dress up and
adorn their surroundings. While this can be called "play," it may easily be channeled like other imitations of adults' activities into appropriate ritual and artistic "making special."

3. The relationship of art to important concerns and to survival

It is important to realize that not all things are made special by humans, and those that are chosen are usually made special for a reason. Until very recently, the arts have been primarily in the service of abiding human concerns: That is, it has been natural for humans to make special what they care about. For example, as I mentioned earlier, tools for subsistence and weapons are frequently made special (by decoration or ceremonial consecration) to ensure that they work better, and ceremonies themselves are intended to ensure good outcomes to uncertainties. They concern the most important emotions and events: birth, puberty, marriage, death, loss, memory, healing, protecting from harm ensuring prosperity and victory, reconciling human wishes with powerful forces of nature. Thus I claim that the principal evolutionary context for the origin and development of arts was in activities concerned with survival. That is, selective advantage would have accrued to those individuals with more considered use and valuation of important implements as well as to individuals who participated in ceremonies that articulated and reinforced common purpose.

4. Relationship of art to anxiety and control

My evolutionary reconstruction also emphasizes art’s close association with anxiety, in that its earliest occasions seem to have been concerned with “something to do” in times of uncertainty—that is, as I described, transitions between one stage and another. It is interesting that humans all over the world have found that shaped, controlled, nonordinary behavior—whether in ritualized behaviors like greetings and partings, or in ceremonial rituals that also negotiate transitions—helps to relieve anxiety.

Rhythmic or patterned movement or vocalization in the self or gro.zp provides, by analogy, an illusion of control of the external situation, and thus such behavior would have been more soothing and unifying to our hominid ancestors (as well as to us today) than “natural,” random, uncoordinated activity. While it does not seem likely that a society’s ceremonies would have brought rain, attracted game, cured infectious disease, or protected from flood and famine—the reasons why the group performed them—it does seem likely that ceremonies mobilized, coordinated, and unified its members, ensuring that they worked together in a common cause, believing in the validity of their worldview and the efficacy of their action. And to begin with, this is how I claim that art originated and was retained.

Psychologists have specifically dealt with the fundamental evolutionary importance for humans and other animals of reducing psychological uncertainty (Kalma, 1986). Psychological studies indicate that “healthy” and “hardy” people of today have a greater sense of control over events in their lives, tend to be committed to others and to themselves, and tend to possess a belief system that includes a sense of the meaningfulness of life (Kobasa, 1979). It seems clear that throughout human evolution, groups that worked together in confidence and harmony would have prospered more than those whose members acted individually, selfishly, haphaz-

ardly, or without reference to communal purpose. And, it should be clear, the arts (the products of the human activity of making special) were vehicles for this kind of unification. They riveted joint attention, synchronized bodily rhythms, conveyed messages with conviction and memorability, and indoctrinated right attitudes and behavior.

While living in Scotland, I learned of a contemporary, continuing “traumatic event” where the arts have provided “something to do” and helped to unify people—the siege of Sarajevo. An Edinburgh composer, Nigel Osborne, has been deeply involved with the people there, and related in a newspaper article the words of one artist: “I think art did quite a lot for the city. Art gave people some energy, the feeling of still being civilised, and perhaps a little bit of self-respect.” He could have been referring to one instance reported by Osborne when, after the grenade massacre in May 1992, the cellist Vedran Smailovic put on his white tie and tails and played the Albinoni Adagio in the middle of the street. According to many, this marked the start of the civil resistance movement. The image of Smailovic playing among the ruins, and in the graveyards under sniper fire, became an icon for a city that chose to see itself as dignified, cultured, and European, rather than barbaric and brutal like its assailants.

The former Obala Theatre, destroyed by shelling, became a public shortcut to avoid snipers, so its director decided to turn the ruins into an exhibition space.

Often objects and images were created from the materials of destruction, like Mustafa Skopljak’s stalagmites of shattered glass and dolls’ faces buried in sand, or Ante Juric’s installations of debris, mud, and water. Here it is as if the legacy of Joseph Beuys has become a dark prophecy but the processes of the work are modernism in reverse. This has nothing to do with fragmentation, deconstruction, or the atomic blast that scatters meaning and reference. It is integrative and reconstructive: an almost sacred act of nurturing and healing. (Osborne, 1994)

The “Witnesses of Existence” exhibition, as it was called, was wrecked by mortar fire on Christmas Day 1993, but the artists rebuilt it, and with the help of the United Nations, it will be exhibited in the West. In Sarajevo during the siege, there continued to be an excellent children’s choir, music education went on despite everything, and the Sarajevo String Quartet gave concerts throughout, predominantly mateenees and ad hoc events.

Osborne concluded his article:

It seems to me that something very strong has come from my colleagues in Bosnia. While the world stood by and watched a holocaust on television, and while Western art floundered in a colossal imaginative recession, the artists of Sarajevo were on the frontlines of European civilisation, creating a new inclusive art, refined in hell-fire, tough enough to deal with anything, and absolutely necessary. (Osborne, 1994)

I hope that the foregoing four points have impressed upon you how important art has been, in my view, to human evolution. In closing, I would like to mention a few other general ideas that emerge from a species-centered view that, even though they are not directly concerned with art are, I believe, relevant to art therapy.

5. Importance of nonverbal mentation

“Prehistory” usually refers to human existence before the invention of writing and recordkeeping. The fact that so much of human nature is evident in children before they become
verbal, and in our species before it became literate (and perhaps even before it became very verbal) suggests that nonverbal thinking and experiencing are important. This is easy to forget in contemporary logocentric society, especially academic society. We have all recently come across claims by philosophers and other masters of theory that people are "nothing but" the sum of their language and vocabulary, that words give us the ability to think and even to have experiences, that they make us what we are. Looking at infants and babies alone should suggest how inadequate such claims are. Children, premodern and prehistoric people, and artmakers commonly and naturally use "intelligences" (Gardner, 1983) that are spatial, mechanical, musical, or kinaesthetic—that is, nonverbal. In modern society, which exalts verbal analytic problem-solving, persons whose natural aptitudes are for these other kinds of thinking are disadvantaged. In earlier societies they would have found a valued place.

6. Importance of emotion
The emphasis on verbal analytic thought and hence "rationality" in Western academic tradition has further meant that the importance of emotion has been neglected. Indeed, "emotion" is typically regarded as an animal or mammalian or "female" trait that is to be guarded against as dangerous and must be repressed or controlled—an "enemy of reason." To an ethologist, emotions are biologically important indications of what is important to us positively and negatively. Colwyn Trevarthen, a psychologist and neuroscientist, considers emotions to be regulators, not products, of psychological activities, and causes, not effects, of perception and action.

[Emotions] are not implanted in subjects by their "objects" and they are not brought into being as cognitive categories or by their perceptual or cognitive associations. Even when they react to or are triggered by stimuli in the "here and now," emotions are aimed toward future action and future consciousness. They are a part of the dynamic generation of conscious, intelligent action that precedes, attracts and changes experiences. (Trevarthen, 1963)

Such a position suggests that as therapists, one should regard emotions less in terms of being defenses or requiring sublimation than as indicators of where values lie and where directions should be taken.

7. Importance of culture
Culture is an outgrowth of nature, not opposed to it, and no matter how different from one another, cultures have evolved to satisfy universal biological needs that are characteristic of our species. It is true that humans are different from other animals in having complex and varied cultures that often make it difficult for us to understand one another. Compared to other animals we have less to depend on from our own innate resources, and therefore require a long childhood in which to absorb our own particular culture. However, it is important to realize that culture is not separate from our biology but indeed is itself an adaptation, or rather is made possible by a number of other adaptations that give us the motivation and abilities to learn from our fellows and, equally important, to learn some things more easily than others. Thus all humans are born—no matter what our race or environment—with genetically endowed tendencies to become cultural, which can be seen in the first year or two of babies, who are born precultural, so to speak, yet are preprogrammed, as it were, to go on and do certain things. I will now name a few of these universal "cultural" abilities that are also universal biological propensities, some of which I have mentioned earlier in relation to art as making special.

a. Grasping, handling, manipulating, which will lead to using and even making the tools of one's society.

b. Understanding and speaking a language used by one's associates.

c. Attaching and bonding to one's particular caretaker(s). In Scotland, I have been working with a specialist in mother-infant interaction. Colwyn Trevarthen with whom I mentioned earlier, and I have thus become somewhat familiar with the British object-relations school of psychotherapy, based on the work of Bowlby and Winnicott, among others. While you undoubtedly know more about their contributions than I, I have been struck with the obvious sensibleness of considering a person not in isolation but in relationship, and of course the early relationships between infants and their caretakers set the pattern for future interaction.

John Bowlby used ethological principles for developing his ideas. Bowlby's investigations into the biological importance of infant attachment, showing that the infant is born actively seeking engagement with another, has been a welcome antidote to Freud's earlier view of the baby as a passive receptacle whose behavior is "conditioned" by its experiences.

d. Imitating and wishing to please familiar persons and gradually acquiring their beliefs. It is interesting that the times of greatest emotional sensitivity in babies and young children are found to be linked to increases in imitative behavior. Apparently the baby's impetus to interact, which is of course an emotional drive, finds expression in imitation. This makes good biological sense, because imitation helps encourage us into the ways of our social group. (You will remember earlier that I talked of both art and play as making use of imitation, and here I mention its very early emotional and psychobiological underpinnings.)

e. Playing, engaging in make-believe (including imitation).

f. Imposing conceptual order, categorizing experiences according to general mental and particular cultural templates.

I have called these things that babies do naturally "fundamental characteristics of human nature," but they can also be thought of as needs. Handling, making, speaking, bonding, imitating, playing, forming concepts—these are among the abilities that make us human. Babies do not have to be trained to learn them in the way that lions can be trained to jump through hoops or elephants to dance. Being a baby means wanting to handle things, imitate, bond and attach, learn to talk, play, and accept the beliefs of those around you. Babies are emotionally motivated to try to do those things they need to do them or they are not normal babies and will not be normal adults in their societies.

Cultures then make use of these natural tendencies of babies and small children and produce adults whose acculturation rests on their common human nature, that is, on abilities and needs that are the same everywhere. The universals of cultures grow naturally out of these tendencies.

As I said earlier, these evolved behavioral tendencies and needs, and the motivations and emotions that empower 1968
them, evolved for a world that is very different from the one in which we now live. Premodern and traditional societies observably do better than modern and postmodern societies in providing opportunities to express such fundamental elements of human nature as:

- Engaging in appropriate and useful activity toward one's subsistence (e.g., making things that one will use for one's life, seeing the results of one's actions, valuing one's efforts and knowing that others value them; this, I would claim, also includes making things one cares about special).

- Acknowledging and expressing one's social nature—experiencing community and reciprocity (e.g., attaching and bonding to significant persons, having an acknowledged place in a group; sharing, giving and receiving; joining with a group to do things perceived as important together).

- Accepting and affirming a world view that is shared by others (e.g., participating in ritualistic ceremonies that manifest this belief; seeing evidence that this system works. (e.g., by experiencing "self-transcendence" or "oneness" states that validate one's belief).

I could name other human universals, but these can be found elsewhere (e.g., Brown, 1991; Glantz & Pearce, 1989). I think I have said enough, however, to convey that in a species-centered view the arts are not superfluous in human life. Nor are they mere sublimation or entertainment. The sources of art extend far back into our individual past as infants in handling, making, imitating, playing, even in our emotional attachments to others, and into our species' past as prehistoric hominids, i.e., in our desire to affect and control our world and to reduce anxiety and uncertainty, in our penchant for the extraordinary dimension of experience, in our need to acknowledge our emotional investment in important objects and outcomes by making things and events special, and in our need to confirm a socially shared world view.

In the infancy of our species, as well as in our individual infancy, we engaged in nonverbal and highly emotional kinds of mentation far more naturally than as adults—especially as adults in a complex, technological, highly literate society—but these nonverbal and emotion-suffused "frames of mind" are well-known to artists and can be reengaged with in the arts.

Art in the species-centric view is also more than individual expression or wish-fulfillment or creativity. It is a way of making and sharing the extraordinary with others. In envisioning art therapy's future, I as a Darwinist would encourage you to learn more about the ways the arts have been manifested and used in premodern societies so that you can appreciate (a) how art is a means of satisfying preculural needs, and (b) how aberrant and unsatisfying contemporary Western society is in meeting these needs. The arts, as in other times and places, can go a long way in allowing our evolved species' needs to find fulfillment.

Tuberculosis: Art Therapy with Patients in Isolation

Abstract

In recent years there has been an unexpected resurgence of tuberculosis, a disease that was considered to have been conquered earlier in this century. Due to environmental, epidemiological, and behavioral factors, it is appearing with increasing prevalence and presenting new treatment challenges. Art therapy, which partly originated in tuberculosis sanatoria, again serves to assist patients in coping with their illness and confinement. Case examples illustrate aspects of the disease and related emotions and highlight the potential for such an expressive activity to counter perceived and real isolation.

Tuberculosis—History and Resurgence

Tuberculosis (TB) is a potentially devastating disease that historically has been a leading killer. In prehistoric time it affected animals, later becoming prevalent in humans in areas with widespread poverty and in crowded cities. This produced the necessary environmental conditions for person-to-person spread of the airborne pathogen of the disease that came to be called the “greenish white plaque” (Dubois & Dubois, 1952). In the early 1900s the incidence of TB increased sharply, and over the next several hundred years the epidemic spread throughout western Europe. It reached colonial North America when European migrants brought the tubercle bacillus with them (Diamond, 1992).

Treatment often required surgery and a period of convalescence, based on the approved regimen of the day which was rest in quiet, pleasant surroundings with fresh air, sunshine, and good nutrition (Lerner, 1993; Rollier, 1952). Tuberculosis sanatoria arose out of a therapeutic concept of “open-air living” while separating infectious patients from the community (Wilson, 1968: 1979).

Before the era of chemotherapy for TB, 50 percent of cases reportedly resulted in death (American Thoracic Society [ATS], 1992). Since the 1950s, TB had steadily declined because of the availability of effective antituberculosis medications. Public health officials treated it as a disease that had been conquered (Bates & Stead, 1993; Boutetoe, 1993; Nardell, 1993; Wilson, 1968). However, since 1985, there has been a resurgence of TB with particular treatment and control challenges related to drug-resistant strains and to non-compliance (Bloom & Murray, 1992; Menzies, Boucher, & Vissandjee, 1993; Pozasik, 1993). In the past decade the incidence of TB has increased significantly nationwide and more than doubled in New York City (Frieden et al., 1993). Due to compromised immune systems, there is a prevalence of TB among patients with HIV infection (Castro, Valdisseri, & Carra, 1992; Centers for Disease Control [CDC], 1990; Hopewell, 1992), with the highest rate of coinfection. 46 percent, from New York City (Bayer, Dubler, & Landesman, 1993; Onorato & McCray, 1992). It is thought that homelessness among urban drug users has further contributed to vulnerability and the transmission of TB (Brudney & Dobkin, 1991; CDC, 1992; Selwyn et al., 1989; Wolfe, Marmor, Moss, & Des Jarlais, 1993).

The resurgence of TB with multidrug-resistant strains poses a serious public health risk in the United States (Bloch et al., 1994). If patients do not complete a course of medication, it becomes ineffectual and requires a change to another drug. Nonadherence, therefore, has contributed to the development of treatment resistance (Bloom & Murray, 1992; Dunbar-Jacob, 1993). The major determinant of outcome is patient compliance, and an official joint statement of the ATS and the CDC (1993b) emphasizes the importance of instituting measures designed to foster adherence and to ensure that patients take prescribed drugs. Programs to improve adherence have included strong educational components, the monitoring of treatment, and behavioral approaches (ATS, 1992; Morisky et al., 1990).

An effective strategy promoting compliant behavior for outpatients has been Directly Observed Therapy (DOT) and the use of incentives. DOT requires that a healthcare provider or other designated, responsible person observe the patient ingesting anti-TB medications. The administration of medication may take place in a clinic, home, workplace, or any agreed upon location. Injecting drug users, who have reported avoiding medical treatment because of fears of detention, are more likely to participate in such a community-based program (Curtis et al., 1994). Studies have indicated that when DOT is used, treatment completion rates have increased, while drug resistance and relapse have decreased (CDC, 1993a; Weis et al., 1994).

The use of incentive schemes rewarding positive health behaviors further fosters adherence. Such enablers include providing care at the DOT site, food, clothes, money for child care, conveniently scheduled appointments, and follow-up for missed appointments (ATS, 1992). Although the benefits of such programs have been recognized and documented in medical literature, behavioral strategies and the use of incentive in TB treatment have not yet been studied or reported in the field of psychology. A review of the literature revealed only one related study in public health, a behaviorally oriented program that studied the value of educational counseling with incentives. Enlisting family and friend support, offering positive verbal reinforcement for adherence, and contracting an incentive scheme resulted in higher levels of compliance to medical regimens (Morisky et al., 1990). It is believed that in order to regain control over this communica-
ble disease, DOT programs supported by inducements for compliance should be broadly implemented (ATS, 1994; Iseman, Cohn, & Sbarbaro, 1993a; Iseman, 1993b; Joseph, 1993).

The Role of Art Therapy in the Treatment of TB—Foundations in the Past

In 1938, British artist Adrian Hill was convalescing from TB in a sanatorium. During his six-month stay, he became involved in his own artwork, discovering its therapeutic value. Indeed, it was Hill who claimed to have first coined the term “art therapy” to describe his work (1945). In “Painting Out Illness” (1951), he reflected on his own restlessness and the importance of engaging in an expressive, constructive activity. “Never does the problem of free-time become so acute as in the period of long-term illness.” He was intrigued as to why the act of drawing and painting seemed to help patients come to terms with their traumas and to speed up the rehabilitative process (Waller, 1991). He went on to encourage other patients and to advocate for art therapy in sanatoria and hospitals in England and other countries.

Hill was also passionate about the concept of art therapy, and his efforts contributed to the formation of the British Association of Art Therapists (Waller, 1991). It seems remarkable to note that the profession apparently had significant roots in a medical setting, with the therapeutic goal of enhancing patients’ coping abilities as related to physical conditions and treatments. This had been an important but relatively rarely practiced specialized area that is only recently returning to the forefront (Malchiodi, 1993a, 1993b).

In the late 1940s, Dr. Auguste Mollier, director of a well-known European sanatorium in Leysin, Switzerland, was a strong proponent of psychological support. He emphasized the importance of healing the whole person, realizing that patients were not only physically but also emotionally sick (1953). He believed that rest alone was not enough and could contribute to depression. He encouraged the medical and nursing staff to keep their patients occupied and stimulated. A positive attitude and sense of optimism through constructive activities could make the difference in real recovery (David, 1992).

The Art Therapy Program-Bellevue Hospital

As a major municipal medical facility in a city with a high incidence of the disease, Bellevue Hospital Center serves a significant number of TB patients. As many as 40 inpatients with active pulmonary TB who are on strict respiratory isolation precautions may be present at any given time. Such isolation requires confinement in a private room, special ventilation systems, and the wearing of protective facial masks by caregivers.

As in the past, patients are prescribed long-term medication regimens and must remain in the hospital, and in their rooms, while they are actively infectious. It is generally believed that with TB “the patient does not have the right to refuse treatment for the disease and continue to expose others” (Frankel, 1992; Pozsik, 1993). In compliance with the New York City Department of Health code, patients at Bellevue who have been previously noncompliant, reluctant to take medications, or attempted to leave prematurely are under orders of detention by the Commissioner of Health. Their isolation is further enforced by the presence of security officers.

These patients’ attitudes toward the hospital, disease, and treatment involve loss of control, anxiety, and anger. Control is often compromised in physical illness, and with the imposed restrictions of TB isolation and detention, it is further diminished. Under such circumstances artistic endeavor may take on even greater value. One may regain some sense of mastery in the art process, while externalizing feelings related to illness (Rosner, 1982b; Rosner David & Sageman, 1987). As stated by Hill (1951), TB patients who engaged in art were “exercising their powers of choice and criticism... a sense of power had now been reached, and with it a sense of well-being.” Human considerations may become as important as scientific ones in the battle against TB (Grange & Festenstein, 1993), and the stage is set for a valuable and highly specialized, renewed area for art therapy.

The authors have been seeing patients with tuberculosis for art therapy sessions for approximately 4 years, with increasing incidence over the past year. Patients are referred by various members of the interdisciplinary healthcare team, most notably from the Psychiatry Liaison Service, which refers patients who are particularly anxious, depressed, or noncompliant. Patients are typically intravenous drug users, many are homeless and may have personality disorders. Lack of cooperation and maladaptive behaviors contribute to the problem of noncompliance and drug resistance (Landesman, 1993, Sageman, 1992). By referring patients to art therapy, caregivers recognize the emotions involved the engaging qualities, and the opportunity to make isolation rooms more humane. The case material presented in this article focuses on such work with patients in respiratory isolation. Their art reveals images and themes related to their disease, prognosis, and confinement. Interpretations are based on clinical observations, common patient perceptions and graphic representations in medical art therapy.

James

Upon initial contact, James was very weak physically. He could barely sit up for more than 10 minutes. He had a long history of alcohol abuse, homelessness, and a personality disorder, all of which contributed to noncompliance. During several previous hospitalizations, as well as outpatient treatment, James did not complete full courses of medication. This resulted in serious multidrug-resistant TB. He had been in respiratory isolation for a month when referred due to depression and anxiety. During the subsequent 9 months of treatment, there were numerous changes in medication in order to find a drug combination that would be effective and curative.

James was verbally very expressive about his feelings of anger, frustration, and anxiety due to his illness, confinement, and prolonged convalescence. He was able to derive positive feelings from his art that served to counteract depression, increase self-esteem, and provide an opportunity to exercise control.

Following infection control guidelines, the art therapist
wore a mask. Due to risk of contagion even with this protective measure, art therapy consisted of numerous brief contacts. James preferred to work on his own, once structure for a visual composition was planned. Due to his weak physical condition, most of his artwork was done in bed, using a lapboard or tray table.

James’ first drawing (Figure 1) is a view from his hospital window showing life going on outside at a distance. In the center of the water is a camouflaged, blurred area. The two-way road has a spotted, droplet-like design that is visually suggestive of germs, blood, or lesions. This spotted motif is prevalent throughout this case. In medical art therapy patients often pictorialize some aspect of their disease or treatment which usually reflects a process of confrontation and integration of bodily changes (Rosner, 1982a). The vehicles on the road are moving but do not seem to have a destination as the road, like the bridge, is cut off.

Little bright red images or spots are scattered over the next drawing (Figure 2) in the form of flowers, foliage, and various markings. This pictorialization may be seen as symbolic of the TB bacillus or blood. James had significant hemosputis, the coughing up of blood, typically bright red, from the bronchi or lungs (Berkow & Talbott, 1977).

James sometimes worked from art reproductions which provided choice, structure, and stimulation. The use of such prints has special value, as they not only expand the repertoire of creative expression but also counteract the visual monotony of months in an isolation room. James’ choices of reproductions and associations were also useful as projective techniques. It seems noteworthy that James often chose to draw landscapes, as if to bring the outside into his limited and clinical surroundings. One such drawing provided a calming and soothing effect (Figure 3). James said that it gave him a ‘sense of peace’ and ‘while doing art, I can forget that I am here in Bellevue.’ Again, there is a blurred area in the center of the water, perhaps a symbolic blemish, and branch-like pathways that resemble bronchial airways.

All the landscapes are from a distant perspective, as if removed from life. This tone continues in the next drawing (Figure 4), but now there are figures looking across a body of water. There are houses on the other side and boats in the water, but it seems questionable whether life on the other side will be accessible. The main figure, and a miniature at its side, are seen from the rear. Primarily done in brown, they appear stiff and wooden and do not look lifelike or suggest mobility. There is a predator—like animal on the ground which James called a ‘crab being roasted,’ repeating germ imagery as well as slow deterioration.

James’ first change in subject matter was a well-grounded still life (Figure 5). It is a bowl of fruit, rich in color and life. It may embody hope and nurturance; however, the banana is beginning to rot with brown spots, reminiscent of the spots of earlier drawings. There is a window and a picture on the wall, continuing the landscape and distancing elements. The indications of houses are prominent and bright red. The fruit is more than symbolic here, as it literally represents nourishment which is a significant part of the TB treatment regimen. At this time, James took on a more active role by his im-
proved nutrition and by requesting books on TB in order to understand his disease. This motivation seemed to be related to an effort to exercise control and resulted in greater compliance.

The ground is very precarious in the next drawing (Figure 6), and the house appears to be sinking. James commented, "The shack doesn't look right... it's all falling apart... it looks mixed up." This seems an accurate depiction of his homelessness and physical and emotional instability. James was very aware of his declining condition. Birds, pathways, and trees as symbols of germs, disease, and anatomy emerge here again. The birds are red and full-bodied and adhere to the airway-like branches.

Feelings of isolation, emptiness, and loneliness were embodied in his drawing of a person on a pathway (Figure 7). He is holding a stick for balance, appears to be on a slow, long journey, and is surrounded by vast, empty space. At this time James was attempting to maintain hope but was realistically saddened by repeated treatment failures.

Expressive landscapes gave way to greater emotion and images of the TB attack on his body. His last drawings were often more directly of himself, and a blue portrait (Figure 8) suggests an unrealistic, alien quality. In addition to conveying fear, the eyes may have exaggerated prominence since they are the only area of a caregiver's face that is visible. Due to the side effects of his medication, James was also experiencing vision and hearing impairment, which may partially account for the emphasis on the eyes and the pointed ears.

James' case of TB was unusually resistant and his prognosis was poor. He was physically deteriorating when he drew "A Path to Nowhere" (Figure 9), which was reflective of his discouragement and agitation after a long period of futile efforts to find an effective drug combination. At this stage James frequently talked about his fear of the future and the possibility of not getting better. His artistic and verbal expression of his perception of the severity of his illness was
honestly confronted in this drawing. Visually externalizing intense emotion provided relief as James was adjusting to the idea that his struggle was beginning to fail. The effect of this drawing is different from his previous artwork in its emotional discharge, agitated graphic quality, and loosely formed images. Pictorial elements again may relate to the body with many branches resembling bronchial airways that perhaps now reflect uncontrollable disease.

Disturbing elements prevail in the last two drawings which reflected his active decline and desperation. He drew his room (Figure 10) which had been the world around him for months with realistic items in the foreground. He rendered himself as a skeleton in the background with a sad, rather than frightened face, and indicated "TB" in his lungs. He included another figure which he said was a doctor, with a strong torso and the caption "madness," perhaps because he could not be cured. He also drew himself in the form of a chest X-ray (Figure 11) labeling "TB" and "cavities" (charac-
teristic of the lung pathology), and proclaiming "resistant," "no cure," and "hopeless." This was an accurate portrayal and confrontation with the end stage of his illness. His inclusion of words emphasizes the images and elaborates on his anguish.

In James' last several drawings a final and direct release of sadness, anger, and emotional turmoil occurred. This intense discharge and graphic representation of his fate may have aided in this transitional phase toward resignation. James' agitation subsided, and he gradually succumbed to his illness. He was receptive and appreciative of the visits that continued when art making was no longer possible. Through the course of his illness and treatment, art therapy served as a link to the outside world, as well as a safe means of emotional expression. It fortified him during hopeful periods and contributed to his compliance with the medical regimen. Through art he increasingly externalized representations of illness and, ultimately, of death.

Ramon

Ramon had been on respiratory isolation for 1 week when he was referred to art therapy. Although he was described as hostile and noncompliant, he was immediately responsive to the opportunity to draw. In the beginning of the first session he sobbed and talked openly about his medical ordeal. He allied himself to the art therapist, claiming to have been an artist for the police department, drawing faces from witnesses' descriptions of alleged criminals. He doubted his ability to continue to draw well, yet boasted about his talent for portraits, needing to look only once or twice at a subject. His statements of pride in his artistic abilities seemed to fortify his self-esteem.

While spontaneously drawing the art therapist, he indeed looked at the paper only twice. He drew the shape of the head and the hair, then looked a long time at the eyes while drawing them. He stopped when he came to the bridge of the nose, apparently realizing that the rest of the face was camouflaged by the protective mask. He appeared sad, but resigned, and completed the drawing between sessions using his imagination. Perhaps drawing the therapist was a way to bond as an artist, and also an attempt to transcend the distance that is experienced with the wearing of masks.

Ramon asked for paper and black drawing pencils and worked on his own to create a very expressive drawing of a face with a mask over the eyes (Figure 12). The mask does not camouflage but, rather, reveals sad eyes. The notion of a facial covering is critical in TB care and isolation. Indeed, this mask merges with, or is an extension of the face. Unlike an opaque respirator mask, this one appears transparent, enabling the viewer to see the eyes and tears behind the obstacle, as well as for the eyes to see outward. Perhaps this represents the partial, guarded existence he was experiencing. Like goggles, the mask provides a measure of protection. It also resembles a harlequin mask with a handle, suggesting that it can be removed to reveal the person. The handle of the mask is ribbon-like, ending in an open scissors image. The transparency may also suggest ambivalence about interpersonal contact and intimacy. Further, it may embody the reality that contact without a mask involves not only emotional risk, but also the real risk of infecting others. There must be a powerful, ominous feeling about the ability to transmit a disease by the simple and natural acts of breathing or coughing.

Figure 12.

The most striking aspects of this drawing are the large, tearful eyes. This is a very eloquent rendition of feelings of sadness and seclusion. The crying that is apparent behind the mask seemed a valuable and safe release. Ramon did not directly verbalize any associations to the drawing; instead, he distanced himself from the emotions by focusing on the technical aspects. He asked whether the therapist had noticed how well he “got the shadows” and “wasn’t it good?” It seemed he was also seeking assurance that he was good, needing validation at a time when his self-esteem had been diminished through illness and confinement.

During the course of his hospitalization, Ramon became more compliant. He remained in his isolation room and rela-

Infection Control Guidelines and Special Considerations for the Art Therapist

Caregivers have unique and real concerns when treating patients with infectious TB. Healthcare workers must take special measures to minimize the risk of becoming infected. TB infection, as indicated by tuberculin skin testing, should not be confused with TB disease. If infection occurs, in most cases immunity develops that prevents active disease. Such people are not contagious, as their immune systems also prevent transmission. Further, they may be medicated as a measure to prevent disease activation. The ATS (1992) and the CDC (1990) provide guidelines and recommendations for TB control. Bellevue Hospital follows such guidelines and educates staff regarding patient isolation and strategies to prevent airborne transmission, including environmental and personal safety precautions.
The environmental interventions recommended have been for the facility to increase ventilation and airflow according to specific standards in order to prevent institutional airborne transmission (ATS, 1992; Nardell, 1993). In the area of personal care, we have adopted the recommendation to use special filtering masks when engaged in art therapy with TB patients (CDC, 1990). These disposable “particulate respirators” are thick and fit tightly over the mouth and nose in order to protect against inhaling droplet nuclei. Greater effort is required to breathe through the masks, and it is therefore quite uncomfortable to wear one for an extended period of time. Due to such discomfort, and in order to minimize risk, we conduct brief sessions, generally no longer than 20 minutes. It is also important to be sensitive to the therapist’s appearance, and the responses and issues that may be elicited from the patient. Patients may attribute the use of such a protective item to being treated like an outcast or alien. Recent studies indicate that many perceive TB as a severe social stigma (Wolfe, Marmor, Moss, & Des Jarlais, 1993), and that duration of illness may be related to feelings of alienation (Sokhey, Vasudeva, & Kumar, 1990).

Another area for consideration involves the art materials. Since organisms would have to be inhaled for TB infection to occur, no particular protective measures have to be undertaken. Following CDC guidelines, art materials fall into the category of “noncritical items,” since they remain outside the body and are in contact only with intact skin (1990). However, washing materials with soap or detergent is advisable to protect against germs from dirt or secretions. The use of clay should present no problem with regard to TB, but one should always be observant. In the unlikely event that any art material becomes soiled with blood or bodily fluids, it should be discarded or left with the patient. Following such basic infection control practices, the art therapist should be able to use the full range of materials in safety.

Lastly, when working with TB patients, the emotions of the therapist should be acknowledged. Although we are well educated on infection control guidelines and diligently implement all recommendations in our work, we realize that some measure of risks does exist. We must be honest about this, as well as accompanying anxieties. In addition, we are often dealing with extremely ill patients and must be prepared to face their deterioration and possible death. To balance this, a caseload is never exclusively comprised of TB patients. This makes the work somewhat less intense and may diminish risk to some degree. Further, as with diseases such as AIDS, care for oneself is vital. The need to express and integrate emotions evoked in medical art therapy is essential, as is having many resources for support and life-enhancing, personal activities (Rosner David & Sageman, 1987; White, Feinster, Franklin, Rosner David, & Weiser, 1991; Winiarski, 1971).

Conclusion

The artwork of TB patients in respiratory isolation reflects aspects of the illness and its restrictions. In the authors' clinical experience, images related to anatomy and manifestations of the disease, and emotional themes or perceptions related to being seriously ill and set apart are prevalent.

Art therapy with TB patients clearly presents special issues for the therapist, especially since the incidence of TB is increasing and therefore offering new clinical interest and opportunity for art therapists. It is important to follow infection control guidelines which currently focus on the utilization of a respirator mask to avoid airborne transmission and TB infection.

Patients benefit from the artistic expression of their emotions not only regarding the disease and prognosis, but also regarding the unique experience of isolation. Existence within such restriction only worsens the tendency toward noncompliance. Participation in art therapy serves to decrease anxiety and to provide an opportunity to exercise control. The therapeutic gains and enriched atmosphere of their quarters help patients to confront their illness and hospitalization with greater compliance. There may, therefore, be significant implications for art therapy and similar modalities in TB care. With enhanced coping abilities and adherence to treatment regimens, such activities may contribute to efforts to control the spread of the disease.

Lastly, the evocative nature and value of artistic expression for patients with TB are echoed in the past. Throughout history, especially in the 19th century, many famous writers, musicians, and artists were thought of as being particularly creative as “consumptives” suffering from pulmonary TB. Among them, Elizabeth Barrett Browning spoke of the “butterfly within, fluttering for release” (Dubos & Dubos, 1952, p. 62). As described by René Dubos in “The White Plague” (1952) the disease:

... contributed to literature a number of symbols, images and moods, of great emotional force because they were then the expression of impacts received in everyday life (p. 48) “... many tuberculous individuals have dazzled the world... by the passionate energy with which they exploited their frail bodies... in order to overcome the limitations of disease. (p. 61)

Editor's Note: The authors wish to express their appreciation to art therapist Susan Conlon, MA, for her contribution of the case of Ramon for this manuscript, and to Evelyn Altenberg, PhD, Linguistics, for her assistance with translation of Auguste Böllé’s paper.

Irene Rosner David, MA, A.T.R.-BC, is Director of Activity Therapy at Bellevue Hospital Center, specializing in various areas of medical art therapy. Shereen Ibarser, MA, A.T.R.-BC, is an art therapist at Bellevue Hospital Center, specializing in rehabilitation medicine and tuberculosis.

Pediatric Art Therapy: Strategies and Applications

Anne Prager, RN, MA, A.T.R., Washington, DC

Abstract

A literature search reveals that little has been published specifically on art therapy with medically ill, hospitalized children. It also is apparent that interest in this subspecialty is growing. The author, whose approach is based on phenomenology, describes the strategies used in her practice of art therapy on the pediatric unit of a large, teaching hospital, illustrating them with case material. Assessment rounds made to evaluate which children could benefit from art therapy; the importance of staff communications; and the clinical work itself are discussed. The art materials used and the organization of products are also described. Necessary adaptations for practicing art therapy in the hospital environment are included.

Introduction

Pediatric art therapy, in general, is a term used for the application of art therapy to children and adolescents who have medical illnesses. This paper refers more specifically to practicing art therapy with children and adolescents who are hospitalized. While there are currently few practitioners in this field, there is evidence that interest is growing.

A literature search reveals very few references directly applicable to the implementation of art therapy for children in general pediatric hospital settings (Landgarten, 1981; Nadler, 1983; Prager, 1993). There are a few more articles with indirect references which: asthma (Gabriels, 1988); burns (Appleton, 1993); cancer (Bach, 1990; Councell, 1993); hearing impairment (Henley, 1987); intestinal problems (Lillitos, 1990); and trauma (Stronach-Buschel, 1990). In contrast, there is an abundance of writings, not related to art therapy, on the psychological aspects of illness in children. Some examples include Bergmann (1965), Freud (1952), Prugh (1953), and Terr (1991). Other literature includes psychiatric consultation in pediatrics (Shugart, 1991) and childhood conceptions of illness (Bibace & Walsh, 1980; Perrin & Gerrity, 1981).

The author has been employed as a hospital pediatric art therapist for 20 hours a week for 4 years and entered the field with extensive nursing experience. Her approach is based on the principles of phenomenology (Betensky, 1987). The premise of this approach is succinctly described by Junge and Linesch (1993) who relate that in phenomenology

the inner experience of the person is focused upon, with the goal of grasping the essential nature of the phenomenon separate from the constructs of intellect and society. Phenomenologists strive to free themselves from the taken-for-granted ideas about things and attempt to get beneath the conventional ways experiences are described to the underlying structures.

Through empathy and a deep in-dwelling, the understanding of the experience is gained. (p. 63)

This approach works well for short-term intervention because it focuses directly on whatever problem the child may be experiencing at the moment. The openmindedness and accurate empathy provided not only elicits valuable information about the child, but also helps to alleviate fear, anger, confusion, and sorrow as the patient begins to feel understood.

Workplace and Caseload

Fairfax Hospital is an attractive, modern, 700-bed facility set in the suburbs of a major city. This private, nonprofit teaching facility also serves as a major trauma center for a wide geographic area. The pediatric art therapy position is under the administration of the Child Life Department, which is comprised of generalists in the normal, psychosocial development of children. The work I do as a specialist is independent, and I am the sole art therapist on the 60-bed pediatric unit. Fifty private and semiprivate beds are available, collectively called "peds main," with 10 additional beds in an intensive care unit. The ages of the patients range from a few days to 18 years, and the average length of stay is 3½ days.

Most of the illnesses seen are acute, either medically or as the result of trauma and accidents. Some are life threatening and others are fatal. There are also children admitted repeatedly for exacerbations of chronic diseases such as cystic fibrosis, asthma, and diabetes. The hospital has pediatric specialists in the areas of trauma, general surgery, neurology and neurosurgery, cancer, cardiology, gastroenterology, renal diseases, and plastic surgery. Because other facilities in the area specialize in HIV-positive children and burns, few of these patients are seen. The only psychiatric admissions are for medical/surgical sequelae of suicide attempts and for psychosomatic evaluations.

To begin the selection of patients appropriate for art therapy, the first task each day is to get an up-to-date computer printout of all the patients on pediatrics. The printout gives each child's name, age, sex, room number, doctor, and diagnosis. Children 5 years and older are highlighted as potential art therapy recipients because patients in this age range generally are more skilled in creating representational art and are better able to sit through group art sessions. Younger children are seen on request, usually when they are especially withdrawn or when abuse is suspected. The average number of potential art therapy patients is about 20 per day, and all of these are invited to the twice weekly art groups.

Children selected for individual art therapy sessions are those most likely to suffer psychological problems resulting from trauma and very serious illnesses and those who endure
chronic illnesses. The length of stay is also a consideration; children who will be in the hospital for a few weeks (e.g., for treatment of cystic fibrosis) need not be seen immediately. Patients referred for art therapy by the medical staff and ancillary personnel almost always receive the service. Hospitalization is stressful for all children, but those who exhibit more than usual sadness, withdrawal, anger, anxiety, or confusion are prime candidates for art therapy. It is unfortunate that not all the children who could benefit from art therapy are able to do so, but there is no money available to increase the service.

Assessment Rounds

Evaluating the psychosocial needs of the patient population is a strategic element in deciding what interventions to implement. On the two days a week when art therapy groups are offered, I go to all the age-appropriate children’s rooms to invite them to the group. These visits can reap a wealth of information about actual or potential psychosocial troubles. Knowledge about child and family dynamics (Kramer, 1971; Kwiatkowska, 1978; Rubin, 1984a) and acuity in visual discrimination (Arnheim, 1969) helps to identify which children will need further evaluation.

By active observation, a sense of illness severity and the child’s coping methods can be discerned. Is the patient pale and listless and attached to a lot of medical equipment? Is the patient crying or demanding or placidly accepting fate?

By noting the belongings in the room, data about the child’s individuality, value to others, socioeconomic status, ethnicity, religion, and so forth, can be gathered. Are there hordes of toys, flowers, and balloons? Cards from classmates? What is the quality of the belongings? Are there items from home? If so, what are they? Are religious artifacts in evidence? Untouched meal trays? Old pizza boxes? Does the room have that “lived-in” look or is it rigidly tidy? In time one learns to register these observations consciously and to organize them into beginning impressions about psychosocial circumstances.

For example, what impression would one have of the rooms drawn by children in Figures 1 and 2? In Figure 1 we see an empty environment with no people and no belongings. The small size of the image with a line drawn through the faceless head, together with theambiguous inclusion of hands, suggests feelings of powerlessness. Noting that the patient does not fit in the bed and also that the surrounding

boundary is incomplete, one could surmise that the child feels a lack of support and safety in this environment. On the other hand, in the second room (Figure 2) we notice that the child has a telephone on the table to maintain contact with others, has received some flowers, and can control her environment to some degree by adjusting her bed position and the lights included in the picture.

As to the family, what members, if any, are there? What is the quality of the interactions? Do the parents speak for the child? Do they welcome a creative opportunity for their child when s/he is invited to group? Are they leery of me? Are they and their child willing to part company for a while? What is the overall atmosphere in the room?

While making the above observations, I introduce myself to the family. I explain that I will be offering an hour-long art group which gives the children a chance to meet each other, a chance to be expressive about what is happening to them, and a chance to have fun in a “normal” activity outside of their rooms. When talking to the parents, I introduce the concept that children in the hospital generally have very limited choices, whereas while creating art they have the opportunity to be in charge, and that this helps to maintain their independence. The children may choose what materials to use, what images to create, to whom they want to show their artwork, and what they want to do with it. I also mention that the hour with the art group offers the parents a break, which most enjoy. Educating the parents in this way helps them to separate briefly from their child. It also helps me to form an alliance with them.

Forming this alliance is crucial. One must be on guard with difficult families not to be so devoted an advocate of the child that the parents become antagonized. When it emerges either in assessment rounds or later that the parents are impeding the overall well-being of the patient, then it is wise to reevaluate the situation and include the family system as a whole in the plan of care. In these situations, family art therapy sessions can be very beneficial, and collaboration with the social work department is key.

Staff Communications

Informal communications with staff, more formal presentations in multidisciplinary rounds, and charting are important to achieve respect and acceptance for art therapy in the
scientifically-oriented, medical model (Robbins, 1976; Rubin, 1984b). Informal communications occur spontaneously in the halls, the garage, the cafeteria, etc. One of the strategies used is to be readily responsive and available when communicating about the children, as this kind of interchange fosters not only good quality care for the children, but good staff relations as well.

Formal staff communications occur weekly at hour-long psychosocial rounds, held separately for the ICU and “peds main.” Participating in these sessions are medical residents, an attending pediatrician, and a psychiatrist. Representatives from nursing, social work, art therapy, child life, nutrition, occupational/physical therapy, speech pathology, pharmacy, and the chaplaincy also attend, along with a host of students from various disciplines.

The purpose of these meetings is to address psychosocial aspects impinging on the healthcare and well-being of each child, which can be hampered by participants who maintain an adherence to their scientific orientations. While this may be done in an effort to defend against distressing feelings, it can result in appearing insensitive. In presenting art, thought needs to be given to its selection: generally, works that clearly prove a point, are dramatic, or are just plain charming are chosen. Showing artwork in a timely fashion that corroborates, refutes, or embellishes statements made by other disciplines underscores the unique contribution of art therapy. It is also a very effective way to capture the attention of the more technically focused staff members because the art itself has the capacity to engage their emotions directly. As an example, the painting in Figure 3 was shown after a rounds participant followed a cursory description of a little girl’s tuneup for cystic fibrosis with the phrase “no psychosocial problems.” (This conclusion is sometimes reached simply because the parents are noted to be at the child’s bedside.) The windowless train seems blind as it careens powerfully to the left, a realm thought by Bach (1986) to be a place of “darkness and the unknown.” One wonders if the “box” might refer to a coffin. The picture seems to provide vivid evidence of the child’s underlying sense of the ominous progression of her fatal illness. Hospitalization always results in some psychosocial disruption and helping to increase the awareness of this is one strategy of art therapy.

The use of rounds for education about art therapy is another worthwhile strategy. One example is that of a 14-year-old boy who had intestinal disease and was nervously awaiting abdominal surgery. He said he hadn’t done art in years. Nevertheless, he decided to try to draw a maze and created Figure 4. When this picture, drawn with remarkable control, was shown in rounds, everyone noticed its likeness to intestines. They could also see how this art therapy patient used the metaphor to express the fears and confusion he had about the integrity of his viscera. The need for control in patients whose bowels are out of control was also discussed.

A second educational example occurred as follows: At the time of our initial session, I did not know that the boy who drew the image in Figure 5 had some years previously undergone irradiation of his brain for a tumor. I pointed out in rounds that the confused organization of stems, flower, and leaf, plus the questionable symmetry of the vase, and the tremulous line quality, seemed to indicate organic involvement. Then the attending doctor told about the radiation, and a discussion ensued clarifying how art can reflect central nervous system impairment. We also talked about what meaning the choice of a black vessel with black flower, drawn as a gift for his mother, might have for this dying child. Everyone attending the session learned something.

The only formal, written staff communication is charting, and the method for doing so varies among hospitals. At our institution, the art therapist charts in the "Integrated Progress Notes" along with the doctors and other personnel.
Clinical Work

One-to-one art therapy at the bedside is done on an as-needed basis. Flexibility is required since appointments need to be made in consideration of medical procedures off the unit, which almost always take precedence. The length of art therapy sessions is variable and depends on circumstances. Sometimes the child does not feel well enough to work for more than just a few minutes. The nature of the illness itself, medical equipment, and interruptions can also present obstacles. When possible, the art therapist must devise strategies for creating art while circumventing these impediments.

Examples of medical hindrances are the need for cardiac and oxygen saturation monitors, nasogastric suctioning, and traction. Children with these devices must be seen at the bedside. Some kinds of leg traction require the art therapist to become a "human easel," which can add a sense of kinesiologic communication as the therapist feels the pressure applied by the drawing of the child and then responds by supplying the appropriate counter-tension. Children who cannot speak due to mouth sores from chemotherapy or new tracheostomies may take to art therapy readily as a major source of making their feelings and thoughts known. The emotions of the girl in the self-portrait seen in Figure 6 are clearly communicated. The brush stroke beneath her chin could symbolize the tracheostomy which had rendered her speechless.

Patients who have limited use of their upper limbs because of IV's, injury, or paralysis also provide challenges for the art therapist. A collage put together by the art therapist at the direction of the patient can give the child a sense of power, while a variety of feelings may also be expressed through the choice of images. When infective processes are present, it is necessary for the art therapist to wear a gown, mask, and gloves. This is not only seems antithetical to creating art, but also seems to impair nonverbal communication. Also, some medicines interfere with the making of art. For instance, aminophylline, which is used to treat asthma, can cause tremors affecting the quality of drawing. Morphine and other drugs also can cause perceptual changes.

Interruptions to therapy, another kind of hinderance, are frequent and come in various forms. Some can be avoided by planning in advance, for instance, by talking with the child's nurse before starting a session to be sure no treatments are scheduled and the IV is filled. Unavoidable interruptions may include friends dropping by, a roommate screaming, time for medication, incoming telephone calls, housekeepers emptying the trash, doctors visiting, the arrival of lunch, and even helicopter activity outside the window. Another major interference is the TV. An effective approach (not always successful) is to suggest to the child that art and TV don't mix well, and that the TV be turned off during the session.

Sometimes it is difficult to arrange for the absence of the parents while doing bedside sessions. On arriving in the room, I attempt to form an initial rapport with the parents by encouraging them to talk about their reactions to the circumstances and by describing what I do. I mention my training as an artist, psychotherapist, and nurse, without emphasizing the psychotherapeutic role since this idea is threatening to some parents. I explain that I use art materials to help children understand and express their feelings about what is happening to them. I add that sometimes children find relief by drawing about their illnesses, and sometimes they like to escape by drawing about something entirely unrelated. The choice is the child's. Then I tell the parents that I will be with their child for an amount of time (depending on the situation) during which they can have a break, adding that most parents like to go to the cafeteria, take a shower, or go for a walk. Almost always, when faced with this positive approach, they are comfortable in leaving their child, and if they are not, that is telling in itself.

Valuable work can be accomplished under optimal circumstances, as illustrated by Figure 7. Here, a boy struggles with his fear of losing his foot, which was perilously injured when a truck accidentally drove onto it and stopped. In the picture, the boy and a passerby in a car yell to the truck driver to "Get off the foot." Interestingly, the artist does not make word bubbles long enough to include the word "foot." It appears that he is starting to deal symbolically with feelings about its possible amputation. Prophetically, he adds the word "foot." after elongating the bubbles. Needless to say, an interruption in the therapeutic process of venting his fears could have interfered with his beginning to cope with the threat of losing his foot and would have been counterproductive. Fortunately, his foot was saved.

Not so fortunate in the realm of interruptions was the 7-year-old child whose drawing is shown in Figure 8. She had spent many soothingly obsessive minutes, using much control, to fill in the grass and draw a sun and clouds before even
attempting the tree. The recent colostomy with which she had to contend seemed to emerge quite evidently in the metaphor of a tree. Because of the sudden availability of the CT scan, the art therapy session had to stop abruptly, and she did not have time to explore any resolution. The best that might have been offered was an observation about how difficult it was not to have control, implicitly referring not only to the interruption itself but also to her inability to control what had happened to her body and its functions. It is important to incorporate these interferences into the sessions for therapeutic gains.

The other major clinical activity is art group which is offered to children who are well enough to attend. Kramer (1979), Limesch (1986), Rubin (1984), and Schneider (1990) provide useful information about principles and facilitating skills used in child art therapy groups. However, additional strategies for groups in the general pediatric setting are needed. DiCowan (1987) presents one approach. The approach used on our unit follows.

The groups are held in the adolescent dayroom, which is spacious and pleasant and looks out onto an atrium. One strict rule is that no medical procedures are allowed, and this affords some sense of security for the children. A colorful sign saying, “Art Group in Session—Please Come Back at ___ O’clock” is put on the door to prevent interruptions. The children sit at a large round table surrounded by walls with electrical outlets for plugging in IVs. It is a good idea to seat those who have IVs in such a way as to avoid tangling the lines as children arrive and depart. Patients also come with oxygen tanks, in wheel chairs, and sometimes even in their beds. It is imperative to have a functioning intercom system nearby to call a child’s nurse, usually for such minor things as a bathroom break or IVs which are low on fluid.

Groups bring their own set of challenges. For example, one small group included a 12-year-old girl with a recently amputated leg about which she was very self-conscious. Shortly after the group began, an 8-year-old arrived who was soon to have surgery for a badly mangled hand. The 8-year-old sat staring fixedly at the other’s stump, and a therapeutic intervention was called for on the spot. Sensitivity, tact, and skill are needed when the children’s appearances are frightening or repelling or perplexing due to their reasons for hospitalization.

There are other demands in these groups as well. Mem-
express feelings in the metaphor about her paralysis and about her brother. The last addition to the garden was a family of worms drawn beneath the flower pots. She fed the worms with the vegetables she had grown. The first worm, drawn in corporal pink, called "the sister worm," is likely herself and is seen above and to the right of the face. The mother worm, drawn next, is above the lima beans at the right. The mother was described with giggles as "gassing out the bottom" and having "lots and lots of buttocks." It must have been perplexing for the patient to be aware of her own bodily odors and functions without the associated physical sensations and control. It is also possible that at this age she confused the mechanisms of bowel movements with childbirth. The child then added that "the mother is pregnant and the baby's foot is coming out of her." The brother worm, depicted beneath herself as a legless rocking horse, has a wooden pole through his head. "That's the thing you hold onto when you ride on him," she said with a smile. She seemed conflicted about his ability to walk, and perhaps she felt punished by paralysis for her hostile feelings toward her new sibling. The face belongs to the father, and for reasons unknown is the only nonworm family member.

The opportunity to create these kinds of reparative interventions goes a long way toward diminishing the impact of the devastating illnesses and trauma seen in clinical work. It is also a useful strategy for preventing burnout, because the act of creativity is empowering and regenerative.

**Supplies**

Another important concern for art therapists is to have high quality art supplies kept in good order; this shows respect for the making of art. Using oil pastels instead of crayons is a subtle way to give the message that the creation of art is more than play. The basic materials for drawing, painting, and sculpture are sufficient, since a thorough exploration of any one medium is more than can be accomplished in a few sessions. While the patient may, of course, choose any medium, in keeping with the philosophy of "being where the child is," tempera paint and clay are always readily available. For the child confined to the hospital, it can be soothing to be in touch with such earthy substances. Also, these media are especially conducive to the expression of feelings.

A 9-year-old boy appeared to seek resolution of the struggle he was having with cancer solely by mixing paints. He had moved to this point after spending many sessions making nonrepresentational designs with a ruler and pencil, perhaps finding comfort in this guarding of his emotions. His many mixtures were made in tiny clear plastic medicine cups, which he anthropomorphized. One grayish-purple cupful was named Oscar. Oscar didn't fit in with the other colors because it was so different, which may have symbolized his feelings of being isolated because of his disease. Sometimes the child created potions, appearing to reenact the battle of the cancer and the chemotherapy in his body. He made potions that would render the consumer weak and helpless and potions providing vigor and longevity. Then he would mix them together, analyzing them to see which seemed to be the strongest. He engaged in a similar process, perhaps as an outlet for his anger, when he dropped little paint-blob "bombs" into the water held in a large clear plastic container. He delighted in seeing their explosive diffusion through the sides of the jar and again in creating battles as other "bombs" were dropped. While he never painted a picture, the strategy of staying empathetically with his lead in the creative use of the materials seemed to be beneficial.

The availability of a kiln can be an asset for children with life-threatening illnesses. When appropriate, clay may be offered with the explanation that the kiln can make the work "become as hard as a brick and last forever." This invitation to make lasting memorials has yielded some extraordinarily moving works of art, later to be treasured by the children's families. More commonly, the children are offered the opportunity to paint their finished sculptures, which enriches the process of art making rather than emphasizing the end product.

A large canvas bag, stocked with art supplies and paper clipped to same-sized, heavy cardboards, is used for one-to-one bedside sessions. If the children feel up to it, they enjoy hunting through the bag to choose their media. Another scheme for managing a greater volume of supplies is a wheel-ed art cart with drawers. This is especially convenient for group use. Separate drawers can be used for drawing, painting, and sculpture materials, and paper can be stored in vertical files attached on the back. The cart is locked away when not in use.

When the children arrive for group, colored pencils, markers, tempera paints, and paper of various sizes have been set out invitingly on the table. These materials offer a range of expressive control—from tight, using pencil and small paper, to a looser style, using tempera and large paper. As the group progresses and one gets a sense of its direction and needs, other materials can be added.

There are a few special considerations about using art materials in the hospital. They are safe to use in most situations, but exceptions must be kept in mind. As an example, it is probably not wise to offer chalk pastels to asthmatics. Also, immunosuppressed children need to have clean materials, and supplies used by children who are isolated because of infections must be decontaminated. With the former patients a few new materials the child likes can be selected and left in the room; with the latter the hospital infection control policy for decontamination should be followed.

**Organization of Artwork**

Managing the art products of the hospitalized pediatric population is complicated because of the rapid turnover. As mentioned previously, the children have the choice of what to do with their finished artwork. Frequently, I have observed that when the work is affectively loaded, children leave it with the art therapist; in contrast, when it has more of a social, "hearts-and-flowers" nature, they keep it or give it to their parents. Portfolios are maintained for patients seen over time, special projects such as sibling and family artwork, staff artwork, and artworks used when giving in-service presentations. Two other portfolios, which can be used for educational purposes, contain art exemplifying normal developmental phases and organic impairment. The largest portfolio is a chronologic one for children who come in for short-term.
acute care. Occasionally these children return at a later date, and when their old artwork is brought to them, they seem to feel a warmth from continuity. Carbon copies of chart entries are kept to refresh the memory if these children are rehospitalized.

In addition to the actual artwork, I have developed a slide library of the children's art, along with the attending parental permission forms. When asking the parents for permission, I tell them that I have a large collection of children's artwork and would very much like to be able to include their child's. Usually they are flattered by this approach rather than uneasy about my wanting to photograph the artwork for possible pathologic content. The slides are filed in plastic slide boxes, alphabetically with the child's name. A corresponding card file refers to each slide by age, sex, date, and diagnosis. Carbons of chart notes for each child in the library are also at hand for reference. In this way, when called for, it is easy to select works done by children of certain ages or diagnoses. The slide library is used for many purposes, including presentations, articles, and potential research. It can also be used to evoke memories and savor past meaningful experiences for patients, families, and myself, much as one would a family photograph album.

New strategies for using the slides emerge from time to time. Recently, I worked with a long-term patient with a grave prognosis to create a retrospective art show of her work. The occasion was overtly a celebration of her creativity in life, and covertly a review in preparation for the letting go of her life. We used the slides collected over the years and planned the exhibition together. She was wholly in charge of the guest list, selection of the artwork to show, and narration of the slides. The experience appeared to offer some resolution for all involved.

Conclusion

There are both pleasures and pitfalls in this job. Because there are no art therapy colleagues at hand for support, it is often lonely. It can also be profoundly sad, and the potential for burnout is ever-present. On the other hand, and far weightier in the balance, is the privilege of the intimacy experienced as one is included by the children in their resilient and courageous responses to adversity. I hope that the strategies presented in this article will serve to stimulate thinking about practice in this field.

Art Therapy on a Hospital Burn Unit: A Step Towards Healing and Recovery

Johanna Russell, MS, A.T.R., Sacramento, CA

Abstract

This article describes how art therapy can benefit patients who are hospitalized due to severe burns. Burn patients typically suffer psychological as well as physical trauma due to their burn experience. This author outlines the psychological phases, identifies how burn patients typically experience their healing process, and discusses how art therapy can assist the patient at each stage of the recovery process. Two case studies illustrate the use of art therapy with pediatric burn patients to express their trauma and cope with their burn experience.

Introduction

Patients who are hospitalized due to severe burns suffer physical and psychological trauma. Burn wounds have been described as one of the most physically traumatic injuries and hospitalizations a person may experience. Additionally, the burn incident and injury itself may be terrifying. The person may experience loss of home, parents, siblings, pets, and/or possessions. Those persons who require hospitalization endure necessary painful procedures such as daily dressing changes, debridement of dead tissue, and numerous surgical procedures. For some, disfiguration and disabilities may occur from loss of body extremities such as fingers, hands, toes, or feet. For all, scarring as a result of the burn injuries can lead to difficulties in accepting a change in body image and self-esteem.

A patient may have to return to the hospital numerous times for reconstructive surgery in order to release skin contractions which may form across joints. Burn injuries can be severe and the psychological ramifications must be dealt with for the patient to successfully adjust and adapt to his/her burn experience.

Art Therapist as Multidisciplinary Burn Team Member

Burn units that utilize a "burn team" approach recognize the need for multidisciplinary professionals who meet both the physical and the psychosocial needs of burn patients. The available literature highlights how important it is that the team include mental health professionals who are not directly involved in the physical, medical care of the patient. Nicotia and Petro (1983) recommend, a "no needle" mental health professional should be available to attend to the emotional needs of the patient. "This should be someone on whom the patient does not depend for direct medical care, and therefore, to whom it is easier for the patient to express a range of feelings, including opposition and anger" (p. 108).

The author is an art therapist and a member of the multidisciplinary team at the medical center. In her work, she brings a variety of age and developmentally appropriate art materials to the bedside from which the patient can choose. The art supplies include oil pastels, felt tip pens, paints, drawing materials, paper, clay, print making and mask making materials to name a few. The art therapist purposely elicits the patients' anxieties, responds to their fears, and passes on this information, if necessary, to other medical burn team staff. Baron (1989) observes, "because the art therapist is accustomed to reading a symbolic language, he or she has the opportunity to cue into these messages and to play a central role in their understanding" (p. 152).

The art therapist can assist burn patients throughout their healing and recovery process. "From a holistic perspective, the art work provides art therapists with a much deeper level of understanding and the possibility to participate more fully with clients in their healing process (Baron, 1989, p. 151). Mehaney (1990) in writing about the use of play therapy with a 3-year-old burn patient concurs with Levinson and Ousterhout (1980), who used art therapy with burn patients, saying "interventions to facilitate adaptation to burns, include the use of art . . . therapy" (p. 57). The art therapist is a valuable member of the burn team in being a part of the patient's therapeutic support system.

Psychological Phases in Adaptation to Burn Injuries

Of particular value to any mental health professional working with burn patients is an understanding of the stages of recovery patients may experience during the process of adapting to and recovering from their injuries. The stages appear to be similar for both children and adults. Children certainly have special needs, but "all burn patients tend to follow a similar course" (Cresci, 1982, p. 475). Not all burn patients experience every stage, and some patients experience the stages in different sequences at varying times. These stages tend to overlap and form a continuum with each stage being replaced by the next stage.

Watkins, Cook, May, and Ehleben (1988) describe seven stages of response that adult burn patients typically experience. The seven stages include survival anxiety, problem of pain, search for meaning, investment in recuperation, accept-
ance of losses, investment in rehabilitation, and reintegration of identity. Doctor (1993) claims these stages can be easily adapted to the pediatric patient as well. In working with burned children, I have found that Watkins' et al. stages are descriptive of the psychological adaptations children may experience. Therefore, I have incorporated these stages into this article to help describe the recovery process. A patient may pass through a stage and later in his/her recovery, may need to return to a stage and reintegrate its meaning into his/her life.

Art therapy provides an action-oriented, external outlet for hospitalized children to cope with their trauma. Steward (1993) states that there is new research to suggest that the selection and use of coping strategies changes across the life cycle, with younger children employing more action-oriented, external coping strategies while older children, adolescents, and adults increasingly employ cognitive and affective, internal coping strategies. Steward further notes that the opportunities of young patients to use developmentally appropriate action strategies in the face of stress (escaping, running away, etc.) are sharply limited by the need to administer necessary painful medical procedures. Action strategies are further limited by the drain on children's physical energy and well-being. By manipulating developmentally appropriate art media such as paints and clay, children can make use of their action-oriented means of coping.

Use of Art Therapy in Assisting Burn Patients with Their Psychological Phases of Recovery

Stage 1: Expressing Surplus Anxiety

During the initial stage, which Watkins et al. describe as "survival anxiety" where the patient wonders if he/she will survive the burn injury, the art therapist may encourage the patient to communicate his/her concerns. Cersci (1982) explains that burned children sometimes need help in clarifying their feelings. "By telling a story about a favorite animal that is sick, or drawing a picture, children will reflect their feelings and concerns" (p. 494).

Stage 2: Problem of Pain

Art therapy is an excellent tool to help burn patients express and cope with pain. McGrath and Vair (1984), in their study of the psychological aspects of pain for burned children state, "It is helpful to give children a way of expressing severity of pain. If children are given effective tools to express their pain and are listened to, they are more likely to be able to cope" (p. 83). They suggest three strategies to reduce pain "(1) enhancing predictability and control, (2) encouraging relaxation, and (3) using distraction" (p. 17). Art therapy may be used to assist patients in pain management in each of these areas.

To enhance a patient's feeling of control, a patient can choose whether or not to do artwork. The art therapist is one of the few people in the hospital to whom the patient can say "no!" If a patient does desire to participate in an art activity he/she has control over the selection of art materials. Most importantly, the child can decide what kind of mark or picture they want to draw or how they want to squeeze, pound, or mold clay. In a hospital environment where the patient has little control over what happens to him/her, art therapy offers a sense of control. In the art therapy literature, Lusebrink (1989, p. 2) summarizes that art therapy "enhances a client's sense of control and mastery through the physical manipulation of materials, reorganization of sensations and corresponding conscious thought processes."

To encourage relaxation, imagery that is soothing to the patient can be imagined and then drawn. The artistic process itself facilitates reducing tension as the patient becomes involved in the art activity. (Klingman, Koenigsfeld, Markman, 1987, p. 164). When the patient is involved in manipulating art materials and creating, he or she is focused on the artwork and, therefore, is distracted from his or her pain.

Stage 3: Search for Meaning

During this phase, the patient may need to retell the burn accident many times as he/she attempts to understand the question "Why did this happen to me?" A child, for example, may be feeling too much anxiety to verbalize this concern, but he/she may be able to express his/her fears through artwork. Roberts and Appleton (1989, p. 63) describe the use of art therapy at a hospital burn center as "a very effective outlet for expression and a basis for exploring the patient's concerns" (p. 63).

Watkins et al. (1988) emphasize the need for patients to resolve their own understanding of their injury. Patients may focus so intently on the circumstances of the injury, that they have little energy left for involvement with others and may become withdrawn or avoid situations because of an overwhelming fear of the situation recurring. Resolution of this stage is very important.

Stage 4: Investment in Recuperation

During this phase, patients move towards regaining autonomous functioning. As burn team members praise patients for small gains, patients learn to focus on their abilities rather than their disabilities (Watkins et al., 1988). By actually manipulating art materials and creating a tangible art product, patients are able to focus on their accomplishments. The art therapist can encourage and praise the patients' attempts to participate and create their own art.

Stage 5: Acceptance of Losses

The next phase of the burn patients' recovery begins when patients start to comprehend cognitively and emotionally the losses they experienced as a result of the injury (Watkins et al., 1988). Orr, Reznikoff, and Smith (1989, p. 454), who studied body image, self-esteem, and depression in burn-injured adolescents and young adults, explain, "Patients with burns may experience inordinate personal losses, such as the death of parents, siblings, or pets and the destruction of possessions, in addition to the loss of bodily functions or limbs" (p. 454). Scarring due to burns can also be devastating in terms of body image and self-esteem.

The art therapist can allow patients to express losses and, thereby, assist patients to define the losses and move toward acceptance. Cameron, Juszczak, and Wallace (1984, p. 108) used creative arts in a hospital setting to help children cope with altered body image and learned that

... creative arts can be helpful as a preventative, therapeutic and assessment technique for helping children with their body
image. It is a way of allowing children to deal with potentially difficult issues at a safe distance and of providing opportunities for making choices and feeling in control. (p. 112)

Cameron et al. summarize: "Carefully selected expressive activities provide children with the opportunity to deal with their body image during hospitalization and thus help foster reintegration and acceptance" (p. 112).

Stages 6 and 7: Investment in Rehabilitation, Reintegration of Identity

During these stages patients are learning to regain as much of their pre-burn level of independent functioning as possible. As patients experience success in accomplishing even simple tasks, they feel a sense of accomplishment and gains self-confidence. However, patients may discover they are unable to resume some functions. At this point patients may feel sadness, hurt, frustration, anger, and anxiety. They may have to re-comprehend emotionally the newly recognized loss, accept it, and move again toward recovery and rehabilitation. Through art therapy, patients can express their fears and concerns and work through their anxieties and frustrations. Patients may also determine and express goals through their artwork which can facilitate their rehabilitation.

Case No. 1

Mary was 8 years old at the time an aerosol can exploded next to a wood stove in her home. She was the only one home at the time of the explosion which caused her and her home to catch on fire. She suffered 80% total body surface area burns, with 65% full thickness burns to her arms, torso, legs, and neck, and 13% partial thickness burns to her face and posterior torso. Initially, the risk of Mary’s death was high due to the high percentage of her body that was burned. Her initial hospitalization was for 5 months during which she had numerous surgeries. She would need to return to the hospital for reconstructive surgery many times.

Mary was 3 months post-burn injury when I joined the burn team and began working with her. At this time she was still undergoing numerous surgeries for skin grafting, experiencing painful but very necessary procedures such as twice daily dressing changes, and learning to move and manipulate her limbs again through painful physical therapy. I worked with her for the ensuing 2 months of her hospital stay and during numerous returns to the hospital for reconstructive surgery over the next 2½ years. From the psychiatric consultation notes in her medical record charts, I noted that she initially expressed fears of mortality, the loss of her kittens in the fire, and the possibility of her deformed appearance. Through art therapy, she continued to express her concerns, losses, joys, and accomplishments as she adjusted to the phases of her burn experience.

Acrylic paints were the first art medium Mary tried. Her hands were still bandaged, yet she had enough grasp for me to slip the paint brush in between her thumb and fingers. She could then move her hand with the paint brush across the paper. She could make bright colors flow onto the paper without needing to apply pressure, which would have been difficult and painful for her to do. Most importantly, she was able to do the activity herself and see the outcome of her endeavors. Painting was initially successful and continued to be Mary’s favorite art medium.

Figure 1 is Mary’s first painting after her burn accident. She discovered that she could manipulate the paint brush and control the color, shapes, and lines within the picture. It seemed important to her at this time to be able to create something bright and colorful, using bright red for the flowers and brilliant yellow for the butterfly with red and blue spots. She also may have been unconsciously acknowledging that she was experiencing a transformation, as does a butterfly, in adjusting to her burn injury. I praised her efforts and hung her picture on the wall of her hospital room so she could proudly show it to family, friends, and hospital staff when they entered her room. During art activities, Mary had control over her art materials; also, it was relaxing, and it was a distraction—all helpful in reducing pain.

After several other paintings on various days, she painted the picture in Figure 2, a green fish swimming in a blue sea. When she finished painting it she exclaimed, “That is the best I have ever painted!” This was a very important realization for Mary because her comment implied that her work was something she could do better now than before the fire and her injuries. Mary was attempting to regain her autonomous functioning.
which Watkins et al. describe in the stage of “Investment in
Recovery.” The artwork was a tangible product that she
could experience creating and in which she could take pride.

Figure 3 is a picture using the bandages from her fingers
which she saved and painted. She originated the idea of
painting her bandages. When I suggested she mount them on
poster board, she did and labeled it, “My colorful spinning
wheel.” The patient was transforming her bandages which
had a connection with her painful dressing changes and inju-
ries into a colorful, playful object. She possibly was gaining
control over her bandages, which in turn helped her control
and diminish her pain.

Nine months elapsed from the time of Mary’s discharge
to our next session in the hospital. During this session, she
painted a light blue figure with yellow hair and eyes extend-
ing out of its head (Figure 4). Two lavender hearts float near-
by. Mary told me she wanted to paint a monster and pro-
cceeded to paint this picture. It is my speculation that this may
be a self-portrait, depicting Mary’s feelings about herself. Her
monster appears to be a friendly, feminine monster with eyes
that are out of its body. The lavender hearts, which are her
favorite color, communicate friendliness and love. Her mon-
ster does not appear to have a neck, which is very similar to
Mary’s appearance at this time until she can have recon-
structive surgery to reform her neck. Mary’s monster (and
Mary herself) may be very aware and seeing, and may want
others to see her friendliness and not her body which may ap-
pear monsterlike. Using the metaphor of the friendly monster
may have been her way of expressing feelings which were too
painful or threatening to verbalize. She was attempting to ac-
cept her body image which was an appropriate response for
her as a burn patient and was expressing a normal concern for
her adjustment process with her world of friends, family, and
school.

Six months later, when she returned to the hospital for
another reconstructive surgery, she created Figure 5, which
she entitled “Different.” The art medium here is print mak-
ing which she had looked forward to trying for several hospi-
talizations. Mary, as usual, decided the subject matter. While
she drew, she said she did not like the clown who smiled all
the time because he laughs and jokes when the other clown is
sad. She then wrote “Different” above the clown’s head.

Another 9 months followed and Mary returned for yet
another surgery. She told me at this time that she and her
family might be moving to another state. She painted the pic-
ture in Figure 6 and spontaneously dictated to me the corre-
ponding poem. The possibility of moving appears to have
prompted Mary to re-evaluate her losses. She is returning to
the phase in her adjustment process of redefining and ac-
cepting her losses. The lost paint brush may indicate that she has
to say goodbye to me and our art time together. She includes
all members of her family, as if indicating the "problems" of daily living that occurred in their lives. Her "Thing" is the green friendly looking monster (that is similar to her other monster). The "Thing" seems to observe all this, understand it, and accept that life is just like that.

One month later, Mary was back. She painted Figure 7 in the afternoon while she was waiting to go to surgery. She said the blue bird is sad and that the background is someplace where no one has ever been before. She was feeling very anxious about her upcoming surgery that day and told me that being busy with art helped her feel less anxious. The art gave her a way to express her anxiety as well as providing an activity she could engage in while waiting.

Art therapy assisted Mary in processing her inner concerns through the various psychological phases of her burn trauma. The artwork was a positive, expressive activity where she had control over the medium and could take pride in the resulting art products. The art was a diversion from pain and anxieties due to hospital procedures and surgeries. Through her artwork, she could express concerns about her body image due to scarring and deformities caused by her burns. She also was dealing with the losses she had suffered and portrayed these feelings through art. Moreover, whenever she came back to the hospital for surgery, she could look forward to seeing me and having our time together, as well as creating art. Art therapy provided a tangible, positive medium through which Mary could express her joys, fears, and anxieties and thereby assisted her in her healing process.

Case No. 2

Tina was a 4½-year-old female who was admitted to the burn unit with burns on her buttocks, genitalia, legs, and feet. Her injuries appeared to have characteristics similar to burns due to forced immersion in hot water and appeared to be several days old. Bruises also were evident on the patient's body. She smelled foul, had a severe case of head lice, appeared frightened, and was malnourished. Her mother, a 20-year-old single parent with two other children ages 1 and 6, first brought her daughter into an outpatient clinic for treatment of diarrhea whereupon the patient was transferred to the burn unit. Child abuse was immediately suspected due to the type of injury, the delay in bringing the patient for medical care, the bruises evident on her body, and the mother's account of how the burn happened, which was inconsistent with the type of burn injury. When the child was admitted to the hospital, Child Protective Services was notified, and Tina was removed from the custody of her mother.

The first day the patient was admitted to the hospital and settled in her hospital room, I introduced myself to her. Since she was very frightened, tired, and hungry, I helped feed her ice cream at her nurse's suggestion. I then read to her from a children's book in which she took an interest. I felt she did not have the energy to do art this first day, but I still wanted to introduce myself and interact with her in a supportive non-threatening manner.

At our second session, which was 2 days later, Tina appeared less frightened. When I offered her a drawing pad and crayons to use, she chose a pink-purple crayon and started spontaneously drawing members of her family (Figure 8).
While she drew, she talked softly about each person. She started with a picture of her mother with a smile on her face. She drew her dad looking sad. As she drew the figures, she talked about the illustrated behavior of different family members, such as one family member pulling out his hair. Tina said the small figure in the lower, left-hand side of her picture was "too little to get hit." The circle shapes beside each figure, she said, were cookies which her mom and dad made. However, she said that if she ate the cookies, she would throw up. Tina explained that the letters BA at the top of her picture meant "I love you," which she wanted to tell her mom. However, Tina became angry at this point and said she did not know how to write "I love you" because no one had taught her.

At this session, Tina was expressing many thoughts and feelings. For example, she was expressing survival anxiety (stage 1 in Watkins et al. psychological phases), however, her anxiety seemed to be primarily because of her abusive family environment. She appeared to have angry, conflicting feelings about her mother and father which she indicated by saying she would throw up the home-baked cookies and being angry at not knowing about love. She did not complain of her pain, which is often typical of children suffering from abuse.

Through her drawing and verbal dialogue, Tina could express her situation and her feelings of anger and sadness. When she was drawing, she seemed to give herself permission to talk about aspects of her abuse. I listened carefully to her and supported her feelings that it was not right to get pushed and hit, and that she had a right to be angry.

After she finished her first drawing, she drew a second picture (Figure 9). First, she drew rain at the top of the page. Then she drew her mother's house and said the wind was blowing, as she made large, back and forth strokes across the page. She then covered her mother's house in color, which she said was frost on the windows. She drew other ovals which were other houses, such as her aunt's, which she also covered with color. Tina talked quietly as she drew and expressed herself through her story and her large sweeping strokes of color.

Tina appeared to be beginning to work through her "search for meaning" (stage 3 of Watkins et al. psychological stages). However, at this point she did not disclose how her burn accident happened, which made it difficult for her to resolve this stage. She expressed her anxiety by drawing wind and then covered up her secret by drawing frost on the windows so one cannot see in or out. During later sessions with Tina, I learned that her mother had told her not to tell what happened, which is typical in abusive situations.

After this session, I charted the significant details of our interaction in her medical record chart. I also talked with the social worker handling this case and communicated to her what I had learned. The social worker could then make any necessary further reports.

Our third session was 5 days after the second session. The patient had received skin grafting several days prior in surgery. Her head had been shaved, which is a normal procedure when using this area as a donor site for skin to graft onto the burned areas of the body. The patient was quiet and withdrawn compared to her talkative and spontaneous manner during the previous drawing session. However, she told me she wanted to draw, and I offered her crayons. She drew one house which she said was her mother's house. Then she put her head down on her table. She said she was hungry, but when lunch came she ate very little.

After lunch I showed her some hearts since it was close to Valentine's Day and during the second session she had told me she wanted to draw a heart. She glued the hearts onto the paper but remained subdued and quiet during this activity.

Tina's mother came into the room during this time, but Tina showed little response or reaction to her mother. She continued gluing hearts onto the paper. After about 30 minutes of very little interaction between the two, her mother said she was going to the cafeteria for awhile and left the room. Her mother did not return again that day. When her mom first left the room, Tina cried and wanted her mother to return. After about 10 minutes, Tina stopped crying and I offered her poster paints. Tina proceeded to paint her entire piece of paper red. She appeared to be absorbed in her painting and talked very little during this time. The painting seemed to give her an outlet to express in paint that which she could not verbalize.

Our fourth art therapy session was 4 days after the third session. I offered Tina the paints again because I knew she had enjoyed using the paints and had been expressive in her choice of color. During this session, she used all the colors and appeared to be excited and happily engrossed in mixing
colors to discover new colors while she painted with large, circular strokes. After about 45 minutes of painting, she said she was finished and wanted to draw.

While Tina drew a large face, she said, "My daddy whips me, and I don't like it." She further said she hit her with a belt. She also said that's how her feet got hurt. Since I knew that her feet were burned, I realized there was an inconsistency in her story and that she was not telling everything. She said her mom did not want her to tell anyone, and she did not want me to tell her mom that she had told me. She then said she was finished drawing. I listened to her, validating her feelings, and told her that it was not right to get hit and that she was right in telling me.

Through painting at the beginning of the session and then drawing, Tina seemed to become more confident and, therefore, was able to begin to express more about her abuse. In addition, she seemed to be continuing to work through the psychological phase of adjustment of "searching for meaning" and beginning to be able to tell her story. By painting and drawing, Tina was able to express her emotions, to reveal aspects of her abusive home environment, and to tell secrets of her abuse which her mother had told her not to tell.

It was determined that Tina would be placed with a medical foster mother when discharged from the hospital. When I saw Tina for our fifth session, a few days before discharge, she was withdrawn and quiet. She apparently seemed to be anxious about going to a new home and leaving the now familiar hospital surroundings and staff. She did not want to talk, paint, or draw. I then sat down next to her, put my arm around her, and read her a book. She leaned up against me and appeared to like the comforting time.

The last time I saw Tina during hospitalization, the foster mother was at the hospital to take her home. Tina was frightened and crying that she did not want to leave the familiarity of the hospital and go to a new home. The foster mother was appropriately sincere and caring in the situation. I helped them pack Tina's belonging, supported Tina's anxious feelings, transported her to the car, and said good-bye to her.

Conclusion

In conclusion, art therapy can play an important role in a burn patient's recovery process. Since some patients, especially children, can express themselves better through nonverbal modalities, there is a need for an art therapist to assist them in working through their trauma and psychological phases of adjustment. Art therapy provides an action-oriented, external outlet for hospitalized children to cope with their trauma. When children manipulate developmentally appropriate art media, they make use of these action-oriented means of coping.

By drawing, painting, pounding clay, etc., children can express their emotions about their burn experience. During hospitalization, their participation in art allows them a distraction from their pain, offers them predictability and control, and provides them with a pleasurable, relaxing part of their day. They can look forward to seeing the art therapist, with whom they have built a relationship of rapport and trust and who is not a part of painful, but necessary hospital procedures.

As burn survivors progress toward reintegrating their body image and adjust to accomplishing tasks or being unable to resume all of their pre-burn functioning, art therapy can be an outlet for expressing their frustrations, anger, sadness, and/or joy. Art can help burn survivors comprehend their losses and gains as well as assist them in determining new goals. Their artwork is a tangible product in which they can take pride and see their accomplishments. Their art also serves as a permanent record of their thoughts and feeling that can be evaluated and used in assessment. Art therapy provides a unique means of assisting, supporting, and enabling patients to cope with their burn experiences.

The Use of Art Therapy in Treatment Programs to Promote Spiritual Recovery from Addiction

Holly Feen-Calligan, MAT, A.T.R.-BC, Detroit, MI

Abstract

A spiritual basis for living is essential if one is to recover from addiction (Alcoholics Anonymous, 1976). Art fosters spiritual development through both the creative process itself and in contemplating a work of art which moves one to a higher level of understanding. This article illuminates the relationship between art therapy, spirituality, and recovery and offers a model in which art therapy can be used in treatment programs to facilitate spiritual recovery from addiction. Literature related to recovery, art, and spirituality is summarized. Personal and professional experiences of the author are provided as illustrations.

Introduction

Addiction is a disease that is spiritual in nature as well as physical and emotional (Alcoholics Anonymous [AA], 1976). The importance of the spiritual recovery of an individual has been underscored by many recovering people and other experts in addiction treatment (AA, 1976; Bill W., 1967; Bjorklund, 1983; Booth, 1985; Chickernoe, 1990; May, 1988). This article illuminates the relationship between art therapy, spirituality, and recovery and offers a model in which art therapy can be used in treatment programs to facilitate the spiritual recovery from addiction.

Personal Experience

I had worked in treatment programs and had taught art therapy courses on the university level at the time I married my artist-husband. As newlyweds, we began painting together. That is to say not only did we paint together in the same room, but we painted together in the same room on the same piece of paper! My husband had been working in oil paints and oil pastels for some time when he spontaneously invited me to join him. The invitation brought feelings of excitement, anticipation, and desire to paint with him, confident that this would be a special opportunity to grow close. Despite these feelings, however, I also feared the prospect of painting with my husband. I feared my painting proficiency or lack thereof would be revealed. In retrospect, I also believe I feared the intimacy required of working together. Later I learned that my husband had similar ambivalent feelings. Ultimately, we decided to paint together, but that decision continued to be fraught with resistance. We threw a load of laundry in, made coffee, did the dishes, and when there were no other tasks to stand in our way, the first brush strokes appeared on paper.

It seemed miraculous that we finally started to paint. But the bigger miracle was that we continued! Exhausted and frustrated, many times our painting sessions just didn’t get anywhere. We kept telling one another what each painting looked like shouldn’t matter as long as we continued to make the effort. Yet we were so overjoyed when what we painted looked good to us, we became frustrated when what appeared on paper did not meet with such success. Despite the failures, however, there was a great attraction to painting together. Something always pulled us back. We experienced a satisfaction in knowing that we were working, that we had made the effort, and that we were taking the steps to what we had begun to believe was essential to our well-being and creativity—a commitment to art and to our relationship. We seemed to be developing a faith that the outcome would take care of itself. We simply needed to do the work.

In addition, we were growing closer. Physically, we were close, working on an 11 in. by 14 in. canvas. Emotionally and spiritually, we were getting close. Sometimes we talked, but even if we didn’t talk, we always communicated. We were becoming more familiar with one another’s insecurities, talents, and comfortable ways of expression. Each of us felt a joy when the other would come up with the solution to an artistic problem that would bring the whole painting together. We felt that together we were involved in doing something that neither of us could do alone. The paintings were not my style nor his style, but a new style, our style. Was this a “power greater than ourselves” described in addiction literature?

With more and more successes, I grew so that I feared less the prospect of painting together, and trusted more the process. The fear of painting was replaced with an excitement about the adventure of wondering what would appear. I had faith that continuing, that is, daily persistence in painting was what was important. The end result would take care of itself.

I saw a connection between what we were doing, what I was encouraging patients at the treatment program to do, and with my own concept of spirituality. I became very aware of the process of “letting go”—letting go of expectations, plans, fears, and my ego. There were times when I poked along contentedly with “my side” of the painting only to watch my husband’s idea override mine as he poured turpentine over the whole thing. “Powerless” over turpentine, I visually experienced a form of letting go as I watched my image disintegrate.

Yet the faith that another image equally as pleasing would appear was always there. The quiet time spent in painting helped me to connect with something both inside and outside of myself. Prior to this painting experience, I had always been a very goal-directed person who needed to be producing something tangible at all times. Painting together helped me to think differently about that. I became able to leave housework alone and not obsess over whether we would paint anything resembling art. The process was meditative, uplifting, inspiring.
and creative. I had the opportunity to daydream, to fantasize, to concentrate, and to work through various little details of my life! Whether or not we liked the end product, we felt positively about the process, pleased that we had done the work, and grateful for this special closeness.

I took what I was learning to work with me. My Friday art therapy groups became “Doing By Not Doing” groups. During these groups, I encouraged relaxation, the emptying of the mind of any problems and thoughts and simply painting alone or with a partner, or being still altogether. The methods used in the art therapy groups will be described in more detail at the end of this paper.

Spirituality and Recovery

As human beings, we are spiritual creatures (Booth, 1985). Spirituality is an aspect of ourselves just as we have physical and emotional aspects (Bjorklund, 1983). Virginia Satir said, “... life is something inside you. You did not create it. Once you understand that, you are in a spiritual realm” (Touchstones, 1986). Bjorklund (1983) states, “Spirituality has to do with the quality of our relationship to whatever or whomever is most important in our life” (p. 3). Because of this, spirituality is closely related to values, priorities, goals, and preoccupations (Bjorklund, 1983).

When too much time and energy are spent preoccupied with drinking, then alcohol is at the center of life and has become too important. If something is important, it is given value or worth. “The process of giving worth to something is called worth-ship or worship. When we worship something, we are talking about a god-like relationship with the object of worship” (Bjorklund, 1983, p. 9). According to Bjorklund, this is the basic rationale for describing alcohol as a spiritual disease.

For the person in recovery for whom alcohol had become God, the challenge in recovery is to find God—“God as we understood Him.” a “power greater than ourselves,” or a new spiritual focus (AA, 1976, p. 59). The person in recovery must discover or rediscover what is most important in life. Something must replace alcohol as the center of the person’s life. Recovery does not consist of simple not drinking. “Just to stop drinking without other growth or change would simply frustrate a person who had not learned any other way to meet basic human needs” (Bjorklund, 1983, p. 10). For the individual in recovery, a change, some transformation of desire and attitude, is required in order to stop drinking. This transformation (that same call to God) is the spiritual experience in recovery. The hope of the person recovering from alcoholism is the maintenance and growth of a spiritual experience, according to Bill W., co-founder of Alcoholics Anonymous (AA; 1967, p. 5).

Maintaining and developing spiritual experiences involve recognizing the spiritual aspect of the self and developing it. Spiritual recovery includes discovering one’s values and priorities, and learning what makes life meaningful and worth living. A friend of Bill W.’s stated his formula for spiritual recovery: “You admit you are licked, you get honest with yourself, you talk it out with somebody else; you make restitution to the people you have harmed; you try to give of yourself without stint, with no demand for reward; and you pray to whatever God you think there is, even as an experiment” (Elbly cited in AA, 1957, pp. 62-63).

Many individuals in recovery want to know how to get in touch with their spiritual selves in order to further facilitate spiritual recovery. Booth (1985) says finding spirituality is a matter of looking within: “It is what it is to be a human being” (p. 31). We are already spiritual creatures. The key to understanding spirituality is understanding ourselves. To do this we must have time every day to nurture ourselves, to meditate and pray. We must slow down enough every day to know what it is we are looking for (Booth, 1985).

Ironically, one must live spiritually before one understands what spirituality is, for spirituality is not something that can be learned through books. Living spiritually for some may mean simply being open to spiritual questions. For others, living spiritually means daily persistence in making contact with God, praying, meditating, listening, and cultivating attitudes of gratitude and peace. Living spiritually may mean helping others or attending religious services or Twelve Step meetings. Spiritual experiences may mean being creative: making art or music, writing, walking, fishing, or camping.

The literature describes certain conditions that seem to foster spiritual growth: quiet, uninterrupted time alone, authentic sharing of the self with others as well as helping others, being still, praying, maintaining an openness to spiritual questions, and living spiritually (AA, 1976; Booth, 1985; Fox, 1983; Fossum, 1989). When one “... takes notice of his inner self and trusts it, when he feels a connection with the things larger than himself, he has begun his spiritual development” (Fossum, 1989, p. 43).

Spirituality has been connected with recovery from alcoholism since the founding of AA more than 50 years ago. At the beginning of AA, Bill W. found he had difficulty sobering other alcoholics. He came to understand that other alcoholics needed to arrive at a willingness to want sobriety through having had a spiritual awakening, rather than being “cured” from some outside element (AA, 1957). Bill W. recalled his own spiritual transformation that came suddenly following a period of deep depression after trying on his own to stop drinking. He found himself crying out in his hospital room. “If there is a God, let Him show Himself! I am ready to do anything, anything” (cited in AA, 1957, p. 63).

Bill W. recalled that in the 1930s, Jung told his patient, Rolland H., that his alcoholism was hopeless unless he found his way to some religious or spiritual experience (Segaller, 1989). His alcoholism was incurable, in other words, without some sort of conversion. Jung said, “His craving for alcohol was the equivalent on a low level of the spiritual thirst of our being for wholeness” (Bauer, 1982). He thought that what people sought in alcohol was in fact the spirit—that drinking was motivated by a spiritual search. Jung believed everyone had a need for clation, for specialness, for the cessation of pain, for heroism, for meaning, and to have an ecstatic dimension to our lives. He believed the need for emotional highs was universal (Segaller, 1989). Jung noted that “... alcohol in Latin is spir-itus... the same word for the highest religious experience as well as for the most depraving poison” (Bauer, 1982, p. 127).

Jung connected the spiritual quest to the metaphor of highs, or height. Jung used the example that in ancient cultures high places such as mountains and the heavens were the places of the gods: The Greek gods lived on Mount Olympus. The Pueblo Indians lived on a 6000 ft plateau close to the father, sun. When an individual seeks experiences of getting
high, he does not feel high, according to Jung (Segaller, 1989). The frequency of drawings made by patients containing mountains, airplanes, and spaceships may relate to that. It is also interesting to note the frequent responses of "skydiving" or "flying" by patients in treatment programs when asked what new hobbies they plan to pursue.

Most hospital-based treatment facilities address spirituality through the context of AA—the 12-step program most credited with helping individuals maintain a lifestyle of emotional, physical, and spiritual recovery. Unfortunately other opportunities to address spiritual recovery in treatment programs such as art therapy, journal groups, relaxation therapy, and therapeutic out trips are frequently those deemed most expendable in an effort to curb costs. Patients attend AA meetings while in the treatment program and are oriented to AA's Twelve Steps through didactic therapy sessions. The first three steps generally addressed in treatment programs involve admitting powerlessness over the addiction, believing that a "power greater than ourselves" can restore sanity to life, and making a decision to "turn our will and our lives over to the care of God as we understand Him" (AA, 1976, p. 59).

Art and Spirituality

Kandinsky (1977) wrote of the value of art in feeding the spirit—that the feeling expressed in the art can deepen and purify that of the spectator. "Such works of art at least preserve the soul from coarseness; they 'key it up,' so to speak, to a certain height, as a tuning-key the strings of a musical instrument" (pp. 2–3). Kandinsky valued art if it expressed the internal life of the artist, and wrote about the importance of knowing and expressing one's inner truth.

Joseph Campbell (1986) similarly maintained the value of art is spiritual in nature. He compared the artist and the mystic, each having been exposed to the same reality. The difference, says Campbell, is that the artist has a craft. The nature of the artist and the nature of the universe are two aspects of the same reality. Creative discoveries made by the artist represent universal truths. The "proper" artist, through his inspiration, functions as a true seer and prophet (p. 132).

Evidence of a connection between art and spirituality also can be found in cultures throughout the world, throughout the ages. Carvings of protective animals and spirits in everyday objects by the Bearing Sea Eskimos (Ohno, 1985); the Hindu dance, the Bharata Natyam reminding onlookers of the supreme greatness of God (Kamuda, 1993); the culture of the Native Americans for whom art is inseparable from ritual or religion (Dufrene, 1991); Egyptian mummies and burial practices; exquisitely crafted places of worship, hymns, fables, etc., all demonstrate the interrelationship between art and spirituality. "In many cases it's the art and artifacts that remain, whether it be the Pyramids, a raku bowl, or a Raphael painting. If there is a soul, the arts are it. They're our voice, our search for meaning, our way of believing" (Halberich, 1993). Albert Einstein said, "The most important function of art and science is to awaken the cosmic religious feeling and keep it alive" (Touchstones, 1986).

The relationship between art and spirituality has been addressed by Matthew Fox (1983) who suggests art is a form of meditation. In the past, art as meditation occurred naturally: People were gardeners, told stories, played instruments, made their pots, etc. In our industrial society today, we must make a conscious effort to do these things, to develop our right brain, the unconscious, or our mystical lives (Fox, 1983).

Fox has maintained that Americans today operate on an introverted meditation model. We take in others' images in the form of television and the movies. We do not empty our minds, experience real quiet, and form our own images and beliefs. Eckhart said, "Whatever I want to express in truest meaning must emerge from within me and pass through an inner form. It cannot come from the outside to the inside, but must emerge from within (Fox, 1983, pp. 191–192). What emerges from within is art. "Only art as meditation reminds people so that they will never forget that the most beautiful thing the potter produces is . . . the potter" (Fox, 1983, p. 192).

Koontz (1986) noted a relationship between God and creativity: God created human beings in His likeness; therefore, we are created to be creators like God. Koontz identified a change that takes place in both art and spirituality. In art, the artist makes something new. On a spiritual level, God transforms human beings into new creations. Bailey (1993) wrote that art can be a way of honoring God. Whether they work in wood, clay, or paint, many artists spend a great deal of time recreating God's handiwork, often pondering the object they are about to reproduce, paying homage to God, sipping "the beauty of creation one detail at a time: the multicolored worn edge of an oak leaf, the expression in a duck's eye, the stories in just one groove of a maple's bark" (p. 39).

In recent years, art therapists have articulated their viewpoints related to art and spirituality (Shoemaker, 1991; MeNiff, 1988; Moon, 1992). Chickering (1990) provided a thorough review of the literature related to addiction, spirituality, and recovery. In her study, 10 individuals in recovery identify how art has contributed to the spiritual part of recovery.

Art Therapy, Spirituality, and Recovery

Recovery, art, and spirituality share certain qualities that lend support to the use of art as therapy in addiction treatment: Recovery, art, and spirituality all require commitment and consistent effort to know them. Recovering individuals make a daily commitment not to use substances and to practice the Twelve Steps as best they can. Like recovering people, artists make a similar commitment to their art. Art requires consistent, regular, if not daily attention. Artists must consistently study and apply what they study and feel. Artists are absorbed with their ideas and with their work, and they are never far from it. There is a high "degree of absorption," investment, and continuity in their work (R. May, 1975, p. 40). This may also be true of recovery—there are no shortcuts, no instant transformations. Recovery becomes a way of life, realized with consistent, daily effort. One's spirituality likewise grows and flourishes with daily, consistent effort at living spirituality and being open to spiritual questions.

Terms such as letting go, powerlessness, and humility, understood by individuals in recovery also can be understood through making art. In art, letting go refers to the creative process, to a freedom required of working with media, or an openness to following new directions. I can remember working and reworking a portrait of the son of a friend of mine—making several finished pieces that were so close but just not right. Exhausted, frustrated, and at my limit. I humbly surrendered! I
put the whole thing away to rest and ask for help. A day or so later something called me back. All at once I was able to sense the individuality and spirit of the child and to capture that spirit perfectly, almost effortlessly. The ability to admit powerlessness and let go of the work was instrumental to my ultimate success with it.

This vignette may be what Christian Koonz (1986) meant by the ability to "let go" to be able to receive the impulse or the invitation from God. "When we have acknowledged our human limitations, the problem drops into the unconscious mind... where Wisdom... makes the needed and desired connection for us. When we are ready, willing, and able to receive the insight and deal with its consequences, she allows it to pop into our conscious mind when we least expect it. Or she allows it to dawn on us so gently that one day we simply realize it is there" (Koonz, 1986, p. 37).

Koonz wrote of doing the work as best one can, and then letting go of it, simply waiting for God to do God's part. There are times when doing nothing is most productive; "... the more useless we allow ourselves to be, the more we find ourselves in the seed bed of genuine creativity. Just being there, inert as a seed, our roots are drawn deeper into the heart of creativity. Sooner or later the sap of life begins to flow through those roots toward the surface. Eventually a new creation—a new idea, a new artwork, a new action, a new relationship, or a new person—breaks through the underground darkness into the light of day" (Koonz, 1986, p. 12).

Letting go used in the context of recovery relates to spirituality, to faith and trust in the higher power. Recovering persons admit powerlessness over addictions, believe that a higher power can restore sanity to their lives, and decide to turn their wills and their lives over to the care of God as they understand God (AA, 1976). Recovering persons "let go and let God."

Step Three mentions "God as we understood Him" (AA, 1976, p. 59). Patients in art therapy groups have at times objectified abstract images or ideas about God in their art. In this sense, art has helped recovering persons come to terms with their understanding of God.

References to "highs" are common to art, spirituality, addiction, and recovery. Leonard (1989) found a connection between addiction and creativity in original etymological roots: "The Latin for addict, addictus, means to devote, surrender, deliver over, or give oneself up habitually... Originally it had a spiritual meaning—dedication to the gods—stemming etymologically from addicere: to say. Thus, inherent in the meaning of addiction is the sense of dedication or bearing witness to creative energies" (p. 4). In recalling the advice of Jung, the recovering individual must acquire that which he is seeking through the use of alcohol or other substances—an emotional and spiritual high. The feeling artists get when dedicated to their creative process may be a sort of high. Doing art might feel good. It might provide meaning and a sense of purpose in the life of the artist.

**Doing By Not Doing: Art Therapy in Spiritual Recovery**

The above concepts formed the basis for art therapy "Doing By Not Doing" groups. The title of the group referred to accomplishing something by doing nothing! The need for such a group became apparent while working on a busy substance abuse inpatient unit. A rigorous schedule gave patients something to do all day. Patients were exhausted when they came to art therapy and indignant that they came into the hospital to learn about their disease, not to draw. Patients were assured that these art groups were just as necessary as other therapy groups.

"Doing By Not Doing" groups provided time to stop and listen, to get in touch with the inner self, and with the higher power. The feelings awakened, concepts learned, and awareness gleaned from the treatment program could be contemplated during this quiet group. Doing by not doing refers to achieving insight after the search for insight has been abandoned. Doing by not doing refers to the paradox identified by Koonz: "The more useless I allow myself to be the more I find myself in the seedbed of genuine creativity" (p. 12). Art allows us to lose ourselves and find ourselves at the same time (Fox, 1983).

**Methods**

Sessions were begun with the provision of opportunities for patients to experience powerlessness in art. This was not too difficult since most patients agreed they were powerless to draw a straight line. Group members were instructed to let go of their preconceived notions about drawing and to let go of their fears of participation. Gestures in the air were made and transcribed on paper. Drawing with eyes closed and with the nondominant hand also provided opportunities to experience powerlessness. Making a drawing together with a partner without talking also was done. Pouring odorless turpentine over the images produced with oil pastels provided an opportunity to visually let go.

At times a passage from Emmet Fox's pamphlet, *The Golden Key* (1931) was read. Fox recommended that readers "stop thinking about the difficulty, whatever it is and think about God instead" (p. 2). Following a moment of silent contemplation, individuals could make art if they so chose. Art materials were within easy access. Individuals could draw, paint, or sculpt, but they were to remain quiet whether they made art or not.

Patients were encouraged to relax and were asked to direct attention inward, to become aware of their inner selves. At times, slides of nature were shown or classical music played, but for fear of encouraging "outside/in dynamics," silence and stillness were preferable. The proper way to use the art materials was demonstrated at the beginning of the sessions: using the sides of the pastels, scraping images with the palette knives, and how to use the turpentine. Group members were encouraged not to plan anything, but to listen and to respond to any impulse they had.

**Observations**

A certain transformation was observed during the sessions. The art therapy groups frequently began with a lot of resistance, noise, and turmoil, and ended in a state of peace. The author cannot recall a single patient who didn't relate feeling more calm and relaxed as a result of these sessions. Even pa-
tients who were not accustomed to being quiet and were uncomfortable with being alone with their thoughts benefited from time-limited periods of quiet. Specific problems patients had were clarified through the meditative process. Objectified on paper, issues seemed to be made more manageable.

Although insights and interpretations were not the primary goal of the group, many insights were made. For example, some patients saw themselves in their artwork. One patient ended up with a "mess" of lines going in all directions. He connected this with his messed-up life and his feelings of being overwhelmed and not knowing where to turn, thus helping him to admit powerlessness. Others saw constellations of designs that appeared to them to show their lives coming together, or that there was light amidst the darkness. A patient whose concentric circles resembled a target was able to acknowledge his own role in being a target to be shot at by others.

Other patients seemed to enjoy the creative process, and in the process being able to put some ideas together. Patients were observed scanning and rubbing the colors on the canvas and finishing multiple pieces. They seemed to be getting hooked, absorbed, or possessed by the creative process. Some of their artwork contained the hallmarks of good art: evocative power, inner consistency, and economy of artistic means to use Kramer's (1971) terminology. These qualities seemed to be attained through the "integration and balance of tensions" and mirrored a "complex balance of inner forces" (Kramer, 1971, p. 67).

The presence of "Doing By Not Doing" groups on the unit in the treatment schedule communicated to patients that "not doing" is necessary to recovery. Making time to listen to one's inner voice and to God is as necessary as going to meetings, exercising, eating right, taking up new hobbies, and any of the other prescriptions in recovery from addiction.

Another observation concerns the difference in the patients' reception to the Doing By Not Doing groups versus the other art therapy groups in which patients were asked to make art consistent with milieu therapy themes of denial, recovery, and relapse, and to discuss their art in front of the group. Patients appeared fearful of what they might reveal and may have modified their drawings in an attempt to reveal less—or to keep that which was feared under wraps. But when interpretations weren't called for, when the instruction was to do nothing, more was accomplished. Artwork was more colorful and consumed a greater portion of the page. Patients were engaged for longer periods of time and left the sessions seemingly feeling better—more enthusiastic, in brighter moods—than in other sessions. Once again Jung's prescription to give patients what they sought came to mind. The author wondered if the patients liked this group better because they could "space out," relax, and fantasize or even experience emotional and spiritual highs in a way that was similar to what was sought from drugs.

Conclusion

The personal experiences of the author in making art were critical to the development of the art therapy approach described herein. While structured art therapy sessions were valuable to chemical dependency inpatients to assist with self-expression and self-awareness, of equal or greater value seemed to be the unstructured, "Doing By Not Doing" approach. As inpatient stays are becoming shorter, chemical dependency programs should provide guidance in areas that are known to promote long-term recovery. Recovery from addiction requires finding a spiritual basis of living. Art therapy, a quiet, reflective, humbling, creative, and meaningful endeavor, may provide the means to assist with this process.

Brief Reports

Terminal Stage Leukemia: Integrating Art Therapy and Family Process

Emily Scudder Teufel, Cornish, NH

Abstract

Children in the terminal stages of a life-threatening illness have special emotional needs. Often, these needs cannot be met by people close to the child as they are dealing with personal feelings of their own. Through art therapy children express symbolically what they will or cannot express verbally. Some children have the added stress of family problems that are magnified due to the situation. Refocusing the family on the child and her need for emotional support became the subject of an art therapy intervention. The resulting artwork symbolised family unity for a 9-year-old girl in the terminal stages of Acute Lymphoblastic Leukemia.

Introduction

Acute Lymphoblastic Leukemia (ALL) is a type of cancer in which the malignancy affects a particular line of blood cells. The result of the proliferation of abnormal cells is the “crowding out” of normal blood cells. This type of leukemia reflects the specific line of blood cells affected, although ALL is usually seen only in children and young adults. Patients may present with symptoms of fatigue, excessive bruising, anemia, pallor, general malaise, or loss of weight.

ALL is treated in several stages. The first and most critical stage is treated via induction chemotherapy which is used to reduce the level of leukemia cells below detection, a state referred to as remission. This is an intensely emotional time for parents and children as the child is often taken directly from the pediatrician’s office to the hospital where the first phase of treatment last up to 2 weeks. Treatment includes invasive and painful procedures that add to the emotional stress of both child and family.

The next phase, consolidation or early intensification, consists of intensive chemotherapy for a certain period of time. The child makes weekly visits to the clinic for blood testing and is admitted bimonthly to the hospital for IV medications. On the off weeks the child could be admitted due to fevers and neutropenia (decreased numbers of infection fighting white blood cells). The hospital staff and procedures become more familiar to the child and parents at this time. Relapse of leukemia during this remission period is a very poor prognostic sign that greatly reduces the odds of a cure. After the first relapse, the child may qualify for a bone marrow transplant. This procedure can cause death and does not have a good record of success for these patients. Of children who are in their second remission, 30% to 60% have prolonged survival (Wilson, et al., 1991). After a second relapse, when there is no hope for transplant, a family can decide to continue chemotherapy, hoping for a remission, or provide palliative measures intended to make the child comfortable. The family is faced with difficult choices throughout the illness, but this may be the hardest to make. The child may be considered in the terminal stages of the disease at this point, but there is no fine line to distinguish this.

The last phase of treatment, once successful remission has been accomplished, is called maintenance. Maintenance continues for several years and consists of lower doses of chemotherapy.

Terminal Stage ALL: Implications for Art Therapy

It is difficult to assess how much children understand about their disease and what the future holds for them. Research has shown that younger children perceive death as impermanent while older children approaching age 9 or 10 view death as personal and permanent (Hodges, 1981). Bluebond-Langner (1978) worked with critically ill children and found that as children progress through an illness to death, their self-concept changed. She described five stages. Stage 1 (seriously ill), Stage 2 (seriously ill and will get better), Stage 3 (always ill and will get better), Stage 4 (always ill and will never get better), Stage 5 (dying). Successful completion of each stage results in resolution and preparation for the next stage but also the mourning process that accompanies any change in self-concept.

Children who successfully pass through the necessary stages are better prepared to resolve unfinished business with family members. However, at this point in time, family members have often exceeded their emotional capacity during the first phase of induction. Denial and anger are among the first defenses to become evident. They may not recognize the child’s changing self-concept and feelings around that particu-
lar stage. Without appropriate support the child is left alone to cope with personal feelings. In addition to their own fears, children sense their family’s feelings. They try to care for their parents and deny their own fears. Tate (1989) stated that “accumulated data indicate that dying is made easier when individuals feel understood and can express their feelings, fears, and hopes” (p. 115). Art therapy is particularly important to these children who can use art to symbolically express underlying emotion and family issues.

Case Study

Margaret, a 9-year-old girl, was diagnosed with ALL in April. She spent the summer traveling 1 1/2 hours from her home where she lived with her father and stepmother to a children’s hospital. After Margaret’s parents divorced when she was 4 years old, her mother moved to Georgia. Although friction existed between her father and maternal grandparents, Margaret often stayed with them (and with her paternal grandparents) because her father and stepmother worked some night shifts. Margaret longed to visit with her mother, but these visits were infrequent. Her mother did not have a peaceful relationship with her own parents, lived at a great distance, and did not see herself as a reliable mother figure.

I met Margaret while I was working as an art therapy intern. Though she spoke very little, it was apparent that Margaret was comfortable and skilled with the art materials. After an introduction and demonstration of basic use, I let her choose what to do with the materials. Margaret carefully thought out and created pieces in a precise manner. As time went on, she became increasingly hungry for a greater array of materials. She apparently wanted to see all of her options before coming up with a unique way of putting them together. It is possible that her hunger for materials reflected her need for care and support since she spent a great deal of her own energy nurturing her family.

Margaret spoke little during our early sessions. Sometimes she gave me a sideways glance and seemed satisfied that I was attentive to her art process. Our therapeutic relationship progressed during the month of December when Margaret relapsed and consequently had longer stays at the hospital. She began to use art therapy sessions to relay verbal tidbits of information about her feelings. The content of her artwork and short bursts of speech conveyed her feelings of vulnerability and concern for her family.

On one occasion Margaret told a story about the divorce group she attended. She heard that some of the girls had been abused by new stepparents. She felt lucky that her parents had found such nice people to live with. During this time she created a house made of popsicle sticks (Figure 1). She placed a small dab of glue on each of the four corners of the foundation, carefully laying down successive layers. The tall roof posed technical difficulty for her. Together we found she could use a long thin piece of clay and glue to attach the roof to the house. The structure of the house she created was solid. It had a transparent quality due to the slats in the sides and the open roof. The house seemed to embody the strength she felt from the love of her family. However, there was no door, no color, nor anything placed inside.

Figure 1. Popsicle Sticks, 8" X 4"

Figure 2. Wood, 3" X 3"

On another occasion Margaret came to the hospital for a routine clinic visit and was told that she had to be admitted. She walked onto the unit, and we had an impromptu art therapy session. She chose a small square piece of wood, some short nails, and a hammer from the closet. Without a word she began to hammer the nails with great force, making a loud noise when she missed the nail and hit the wood. I helped her hold the wood and said nothing as she began to create a star pattern (Figure 2). As she hit the nails she looked towards the door and chanted softly, “This is for the doctors . . . and the nurses . . . .” Her catharsis ended before she finished the star pattern, but it was important for Margaret to vent her anger and frustration in a safe place. She was not directly angry with the doctors and nurses but frustrated with her illness and moving from Stage 2 (seriously ill and will get better) to Stage 3 (always ill and will get better). She was faced with a harsh reminder that neither she nor her father was in control of her life, and that the disease dictated what would happen each day.

I rarely suggested a theme for Margaret in art therapy. However, one interaction led me to explain how some children had used three-dimensional materials to create a special place to keep feelings, but my introduction to this project was terribly awkward. Margaret looked at me quizically but she must have forgiven me my fumbling. She chose a small 4½ in. high box from a large selection of materials and cut off the lid. She then used tissue paper and glue, a technique we had been working with, to apply a colorful veneer to the outside of the box. The colored tissue she used was integrated with
black tissue so that the end product was fairly dark overall. In subsequent sessions she painted the surface with clear acrylic that intensified the colors. She then made a knotted piece of cardboard and chose black yarn to weave a small pouch about 2 in. wide. Without any explanation she put the pouch inside (Figure 3).

As usual, Margaret did not attribute a direct meaning or metaphor to her artwork. She did not need to because the artwork gave me clues that were confirmed later. After a few months, Margaret told me that she shared her unpleasant feelings only with her cat. She did not want to burden her family because she saw the emotional toll her illness had already taken on them. Her statement opened an avenue to discuss the energy involved with keeping feelings inside. The box she had created earlier seemed to symbolize a quiet and brooding self. The soft, delicate pouch hiding dark and hurtful feelings was kept inside to help others. The box and pouch were left open, symbolically inviting me to share her feelings and to support her. Expressing her feelings through the artwork helped Margaret learn something about herself. As a result, she also felt comfortable addressing her feelings more directly with me.

After her relapse, the medical team and her family decided to continue with intensive chemotherapy and hoped for the possibility of remission and subsequent transplant. Margaret visited doctors at a special transplant center who explained that she could die at any time during the transplant procedure. In several following art therapy sessions, Margaret produced a construction paper collage of a rainforest (Figure 4). She chose a large piece of white paper and covered it with black construction paper. She put me to work cutting out shapes from a pattern she had drawn on construction paper. I sensed that she needed support in her travel to the dark jungle she had started to create. The rainforest includes a snake and flowers among the vines and fallen trees. Perkins, quoted in Tate (1989), found that a "notable symbol in the art of life-threatened children was that of a snake, which seemed to represent a threat" (p. 115). The snake in Margaret's picture is located in the lower left part of the picture and is the only element that she cut out of white paper and colored with markers. All other pieces have been cut out of colored construction paper and glued onto the background. The pink flowers may symbolize hope, but the sunlight here does not penetrate through the dense green and brown undergrowth. The rainforest may represent Margaret's move from Stage 3 (always ill and will get better) to Stage 4 (always ill and will never get better). The jungle shows little hope for survival with the black of night, the entangled vines, and the snake in the trees. For society in general, the rainforest has come to represent the potential for extinction.

During the last session working on this project, Margaret voiced her concern that her father had taken up smoking again. She said that he did not have any other method of stress relief. Perhaps with the realization of potential death, she was unconsciously concerned that her father might not be able to go on without her. Denial of her own fear and focus on her father may have also been part of the feelings associated with the move from Stage 3 to Stage 4.

In March Margaret relapsed a second time. As her physical condition deteriorated, the family situation became increasingly complex. Her mother arrived from Georgia, and her grandparents made more visits to the hospital. With the increased contact between family members and heightened concern about Margaret's future, the tension among family members grew. Margaret wanted to spend time with her mother, but her maternal grandmother was concerned that her daughter could not handle the situation emotionally. The grandmother felt out of control with Margaret's illness and in an attempt to help both herself and the family, she unwittingly presented an obstacle in Margaret's need to resolve unfinished business with her mother. The grandmother's resentment was projected onto Margaret's father, her mother, and in part to Margaret herself. It was clear that something needed to be done to help the family come together for Margaret.

Feifel (1973) stated that "opening channels of communication tends to mitigate feelings of inadequacy and guilt not only in the dying patient, but among the professional people involved and family members as well" (p. 3). In an attempt to open up communication, prompt family support, and help Margaret resolve her concerns, I gave her white foam core petals to give to any family member or friend that she wanted. Instructions given to each family member explained various ways the petal could be decorated and that it would represent him or her. The petals would be assembled in
Margaret's room around a circular center piece that she would complete. She could place the petals in any configuration, and petals could be added so that the flower would grow. Each petal had Velcro on the back and would adhere to a piece of magenta fabric that Margaret chose.

Margaret and her father participated in a joint art therapy session to complete the first petal and her circular piece. During the session, she worked with acrylic paints making her circle a medium pink with dark red dots on it (Figure 5). Margaret's use of pink and red seemed significant. It has been proposed that "the use of a great deal of pink can be an admission of vulnerability, fear of exposure, and a need for caring from the therapist . . ." and also that it might be used by "one who is preoccupied with disturbances of the flesh . . ." (Kellogg, MacRae, Bonny, & DiLeo, 1977). These authors also mentioned red as being "largely connected with the physical life of man . . ." (p. 124). Color usage could point to Margaret's preoccupation with her body and what was occurring within.

Her father's technique of working slowly and carefully with a small brush was similar to her own technique. He painted a light yellow-green background with the images of a duck, an owl, a leaf, and two fish (Figure 6). The yellow-green he used was the color of one of Margaret's chemotherapy drugs. Perhaps he was struggling with the decision they had made to discontinue the chemotherapy. As father and daughter worked, a constant interchange about their life and happy memories flowed between them. Her father showed me wallet photographs of Margaret as a child and the time before her illness. He asked her questions about her artwork and explained the meaning of each symbol on his petal. This session lasted almost 3 hours.

Her mother chose to paint her petal alone with Margaret. The finished petal (Figure 7) depicts a scene from the beach symbolizing her home far away. The sun could be rising or setting, symbolizing either hope or death. The vacation-like scene might reflect her desire to escape this situation or to help her daughter escape. Other petals were completed by her stepmother, aunts, uncles, friends, and grandparents.

Eventually Margaret's condition and medication resulted in heavy sleep, but on some days she was alert for a short time. Our sessions became shorter, but we carried on the same schedule as before. Sometimes she looked up at the flower at the foot of her bed and asked me to pull off a particular petal. She remembered stories from holidays and special events and described the photos in detail. One day she told me that she would like to complete a petal. I brought her one, and she decided to use the tissue paper. She seemed to
review our time together, thinking back to one of the media she had used to express her vulnerability. She cut out tissue paper hearts and used bright colors for the background. I felt that she was completing a petal that would remind her of the time she spent in art therapy (Figure 8).

The flower project was not easy for the family to complete (Figure 9), and it became a catalyst to bring family problems to the surface. Family members showed great personal strength as they sought to examine and resolve, as best they could, the problems that arose. The project highlighted the way in which family struggle affected Margaret. Early in the project, Margaret called her grandmother in tears saying that there were not enough petals for her to have one. When Margaret and I met for art therapy, she related this story and said that her grandmother was angry. There were more than enough petals for whomever Margaret chose, but it seemed that she was reacting to underlying family stress. She needed support to resolve unfinished business with her grandmother. Conflicts simmering under the surface became evident when the family was asked symbolically to admit that Margaret was dying. Her grandmother eventually saw the petal as a way of contributing to Margaret’s happiness. She spent an entire day at home going over old photographs, crying, and remembering. She covered the petal with many small photos spanning Margaret’s life.

In the end, Margaret’s family created a beautiful flower for her and were able to work through their feelings about Margaret’s illness, putting their personal differences aside. The family will have the artwork to remind them of the strength they had within themselves to come together for her. In the end they supported her and showed her a united front. (Margaret died the day before the 1 year anniversary of her diagnosis. She died with her mother, father, and stepmother at her side and her grandparents nearby.)

Conclusion

In this case art therapy was used to support a child through various stages of illness and a changing sense of self. Words are often inadequate and difficult to find when family and friends watch a young child die. Words are difficult for the child as well. Communication among people who were suffering both emotionally and physically was accomplished through the artwork, particularly the last intervention. This intervention helped the child resolve family issues in her mind and helped her family express their good-bye. The artwork remains as tangible evidence that the family supported Margaret and made a difference in her final days.

Art & Endometriosis (From an Artist’s Sketchbook)

This is a personal story about my struggle to overcome a chronic and oftentimes debilitating illness called endometriosis, and how my artwork has played a vital role. The Endometriosis Association’s brochure (1987) defines endometriosis as follows:

Endometriosis is a puzzling disease affecting women in their reproductive years. The name comes from the word "endometrium," which is the tissue that lines the inside of the uterus and builds up and sheds each month in the menstrual cycle. In endometriosis, tissue like the endometrium is found outside the uterus, in other areas of the body. In these locations outside the uterus, the endometrial tissue develops into what are called "nodules," "tumors," "lesions," "implants," or "growths." These growths can cause pain, infertility, and other problems . . . .

The most common symptoms of endometriosis are pain before and during periods, (usually worse than "normal" menstrual cramps, pain during or after sexual activity, infertility, and heavy or irregular bleeding. Other symptoms may include fatigue, painful bowel movements with periods, diarrhea and/or constipation and other intestinal upset with periods. Some women with endometriosis have no symptoms. Infertility affects about 30-40% of women with endometriosis and is a common result with progression of the disease.

My purpose in sharing my experience and my artwork is to make others aware of this troubling illness. I feel it is my task as a woman/artist/art therapist to inform, educate, and share my experience about endometriosis in the hopes of helping others.

I need to provide some background information before discussing the artwork. In my struggle to get help, I have gone to many traditional medical doctors, tried traditional treatment (i.e., pain medication, hormonal therapy [including menopausal hormones and birth control pills], and two surgical procedures [laparoscopy], and I have also tried alternative medicine [acupressure, TENS Unit—Transcutaneous Electrical Nerve Stimulation System, vitamins/supplements, dietary changes, listening to relaxation tapes, prayer], and my own art therapy). At the writing of this article, I am 37 years old, single, and have never been pregnant. Most likely I will need to have a hysterectomy due to the severity of my medical condition.

Unfortunately, endometriosis is often misdiagnosed and/or underdiagnosed by the medical field, specifically gynecologists. After going to four gynecologists and after surgery (laparoscopy is usually required to prove the diagnosis), I finally was diagnosed with severe endometriosis. The endo was all over my internal organs. I remember that before my first surgery for endo (June 1990), my biggest fear, based on the way I had been treated by previous doctors, was that the surgeon would not find anything. Well, that was not the case! There was a reason for my pain and fatigue! My first surgery confirmed that there was something wrong and that my suffering was not a figment of my imagination.

In retrospect, I had suffered with endo for at least 10-12 years before receiving the diagnosis. On a gut level, I knew something was wrong, but I did not have a name for it. In looking back, I believe I was in denial in the early years of pain. In any situation, with the passage of time, the pain became worse and a daily experience. When I became aware that I might have endo, I asked two gynecologists directly if I had endo, given my symptoms. I still did not get an answer to my question. Even a few years ago gynecologists were not picking up symptoms of endo. My personal story is common to many women! It is for this reason I need to share my story to encourage better and faster diagnosis and treatment.

The importance of documenting my symptoms (i.e., the pain) through my artwork was so necessary for me—knowing that it validated my suffering and knowing that there was something wrong with my body even though the medical doctors missed the diagnosis. In essence, I was told that it was all in my head. The IT was endo. The artwork was so significant to me in my struggle to fix whatever needed fixing, that I brought my sketchbooks to the doctors’ office visits and shared my artwork with the doctors I felt most comfortable with (i.e. the two gynecologists who performed my surgery, my homeopathic doctor, and my clinical psychologist).

As an art therapist, I work in a state institution; the paper work is very important. If an incident is not documented in writing, it did not happen. For me, I considered that to be the case with my drawings—that I needed to document, to have proof that I actually went through this horrendous pain. The documentation for validation of my symptoms, specifically the pain, were in my drawings. The drawings are part of the overall picture.

From the drawings in my sketchbooks (approximately 450 drawings within a 12-year period), I selected only a sampling to discuss in this paper. It was very difficult to pick out a handful of pictures. I tried to select the most linear drawings, mindful of the black-and-white reproduction limitations. Unfortunately, the pictures cannot be viewed in the original form, in color. For this reason I have selected certain pictures that still portray the meaning/message when seen only in black and white. I have concentrated on the pictures I drew in the midst of my most painful times.

On each drawing in my sketchbooks, I have compulsively written notes such as date, time of day, time of menstrual
cycle (i.e., day one of period is day one of cycle, day 14-16 is usually ovulation time, etc.). Each drawing is on 8½" x 11" paper. The materials I used were mostly Pentel markers, Crayola markers, and Schwan Stabilotones (i.e., in pencil form, which is between a pastel and a crayon). The markers were used for the most part because they were easy and quick to use with no preparation or cleanup, necessary factors when I was in pain. I kept these materials near my bed and took them with me in my travels.

As an artist I consider my artwork to be abstract expressionistic. The first picture (Figure 1) that was selected is not specifically an "endo" picture. In 1983, I went to Israel and when I returned to the United States, I was quite ill with a virus and in bed for 6 weeks. This is when I began drawing in my sketchbooks. This first picture depicts my image of being flat in bed. This image is also relevant to my suffering with endo. The endo has controlled my life, draining my energy approximately 2 weeks out of every month.

Many of the pictures selected for this article were created during the middle of the night while I was in excruciating pain, with my TENS Unit on, under the influence of pain medication and homeopathic remedies. Some of my drawings were created rapidly in a matter of minutes; others were drawn at a slower pace, 15-30 minutes, on average. For this article, due to limited space, I concentrated on my pictures from the last few years.

My drawings document my story: Drawing was a release, a way to vent my innermost thoughts and sometimes my only salvation. Who are you going to call at 2, 3, or 4 a.m. to talk to about your discomfort, the kind of pain that makes you question whether it is worth living. Some of these drawings are powerful and some are hard to look at. My own drawings helped me get through the time periods when the pain was most excruciating. It helped me survive the awful pain, especially while I was waiting for the pain medication to work, "kick in" so I would be "knocked out." At times, the pain would wake me from a sound sleep. Usually, this is when I would draw, to help ease the pain until I could rest again. I also drew at others times during my menstrual cycle. The vast difference between the drawings, use of color, and line quality during the period and PMS time of the cycle and less painful days is significant. During the pain, I would most often use red, black, and brown, not my regular colors. During the times of the month with less pain, I would use my regular palette of colors (many colors, especially pink, blue, and purple).

Before my second surgery, June 1993, I sent my medical records to the surgeon for a records review and evaluation. The surgeon asked for a brief description of my pelvic pain. The following paragraph was part of my letter to the surgeon dated 2/10/93:

Presently I have pelvic pain in the middle of my pelvis, below or near the belly button and going out towards my ovaries/hips. Generally speaking, the whole pelvis hurts. As an artist, my description is to draw a rectangle covering the entire area of hips, ovaries, and pelvis. The pain radiates out from the middle of my pelvis towards my ovaries/hips. While the left side gets radiating cramps and pain during the period, sharp pain during ovulation is not usually present on left side. Specifically, the pain in the middle of my pelvis is usually [sic] dull ache and/or cramps, which can be quite intense. Sometimes it comes and goes, and other times it is continuous, usually few days before and during the whole period. The cramps continue on and off. When flood-

The next few pictures are what I call my typical pain pictures. Figure 2 was created at 1:15 a.m. on the first day of my period, while awaiting some relief from a new pain medication. Figure 3 is a typical pain picture. Intense pain was in the middle of my pelvis radiating out towards my ovaries. The line quality is sharp like the pain.

Figure 4 shows line quality similar to Figure 3, in addition to having a triangular shape. This picture was drawn on the second day of my period. The pain would come. It did not matter where I was or what I was doing. Many times I would be out shopping or doing errands, and I would have to curtail my activities due to sudden pain.

Figure 5 is one of my favorite pictures because it has so much movement, depth, and color. However, I drew this pic-
Figure 3. 3/15/92 (Sunday) 2:35 p.m. Fourth Day of Period. Pain returned with a vengeance. Took prescription pain medication and put on TENS Unit. Waiting for relief. My legs ache. The pain is intense in pelvis area and out toward ovaries. My abdomen is bloated. Yesterday, I slept most of the day and night due to pain and medicine.

Figure 5. 11/28/92 (Saturday) 12:45 p.m. "The storm hit." Period—flooding. The storm looks like it is moving. I am glued to the chair. Hard to move. Zonked out on drugs due to pain.

Figure 4. Drawn on 10/31/92 (Saturday - Halloween) 11:00 p.m. Second Day of Period. Pain on and off. Took homeopathic remedies, prescription pain medication, and extra strength Tylenol. Heavy flow. Visiting a friend on route to AATA conference. Friday night (10/30/92) woke up at 3:00 a.m. with bad pain. Took homeopathic remedy for excruciating pain.

Figure 6. 11/29/92 (Saturday) 5:30 p.m. Wearing TENS Unit. In excruciating pain. Bad cramps. Can’t do anything but draw. Took prescription pain medication and extra strength Tylenol. Waiting for some relief. Period—flooding—heavy red flow.

Figure 8 was done in the hospital after my second surgery (laparoscopy) in June 1993. I woke up at 4 a.m., the second night after my surgery, with pain and bleeding. The tears rolled from my eyes due to the pain. This picture was different because of its shape. However, it was what I call a typical "endo" picture. The shape reminds me of the feminine pad which I needed to wear due to the bleeding.

Before going on to the next picture, I want to explain a little about my second surgery. I chose to go to an out-of-state endo specialist and had to travel by plane. I brought my sketchbooks and markers to the hospital. I drew up to the time I was taken to pre-op and drew as soon as I could, postoperatively, the day after surgery. I also brought my Walkman with me for surgery. I told the surgeon that I want-
ed to listen to Louise Hay's Self-Healing tape before surgery; during surgery I wanted to listen to Dr. Bernie Siegel's "Love, Medicine, and Miracles" meditation tape. I was more prepared emotionally for my second surgery. Before my first surgery I was literally in pain every day and wore my TENS Unit into the hospital the day of surgery. After my first surgery, but before my second surgery (approximately 3 years), the pain became progressively worse and it affected my bodily functions, with pain during eating and bowel movements. Before my first surgery, there was so much pain all the time, all over, that I did not differentiate the pain. Figure 9 (June, 1993) was drawn after reading my surgery report and seeing my doctor's sketch of the inside of my pelvis and his explanation of what he did in surgery. Essentially, this portrays the endo all over my pelvic organs. The endo was on my intestines and on the surface of my bowel, which is why I had pain during eating and when using the bathroom.

Another pain picture, Figure 10, was drawn at 1:30 a.m., a few months after surgery. It would take several months to notice a difference after surgery. I was told that the pain could be worse than usual. Well, it was. The week before my period and the week of my period, it seemed an alien force had invaded my body. The line quality is sharp, jagged edges, and the red and black are typical of my pain pictures.

I began to draw circular pictures on and off during the last few years. Figure 11 represents day 14 of my cycle.
ovulation time with pelvic pain. I began to add colors to my pain pictures. Here, I used red, black, and blue. During ovulation my ovaries can be quite painful. This circle picture shows what is happening inside my right ovary. During my second surgery, the surgeon removed endo, a cyst from my right ovary, in addition to removing adhesions caused by endo, and two fibroids on my uterus.

Another circle picture (Figure 12) was drawn on the 29th day of my cycle, right before my period. I had a vaginal yeast infection due to being on antibiotics because of chronic ear, nose, and throat infections. Very itchy and in pain. Looking at this picture, I can feel the itchiness.

Figure 13 depicts knife-like pain in a black and red drawing. A dull ache is in the middle of my pelvis and/or knife-like cutting pain is near my hips/ovaries. I am waiting for some relief from the pain. Figure 14, done the third day of my period, shows my intense pain. The flood gates opened. I cannot get enough red and black. This is quite different in that it has a flower shape in the middle with a wavelike shape around it. It is like a light at the end of the tunnel. Figure 15 is another red and black drawing, drawn on the third day of my period when the flow was still heavy. I had a headache and was nauseous from pain medication. I was not able to function or to drive; I was drugged out.

Figure 16 is the most recent pain picture using a circle. I used black, red, brown, and gray.

In this article I focused on the pain pictures. I would have liked to have been able to show more of the pictures.
from my sketchbooks, but hope to publish a book with many of my pictures in color and elaborate on different times of the menstrual cycle.

Pain is universal. In showing others my sketchbooks, anyone could pick out the pain pictures from the others. Even though pain is experienced by each person differently, one can relate to another person’s pain on some level. In looking at this selection of pictures, most of which focused on pain, some of the common characteristics of the pain pictures were the line quality, jagged sharp triangles, teethlike claws, knife-like cuts, and the colors red and black depicting feelings of anger, fear, depression, and frustration. My pain drawings became more elaborate with levels of colors and the intensity of the texture in the line quality.

This article may shed some light on a growing health issue for women. My reason for sharing my drawings and thoughts and feelings is to help others cope and deal with a chronic debilitating disease, endometriosis. My artwork and my sense of humor helped me to deal with a complex medical condition. I am not aware of anything published in the art therapy literature that pertains to endometriosis. It is a troubling illness because there is no cure; medical science has not figured out the cause. Thus, there is confusion about the best way to treat the illness. I hope this article has opened some minds, eyes, ears, and hearts.

Taking Inventory in the Age of AIDS

Emily Piccirillo, MA, A.T.R., Montclair, NJ

Know your path to be the path of all.
That you may safely guide.
Love all beings as members of your own Body.
That you may truly serve. (Trevino, 1993)

As the AIDS epidemic advances, every practicing art therapist is likely to have PLWAs (persons living with AIDS) as clients, whether we know of this particular diagnosis or not. Despite media emphasis on stereotypes of gay men and IV drug users as those infected, this virus has crossed all barriers—age, gender, culture, socioeconomic, geography. All mainstream and special populations have been touched, urban and rural, directly or indirectly. Therefore, I believe that each discipline has a responsibility to become familiar with basic treatment issues, from the practice of universal precautions to clinical dilemmas.

Based on my 3 years of experience in a large AIDS long-term care facility for adults in New York City, I would like to share some observations and suggestions that I hope will advance the care of these individuals. Many of these ideas may have general appeal and application, but I have chosen to underscore them here because of their specific importance, both intrapersonally and interpersonally, with this deeply complex population.

First and foremost, it is vital to admit that the versatility of this virus is utterly bewildering, even to the medical authorities. Anyone involved with this ambiguous syndrome must realize they are pioneering a strange new frontier, so there is plenty of room for doubts and questions, many controversial. Just when caregivers and clients believe they have seen the full spectrum of potential pathology and have their bearings, new symptomatology and conditions surface. There is no such thing as a textbook case. The progression of the disease can fluctuate wildly, even over the course of a single day, often due to sudden stressors or changes in medication. In addition, the virus itself can mutate spontaneously, transforming how it presents itself clinically. Use of the metaphor of a roller coaster is commonplace, it is helpful to keep in mind that if you do not like the unpredictable experience of being on one, you will be especially challenged working with HIV+ individuals.

The complex constellations of thoughts, feelings, and conflicts that accompany this syndrome can place extraordinary demands on linear thought and verbalization, even for highly articulate individuals. Spatial and symbolic expression, with its unique tolerance of ambiguity and contradiction, can better accommodate the overwhelming confusion and uncertainty, without frustrating the client’s need to process the profound effects of this experience (Figure 1). The PLWA can begin gradually to give shape and definition to troubling internal and external issues. As with art therapy in general, any latent or vague changes can manifest in the artwork, potentially informing you before the client is consciously aware of them, thereby providing important impressions for differential diagnosis and future treatment.

With variability as central to working with PLWAs, vigilance to shifts in their functioning, whether physical, cognitive, social, emotional, is essential. If you are working in a setting where you have substantial contact with this clientele, you easily could be the first to notice a new symptom. It might be a faint slurring of speech, the favoring of one leg over the other, minor forgetfulness, or hostility; the possibilities are endless. While one cannot immediately comprehend the full significance of the change, it is important not to hesitate to bring it to the attention of the related disciplines. Swift recognition and appropriate interventions can make a world of difference to the client’s quality of life. Fortunately, the changes also may take the form of marked improvements. Since so much is going on, members of the treatment team need to stay in very close touch.

Intrinsic to the virus’ unpredictability is a strong sense of one’s lack of control, for both you and your client. Now, it is said that a good therapist begins where the client is, but it is hard to imagine easily entering the world of a person living with AIDS when you can tell their suffering is explicit (and when you are struck by the proximity of their birthdate to your own). Establishing a comfortable, well-modulated place for oneself in their chaos is a daily challenge. Just as each client is variously in any one or combination of Kubler-Ross’ grief stages (1987), there is an approximate parallel process in the staff. But the unique nature of this grief is defined by the

Figure 1.
persistent repetition of loss, creating a strong potential for "survivor guilt," "compassion fatigue," or burn-out. Even at an optimal moment, a trained, seasoned therapist can defensively respond to a PLWAs’ intense distress with either flight or flight, as more typically characterize our clients. Unfortunately, such reactions in staff usually exacerbate an underlying sense of rejection, futility, and misery in those we serve.

So, at times there is the problem of doing too much—the flight response. Figure 2 shows a client's early depiction of the anger that often drives a healthy wish to combat the illness. The therapist might, however, confront persons who do not get out of bed by taking a "tough love" stance, criticizing their apparent unwillingness to help themselves. Others may try to override signs of decline, urging impaired clients to restore an unrealistic level of functioning while exposing their vulnerable self-esteem to messages of shame, contempt, and ridicule. It is also common for caregivers to try to rescue the clients' sagging spirits, making extreme efforts to insulate them from their graphic reality. Surely there is plenty of room for a well-timed pep talk, distraction, or reassurance, but it is paramount that the prevailing message be that we accept them just the way they are at the moment, with all their attendant chaos. It is when we impose our own agenda, communicating our preferences of how we would like them to change, or change back, that we begin to fail them and wear ourselves out.

Alternately, there is the inclination to do too little—the flight response. Figure 3 shows an "alienated" depiction by a client who held an intense wish to escape his condition. For many therapists it seems safer to choose not to establish close bonds with PLWAs, confusing detachment with objectivity. Yet, if you stand back and spectate, you will be held suspect. One client referred to this tendency as "rubber-necking." Inevitably, you will become very attached to some of these persons and will be put through personal changes of your own, some painful and destabilizing, but mostly enhancing. HIV+ persons know they are in the midst of a bizarre drama and often describe feeling like they are from another planet; it is up to every person working with them to be as present and open as possible.

While AIDS caregivers rationally grasp that the virus is only transmitted through body fluids, there are still an infinite "what ifs" that can intrude upon the psyche. If these cannot be readily talked about, and quieted with other staff and in support groups, the infectious nature and tragic potential of HIV can overwhelm one's best intentions, severely compromising treatment. Since these clients naturally engage in their own life review, it would serve you well to do your own soul-searching about death and dying. Creating your own artwork and completing exercises such as those described in Mortal Acts: Eighteen Empowering Rituals for Confronting Death (Feinstein & Mayo, 1993), can be very valuable to this process.

Keep in mind, PLWAs experience devastating losses over the entire course of the disease, in every sphere of their lives. Many are hardened survivors, veterans of chronic trauma, and all too often PLWAs have been abandoned or shunned by their families and friends. Surely this can pose tremendous therapeutic challenges, often reflected in their urgent need to test your sincerity and allegiance as a "real person" in their world. This early socialization can be unwittingly repeated by our first establishing an alliance, only to withdraw attention later as the physical deterioration sets in. Or, it can be corrected through sustained attunement and helpful boundaries. The gravity of the situation, and knowing that each interaction might be your last, makes this second option imperative in order to keep a clear conscience while not becoming thoroughly exhausted.

The experiential nature of art therapy provides PLWAs an immediate opportunity to learn new behaviors and build coping skills since it requires experimenting with change and unknowns. Using the imagination and finding solutions to problems are essential to the active art process, letting them safely practice ways of perceiving and managing the unpredictable. This can have dramatic consequences for PLWAs, empowering them to visualize possibilities as they transform and integrate "mistakes." The art therapy experience serves as a format for dealing with existential dilemmas by reframing them as workable realities: clients literally take their situations into their own hands and do something about them. The active development of inner resources, reasonable goals, and a stable sense of mastery challenges the sense of being a passive victim.

The mural of the volcanic island, shown in Figure 4, was created in a small, open art group. As the small depictions of people were being collaged in at the bottom right, the group's
anxiety over their expressed explosiveness and rage became palpable and the challenging reality of the catastrophe transformed the members’ discussion. After acknowledging their satisfaction from the catharsis, they moved swiftly to re-define the situation with the clear intention of helping those caught in the midst of their dangerous erupting scene. Instead of calamity, the final interpretation took a poetic, reparative turn, and the lava became “love rising, flowing freely and spreading its’ magic everywhere, purifying rather than burning them.” The resulting air of togetherness, relief, and even joy, seemed like quite an achievement. The final additions of the large bumblebee and butterfly at the top seemed to serve as signs of hope and renewal.

Naturally, some PLWAs intuit the possibility of such an intense experience and become ambivalent and frightened of taking such steps. The reasons are manifold and must be carefully explored and respected. Many are reminded of the perils of risk-taking. Others believe that by participating they are capitulating to their predicament; there are others who have seldom felt cared for. With such intense unmet dependency needs, they decide that the secondary gains of having the role of patient are too satisfying to forfeit, and refuse to relinquish them. Their only action may be to say “no.”

Since many PLWAs have felt marginalized in society since long before their diagnoses, they have an uncanny ability to know your fears, prejudices, and pretenses. Remarkably, having the disease only heightens this sensitivity. This is largely a behavior-based disease—behaviors we are generally taught to judge, and to judge with disdain, creating a good “us” and a bad “them,” which reinforces splitting tendencies. This devious view tends to sacrifice the personal to the political and compounds the suffering; it requires a rigorous struggle to retain one’s focus and a sense of togetherness. The damaging internalized messages and habits can then interfere with our capacity to be available to humbly bear witness to another’s distinct experience and respond with compassion.

Due to the continued stigma of seropositivity, as well as many of the precipitating high risk activities, clients are often reluctant to own their condition, inhibiting their ability to communicate freely and restore a sense of wholeness. (It is important not to confuse this blocked reaction with the apathy and social withdrawal resulting from dementia, see below.) As HIV+ persons enter the health care system, they often feel stripped of their privacy; ironically this exposure can cause or aggravate a sense of isolation. The small pieces of Figure 5 were made by a resident who presented himself as a very hostile, difficult individual, as he struggled with his need for placement after years of living on the streets. Suddenly, one day he hung these collages as signs on his door, quietly sharing his humanity and humor, parts of himself he had fiercely hidden until that moment. They served him well, providing the staff with a new and positive impression of someone who had been labeled “oppositional” and resistant.” His simple, loose, arranged words had a complex effect as they invited staff to reconsider assumptions about him and the strategies being used.

Art therapy grants permission of expression to PLWAs that family and friends sometimes forbid or avoid. Creative languages, from candid to cryptic, allow them to maintain valuable contact with others, while being able to reasonably monitor what they reveal and conceal. Through careful selec-

Figure 4.

Figure 5.

Figure 6.

tion of materials and optimal interventions by the therapist, vital defensive maneuvers can be maintained without the threatened loss of interpersonal closeness. In this alternative way, an HIV+ client can purge toxins out of his or her system, a system experienced as acutely contaminated. This can be crucial to gaining relief from the depression that characteristically paralyzes many PLWAs.

The content of some art pieces can be very provocative, even raw, and requires finely tuned responses by the therapist. An honest inventory of our deepest beliefs about illness, and this disease in particular, sexual orientation and behaviors, gender relations, chemical dependency, race, culture, religion, capitalism, and criminal justice, will spell out the subliminal influence we will have on discussions as they occur during groups, individual treatment and as they manifest in the artwork. Figure 6 provides a strong example of such an image, as it captures a male resident’s not uncommon preference to focus on his sexual contacts with women, instead of his history of IV drug use, as the source of his HIV infection. It clearly depicts an aggressive, seductive effort to engage the viewer in his fierce conflicts, perhaps to “push buttons.” A therapist’s caution in such instances can protect the client from the very reactions he might elicit, allowing new and healthier types of exchanges to occur.

Much healing work can occur when clients are supported in their variously desperate and brave efforts to face, sort through, and possibly resolve the turmoil that compromises their well-being and sense of belonging. It is most helpful to be inclusive rather than exclusive, due to the client’s often overwhelming urge to blame, menace, persecute, or scapegoat others. Moralizing is all too tempting with such
loaded situations and must be consciously reflected on and processed. I find that it is best to try to practice the kindness, fairness, forgiveness, respect, and patience that are so much easier to preach, and to try to listen as closely as one would to a teacher.

In an inpatient setting, the social nature of art therapy groups cultivates cohesion and builds community. It enlivens and humanizes the often institutional environment. It can reveal astonishing strengths within the population. Wishes, fantasies, and worries can be shared and elaborated and common ground can be discovered. Attention to the "here and now" can be encouraged and appreciated. Some exercises can be interactive and playful, spontaneously providing relief from the sobering reality. Simply having fun is a significant benefit for everyone.

The chance to experience pleasure and ease tension in an enjoyable "cheap thrills" fashion is deeply reparative since familiar and favorite sources of satisfaction frequently have been restricted or eliminated. The "spin arts" in Figure 7 represent a fraction of one resident's remarkable collection of these instant images that evolved from random accidents to cleverly choreographed sequential expressions. Media such as this, that I might have previously overlooked, becomes a surprising resource with this population. No material or process should be taken lightly. Particularly for substance abusers, the art materials can serve as an appropriate, alternative means of stimulating and soothing for affect regulation.

Especially for individual contacts, I recommend studying and cultivating the skill of empathic attunement as described by Rowe, Jr. and Mae Isaac in *Empathic Attunement: The Technique of Psychoanalytic Self Psychology* (1991). This book provides ways to assist the client in fleshing out his or her thoughts and feelings without becoming dangerously depleted yourself. In this line of work, you witness a great deal of psychic and physical anguish, rage, and sorrow, often deeply locked within ego deficits and alexithymia (Krystal, 1988). While some individuals are more self aware, having developed effective coping techniques and being able to ask for guidance, space or company as they need it, others are far less competent, even desperately impoverished. This can leave you feeling utterly inadequate, often through projective identification.

It is helpful to try to educate yourself about the most common opportunistic infections and treatments in order to help organize the mind of someone who is struggling to make sense of what is happening. Facts can offer focus and bind anxiety, but be careful not to embellish to create a false sense of security. Any organ can be affected by HIV, for it is carried by the blood to the lungs, liver, brain, uterus, skin, everywhere. As the immune system deteriorates, all the environmental hazards and latent pathogens already in the body can impinge violently. One's medical history can be relived. Some of the symptoms are intermittent, or become chronic, or advance. Others resolve, suddenly or gradually, spontaneously or with treatment.

While I cannot review the multitude of medical problems that can occur with this syndrome, I have selected one HIV-related problem that I seldom see mentioned by the press, but that complicates treatment at every turn. Observation suggests that there is a high incidence of some degree of dementia in AIDS clients. It does not follow a familiar course, as does Alzheimer's disease, and can resemble many other disease processes. It has a bewildering number of medical causes, frequently complicated by pre-HIV factors like head injuries or schizophrenia, and it is common enough that you will find it listed in the DSM-IV. Of those who are too intact for this classification, many more seem to experience some defect in their cognition or short-term recall, even if it is only an occasional lapse of sharpness or quickness.

Significant memory and attention problems are common, requiring substantial reminders and cueing, sometimes on a moment-to-moment basis. Changes can be sudden and surprising, and there can be unnerving instances when you discover you are in the midst of their discovery. A sign might be minor, like needing to write down a previously familiar phone number. Most clients minimize, ignore, or deny it until it advances to the point of embarrassment or marked interference, like forgetting the location of their assigned room. Some experience terrible anxieties with these symptoms and protest loudly that they are neither stupid nor crazy. The deterioration is usually uneven, creating startling discrepancies between areas of functioning. Teaching them small tricks to compensate for the deficits goes a long way.

If the dementia worsens, some clients can become utterly scrambled, babbling nonsense. Still others are so cognitively impaired that they become mute, or forget to chew
and swallow, or are unable to follow the simplest one-step directive. Some sit in a dull stupor, impassive to the most lively stimuli. Others become hyperaroused by the slightest external and internal signals and are easily agitated or thrown into a panic. They may have features of organic psychosis, scary hallucinations, or massive delusions. Some perseverate (Figure 8). Many become irritable and suspicious, especially when the dementia is just beginning, accusing others of stealing or lying. Sometimes medications and interventions can help slow or reverse it; sometimes not. In time, it usually progresses.

A more familiar feature can be the tendency to regress, with some PLWAs becoming more like young children, even babies, at times. Social judgment can deteriorate; they can become disinhibited and impulsive. For some, everything goes into the mouth. Figure 9 shows the scribbling tendencies that can occur. The resident who made this picture was unable to differentiate an appropriate drawing surface, moving onto the spoon without interruption. He then tried to lift the drawing from the paper and lick the marks off the spoon. Often the descriptive "pleasantly demented" is applied to those clients who become playful and lighthearted in their efforts to get attention. Usually they need special assistance or individual attention since they are unable to accommodate group demands. Nevertheless, with careful adjustments to the art process, even severely demented clients can continue to gain orientation, gratification, and pride from their creative efforts.

Lastly, by enduring over time, the artistic products prove to affirm the very existence of the creators and often serve as their final mark in the world. This is very helpful as HIV+ persons grapple with their mortality, demonstrating their simultaneous transience and their permanence. Figure 10 was created by a resident who was exploring his spiritual beliefs and relationship with God. Poignantly, for some, the art is the only thing they feel they have to leave behind, granting them a precious taste of immortality. As the pieces accumulate, they can observe their technical and expressive accomplishments and growth, even as their bodies decline. Each completed piece can give fresh meaning to their lives, providing a sense of purpose, peace of mind, and wholeness.

While there are limited treatments for AIDS and no cure in sight, art therapy offers a profound opportunity to heal one's self, one's life, one's soul. This strengthening of identity can help counteract the demoralizing effects of this disease. It can pull HIV+ clients out of their constricting orbits of illness and deliver them back to earth. They are able to gain a sense of fulfillment from the generative nature of art therapy in their often bleak world. They can use their artwork to bring themselves and others closer to understanding, by sharing and displaying it. It can restore laughter to their lives. It can be used as gifts to articulate their gratitude, fondness, and their concern for others. It can even serve as a supplemental livelihood. And, for you, the therapist, it can provide a lasting, resonant, transitional object to ease the ultimate termination.

Let Me Wipe My Tears So I Can Help with Yours

Audrey Elkinson-Griff, MA, A.T.R., Birmingham, AL

During the past 6 months I have been moved by the expressiveness of the artwork created by the staff at a nationally recognized research clinic for HIV-infected and AIDS patients in Birmingham, Alabama. Increasingly, walls metamorphose into gallerylike halls, and the benefits of an art therapy program become apparent. The personal touch of aesthetics and emotions seen in artwork on their office walls exposes the need for staff members to minimize personal stress. Amidst a hectic day, when catching a glimpse of his/her own artwork, the creator is reminded of a short respite and period of solace. In this writing, my goal is to highlight multidimensional aspects of nurturing oneself through art therapy, and to reveal its invaluable benefits, in hopes that others may allow time to take care of themselves.

An opportunity for the staff to use art materials was strongly supported by the clinic’s director who was sensitive to the needs of his staff and their likelihood for burnout. Following implementation of an art therapy program for patients, a staff art program was begun. Our monthly art groups have provided an expressive outlet for highly stressed workers to rechannel their energy via the creative art process. Staff members have entered sessions noticeably burdened with work-related stress or preoccupied by a particular patient’s deteriorating physical condition. Distracted or interrupted by beepers and pages, they attempt to focus on themselves for a short period of time. Upon completion, they leave with insight to their thoughts and feelings, their energy freed up to attend better to the needs of others.

The group time is loosely structured, with the same art materials available that are routinely used for patient groups: pastels, paints, and clay. I usually have some techniques ready in mind to suggest, although, to date those participating have usually entered with ideas of their own. At the start of a session, staff members defuse spontaneously by discussing a particularly difficult event or series of events which occurred over the past few weeks, including the number of recent deaths, varying degrees of illness of patients, and research protocols. Most discussion of artwork takes place on an individual basis which minimizes group process, and simultaneously establishes a safe environment for disclosure. Personal issues, in addition to work-related issues, have emerged in the artwork. With a forum to express concerns that surface, they may be less troublesome on the work front. Here are some examples of what has appeared.

In Figure 1, the immediate stress-reducing benefits of creating art can be seen. It was drawn by a member of the administrative staff, L., who regularly attended staff art. One day, as I set up for a patient group, I was approached by several staff members who asked me if I had seen what L. had done in her office: “It’s wonderful!” “It’s beautiful!” ”She did some great art!” I found this brightly colored, fluid, abstract image drawn on her memo board with display markers. L. commented, “It was one of those days, and I had to do something. After I did this, I was able to get back to work.”

Through her artwork, Q., a clinical social worker, highlights some of the issues one frequently expects to face in this clinic setting. Her time and energy is demanded by many, and she is pulled in different directions. Often, her attempts to meet the needs of patients are met with frustration. A strong supporter of art therapy and instrumental in establishing an art therapy program, she has been responsive and sensitive to her own process. In Figure 2, she began with oil pastels to create colorful, energetic, fanlike images. Brightly colored circles were added, with pieces of colored tissue paper randomly placed throughout the picture. Lines were added to the curved edge of the fans, as if curtailling their movement. When discussing this drawing, the metaphors of popcorn and fires emerged. Q. related each colored fanlike image to a different patient and her continual need to put out fires and bring things under control as new issues popped up. The green fan in the center depicted today’s focus, and the new fires expected to erupt tomorrow were depicted by the solid colored circles. The tissue paper additions were thought to be expressions of her own playfulness and an attempt at maintaining balance in light of daily burdens. From these images, one can only imagine the amount of energy she continuously needs to expend fanning fires, and her continual concern for the health of her patients.

![Figure 1. L's memo board image](image-url)
She produced Figure 3 a few months later. In an effort to contain or minimize her expression, the paper was folded to one-quarter its original size and it seemed she might be making a greeting card. She used watercolors to create small shapes that resembled teardrops, expressing overwhelming feelings of sadness which she related to recent patient deaths and the physical deterioration of other patients. She said that if what she created were a greeting card, she would like to send it to G-d so He would know how she was feeling. She talked about the cathartic value of crying and was thankful she could still release tears, commenting that many staff members who have worked at the clinic for a longer period of time are no longer able to cry.

W., a researcher, was, for many months, a sideline observer of the art therapy program. Although he was gregarious and curious, he never seemed to have the time to participate. As he saw me setting up for a patient group one day, he commented, “If I were to come to art today, I’d make something blue. It’s been a blue day today. —— died over the weekend and I just learned ——— a long time colleague, is HIV positive.” A few weeks later, W. attended his first staff art session. He came with specific ideas for artwork, although he felt uncertain whether his artistic skills would allow him to execute his thoughts. A quote by G.K. Chesterton, originally heard in a sermon, had been on his mind: “Death is but a field of flowers.” Figure 4 is an illustration of this quote. A field of flowers is dedicated to all the people W. knows who have died of AIDS, currently approximately 300. After completing his picture, W. said he wanted to add more flowers; the whole field should be covered. However, he would not be able to do it that day: “I can’t get past the black today [seen as a dividing line between the hills and meadow]. I’ll try to do that next time.” Instead, he spent much of his time working on the trees and hill, and added the flowers last.

C., a newly hired clinic chaplain, completed the drawing in Figure 5 during his first participation in staff art therapy. C. was very sensitive and seemed at ease with the art process. He was curious about the meaning of his artwork. His initial comments included discussions about death and references to a family-requested eulogy he recently gave for a patient. He believed there was a bittersweet element to death, that the individual was at peace following death, although survivors were pained by the loss. In his artwork, this belief is illustrated by the contrast between bright rain-
bowlike colors and the gray box in the lower, left-hand corner. C. returned to the drawing and blended the pastel colors, minimized the outline of the gray box, and worked it into a circular shape. The red-banded area surrounding the gray became more prominent, and he blurred the rainbowlike colored stripes. Later, he commented that issues related to death are not quite so clear and cannot be easily compartmentalized, while the emotional pain of loss, depicted by the red area, is evident and well-known.

Each week C. had a "Thought for the Week" posted on his door. The week after this experience, the text read: "Approach your life as an artist creating."

Many images of flowers and vacation spots appeared in artwork not discussed here. Beaches and boats were often seen in illustrations of favorite weekend getaways and vacations, with comments about the desire to escape and leave behind daily stresses. Flowers growing in gardens and arranged in vases left the creator feeling good about their inherent beauty. The staff's need to regenerate the depleted and efforts to fight off burnout are illustrated by this type of picture.

Synonymous with concepts of mortality and dying are the words HIV and AIDS. An HIV or AIDS diagnosis suggests an abbreviated finiteness to the infected one's life. There is no escape. Work with this population forces all involved to face the issue of death and to individually find resolution. Several weeks after completing the artwork discussed, Q. commented, "I think I've come to accept death, and believe these patients are truly at peace following death." W. commented, at the end of his first session, that he has always been intrigued by the issue of death and at one time considered becoming a mortician. Although affected by the loss of others, he attempts to embrace death.

If the art process can provide an opportunity for the emergence of thoughts and feelings that lead to resolution of personal issues related to death and dying, it can serve as a vital link in this current medical crisis. If staff members come to terms with their own mortality and reduce personal fears, they are better able to assist others with their needs. Just as images in gray and black give way to brightly colored flowers and other sources of life, the brief cases described here suggest that initial steps toward healing are occurring through art.
Healing Through Art

Darcy Lynn, Brooklyn, NY

Artists have always used their creative talents to deal with life's difficulties. I never found this to be more true than when I was stricken with lymphoma in April 1991. My circumstances were such that I was diagnosed only after lifesaving surgery and chemotherapy.

I spent 3 weeks in the hospital, but after 3 weeks out, I was readmitted with an unidentified lung infection. A Hickman catheter was placed in my chest to facilitate the administration of IV antibiotics. During this time I drew and made sketches of my experiences, images I had seen, and images of myself and my doctors. I began to develop these ideas in paint in mid-June after my second stay in the hospital. I painted a few hours each day, depending on my energy level. On days when I was too ill or fatigued, I did not paint at all.

Painting was one thing I could do to be in control of my situation. No one could tell me how or what to paint. I was fortunate to have the encouragement of family, friends, and doctors who all understood the importance of painting.

I developed a body of work which covers the whole of my treatment until I was physically and emotionally recovered in early Spring 1992. Here are a few of the paintings:

Seals I (Figure 1) is from an image I saw while in intensive care, after being taken off the respirator and given oxygen. I was swimming under water with two large protective purple seals. We did not surface but remained below in our underwater heaven.

The painting is about the realization that life is a gift, and the image became such a positive one that I carried the seals motif into other works. I felt the seals were my symbol of survival and hope.

The Hospital Nightmare (Figure 2) was about a specialist who I had seen before my hospital stay. His later visit resulted in this nightmare. He is chasing me on a wheeled platform down a dark hallway of the hospital's basement. On one side of him are dying AIDS patients and on the other, body lockers. In my dream he was threatening to catch me and operate. The nightmare was a warning, a reality almost foretold, because on my second stay in the hospital he did threaten to operate. Luckily it did not happen.

In The Garden (Figure 3) is the image I had just before ending my first hospital stay. My hair was falling out fast. I knew I would soon be bald. I was anxious about what lay ahead, knowing that in the end, it was just me and the lymphoma.

In the painting I am sitting in a garden all misty and grey, full of broken statues. I am in a limbo of loneliness and solitude.

Self-Portrait with Hickman and Scar (Figure 4) was my first nude self-portrait. Using a timer, I photographed myself. The painting was about accepting what had happened to me and the fact that I was still alive and strong in myself.

The image is a female Christ showing all her wounds. The scars under my breast are from the biopsy and other

Figure 1. Seals I. Oil on canvas. June 1991. 28" X 16".

Figure 2. The Hospital Nightmare. Oil on canvas. July 1991. 16" X 24".
minor procedures that were performed, along with the Hickman, which remained in me for 8 months.

Rebirth (Figure 5) is about all the new and positive changes that happened to me as a result of the cancer. I was completely bald, head and body, and felt reborn. A feeling of newness spread through me, and I felt like a child/woman starting over. I had an appreciation of my body and soul and felt blessed for seeing how wonderful life is. The seals swim around like angels flying.

The Three Musketeers (Figure 6) is a comical group portrait of my doctors. The idea came to me after I told my surgeon my plan to paint them. He said, "We'll be The Three Musketeers!" It is also a painting showing the very human side of my doctors, something I always kept in mind.

From the left, in profile, is my surgeon with comical look on his face, a protective, sweet man. In the middle is my physician, laughing. He supported me throughout with his warmth and wisdom. Behind him is my oncologist, grinning confidently, an intelligent, gentle man with humor similar to mine. As the saying goes, laughter is the best medicine.

---

**Editor's Note:** Darcy Lynn, Brooklyn, NY is the artist and author of a recently published book entitled "Myself Resolved, an Artist's Experience with Lymphoma."
TB, the mask, and me

Susan Conlon, MA, New York, NY

The first time I put on a mask to go into a TB patient’s room I felt quivery. The second time I put on a mask to go into a TB patient’s room I felt quivery.

Putting on a mask to go into a TB patient’s room is not as natural as putting on a hat or buttoning a coat. The reason you put on a mask is not to be pretty or to stay warm. It is to protect yourself from the person you are about to meet, and this is not natural at all.

I think about this as I slip one yellow rubber band over my head, then the other.

I am putting on this mask to protect myself from the person I want very soon, and very much, to trust me. But do I trust him?

I want him to feel safe with me. But do I feel safe with him?

I hold the mask over my face and position the rubber bands, one by one. I pinch the metal nosepiece snug to my face. Nice and tight. Good. No air can get in.

How can a patient feel safe with a person whose face he can’t wholly see? Is it reasonable to expect a patient to “express himself” when I myself keep from him that part of my face which expresses so much?

Can a person communicate with only half a face? How will he know if I am smiling? If I am friendly? Will he know that I care?

I open the door.

“Hello,” I say to a patient who has no idea who I am or why I’m there or what I really look like. But I am a person. And I did say hello. And I’m not wearing a lab coat.

“Hello,” he says back.

When a patient tells of having “feelings of isolation” we may imagine what he is feeling because we ourselves may have had such feelings. And when he says he feels “different” from other people—an outcast—we may recall having had a feeling similar to that feeling.

And so we empathize.

But when we enter the room of a patient who is in fact isolated, who has been cast out, who is different from everyone else—so different we must wear a mask when we are with him lest we become “different” too—we are on unfamiliar ground. No longer are we treating feelings of isolation, we are treating real isolation, and that we know nothing about.

So we can’t rely on that most useful of tools, empathy. Yes we do have sympathy but this “tool” must be used gingerly if it is to be used at all.

We ask ourselves: “What must it be like to be in this room for weeks, for months? . . . nobody . . . .”

We wonder: “Were I in this room, what would I want?”

Our sympathy may lead us to want to treat our patients as we ourselves would like to be treated. But were we to treat ourselves as we would like to be treated, we might very well put our own health at risk. We could ourselves become TB patients. This fact makes the difference between the “usual” art therapist/patient relationship and the TB patient/art therapist relationship.

And so we wear a mask. And follow very carefully the guidelines set for us by our hospital staffs. And no, putting on a mask isn’t as natural as putting on a hat. Nor is it as natural as wearing one.

When you say hello in a hat you hear yourself clearly. A nice warm hello. “Hello.” Say hello in a mask and you’re not sure what you said; it sounds so garbled. (“How did I sound to the patient?”) You wonder if the breath you just used saying hel-low escaped completely; some seems stuck in your mask. You are conscious that you are self-conscious. Aware too that you are slightly panicky about getting your next breath.

But you keep on; yes, aware that the rubber bands are inching up slightly as you continue talking. You feel your hair bunching up. If, at any time, you are unfortunate enough to catch a glimpse of yourself in the patient’s mirror, you will wonder who you are. (“Is that what I look like?”)

But the wearing of a mask has one beautiful and immediate benefit. It gives you, the art therapist, your first inkling of what it is like to be a patient in real isolation. To be a patient that is different. And what happens is that tool you lost—empathy—now unhides itself.

This means you can begin to relax. You can now be the art therapist you know yourself to be, even with a mask on. And the good news is that because you can now begin to trust you, your patient can too.

And so another good art therapist/patient relationship begins.

Editor’s Note: Susan Conlon, MA, is an art therapist at Bellevue Hospital Center in New York, specializing in work with HIV/AIDS patients.
Cancer Stories: Creativity and Self-Repair

269 pp., 42 black & white illustrations. $33.95 cloth.
Reviewed by Susan E. Cheyne-King, MS, A.T.R, LPC, Kent, VA

Few people have been untouched by cancer. In Cancer Stories: Creativity and Self-Repair, Esther Dreibuss-Kattan draws us into the inner worlds of cancer patients through their writings and artwork. Dreibuss-Kattan, a psychooncologist and art therapist, emphasizes the need to understand patients' metaphors for cancer. Frequently the metaphor depicts a punishment for a life poorly lived or for suppressed hostility, or else it is the culmination of one's hopelessness (p. 2). Psychooncology is described as an attempt "to deal therapeutically with the psychological realities behind these metaphors and with the defenses that the patient and doctor employ against these overpowering images" (Ibid.). It is also a psychological examination of responses to treatment and the threat of death.

The book is divided into two sections: "Psychological Analysis of the Cancer Literature" and "Psychoanalytic Perspectives." In Part I, a literature review provides examples of stages of cancer, the accompanying defenses, and how they are addressed in therapy. The cancer stories are examined from a psychoanalytic perspective" (p. 117). I found the first half of this book painful, but gripping, and difficult to put down. It can be appreciated by anyone personally touched by cancer and is especially beneficial to nonphysicians for its description of basic physical and scientific aspects of the disease and treatment. Physicians, however, are given insight and advice on how to deal better with the patient, rather than the illness. At the point of initial diagnosis, "distress is determined largely by how patients are told about cancer, not what they are told" (p. 19). An empathic approach is emphasized. Anyone dealing with chronically medically ill and/or terminally ill patients including, but not limited to, those with cancer and HIV, might read the first few chapters to gain a better appreciation of what patients often must endure at the hands of nonempathic clinicians and technicians.

Dreibuss-Kattan points to the importance of openness and honesty with the patient as "the most powerful weapon with which to fight the cancer patient's fear ... (p. 63). Denial is frequently discussed throughout this section in terms of its adaptive and maladaptive capabilities. The author sees depression (following initial denial), as "a necessary phase of the working-through process in an illness like cancer" (p. 64), and differentiates it from mourning. Other feelings and defenses are explored such as projection, aggression, envy, and guilt.

Dreibuss-Kattan carefully chooses literary examples that eloquently express the terminal phase of cancer. However, most of them "describe the beginning of this phase, because later the patient typically withdraws into himself and no longer feels the need to communicate his feelings in writing" (p. 98). It is for this reason that she relies on Tolstoy's (1882) short story "The Death of Ivan Ilych" to illustrate emotional aspects of pain and the late terminal phase.

As I read the first half of this book, I found myself wishing it had been available to me when my mother was dying of cancer. I remember searching through On Death and Dying (Kubler-Ross, 1969) in an attempt to better understand some of her behaviors and affects. This portion of the book is similar to that classic text, but adds glimpses into the patient's world by way of creative writing and journaling.

The author's goal for Part II is to demonstrate that "there is indeed an intrinsic, if elusive, psychological connection between creativity and loss...understanding this connection enables us...to respond better to the unique needs of the terminally ill individual" (p. 119). She attempts to do this by first reviewing psychoanalytic theories on creativity and connecting them to separation issues, then interviewing cancer stricken artists. She conveys her hope "that what is at stake in these reports is sufficiently universal to be accessible both to the general reader and to professionals from other disciplines" (than art therapy) (p. 117). Despite this wish, I believe not only will the "general reader" be lost in much of the psychoanalytic interpretations, but the nonanalytic clinician will be mildly annoyed by what may be seen as extremes in interpretation.

Artwork does not appear until the second half of the book. In "Mourning, Loss, and Creativity," Dreibuss-Kattan states "the ability to create new symbols, even threatening ones, plays an important role in the creative response to a life-threatening illness" (p. 130). The artist with cancer "has the ability to give form to life and death and to creativity and mourning" (p. 133). Although only one chapter is specifically devoted to art (psycho) therapy with cancer patients, Dreibuss-Kattan does a nice job of explaining our profession to those unfamiliar with its unique benefits in treating cancer patients. For example, art therapists can recognize split-off feelings such as anger and jealousy in the artwork of the terminally ill. In addition, "art therapy attempts, as one of its principal tasks, to reveal the intact, healthy, creative parts of the self, disclose them to the patient and thus heal the rift" (p. 190). Art is also seen as immortality for the dying patient. Despite these descriptions, the major topic of interpretations of art produced in art therapy sessions is focused on the manifestation of transference issues.

In one of the final chapters, Dreibuss-Kattan shows us her own artwork to illustrate countertransference to a dying
patient, crystallizing some of the overwhelming feelings (both positive and negative) a therapist might experience when working with terminally ill individuals. She says, "only if the psychotherapist can experience his feelings of hate as well as love can he deal with his grief for the patient he has come to care for so deeply" (p. 226).

One shortcoming of the book is the absence of a discussion about cancer survivors. Each year, more and more individuals are able to survive cancer. Still, they have experienced much of what the less fortunate have experienced, from chemotherapy to types of loss—body image, assault, and fear. Another minor problem is several sloppily edited areas and misspelling the cover artist’s name on the dust jacket.

This book is an important contribution to the literature on cancer and creative writing. If the author had devoted more text to art therapy it could have made a significant contribution in this area as well. I found Part I, plus the exploration of artwork in Part II, to be the most effective sections. Except for what some may consider excessive psychoanalysis, the book is basically "user friendly" for clinicians and lay public. It contains an extensive reference section and selected readings and an excellent index.

Cancer Stories is a moving and enlightening book. “To be sure, when we are moved by a cancer story, it is in part because the work embodies a profound, deep experience of the juncture of life with death with which we can identify” (p. 149).

California Art Therapy Trends

Intended for a range of readers, from the "complete novice" to those interested in "how these California art therapists practice" (p. viii), Dr. Virshup presents a collection of articles by 30 California art therapists. She does not claim these authors are typical, nor is there a specific focus; Virshup emphasizes that California is known for innovation.

The book is loosely organized in five sections with emphasis on "hands on, clinically oriented" art therapy (p. viii). Rather than discuss the material under each section heading, where some articles appear to be arbitrarily assigned. I have chosen to focus on four major themes coalescing the book’s major contributions.

The most valuable material in this book describes how art therapists responded not only to budgetary constraints, but to California’s increasingly ethnically and culturally diverse population. Formulated following the Rodney King verdict and subsequent Los Angeles riots, articles by Shirley Riley and Anna Hiscox open the book and address the needs of adolescent youth, "the unfortunate fraction of teenagers that have been so damaged that their behaviors have called attention to their plight. These children who come to us are in the greatest need, the sorriest state and with the least resources" (Riley, p. 3). These authors struggle to find ways art therapy settings can address these children’s massive needs and provide resources for them.

Riley, an experienced teacher and practitioner with adolescents and families, questions the use of traditional art therapy with a population whose lives allow "for little if any integration or resolution of adolescent tasks" (Ibid). She identifies a basic stance of "not knowing" (p. 5) within a crisis intervention mode of problem-solving. . . . Not creativity in the art product . . . but creativity in gaining coping skills” (p. 6).

Hiscox, too, emphasizes "the role of worker as learner" (Green, referenced in Hiscox, p. 20). In "Clinical Art Therapy with Adolescents of Color," Hiscox, chair of the Mosaic Committee of the American Art Therapy Association, discusses the intercultural diversity of California’s current population. She asserts it is necessary for art therapists in this changing urban environment to "become familiar with cross-cultural and inner-cultural systems and ideology in order to develop cultural sensitivity, empathy and genuineness" (p. 17).

The severely traumatized population is also addressed in Thelma Kronreich’s article, “Group Art Therapy Intervention with Bereaved Children in the Elementary School.” Kronreich describes an innovative program developed to help children use art therapy groups to cope with issues concerning separation and loss. As with each of the authors, Kronreich advocates a use of art that is sensitive to the cultural, ethnic, and socioeconomic needs of youth in today’s urban centers.

A second major emphasis in this book, both in case material and chapters on program development, is on families at risk following domestic violence, substance abuse, and sexual abuse. The aftermath of abuse, including posttraumatic stress disorder (PTSD) in children and adults, is also covered in the section titled “Art Therapy with Families and the Abused.” They reflect our society’s recent awareness and focus on these problems.

Emphasis on treatment within the family system is an important contribution. Thoughtful investigations by Shirley Riley in "Art Therapy with Families Who Have Experienced Domestic Violence," and Gayle Callaghan and Mary Rawls in "From Entrapment to Empowerment—Family Therapy with Battered Women and Their Children," present case material that describes the importance of working within the family that has experienced domestic violence. This work spans the shelter experience through postshelter support. Anne Kellogg and Janet McEliece, in "Youth at Risk/Families in Recovery, Multi-Family Group Art Therapy," present a highly structured multifamily group art therapy approach to treatment.

Other authors present casework with children and adults who have experienced abuse, discussing theory and giving examples of casework with individuals. For example, Julia Whitney details the issues and methods used to combine art therapy with psychodrama and sand tray work with a sexually abused homosexual HIV patient. Seven of the 29 articles
center generally on abuse issues, providing an opportunity for the reader to see how theory and practice applies to their particular setting and where they can make a contribution in the cycle of abuse and violence.

California has been seen as a fertile ground for experimentation and integration of methods outside the mainstream of traditional therapies. A third major contribution of this book lies in articles by six art therapists who have integrated their experiences and training in art therapy with that of another discipline or practice. Particularly impressive and valuable in the contributions found in "Art Therapy and," is the careful elucidation of the necessity for formal study and experience, both in art therapy and another discipline. Together with the articles on family therapy, these writers may offer the most useful information to experienced practitioners as they discuss their training and theoretical stance within the context of descriptions of their work. Selections include Linda Cohn's chapter concerning the integration of art psychotherapy and eye movement desensitization reprocessing (EMD/R), Suzanne Lovell on combining art therapy and authentic movement, Betsy Caprio on using art therapy with sand tray, and Lilian Rhinehart and Paula Engelhorn on art therapy with the art of the sun wheel.

The fourth major contribution of this book lies in articles that describe how these authors have met the challenge of rapidly decreasing health care funding. As experienced practitioners and teachers, they systematically address ways in which California art therapists have developed programs and secured funding. (Unger, Chapman, and Arrington) expanded their practices to work with new populations. (Coufal, Leonard, and Virshup and Virshup) found ways to incorporate art making into training (Howard); and disseminated information about art therapy to other professionals through in-service training (Long and Chapman) and a brochure produced jointly by the Southern California Art Therapy Association and the Los Angeles Cultural Affairs Department (Virshup, Rife, & Shephard). Chapman's article, "Establishing a Pediatric Art and Play Therapy Program," is particularly inclusive and practical. It provides an important guide to the elements that need to be considered in program development. Each of these are thought-provoking, both for the new professional and experienced therapist.

In my opinion, this book is most useful for the novice art therapist who is in training or beginning to practice. The book appears to be similar to earlier collections of readings, edited by Elinor Ulman (1975, 1980), which survey a range of theory and practice in the field. Of the 30 authors included, 26 are Registered Art Therapists (A.T.R.), 12 or 13 are Licensed Marriage, Family, and Child Counselors (MFCC), and seven are otherwise certified or licensed.

Despite the many contributions of this collection, I do not recommend it without qualification. The book is not well-organized and lacks clear focus. While it represents trends, problems, and solutions in art therapy, it may also represent problems found in art therapy publications. Cathy Malchiodi, Editor of Art Therapy: Journal of the American Art Therapy Association, writes:

First, much of our literature, particularly books, has not had to pass any particularly rigorous standards in order to be published . . . . Often no request is made of the author to submit the final manuscript to objective reviewers in the field for verification and criticism of content. A practice standard in many fields and with many publishers. . . . These types of practices result in publications that often have flaws in factual areas as well as theoretical and methodological areas. (1994, p. 83)

California Art Therapy Trends raises questions for me about the level of scholarship and publication standards in our field. Although these selections vary in quality, I will focus my comments on format and scholarship.

Today, an author may have little control over title page or table of contents. But, when we consider how hard the AATA has fought to insure the validity of the "A.T.R.," it is alarming to see the editor listed on cover and title page as "ATR," and this by a press that prints and distributes art therapy materials.

Certainly, today one rarely sees a book that does not contain typographical errors. However, it is troubling that at least one author's name is misspelled in the table of contents (Anne [sic] for Anna Hiscox). In addition, a figure is apparently printed upside down (p. 352, Figure 1), and incorrectly referred to (p. 353). However, I become alarmed at a completely omitted page! (Page omitted between p. 400 and 401. The publisher is now inserting this page and will mail it on request). This page is critical to an understanding of Howard's thoughtful integration of weekly art making in her graduate program and to understand her framework of "active participation with each art object." (p. 401a, insert).

Other significant problems lie with inconsistencies in format, primarily references that are not held to the APA format. The Publication Manual of the American Psychological Association (1984) states, "All citations in the manuscript must appear in the reference list, and all references must be cited in text." (p. 28). Many authors carefully reference every author mentioned in the text, and, as per the APA, do not list authors not mentioned. However, other authors fail to follow APA format. For example, one author (p. 119) describes the "Diagnostic Drawing Series created by Barry Cohen and Anne Mills," but fails to cite these authors in the references and gives inaccurate wording for the directives. In the same article, as in others, articles not mentioned in the text are listed in the references. On pages 101–102, three authors who write about Multiple Personality Disorder (MPD) in children are cited. While text are provided for projective drawing texts, books on art therapy with children, art with abused children, and art therapy with MPD, no art therapist is cited in either literature review, method, or discussion of artwork. No art therapist who has published on evaluation and treatment of abused or MPD children using art is cited (Cohen & Cox, 1990; Jacobson & Mills, 1992).

At a minimum, professional practice and scholarship require that in presenting theory and practice, those who have done "research pertinent to the specific issue" (APA, 1984, p. 25) be cited. Furthermore, it seems to me essential that art therapists cite primary sources and current art therapy literature pertinent to the specific topic. This is especially imperative in a field only now developing a significant body of literature, literature rarely referenced by those outside art therapy (Fleming, 1985, pp. 94–95). If we can no longer count on rigorous editing from the publisher, each of us must take responsibility for careful scholarship, particularly in training institutions, by adhering to publication standards, and as individual authors and editors of collections.
As it is, this book does a disservice to the many valuable contributions of the included authors. Art therapists may indeed be innovative, but scholarship requires professional editing to ensure that art therapy is presented professionally.

The Picture of Health: Healing Your Life with Art

165 pp., 83 black & white illustrations. $12.00 paper. ISBN 0-937611-63-9

Reviewed by Marcia L. Rosal, PhD, A.T.R.-BC, Louisville, KY

During my first year as an art therapy graduate student, I was introduced to keeping a visual journal. Since that time, I have filled numerous sketch books and bound journals with scribbles, doodles, and images derived from my daily life experiences. Although I cannot conclusively say that journaling has saved my life or changed the course of my existence, the process has enriched my world and expanded awareness of my conflicts and joys. Dr. Capaccione agrees that creating a visual journal can add depth and meaning to human consciousness.

Beginning with *The Creative Journal: The Art of Finding Yourself*, Capaccione (1979) has been a powerful champion of the therapeutic potential of keeping one's own drawing journal. Capaccione believes in the ability of creative journaling to tap one's inner resources and to help people gain inner knowledge and understanding. The four volumes to be reviewed represent only a few of Capaccione's prolific set of books on the self-help journaling methods she espouses.

In this review, these four books will be outlined and described. Two of the four books reviewed here are focused on keeping the "child" (both the young child and the inner child) alive and well. The other two books are creative journaling methods to keep healthy and fit. I will present a general overview of the books before offering comments on each individual book.

General Overview

Capaccione acquired a wide following among the "12 Step" program advocates and the self-help crowd as a result of the journaling method. Her books have mass appeal because of an easy to read writing style and the simple-to-follow methods outlined in each volume. In each book she discusses her personal journey and how journaling has facilitated her growth and development on her path to physical well-being. This intimate touch engages readers and offers them permission to tell their stories through working in their journals.

Capaccione clearly defines what journaling is and delineates the rationale for the methods prescribed. Although the basis for engaging in the journaling process has somewhat different purposes for each population, the main reason for working within the creative journal format is to get to know and understand one's self better.

The parameters for journaling are clearly stated. One vital boundary, even for use with children, is underscored by Capaccione: The journal must be private and confidential: no one must have access to another person's journal without permission. The private and secret nature of the journal is at
the heart of its therapeutic value. If this is violated, the method is not useful to many who use it.

Finally, Capaccione discusses the limitations of the diary and urges users of the journaling method to find outside support when needed. Creating a visual record of one’s life is not a panacea and the use of the method in addition to other interventions is encouraged. Nor does Capaccione dictate that her journal exercises are to be followed by rote. Instead, she urges readers to use the books as points of reference or as resources and to do the activities which best suit their needs or to develop new, more individually focused exercises.

What Is in Each Book?

Although all four books are about the art of journaling, each book offers a different perspective on the visual journal and the purposes for engaging in the process.

The Creative Journal for Children. This book is a guide for adults who work with children. Whether one is a parent, teacher, counselor, or therapist, the book offers assistance to the helping adult for encouraging children to begin and maintain a creative journal. Capaccione outlines 19 goals for the journal method with children. In addition, rationale is given for use in varied settings and under a variety of circumstances.

The journal exercises are divided into six themes ranging from “About Me” to “Dreams and Wishes.” Under each theme are 12 journal activities which are designed to assist the child in the self-discovery process. To aid adults in discussing the journal activity with the child, the “how” and “why” and “when” to use the project are outlined. Examples from children’s journals illustrate the various exercises and serve to inspire the child.

Recovery of Your Inner Child. Of the four books reviewed here, this book is the most intricate and deviates the most from a general instruction book on the journaling process. The first goal of this book is to help adults from a wide variety of backgrounds to identify and empower the inner child. Therefore, Capaccione discusses the concept of the inner child and her rationale for helping others recover from dysfunctional childhoods. Naturally, her method of healing the child within is through the creative journal process. In this book she recommends that the exercises which accompany each chapter be closely followed. The book begins with learning about the inner child and leads to discovering the spiritual child. Thus, the work somewhat emulates the recovery process of 12 step programs.

Each chapter opens with a narrative about the one particular aspect of inner child work discussed. The author pulls concepts from Jung and archetypal psychology as well as recovery programs to support her ideas and the creative exercises outlined. She asks participants to do a variety of exercises using the nondominant hand. Capaccione states that the inner child is accessed more quickly through the nondominant hand as our dominant hand is closely aligned with our everyday existence. She explains that the written dialogue which occurs between both hands fosters awareness of the conflict between a critical outer world and the needs of our inner consciousness. In sum, the book illuminates the power of experiential creative methods in the healing and recovery process.

Lighten Up Your Body—Lighten Up Your Life. In this book, co-written with Johnson and Strohecker, Capaccione addresses the issue of body image and how it affects our sense of self-esteem. She terms one’s sense of ease with the body “feeling at home in your body” (p. 2). The authors claim that well-being with one’s body has nothing to do with weight or cultural norms or ideas. The “feeling at home” is experienced from the “inside looking out” (p. 1). After exploring the main concept of the book to feel better about our bodies, the authors offer creative journaling experiences which correspond with six themes.

The first theme is geared toward getting to know one’s body. Secondly, exploring the meaning of food in one’s life is advised. Through the exercises, the relationship between feelings and eating is uncovered. Other themes support one’s quest for finding alternate avenues of nurturances such as nurturing one’s self and cultivating relationships which “feed the soul” (p. 107). The final themes urge readers to find their appropriate body size and type and to discover their unique style and body image. The book ends with a bibliography which serves as a resource for further reading about body image concerns. The authors urge readers to use the exercises in this book as a companion to their health care and exercise programs as prescribed by medical personnel.

The Picture of Health. Capaccione has a broad definition of health. She defines health as “wholeness” (p. 1). Working from this definition, she espouses art as an avenue many of us can use to strive toward wholeness and that she believes our inner artist is a healing entity. The theme of this book as with the others is that working from inside can assist in health and well-being.

Capaccione is clear about her goals for using the workbook. Five goals are stated including finding the mental roots of stress and disease and using the healing power of visual imagery. She discusses the connection between the mind and body and cites the work of psychoneuroimmunologists and oncologists to anchor the concepts.

As this book is for the nonartist public, Capaccione first offers a basic understanding of how to use drawing. She asks us “to play on paper” and the process of doodling and experimenting with drawing materials is artfully explained. As in other Capaccione books, exercises using both the dominant and nondominant hand are presented. Illustrations of scribble journal entries accent the idea that a nonartist can employ the creative journal techniques.

The exercises in the book center around becoming aware of the body and uncovering one’s sense of health and well-being. In addition to black and white pictures from journal entries, the book has several full-color prints which add zest to this self-help journaling workbook.

Final Thoughts

Visual journals are not art therapy nor is the use of journaling a substitute for formal therapeutic intervention. Nonetheless the visual journal is therapeutic. These books offer to lay people and to individuals interested in self-help ap-
proaches one avenue of exploring their lives. And many people use Capacehione’s books for just this purpose. In this sense, Capacehione has spread the good news about the use of art as a means of discovery, as a tool for problem-solving, and as an avenue for healing to a wide audience. I had the opportunity to attend a workshop lead by Capacehione and was heartened to see the positive response of mental health professionals from related disciplines to visual imagery and to the healing power of art. For the professional art therapist, however, little new or advanced material will be garnered from reading these books. Nevertheless, as art therapists we may wish to pass on one of these books to a colleague of friend who wishes to start a journal.

Integrative Approaches to FAMILY ART THERAPY
By Shirley Riley, MFCC, A.T.R.
observations by Cathy A. Malchiodi, MA, A.T.R.

This important new book by noted family art therapist Shirley Riley is designed for both the beginning practitioner as well as the advanced family therapist. An important source of ideas, this text provides not only examples of integrative approaches to family art therapy, but also offers practical ways to utilize art therapy with individuals, families and couples. The volume emphasizes the integration of current thinking in family therapy and the application of art therapy in family treatment. Chapters cover a wide range of theoretical viewpoints, including structural, systemic, narrative, family of origin and social constructionism. Riley brings these theories to life through case examples as well as commentaries on contemporary socio-economic and cultural aspects of family art therapy in the '90s. Cogent introductions to each section by Cathy Malchiodi lend cohesion to the whole.

This is an invaluable resource in both art therapy and family therapy courses. Suggestions for utilizing the material in the classroom as well as in clinical settings are included, making this book a practical guide for students, educators and therapists.

MANDALA: THE SACRED CIRCLE

A CONFERENCE HONORING THE LIFE AND WORK OF JOAN KELLOGG

sponsored by the Association of Teachers of Mandala Assessment, Inc.

June 4-6, 1995
Johns Hopkins University
Baltimore, Maryland

This conference is a celebration of 25 years of the work of Joan Kellogg, M.A., A.T.R., one of our most remarkable and innovative thinkers in the area that explores the interface between psychology and the arts. Joan Kellogg is best known for her work in the assessment of drawn Mandalas. Her theoretical model, the Great Round of the Mandala, has enabled hundreds of clinicians and researchers to understand how archetypical images and symbols and colors reflect dynamics of self and psychological development.

SANDPLAY THERAPISTS OF AMERICA

THIRD NATIONAL CONFERENCE

SANDPLAY
THE SILENT VOICE
OF THE SOUL

MAY 28-31, 1995
SKAMANIA LODGE • STEVENSON, WASHINGTON

Sandplay is a powerful in-depth nonverbal therapy for adults and children. It is rapidly gaining national and international recognition because of its cross-cultural capacities.

☐ Case Presentations  ☐ CEU & Sandplay Credits
☐ Workshops and Lectures  ☐ Trade Show (books & miniatures)

Skamania Lodge is a nestled amidst the waterfalls, mountain peeks, forests, and canyons of the Columbia River Gorge. Amenities include an indoor swimming pool, hot tubs, saunas, fitness center, hiking trails, game room, golf courses, horseback riding, and bicycling. Just 45 minutes from Portland and 3½ hours from Seattle, it offers easy access to the Columbia River Gorge’s American Indian petroglyphs, windsurfing, the region’s wildlife, and nearby Mt. St. Helens.

IRIS
"ON THE TRAIL OF BEAUTY"

ANNOUNCING

THE SIXTH JUNGIAN ART THERAPY CONFERENCE

AT THE UNIVERSITY OF NEW MEXICO, ALBUQUERQUE, NEW MEXICO,

FROM JULY 28TH THROUGH JULY 30TH, 1995

MEINRAD CRAIGHEAD

New Mexican Visionary Artist and Writer, will open the conference with a slide presentation of her paintings, some of which appear in her books The Mother's Songs and Litany of the Grail at River. She will speak of her own spiritual quest "on the trail of Beauty."

DONALD SANDNER

Jungian Analyst and author of Navajo Symbols of Healing, will show slides of the sacred sand paintings used in Navajo Healing Ceremonies. He will give the Keynote Address on BEAUTY WAY CHANT, devoted to Snake Woman's underground journey to the Snake People to obtain their healing power.

VIRGINIA BEANE RUTTER

Jungian Analyst, Art Historian and author of Woman Changing Woman, will give a Closing Presentation WALKING INTO BEAUTY, showing slides of an Apache girl's Sunrise Initiation Ceremony. She will lead a culminating ritual of the conference theme: The Role of Beauty in Traditional Healing and in our Therapeutic Practice.

2026
THE ORGANIZATION

The American Art Therapy Association, Inc. (AATA), is a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board elected by the membership. AATA has established standards for art therapy education, registration and practice: AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films, and awards.

PURPOSE

• The progressive development of the therapeutic use of art.

• The advancement of standards of practice, ethical standards, education, and research.

• The provision of professional communication and exchange with colleagues.

• The provision of legislative efforts to promote and improve the status of professional practice.

• The promotion of the field of art therapy through the dissemination of public information.

CHAPTERS

Affiliated chapters of the AATA have been established throughout the US. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS

All members receive:

Publications

• Art Therapy: Journal of the American Art Therapy Association.

• The Quarterly AATA Newsletter

• Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and the membership directory.

• AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.

• Mailings of professional interest.

Services

• Insurance, including professional liability, major medical, life and disability through Maginis & Associates.

• Access to national experts in art therapy.

AATA Conferences

• Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy.

• Governmental affairs activities including Congressional review and monitoring

• State legislative and regulatory activities

• Promotion of recognition and reimbursement of art therapists by third-party payors.

• National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards

• Development of model job description and recommendations for licensing standard

• Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy

• Development and implementation of nationally recognized Standards of Practice and Code of Ethics of Professional Art Therapists

GENERAL INFORMATION

Membership in the American Art Therapy Association, Inc. (AATA) and Registration (A.T.R.) with the Art Therapy Credentials Board, Inc. (ATCB) each have separate procedures for administration and application. Annual A.T.R. Maintenance Fee is billed separately by the ATCB.

For NEW Associate, Student, and Contributing members only: please follow the chart below when submitting membership applications:

The Membership year is the calendar year: January 1st, through December 31st.

Applications received between:

June 1st - Sept. 30th: Half year dues plus $5.00 payment; membership expires Dec. 31st of same year.

Oct. 1st - Dec. 31st: Full dues payment; membership for the remainder of the current year and the next full year.

CATEGORIES AND FEES

Professional - By application review process only; approved members may vote, hold office and serve on committees.

• Certified Professional Member - Individuals who have been dually approved for Professional Membership by AATA and Registration (A.T.R.) by the ATCB; AATA dues are $85/year. A.T.R. Maintenance fee is billed separately by the A.T.C.B.

• Professional Associate - individuals who have completed educational training in art therapy; dues are $85/year.

Associate - Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. Such members may not vote, hold office, or serve on committees. Dues are $85/year.

Student - Individuals who are currently taking full time coursework in art therapy or a related field. Requires a current statement from the institution of learning indicating full time status and coursework content (6 graduate or 12 undergraduate credits.) Student members may not vote or hold office, but may serve on the Student Sub-Committee of Membership. Dues are $35/year.

Contributing - Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120/year.

Retired - Individuals who are at least 65 years of age and who are no longer practicing. Retired members receive publications and reduced fees, but may not vote or hold office. Dues are $35/year. Application provided upon request.

2023
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the Journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

★ An Application of Art Therapy to the Trauma of Rape
★ The Art of Art Therapy May Be Toxic
★ The Children’s Diagnostic Drawing Series
★ Art Therapy with Native American Clients: Ethical and Professional Issues
★ Diagnosis or Dilemma: Drawings of Sexually Abused Children

Art Therapy is available to AATA Members as part of their membership. Non-Members may subscribe at the following annual rates:

Individuals: $40.00 (U.S.) - $60.00 (Foreign)
Institutions: $57.00 (U.S.) - $80.00 (Foreign)

Single Copies are available at:

Members: $10.00  -  Non-Members: $18.00

Make checks or money orders payable to AATA and return with this subscription order form to:
American Art Therapy Association, Inc.
1202 Allanson Road
Mundelein, Illinois
60060

Please enter my subscription for 1995. Enclosed is a check in the appropriate amount:

Name: ____________________________________________
Address: ___________________________________________
City: ____________________ State: __________ Zip: ______
Dissociative Disorders

Presenters: Deborah Good and James Consoli (third presenter to be named at a later date)

Topics include: Dissociation as a part of abuse, assessment and diagnosis, sexual and ritualized abuse issues and concerns, various forms of abuse and their relationships to each other, ethical concerns, legal testimony, and vicarious traumatization/Secondary PTSD.

Addictions

Presenters: Lynn Jones, Holly Feen and Katie Webb

Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

Family Art Therapy

Presenters: Mari Fleming, Shirley Riley and James Consoli

The objectives of this symposium is to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The art therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication and restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

Art Therapy in the Schools

Presenters: Janet Bush, Sarah Hite and Rebecca Taulbee

The objectives of this symposium will provide the participants with understanding the administrative procedures for implementing an art therapy program in a large, urban school system, become familiar with the uses of art therapy for students in a public school system, become aware of techniques and strategies used in the training and preparation of school personnel; utilize the information they have gained to initiate discussion on approaches and practices of art therapy in public schools; and to be prepared to transfer techniques and strategies for implementing art therapy services to other public school systems.

Art Therapy with the Older Adult

Presenters: Larry Barnfield, Bernadette Callanan and Judith Wald

The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

Going for the Gold: Grants and Research in Art Therapy

Presenters: Frances Anderson, Vija Lusebrink and Doris Arrington

Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90's. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal "in process".

Art Therapy with Children at Risk

Presenters: Cathy Malchiodi, Julie Eppehorn and Deborah Good

This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. "Children at risk" are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitation which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychologica functioning.

Art and Medicine

Presenters: Cathy Malchiodi and Anita Mester (third presenter to be named at later date)

The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterberg, Simonton, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life threatening illness will be addressed.

Addressing Domestic Violence through Family Art Therapy

Presenters: Cathy Malchiodi and Shirley Riley (third presenter to be named at a later date)

This symposium will focus on art intervention and treatment with families who have experienced domestic violence, with the notion that such intervention can be helpful in addressing a larger scope, including social violence. The first half of the symposium will address the use of art expression as intervention for the immediate effects of family violence, with an emphasis on what the art therapist can accomplish in a time-limited setting; focus will be on the unique role of the art therapist in crisis care in shelters, safe houses, and other short term, crisis-oriented facilities. The second half of the symposium will be devoted to how art therapy may be utilized in treatment, focusing on issues of family reconstruction, role adjustments, and post-traumatic separation and loss. The use of art tasks to assist the family in re-thinking gender roles and assigned relationships and to experiment with new modes of interpersonal and intrasocial communication will be presented.
ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to each copy of your manuscript:

Name: ________________________________________________________________

Degrees/Credentials: __________________________________________________

Address: _____________________________________________________________

Phone numbers: Home ____________________________ Work __________________

Type of Submission (check one):

□ Article □ Viewpoints □ Brief Report

□ Film/Video Review □ Book Review

Title of Submission: ___________________________________________________

______________________________________________________________

Checklist:

□ Five (5) copies, typewritten on 8 1/2” x 11” paper.

□ Black and white photos of original artwork plus four (4) photocopies of each.

□ Abstract of 75-125 words (for articles and brief reports only).

□ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

□ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

□ This Attention Authors form.

Author’s Signature __________________________ Date __________________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060

______________________________
Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

Manuscript Categories

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
6. **Comments.** Brief comments on articles published in Art Therapy, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

Other Requirements

1. Send five (5) clear copies of each manuscript to Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allison Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original articles that are not under consideration by another periodical or publisher are acceptable.
3. Manuscripts must be typewritten on 8 1/2” x 11” white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 75-125 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5” x 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author’s responsibility to secure such permissions; a copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any manuscript accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5” diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois, U.S.A. 60060. Telephone (708) 949-6064; FAX (708) 566-4883. Non-members may subscribe at the following annual rates: $40 (U.S.) and $64 (Foreign); institutions: $57 (U.S.) and $80 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060 (708) 949-6064.

This journal is abstracted in: Resources in Education (ERIC), INNOVATIONS & RESEARCH, Art Bibliographies Current Titles and Art Bibliographies Modern.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

adjunct professor at the Graduate Art Therapy at Springfield College in Massachusetts. “This series of house/shrines can simulta-
neously signify self, family, culture. In the words of a recent reviewer, these pieces express the nexus of intimacy and betrayal
in which homes can hold the heart. The ancient symbol of the hand often appears in my work.”

2035
Milestones

Cathy A. Malchiodi, MA, A.T.R., LPAT, LPCC, Editor

This issue of Art Therapy presents an important update on the New Mexico Counselor and Therapist Practice Act, the first legislation to license art therapists (see Good & Syl-Linton). Although several other states have allowed art therapists to apply for licensure as professional counselors (e.g., in Massachusetts where art therapists with appropriate coursework may apply for a clinical mental health counselor license), the New Mexico law is currently the only one which licenses art therapists by their professional title and according to their particular educational training. As a result of this landmark legislation, art therapists in several other states are currently pursuing the implementation of similar legislation, efforts that would be extremely difficult without this precedent-setting event.

In addition to art therapy licensure the profession has witnessed several other milestones during the last year. The Art Therapy Credentials Board (ATCB) and the Certification Committee recently completed the three-year project to create a national certification program and subsequently conducted a certification examination for art therapists last November. Membership in the AATA continues to rise and the 1994 annual conference was the most well-attended event in many years. There is an increasing level of professionalism throughout the association, including a new ethics document, standards for independent practitioners, educational guidelines, and a continuing education program. This journal continues to see record-breaking numbers of submissions, an indication that interest in the field is high.

There have been other milestones; however, they are ones we would probably like to ignore, but important ones nonetheless. Healthcare professions are currently in precarious battle for turf, leaving many clinicians scrambling for positions, slots in managed care/HMOs, and insurance dollars. As a result, many public agencies are no longer willing to hire unlicensed art therapists and there are reports that private psychiatric hospitals in many parts of the country have laid off unlicensed therapists, including art therapists. Also, it is actually now illegal for unlicensed art therapists to conduct a private practice as a psychotherapist in states where they are not named in licensure legislation or are not specifically excluded (see Webster, 1994, for one example).

Additionally, in some cases art therapists have not been included in counselor and therapist licensure bill, or have been denied the opportunity to apply for equivalency under counselor licensure acts. Although some art therapists have been able to apply for licensure as professional counselors, that may not be easy or even possible in the near future. Recently, the National Counselor Certification Board (NCBB) closed the window of opportunity for individuals with related degrees to sit for the counselor examination. This milestone within the field of counseling may have a serious impact on the possibility of art therapists who have a degree other than in counseling sitting for examinations in states where there is a counseling license available.

One other sad milestone for the field of art therapy is the passing of Janie Rhyne, PhD, A.T.R., HLM (a tribute to Dr. Rhyne appears in this issue of the journal). Although I had the privilege of talking with Janie Rhyne many times at annual conferences over the years, I did not really get to know her until the last two years of her life. I unwittingly orchestrated our contact by using a quote by Janie in an editorial I wrote titled "Is There a Crisis in Art Therapy Education?" (1993); in it she stated:

I've said this to lots of top-notch art therapists and you might as well know it, too: we don't even know that art therapy is a separate field or will it last as a separate field. Quite a few of us are doing other things more than we're doing art therapy. Should it be a separate field? I'm one of the ones who think it probably should not be. Gradually we'll become a part of other fields: psychologists and social workers who use art therapy (in Jordan, 1989, p. 12).

When I first read this quote it raised fundamental issues about art therapy for me, particularly concerning the field's identity as a modality versus discipline. Over the years I have watched art therapists increasingly becoming licensed under other job titles such as counselor, marriage and family therapist, social worker, or psychologist. This trend, along with other problems in areas of training, research, and scholarly writing (Malchiodi, 1993; 1994), has led me to wonder aloud on the pages of this journal whether or not art therapy could ever fully articulate itself as a separate discipline. Janie's candid thoughts on these subjects generated a great many questions for me on these issues and others in our field.

After the editorial was published it was Janie that initiated communication with me. In fact, shortly after the journal was sent out to the readers my telephone rang late one evening; it was Janie calling to let me know that she would be responding to my editorial! It was not a quarrelsome or uncomfortable exchange; she told me she was going to write a rebuttal to what I had written and playfully wanted to know how I was going to respond. Frankly, I did not know how I was going to respond, particularly since I am not as quick of mind as Janie Rhyne. But I became intrigued and delighted that evening with her directness and interest in what I had to
say. She did eventually respond in writing in a very thoughtful letter to the editor (see Rhynie, 1994).

That first exchange began a long series of conversations that I will treasure as milestones in my life. Often it was Janie who would initiate the call and I would usually recognize the ring as hers because it generally came late at night. We talked about many fascinating and challenging topics: research paradigms, certification and licensure, healthcare, art, and cybertechnology, among others. What impressed me the most was how easy it was to engage in debate with Janie, and how much she enjoyed participating in a good, intellectual argument. But argument is the wrong word: Our conversations were really compassionate discourse, talking out a variety of ideas in a forum of mutual support. While within the AATA people often seem threatened by disagreement and debate, Janie Rhynie was not afraid to look at an issue from all sides and in depth. I will always be impressed by Janie's ability to simultaneously think through ideas on many levels and to stimulate and support others in examining these ideas in new and fresh ways.

Both licensure and certification have been milestones sought after by many in the field of art therapy as necessary to the growth of the profession. However, although we have attained these milestones, there are still more basic ideals to be achieved if we are to grow as a profession. One is our collective ability to encourage the discourse necessary to tackle the tough problems in this difficult healthcare climate and to flourish as a discipline. The second is the intellectual rigor and thoughtfulness that are necessary if we are to continue to expand and define this profession. My conversations with Janie Rhynie remind me that we must attend to both compassionate discourse and the quality of that discourse if we wish to see continued milestones as a profession in the years to come.

**Art Therapy**

has extended the deadline for the following special issue:

Art Therapy in the Schools

*Art Therapy* is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to the use of art therapy within schools. Submissions may focus on any aspect of art therapy or population related to this theme; of particular interest are specific applications of art therapy to clients/students in school settings, research, ethical and professional issues, and issues in providing art therapy services within an educational milieu.

**New deadline for submissions for "Art Therapy in the Schools" is September 1, 1995.** Please see "Guidelines for Authors" in the *Journal* for specific requirements in terms of style and format; submissions which do not follow these requirements will be returned without review. Please send five (5) copies of all submissions to:

Letters to the Editor

I have some comments about Dee Spring's article, "Progress or Politics," in the recent issue (Vol. 11, No. 4) of Art Therapy. While I agree with a couple of her basic complaints about AATA's history—our stinginess in accordance honors to our members and a divisiveness that may have stemmed from the Naumburg versus Kramer orientations—I must take issue with her reference to me and quotes from an article I wrote: "The Art Therapist as Exhibiting Artist: Messages from Joseph Beuys, Suzi Gablik, and Donald Kuspit." Art Therapy, 10(3), 141-146.

She talks about "an either-or approach to the field," saying that she has "not been able to understand why being a good clinician and a good artist, which includes exhibition, are not compatible... and why psychotherapy seems to be tinted in some way that takes away from art expression and vice versa. Yet this argument continues in full force as presented by Lachman-Chapin." She quotes from my opening, questioning about whether the two roles—art therapist and exhibiting artist—are fundamentally opposite. This is not an "argument": it is a profound question which I examine from many points of view. Only someone deeply entrenched in either-or thinking would thus miss the whole thrust of my thinking.

What I am examining is whether, as an exhibiting artist, I can feel the same sense of being an "activist," that is, effecting change, as I do as an art therapist. I examine the concept of activist art, as exhorted by Gablik and Beuys, and compare it to ideas of Kuspit, Marcuse, Becker, etc., who propose that the expression of individual vision through aesthetic means can, in its own way, have profound effects on people. I am not talking about individualism versus community. I am saying that the most important debate in the art work now is whether activist art—art specifically aimed at effecting change—or personal art, where the subversive imagination is at work, can be most useful for changing the way humankind is living its life on this planet. No one has the answer. A recent weekend series of seminars at the Art Institute of Chicago addressed issues concerning the place of the artist in society. Artists from all over the world passionately addressed these questions.

The ideas with which I struggle in my article cannot be boiled down to art therapist versus exhibiting artist as Spring does. Her simplistic categorization of my "argument" stretches the truth of my writing out of focus, out of plumb. It distorts what I have to say so that it becomes, indeed, something else.

I am far from the black-white, either-or thinker that she calls me. Note one of my article's final statements concerning presenting our art therapy identity to the art world:

'I see us as being both activist and aesthetic artists. We help, therefore we act. But we also deeply value the aesthetic concerns that make us artists, and which we can impart in our activist role to our clients... We can hope that our clarified identity and our activities both as therapists and exhibiting fine artists—joined with other artists in the art world—will have some power to effect some of the social changes we want.'

Note also that I was very involved with the angry debates she refers to around AATA's continued publication of the American Journal of Art Therapy. Despite my support of AJAT, when members voted to start a new journal, I was at the founding meeting of Art Therapy, helping to formulate its focus and becoming the Assistant Editor for the first issue. This is not either-or behavior. It is healing behavior and this too is part of AATA's history.

Lest Ms. Spring and her readers get carried away with simplistic theories, I urge her to reread my complex (and therefore closer-to-the-nature-of truth) article.

Mildred Lachman-Chapin
Sedona, AZ

After reading Dee Spring's article in Art Therapy (Vol. 11, No. 4), I feel much more comfortable in the awareness of and saddened by the constant bickering and factions within the AATA. Lack of respect and acceptance for individuals and points of view indicates that our association is more polarized than ever before. We need the courage to face our dark side and ask some basic questions. As healers, we must continue to do all we can to bring these factions together in a working relationship and through creativity bring about lasting solutions, lest we destroy the functional purpose of the AATA.

At 62 this year and feeling too old for such nonsense, I refuse to identify with the defeatist attitudes that rob the innovator of the joy of creating. I take this opportunity to let the Journal know of the quite helpful support I have received from Terry Towne, MSW, A.T.R., of the Governmental Affairs committee, and from Deborah Good, A.T.R., and the NM Licensure Board. They were there when I was being threatened by local psychologists with new Wyoming Licensure Law and the new Psychologists Law (which is currently in abeyance).

These two women took the time and made the effort to keep in contact, to follow up and encourage me, sending ample materials, giving leads to others who were helping to make the necessary changes in the laws that will allow us to be meaningfully employed. I am deeply grateful for their encouragement, supportive attitude, and practical resources and recommendations. They represent to me the best of what AATA can be.

Spring's article focused on the need for revamping educational requirements. It is wonderful to have the base of an association that maintains high educational standards, but who is out there creating jobs for our graduated students? If we do not expend as much energy on creating new ways to
utilize these graduates, to open doors that are currently closed by prejudice and fear of the "adjunct therapies," where will they find work? Our senior therapists do not seem ready, or willing, to retire, share power or positions, or create new jobs. Who will consider the currently under-employed or unemployed Registered Art Therapists in our midst?

If we are going to survive as a profession, we must provide job opportunities for our own. Why must we fear the new, innovative, or untired? Just because something is new to us does not mean it's unworkable or lacks value; it only means someone must risk trying it. Such risk-taking is the only way we can grow, thus assuring change and development. Not to risk suggests a stifling of creativity that breeds death to any system or organization.

There are quite a few new frontiers yet to conquer, if we can encourage those who see the need to provide alternatives and risk the venture. I returned to Wyoming to fulfill a personal vision of the Arts Ranch that could sustain a minimum of five creative arts therapists full time and 15–45 for the venues within 5 years. I have experienced an excellent working model in Great Britain's program, successful for over 26 years and still going strong. It is easily adaptable to the arts therapies that I have seen and has the power to effect change for children that such venues can create. It is a model that could easily be duplicated, and the program design includes a longitudinal research study to document the results. We are trying to provide exposure, a workable model, a paper trail of what does and does not work, and how effective the design is for employing and opening jobs in the community for arts therapists.

My goal is simple—to pass on my experience, establish a working model that others, younger and more able than I, can continue, duplicate, and recreate in their own creative lights. Few of us work best in a vacuum, without the help, encouragement, support, and counsel of our peers. Without this support it becomes harder and harder to risk rejection, ridicule and belittling snide remarks, and power games to try to establish a new program. This network of support is one of the main purposes of a national association. New ventures and ideas can be nurtured and cherished, even though we didn't think of them ourselves.

Industry seeks the ideas of children because they are not confined by what has been done and are willing to risk exploring possibilities. Wouldn't it be courageous if the AATA would provide resources for development of new job possibilities? Isn't it more productive to encourage new job opportunities that foster our field and organization?

Thank you for the opportunity to express my thoughts. And thank you for the excellent articles that express so well the pain of many of the members while giving some working models to transform the situation.

Lora Diggins, MA, A.T.R., LPAT
Sheridan, WY

I am responding to the letter written by Carol Thayer Cox, A.T.R., LPAT, that appeared in the last issue of Art Therapy in which she stated that at the 1993 business meeting the membership approved a resolution by Gladys Ageil "that any changes in documents be published in two newsletters preceding a vote." The minutes of the 1993 AATA Annual Business Meeting were printed in the Fall 1993 AATA Newsletter (pp. 42–43). No such resolution was presented or approved at that meeting. Resolutions are advisory to the Board and do not set policy.

The Motion No. 11 that she refers to was a motion passed at the November 17–18, 1993 Board of Directors Meeting. The full motion was as follows:

That changes in policy documents that are publicly distributed must be published in the AATA Newsletter two issues before the proposed changes are voted on by the AATA Board. It is recommended that the ATCB follow the same procedure.

Such motions became a part of the AATA Policy and Procedure Manual. The manual is used to guide the Board as it carries on the business of the Association. Approved policy and procedure is, and always has been, subject to revision when current Board members decide changes are necessary.

At the Spring 1994 Board Meeting that policy was revised because the Board felt that one publication was sufficient for the membership to respond to, that the Board needed to approve documents before they were published in the Newsletter and that ATCB, as an administratively independent corporation, should set its own policy. Policy No. 5.01b Section D. now states:

Changes in policy documents that are publicly distributed must be published in the first possible AATA Newsletter after the proposed changes are voted on by the AATA Board.

Unlike The Ten Commandments, no document is cast in stone and the Board welcomes comments, questions and suggestions from the membership on any document that is to be publicly distributed.

At the 1994 business meeting, I stated that I had assumed the revised Ethical Standards for Art Therapists would be published in the Newsletter prior to the Conference in Chicago. Unfortunately, it was not. However, in April, this document was sent to the membership for their vote. It was also published in the Spring Newsletter.

Secretary Mary St. Clair's Winter 1995 Newsletter report informs the membership that all Board motions that directly affect the membership will be published in the Newsletter (pp. 7 & 36). This should help to keep the membership informed of the Board's activity. I sincerely hope that I have addressed the concerns raised in Carol Thayer Cox's letter.

Virginia Minar, A.T.R.
AATA President-Elect
A Tribute to Janie Rhyne, PhD, A.T.R., HLM

1913-1995

Janie Lee Rhyne, 81, of Iowa City died Wednesday, March 1, 1995, in her home after a long illness. Memorial services were held on April 13, Iowa City, IA. Memorial donations may be made to The Institute for Intercultural Studies. Suite B, 165 72nd St., New York, NY 10021.

Ms. Rhyne was born August 14, 1913, in Marianna, Florida, to Martha Jane and Cecil Rhyne. She received her bachelor of arts degree in 1935 and her master of arts in 1956 from Florida State University at Tallahassee. She received her doctoral degree in psychology in 1979 from the University of California at Santa Cruz.

Since 1980 she taught visual language communications to graduate students in the school of social work at the University of Iowa as an adjunct associate professor. From 1979 to 1992 she was visiting faculty in the Vermont College Graduate Art Therapy program. She taught annual courses in the Marylhurst art therapy program and the British Columbia School of Art Therapy. She was an assistant professor at the Institute of the Expressive Therapies, University of Louisville, from 1978 to 1980.

She authored Gestalt Art Experience and several articles. She was a member of American Art Therapy Association, American Psychology Association, Northern California Art Therapy Association and Iowa Art Therapy Association. She was one of three co-founders of the San Francisco Gestalt Institute. She led several training groups and operated a private practice.

She married Glenn Middlebrooks in 1936; they divorced in 1955. She married Jack Wise in 1957; they divorced in 1965.

Survivors include one daughter and her husband, Jan and Rock Williams of Iowa City; one son, Jeff Middlebrooks of Baltimore; two brothers and their wives, Cecil and Winifred Rhyne of Tallahassee, Florida, and Jeff and Amy Lou Rhyne of Marianna, Florida; one sister and her husband, Mary Elizabeth and Jack Witherpoon of Knoxville, Tennessee and three grandchildren.—from Iowa City Press, March 10, 1995.
A TRIBUTE TO JANIE RHYNE

Janie Rhyne, PhD, A.T.R., HLM

Vija B. Lusebrink, PhD, A.T.R.-BC

Janie Rhyne was born on August 14, 1913, in Marianna, Florida, and died on March 1, 1995, in her home in Iowa City, Iowa, after a long illness. In the 81 years of her lifetime Janie covered diversity of life styles and education, and lived in many places, including Mexico, Canada, and Europe. In her professional life her interests focused on people as individuals, their life "dramas", their explorations thereof and expressions through art experiences, their perceptions, and their discovery of meaning through visual thinking. Above all, Janie never ceased to be a seeker of intellectual knowledge.

After receiving her B.A. with a double major in art and social sciences from Florida State University, Tallahassee, Florida, in 1935, Janie obtained teacher certification in art, psychology, general science, and English. She taught for a year at a rural consolidated school in Florida, then did graduate research on cultural and psychological implications of State-sponsored art programs and exhibitions in Heidelberg, Germany, in 1937. While raising her family, from 1940 to 1948, Janie was working as an illustrator, mostly for textbooks, for Lippincott's and Winston, Pennsylvania. From 1948-1954 Janie taught children with emotional problems at the Media Friends School in Media, Pennsylvania. She also taught children part time in ghetto areas using art as communication, and worked with paraplegics at the Naval Hospital in Philadelphia.

From 1954-1956 Janie studied art and cultural anthropology at the University of Florida, Tallahassee, Florida, including summer studies in lithography and Middle American Indian culture in Mexico. Upon receiving her Masters degree, Janie moved with her second husband to San Miguel Allende, Guanajuato, Mexico where she was the co-director of VAKI. S. A. from 1956-1960, training Mexican boys in crafts and in producing batik wall hangings. From 1962-1964 Janie lived in an experimental artists community in Fauquier, B. C., Canada.

Janie trained as a Gestalt art therapist with Fritz Perls and various other therapists at the Gestalt Institute of San Francisco, California from 1965 to 1967, and was its Senior Training Therapist from 1966 to 1972. During this time she also maintained a private practice.

Upon finishing her book, Gestalt Art Therapy, in 1973, Janie embarked on her doctoral studies in psychology at the University of California, Santa Cruz, and received her PhD in psychology in 1979. During this time Janie presented many workshops on Gestalt art therapy, and visual thinking through the Continuing Education program of the University of California, Santa Cruz. In addition, she was also on the field faculty of Goddard College and Union Graduate School, and supervised graduate practicum students from Goddard College, Lone Mountain College, Pratt, and the University of Louisville. From 1978-1980 Janie joined the faculty of the Expressive Therapies program at the University of Louisville, Kentucky, as an Assistant Professor. After moving to Iowa City in 1980, Janie taught visual language communications at the School of Social Work, University of Iowa, as an adjunct associate professor. She was a visiting professor at the art therapy program of Vermont College of Norwich University from 1979-1992, and also taught courses annually at the Marylhurst College Art Therapy program and the British Columbia School of Art Therapy.

Janie was active in the American Art Therapy Association (AATA). She was the chair of the AATA Research Committee from 1981-1985. She served on the Honors Committee and Professionals Standards Committee, and was consultant to the Education and Training Committee.

Personal Recollections

I have known Janie as a teacher, friend, and colleague; she was my model, and she was a wise woman. Janie spanned the past and the future, she was a lady and a rebel, and she was forever young.

My first meeting with Janie was in San Francisco, at the formation meeting of the Northern California Art Therapy Association in the early 1970's. Janie was reserved in her involvement in the discussions and formulations of the organization, but she stood out in the crowd with her presence. Later that year I attended Janie's Gestalt art therapy weekend. Janie lived in Pescadero near the California coast south of San Francisco, in a rambling California ranch style house in a small valley surrounded by a redwood forest. It was a perfect setting for her workshop—a large studio living room, and a deck facing the morning sun overlooking the trees. Janie was always the perfect therapist and hostess, relaxed and casual, open and sensitive to others' needs.

Janie had developed her own style of Gestalt art therapy based on her training at the Gestalt Institute of San Francisco; she had been friends with Fritz and Laura Perls, and had spent time at Esalen. Her workshops offered Gestalt experience in the here and now in the fullest sense of the word. Her presence and depth alone combined with her laid-back acceptance of individuals and their experiences permeated the air during the experiences, discussions, and meals.

As a friend I had the privilege to visit and stay with Janie a number of times in 1973-74 in her Victorian house in Santa Cruz, California. At this time Janie was already working towards her doctorate in psychology, and was friends with intellectual trailblazers like Gregory Bateson and his wife. Janie's house again permeated her essence and hospitality, and reflected her diverse interests. Her office and studio for workshops were in an annex to the house, but her study occupied part of her living room. This was a time of transition for Janie from Gestalt therapy to cognitive psychology incorporating Rudolf Arnheim's insights into Gestalt psychology and art, and Hans and Sulamith Kreitler's research and writings on the psychology of the arts. At this time, though, Janie was searching for her own approaches to scientific investigation dealing with the structure of visual expression. She sought an approach which would honor individuality along with the structural characteristics in the visual expressions of different moods, and she adapted George Kelly's personal construct grid concept to her work with drawings.

Conversations with Janie were challenging, sparkling with ideas and connections produced by her brilliant mind, interspersed with clarifications and questions "You mean that . . . ?" Art, psychology, creativity, are perception were intertwined in these conversations; although Janie insisted on
earthbound anchoring and references, her spirit soared and her intellectual energy created a force field—for lack of better definition of the experience—which enveloped and challenged the visitor.

My friendship with Janie expanded into collegiality when Janie joined the faculty of the Expressive Therapies program at the University of Louisville, Kentucky, from 1978–1980. Upon her arrival in Louisville Janie was making her final corrections on her doctoral dissertation. She had persevered in her search for her own approach in investigating the visual language with which individuals create visual messages about their personal reality. She had analyzed over a thousand black on white mood drawings according to the individuals own perceptions as reflected in their constructs reported on the Kelly’s grid. Janie was pleased with the high number of agreement of the results with her predictions of the structural representations of the different mood states. She presented the results of her research at the 11th Annual AATA Conference, and the "personal dramas of transition" as expressed through the visual language and corresponding constructs at the 12th Annual AATA Conference (Rhyne, 1979a, 1983b).

Janie had achieved her goal to prove and show that “art therapists—if they put their minds to it, add a bit of creativity, hard work and stubborn perseverance—can do research that involves art as science in elegant interplay” (Rhyne, 1979a, p. 97). Janie had turned 65 when she received her doctoral degree in academic psychology from the University of California, Santa Cruz.

At the Expressive Therapies program Janie’s special class was in Visual Thinking based on her studies and dissertation research (Rhyne, 1979b). She also encouraged the students to test their own ideas through research. Her therapeutic work reflected her change to a cognitive approach in that her focus was “to raise individual levels of cognitive awareness of personal constructs of events” (Rhyne, 1979c, p. 125), whereby the drawings provided possible alternative solutions. Janie’s emphasis in her work was on structure and form as content and on figure/ground organization in visual expressions (Rhyne, 1987).

In Louisville, same as in California, Janie’s living space and environment were very much a part of her. Janie now lived on the eighth floor of a highrise, in large spacious rooms, with the view from her desk overlooking part of the city. The rooms and furniture were white and cream, highlighted with many shelves with books, and Janie’s collection of art and artifacts, and her plants. Janie greeted visitors with her southern hospitality and a glass of wine.

At this time I was working on my dissertation research. I appreciated Janie’s supportive presence and questions in what she defined as “heuristic” style of inquiry and teaching; listening and stimulating the person to investigate him or herself further (Rhyne, 1979b). It was a style similar to one she had used in her Gestalt art therapy workshops by asking “I wonder if...?”, but this time she supported the unfolding on an intellectual level.

When questioned about it, Janie was willing to share stories of her experiences living in a commune in Canada, as well as her experiences as a therapist living in the Haight/Ashbury area of San Francisco in the late ’60s. Nevertheless, her interests were in the here and now, in intellectual challenges. Her comment was: “I am not using so much energy when I am creative, I use much more energy when I am bored” (Rhyne, 1979d).

At the University, Janie, Sandra (Graves), and I used to have discussions about different approaches to art therapy. Janie was interested in the phenomena of seeing and in the two kinds of subjective attributes, namely the formal qualities of the image and the meaning attributed to it; for example, the rectangularity of an image, such as a box or a cigarette case and the individual’s constructs for it. Janie acknowledged that she was mostly cognitive in her approach, and that she had some problems with the Gestalt approach in that Gestalt was anti-intellectual, whereas she was not. Janie was not interested in the hidden meaning of the images or their symbolism: “I am interested in form not dragons!” Janie deplored the lack of clear definitions of terms and vocabulary in art therapy approaches and literature (Rhyne, 1980). Janie was always prepared for such discussions and had done her homework by reviewing the appropriate sources. She was clear and explicit in her statements and kept Sandra and me down to earth.

After leaving Louisville in 1980, Janie moved to Iowa City to be closer to her daughter and her family. My contact from that time on was mainly at the annual AATA conferences.

In the following years Janie made her own next intellectual “drama of transition”—synthesizing different large theoretical frameworks into her own style. In her presentation on the “Psycho-evolutionary approach to expression” at the 12th Annual AATA Conference she drew on Darwin’s work on the evolution of emotions, Suzanne K. Langer’s philosophies of mind, Gestalt psychology’s holistic emphasis, Kurt Goldstein’s extension of his view in psychotherapy, Robert Plutchick’s psycho-evolutionary perspective of emotion, and contemporary Existential psychotherapy (Rhyne, 1982). Eventually Janie integrated the different views into a systems framework with an emphasis on the individual. She perceived humans as innately systematically functioning and self regulating organisms who use signs, symbols, and other nonverbal languages to give and receive feedback (Rhyne, 1991).

Throughout the years Janie questioned the validity of art therapy as an independent discipline. At the same time she continued to contribute to the field. She was awarded Honorary Life Membership of the AATA in 1980. As the Chair of the AATA Research Committee from 1981–1985 Janie surveyed all the art therapy research up to that date, and wrote the outline “Ten steps in planning good research.” She taught at the University of Norwich and other graduate art therapy programs, gave presentations at AATA Conferences, and conducted workshops.

In her work and in her pursuit for new horizons Janie remained true to herself, honest in her comments, and grounded and solid in her being. In her final assessment of art therapy, “The future of art therapy: In what context?” (Rhyne, 1994), she again questioned the diversity in art therapy, and “the vocabularies and descriptions of perceptions and performances in the context of art therapy” (p. 250). She professed that she was still living with questions about art therapy and did not have the answers. Her advice was to reach for “wisdom in deciding which ideas to attend and which not to” (p. 251).

Janie celebrated her 80th birthday with a circle of friends...
and admirers at the 24th Annual Conference of the American Art Therapy Association in Atlanta, Georgia. Janie had just presented at the Conference her views on new perspectives on art therapy gleaned from the fields of philosophy, psychology, art history, biology, anthropology, and even paleontology and cybernetics (Rhyne, 1983b). At the party Janie was as young in spirit and alive as ever (Figure 1).

Janie touched the lives of many people, and contributed to the field of art therapy in many ways. Her Gestalt Art Experience (Rhyne, 1973) is one of the cornerstones of art therapy. Janie’s thesis was that “each of us writes our own script for our personal drama of transition, that we do so congruently with our construct systems of the nature of our role in and out of the world of reality” (Rhyne, 1983a, p. 34). In her life Janie lived her own Gestalt fully. She was honest with herself, and she was her own director of the experiential and intellectual dramas she was living.

Some Memories of Janie Rhyne

Robert Schoenholtz, A.T.R.-BC

I met Janie at the AATA conference of 1985 in Chicago where I introduced myself to her at the conclusion of her presentation. A few months earlier I had been driving Heinz von Foerster (the physicist, philosopher, cyberneticist, and consultant to family therapists) to his hotel in Philadelphia, and when we discussed Gregory Bateson and psychotherapy, we eventually began to talk about art therapy. While he did not know much about art therapy, he did ask me if I knew Janie Rhyne, who had been a neighbor of his on Rattlesnake Hill in Pescadero, California. Eventually, each told me that although they had a few conversations over the years, neither had a deep understanding of each other’s work. I asked him if it would be all right to use his name as an introduction to Janie, and he approved.

When I attended the panel on research where Janie was presenting, she was discussing her major research influences and included Bateson! I had no idea she knew him or was influenced by him in any way. I anxiously awaited the conclusion of the panel and when I finally was able to approach the presenter’s table, she agreed to meet at lunch and seemed to be as interested as I in having a talk. Later, at the lunch table and afterward, I found her to be quite interested in collaborating in developing a way of including Bateson’s ideas within art therapy context.

An interesting anecdote from this time was that there were many hippies in the Bateson classes at Santa Cruz because of his focus on consciousness. This was very stimulating for all and eventuated in Janie’s going to work and even moving into the Haight-Ashbury section of San Francisco to help with the drug casualties. This is a good example of the courage and spirit of adventure she exhibited throughout her life.

Eventually Janie shared with me, in increasing detail over time, facts about her relationship with Bateson, which was close and rich. She met Bateson at her PhD program at the University of California at Santa Cruz and, among the many stories she told about this time, she revealed how they had become good friends and how Bateson had set up all night reading her book when it was first published. He had to read it in the bathroom because it was the only way he could have enough light without disturbing his sleeping wife.
Bateson was negative about the idea of psychotherapy but, of course, Janie’s book was about art “experience,” so it was okay. Their friendship grew to the extent that when Bateson was later diagnosed with cancer, he and his wife, Lois, drove directly from the doctor’s office and that initial diagnosis to Janie’s apartment so that Gregory could talk with Janie about it.

She pointed out how her work was not based on Bateson in any direct, conscious way but that there is a clear similarity between some of the cybernetic/constructivist ideas of Bateson and the personal construct work of Kelly. We discussed these issues at length and many times in the subsequent years and even presented together at AATA conferences. Two of these presentations stand out as remarkable. The first was when she agreed to let me interview her publicly about Bateson and his ideas regarding art therapy. This was done in a spontaneous, loosely structured format allowing Janie to go on at whatever length she felt appropriate and with the inclusion of comments and questions from the audience throughout the interview. Since we had spoken about these issues at length in the past, it was a joy to participate with her as a rather educated questioner/moderator. It was one of those times when her natural warmth and charm really showed.

At another conference, for the American Society for Cybernetics in Philadelphia in 1993, Janie participated in a panel on art therapy and cybernetics with Maxine Jung and myself. One major presenter at the conference was Mary Catherine Bateson (the well-known daughter of Gregory Bateson and Margaret Mead). In the audience for our panel, sitting directly in front of us, was Lois Bateson, Gregory’s wife from the California days who had come specifically to see Janie. Janie’s presentation was especially personal: a verbal tapestry, with interweavings of various strands of her life and thoughts eventually culminating in a beautiful statement about art therapy and cybernetics/constructivism. The new introduction to her classic book, The Gestalt Art Experience, will address some of the same content as that presentation, its new addendum, on which she was working at the time of her death, to be more of the same. The former is more about her own life and the latter more about Bateson and cybernetics. At this writing I do not know whether the addendum was finished or close enough to be included in any form.

Janie was a remarkable person—a pioneer in the field of art therapy from over 20 years ago who was not willing to rest on her laurels, but rather always interested in new ideas and new ways of synthesizing ideas. We had many discussions about transpersonal psychology and psychotherapy versus humanistic approaches, and she was always interested in reading, studying, and understanding ideas whether or not she eventually came to accept them.

It was wonderful to see the respect and love with which she was showered at the end of an art therapy presentation, many art therapists were enchanted with her and her ideas. And it didn’t seem at all unusual, having known her close up. I met her expecting to find an interesting professional relationship, and instead I found a teacher, colleague, friend, and a vibrantly alive individual for whom I developed a great deal of affection and whom I will never forget. I am very grateful to have known Janie Rhine.

Art Therapy Licensure Update

Abstract

The New Mexico Therapist and Counselor Practice Act has been in effect for 2 years. This omnibus act includes the first licensure for art therapists in the United States. Two art therapists provide an update on the evolution of that licensure and how these changes have helped other art therapists in their endeavors to create laws to protect themselves as professionals.

Introduction

Five years after the introduction of legislation, the State of New Mexico passed into law the first licensure bill in the United States to govern the practice of art therapists. A previous article (Good, 1993) published in Art Therapy explains the original concept development, the process of writing the actual legislation, how the bill was introduced during three legislative sessions, the transformation to an omnibus act, and the factors pertinent to the final passing of this legislation during the 1993 New Mexico Legislative Session.

Deborah Good, MA, A.T.R., LPAT, LPCC

It was difficult to let go of the New Mexico Therapist and Counselor Practice Act once the legislation passed it in 1993. I was tired after the active 5 years in the legislative process. I also was concerned that the art therapist who would eventually be appointed by the Governor to the Counseling and Therapy Practice Act Board must be someone who would continue the work that had been started and who would be diligent, persistent, persuasive, and dedicated. At the request of the New Mexico Regulations and Licensing Department and the Governor the names of three New Mexico art therapists were submitted to be considered for this important position.

By the end of the summer of 1993, all the board members had been selected except for an art therapist. The board began to meet and schedule hearings and the position of art therapist still remained vacant. A public member with an art background influenced the art therapy section of the law, voicing opinions concerning the art therapists governed by the law. I became concerned and contacted the head of the Regulations and Licensing Department to communicate my concerns. I also spoke with the key legislative figures who sponsored the original bill and requested that they communicate my concerns to the Governor and reinforce the appointment of an art therapist to fill the vacancy on the board as soon as possible. Finally, in October 1993, the governor appointed Kris Sly-Linton, MA, A.T.R.-BC, LPAT, to the licensing board.

The time and work that have been donated by Kris since her appointment as the board’s art therapy representative are enormous. The writing and passing of legislation is only the first step that begins the legal process of licensing professionals. In her section of this article, Kris outlines the separate process of participating as a state board member once legislation has passed. Since New Mexico law governs three separate but related therapeutic professions, committee appointments by the board continue to accomplish extensive work.

The art therapy section of this legislation was written in a clear, concise framework that left room for the board to create specific and detailed guidelines governing art therapists. To include all of the rules and regulations in the original legislation would have made the bill cumbersome to pass and would have unnecessarily restricted the representation of art therapy as a profession. A licensure bill must be easy to read and clear to a layperson, yet protect the integrity of the profession. When introducing the original legislation I had to inform, educate, and sell art therapy to the New Mexico legislators as a productive, viable means of helping and protecting public consumers. In contrast, the subsequent Counseling and Therapy Practice Act Board had to enforce this legislation once it was passed, following the regulations in the bill and creating additional standards by which professionals must abide.

In the original 1989 Art Therapy Practice Act, a provisional licensure was created for art therapists who had recently graduated and/or not met the requirements for art therapy registration (which are the requirements for licensure). Because the 1993 Counseling and Therapy Practice Act governs separate disciplines individually, a licensure category was created to meet the provisional status of many professionals. This category is the Registered Mental Health Coun-
counselor (RMHC). Licensure is granted under this title for all professionals working toward the requirements of full licensure as a Licensed Professional Art Therapist (LPAT), Licensed Professional Clinical Counselor (LPCC), Licensed Professional Counselor (LPC), or Licensed Marriage and Family Therapist (LMFT). Upon application for the RMHC, a plan of intended supervision and contract with the supervisor is required. This allows new professionals to have licensed job opportunities in order to gain the experience they need for licensure within their field.

When the final 1993 omnibus bill was created, a representative from each profession carefully selected the appropriate title for their licensure. The title "Licensed Professional Art Therapist (LPAT)" was chosen for two reasons: (1) having the word professional in the title matched the counselor's title in recognition and status, and (2) most importantly, it came to my attention that in some states activity therapists are licensed as LATs. Many art therapists have had to deal with that title, in one way or another, in order to find employment. The law that New Mexico passed refers to the title Licensed Professional Art Therapist, in order to distinguish it from activity therapists.

Unfortunately, when the licenses were first issued, they read Licensed Art Therapist (LAT). This is an excellent example of the fact that even though a licensing board has to follow the letter of the law that was passed, in executing the licenses mistakes can be made. Fortunately, when Kris Sly-Linton was informed about the reasons for choosing LPAT over LAT, she was able to take this concern to the full licensing board and have the LPAT reinstated. If you have a license in New Mexico, you should be using LPAT after your name, regardless of whether your certificate states Licensed Art Therapist.

An interesting part of this licensure act is that residency in New Mexico is not required in order to be licensed. I am surprised that more art therapists nationally have not taken advantage of the opportunity to become Licensed Professional Art Therapists. However, it is uncertain how other states will view a New Mexico licensed professional art therapist practicing in their state. The rationale for applying for the New Mexico licensure is that it would at least increase your credibility to be a licensed therapist, even if it is in New Mexico. By doing so, you made the effort to obtain art therapy licensure where it is available. Insurance companies will decide individually how they are going to recognize those professionals who do not fit within their state guidelines. Another reason to be licensed in New Mexico is to use your out-of-state license as a rationale for your state to institute art therapy licensure. Why spend the money you spend to be state credentialed to another state when your state could be making money by licensing art therapists? This is a rationale that most legislators will listen to. It is a fact that the State of New Mexico has licensed more than twice the number of people expected. Because of this, the state has made over one million dollars to date licensing therapists and counselors.

Lastly, I continually hear arguments within our profession comparing state licensure and national certification. This argument compares apples and oranges. The timeliness of board certification for art therapists through the Art Therapy Credentials Board (ATCB) is remarkable in relationship to the New Mexico Counseling and Therapy Practice Act. Licensure and certification are related; licensure needs the national certification exam in order to maintain a consistency of standards for art therapists throughout the nation. The counselors and marriage and family therapists use their national exam on the state level to qualify and test new professionals for licensure. This unity between state and national insures that the standards we have fought so hard to obtain as art therapists will be maintained.

There are many stages involved in creating laws and standards on the state and national level to enhance our profession and hopefully create new jobs. We can tackle them only one at a time, but the job is never complete. The concept of a working document has become more clear to me through the legislative process. We must stay on top of all laws being created nationally and in our own states so that we can continue to do the work that we have been trained to do. We must maintain awareness of the world in which we live and continue to learn not only how to play by the rules, but also how to create them.

When the bill passed, there were five levels of licensure created: Licensed Professional Art Therapist (LPAT), Licensed Professional Clinical Counselor (LPCC), Licensed Marriage and Family Therapist (LMFT), and Licensed Professional Counselor (LPC). Standards Committees, made up of a professional member, a public member, and three other professional members from around the state, were established for each level of licensure to review rules and regulations pertaining to each category and individual license applications.

Although the bill was passed in the winter of 1993, appointments to the Counseling and Therapy Practice Board were not completely filled until the end of October 1993. However, there could be no delay in issuing licenses by July 1, 1994. Although this may seem like ample time to get the job done, due to open meetings acts, legal notice of public hearings, amendments, and so forth, the rules and regulations implementing the new law had to be ready by the end of January 1994, allowing a very short time to prepare such an important document.

In an effort to get as much public input as possible, public Standards Committee meetings were held throughout November and December 1993. The concept was admirable, but many individuals involved in the lobbying process and those who feared they might be excluded from licensing due to educational requirements sometimes turned the meetings into verbal battlegrounds. I was asked by the acting board chair to attend each of the Standards Committee meetings to witness what was occurring and possibly offer some objectivity, since I was the last professional member appointed and had not been overly involved in the lobbying effort.

Prior to my appointment, initial rules had been drafted by the board administrator based on other professions' rules and regulations. These rules had become increasingly more specific, identifying the various professional standards and whenever possible, exact specifications mandated by the bill itself. When I finally attended my first Art Therapy Standards Committee meeting, I found alterations to our portion of the rules had been made, compromising standards regarding su-
pervision and post-graduate professional hours. These resulted from advisory input from art therapists not yet able to be registered through AATA and public and professional members not familiar with the field of art therapy. This should come as a word of caution: Don’t assume that the process will take care of itself after the bill has passed. Continued vigilance is necessary at all stages of licensing.

I was the last board appointment because the Regulation and Licensing Office's clear preference was that Deborah Good be the professional art therapy member. They seemed to be hesitant to review other recommendations for the position. In retrospect, observing how personal agendas by lobbying professionals have occasionally impaired their judgment in designing standards that may be beneficial to their peers and the public, I now understand Debbie's position that an individual with less personal historical involvement in the legislative process may be able to serve the board's need to a greater advantage.

At this point it is important to stress the purpose of the licensing board and licensure in general. Licensure is not as much to protect the profession as it is to protect the public. It seems that the ultimate outcome of licensing is to maintain professional standards and conduct, and yet it is not the intent to exclude individuals from a given field. We as licensed professionals (and psychologists and psychiatrists have been subjected to this for years) are often criticized for trying to form exclusive organizations that dominate the healthcare field. I received some of these accusations and was interviewed by a newspaper in New Mexico after having addressed this issue at a special meeting of over 200 paraprofessionals and peer counselors who passionately opposed the licensing bill. They feared losing their jobs and state contracts because they didn't have the educational or supervisory background to be licensed. I was in a difficult position, but the training I had had as a board member in identifying the purpose of the bill helped me to present the case for licensing and public protection.

Regarding art therapy in particular, we were often faced with applications from A.T.R.s who had been awarded their registration under special circumstances. Our law does not permit special circumstances and that became an issue with many A.T.R.s who assumed that licensing was equivalent with possession of registration. This became a recurrent topic at the November AATA conference and was addressed publicly. Throughout the entire licensing effort in New Mexico, AATA has been supportive and helpful. From the AATA stuff to the Art Therapy Credentials Board they have always assisted the New Mexico Board with any questions brought to them. As one counselor highly regarded locally and nationally wrote, "From my perspective as a member of the LPCS Standards Committee, I believe that of all of the groups they [the art therapists] have demonstrated the highest level of professionalism and genuine collaborative spirit."

Over 3500 individuals applied for licenses in New Mexico, twice as many as had been anticipated. Of these approximately 10% to 15% were art therapy licenses. A majority of these applications were from outside New Mexico, a strong indicator of how important the licensing issue is. At an international conference I attended last fall, deregulation, standardizations set by the trade, and a trend to consolidate and reduce the number of licensing boards were primary topics of concern. In the near future I do not anticipate any less concern with licensing or professional regulation.

I am currently following up with a Medicaid/Medicare Task Force that is debating whether or not to specify art therapists as providers. The hopes of many art therapists (which were the same for social workers, counselors, and marriage and family therapists) is that licensure will provide more third-party payor reimbursements. Although this can occur (as exemplified by social workers' licensing and certification efforts), it is not a guarantee that we will be identified professional providers. However, it does guarantee that program administrators become more familiar with the professional aspects of art therapy. In our state, which has a reputation for being "arty", where art as a cultural necessity is not questioned, it did mean an increased awareness—not everyone who packs a paintbrush or has kids draw their feelings should be considered clinically viable. It means that to a certain extent, validity to the profession has substantially been heightened and that qualified art therapists are more likely to be considered for clinical positions than those purporting to be artists-as-therapists. It also means that the public is better protected against individuals who may use art to open up past wounds or trauma and that they won't be abandoned because the therapist doesn't have the training necessary to follow up with an individual.

Although much of the work had occurred when the rules and regulations were already published, applications distributed, and licenses awarded, this was only the beginning. Since July, we have established a Code of Conduct that all licensees must adhere to, and, most recently, a Complaints Committee that includes legal counsel was created to review reports of unethical conduct within the profession.

In the last month, with the advent of a new administration that views licensing and regulation somewhat differently than in the past, we have been involved in evaluating how the board can become more proactive in dealing with future bills that would greatly affect how the board operates. Already this year new legislation has been introduced regarding peer counseling, exemptions, and the addition of other types of counseling professions to the board; however, the board had not been consulted about these proposals. After only two years in operation, the board has begun to realize the scope of its responsibilities, and I feel sure there is even more in store for us in the future.

Since we have come so far in licensing art therapists, the singularly most often asked question I receive is, "Should I apply for the New Mexico license?" My reply reflects what we are learning from applicants across the country. We have received applications from individuals in states that do not recognize art therapists in a current counseling or therapy licensing act and ones where there are measures to reduce the scope of professional practice. In states that currently have licensing bills including or referring to art therapy licensing, reciprocity is a reason to apply. And for individuals working with EAPs or agencies that receive professional referrals, a license number is all that is usually required by insurance companies for reimbursement of special services.

The ongoing issue remains: Does licensing standardize a profession that was born out of respecting the uniqueness of the individual? The education I have received as a licensing board member has at least settled this issue in my mind for
now. We as therapists have an enormous responsibility to those we treat. Part of this obligation can be met by keeping abreast of the issues and new theories in the field, not just in art therapy, but in the mental health field in general because we do not live and work in a vacuum. Expectations of professionalism do not diminish the creative process that can be enlightening or healing; rather, it asks us only to be more accountable for our actions and recognize our limits. It also serves as a reminder that good business practice reflects, overall, an awareness of good ethical practice. I have not found licensing to be an inhibitor to therapeutic style. If anything, licensing encourages one to grow and find one’s own best therapeutic style by expecting the professional to participate in the therapeutic community and to be part of the continuum of that learning process.

Building Bridges Within the Culture of Pediatric Medicine: The Interface of Art Therapy and Child Life Programming

Diane C. Rode, MPS, A.T.R., New York, NY

Abstract

This article discusses the interface between art therapy and the parallel profession of child life. A collaboration between these two disciplines within a pediatric medical setting encourages optimal adjustment for patients and families based on a thorough perception of the individual child’s psychosocial reality and illness. Art therapists must acknowledge and build on current literature, national policies, and programming related to the psychosocial needs of children and families during illness and hospitalization. Art therapists practicing in pediatric medical settings are encouraged to broaden their ability to use a wide range of art and play modalities to reach the broadest range of patients and families.

Introduction

Serious illness in childhood and adolescence inevitably requires hospitalization. Life-threatening, chronic illnesses often require multiple, ongoing hospital admissions causing a potential disruption to growth, development, and family and social interactions. Reviews of the literature in 1985 (Vernon, Foley, Sipowicz, & Schulman) and 1985 (Thompson) reveal nearly 500 articles and studies examining children’s psychological responses to hospitalization. The literature describes how the experiences of illness and hospitalization can be disruptive and have the potential to negatively influence a child’s future psychosocial development. The literature also focuses on the importance of providing developmentally based interventions to prevent or mitigate undue distress (Prugh, Staub, Sands, Kirschbaum, & Lenihan, 1953; Plank, 1971; Hardgrove & Dawson, 1972; Petrillo & Sanger, 1980; Thompson & Sandford, 1981; Bolig & Gnezdal, 1994; Goldberg, 1988; Gaynard et al., 1990). Golden (1983) identifies three major sources of stress in children who are ill and require hospitalization. These are related to (a) separation from parents and necessary relocation to a new environment, (b) loss of autonomy and control, and (c) fear of bodily harm and/or death.

Heightened awareness of the psychosocial needs of children and families in the health care setting has had “a profound effect on the shape and function of pediatric units in the hospital. Physical recovery that leaves emotional scars in its wake is now unacceptable in pediatric practice. General hospitals increasingly reflect sensitivity to children’s needs for emotional comfort through the provision of accommodations for parents, playrooms, school programs, and carefully planned environmental design” (Wojtasik & Sanborn, 1991). The Association for the Care of Children’s Health (ACCH), a multidisciplinary, international organization which promotes the psychosocial well-being of children and families in health care settings has articulated standards for pediatric “family centered care.” Founded in 1965 by child health experts, ACCH fosters and promotes the health and well-being of children and families in health care settings through education, multidisciplinary interaction, and research. In its position paper on the care of children and families in health care settings (1977), the Association states: “Threats posed to the emotional security and development of many children and families by serious illness, disability, disfigurement, treatment, interrupted human relations, and nonsupportive human environments have been clearly demonstrated by worldwide research studies. The outcomes can range from temporary but frequently overwhelming anxiety and emotional suffering to longstanding or permanent developmental handicaps. Closer contact with the emotional life of children, increased parent involvement, and communication amongst professionals have contributed to greater understanding as well as to improvements of care.” For all pediatric environments ACCH strongly endorses the provision of “readily accessible, well-designed space, equipment and programs for the wide range of play, educational, and social activities which are essential to all children and adolescents.”

In its Handbook of Hospital Care for Children and Youth (1986), the Academy of Pediatrics recommends that all institutions with 10 or more pediatric beds create programs addressing the emotional and developmental needs of children. The child life profession has developed during the past 25 years in response to the needs of children and families for developmentally specific psychosocial services in the context of hospitalization and illness. The child life specialist joins the pediatrician, the child psychiatrist, the pediatric nurse, and the medical social worker in a multidisciplinary approach to offering comprehensive services within pediatrics. Child life specialists use play to provide developmentally appropriate, normalizing, and educational experiences to children during hospitalization and illness. Child life programs strive to promote optimum development of children, adolescents, and families, to maintain normal living patterns, and to minimize psychological trauma (Child Life Position Paper, 1979). Through play, child life staff provide opportunities for mastery, learning, self-expression, family involvement, and peer interaction. The ACCH articulates three essential goals of child life programs in pediatric settings: to minimize stress...
and anxiety; to provide “essential life experiences”; and to provide opportunities to retain self-esteem and appropriate independence. As elaborated in the Child Life Position Paper (1979), each of these goals is related to the provision of “abundant play opportunities.” Both arts therapists and child life specialists can share these goals and find dynamic ways to collaborate within the pediatric setting.

Creative Arts Therapy in Pediatrics

What is the role of the art therapist in the multidisciplinary milieu of the pediatric medical/surgical setting? How can the art therapist interact and collaborate with child life programming which focuses on “therapeutic play” as its primary intervention modality?

In the current discourse within the field of art therapy regarding art in pediatric medicine, there has been an absence of reference or relationship to the established psychosocial care practices and literature described above. In our own literature regarding pediatrics and medicine, art therapists have shown an interest in demonstrating the “efficacy of art therapy” (Cournell, 1993) with specific illness populations or in describing “applications” of art therapy. In a recent special issue of Art Therapy (Vol. 10, No. 2) dedicated to art and medicine, the term medical art therapy described the “specific use of art therapy with individuals who are physically ill, experiencing trauma to the body, or undergoing aggressive medical treatment such as surgery or chemotherapy” (Malchiodi, 1993). Although it is obviously of some value for art therapists to articulate the applications and efficacy of our specific interventions in specific health care contexts, if we do so in a conceptual, philosophical, and clinical vacuum, we risk participating in what patients often experience as fragmented care. Art therapy interventions in the pediatric setting can be more effective when they are woven into the fabric of the environment, including the patient’s relationships with hospital staff, the place of the medical unit, and the illness itself. Art therapists must find ways to develop and build professional identity within the context of the pediatric health care setting, and this development must begin by acknowledging what already exists in the literature, policies, and programming related to the psychosocial needs of children and families during illness and hospitalization.

As an art therapist, child life specialist, and director of the Creative Arts Child Life Program in an urban medical center, I have learned the value of a perspective and approach which embraces multidisciplinary programming in this setting. The interfacing of child life and art therapy in our program reflects a commitment to “family-centered care” (Johnson et al., 1992) and to eclectic creative arts programming designed to address the needs of a variety of children, adolescents, and their families. Through this interface, we have been able to explore a dynamic interrelatedness between professions based on a common philosophy of comprehensive, creative, and developmentally focused family-centered care programming. Child life and the creative arts therapies as interconnected, parallel professions can build bridges within the culture of the medical environment to meet the psychosocial needs of hospitalized children and their families through art and play.

The Culture of the Pediatric Environment

To elaborate art therapy’s role in the context of illness and medicine with any population, art therapists should first investigate the culture-creating conditions of illness and the hospital environment itself. The hospital environment, with its specific health care staff and unfamiliar routines and technology, is a unique culture. “A patient admitted to the hospital leaves his/her normal life behind, and enters a state of limbo characterized by a sense of vulnerability and danger. As with other institutions, such as the Army or prison, patients undergo a standardized ritual of entry, by which they are divested of many of the props of their social identity. Their clothing is removed, and replaced by a uniform of bathrobe and slippers. In the ward they are allocated a number, and transformed into a ‘case’ for diagnosis and treatment” (Helman, 1990, p. 203). In a pediatric medical environment, where many of these events are perceived as threatening and nearly everything is out of the child’s control, a physically ill youngster and his or her family may easily feel intimidated or disempowered by the collective “culture” that the hospital represents.

The importance of considering culture and values in the context of art therapy practice was featured in a recent issue of Art Therapy (Vol. 11, No. 3). It reminded us of our often neglected responsibility to perceive and respond to the culturally shaped dimensions of our patient’s experience. The pediatric medical setting can constitute a “culturally shaped dimension of experience” for patients and families, one which must be addressed to facilitate optimal coping and adjustment. Here, the art therapist is uniquely equipped to encourage imaginative expression regarding the experience of both illness and health within or outside the institutional health care environment. “Although as art therapists we deal with all the factors that shape an individual personality, our special facility is our fluency in visual expression and communication. Culture is a powerful influence on visual language” (Cattaneo, 1994, p. 184).

Since the medical/surgical setting constitutes the cultural reality in which a child and family are immersed during illness, art therapists must begin to conceptualize their role by recognizing the fundamental effect of the setting in which they encounter the patient. Within that setting, perhaps the interpersonal interactions with health care staff have the greatest potential to impact a patient and family’s potential for coping and adjustment. Where interventions are collaborative and comprehensive in multidisciplinary efforts, children and families experience a coherence in care designed to address the developmental, psychological, social, spiritual, and cultural dimensions of their worlds.

The Interface of Child Life and Creative Arts Therapy in Pediatrics

Winnicott (1971) commented about play and creativity: “It is creative apprehension more than anything else that makes the individual feel that life is worth living” (p. 41), and “Play is universal; it belongs to health; playing facilitates growth and therefore health; playing leads into group rela-
tions; playing can be a form of communication in psychotherapy; playing involves the body; it is in playing, and perhaps only in playing, that the child or the adult is free to be creative” (p. 65). Art therapists and child life specialists share a primary concern: How, through play (and play always involves the creative arts), does the physically ill child experience meaning and a sense of continuity of living? How can both professions join forces to create programming which encourages the child and family to maintain a relationship to their creativity and imagination during the experience of illness and hospitalization?

It is the unique role of the art therapist in the culture of pediatric illness and health care to address this need to engage and preserve imagination for the physically ill child. Hillman’s term *arts therapies* (1993) advocates for the use of *all* of the expressive arts: visual arts, music, movement, video, creative writing. “Arts therapies” refer to creative acts entered into with the goal of stimulating or engaging imagination. Hillman’s idea is that we “engage in *art* therapy not directly for art, or for the person, or for the emotion, but for the imagination” (1993).

A first step in conceptualizing an interface between creative arts and child life programming in a pediatric medical setting is in understanding the place (or function) of the arts, creativity, and imagination in human life, both practically and psychologically. Art therapists can then begin to appreciate the importance of establishing an environment, a space (imaginarily, intellectually, and literally) for patients and families within the hospital setting which allows for a broad range of creative arts expression and play. Within the context of a collaborative approach, art therapists can offer play experiences through a wide variety of creative arts modalities to create a transitional space in which the child, the family, and even the health care staff can experience a sense of “order and connectedness,” even in the face of serious illness.

In the hospital setting, art therapists and child life specialists often function as translators of experience. They search, with the patient and family, for play or art modalities that will stimulate imagination and create a transitional space. Then, in the transitional space facilitated by a creative arts experience such as music, drawing, or sculpture, the child can begin to create a dialogue between the inner experiences of illness and hospitalization and the outer world in which he or she lives. Through creative activities a child can access and give form to inner fantasies, concerns, meaning, and even resources related to the experience. Through a collaborative, multidisciplinary approach, art therapists seek to perceive the unique ways in which a patient or family is dealing with the experience of illness and hospitalization and work to translate this information into clarifying communication with health care providers and supportive responses to the patient/family.

The Arts in Action: A Child Life Creative Arts Therapy Program

The primary goal of both creative arts and child life programming in our pediatric medical/surgical setting is to protect and enhance the emotional, social, cognitive, creative, and imaginal integrity of children undergoing the stress of illness and hospitalization. To this end, the program plans and implements diagnostic, supportive, educational, therapeutic, and preventive programs for children and families individually and in specifically designed groups. The Child Life Creative Arts staff endeavors to facilitate and encourage positive coping strategies in children and families as they encounter the wide range of illness-related experiences that occur in the hospital setting.

Children from birth through adolescence are included in the child life program’s services on all inpatient units (85 beds) and in two special care units as well as several outpatient programs. The program focuses on the relationship of creativity and imagination to illness and the recuperative experience. The staff is committed to the principles set forth by the Association for the Care of Children’s Health and the Child Life Council’s philosophy which emphasize family-centered care and psychosocial support via preparation, education, and play opportunities. The staff believe that the dimension of play and our expertise in this sometimes misunderstood domain is the central, most important aspect of our work with children. Play and the related springs of creativity and imagination are the primary realms in which the Child Life Creative Arts staff makes contact with, supports, encourages adjustment, and educates children and families during hospitalization.

The arts play a substantial role in the child life program. Eighty percent of the child life specialists in the program are also Registered Art Therapists (A.T.R.s). The staff is supplemented by artist-in-residence consultants, including video artists, musicians, puppet specialists, a media/computer resource specialist, and a horticulture therapist. There is a formal, intensive training internship and fellowship program for creative arts therapists and child life specialists. This rich tapestry of diverse and talented personnel makes for a dynamic and innovative program which utilizes many creative arts modalities and offers a wide range of programming for patients in both individual and group contexts.

Although the staff seeks to meet the specific learning and therapeutic needs of individual patients and families, the Child Life Creative Arts staff focuses on interventions which attempt to create a sense of community and relationships to the environment. In addition to facilitating open play sessions in three play spaces, they lead daily structured activities including art, performance groups, music, cooking, gardening, puppet play, computer, “hospital bingo,” rap, and a weekly “Good Day Show” in which patients function as hosts, audience members, and puppet assistants to create “Ask the Doctor” interviews featuring staff physicians and nurses. Much of this programming seeks to facilitate relationships among patients, families, and health care professionals in the pediatric setting. Nurses and physicians are invited regularly to join specialists and art therapists in playroom activities as “assistants” or “special guests.”

Over the years, experimentation between staff specialists and art therapists has resulted in innovative programming with a wide variety of modalities and processes. Video work with patients and families is an example of one such process which has developed into important programming in this setting. Over the years patients have participated in video performance forms from video diaries, to video poems, to more formal efforts in the patient production company, “Through Our Eyes Productions.” In this collaborative video production
program, patients function as video producers to document their experiences and perspectives on coping with illness and hospitalization. Through this process, patient producers educate and inform fellow patients, families, and health care providers about their coping strategies, concerns, and experiences living with illness.

In these full-feature videos, interested patients work in therapeutic video workshops with a team of child life, art therapists, and video artists. Finished productions range from documentary-style works to short educational videos about specific medical procedures. These are then available for patient education efforts in our own institution and for national distribution. More intimate, interpersonal video programming also exists, for example patients use the video and sand tray modalities to create short, impressionistic “video poems” of their hospital experience for themselves only. Video has become a prominent tool because of its success and popularity with patients and families and also because of the wide range of modalities it can embrace: art, music, movement, and dramatic representation, to name a few.

Creative Arts Processes in Pediatric Settings

I once worked with a mother from Peru whose one-year-old child was dying from bone cancer. She spoke no English and was with her child, alone in this country, for an entire year. In my broken Spanish I tried to communicate with her and find a way to be helpful. We worked together to find soothing physical ways for her to hold her child and to otherwise continue general parenting functions during his illness. We spent long sessions with her son in the rocking chair, quietly rocking and watching him. One day she interrupted the silence of our sessions by saying, “I want to find something to do.” She knew I worked in the art room and asked to come and look at the materials. She chose fabric, yarn, and sewing materials and began a year-long project of creating dolls for the parents of children on the unit. Using her sewing skills, she was able to enter what she described as a “meditative state” while sewing and creating many expressive doll figures. Each doll was dressed differently in handmade clothes, and each face was created with a different expression—some joyful, others sad and pensive, some sleeping. She allowed parents to choose a doll from her growing selection. She eventually began a parents’ sewing circle in which she taught others to sew dolls. Through her sewing art activity, this mother was able to give her waiting, her many emotions, and her need to experience a sense of community a form in the hospital environment. She was also able to experience a sense of purpose and usefulness through her creative arts process.

Lewis Thomas observes, “The thing we are really good at as a species is usefulness. If we paid more attention to this biological attribute, we’d get a satisfaction that cannot be attained through goods or knowledge. Plain usefulness!” (New York Times, November 21, 1993) These words remind us of one of the important functions of the arts in our work with pediatric patients and families. The impulse to be of some use, to “make a mark” (as a child with cystic fibrosis once put it), to have a purpose even during illness is an important desire patients often express. Patients realize this desire by hanging artwork, performing music for each other, “decorating” the units, participating in community cooking groups, tending the unit’s garden, creating videos for other patients, and working on patient newsletters.

Dissanayake (1992) argues for a view of art-making and creative expression as an “inherent, universal, and biological trait of the human species.” She explores the anthropological meaning and function of “the arts” in small scale, premodern societies: “There, while there is no abstract concept of ‘art,’” everyone may be an artist—decorating their bodies and possessions, dancing, singing, versifying, performing—even when some persons are acknowledged as being more talented or skillful than others. In these technologically simpler societies, the arts are invariably and inseparably part of ritual ceremonies that articulate, express, and reinforce a group’s deepest beliefs and concerns. As a vehicle for group meaning and a galvanizer of group one-ness, art-conjoined with ritual is essential to group survival—quite literally art for life’s sake” (1992).

In her “paleoanthropological” view, Dissanayake understands art as a “behavior of making special,” which is a fundamental human proclivity or need. “The arts have always been with us. So have ideas of beauty, sublimity, and transcendence, along with verities of the human condition: love, death, memory, suffering, loss, desire, repression, and hope. These have been the subject matter of and occasion for the arts throughout human history. . . .” (p. 175). During hospitalization, patients and families often express frustration and a sense of diminishment or disempowerment. In the literal and psychological environment of the hospital, with its high technology and specialist medical staff who are often perceived as not “related,” the arts offer the opportunity to create community and re-empower individuals. Creative arts processes offer more than “normalizing” or diversionary experiences during hospitalization; creative arts activities provide patients and families with the means to engage in this “fundamental human proclivity” and dialogue with some of illness’s essential themes: loss, mortality, vitality, and transcendence.

In observing the energy and desire that a physically ill child brings to his or her involvement in a creative arts/play process, sometimes despite physical pain, art therapists come to understand something of this impulse, this propensity to “make special,” to engage in art and imagination. Ayyard (1992) observed, “The sick person’s best medicine is desire—the desire to live, to be with other people, to do things. I’d like to suggest, to invent or imagine or recall, ways of keeping one’s desire alive as a way of keeping one’s self alive” (p. 69). These deceptively simple pursuits of stimulating or facilitating desire and the capacity to “make special” are perhaps the cornerstones of our work with the physically ill child and the creative arts.

Time and time again, those art therapists who work in pediatric medical settings are moved or surprised or inspired by the resilience that children often demonstrate in the face of illness. This capacity for resilience and maintaining a sense of being in the world and dealing with the illness at the same time very often is related to the child’s relationship to his or her imaginative life. Often intuitively children make use of creative arts experiences to process the problem of their illness and the often restrictive experience of hospitalization. Hillman notes, “We live imagination, not just life, for even
'life' with its problems and troubles is a specifically organized narrative of experience, a way of styling and imagining. ... We must discover the imagination shaping and informing the problems and then work them out on the level of images" (1989, p. 103). “Working out” problems on the level of images points us again towards an art approach, as images take unlimited varieties of form via materials and modalities.

As facilitators of these processes, creative arts therapists must approach their patients with a familiarity with various modalities, an openness to experience unknown forms (we will not always recognize or be personally comfortable with each patient's form of choice), and a capacity to relate to our own imaginative awareness of the context in which we work.

Case Example

How does a perspective which embraces these philosophical thoughts about imagination, illness, and art assist the art therapist in pediatric practice? How does one “follow the patient’s lead” and allow the patient and the illness to determine the modalities and the processes which will invite the child to, as Broyard says, “dance his condition” (1992)? The clinical case described here illustrates how the therapist’s capacity to be open to the movements of the patient’s imagination is an important and often fruitful beginning. The child life specialist who worked with this child is also a Registered Art Therapist and will be referred to throughout the case as the “therapist.”

Valerie was 10 years old when she was brought by her grandmother who had raised her from the West coast of Africa to our busy urban medical center in New York. Ongoing pain in her throat, unable to be diagnosed in her small town, created a fatigue and weakness that concerned Valerie’s grandmother. After a reunion with her birth mother whom she had never met, Valerie’s throat condition worsened until fever and pain demanded hospitalization. In intensive care following exploratory surgery and diagnostic tests, Valerie was diagnosed with Rhombo sarcoma. Her prognosis was poor.

Valerie spent the next year primarily living in the pediatric medical/surgical unit and receiving chemotherapy and radiation treatments. In the beginning of her ordeal she was frightened and withdrawn, unable to leave her room because of her lowered immune system. In early art and play therapy sessions at her bedside, Valerie did not relate well and was lethargic and unable to use any materials in expressive activities. She was soon diagnosed with clinical depression which was clearly a result of struggling physically with a sudden catastrophic illness, separation from her country and familiar surroundings, and ongoing isolation in a private hospital room. Her grandmother described her as a very dynamic and creative child who loved art and dance prior to her illness.

For several weeks Valerie remained unable to engage in the arts activities offered by the therapist. It wasn’t until the therapist began to talk with Valerie about her country and what her life was like there that she began to relate more actively in conversation. Remembering Valerie’s interest in dance, the therapist wondered if she might be interested in doing a small demonstration of dance steps from her African town to teach the therapist during their sessions alone in the room. Surprisingly, Valerie was very interested in demonstrating her dance talents and in instructing the therapist. Despite her weakened state Valerie gave daily “dance lessons” to her therapist, instructing her grandmother and mother to bring special audiotapes for the classes. For the month or so that she remained in isolation, Valerie continued her enthusiasm for the dance classes and for the regular performances she gave to the therapist. During this time, with a newly donated hand-held video camera, the therapist introduced Valerie to video technology. Valerie used the camera in a self-initiated program of recording her dance routines and introduced singing into the productions. She chose songs from her African homeland as well as American songs she was learning from television. She directed the therapist in the assigned job of camera work and in the task of presenting the video outside the room to staff and other patients so that they would “know who I am.”

In the year that followed, Valerie remained hospitalized most of the time for chemotherapy treatments and multiple infections. She continued to mobilize her inner resources via her video and performance work. Staff and patients responded to Valerie’s videotapes with admiration and enthusiasm, and she was able to establish and cultivate relationships with others from inside her room. When she was finally able to leave isolation and participate in activities, she took a leadership role with her peers and immersed herself in the unit’s creative activities led by child life including art, music, cooking, gardening, and video.

Throughout her hospitalization, which was the better part of a year, Valerie continued her work individually in child life art therapy sessions to create a “video diary” of song and dance performances. She would dress in special outfits and direct the therapist to document the dates and sequences of the pieces. She took particular pride in these video productions and often requested scheduled “screenings” so that other patients, staff, and her family could view her work.

Valerie’s condition worsened after 9 months. The tumor in her throat began to grow despite the chemotherapy and radiation treatments. Valerie continued to sing in her productions until she was no longer able to produce sound vocally; she continued to dance her African traditional dances as well as experiment with newer American forms. For Valerie, the combined modalities of dance, song, and performance, which she engaged in throughout her illness, served as “metaphoric hammocks suspended between self and world” (Rose, 1980, pp. 11–12). Her performances for video provided her with a transitional space in which she could live, relate, and be seen even as her illness threatened to annihilate her body and her sense of self. The video modality allowed her to document and preserve her vibrancy, her connection to her lost country and life; and her relationship to her new cultures: her new country, the hospital setting, and the imaginative culture or “the land of the sick,” which she now inhabited.

When Valerie was terminally ill and restricted to bed, unable to speak because of the size of the tumor growing now through her mouth, she directed her therapist to set up an ongoing screening of her video performances in her room. Although she did not explain her intention for this, the effect of the videos playing in this dying girl’s room seemed to provide her family and those who had cared for her with an indelible impression of her creative, imaginative life in the face of illness. Her positioning of the VCR so that visitors were sitting...
near her while viewing the videos, but not focusing on her current physical dying condition also allowed her to control and choreograph her death so that it was infused with her life.

Discussion

In her video song and dance performances, as in her enthusiasm for creative activities on the unit, Valerie demonstrated an intimate relationship with both aspects of her existence: the disease which was progressing rapidly and the dynamism and vitality she experienced in her life and wanted others to relate to as well, even in her dying. Valerie employed a creative music and dance mode of expression from her life in her native Africa before illness and combined it with mastery of the previously unknown modality of video to "dance her condition" during her illness until her death. And after her death, she lives on through her video performances.

In the words of her mother, "Valerie gave us the gift of her life preserved, so that now, even though I remember how much she suffered, I also see how much she lived."

Winnieott noted a wish as he imagined his own death: "Let me see. What was happening when I died? My prayer had been answered. I was alive when I died. That was all that I had asked and I had got it" (1971). Even when they are not facing an imminent death, children often seem able to spontaneously achieve this state of living with their illnesses in their ability to use play and creative arts expression to continue their lives in the face of illness. Hence, the role of creative arts therapists in this setting is to provide a rich and varied creative arts environment in which the children and their families can shape and form their lives and their style and make their own "mark" through their illnesses.

The work with Valerie evolved from her desire to participate in her illness and to make contact with others in the hospital setting. The presence of, and close collaboration with, child life staff and programming made it possible to create opportunities for Valerie to participate as fully as possible in life during her illness. Even in the face of debilitating illness, she was able to maintain a relationship with her life through both the video work and her participation (when physically possible) in daily child life activity groups. Art therapists in pediatrics settings are in this way able to collaborate with child life programming and build comprehensive treatment plans to protect the psychological integrity of young patients.

At a recent American Art Therapy Association Conference (1993), James Hillman’s keynote address argued for “arts therapies as the therapy of choice.” He spoke of “facing the creative act” as fundamentally terrifying because we are facing inhuman forces. Illness, too, can be experienced as terrifying and as belonging to these realms of inhuman forces. "And so," Dr. Hillman said, "the patient needs an ally at his or her side so that he or she can go on imagining, only imagining, can cure the damaged or threatened capacity to imagine."

In a medical setting with children, with play as the medium or mediating activity, art therapists strive to create opportunities for children and families to experience the illness within the context of their lives. They align with the patient to observe the illness and to devote time and space to allow it to tell its story. They provide tools and materials so that it might, in its own way, describe its condition.

During his difficult illness, Bruyard (1992) wrote of the “imaginative life of the sick.” He said, “Always in emergencies we invent stories. We describe what is happening as if to confine the catastrophe. The patient’s narrative keeps him from falling out of his life and into his illness. Like a great novelist, he gives his anxiety a shape” (p. 19). When children and families interact with creative arts modalities to find and shape images which describe or respond to their illness, they are able to participate in their illnesses without “falling into” them. As art therapists collaborating with child life specialists, we are able to encourage this dialogue, this preservation of imagination, in our attending to the imaginative lives of our patients. The original meaning of the Greek word for “therapy” (therapia) was “to serve, to foster, to nurture, or to tend.” Art therapies along with child life programming in pediatric medical settings encourage and foster the imagination that exists in each child.

Clinical Application of the “Scribble Technique” with Adults in an Acute Inpatient Psychiatric Hospital

Michael J. Hanes, MAT, A.T.R.-BC, LPAT, Oklahoma City, OK

Abstract

The “scribble technique” described in Florence Cane’s book, The Artist in Each of Us, (1983) has historically been employed by art therapists as a technique to reduce inhibitions and liberate spontaneous imagery from the unconscious. The author reviews the “scribble technique” procedure and presents examples produced by adult patients in an acute inpatient psychiatric hospital. The examples illustrate how the “scribble technique” can be utilized to empower the client to produce spontaneous imagery from the unconscious and overcome apprehension toward the image-making process.

Introduction

Cane (1983) used the “scribble technique” as a kinesthetic method to facilitate the creative faculty within children. She alleges the creative capacity is innate and that it can be enticed through reassurance and by providing a favorable combination of circumstances. The “scribble technique” was utilized as a possible means of producing those circumstances conducive to creativity.

Naumburg (1987) later used her sister’s technique along with the client’s verbal associations as a means of acquiring insight into personal symbolism emerging in graphic content. The open-ended approach of this technique lends itself to projection and the liberation of unplanned and impromptu imagery. Oster and Gould (1987) state that the “scribble technique” is “an entertaining, nonthreatening method to help individuals express outwardly those portions of their inner selves that they are reluctant to share” (p. 55). The use of a scribble allows the patient to bypass normal resistances in an attempt to approach and contact less conscious types of imagery (Rubin, 1984). Kwiatkowski (1978) states, “The accidental shapes have a good chance of evoking images from the unconscious, thus bringing into the open material that has been repressed” (p. 40).

The technique is an act of projection comparable to that of the Rorschach blots (Kramer, 1971). Like the inkbLOTS, the scribble is ambiguous, nonthreatening (“anyone can scribble”), and does not elicit learned responses. The individual responds to the stimuli in a personal and unlearned fashion, whereas there are no expected or anticipated responses. Contrary to the inkbLOTS, the “scribble technique” offers the client the opportunity to design his/her own unstructured stimulus upon which to project dormant imagery.

Winnicott (1971) introduced a technique similar to the “scribble technique” which he referred to as the “Squiggle Game.” This technique required the child and clinician to alternately draw squiggly lines with the expectation that each would discover and complete an image from the other’s squiggy line. Winnicott employed the technique as a method for communicating with a client and asserts the primary objective was not interpretation of the unconscious. Winnicott, who used the “Squiggle Game” as part of the psychotherapeutic interview, felt the technique provided the individual the opportunity to reveal and communicate his or her current problems or emotional conflicts. Winnicott asserts, “In the therapeutic consultation the material becomes specific and acutely interesting since the client soon begins to feel that understanding may perhaps be available and that communication at a deeper level may become possible” (p. 7).

Materials

Media selection is an important consideration. Naumburg (1987) suggests the art media be simple for easy and quick manipulation, since most of the patients undertaking the art task have limited exposure to the art process. Wadeson (1987) asserts that art media which requires minimal preparation are more conducive to facilitating the emergence of unconscious and spontaneous imagery. Naumburg (1987) also proposes that certain semi-hard art materials are more suitable for releasing spontaneous art expressions. She recommends the use of semihard pastels and acrylic or tempera paints. Case and Dalley (1992) affirm that “paint has more subtle possibilities in aiding the expression of feelings than, for example, felt tip [markers]” (p. 104). Nevertheless, painting by brush may not lend itself efficiently to the production of a continuous and unbroken line. The paint brush may run out of color while in the process of forming the scribble and would impede the production of an uninterrupted line.

Materials that permit modification also allow for psychological insight into areas of difficulty which the patient is presently experiencing (Furth, 1988). I provide the client with a 2B pencil because of its ability to be modified. Pencils may also glide unhindered and consistently across the paper while forming the scribble. Other media such as conté and charcoal sticks do produce a consistent line; however, they do not provide the benefit of being erasable. Wadeson (1987) generally avoids the use of pencils asserting that they lend themselves.
to formality and constriction and attributes this phenomenon to their possible mental connection with writing. However, I have discovered that a series of aerial arm motions prior to completing the scribble reduces this potential association for some clients. On occasion I have observed clients discovering significant names or words “accidentally” drawn in the formation of the scribble. This occurrence may be attributed to the combination of pencil and aerial arm motions, which are associated with formal instruction in handwriting. Some clients have discovered that these significant names or words are messages from the unconscious which have sought expression through the random movements of their own arm and body. Case and Dalley (1992) affirm that words appearing in graphic material may be the client’s attempt to draw the therapist’s attention to something he/she wishes to address.

Additional factors contributing to media selection include drawing surface and coloration. The paper surface is the receptacle or container for the projected image. A small surface may be seen as constricting and incapable of containing the potential image; a large surface may be experienced as overwhelming, if the client feels compelled to fill the entire space. Therefore 18” × 24” paper seems to be a good size. Wadeson (1987) also advocates these dimensions because paper this size encourages expansiveness rather than constriction. Anything smaller may not be conducive to the production of a sweeping, free-flowing scribble.

Scribble drawings can be created with media such as crayons, cray-pas, and colored pencils; the latter allows for greater detail and shading and permits variance of color intensity. These qualities may yield significant information and draw attention to areas of conflict or importance (Furth, 1988). Dry media also is more controlled than wet or fluid media. Liebmann (1986) asserts that dry media provide safety and security for patients who are apprehensive about employing wet media or “losing control.” Some psychiatric patients may find that pencil binds and limits their ability to respond to the scribble technique.

Procedure

The original scribble procedure began with a series of aerial arm motions performed in a sweeping rhythmic fashion. These warm-up rituals are preparation for the drawing of free-flowing lines on the paper. Cane (1983) contended that while expressing an idea through sketching, significant nerves in the shoulder conduct the message from the brain to the hand. Rhythmic arm motions are used to increase blood supply and reduce muscle tension, consequently accelerating the passage of the projected image. Oster and Gould (1987) note that the introduction of rhythmic arm motions is advantageous and contend that the use of aerial arm movements permits individuals to make less constricted scribbles. Some clients may be reluctant to participate in spontaneous arm movements. Cane (1983) employs a sequence of successive exercises which help to liberate spontaneity and build confidence. These elementary exercises consist of simple body movements needed to perform vertical, horizontal, and curved lines.

Steinhardt (1989) alleges the “scribble technique” later declined into a stereotyped procedure which no longer took into consideration the individual’s natural body rhythm. The procedure became routine and its application complacent. The technique was “no longer created by free body movement but by random motions of the hand performed without pleasure or conviction” (Kramer, 1977, p. 11). Often the technique is employed without first introducing the rhythmic movements of the arm and body. This divergence from the original procedure may have been brought about by the wish to simplify and accelerate the procedure. The deviation may also be due to the therapist’s need to avoid his/her own discomfort and/or the group’s uneasiness and resistance to performing the aerial arm movements.

Upon completion of the rhythmic arm motions, the individual is encouraged to draw a continuous and unpremeditated fluid line. During this process the art media (e.g., crayon, chalk, etc.) continuously touches the paper. The resulting scribble may intersect many times forming an irregular and unpredictable pattern or design (Naumburg, 1987). The person is instructed to stop when he/she feels that the scribble is complete. Ulman (1975) advocates interrupting the scribble at a juncture where the paper is reasonably covered with intersecting shapes, but prior to it becoming an unapproachable entanglement of lines. It is also advantageous not to disturb the person once he/she has engaged in the scribble process. To impede the activity results in the loss of valuable observational data and to interrupt this process would contaminate the client’s spontaneous approach to the task.

The scribble may be made with eyes open or closed. Cane (1983) notes that closing the eyes obstructs the mind from consciously directing the hand to represent some customary object. Another variation of this technique encourages the individual to use his/her nondominant hand to assist in making an unconscious rhythmic pattern.

Having created the scribble, the individual is encouraged to review the shapes and forms brought about by the intersecting lines with the expectation of discovering some resemblance or approximation of an image. The individual may survey the scribble as a whole or concentrate on specific shapes and forms within the scribble. The paper can be rotated if the original position of the scribble is not suggestive of an image (Ulman, 1975). In the event the scribble still does not prompt an image, the scribble can be distanced from its creator and once more examined from all angles. This maneuver seems to detach the client from his/her scribble, permitting liberation of the scribble’s not yet acknowledged content. Distancing provides separation and may promote a more open-minded point of view.

While developing the projected image, the individual may add as many lines as he/she wishes or obliterate those that obscure the primary image found in the initial scribble. Cane (1983) encouraged her students to emphasize or accentuate the principal lines in an attempt to bring forth the projected image. The completion of the picture may include using colors according to the personal wishes of the individual.

Occasionally no objects are seen by the client, and a design is created from the scribble by randomly filling in shapes with colored media (Figure 1). Kramer (1971) views this as “busy-work” and compares it to the traditional coloring book. It may also be a defensive response to the therapist’s request.
to discover an image within the scribble. The mindless coloring of shapes allows the individual to remain detached from both thoughts and environment. Case (1990) asserts that “busy-ness does not allow a moment’s expression of feeling or unwelcome thought” (p. 141).

At first glimpse the color design may seem meaningless, yet under closer scrutiny one will find several benefits to creating a design of randomly colored shapes. This process can be useful for liberating the individual from initial inhibitions and self-deterrence (Cane, 1983). The color design becomes a springboard from which the client can plunge into his/her creativity. The seemingly purposeless activity may also create an additional stimulus for releasing or projecting images from the unconscious. This is accomplished by encouraging the client to review the colored shapes in an attempt to discover some semblance of a picture or object. Many times the client discovers that the randomly colored forms are not so “accidental,” rather, they combined to form an image from the unconscious.

**Sample Scribble Drawings**

I obtained the following examples from adult patients participating in group art therapy in an acute inpatient psychiatric hospital. The group structure was what Lichmann (1986) refers to as “semi-open.” The clients commit to attending regularly, but membership changed as patients were discharged and new individuals were admitted. A nondirective approach was employed in the sense that participants were provided a variety of art media and encouraged to use these according to their own choices and needs.

In the examples that follow, the clients were hesitant to engage in the art process because of artistic inadequacy, insecurity, and their reluctance to trust their creative faculty. The “scribble technique” was introduced as a means of providing a personal semistucture that would enable the client to bypass his or her feelings of apprehension and begin to approach the image-making process. By stimulating faith in the patient’s own creativity, the therapist hoped that in subsequent sessions the patient would be able to employ the art materials without the need for themes or suggestions.

**Case Example: Lea**

Lea, a 38-year-old female, was admitted to the psychiatric hospital for treatment of a depressive episode coupled with a panic disorder. The client was divorced and had a 15-year-old son who resided with her former husband. Lea had suffered intermittently with battles of depression and anxiety for most of her adult life. The client remained in the hospital for 9 days, during which she attended two art therapy sessions.

In her initial session Lea was extremely hesitant to use the art materials and requested instruction and assistance from the therapist. Since the therapist’s time with Lea was going to be limited, the “scribble technique” was utilized because of its minimal structure, artistically nontreating properties, and ability to swiftly access images from the unconscious. The scribble drawing also provides the client with the structure needed to develop an image independently from the therapist, hence reducing her reliance.

Lea performed the aerial arm motions in a rigid manner, possibly illustrating her controlled demeanor. Her scribble was completed in the same fashion, demonstrating her hesitancy and reluctance to permit her conscious defenses to abate. Initially she experienced difficulty discovering imagery within the scribble. She was encouraged to rotate the paper and eventually created the image in Figure 2.

Lea described the picture as “a shark searching in the dark ocean, twisting and turning, hunting for food.” The shark image is sensuous and laden with sexual symbolism. There is a composite of both male and female elements. The whole shark can be interpreted as an immense penis, conceived as a menacing weapon with teeth. The shark’s mouth is central to the picture and may represent vagina dentata (Figure 3), which is devouring the male organ. During the session the client disclosed that she had been involved in a homosexual relationship for the past 13 years; the relationship had recently been terminated by her lover. It is interesting to note there are 13 teeth in the mouth of the shark. Bach (1975) states that numbers of objects found in pictures often signify units of time in a person’s life. The imagery may also illustrate her thoughts of castration and ambivalence towards her sexuality. This struggle is echoed in her second scribble drawing.

Figure 1.

Figure 2.
possibly illustrating the client's transferred feelings onto the therapist for not adequately assisting and joining her therapeutic journey.

In her second art therapy session, Lea used the "scribble technique" to develop the image of a sky diver (Figure 4). On the back side of her paper she wrote, "The sky diver has free-fallen and opened his/her chute, floating freely and calmly toward land. The sky and clouds are beautiful and peaceful." However, the content of sky diving is not congruent with an individual suffering from panic attacks. Figure 5 reveals Lea's thoughts concerning her sexuality. The clouds contain both male and female elements, as did the shark in Figure 2. The clouds form a vagina and penis, and the male organ is facing away from the vaginal opening. This may illustrate her possible rejection of or conflict with heterosexuality. Upon completing the sky, Lea was astonished to discover the sexual significance of her clouds. She disclosed that her marriage and child were an attempt to thrust herself into accepting heterosexuality; however, she stated she felt most at ease with homosexuality.

Although the therapist's time with Lea was limited, the "scribble technique" was useful in helping the client to overcome her inhibitions regarding the art process and to initiate impromptu imagery. Lea was able to overcome her artistic insecurities and develop faith in her creative capacity by utilizing the semistructure of the "scribble technique." The projective qualities of the technique unloaked feelings and thoughts otherwise denied or repressed. The "scribble technique" provided a means of accessing and externalizing internal conflicts, whereupon she could begin to acknowledge and own her intense feelings towards her current and past relationships.

**Case Example: John**

John, a 42-year-old male, was admitted to the psychiatric hospital for treatment of a depressive episode. The client was divorced and had no children. John had been plagued by excessive feelings of worthlessness and inadequacy for most of his life. He had an extensive history of sexual abuse during his childhood, for which he harbored immense guilt. The client remained in the hospital for only 3 days during which he attended one art therapy session.

John was reluctant to engage the art media and, like Lea, requested instruction and direction from the therapist. He made aerial arm motions in a rigid and taut manner and his scribble was created in the same taut and hesitant fashion. While completing his scribble he asked repeatedly, "Am I doing this right?" further demonstrating his need for reassurance. Upon completing the scribble, John immediately discovered the image in Figure 6.

The client described the image as "a hot air balloon hiding in a valley from the swirling winds." His associations give the impression that John is literally attempting to stay "out of sight" or elude something or someone. The client disclosed to the group that he sought refuge from his problems by placing himself within the confines of the hospital. The menacing sky from which the hot air balloon seeks asylum may actually represent his psychic environment which he perceives as hostile and unpredictable. The viewer can see only the top portion of the hot air balloon, while the remaining part is obscured and
protected by the mountains, suggesting John is attempting to keep something or someone concealed. Bertoia (1993) asserts that edging may be an attempt to deny or hide something from consciousness.

The hot air balloon may represent John’s wish to ascend or seek a position of dominance or escape (Burns, 1982), yet it appears underinflated and somewhat flaccid or limp. This possibly illustrates his feelings of ineptness and dejection, hence his need to seek a place of refuge.

John terminated his treatment prematurely and discharged himself from the hospital against the recommendation of his psychiatrist and treatment team. John mentioned to the group that he had come to the hospital to seek refuge from his problems; consequently, his expeditious exit from the hospital implies he continues to flee from himself and his internal conflicts. Even though he attended only one art therapy session, the “scribble technique” was beneficial in helping him bypass his intense feelings of artistic inadequacy and create impromptu imagery.

Case Example: Mary

Mary, a 32-year-old female, admitted herself to the psychiatric facility for treatment of a depressive episode and marital discord. The client had been married approximately 9 years and had two children. She described her marriage as stormy and stated that her husband was both verbally and physically abusive. Over the past year the client had made several unsuccessful attempts to separate from her spouse. Mary was crippled by her low self-esteem and feelings of inferiority. She had no medical insurance; however, she was admitted to the hospital’s 5-day charity bed, during which she attended two art therapy sessions.

The client voiced strong inadequacies regarding her artistic abilities and was opposed to engaging the art materials due to her dread of failure and performance anxiety. Her aerial arm motion: were performed in a strangled and hesitant manner; however, the warm-up activities enabled her to orchestrate a flowing, unpremeditated scribble. She did not discover an image in the randomly formed shapes and requested to color the various patterns revealed in the scribble.

Upon completion of her design (Figure 1), Mary was encouraged to uncover an image or picture in the colored forms. She immediately discovered an image (Figure 8) which she described as “frightened and shocked.” The alarming image
enabled the client to begin disclosing her fears of being physically abused once again by her husband. The expression also depicts a sense of trauma and helplessness brought about by her husband’s relentless physical abuse. When the color design was inverted (Figure 9), the client exposed the image of an erect male organ with testes. The dark circles were viewed as testicles and the softer colors around them as the scrotum. The erect penis protrudes in a penetrating posture. Mary became tearful as she disclosed to the group that her husband habitually compelled her to engage in nonconsenting intercourse.

The scribble technique was useful in helping Mary to overcome her inhibitions towards the art process, which were due to her feelings of failure and artistic inadequacies. The nonthreatening qualities of the technique encourage self-assurance and the production of impromptu imagery. Mary was able to utilize the art process to externalize her fears and pain, at which time she received acknowledgment and support from the group. In a subsequent session, she was less apprehensive about her artistic abilities and able to engage the art materials without the introduction of structure or a liberating theme. She continued to utilize the art process and group setting to explore the horrors of her abuse and find security and support.

Observations and Discussion

In the preceding examples, the “scribble technique” was employed to assist adult clients in overcoming their inhibitions regarding the art process and to elicit impromptu imagery. In each of the examples, the scribble technique was introduced during the client’s initial art therapy session due to intense misgivings and apprehension towards the art process. Steinhardt (1989) promotes the use of an open-ended approach at the initial phase of therapy to establish the value of the creative process and the therapist’s unconditional acceptance. It is in the initial art therapy session that most clients experience apprehension towards the art process due to their artistic insecurities. Denny (1975) also advocates using the scribble technique as a starting point in therapy with clients who feel intimidated by the art process and who have little conviction in their own creative faculty. The preceding case examples illustrate how the scribble technique can be applied as a means of bypassing performance anxiety and artistic insecurity, while simultaneously promoting the individual’s creative capacity.

The open-ended approach of the scribble technique provided the guidance and structure sought by the clients, while at the same time promoting self-assurance and confidence in their own creativity. The scribble’s ambiguity permits clients to use the task according to their own needs, rather than imposing excessive and unnecessary emotive themes that may be founded more on the therapist’s own needs.

The clients were able to use the scribble technique to create spontaneous images which expressed feelings and thoughts otherwise denied or repressed. The projective properties of the scribble provided swift access to portions of their inner selves which they were reluctant to acknowledge. McNeilly (1983) warns that themes have the tendency to elicit feelings too abruptly, making it difficult for the group and therapist to embrace and comprehend the material; the scribble technique is no exception. In the preceding examples, clients brought forth unconscious material; it is then the therapist’s responsibility to help the clients understand this material.

Additionally, the spontaneous images which emerged through the scribble technique enabled the preceding clients to develop faith in their own creativity and image-making process. They became springboards from which the clients were able to engage in the image-making process. The clients became less apprehensive towards the art process and were able to employ the art materials according to their own needs and wishes. Lastly, the scribble technique was useful in bypassing the clients’ refusal to participate in the image-making process due to insecurities regarding the art process, discouraging the clients’ possible premature termination of art therapy and permitting each individual the opportunity to address unique issues.

The Diagnostic Drawing Series and the Tree Rating Scale: An Isomorphic Representation of Multiple Personality Disorder, Major Depression, and Schizophrenia Populations

Maureen Batza Morris, MA, Washington, DC

Abstract

This pilot study used the Diagnostic Drawing Series (Cohen, Hammer, & Singer, 1988) and the Tree Rating Scale (Creekmore, 1989) as a means to research isomorphic representations in tree drawings. The tree drawings of 80 subjects, 20 of whom were diagnosed with Multiple Personality Disorder, 20 with Schizophrenia, 20 with Major Depression, and 20 in the Control population, were rated. Patterns which emerged within each diagnostic category were examined, and graphs were used to depict the results. Certain features were found to distinguish each diagnostic category. The descriptive statistical findings were both consistent and inconsistent with earlier Diagnostic Drawing Series research findings (Cohen, Hammer, & Singer, 1988; Creekmore, 1989; Kress, 1991, 1992; Mills, 1989; Mills & Cohen, 1993; Rankin, 1994; Torem, Gilbertson, & Light, 1990).

Introduction

Throughout history, the tree has continued to be one of the most central and consistently used symbols. This universal metaphor depicting human development is used in virtually every religion and in myths, rituals, legends, sacred literature, art, poetry, and dreams. Greek mythological associations include the pine tree with Attis, the cedar tree with Osiris, and the oak tree with Apollo to name but a few. Nordic mythology cites the Cosmic World Tree, Yggdrasil. The Celtic (oak), Scandinavian (ash), and German (lime) heritages specify the use of the tree as a traditional symbol. Within religious realms, Christians refer to the Garden of Eden whose center contains the Tree of Knowledge, while Judaic tradition points to the Tree of Life in the City of New Jerusalem of Apocalypse as a central symbol. More recently, Dante portrays the pattern of celestial sphere as foliage of a tree whose roots spread upwards.

With a greater appreciation and deeper knowledge of the cultural, religious, and mythical implications of the tree metaphor, many authors contend that the tree symbol facilitates the deepest tapping of the psyche (Cohen, Hammer, & Singer, 1988). Hammer (1980) hypothesizes that in the process of drawing the tree, the individual creates a self portrait which is a projection of the self. Others assert that the tree serves as an inanimate object upon which it is easier to attribute a greater amount of less desirable personality traits (Burns, 1987). From a Jungian standpoint, the tree represents the persona. In an attempt to further understand the symbolic meaning of the tree, Jung suggests that “if the mandala may be described as a symbol of self seen in cross section, then the tree would represent a profile view of the self depicted as a process of growth” (Jung, 1954/1967, p. 253). In addition, Flokker (1962) describes the tree as a symbolic representation of one’s own personality. Thus, in a variety of ways, the tree can be seen as a graphic representation of the inner self.

While the tree is viewed as a symbol in mythology and religion and a metaphor for one’s own personality, the nurturing aspect of the tree is asserted by Koch (1952) as he speaks of the tree as an “embryonal house”. The nurturing aspect of the tree is viewed in another context as a representation of the feminine principle (Cooper, 1978), which possesses the nurturing, protecting, and sheltering qualities of the Great Mother. Just as the Great Mother and “embryonal house” are depicted as nurturing, so too might the idealized image of the self-concept be depicted as nurturing.

Although the tree historically has been viewed as a metaphor for development, the use of tree drawings as graphic indicators of self-concept and potential clinical indicators did not emerge until the 20th century. Decades after French and German psychiatrists asserted the use of art as a diagnostic tool, Buck and Hammer introduced the House-Tree-Person (H-T-P) drawings as a means to facilitate freer verbalizations (Buck, 1948; Buck & Hammer, 1969). At the same time, Jucker developed and advanced the projective capabilities of the tree drawing of the tree (Hammer, 1958). This projective device was further developed by Koch (1952), a student of Jucker, into a projective instrument to capture the total personality in its deeper layers of being. The clinical applications of the H-T-P were expanded in later research (Burns, 1987; Burns & Kaufman, 1972; Hammer, 1958; Jolles, 1964).

Within the past decades, tree drawings have been examined and analyzed in relation to a variety of diagnostic populations. Read (1931) assessed a series of trees drawn by children to determine the mode of plastic expression. In the study of a young schizophrenic female, Flokker (1962) analyzed the tree drawing in terms of graphic correlations with diagnostic symptoms. Specifically, he cites the lineation, positioning, and relationship of parts as indicators of this particular pathology. Dax (1965) used tree drawings to aid in providing a pictorial representation of depression. In each of these studies, the tree theme was utilized and explored as a diagnostic tool.

According to Arneheim, as the notions of the brain do not deviate from the thoughts to which they are tied, the artwork is indicative of isomorphic representations (Arneheim, 1986). In this manner, the creative processes and products can be
viewed as outward expressions and manifestations of internal states. In an effort to understand the meaning of the artwork and the creator of the artwork, individual characteristics of tree drawings have been examined and explained in divergent interpretive studies. Buck (1948) and Hammer (1958) suggest that the trunk depicted within the tree drawing represents the subject's feelings of energy, growth, development, and ego strength. Boller (1977; Buck, 1948; Hammer, 1958; Rankin, 1994; Torem, Gilbertson, & Light, 1990).

In a similar manner, additional individual characteristics of the tree have been studied. According to Jolles (1964), the existence of falling or fallen apples suggests feelings of rejection or guilt. Jolles further states that broken bark represents a stormy, difficult history, while a heavily drawn bark suggests anxiety (1964). According to Burns, trees drawn in complete symmetry in a detailed manner indicate a compulsive need for control (1987). Branches which are broken or cut off suggest feelings of trauma and/or castration (Hammer, 1968; Jolles, 1964). Branches with large leaves suggest dependency associated with feelings of inadequacy (Burns & Kaufman, 1972; Burns, 1987; Jolles, 1964). According to Jungian psychology, the roots are an expression of the unconscious (Plokker, 1969). In addition, an emphasis upon the roots suggests attention to the past (Burns, 1987).

Although a breakdown of component parts is useful for examining details, an integration of these parts toward a holistic view of the drawing and of the subject is imperative. It is the author's opinion that these parts must be seen as an integral part of a whole, an integral part of the total self.

Existing research using the Diagnostic Rating Series (DDS) has primarily focused on establishing objective correlations between structural components of artistic expression and psychiatric diagnosis. Normative studies have produced data to establish standards in the following diagnostic groups: Alzheimer's (Knapp, 1994); Borderline Personality Disorder (Mills, 1989); Depression in children and adolescents (Gulbro-Leavitt & Sehimmel, 1991); Eating Disorders (Kessler, 1994); Major Depression. Dysthymia, Schizophrenia, and Multiple Personality Disorder (Cohen, Hammer, & Singer, 1988); Multiple Personality Disorder (MPD) (Kress, 1991, 1992, Mills & Cohen, 1993); and Organic Mental Syndrome (Couch, 1992, 1994). Specifically, tree drawings are collected and assessed as the second drawing within the DDS.

Creekmore designed the Tree Rating Scale to provide a more in-depth examination of the detailed aspects of tree drawing, which appeared to be lacking in the DDS Rating Guide (Cohen, 1985; Creekmore, 1989). In doing so, Creekmore rated the tree drawings of the following populations: Control; Depression; Schizophrenia. In 1992, Kress modified the Tree Rating Scale to provide an even closer examination of the formal characteristics and content of the tree drawing.

In view of the historical significance and personal implications of tree drawings, the present pilot study attempted to provide a deeper understanding and validation of tree symbolism, the DDS, and the Tree Rating Scale. It served to augment the perception of the tree as a self-concept depicted within specified psychiatric diagnoses (Multiple Personality Disorder, Schizophrenia, and Major Depression populations) and a Control group. Ultimately, this study provided data used to highlight the possible emergence of an isomorphic pattern.

Through the collection and assessment of this information, the author expected to see patterns of isomorphic representations within each diagnosis. These patterns would be reflected within the graphic content and formal graphic qualities of each tree drawing. Specifically, the tree drawings within each category were expected to reflect the divergent graphic depictions of self-concept for each diagnostic group.

Method

Subjects

The sample population was comprised of persons diagnosed with Multiple Personality Disorder, Major Depression, and Schizophrenia, and a Control group. Specifically, the sample population consisted of 80 subjects, 20 in each diagnostic category. The Control group included six males and 14 females, and the average age for this group was 38.6. The Multiple Personality Disorder (MPD) group consisted of one male and 19 females, and the average age was 34.65. Within the Major Depression group, there were eight males and 12 females whose average age was 41.55. Lastly, the Schizophrenia group consisted of 11 males and nine females, whose average age was 29.05. Each of the sample populations was taken from the DDS Archive.

Procedure

The present research served as a continuum for the study of tree drawings. Creekmore (1989) and Kress (1992) examined in great detail the tree drawings of specific diagnostic populations. My decision to use the Tree Rating Scale was based upon the scale's focus on formal as well as content considerations within the drawings. This pilot study incorporated the Tree Rating Scale into the assessment and interpretation of the second drawing of the DDS. The DDS was chosen for its consistent standards and research design.

Eighty drawings were collected from within 80 DDS. Specifically, the drawing represents each subject's response to the following directive: "Draw a picture of a tree." Only the second drawing in the series was rated. Trees depicted in the first and/or third drawing were not considered for this particular study. Each of the 80 second drawings received from the DDS Archive was rated according to the Tree Rating Scale. In addition, data on the age and sex of each subject was collected. Lastly, descriptive statistics in the form of percentage data were generated from within each category and each diagnostic group. Graphs were created to depict findings.*

*Gratitude is expressed to Michelle Batza Bailey for her assistance in the design of the graphs.
Materials

The present pilot study called for the use of the Tree Rating Scale, modified by Kress, in association with the DDS (see Appendix A). Specifically, the Tree Rating Scale was used to assess and interpret the second drawing of the series which illustrates the directive, "Draw a picture of a tree." This scale examined the following formal characteristics and content within the tree drawing: space usage, page orientation, color usage, idiosyncratic color usage, use of line and/or shape, line quality/pressure, depiction of a landscape, inclusion of flowers, inclusion of animals, tilt, inclusion of writing, integrated tree versus disintegrated tree, ground depiction, leaves, root emphasis, inclusion of knothole, inclusion of swing, unusual placement, inclusion of people, depiction of blood, more than one tree depicted. To properly understand these characteristics, the reader should refer directly to the DDS Rating Guide and the Tree Rating Scale Definitions (see Appendix B).

Results

In an effort to comprehend the results of the research, it is necessary and more effective to view the results in terms of comparative categories between diagnostic and control groupings. As illustrated by the graphs presented, some distinguishing percentage differences emerged among the four populations. Conversely, in many categories the percentages among the populations were too similar to provide a comparison. Caution must be exercised because the percentages provided in this study are descriptive statistics. While these numbers can be compared to other research findings, they are not necessarily statistically significant. While the results of each category will be examined, greater emphasis will be placed on the specific categories which produced distinguishing differences among populations.

The first category examines the use of space (see Figure 1). Within the "space usage" category, the cluster of usage appears to be in the 33% to 66% range. While 55% of the Control, 45% of the Major Depression, 60% of the MPD, and 60% of the Schizophrenia subjects used 33% to 66%, a limited percentage of subjects within some diagnostic groupings used the 0% to 32% or full usage. Specifically, 0% of the Control and Major Depression subjects, 15% of the MPD subjects, and 5% of the Schizophrenia subjects used 0% to 32% of the paper. It can be noted that a low percentage of all of the subjects except Schizophrenia used the full page. At the same time, a similarly low percentage of subjects within each population used 67% to 99% of the paper.

Next, the placement of the paper was examined within the "orientation of paper" category (see Figure 2). Within this category, both the Control and Major Depression groups produced results that indicate little difference in preference for the use of a horizontal or vertical orientation of the paper. At the same time, a high percentage of the Schizophrenia sample (85%) chose a horizontal orientation, while 65% of the MPD sample chose a horizontal orientation.

The use of color was explored next (see Figure 3). In terms of the amount of color used within the drawings, a high percentage of the Major Depression (65%), MPD (65%), and Schizophrenia (75%) subjects used two to three colors. Results indicate that 50% of the Control used four or more colors, and 40% used two to three colors. A small percentage of the Control (10%), Major Depression (10%), MPD (20%), and Schizophrenia (15%) samples used only one color.

The use of line and shape was investigated next (see Figure 4). The "line and shape usage" category produced noteworthy results. A large percentage of the Control (80%) and Major Depression (60%) subjects used both line and shape
within the drawing. Conversely, 75% of both MPD and Schizophrenia subjects used line only. Interestingly, shape only was used exclusively by 5% of the Major Depression subjects.

The "ground depiction" category provides notable results (see Figure 5). A substantial percentage of the Major Depression sample (55%) used the base of the paper as an implied groundline. The majority of the MPD sample (70%) depicted the tree as floating. The Schizophrenia sample was varied in its results as 30% used a line to represent the ground, and 45% depicted the tree as floating. In addition, the Control sample was varied in its results. The Control group used a line, line/shape, and paper base 20% each, while 30% used a shape only and 10% depicted the tree as floating.

The use of leaves was examined in the "leaves" category (see Figure 6). The Control and Major Depression groups provided similar results in that 70% of the Control and 75% of the Major Depression subjects depicted no leaves on the tree. Similarly, 95% of the Schizophrenia and MPD samples depicted no leaves on the tree. It is worth noting that falling leaves were depicted exclusively by the Major Depression sample (25%). In addition, while leaf emphasis was depicted considerably by the Control sample (30%), only 5% of the MPD sample depicted leaf emphasis.

Next, the "root emphasis" category examined the depiction of the tree's roots (see Figure 7). A large majority of the Control (70%), MPD (90%), and Schizophrenia (100%) subjects did not graphically emphasize the root system of the tree drawing. While 65% of the Major Depression subjects and 70% of the Control did not emphasize the roots, 33% of the Major Depression and 50% of the Control populations did emphasize the roots.

Within the "presence of knothole" category, the Major Depression sample (40%) and Schizophrenia sample (30%) depicted a knothole on the tree (see Figure 8). In contrast, the percentage for a knothole depicted was considerably lower for the Control sample (10%) and MPD sample (15%).

Figure 4. Line and Shape Usage Within Tree Drawings

Figure 5. Ground Depiction Within Tree Drawings

Figure 6. Leaf Depiction Within Tree Drawings

Figure 7. Root Emphasis Within Tree Drawings

Figure 8. Presence of Knothole Within Tree Drawings
The "unusual placement" category assesses the placement of the tree image on the paper (see Figure 9). The Control sample and Major Depression sample both demonstrated no unusual placement 95% of the opportunities given. Similarly, 85% of the Schizophrenia sample demonstrated no unusual placement. In contrast, 30% of the MPD sample placed their tree to the left of the vertical axis, as well as the 5% of the Major Depression sample who unusually placed trees.

The "integrated versus disintegrated" category classifies each tree as either integrated (fruit, evergreen, palm, willow, or deciduous) or disintegrated (unrecognizable, chaotic branch, without branches, minimal trunk, falling apart, impoverished, broken branches, cut down, or dead). While 85% of the Control sample created an integrated tree, 65% of the Major Depression, 80% of the MPD, and 65% of the Schizophrenia samples created disintegrated trees (see Figure 10).

Specifically within the "disintegrated tree" category, 32% of the MPD subjects created trees classified as "falling apart" and 26% created trees with "chaotic branch systems" (see Figure 11). A majority of the disintegrated trees created by the Major Depression sample (40%) were classified as having "chaotic branch systems" (see Figure 12). A noteworthy percentage (75%) of the Control sample's disintegrated trees were rated as "falling apart" (see Figure 13). Lastly, the Schizophrenia sample created disintegrated trees in which 28% were "impoverished" and 22% had "chaotic branch systems" (see Figure 14).

Within the "integrated tree" category, the majority of the Control group created "fruit" (41%) or "willow" (35%) trees (see Figure 15). As 20% of the MPD sample created integrated trees, the majority of these trees were classified as "deciduous" (57%) (see Figure 16). While 35% of both Schizophrenia and Major Depression sample groups depicted integrated trees, 40% of the Major Depression sample depicted "evergreen" trees and 43% of the Schizophrenia sample depicted "fruit" trees (see Figures 17 and 18).
Finally, the following categories provided data whose results were similar for all of the sample populations. "idiosyncratic color usage," "line quality pressure," "flowers," "animals," "tilt," "writing," "swing," "people," "blood," and "more than one tree." Only one subject, a Schizophrenic subject, used idiosyncratic color. The results indicate that at least 80% of each population used a medium line quality pressure. The only deviation emerged within the MPD sample of which 20% employed heavy line quality pressure. Among all of the sample populations, at least 90% consistently responded by not including flowers, animals, tilt, writing, swing, people, blood, or more than one tree within the 80 drawings.

**Discussion**

The results of this pilot study can be interpreted in a variety of ways. Several distinguishing patterns emerged among the four sample populations. These patterns can be examined in terms of external manifestations of the internal states of each diagnostic population.

The Control group can be set apart from the other sample populations in several categories. Predominantly, the results indicate that the Control group characteristically used four or more colors, a mixture of line and shape, variety in ground depiction, and created the largest percentage of integrated trees. In addition, the Control group did not depict knotholes or emphasize roots. Several elements that appear prominently in the Control group's tree drawings are consistent with previous research results. Mills & Cohen (1993) and Creekmore (1989) reported the tendency for the Control population to include a groundline, use two or more colors, use a mixture of line and shape, and possess a tendency to create integrated trees. Conversely, Creekmore reported a predominant use of 67% to 99% for full space usage, which is
inconsistent with this study's findings. Despite these differences, it is helpful to look at these results as a reflection of individuals who present as integrated selves, energetic, untraumatized, and grounded.

The Multiple Personality Disorder sample characteristically used a larger number of colors, a paper-based ground line, root emphasis, and the inclusion of knotholes. These results are consistent with previous research findings (Kress 1991, 1992; Mills & Cohen 1993; Rankin, 1994). In addition, these results coincide with research that relates knotholes to trauma experienced by the subject (Rankin, 1994; Toorem, Gilbertson, & Light, 1990). It is necessary to note that the rating scale used in this study did not include a way to score mutation and scarification seen in previous DDS research. The findings of this study, however, imply a damaged tree was often drawn. In this manner, the results of this study and others provide artwork which might generate an image of a damaged, but energetic, individual resting on the outer edges of the paper.

The Major Depression sample characteristically used an average coverage of the paper, two to three colors, line only, unusual placement, and depicted a floating tree image and no disintegrated tree with a chaotic branch system. A preference for the use of line only, two to three colors, and a depiction of a disintegrated tree is consistent with previous research (Creekmore, 1989). In contrast, unusual placement was cited by Cohen, Hammer, and Singer (1989) as a main characteristic of the Major Depression population sample. To analyze this data, it is beneficial to examine the art in terms of conveying intense affect, sadness, isolation, despair, and weak lines. By doing so, a sense of the depressed self emerges.

Lastly, the Schizophrenia sample characteristically used an average amount of space on the page, two to three colors, line only, no unusual placement, and depicted knotholes and disintegrated trees which were impoverished and had chaotic branch systems. The use of one color is consistent with Creekmore's results (Creekmore, 1989). The results fail to support the inclusion of writing and use of idiosyncratic color reported by Cohen, Hammer, and Singer (1989). Nonetheless, the sense of self depicted by this sample population is indicative of a fragmented and impoverished self-concept.

Conclusion

The significance of this preliminary study lies in its implications for expanding the perception of the tree drawing as a manifestation of the inner self. The tree drawings created by the four diagnostic categories appear to offer an indication of the inner self of each individual. A tree that was untraumatized, integrated, colorful, and grounded was characteristic of the Control sample's tree drawings in this study. The tree drawings of the Multiple Personality Disorder sample generated an image of a grounded, usually well-rooted and colorful, but traumatized tree. The tree drawings of the Major Depression sample conveyed an image of a floating, unusually placed, and disintegrated tree drawn in few colors. Lastly, the Schizophrenia sample was characterized by the creation of an impoverished and disintegrated tree, drawn in few colors, and in line only. In this manner, the patterns of isomorphic representations found in this study provide insight into the relationship between pictorial structure and psychiatric diagnosis.

This pilot study has provoked many questions and concerns. Expansion and modification of this preliminary study should be considered by future researchers. The Tree Rating Scale might be modified further to more accurately score observations cited by previous research. Specifically, it would be helpful to score a category relating scarification and mutilation. In addition, it would be beneficial to match the ratio of male to female samples and age averages more closely. Lastly, as the author rated the pictures herself, this must be viewed as a limitation; therefore, an inter-rater reliability test of the Tree Rating Scale is necessary. Despite these limitations, through this pilot study the author hopes to inspire others to become involved in research within the field of art therapy.

APPENDIX B
Diagnostic Drawing Series
Tree Rating Scale
Definitions

Space Usage
Choices are: 0 for 0%–32%
33 for 33%–66%
67 for 67%–99%
F for Full
See page 6 of DDS Revised Rating Guide for definition.

Color
Choices are: C1 for one color used
C3 for 2–3 colors used
C4 for 4 or more colors used
See page 1 of DDS Revised Rating Guide for definition.
Rate colors used in the whole picture.

Idiosyncratic Color
Rate Tree only. Acceptable as normal (nonidiosyncratic) colors: black, brown, green (trunk), and autumnal colors (crown) are not considered idiosyncratic use of color. Bluish tones are not considered idiosyncratic in conifers, but idiosyncratic in deciduous trees.

Line/Shape
Choices are: L for Line only
S for Shape only
L/S for Line-Shape mix
See page 2 of DDS Revised Rating Guide.
Rate just the tree. Dots do not count as Line or Shape.

Line Quality/Pressure
Choices are: Lt for Light
M for Medium
H for Heavy
See page 5 of DDS Revised Rating Guide.

Landscape
Rate yes with inclusion of grass and sky, or grass plus one or more environmental object.

Grass
Must be more than one line on either side of tree (Line only is rated as Ground Line); must include repetitive movement or shape. Also rate for ground that is not green.

Subcategories:
Choices are: L for Line only
S for Shape only
L/S for combination of Line and Shape
Also rate direction of grass.
Choices are: V for Vertical
Z for Zigzag—grass is predominantly made up of a mix of vertical and horizontal elements.
H for Horizontal—grass primarily goes in this direction.

Flowers
This category includes flowers on ground or in tree.

Animals
Limited to animals, in, on, or under tree; also includes those on ground.
Does not include birds flying in the sky.
Rate no if there is a nest and no birds.

Tilt
Must occur at the trunk of tree and axis must slant 15 degrees or more.

Writing
Includes titles, nonsense words, labels, name, and date.

Integrated Trees
Rate only if recognizable—Must be integrated.
Choices are: Fruit
Evergreen—includes many types of pine.
Christmas trees.
Palm
Willow—branches must extend below midpoint of tree.
Deciduous—sheds leaves annually

Disintegrated Tree Choices
If tree is not any of these choices below, then it must be considered integrated and rated according to the Integrated Tree category.
Unrecognizable—(Un) The image, viewed in context of being the Tree picture, would not be recognized as a gestalt of a tree.

Chaotic Branch System—(Ch) Lack of organization among branches when articulated, or in Crowns drawn by scribbling. Do not confuse with “curlicue” crowns.

Without Branches—(sB) No branches are drawn; trunk ends without branching out. Includes advanced (not impoverished) lollipop shapes, trees with “curlicue” crowns. Do not rate for palm trees or conifers.

Minimal Trunk—(Min) The trunk extending below the branch system is less than ¼ the length of the tree.

Falling Apart—(Fall) Elements of the tree are primarily disconnected and disjointed. Rater should pay particular attention to the relationship of the trunk to the branches, as well as subsidiary branches to the main branches. Trunk has two sides, at least one of which is not solid or clearly delineated.

Impoverished—(Im) Line-only trees in monochrome or two colors; particularly when spiderlike, keyhole, or crude lollipop shapes.

Broken Branches—(Bb) Branches that are no longer fully connected to tree; includes branches on ground and cut off or damaged branches.

Ground Line—(GL) Must be Line Only and extend at least one inch on both sides of trunk. A continuous line that spans the base of the trunk must also extend at least one inch on either side of the trunk. Roots do not count as groundline. Grass may count as groundline (if it is line only). Does not include horizon lines in middle of the page. Rate as Ground Line if tree is resting on a continuous groundline with shape filled in underneath it.

Ground Shape—(GS) Shape that surrounds tree base; it must extend at least one inch on either side of trunk and be Shape Only.

Ground Line/Shape—(GL/S) Tree rests on combination of both line and shape which extends one inch on either side of trunk. If tree rests totally on line with shape underneath, rate as Ground Line (see definition above).

Floating—(Fl) Tree is floating in mid-air, at least three inches from paperbase.

Paperbase—(Pb) Bottom of tree trunk is drawn within one inch from bottom edge of paper. Rate no if the highest part of tree base is more than one inch from bottom of paper (even though roots may be within one inch of edge).

Leaves

Choices in this section are:

Leaf Emphasis—(E) Some individual leaves are prominent; they are drawn separately and can be identified as leaf shape and counted. Does NOT include lines for pine needles or fronds of palm trees.

Leaves-Falling—(F-a) Leaf/leaves must not be connected to tree; they are either in mid-air or on ground. If Falling is chosen, then Emphasis should be left blank.

Leaves-None—(N) No leaves on tree; no crown suggested. Includes winter trees and dead trees.

Root Emphasis

Specific roots are clearly delineated with double or single lines; must be more than two lines. Examples of acceptable choices:

Not acceptable:
Knothole
Circle enclosed in trunk. May be left empty or filled in; may contain a spiral, be viewed sideways, or suggested with a few lines. Examples:

Swing
Tire swings or swing connected to tree.

Unusual Placement
The image is drawn predominantly above the midline of the page (horizontal axis) OR most of the image is drawn to the right or left of the vertical axis; particularly when the remainder of the page is blank. Trees off center but with other elements in the picture are rated no.

People
Includes stick figures or any recognizable human figure image. Figure must be drawn from the head area at least as far as the waist area or below.

Blood
Blood on tree or in any other section of the picture.

More Than One Tree
Rate yes if other trees are present in picture; bushes do not count as trees. (Bushes are less than half the size of trees and do not have any predominant trunk.)
Brief Reports

The Art of West Indian Clients: Art Therapy as a Nonverbal Modality

Anna Hiscox, MFT, A.T.R., Albany, CA

Abstract

African Americans in psychotherapy may present complex issues related to ethnicity and culture in addition to their presenting symptoms. Current literature is limited in the area of group identity versus individual cultural differences among African descendants. Historical experiences bind Black people irrespective of geographical location. Being culturally sensitive to clients dictates that therapists understand the bond among Blacks of various social-ecological backgrounds. This paper discusses some of the fundamental distinctions between African Americans and Black West Indian clients.

Introduction

As I thought about writing this article, I reflected on a statement by Nancy Boyd-Franklin in her book, Black Families in Therapy: A Multi-systems Approach (1989). She boldly states: "There is no such thing as the black family" (p. 6). This provocative statement intrigued me and also set the tone for this paper. Boyd-Franklin gailantly articulates feelings I have toiled with throughout my childhood.

I am a Black American. However, my heritage and ethnicity could prove to be problematic to the art therapist who conceives African Americans as analogous, closed, and inclusive in behavior and culture. I am especially cognizant of the ethnic and cultural diversity that can exist within families because I grew up in a Black family with both African American and Caribbean roots. I was born in New York City and raised in Manhattan. My paternal family has southern Black roots and moved to New York from South Carolina. My maternal family has its roots in Antigua, Monserrat, and Nassau, Bahamas.

As art therapists, we are just beginning to broaden the scope of our knowledge and practice to encompass a global macrosystem of ethnic diversity. Dana (1993) found that "the 1990 census reported approximately 25 percent of the population of the United States were persons of non-Anglo-American origins, from our four major ethnic/racial groups" (p. 31). This information supports the belief that a contextual understanding of the Black community's intercultural and multicultural differences must be developed prior to working with Black clients.

Frequently, Black people are perceived and classified as a group without the understanding or awareness that there are distinct differences within the culture. Concomitantly, there are historical experiences that must be acknowledged which bind Black people regardless of geographical location. According to Boyd-Franklin (1989):

While it is necessary to emphasize the heterogeneity of Black families, of equal importance is the consideration of how Black Afro-American families differ from other ethnic groups. The four main areas in which the experience of Black people in this country has been unique from other ethnic groups are the African legacy, the history of slavery, racism and discrimination, and the victim system. (p. 7)

Becoming a culturally sensitive therapist demands understanding of the bond among Blacks of diverse backgrounds. Brent and Callwood (1993) assert that clinicians must be able to make an accurate assessment of a client, which is unbiased by ethnocentric responses based on their own socioeconomic status and cultural beliefs and practices. If safe and effective treatment planning and implementation is to take place (p. 293). For the Black Caribbean American client, this entails insights into both the common Black experience and the unique experiences of the Caribbean Black heritage.

Many therapists are not aware that Caribbean people are a migrant group. Understanding the inherent reasons for migration contributes to effective therapeutic interventions. Natural resources and advancement opportunities are limited in the islands. Family members frequently relocate to acquire economic stability and/or educational advancement.

According to Brent and Callwood (1993), most families have at least one member who has emigrated to another island or to a major population center of North America or Europe (p. 290). The therapist's understanding of who has the power in the family regardless of the physical proximity to the client increases rapport and trust. For example, my grandfather lived in New York, but he gave advice and reprimanded the inappropriate behavior of relatives residing in the islands.

West Indian families are subject to many traumatic dichotomies. The first dilemma is living in a racist society. The second difficulty is acculturation: the ability to adjust to both Euro-American standards and the mores inherent within the Black community. White and Parham (1990) discuss the di-
lemma of African American youth interaction. The ecosytem in which these children interact also explicitly illustrates the acculturation difficulties of West Indian teens in North America. White and Parham contend:

Young adults are confronted with a set of dualities defined by being part of, yet apart from, American society, in it but not of it included at one level and excluded at others. The inclusion-exclusion dilemma is further complicated by their exposure to two different value systems, world view, and historical legacies. (p. 47)

White and Parham unquestionably define the parameters of young Blacks living in America. Viewing ethnicity systematically, there appear to be no differences among African descendants. However, there are major intercultural differences within the Caribbean culture.

West Indian Culture

English is the primary language spoken in the islands. However, misinterpretation and missed nuances by the therapist could initially harm the therapeutic relationship. According to Brent and Callwood (1993), "The linguistic form, depending on the island of origin and the level of education of the speaker, may be any combination—standard British English to a very rapidly spoken rhythmic Creole dialect, which the uninstructed ear may mistake for a foreign language." (p. 293)

West Indians are formal people. Engaging the client(s) during the initial interview can be greatly enhanced by addressing parents and elders by their formal names. Social amenities are required protocols of behavior. Elders as well as all adults demand and expect respect. The accepted behavior of minors is that children should be "seen and not heard." The latency period of childhood is often governed by strict behavior control, with punitive responses by the parent(s) or caretaker. Therefore, therapists should be cognizant of erroneously judging parental control and punishment by imposing Euro-American standards.

Caribbean people are naturally rhythmic and colorful. Bold, bright colors are often reflected in artwork. Also, obtaining the artist's story will reduce the tendency to apply clinical diagnoses to projections that may be based on cultural themes. For example, festive celebrations such as Junkanoo, Christmas, and Three Kings Day can be utilized in art experiments to help mend family conflict by reflecting on happier times.

The Importance of Religion

Dana (1993) described the traditional spiritual beliefs and folkways of African Americans. Similar beliefs are also an integral part of West Indian culture due to the kinship of Black people stemming from African roots. According to Dana, "Spirituality need not be associated with church membership for African Americans but often includes the abiding belief that it is possible to reach out to a superior power for strength and solutions to problems" (1993, p. 42). Spirituality and the belief that God will solve problems may be expressed in several ways; by viewing the problem as punishment from God, by seeing the church as one's personal salvation, and by the occasional practice of witchcraft and voodoo (Knox 1985, cited in Brent & Callwood, 1994).

There are a variety of traditional religious groups and cults, such as Catholics, Lutherans, Moravians, and Rastafarians, on the islands. Although one may belong to a particular religious sect, belief in supernatural phenomena is culturally accepted across denominational groups. However, belief in the supernatural should not be attributed to all Caribbean people and often may become a false stereotype. Therapists must be open to and educated about spiritual beliefs encompassed by Caribbean culture. Misunderstanding alternative belief systems often ends in faulty therapeutic interventions. Teish (1985) contends that voodoo has been mislabeled, misunderstood, and exploited. She asserts, "Voodoo is a science of the oppressed, a repository of woman-knowledge" (p. 171).

Modern Western medical technology is often sought in conjunction with folklore medicine. One element of Caribbean spirituality and cultural belief is the Obeah—a shaman man or woman found primarily in Eastern Caribbean culture where folklore medicine is often practiced alongside modern medical technology. The Obeah practice is based on the belief that illness is the product of unnatural influences. McCartney, a clinical psychologist and native Bahamian, describes Obeah as the phenomenon of the supernatural that renders evil or good makes dreams come true, influences individuals either for their demise or to hold them in one's power. Obeahs can cause either physical or mental illness, or can cure any physical or mental problem (cited in Brent & Callwood, p. 295).

Art therapists working with clients whose frame of reference is strictly from a Euro-American medical model will require assistance in differentiating pathology from traditional
the Caribbean with Europeans and North Americans have led to an adaptive, self-protective paranoid stance that guards against exploitation" (p. 299). Generally, continental are treated with respect, but trust is often withheld until there has been a testing period (ibid.). With clients who are skeptical about the benefits of traditional verbal therapy, an awareness of nonverbal communication is paramount.

The therapeutic relationship involves many forms of communication. By observing the client’s metacommunication, the clinician may gain insight into the client’s affect and thought processes. Sue and Sue discuss the meaning of nonverbal communication and have documented areas of concern in the therapist/client relationship. According to Sue and Sue (1990), “Nonverbals oftentimes occur outside our level of awareness. As a result, it is important that counselors begin the process of recognizing nonverbal communications and their possible cultural meanings” (p. 53).

This article presents only a few considerations when working with West Indian clients. Due to the dynamics of the individual as well as the family, it is wise to remember that not all West Indians are characteristically analogous. However, Brent and Callwood (1993) note, “Integrating cultural and ethnic information into client assessment is necessary to determine what threatens the client’s psychosocial security, how the client interprets those threats, and what adaptive strategies the client may have developed to cope with those threats” (p. 301). Art therapists must break through cultural and verbal barriers by showing respect for traditions and customs they are not acquainted with and by utilizing effective techniques for interventions.

The Caribbean culture is rich and vibrant. With the growing change in the U.S. population as indicated by 1990 census, art therapists would be remiss in not examining countertransference issues, persona beliefs, and attitudes when working with people from different backgrounds, such as West Indian people. The importance of cross-cultural art therapy is to provide empathic, safe space where the client can project his/her feelings without worrying about the therapist’s stereotypical ideologies. As clinicians, we have a responsibility to paint new avenues of understanding. This can be achieved through the awareness and incorporation of social, cultural, and ethnic traditions in the therapy session.

One Thousand Penises: Working with Adolescent Groups

Elda Unger, MA, A.T.R., Malibu, CA

One of the benefits I have realized from working with adolescents is that I have become unshockable. Most of my work with these children has been in residential care facilities and in psychiatric hospitals, where they are forever testing you. You need to have the right combination of honesty, genuine interest, caring, firmness, flexibility, and enthusiasm to pass their test.

One of my favorite patients, J., entered my art therapy room at the psychiatric hospital with nine other male and female adolescents. He was about 15 years old, 6 feet, 3 inches, well-built, and energetic—and, a gang member who had been picked up by the police on drug and possession of dangerous weapons charges. For the most part the staff was apprehensive about him and wished him a short stay. Meanwhile, the adolescent group looked up to him as its leader.

J.'s parents have had some college education and come from middle class families. J. was selling and using drugs at an early age, and he was in gun-toting pursuit of a member of another gang when he was picked up by the police. His father, a recovering addict, managed to get J. into the hospital instead of jail.

When I guided the group into an exercise dealing with “empowering others,” J. approached me with a piece of paper and asked me to look at it and tell him what he had drawn. It was a rather good likeness of a penis (Figure 1). "It looks like a penis," I said. "You're right!" he replied. With that exchange, J. walked back to his seat and continued drawing. Once again he came to me with the results of his efforts and asked me what I thought it was.

Now there were five penises surrounding the pelvis of a female, complete with pubic hairs (Figure 2). "It looks like five penises," I said. One of the other boys commented that it looked like gang rape. J. said, "Absolutely not; it is only a girl who likes a lot of sex." The others in the group agreed that this sounded right.

The next day I asked each person "to draw a scene exhibiting great personal courage." Instead, J. continued to draw another penis.

I took a large roll of paper and all the colors of markers, pens, crayons, and oil pastels and firmly told J. he was to draw 1,000 penises, using every color in turn, and then repeating every color until he completed 1,000. The group watched this exchange with great interest as J. started the assignment. After drawing 53 penises, J. stopped drawing them ejaculating. After more time, J. stopped and said that he did not want to draw anymore. I insisted that he needed much more work in this area and that he absolutely had to complete the assignment of 1,000.

Somewhat to my relief, J. began again, but at the top of the page, he wrote "E's Penis Envy." It was difficult to suppress laughter and surprise at the sophistication of his wit.
saw that I was adamant and he continued drawing. By the end of the class period, he was not finished and we neatly put his artwork on the shelf.

When coming upon the adolescents returning from the cafeteria, I heard one of them say to J. "Here comes P.E."
(Penis Envy). I said, "Cool it." to the boy who spoke. It was apparent that J had had enough of this subject.

J was very pensive at the next session and quietly confessed to me that he was "intimidated" by having to draw, and that is why he behaved as he did. I was surprised by his word choice and asked him what he would rather do. He said he liked to read. Using this information as a way to reach him, I promised to bring him something to read for the next session. But, in the meantime, I asked him to look at a photograph of a painting I had done, to make up a title, and to tell me a story about the figures in the painting. He immediately began writing a story about "The Family," the title he gave the painting. The writing was eloquent and most revealing.

I filled him with praise, so did the members of his group with whom he shared his work. His self-esteem was elevated and he asked if he could do the same with all of my paintings.

When I arrived the next day, J's school teacher informed me that he was ill and did not come to school that day and would probably not come to my art therapy group. To my surprise, he was the first to enter my room. He said, "I was sick all day, but I didn't want to miss art therapy. Did you bring the books?"

I had two books for J. One was an art book with many quotable lines. The other was science fiction. Stranger in a Strange Land by Robert Heinlein. J. was delighted. He asked me how I knew that his friends called him "Stranger." I explained that I did not know this and we spoke about synchronicity.

J spent the session with our new-found projective therapy in which he wrote about four more paintings. (Examples are Figures 3-7.) Each title and story revealed more of his incredible use of language and his vulnerability. Reflecting J's positive response to our meetings, the nine others in the group became the best behaved and productive adolescent group I ever experienced.

Learning from one of the mental health workers that J was listening to some Mozart on his radio, I asked him about his interest. He explained that he had seen Amadeus and recognized the music from the movie. I asked him if he would like a tape of some Mozart music, and he said that he would enjoy that. The other members of his group were then playing their own "rock" tapes.

The next day, I presented him with a tape of Mozart's Jupiter Symphony and Beethoven's 5th Symphony. He thanked me affectionately. I went on to my next session and left him to enjoy the tape.

At the end of the day, when I was charting, one of the staff asked me to come and observe a miracle. She said that I wasn't going to believe my eyes. She quietly led me down the hall. As we approached the day room, I could hear the faint echo of Mozart. I looked through the window and saw J and 16 other adolescents sitting silently and listening to Mozart. These were adolescents whose Heavy Metal tapes had been confiscated, but who had all their Rock tapes going full force whenever they were allowed free time.
For the next several weeks, almost every one of the adolescents on the unit asked me if I would tape a symphony for them.

Here is an adolescent who was a violent gang member, but a natural leader. By disarming him at the beginning when he was challenging me, but allowing him to win in an area that provided him with much pride and praise for his creativity, I had discovered a talented, responsive individual who was still accessible.

The recent Los Angeles riots have reflected the anger of our disenfranchised youth. Art therapists have an opportunity to reach adolescents who have been alienated by society and give them a chance to succeed at something creative in which they experience pride.

I feel strongly that the most important attitude to bring these adolescents is to make them aware that they are all artists. In C. G. Jung’s words:

The creative urge lives and grows in the artist like a tree in the earth from which it gets its nourishment. We would do well, therefore, to think of the creative process as a living thing planted in the human psyche.

We, as art therapists, have this incredible opportunity to do this planting and to awaken the creative urge in the adolescents whose lives we touch.

Associate Editor’s note: Captions 3-7 are stories J wrote for Ms. Unger’s paintings (pictured). The stories are reproduced as they were written with the original spelling, punctuation, and grammar.
Medical Art Therapy: A Window Into History

"Spring Flowers"

"It really all started with my pot of flowering cyclamen, which followed me to hospital and stood on my bedside table. . . . We eyed each other like hostile strangers, staring each other out of countenance. I learnt that plant off by heart. . . . It is not a particularly pretty flower, it has no scent, revives no sentimental memories, but grows aloof in chill celibacy and takes an unconscionable time a-dying. . . . Illness, especially a fairly painless one demanding a long convalescence, is a great cleanser of muddled thought and anxious agglomeration. It is a definite anodyne of the mind. . . . Yes, but only for a time. The inexorable revolt against rest is inevitable and this is a most difficult phase."

"I Draw My Room"

"Objects graced my bedside, all of stubborn medical utility. I was increasingly aware that time, which had been 'marking time' for some weeks past, was now definitely halted and stood still—very still! And with this dread realization came the happy discovery of how to set the pendulum in motion again, by the simple act of drawing—drawing the nearest objects to hand. . . . For it is true to say that a bed patient can be described as existing rather than living. It is an impotent spectator that the patient is forced to view events . . . watching rather than participating in the daily round, like a frustrated witness at his own trial."

Commentary: These drawings and quotations are the work of an art therapist who, by his own account, was the first art therapist! They appeared in 1945 in Art Versus Illness by the English artist Adrian Hill. While being treated for pulmonary tuberculosis in a sanatorium, Mr. Hill personally discovered the special value of artistic release during his long-term hospitalization. Although many art therapists are aware that he was one of the forerunners in the field, few realize his significance, particularly to medical art therapy. As an art therapist involved in the treatment of TB patients and having researched the history of the profession while in England, I have had the privilege of reading Mr. Hill's original writings. His expressive comments of 50 years ago related to isolation and alienation are again relevant today with the resurgence of TB. His revelation that art making countered inactivity and reinstalled a sense of life seemed to set an eloquent foundation for the profession.

Grandmother’s Clause

Here, read my journals
Contemplate the titles
On my bookshelves
Enjoy the paintings
Decorating the walls
My eyes are clear
I won’t flinch
If you look into them

Come in
Make yourself at home
The roses
Are from my garden
And the hot bread is
Fresh out of the oven
Kneaded with time

And the silence
Of its rising
Wisdom is the yeast
Nothing can speed
The process
I share the taste
The particular spices
In this loaf
The nourishment
Is offered
Through my labors
Honor the bread
As you partake
And don’t insult me
With a request

For the recipe
To verify
That it is
What it is
The proof is in
Your taste buds
Trust them

(Grandmothers have their
laurels and many full
tummies as testimony)

Come in
Sit down
Let’s share some bread
Would you like honey
Or jam on yours?

Call for Papers
9th Art Therapy Association of Florida Conference
Multiple Dimensions of Art Therapy: Art, Client, Therapist
Spring 1996 Conference
May 3, 4, & 5

Attention Art Therapists, Creative Art Therapists, Mental Health Professionals, Allied Professionals and Educators: ATAF is seeking papers, presentations, panels, and workshops devoted to understanding and experiencing the process of art therapy in relationship to the art, the client, or the therapist. Submissions may focus on any topic or population related to this theme; of particular interest are: the value of different approaches and paradigms in art therapy, the use of art in the care of the therapist, and how specific psychopathology informs art-making in clinical practice.

Due October 10, 1995
Qualifying materials needed from each presenter includes:

1. Six copies of Presenter’s Resume
2. Six copies of Completed Call for Papers Application*
3. Six copies of Bibliography for Presentation

*After June 12, 1995, for further Information and proposal forms, please contact:
Mrs. Peggy Dunn-Snow, A.T.R.-BC, LPAT
165-07 Crenshaw Drive
Tallahassee, Florida 32310

CEU’s for art therapists, nurses, social workers, mental health counselors, and marriage and family therapists are being arranged

Reverberations: Mothers and Daughters

Reviewed by Erika Cleveland, MA, A.T.R., LMHC, Boston, MA

This lovely book reaches me at several levels, as it will surely reach art therapists and others interested in developing a personal relationship to their art and the world around them. The powerful imagery depicted in color and black and white reproductions enhances an accompanying text. This is a book that can be read and viewed repeatedly without losing the impact of its message about the joys and struggles in mother-daughter relationships. I imagine giving it as a gift to my mother or sisters.

As an artist I am inspired by the rich texture of Mildred Lachman-Chapin’s artwork which intertwines intimate themes of relationships with broader themes of war and violence. Repetition is used to develop a theme, or, as she describes it, a “pattern.” Lachman-Chapin begins with a newspaper clipping of “a screaming Vietnamese boat woman and her husband” (p. 4) and develops this image in a series of screaming faces, each becoming progressively more abstract. This begins an exploration of similar themes on a more universal level.

The body of the book consists of images representing feminine archetypes, accompanied by poems. In “Exposure Conversation,” two women confront each other against a black background:

| I bare my breast to you, another v woman. |
| We are both nurturers. You, like me, are no longer a child. |
| You know the pleasures of offering milk, solace. |
| You know the tyranny of the hungry mouth, the raging hate of the needy one. (p. 29) |

This is a haunting image: woman as mysterious, as breast and covered face, dark and deep, rich, evoking an archetypal nurturing power in all women.

Intimate images are contrasted with others that address global issues. “Atomic Prayers” reads:

| Prayers for the dead. For peace. |
| We have our ceremonies and rituals. |
| In memoriam for past horrors. |
| Will they cease? |
| Hoping for some answer, a sound, a sign, to break the pattern of killing, loss and death . . . |
| Together we cover our heads and pray. (p. 41) |

In the accompanying painting three women, hands on faces in prayer, are depicted against a black background. Covered faces are repeated, but now they are completely obliterated and breasts are not visible. There is an element of beauty and sense of strength in women who confront the pain and horror of wartime.

Building and echoing through images and poems provide a clear message of the ways women confront pain, anguish, and loss while maintaining hope and connectedness to each other. Touching on cycles of death, birth, and renewal, the book characterizes women’s experience throughout the world. For this reason, the book is useful as a meditation tool for women clients who are facing issues of female identity.

Reverberations: Mothers and Daughters is a worthy addition to the tradition of therapeutic texts that reflect on personal experience through artwork and text, such as Pictures of a Childhood: Sixty-six Watercolors and an Essay (1986), in which Alice Miller confronts her feelings about her childhood through a series of watercolor drawings.

Lachman-Chapin’s book builds on her earlier writing on the trancelike relationship that occurs between art and artist, art therapist and client. Though related to her earlier writings, this book is more personal. It stimulates thought for those who use art in a symbolic manner, but one does not have to be an art therapist to appreciate and enjoy Reverberations.

Art Therapy with Families in Crisis: Overcoming Resistance Through Nonverbal Expression

165 pp., 75 black & white illustrations. $25.00.
Reviewed by James J. Consoli, MA, A.T.R., Norfolk, VA

An image continues to be played out in my mind as I consider reviewing this book: A man, traversing the Sahara and close to death by dehydration, is handed a tall glass of water. He immediately and without checking the contents or examining its purity, eagerly swallows it. He is then asked, “Tell me about it; how was it?” He emphatically responds, “It was wonderful!”
I found it difficult to remain completely objective while reviewing and critiquing the contents of a resource that is difficult to find anywhere in the field. Our literature is very light in terms of theory, and heavy with case examples of art therapy success stories. So, please allow me the opportunity to applaud Dr. Linesch's effort at describing family art therapy theory; the book truly provides a resource toward understanding theory with supportive case material, rather than another compilation offering art therapy cases. Thank you. Now, I believe I can proceed more objectively to review this book.

The title of this long-awaited book may be a bit confusing if one were to assume that "...Families in Crisis" describes families that are in need of crisis intervention, (which is addressed in Chapter Two). In fact, the definition of crisis is likened to "a turning point" or "an emotionally significant event" (Mish, 1986, p. 307), which does basically describe the status of the families in this text. Also included in the title is the word resistance, defined as "preventing unconscious material from becoming conscious, or from receiving expression ..." (italics added) (Drever, 1979, p. 249). In fact, it is not that the family is resistant to verbal therapy; it is simply that verbal therapy alone does not work as well, nor does it allow for concepts, thoughts, or feelings to be expressed, as does the incorporation of imagery and art within the session. This is obvious when there is a language barrier, as described in the chapter on family art therapy with political refugees. The need for "nonverbal expression" can be less obvious to "verbal" therapists who may consider that a child who responds minimally to questions is being "resistant." When, in fact, he or she does not possess the verbal sophistication of adults. However, what is generally true and yet even more subtle is that "The art facilitated intrafamilial dialogue. Communication grew out of self-expression and family members were able to share experiences, feelings, and hopes in ways that were freed of rigid systematic limitations" (p. 157). To visually exaggerate this point, family "verbal" therapy can be analogous to asking a family to, for example, describe their concerns using only their eyes. The individuals can quickly become frustrated and will most likely not return, while the therapist sits back and percieves the family as being "resistant." The client is not resistant; the therapist is resistant (or uninformed) about allowing the client a more direct mechanism for expression than art and imagery allows.

Art Therapy with Families in Crisis was tailor-made for the visually oriented person. I appreciated Dr. Linesch's graphic depictions of varieties of family dysfunction, types of family structures, and art therapy theory regarding how the art process can facilitate a therapeutic intervention to promote positive change and reduce strain on the family system.

Dr. Linesch reports that the intent of this book is to "[w]e just one step further ... to focus on the nature of the relationship between the art experience and the curative process as it becomes part of the treatment intervention" (p. vii). She states that other art therapists (Kwiatkowski, 1978; Landgarten, 1987) have described the art process as augmenting and supporting family approaches. Although I agree that Dr. Linesch was successful in explaining family art therapy theory, as opposed to using art in family therapy, the previous art therapists have also written about family therapy as a primary form of treatment as opposed to something that is adjunctive.

Linesch begins the book by describing relevant theory. She provides the reader with some background on family systems thinking and how art can be useful when integrated into the treatment. She then offers case examples written by therapists who describe ways in which art therapy can be helpful with special needs families. Her final chapter, "The Second Look," sums up the answers to questions stated at the outset of the book, considered in relation to the case examples. The questions she presents along with theory and answers in the last chapter are:

1. What are the characteristics of the special needs families discussed in this book that invite the implementation of the art therapy process?
2. What are the characteristics of the art process that seem responsive to these families' special needs?
3. What is unique about the curative relationship between the needs of these families and the art interventions?

Each chapter describing a special population can stand alone as a separate article. What is most impressive is that each author begins with a theoretical model that is applicable to a given special population. For example, in a chapter by Susan Brook, titled "Family Art Therapy with Single-Parent Families," it is averred that one of the most important and most overlooked aspects of working with this family type is providing support for the single parent. Oftentimes we focus on trying to uncover what is wrong with a family and do not emphasize its strengths. By so doing, the therapist can do more harm than good. Susan Brook incorporates examples from the literature, including Riley (1968) and Landgarten (1987), which add to the field of family art therapy theory in this regard. She then provides case examples that begin with her rationale for the interventions based on her hypothesis about that particular family system. Other chapters are written in much the same way and include topics that are unavoidable in treatment, including alcoholism, sexual abuse, and crisis intervention, as well as less prevalent topics such as the aforementioned "Family Art Therapy with Political Refugees." However, what is important about this last inclusion is that the process cannot only be generalized to other populations (specifically the potency of the multifamily art therapy group), but also to the ever important issue of cultural sensitivity and the universality of art and imagery.

It is not clear who the audience is for this book. My assumption is that it can be used for training in family systems theory if presented as part of an art therapy curriculum. Unfortunately, this is not the case in most art therapy training programs. As an instructor I have used it with my students and most of them report that it is a helpful resource that should be placed within the first semester of family art therapy coursework. My fear is that if the non-art therapy training programs were to consider it as a text, they may fool themselves into believing that they, too, can provide the use of art in their family sessions without the appropriate training. However, it appears that the process, as described, may be complex enough to intimidate the would-be art therapy amateurs. I recall a clinical social worker being excited about the news of this book’s release and asking me to let her borrow it when I obtained a copy. Her affect was significantly different.
when she returned it. It appeared she had hoped for the proverbial cookbook of art techniques to use with a family, and, instead, disappointedly returned the text because of its sophistication to non-art therapists.

Dr. Linesch successfully takes chapters written by other authors and sews them together into a quilt. Her thread is easy to see, and the stitching is simple. The reader can see not only the common theme among all of the chapters and the special populations presented, but also the potency of using imagery within family treatment.

My only criticisms are with the format of Dr. Linesch's first and last chapters. These are overly structured and repetitive, resulting in distracting reading. These chapters have the quality of an outline or rough draft rather than the well-integrated fluidness that is more apparent in her other publications. Also, many times prefatory statements are made, like "Again, at the risk of over simplification . . ." (p. 6), or, "...and consider the simple models being developed in this chapter in order to theorize about its form" (p. 8). I found myself wanting her to take that extra step and describe the complexity of the process. I question, however, if this is an objective reaction, or, am I just thirsty for more (?).

Southern California Art Therapy Association: Art Therapy Today

VHS 1/2", 25 minutes per tape, color. Purchase: $39.95 for the first tape and $29.95 for each additional tape ordered at the same time from Southern California Art Therapy Association, P.O. Box 4455, Surland, CA 91041-4455. (California residents add 8% sales tax.)

Reviewed by Harriet Feinstein, MCAT, A.T.R., Centre Hall, PA.

Musing about the video series Art Therapy Today, the image of an amoeba surfaced in my mind's eye. An amoeba has the ability to create new appendages to meet the demands of its environment, nourishing and propelling itself at will. This vision of "shape shifting," adaptability, and self-creating seems intrinsic to the practice of art therapy. Likewise, the ability to electively impose boundaries and structure while retaining one's flexibility is a hallmark of the field.

The art therapists interviewed in this series are akin to the amoeba; their malleability supports their ability to rise to the challenges of the populations being addressed. Each therapist has placed her personal stamp on her treatment mode in accordance with her unique life experiences, skills, and professional repertoire. While a conventional format is used throughout the series, a less conventional tone results from the actual interviews. Watching other practitioners in our field demonstrate and discuss their techniques is an inspiring and expanding encounter; their freshness and vitality stimulate the viewer's choices.

Each interview is set in a quietly lighted studio with the participants seated around a table. The introduction and some preliminary questions are initiated by Evelyn Virshup, PhD, A.T.R., who assists in decreasing the awkwardness of the tapping process. As the drama evolves, the therapist takes the initiative by providing points of interest. For illustrative purposes, artwork is often intertwined with dialogue; the spark is lighted!

Issues of bereavement, including early and later stages of grief, were presented by Bella Schimmel, PhD and Thelma Kornreich, A.T.R., the only team to be interviewed. As colleagues at the Center for the Widowed, they have had a long-standing professional relationship of more than 15 years. Their fluidity and comfort in working together are exhibited throughout the program as they smoothly alternate speaking without discernable cues or rehearsal. Several theoretical stances are mentioned, and their belief in group process and image formation is well-documented though examples displayed by Kornreich. In addition to instituting therapeutic groups for two levels of loss, recent and over a year, Schimmel and Kornreich provide a hotline listing and liaison with the community.

Frequently, the presenting problems of this population include overwhelming sadness, depression, and hopelessness. The slides of artwork exemplify these statements and present some of the ways art therapy groups are used to achieve better functioning. This includes capitalizing on a sense of universality among group members, taking risks with one's feelings and thoughts, and supporting the expression of feelings. Directives are demonstrated as the group leaders ask, "What brings you to the group? What happened this week? What images keep repeating in your mind? What have you not been able to share yet? Is this your first sad loss? What was the holiday like? How are you coping?" Artwork shown here is powerfully expressive and depicts universal themes of loss.

In Your Art as Language, Violet Oaklander, PhD, A.T.R., a gestalt therapist, is interviewed to explore her work with children. As part of the introduction, Virshup talks briefly about the integration of play forms and uses of creativity. She states the art, music, dance, and drama help us understand ourselves. Virshup and Oaklander demonstrate the
string and ink technique which allegedly coordinates brain functions to create personal revelations. They also demonstrate a minimal processing of the result.

After a brief recommendation of Oaklander's book, Windows to Our Children, Virshup and Oaklander discuss uses of her method with puppets. A case study is vividly enacted and, abetted by Virshup, a spontaneous session is created to further display the possibilities of puppet work. This shift felt somewhat stilted and labored, increased by the fact that adults, rather than children, were involved. Throughout the session a slide of a right-leftBrain image behind the presenters was distracting and unnecessary.

Subsequently, Oaklander and Virshup touch on parental attitudes and expectations that often present when working with children. Oaklander addresses the "fix-it" expectation often placed on the therapist by parents. She states that she sees herself as helping the client "feel more of who [he/she is] . . . feel good . . . get along with his/her parents." She also attempts to expose "reflected" feelings to help the children understand the role feelings play in what happens to them. She notes that some children learn this so well that, in their families, they become therapists to their parents.

Oaklander feels that "a changing child changes the family." This is demonstrated in two case studies involving the use of graphic media and Oaklander's processing. She describes a humorous episode about a session for a television station which involved an 11-year-old boy who volunteered to participate. The end result is as clear a description of catharsis via the creative process that I have ever heard, although the term "catharsis" is not specifically used.

In the video with Shirley Riley, A.T.R., MFCC, Riley and Virshup discuss families in crisis and the use of art therapy with this population. Riley is one of the original art therapists trained by Heilen Landgarten, who, likewise, focuses on this population. Riley offers the proposition that by using art tasks everyone in the family may be included in the dialogue. Children use art as a natural language and seem to "talk more easily through drawing," particularly when they are at a concrete stage of development. Adults, although more inhibited, initially think more abstractly and are therefore able to process at this level while becoming aware of the children's communication. Adolescents have the opportunity to demonstrate their autonomy through art and may be seen and heard more succinctly in this way.

Riley believes using art tasks allows everybody in the family the ability to explain how he or she sees "the problem." Art permits two levels for messages: the communication and the "meta message." Art also helps move "the toxicity away from feelings." Once a family has successfully worked together on an art effort, the next step is to generalize this ability to problem-solving of family matters. "Art enters their lives," comments Virshup.

Riley and Virshup discuss the value of well-trained art therapists versus other modalities in the use of creative graphic arts. "The reality is that children draw," says Riley. Other professionals recognize this and use artwork in limited ways (i.e., "appreciation of the image"). Both believe that art therapy has an advantage over verbal therapies because "the art therapist has more tools."

Using slides, Riley shows a variety of responses to family directives. Several of the families are involved in abuse issues and the artwork displays elements of beginning stages of the healing process. Riley reminds the viewer of the cardinal rule in many abusive families: "Don't talk; don't tell." Art allows the child to communicate without violating this rule. Riley demonstrates this in an especially vivid pair of drawings on the subject of guilt and how it is passed from parent to child and subsequently internalized. This video demonstrates her sensitivity to the issues at hand and the viewer emerges with a real appreciation of the style and personality of this therapist!

Suncrest Hospital's Donna Heider, A.T.R., MFCC, works with adult women who are incest and ritual abuse survivors. She does not conduct mixed-sex groups because many male survivors "become perpetrators and are actively acting out and not trusted." She describes some of the characteristics of the abuse survivor group, reporting that they are "scanners." Scanners constantly tune into others to discern their needs, are superficial when referring to themselves, tend to disclose information easily with emotionally removed statements, and are overly compliant. A surprising commonality is that most group members are mature and have passed through their early adulthood almost automatically. They have raised families and held jobs. However, they now want to focus on problems which seem to be intruding into their lives.

Heider discusses the borderline personality makeup of most of her clients. She notes that some are also diagnosed with dissociative identity disorder. These clients test the therapist, waiting for her to fail them. Heider and Virshup also discuss how vital it is to recognize one's own countertransferential feelings, particularly the anger evoked when patients recall horrific events. "Patients need to feel their own anger" in order to trust their affective responses.

Heider is emphatic in her belief that art quickens the pace of the therapeutic relationship because the image is brought forward, fostering an immediate concrete response. Using uncomplicated directives, she focuses on what is happening. "What does it feel like to feel? What was the last thing in group to shake you up? What does disappointment feel like?"

Although examples of dissociative identity disordered patients' artwork are not offered, a discussion of the process is presented. Heider's understanding is that complex dissociation is a frightening experience and a patient with verified alter personalities will usually not advertise this phenomenon. She suggests that the therapist must be wary of someone who too willingly offers this label.

The graphic material shown in this interview is the most disturbing in the series, calling into question one's own reality testing. Heider discusses ritual abuse (i.e., cults), yet it is difficult for the viewer to tolerate, as a result, reality is questioned. A sense of hope is almost nonexistent; the wounds are so profoundly deep.

Once again, we perceive the manner and style of this art therapist and have a sense of what it might be like to work with her. A minor distraction during this video was Ms. Heider's earrings. One may not take jewelry into account when treating clients, however, this video proved it to be a worthwhile consideration.
The last videotape in this review focuses on an unusual speciality, adoptees. Rita Coufal, A.T.R., MFCC, is a former actress and an adoptee. She believes that her acting background was an asset to her training in art therapy. These skills gave her an ease of presence in front of groups, role playing experience, and the quick ability to pick up verbal and movement cues.

What makes this population unusual is that they do not come into treatment as known adoptees. It is through their imagery that the subject emerges. The most frequent presenting problems are depression, suicidality, eating disorders, and powerlessness. Phrases like “sleeping self” and “in a trance” are often used to self-describe. The issue of adoption does not arise or may be mentioned casually, perhaps a denial that adoption is any problem at all. This attitude possibly evokes from those who do not want to appear “ungrateful” or betray the parents who love them.

Among those adoptees who are now wrestling with this, a division may occur which is seen as a split: “good adoptee—bad adoptee.” Many tensions arise from this implied state, as in “being sent back” if bad, or the threat of loss of love. There is a great need to find one’s real identity, especially when there is a sense that one is “less than” or “was unwanted or given up.” The artwork demonstrates the range of these issues affecting both sexes struggling with identity issues.

Coufal says that adoption is an identity which often presents through images as part-versus-whole figures, light and dark divisions, walls, and trust issues.

Coufal has formulated specific tasks to help illuminate the issues surrounding adoption. She asks for pictures about resentments, the empty chair, or a significant person in order to explore the client’s realities. She understands the curiosity of adoptees to search for birth parents, not out of disloyalty to adoptive parents but as a way of dispelling myths surrounding their real identity. This lifts the “veil of secrecy” which has had official sanction for over 90 years. As a result of this need, Coufal is part of a network of search organizations and support groups. She recommends Betty Jane Lifton’s book Lost and Found, an anthology of adoptees’ stories.

Reflecting on the video series, I believe there is much to be gleaned from these therapists and their material. Although aesthetically unimpressive, the videos present a survey of art therapists’ styles and ways in which therapists use themselves as tools to mediate between the psyche and external world. Their creativity sparks the client, allows for exploration, and gives form and content to expression when words fail.

Using interns, these videos were televised for the public access station; they are not edited. Despite their lack of polish, they are most useful for educating art therapy students and allied professionals. Practicing art therapists will also find them informative since they provoke brainstorming about dealing with various populations, although the experienced art therapist will be screaming for “more artwork!”

Because the tapes are not related to one another, I found it difficult to review the series as a whole. However, each individual tape is worthwhile and moves quickly. I would certainly recommend renting these tapes, were they available for rental purposes. Although the entire set is expensive to purchase, it would be an asset in a medical or teaching library where many could benefit from viewing them.

Video Review

Suicide: A Teenage Dilemma

VHS, 30 minutes, color. Rental: $80.00. Purchase: $365.00 from Distribution Department, Health Sciences Consortium, 201 Silver Cedar Court, Chapel Hill, NC 27514. (919) 942-8731.

Reviewed by Nancy Gerber, MS, A.T.R., Philadelphia, PA

Teenage suicide is a subject that universally evokes sadness and helplessness. Because teenagers often communicate their despair and hopelessness behaviorally rather than verbally, the suicidal message often is not heard. Increasing rebelliousness, aggressiveness, disrespect, decreasing school performance, promiscuity, and substance abuse can be some of the more drastic signals of depression and suicidal ideation in teens. These behaviors can cause parents, teachers, and other adults to react with anger, punitiveness, or alienation, rather than with understanding. The most persistent and profound statement of this video is a reminder to all adults that drastic changes in the behavior of a teenager should be taken seriously and investigated for the underlying depression and despair that lead to suicide.

This video, which is technically well done, dramatically presents the problems of parents, the expertise of therapists, the poignancy of the teens, and the pain of the survivors in relation to teenage suicide. Its touching, albeit somewhat melodramatic, presentation is appropriate for parents, teachers, and other nonclinically trained adults. Behavioral clues which may suggest suicidal ideation and intent are highlighted to alert the adult audience. Also, conceivably the video can be useful to stimulate discussion among teens, or between teens and their parents, opening doors of communication and understanding.

The video opens with a dramatic enactment. A teenage girl is desperately attempting to talk to her father about her problems. The father is too preoccupied with his televised baseball game to listen to his daughter and simply asks her to get him another beer. The daughter leaves the living room and makes a phone call to an unidentified party with no apparent success. She goes to the bathroom and takes pills and a razor from the medicine cabinet. Finally, in the first illusion to art therapy, she takes lipstick and draws a spiral on the bathroom mirror. End of scene.

This rather cliched and dramatic opening is the weakest part of the video. Although the role-play successfully highlights an apparent detachment that often occurs between parents and their adolescent offspring, the sketch contains too many unclear innuendoes. An analysis of the opening drama would increase the instructional value of this segment. A discussion about the role-play might have reviewed the behaviors of the teenage girl and her father and explained how this
behavior and the graphic expression relate to her feelings and potential actions. An explanation of possible parental interventions could contribute to the usefulness of the dramatic portrayal. Instead, the viewer is left to draw his/her own conclusions until the scene is reenacted at the end of the video with a warm, fuzzy resolution.

The remainder of the video contains commentary by knowledgeable therapists, including the producer of the film, art therapist Evelyn Virshup. These segments are interspersed with staged group discussions by teens and interviews with hypothetical parents and survivors of suicide.

During the commentary portions of the video, detailed discussions focus on socioeconomic and cultural factors that contribute to the increase in teenage suicide, the behavioral equivalents of depression in teens, and clues to watch for in adolescents contemplating suicide. The excerpts are succinct, understandable, and educational. They successfully sensitize the audience to these aspects of teenage suicide.

The discussion among teenagers who have made suicide attempts or who have been connected closely to the suicide of a friend or relative is very poignant, but comes dangerously close to melodrama. In these sketches, teens discuss their suicide attempts, share poetry and artwork, and reveal the external or situational precipitators which led to their problems. Teens’ descriptions of their internal feelings and behaviors in reaction to these feelings are particularly valuable because they remind adults to look beyond the presenting behavior to indicators of suicidal ideation.

Individual interviews with parents and friends of teens who have successfully committed suicide are a powerful vehicle. These maudlin dramatizations highlight the guilt, anger, and helplessness experienced by survivors of suicide victims. The point is made that teenagers often act impulsively and find “permanent solutions to temporary problems,” implying that they have no conception of the reality of the act or the impact their actions might have on others. These monologues by family members and friends underscore the forgotten repercussions of suicide and may be particularly effective in communicating this aspect to a teenage audience.

All of these aspects of the video are quite effective in content and emotional impact. The video is less successful in its treatment of art therapy. Although there is a cursory review of art productions as a valuable form of communication by suicidal teens, the role of art therapy as treatment is never mentioned. A major deficit of this video is the omission of suggested interventions that could be used by parents or teachers who observe graphic clues of suicide. Art therapy content is limited to a brief mention in the excerpts by professionals who remind us that teens often communicate their intentions and despair in their writings and drawings.

In a three to four minute excerpt, Dr. Virshup comments on artwork done by teens who were either contemplating suicide or who had successfully committed suicide. Dr. Virshup discusses some symbols that often appear in the artwork connected to suicidal ideation or intent. Cemeteries, coffins, guns, and blood, she says, should alert parents and teachers to the possibility of suicidality. The spiral, used in the opening dramatic sketch, is never mentioned or explained.

Overall, too much is left to the viewer’s imagination and interpretation of the art productions. This vague and dramatic presentation of artwork can, and often does, lead to misinterpretations and misuse of art therapy. More explicit descriptions of art expressions and their connection to human behavior are necessary to teach the audience to be alert for suicidal imagery and to understand and use these messages with teenage charges. Suggestions, such as talking to the teen about his/her artwork or consulting a school counselor or therapist when suicidal imagery surfaces, are practical interventions. Why not use a role-play of a parent who discovers the teenager drawing? How should the parent engage the teen in discussion about the drawings? How should a parent react to symbols which seem particularly alarming or morbid? When should the parent seek professional help?

Every public and professional opportunity must be seized to demystify art therapy. We increase the credibility and impact of our profession when we demonstrate how the drawn image relates to individual concerns and, ultimately, behavior. The lack of such explanations in this video, both in the dramatic and art therapy portions, is disturbing.

This reviewer also felt cheated out of more discussion about both the artwork itself and the process of art therapy with suicidal teenagers. For example, the clinicians repeatedly state that adolescents express their despair in actions, often self-destructive, rather than words or typical symptoms of depression. Art therapy is an ideal intervention that allows the skilled art therapist to evaluate art productions and determine underlying conflicts, defenses, and potential risk of suicide or other acting out behavior. During the evaluation process an opportunity for communication, rather than acting out, is provided. The strength of the art therapy experience with adolescents lies in the creation of empathy between detached and rejecting teens and those who can help them. A depiction of this process should have been provided.

Overall the video clearly accomplishes the following: it emphasizes that extreme behavior in teenagers is often a warning signal to suicidality; it describes the causes and repercussions of suicide; and it implores those who are involved with teenagers to “listen” closely. Conversely, if this video were produced as a public service for parents and teachers who are unfamiliar with therapy or human behavior, it fails as a result of its love affair with melodrama and its neglect of practical interventions and explanations. Commentary and dramatic sketches were often unintegrated, resulting in a patchwork effect. Segments often left interpretation to the viewer; this was disturbing, especially considering the subject matter.

Parents and teachers might benefit from further analysis of intervention techniques and dramatic presentations by experts. Parents or teachers of teenagers often feel completely powerless when attempting to understand or make meaningful connections to the troubled adolescent. It is for this reason that additional practical interventions, rather than innumerable, would enhance the public service value of this video. By offering some steps to take and some tools to use, the video would provide a greater service to those involved with troubled teens.
ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to each copy of your manuscript:

Name: ____________________________________________

Degrees/Credentials: ____________________________________________

Address: ______________________________________________________

Phone numbers: Home __________________________ Work __________________________

Type of Submission (check one):

☐ Article ☐ Viewpoints ☐ Brief Report

☐ Film/Video Review ☐ Book Review

Title of Submission: ____________________________________________

Checklist:

☐ Five (5) copies, typewritten on 8 1/2" x 11" paper.

☐ Black and white photos of original artwork plus four (4) photocopies of each.

☐ Abstract of 75-125 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature __________________________ Date _________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060
Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

Manuscript Categories

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
5. **Film/Video Reviews.** Reviews of media (films or videocassettes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
6. **Comments.** Brief comments on articles published in Art Therapy, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

Other Requirements

1. Send five (5) clear copies of each manuscript to Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Munceleln, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original articles that are not under consideration by another periodical or publisher are acceptable.
3. Manuscripts must be typewritten on 8 1/2 x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 75-125 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors' names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figures numbers and captions should be noted on the back of photographs. Captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author's responsibility to secure such permissions. A copy of the copyright holder's written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any manuscript accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

- Tuberculosis: Art Therapy with Patients in Isolation
- Art Therapy on a Hospital Burn Unit
- The Children’s Diagnostic Drawing Series
- Essential Legal Issues for Art Therapists in Private Practice
- Diagnosis or Dilemma: Drawings of Sexually Abused Children

Art Therapy is available to AATA Members as part of their membership. Non-Members may subscribe at the following annual rates:

- Individuals: $50.00 (U.S.) - $75.00 (Foreign)
- Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:

- Members: $12.50 - Non-Members: $23.00

Make checks or money orders payable to AATA and return with this subscription order form to:

American Art Therapy Association, Inc.
1202 Allanson Road
Mundelein, Illinois 60060

Please enter my subscription. Enclosed is a check in the appropriate amount:

Name: ____________________________
Address: __________________________
City: ____________________________ State: _____ Zip: _______
ADDITIONS

Presenters: Lynn Jones, Holly Feen and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY

Presenters: Mari Fleming, Shirley Riley and James Consoli
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families a????enriched vocabulary to assist them in solving family problems. The art therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN THE SCHOOLS

Presenters: Janet Bush, Sarah Hite and Rebecca Taulbee
The objectives of this symposium will provide the participants with understanding the administrative procedures for implementing an art program in a large, urban school system, become familiar with the uses of art therapy for students in a public school system, become aware of techniques and strategies used in the training and preparation of school personnel; utilize the information they have gained to initiate discussion on approaches practices of art therapy in public schools; and to be prepared to transfer techniques and strategies for implementing art therapy services to other public school systems.

ART THERAPY WITH THE OLDER ADULT

Presenters: Larry Barnfield, Bernadette Callanan and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

GOING FOR THE GOLD: GRANTS AND RESEARCH IN ART THERAPY

Presenters: Frances Anderson, Viia Lasberg and Doris Arrington
Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90's. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal "in process".

ART THERAPY WITH CHILDREN AT RISK

Presenters: Cathy Malchiodi, Julie Epperson and Deborah Good
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. "Children at risk" are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitations which put them at greater risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE

Presenters: Cathy Malchiodi and Anita Mester (third presenter to be named at a later date)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterburg, Simonton, Bach and others will be covered to assist the participants in integrating the uses of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life-threatening illness will be addressed.
### THE ORGANIZATION

The American Art Therapy Association, Inc. (AATA), is a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board elected by the membership. AATA has established standards for art therapy education and practice: AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films, and awards.

### PURPOSE

- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education, and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

### CHAPTERS

Affiliated chapters of the AATA have been established throughout the US. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

### MEMBER BENEFITS

All members receive:

- **Publications**
  - The Quarterly AATA Newsletter
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and the membership directory.
- AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailing of professional interest.

**Services**

- Insurance, including professional liability, major medical, life and disability through Magirus & Associates.
- Access to national experts in art therapy.

**AATA Conferences**

- Discounts on registration fees to AATA national and regional conferences.

**Nationwide Advocacy**

- Governmental affairs activities including Congressional review and monitoring
- State legislative and regulatory activities
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of art therapy.

**Professional Standards**

- Development of model job description and recommendations for licensing standards.
- Development and implementation of national Education Standards for approval of graduate level Art Therapy programs.
- Development and implementation of nationally recognized Standards of Practice and Code of Ethics of Professional Art Therapists.

### GENERAL INFORMATION

The American Art Therapy Association, Inc. (AATA) and the Art Therapy Credentials Board, Inc. (ATCB) are administratively independent. Membership in AATA and registration (A.T.R.) with the ATCB requires separate applications and approval. Membership applications are available from ATCB, 708-566-8910.

For NEW Associate, Student, and Contributing members only: please follow the chart below when submitting membership applications:

The Membership year is the calendar year: January 1st, through December 31st.

**Applications received between:**
- **Jan. 1st - May 31st:** Full dues payment; membership expires Dec. 31st of same year.
- **June 1st - Sept. 30th:** Half year dues plus $5.00 payment; membership expires Dec. 31st of same year.
- **Oct. 1st - Dec. 31st:** Full dues payment; membership for the remainder of the current year and the next full year.

### CATEGORIES AND FEES

**Professional** - By application review process only; approved members may vote, hold office and serve on committees.

- **Certiﬁed Professional Member** - Individuals who have been *dually approved* for Professional Membership by AATA and Registration (A.T.R.) by the ATCB; AATA dues are $85/year. A.T.R. Maintenance fee is billed separately by the ATCB.
- **Professional Member** - Individuals who have completed educational training in art therapy; dues are $55/year.

**Associate** - Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. Such members may not vote, hold office, or serve on committees. Dues are $85/year.

**Student** - Individuals who are currently taking full time coursework in art therapy or a related field. Requires a current statement from the institution of learning indicating full time status and coursework content (6 graduate or 12 undergraduate credits.) Student members may not vote or hold office, but may serve on the Student Sub-Committee of Membership. Dues are $35/year.

**Contributing** - Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120/year.

**Retired** - Individuals who are at least 65 years of age and who are no longer practicing. Retired members receive publications and reduced fees, but may not vote or hold office. Dues are $35/year. Application provided upon request.

**NON-U.S.** - AATA members MUST include an additional $17.50 above required dues when submitting payment to cover the cost of foreign postage.

WEAVING NEW VISIONS
Art Therapy in Collaboration with Allied Professions

November 9-12, 1995  •  San Diego, California

KEYNOTE SPEAKER
Kay Redfield Jamison, Ph.D.
Author of
Touched with Fire: Manic Depressive Illness and the Artistic Temperament

Dr. Jamison is a Professor of Psychiatry at the Johns Hopkins University School of Medicine and the co-author of the definitive text Manic-Depressive Illness. As a clinical psychologist and prominent researcher on mood disorders, she has studied the relation between manic-depressive illness and artistic endeavor, and applied this knowledge to the lives of great artists.

Commentary on Touched with Fire

“This enthralling study... enlarges our understanding of the creative process in new and unexpected ways. Professor Jamison combines psychiatric sense with artistic sensibility...”

Dr. Anthony Storr, Author of Solitude: A Return to the Self and Music and the Mind.

Studio Approaches to Art Therapy

Cathy A. Malchiodi, MA, A.T.R., LPAT, LPCC, Editor

In the recent issue of the AATA Newsletter, the president’s report notes the flurry of activities involving inclusion of art therapists in existing licensures, recognition as independently licensed professionals, and/or acceptance of art therapy certification by state licensure boards (Stoll, 1995). It is no surprise that an urgent need exists within the profession to address issues of managed care, licensure, and provider reimbursement, given the fast-moving, ongoing market reforms in the healthcare arena. The advent of managed care organizations (MCOs) has forced art therapists who are employed in clinical positions or in private and group practices to consider issues such as certification, licensure, and provider status. It has also apparently encouraged the profession to intensify efforts to complete outcome and efficacy studies of art therapy that will convince MCOs of the value of art therapy to clients (also see Stoll, 1995).

While the profession struggles on both the state and national level with these very real battles for livelihood and recognition, there are still philosophical questions within the field of art therapy that remain largely unanswered and often unexplored amidst the bustle over which letters are best to have in back of one’s name. This special issue of the journal addresses a theme loosely defined as studio approaches to art therapy and puts forth some aspects about our work that may have been forgotten or at the very least, neglected in our urgency to certify, regulate, and defend our professional turf. Although the articles and viewpoints on these pages may have little to offer to solve the perceived struggles for recognition, provider status, and job security, they do offer some important thoughts that relate to the issue of efficacy of art therapy interventions and how, as art therapists, we can best be of service to our clients.

The concept of art therapy within a studio space is not in and of itself novel, although it has not received much formal attention in our literature. One historic, yet relatively unknown milestone in the development of a studio approach to art therapy is the work of Mary McGraw, A.T.R., at the MetroHealth Medical Center in Cleveland, Ohio (see article in this issue). For over 25 years McGraw has developed and expanded the concept of the art therapy studio through her work with children, adults, groups, and families. A statement in The Art Studio—Center for Therapy through the Arts: 25th Anniversary catalogue (1992) describes the essence of the program:

...patients’ introductions to the Art Studio came by word of mouth, not by referral; they would come in out of curiosity. When they arrived, in cart or chair, they would find inviting things—a bit of current music playing, paintings on the wall, coffee or tea. It might take two weeks of looking on before a patient got up the courage to join those already engaged in creating art. Right away though, surprising things began to happen. People who had never drawn or painted before found themselves unable to stay away, and spending their free time thinking of what they would do next.... (p. 8)

Since its inception, the Art Studio and its satellite programs throughout the Cleveland area have provided creative and therapeutic environments for artmaking for over 16,000 individuals. In addition to McGraw, other art therapists have worked or are currently working in this manner, including Robert Ault at the Ault Art Academy, Topeka, Kansas; Pat Allen, Deborah Gadiel and Dayna Block at The Open Studio, Chicago, Illinois, referred to in this issue; and Irene Ward Brydon at the Creative Growth Center, Oakland, California.

In actuality, what exactly the studio approach to art therapy is remains largely undefined, although there are some identifiable characteristics. One characteristic centers around the idea of space—the environment where the art therapist, the space itself, and people who visit the space come together in what McNiff (see article in this issue) refers to as a “creative ecology of forces.” This synergistic effect of therapist, people, and space is rarely discussed, although it is a vital aspect of why artmaking might be helpful to the clients we seek to serve. It has often been observed that art therapy involves both the two important components of product and process; equally crucial to what comprises therapy is how art therapists bring people together within a space.

Time is another important factor in the studio approach; by its very nature, the studio as an environment encourages a more in-depth experience with artmaking. In contrast, clinical approaches often encourage quickly drawn, rudimentary sketches or hastily pasted collages within a 50-minute hour. They also may involve assigning an art task with a specific theme to clients such as draw your anger, draw a person in the rain, etc. After these images are hurriedly completed, a discussion ensues with the person verbally sharing his/her work and the therapist providing feedback. These types of art therapy sessions are particularly common in psychiatric settings where art therapy may be
part of an overall treatment program and are prevalent in brief therapy milieus where contact time is limited.

In comparison, studio-based approaches usually involve little or no directives, more time, and therefore, a more in-depth experience with the art process. For example, an individual might, as Timm-Bottos describes in her viewpoint piece on the ArtStreet program, attend the studio as much or as little as s/he wants, working on one ongoing piece or a series of several different works. There are no formal group sessions, although special instructional workshops may be offered from time to time. Working artists/art therapists are generally present and the dynamics of the space are dependent on the ever-changing flux of visitors and participants.

Although both clinical and studio approaches to art therapy may be of value in certain circumstances and within certain frameworks, a comparison of the two approaches does generate many questions about the basic definitions of what is "therapeutic" and what is "artmaking." For example, under what circumstances is it truly helpful or therapeutic for clients to be specifically asked to draw their anger, draw a person in the rain, etc.? When is it more effective for clients to work for more extended periods of time and in unstructured environments such as studio settings? Is it OK for an art therapist to work on his/her own art during a session? Other more general questions come to mind, such as how do we define artmaking? Art? Artists? Do we see our clients as artists or only as clients? Do art therapists see themselves as artists? Is all work that comes from art therapy art? When and if is it important that it be art? Many of these questions have been asked before, but are certainly worth revisiting with respect to the articles and ideas presented on these pages.

As with any methodology, there are some difficulties with the studio approach that must be mentioned. Just as becoming a health care provider and receiving third party payments is difficult for clinically oriented art therapists, working as an art therapist in a studio setting involves similar but perhaps even more intense financial struggles. Since studio programs may be viewed as more art-oriented than clinically based, one of the more difficult aspects of the studio approach is obtaining funding in this time of cuts in grants for art programs and artists in general. The National Endowment for the Arts (NEA) has been threatened with extinction, with proposals to reduce the funding to the arts agency altogether or eliminate at least 40-50% of its available grants (Steis, 1995). Although most artists do not receive grants directly from the NEA, its threatened elimination does impact state art councils who receive funds from the National Endowment and influences the general belief that the arts are not worthy of public funds.

Art therapists interested in funding the types of studio-based programs discussed in this issue may have to seek funding other than public money, focusing on local or corporate foundations, community donations, and receipts from workshop fees and sale of art or related items (see Noteworthy piece on art calendar at the National Jewish Hospital). Strategies for arts-based funding are available (Malchiodi, 1987; Gray, 1995), but art therapists exploring this type of funding are cautioned that their artist identity must be strong in terms of current portfolio and exhibition records (Gray, 1995). In order to be considered, they must demonstrate that they are truly working visual artists with a primary dedication to art and studio work. More often than not, due to lack of time or inclination to do studio work, art therapists may fail to meet these criteria.

Another difficulty those with an interest in the studio approach to art therapy may face is the lack of understanding and acknowledgement within the field of art therapy. The call for papers for this special issue generated surprisingly few responses; perhaps studio-oriented art therapists want to make art rather than write. But I will also venture that studio approaches to art therapy are seen as a less prestigious career path as opposed to clinical positions. For years art therapists have differentiated themselves from the art-as-therapy approach by calling themselves "art psychotherapists," a term that seems to imply more credibility and clinical expertise than plain old "art therapist." This desire to appear more clinical and psychotherapy-oriented also stems from basic economics; a full-time clinical position offers higher, hopefully more stable salary (and benefits) than any artist-in-residence position. Having been an artist-in-residence for three different state arts councils, I can unequivocally state that residency money is lean (and does not include health and retirement benefits) and grants for any type of art therapy programming are difficult to obtain, and when obtained, are impossible to live on without other income.

A third dilemma involving studio approaches to art therapy relates to the recent revisions of the AATA ethics document. By its very nature, an art studio sets up a unique set of dynamics among its participants as well as an environment that differs from a clinic or hospital, bringing to question our notions and rules about confidentiality and personal boundaries. As described in both McGraw's and Allen's articles, people can drop in at various times to work in an open studio; space is shared by all participants and privacy is nonexistent; participants freely display their art on walls that, in some cases, the public may look at through windows or by visiting the studio space. There are also undefined aspects of the facilitator's responsibilities and relationship to the participants who attend an open studio. These are not questions easily answered by the profession and are not addressed in the current ethics document which largely focuses on clinical applications of art therapy.

At the start of this editorial a pressing need for efficacy and outcome studies of art therapy was noted. It seems that for the profession of art therapy a crucial question remains: what is it that really makes our work with clients effective? Although there has been considerable research in the area of art-based assessments, these findings are not at the heart of what actually helps our clients to find healing, support, and wholeness through their experience of art therapy. The ability of art therapy to help clients express themselves in ways that words cannot is indeed powerful, but there are deeper aspects of the art process itself and all that it entails which create health and well-being in our clients. In our collective push for clinical recognition by other professionals, organizations, managed care corporations, and state and federal government, we may be neglecting the exploration of aspects of artmaking necessary to justify our uniqueness as a separate discipline.

Like many art therapists, what brought me to this profession is the powerful and personally fulfilling experience of artmaking, of exhibiting and sharing my work with others, and of making art in a studio setting, in groups and individually. Working in my own studio or in others, feeling connectedness to other artists, seeing
art in progress, getting lost in hours of artmaking, sharing a cup of tea with a fellow artist, or receiving feedback on my work—these are aspects of artmaking that reinforce my belief about the ability of the art process to effect change, build community, and enhance one’s life (Malchiodi, 1994). They are the experiences that led me to consider graduate training in the field, and still inform and inspire my work with clients today.

However, I don’t believe that we will come to many favorable conclusions about the efficacy of art therapy until we recognize, investigate, and honor the unique properties of artmaking and how artmaking is best presented in service of our clients. Identifying the efficacy of art therapy will come from our deeper understanding and exploration of media, the art process, and therapeutic space, and how we define these as artists. The answers to our search will not come from our clinical expertise alone, but rather from our knowledge of art and from an intimate, personal connection to our own artmaking.

Letters to the Editor

In the last issue of Art Therapy (Vol. 12 No. 2), Virginia Minar wrote a letter in response to my letter which appeared in the previous issue. I appreciate Virginia’s clarification pertaining to Gladys Agell’s Motion No. 11 at the Fall 1993 AATA Board Members Meeting that states that any changes in policy documents be published in two newsletters preceding a vote. I stand corrected that it apparently was not voted on by the membership as a resolution. I remember this motion being presented at the 1993 Annual Business Meeting, and I remember thinking that it would be a positive step towards informing the membership of changes in policy documents that are being considered by the AATA Board well before a vote would be taken.

In Virginia’s letter, she stated that Motion No. 11 was passed by the Board at the 1993 Board of Directors Meeting and then revised at the 1994 Spring Board Meeting to read: “Changes in policy documents that are publicly distributed must be published in the first possible AATA Newsletter after the proposed changes are voted on by the AATA Board.” Virginia wrote that she “assumed the revised Ethical Standards for Art Therapists would be published in the Newsletter prior to the Conference in Chicago. Unfortunately, it was not.” Unfortuately, indeed. It seems unfortunate as well that somehow it did not get published in the Winter 1995 Newsletter. But we finally have it published in the Spring 1995 Newsletter, which came out AFTER the document was sent to the membership for a vote.

The first time the membership got to see the revised Ethical Standards for Art Therapists was when it arrived in the mail in April for a membership vote. Mine was postmarked April 7th, I received it April 10th, and it had to be mailed back to the AATA office by April 17th. That left 1 week to review this document during the time when most people are busy filing taxes and allowed no time for suggestions, comments, and discussion by the membership. Even though this document was approved by the membership, I question its validity. Why have standards of procedure for policymaking if they are not followed? These standards were created so that the membership could have ample time to give feedback to the Board before the final version of a document is offered for a vote.

I continue to be concerned that the membership is not being consulted or heard. I wrote the last letter because there was so much discontent among the members at the 1994 Annual Business Meeting regarding communication between the AATA Board and the members, the way in which the revised ethics document was presented to the members, and an apparent disregard for following policymaking procedures. The Ethical Standards for Art Therapists is an important document that affects all art therapists and their work. It requires serious consideration by all of our members. The fact that the last two ethics documents have been copied from other mental health professionals’ ethics documents and do not begin to address adequately issues specific to art therapists should be cause for alarm. (Please see Agell, G., Goodman, R., and Williams, K. (1995). The professional relationship: Ethics. American Journal of Art Therapy, 33(4), 99-109.) If proper procedure had been followed, each member of AATA would have had time to study and deliberate on these matters.

I appreciate the fact that the Board members are volunteering their time and are dedicated to doing the best job they can. Positions of power, however, can be abused, sometimes unwittingly. When there is an elephant in the living room, someone has to talk about it. If I were a Board member, I would want to know the reactions and responses of the members who elected me to represent them.

One problem seems to be a basic misunderstanding of the relationship between the members of an organization and its Board of Directors. Certainly, between meetings of the members, the affairs of the organization are managed by its Board of Directors, as it is stated in our bylaws. However, it is the membership itself which has the ultimate power to make all decisions as to policy and any other matters which the membership votes on at its meetings. Virginia’s statement, “Resolutions are advisory to the Board and do not set policy,” is indicative of the present Board’s erroneous concept of this relationship. Resolutions of the membership are not “advisories to the Board,” they are directives to be followed. In every organization ultimate power lies with its members.

Carol Thayer Cox, A.T.R., LPAT
Fredericksburg, VA

This is a response to Carol Thayer Cox’s letter in Art Therapy (Vol. 12 No. 1). If, indeed, during the business meeting in Chicago this past November the Board had been engaging in secrecy, defensiveness, “not leveling with its members,” and “exercising powers not granted to it” which you say you sensed, I, too, would have grave concern for what is happening to our association. I’m glad you specifically outlined the cause for your grave concern and hope that by correcting a few of the inaccuracies you relied on, you, too, will recognize this Board’s accessibility, industriousness, strong commitment to survival and professional growth, maintenance of open and regular communication with the membership and wide-ranging responsiveness to numerous challenges faced by our profession and its practitioners in today’s chaotic marketplace. This Board is proud to be “defenders” of art therapy and proud of the scope of its achievements. As I see this Board continuously striving to keep art therapy positioned as a frontrunner in any reform health care delivery, my concern is focused on external forces and the potential effect on our association. I am confident that whatever the impact, our association is in good hands.

Throughout many months of research, writing, and review, legal counsel was used with AATA’s Committee on Ethics and
Professional Practice (CEPP). Through their struggles to apply AATA's existing ethics to the increasingly serious cases being referred, CEPP recognized the importance of developing more workable and professional standards of ethical practice consistent with those generally accepted among mental health disciplines. With Board Certification in place and art therapists across the country actively seeking licensing, every bid for professional status necessitated an equally professional code of ethical standards. The need, echoed both from within our own CEPP and by our members needing support for their legislative bids for inclusion and legitimacy of practice, was urgent.

The legal ramifications involved to protect consumers with whom art therapists work, to uphold the profession of art therapy by establishing ascertainingly high standards of professional conduct consistent with those of other mental health professionals and to protect and ensure the integrity of AATA demanded legal review and participation at every juncture, even in the incorporation of members' suggestions. Did the Board have the authority to proceed as it did? Was the Board empowered to update the profession of art therapy? To prepare art therapists for the emerging health care delivery system and its increasingly exacting standards? I believe so.

According to AATA's Bylaws, Article V, Section 2, the duties of the Board of Directors include "... the management of the affairs of the ASSOCIATION and ... to carry out the purposes of the AATA." Article I, Section 2 outlines the purposes which the Board is charged to carry out. These include, but are not limited to, the advancement of "... standards of clinical practice, the maintenance of criteria for training future art therapists in ... therapeutic techniques; the provision of appropriate vehicles for the exchange of information with colleagues and the general public; the coordination of the therapeutic use of art in institutional or private practice settings...."

You are correct, Carol, in stating that the Board of Directors is elected as an agent of its members. To say that this same elected Board is not empowered to make policy changes without consulting the membership is to tie the hands and feet of those very agents elected to act on behalf of the members. Over the years, AATA's Board members have developed numerous policies and procedures governing the actions of the Board, Committee Chairs and committee members, publications and editorial boards, and even the National Office staff. These are under constant review by the member-workers who follow them in discharging their duties. Committees and Board members are held responsible for annual review of the policies and procedures governing their tasks and are expected to submit motions to the Board to continuously update, upgrade, refine, and clarify obsolete methods and/or policies no longer appropriate or productive in favor of more realistic and workable methods. Thus, motions are regularly submitted to the Board by the Committee Chairs and volunteer workers. Consideration is given to these motions and action taken at every Board meeting which results in changes being made to the Policy & Procedure Manual.

Current policy governed our handling of the revision of the Ethical Standards for Art Therapists. If you find this "truly appalling" I can't help but wonder what you (and other members) would say to the Board's failure to take necessary action to remove or revise obstacles or impediments to progress!

I, too, believe the Board owes the members explanations.

President-Elect Virginia Minar's response speaks to the specific development and approval of the Ethical Standards. I trust my lengthy explanation will provide a more accurate perspective on Board practices and reinstate trust in my very well-chosen, elected Board members. I do not believe the Board owes anyone an apology. In my 9 years of service on AATA Boards and 16 years of service on other Boards of Directors, I have never witnessed more dedicated workers, more intensely committed and goal-directed, nor more cohesive task groups than the 1994 and 1995 AATA Boards. Am I being defensive? You bet I am! I am proud to publicly applaud their organizational and strategic accomplishments to protect art therapy and art therapists in this era of professional crises. The inestimable value of the collective talent and wisdom represented on the Board and the effort they've directed to the professionalization, promotion, and protection of our field deserves applause from all our members. Neither AATA nor I could function or survive without them. I will certainly defend the Board members and their productive efforts against any unfair charges of secrecy or withholding information!

Bobbi Stoll, A.T.R.-BC, MFCC
Los Angeles, CA

I was very pleased to read your editorial, "Milestones," in the most recent Journal (Vol. 12 No. 2). It gave me a wonderful opening to share how we are handling licensing A.T.R.s in Massachusetts. Basically, we have an umbrella, formed by the far-reaching wisdom of Berna Haberman, Emily Mitchell, and Suzanne Canner-Hume. It was not until recently that I have realized how important their formation of the Licensed Mental Health Counselor status actually is. The LMHC in Massachusetts is an umbrella which covers ALL expressive therapists as well as counselors, some PhDs, EdDs, MEds, and probably others of whom I am unaware. Most of the current 4,000 LMHCS in the state were grandmothered/grandfathered into their license. As we reach our second stage, the passage of our vendorship bill, SB 1809, which will guarantee third-party payment to all LMHCS, we have needed to see changes in the educational system. We have been fortunate in having the schools which give A.T.R.s agree to meet the counseling requirements of the states. In Massachusetts, schools with expressive therapy and counseling programs are attempting to match the social work schools in the number of credit hours. Our parity with social workers will be both financial and educational. Currently, we actually require more hours in clinical work than social workers who require more hours in policy and procedure.

There are disadvantages to the increase in credit hours—the primary one being financial. We are afraid that this will impact people with lower incomes in negative ways and that we may lose some of the brightest and most creative of our people as well as our struggle for diversity.

As a very low-income single mother, I put myself through the Cambridge graduate program on loans and hard work. My life is still a difficult financial struggle. I would be the last person to wish to exclude anyone because of finances. However, in order to survive in today's market, we have made compromises and the chief is the increase in credit hours necessary for licensing.

Meanwhile, the good news in Massachusetts is that we are working together for our licensure and are working in coopera-
tion with social workers as well and hope to improve our relations with psychologists.

I hope that as an art therapist, I can bring a greater sense of working together into the Massachusetts Mental Health Counselor Association and that we have the support of other disciplines. It is certainly nice not to have the divisiveness between art therapists and everyone else in this licensure achievement and in the vendorship attempt.

Progress or Politics?: Neither

Taking psychological and clinical theories designed to address individual intrapsychic issues and then applying them to a profession and professional organization issues is an inherently flawed way of addressing the very genuine concerns that are referred to in Dee Spring's recent "Viewpoint" (1994). A similar article recently appeared in The Arts in Psychotherapy (1994) in which David Read Johnson characterized creative arts therapists collectively as functioning from a shame-based dynamic which he maintains informs our every personal, professional, and organizational move.

Shame and abuse—buzz words in both the clinical and popular press which have been applied now to our own work and been posited as the source for a myriad of evils. For example, Johnson states that all of the following are related to the shame-based dynamics among creative arts therapists: criticizing each other, inviting no member male keynote speakers to our conferences, not joining our organizations into a creative arts therapies larger organization, poor mentoring, and big publicity campaigns ("compensation for feelings of inadequacy") (Johnson, 1994). Similarly, Spring (1994) bears witness to "invisible wounds" that she sees as part of an overall destructive crisis abuse cycle. These "wounds" include her dealings while on the AATA Honors Committee, as an educator dealing with the ETB, "contempt" for her research, and "not being permitted" to present her work at AATA conferences; she then generalizes from her own experience to more global assessments of our profession.

I would like to take issue with the general pathological conceptualization of art therapy as well as the generalizations from personal experience and suggest other avenues toward understanding each other better. I have already mentioned what I see as a major contextual flaw in applying a psychological theory addressing the individual and family to an organizational system or a professional role. However, I realize this is a common method of analysis in the popular literature of our day and, thus, join with others in being interested, indeed titillated, by this sort of National Enquirer approach to our professional lives; that is, "who did what to whom" with a general dearth of named sources or even named participants.

What I truly object to is the use of psychological theory as the framework for a personal or even organizational agenda or issue regardless of how valid the issue may be (and I am in no position to dispute the "history" of AATA or Dee Spring's personal experiences). The contradictory messages within the theoretical framework offered are the clue that the theory serves only as a frame and not as a support. For example, Spring refers numerous times to the "ancient leaders" in art therapy with whom she takes issue, describes the members of AATA as "stingy" with awards, and so forth. This language, as well as the labeling offered for every possible involvement one might have with AATA ("secret keepers," "warriors," etc.) and the characterization of "our adolescent crisis-oriented behavior" are all appalling to me as an individual art therapist. I agree with Spring and others that "our response to contemporaries must be respectful rather than destructive if we expect to collect a body of knowledge that includes proof, not just words or case studies" (Spring, 1994). However, I would add that this response is due ALL art therapists, not just our contemporaries, and that the labeling, pathologizing, generalizations, and personal history offered by Spring do little to promote such respectful interchange among us.

Spring is clearly not the only art therapist to ever engage in negative labeling of peers or viewpoints. For example, Bob Ault, in the middle of a very wise and overall balanced article (1994), warns us not to "go off into some hocus pocus of spirituality, or the rigidity of scientific research..." To describe different approaches with terms such as "hocus pocus" or "rigid" is unfairly characterizing positions that have been articulated more clearly and deserve our respect, if not agreement.

Theoretical frameworks and contexts aside, this is not to deny the truth in the importance of knowing our past in order to inform our future. I just take issue with what is offered to me as "the history of AATA" by Spring or others. Am I to listen to the tales of each art therapist as he or she recounts versions of the past 25 years, or am I to look to the publications, conferences, and professional interchange that I have had personal access to? I choose both and seek even more context, information, and history. Junge's (1994) broadening of the history of AATA and art therapy to include the social and political context is a needed correction to the oral history tradition. It is important to deal with our professional history and to address the evolving relationships and roles art therapists will take in the future. In this process, however, we must exert some judgement, discipline, and critical thinking along with respect for our fellow art therapists and our professional organization.

I would like to suggest that there are at least two major contexts, or subtexts, that have not been addressed by either Spring or Johnson among concerns about the future of our profession. One is geographic and the other is generational. Experiences of art therapists vary a great deal depending upon the state or region in which they practice. I write this as one who has always practiced in Oklahoma and as part of a minority within AATA geographically. I have read with genuine concern the issues relative to licensure and practice in California and other areas, but I feel that to generalize about our profession or organization without considering the experiences in other geographical areas is to risk being narrow and provincial. Similarly, generational issues seem to be of growing importance in our organization as we just celebrated our 25th anniversary and are more aware of our "pioneers." I wonder if I am a "new" or "old" art therapist and am content just to be whatever I am. But in reading Spring's article with its references to "ancient leaders" or those "stuck in a 60s mentality" I sense a larger, unspoken issue about leadership, recognition, and the growing generations of art therapists.

Another context for viewing AATA and our profession is one...
of optimism and strength. Judith Rubin's comments in the special 25th anniversary section of our recent journal attest to this more positive approach: "Art therapy has been a marvelous matrix for me, both personally and professionally, and I feel extremely fortunate" (Rubin, 1994). Our profession is growing; in numbers, in divergent viewpoints, in educational options and focus, in job variety and challenges. I too feel very fortunate to be in this field, to continue to learn and grow as I consider all the embodiments of art and art therapy. To me, it is exciting to see the developments of art therapy in psychotherapy, clinical settings, for personal growth and spiritual discovery, in nonclinical settings, in schools, prisons, rehabilitation centers, and so forth. I feel there is such a need in our society and world for art, expression, and therapy that I hope our organization can embrace all the manifestations of art therapy offered by both licensed and nonlicensed art therapists as long as we all embrace an ideal of a skilled, ethical, and caring art therapist. During my years of membership in AATA, I have benefited from the conferences, preconference courses, Art Therapy, AATA Newsletter, networking, and stimulation that AATA has provided. No other professional organization speaks so directly to my professional interests. AATA has always been a lifeline of information and has provided a forum for dialogue and for this I am very grateful.

**Call for Papers**

9th Art Therapy Association of Florida Conference

*Multiple Dimensions of Art Therapy: Art, Client, Therapist*

Spring 1996 Conference

May 3, 4, & 5

Attention Art Therapists, Creative Art Therapists, Mental Health Professionals, Allied Professionals and Educators: AATA is seeking papers, presentations, panels, and workshops devoted to understanding and experiencing the process of art therapy in relationship to the art, the client, or the therapist. Submissions may focus on any topic or population related to this theme; of particular interest are: the value of different approaches and paradigms in art therapy, the use of art in the care of the therapist, and how specific psychopathology informs art making in clinical practice.

**Due October 10, 1995**

Qualifying materials needed from each presenter includes:

1. Six copies of Presenter's Resume
2. Six copies of Completed Call for Papers Application
3. Six copies of Bibliography for Presentation

*After June 12, 1995, For further information and proposal forms, please contact:

Mrs. Peggy Dunn-Snow, A.T.R.-BC, LPAT
165-07 Crenshaw Drive
Tallahassee, Florida 32310

CEU's for art therapists, nurses, social workers, mental health counselors, and marriage and family therapists are being arranged.
Coyote Comes in from the Cold: The Evolution of the Open Studio Concept

Pat B. Allen, PhD, A.T.R., LPAT

Abstract

The Open Studio as a way of working evolved in an effort to maximize the effectiveness of the artmaking process as a means to increase and deepen consciousness. This method differentiates art from psychotherapy and calls into question the validity of marrying these two experiences. Is the open studio within the purview of art therapy? This remains an open question subject to the experimentation of art therapists who apply the method in work situations.

Introduction

I began this paper with an inflated, almost giddy sense of having the answer. Yes, the answer to the malaise of art therapy is to be found in the studio approach. It was shortly after our successful one-month pilot of the Open Studio Project in June of 1993 when I began writing. Yet, somehow, the paper did not get written. The Open Studio Project continued to develop and grow, we found a permanent space and officially opened for business. Still I struggled to write, felt blocked and constricted. I had been sure that the call for papers for a special issue on studio approaches would yield hundreds of papers and Viewpoints flooding the journal. In fact, finding enough good material for an entire issue was a daunting task (see Editorial).

Finally, while trying to work on the paper on a plane trip to Boston, my pen exploded in my hand. This same pen had functioned quite nicely mere minutes before as I penned a postcard to a friend. As I wiped the ink from my hand and off the airplane tray, I felt strongly that I needed some help. I decided to settle down and enter the image process right there on the plane. I asked for help from Coyote, the totem animal of the Open Studio. I asked for an image and this is what I got:

A bird is flying high over a landscape. From up above there are no divisions. The bird's eye view is dispassionate. Your idea is just a tiny little corner, one sparkplug, a small piece of the overall picture. No need to be grandiose. Remember, Coyote is mangy, a bit dirty and smelly, scratching and such... and real.

After thanking Coyote for puncturing my balloon of self-importance, I put away the writing for a while. When I returned and reread my beloved opening paragraphs, I realized how intoxicated I had become with the studio idea. I felt comforted in rereading Jolande Jacobi (1977) on inflation:

...there is nothing surprising about this sort of hubris; everyone succumbs to it in the course of a deliberately deepened individuation process. But the forces that have been activated in the individual by these insights become really available to him only when he has learned in all humility to distinguish himself from them. (p. 126)

Now doubly grateful to Coyote for my exploding pen that prevented my purple prose from reaching print, I realized I needed to begin the work of distinguishing myself from the ideas.

Background

My initial job in art therapy was a rudimentary variation on the open studio, not by design but through simple ignorance. I didn’t know any better than to make art with the people who came to the church basement we called an “after care center.” I was an art student, and they all had various psychiatric diagnoses and had been swept back into the community when state hospitals were declared too restrictive an environment in the early seventies. What I remember about my job is that I felt a lot more at home making art with the center’s “members,” as they were called, than I did in art school with my classmates. As I gradually got an education in art therapy through supervision and further training, I realized we were supposed to have a different sort of relationship—one in which I maintained professional boundaries and kept more distance, one in which roles were clearer. But, looking back, I don’t think anyone was worse off for being party to my image making, nor do I think that any more systematic approach would have made a big difference in ameliorating the wounds of the men and women who came to our center.

What was going on in that church basement was simple. Former mental patients had a place to go during the day and an occasional evening, to socialize and add some structure to their lives along with a hot lunch and an ever present coffee pot. Those of us who worked there created ways to pass the time together based on our interests or skills, whether art, yoga, drama, or current events. No big therapeutic outcomes were really expected nor sought beyond trying to provide a supportive community to help people stay out of the hospital. We kept track of who was holding their own and looked for warning signs when members were feeling stress. Often we could avert a crisis or rehospitalization by nothing more sophisticated than knowing people well enough to notice changes in behavior and offering to talk about whatever the problem might be.

We spent 15 to 20 hours a week together in groups, taking...
field trips or just hanging around in the coffee room playing Scrabble. The setting had limitations which precluded a "real" open studio. The church members who donated the space were fastidious folks. No artwork could remain on the walls and our presence had to be cleaned up before Sunday school each week.

The images of the kindly Jesus surrounded by children and holiday theme posters were not to be disturbed. But even with such restrictions, members felt free to create, and so did I.

Gradually, as I learned more about therapy, I began to see individuals, families, and groups in the outpatient mental health center of which the after care program was one small part. After some years of practicing art therapy in more conventional ways, I returned to an open studio approach, this time by accident. I was utterly spent trying to apply the principles of therapy I had so painstakingly learned on a short-term psychiatric unit. I was defeated by the limited length of stay and sterility of the setting, and I was bored by listening to shallow discussions of superficial imagery made by patients trying to do what was expected of them. I pretty much gave up and just began to make art during the art therapy time. I stopped cajoling patients out of bed or away from TV. To my surprise, interest in art therapy grew and some patients who had avoided the structured groups showed up and worked intently on self-initiated pieces. The atmosphere shifted and energy grew; for a while, something felt real and right.

In reviewing a paper I wrote about this work (Allen, 1983), where I first used the term "open studio," I was surprised to realize I did not mention the role my own artmaking played in the brief resurgence of a studio atmosphere on the short-term psychiatric unit. In fact, I remember vividly the piece I worked on when participation in my draw-and-talk groups dwindled to nil. It was a fairly large sculpture of a dragon made of newspaper and masking tape, eventually covered with plaster gauze. I would bring it upstairs to the office I shared with the occupational therapy staff and work on it in odd, free moments between groups. After a while, as I entered the locked unit for my nonexistent group, the evolving dragon, now recognizable, sparked interest among patients who began to come in and want to learn how to create sculptures of their own. That was one of my first glimmers that my own artmaking could have a motivating effect and perhaps be a valid part of the art therapy process.

Why didn’t I write about the role my art played as a catalyst for patients? Instead, I tell about a goals group I co-led and how that helped me to refocus my energies (p. 94). The goals group was a helpful interlude partly because it was collaborative, partly because it was very clear in structure and format. Also helpful, but not as safe to write about, was my relationship with a patient around that same time. This young man was acutely psychotic when admitted. As his symptoms abated I learned he was also a trained and talented photographer. We spent many hours talking about art and looking at his photographs, though he attended the studio group only once. Gradually I recognized that I had a powerful countertransference response to this man. He mirrored back to me the wounded artist in myself. Once I gained that insight, I experienced a surge of energy in my own artmaking, which I had neglected for quite a while feeling uninspired and having little free time. My relationship to the patient simmered down to collegial friendliness. When he was discharged, I felt the loss; he had taught me a great deal. My belief in the prescribed boundaries of the "patient-therapist" relationship was also shaken. My identification with him helped me to restore and reawaken a very important part of myself. He did far more for me than I did for him.

I didn’t write about this aspect of the process in 1983 either. I also didn’t write about how making art together begins to blur the boundaries between "staff" and "patient." In a studio session, a patient might just as likely have useful feedback for me as I would for him or her. I did realize that I couldn’t tolerate the hierarchical roles that are the norm in an institution. It seemed easy for the nurses and doctors; for example, it is very clear who prescribes medication, who hands it out, and who swallows it. For me, blurring the boundaries felt vaguely dangerous, a violation of the cultural norms of the treatment setting. I knew I couldn’t continue working in a hospital.

At this same institution, I also worked on an alcoholism treatment program (ATP) where it was necessary to create a very structured approach to art therapy to complement the existing goal-oriented program (Allen, 1985). This was not my favorite way of working. The main goal of the ATP was to break down patients’ resistance to recognizing their disease. This confrontational approach was designed to shake the alcoholic patient out of his or her denial of life-threatening behavior. While I saw the value of this approach, I was uncomfortable using art in this way. I felt the time pressure of the brief 3 week length of stay, yet I deeply feel the image has its own time that could not be accommodated in this approach. I fantasized about a studio space on such a unit where, after the confrontational work of group and individual counseling, a patient could come and work at length, painting his or her reactions and putting himself or herself back together. There was no space for such a studio. The room where art therapy was held doubled as dining room, group room, staff meeting room, and leisure space in the evening. Patient images remained up on the walls during all those activities, for better or worse.

To ground myself I created an art talk as part of the lecture series used to educate patients about the disease process. Nurses showed slides of cirrhotic livers in their lecture on physical effects; I showed slides of paintings by well-known artists who grappled with issues of life and death, depression, faith, and relationship. I tried to explain how artists use images to reconcile inner and outer reality and how this process is accessible to anyone. I also showed slides of my own work, which is fairly self-confrontive. I tried to show that I used the process, that I wasn’t asking them to do something I wasn’t willing to do myself.

Why didn’t I write more about these aspects of the art process? I felt I was violating some art therapy taboos. If I am making art during my art therapy job, am I stealing from my employer? If by making art together with patients I am contributing to a breakdown of the tradition of professional distance, am I harming the patient? Is showing slides of my art that are obviously intense, emotional, as well as artistically formed intimidating to the patients and inhibiting their ability to use the process?

These are serious questions. Therapy principles rang in my head: the role of the therapist, the boundaries of the session, appropriate self-disclosure. I certainly knew and had adhered to and respected these rules for some time. I taught these rules to my graduate students. I experienced the validity of the con-
straitst of therapy myself as a client in psychotherapy; yet, as
time went on, these rules felt constricting, deadening, in fact
harmful to the art therapy process. I began to feel the paradox
that much of what makes psychotherapy effective and safe makes
art therapy dead and lifeless. I began to seriously doubt this
hybrid, this marriage of art and therapy, to which I had been
thoroughly dedicated.

Struggling with Art Therapy

The next phase in the development of the studio idea was my
doctoral work. I set myself the tasks of looking at art therapy as it
had been practiced and documented in the literature and of looking
at artmaking as it is done by artists (Allen, 1986). I read artists’
accounts of artmaking and carried out a series of interviews using
phenomenological methodology which sought to get at the
essence of the art-making experience. My research question was,
“What is the experience of making art?” I wanted to find out the
constituents, the necessary or universal aspects of this experience.
By interviewing a range of artists, including some who are also art
therapists, I learned that the essence of artmaking—feelings
about, even motivations for making art—was indistinguishable
from what my goals were in art therapy. Self-expression, commu-
nication, feelings of wholeness, suspension of time, entry into a
different realm or state of grace: these are some of the constituent
parts of involved artmaking, whether the artmaker is a client seek-
ing help for a problem, a professional artist making work to
appear in a gallery, or an art therapist fully engaged in his or her
own art process. The nature of the final product may distinguish
these various artmakers (thought not in all cases), but the process
had the same essential elements. McNiff (1977) in a study of
artists across disciplines concludes that “all artistic expression
emanates from the same human needs” (p. 134). The basic goal of
all artmakers seemed to be to know the self, which is also a fun-
damental goal of art therapy.

The outcome of my doctoral work was the conclusion that
artmaking is a process that when practiced in an involved way, in
itself promotes health and wholeness. However, such practice
can exist side by side with destructive behaviors as well. Human
beings are complex. I came to believe that the rules and regula-
tions I had painstakingly learned in order to practice art therapy
paradoxically prevented artmaking itself from being fully effec-
tive. Consciousness is the crucial element that art therapy added
to the equation that is not always present in the practice of art-
making by artists. By adding intention, the clear desire to know
something through art, and attention, the honest consideration
of meaning in the image, we experience artmaking as creating or
deepening consciousness (Allen, 1995). Then, the island of
health or wholeness from which the creative impulse springs can
be enlarged and strengthened. Psychotherapy can also be a con-
sciousness-creating activity, but its methods function largely on a
verbal level. Artmaking, when practiced in an involved way, espe-
cially according to some methods developed in art therapy that
emphasize allowing the image to create itself (McNiff, 1992)
touches a different, preverbal, nonverbal, and even spiritual
level. As Florence Cane describes, life situations have parallels in
artmaking situations, and understanding the art process can have
a carryover into life (1951).

By using the same rules as psychotherapy, art’s effectiveness
is decreased. The stringent rules of psychotherapy are necessary
to safeguard the client as well as the therapist from potent feel-
ings and wishes stirred by the intimacy and intensity of the
process that can lead to exploitation and abuse of power in this
inherently unequal relationship. In 1988 I wrote:

Art therapy has the potential to affect the balance of power in the
therapeutic relationship in favor of the client if the focus is less on
the transference and more on the art. In other words, the client is
empowered when his or her primary relationship is to the art rather
than to the therapist.... Transformed by the art process, through the
discipline of adhering to the limitations and requirements of the
medium, the unconscious material can be experienced by the client
while he or she maintains an adult's sense of personal dignity. (Allen,
1988, p. 118)

The next phase in the development of the studio concept
occurred in collaboration with Deborah Gadiel, presently one of
the codirectors of the Open Studio Project, but at that time a
graduate art therapy student at The School of the Art Institute of
Chicago, where I teach. Having found myself frustrated with the
limitations of clinical positions, I was teaching and supervising art
therapists and doing a small amount of consulting and private
practice. I was uncomfortable in my position as critic of the clinical
approach to art therapy without a place to try to develop an
alternative; even private practice seemed too restrictive. Deborah
wanted to do her thesis on working as an "artist-in-residence" as
an aspect of her second year placement. I suggested she try an
agency where I supervised the art therapist, Dayna Block, the third
founder and director of the Open Studio Project. I felt Dayna
would be receptive and supportive of this idea. I have never known another artist therapist as grounded and clear in her
identity as an artist as Deborah or as knowledgeable and fluent
with materials of all kinds. Her idea of artist-in-residence was an
operational definition, an alternative role for an art therapist to
take that widened the scope of practice to include and validate
artmaking within the workplace. At that time she said:

We as artists can demonstrate problem-solving, risk-taking, and self-
fulfillment. We create an atmosphere of involvement. We model a
dialogue between ourselves and a piece of art. (quoted in Allen,
1992)

Consulting to this agency and supervising Deborah have
helped me to see that the open studio idea can be put into prac-
tice in a mental health setting. She continues to perform some of
the more traditional tasks of a therapist in her job, though the
bulk of her client contact is within the studio.

Presently, the approach Deborah, Dayna, and I have
evolved in the Open Studio Project goes even further. We are
dropping the therapy paradigm altogether and looking at what
the studio process generates as its own paradigm or guiding prin-
ciples.

What Is the Studio Approach?

Our approach is still evolving, and I have concerns about
writing about it at such an early point. Although I can describe
what we do and how it seems to work, I can't make many firm
conclusions. I can point out concepts in art therapy that this
approach challenges and aspects of practice that are called into
question. We are defining a little area where the disciplines of

2111
art, art therapy, spiritual practice, and service to others intersect. We are at the outskirts where, like Coyote says, things are ragged, many, and a little bit rough. That's how we like it. It's not everything nor the only thing. But, it can give some ideas to art therapists, enliven them, maybe be a sparkplug.

The primary attribute to an open studio is energy. Energy is drawn into a place by a variety of factors. The main source of energy is generated by the artists working in the space. It is not enough to put out materials and just let people flounder around with them. It is not enough to solicitously be a monitor and hand out the right brush. It is necessary to be real and active. Over the years there have been more and less successful attempts at having an open studio at the AATA conference. It has seemed to me that not only the space, not only the materials, but the energy of those working in the space is the crucial, yet ineffable ingredient. Discovering how to tap into creative energy is my primary learning goal at the Open Studio. What makes people able to access this in themselves and what prevents it? The arrival of Coyote illustrates something about this.

Our pilot program took place at a downtown gallery run by several young artists who were interested in creating an alternative to the usual gallery scene. Fans of Joseph Beuys, they liked our idea that everyone can create art. They were intrigued with the concept of people from all walks of life coming together in the space. We invited them to come and work alongside participants during workshop and drop-in times. Further discussion revealed a slight discrepancy in our ideas. One artist offered to come in and demonstrate how a "real artist" makes collage. On the only day they actually came to the space to work, about six people were busily working on various pieces. I was painting when one of the artists began a conversation with me about how "...you can't just paint..." and elaborated for me how artists are different and need certain conditions, the right time, the right place, that he was really conceptually beyond this sort of direct image-making. As I listened, I continued painting and Coyote emerged, smoking a cigarette (Figure 1). This trickster figure spoke volumes to me about the trap of taking oneself too seriously, the trap of role, the trap of specialization. The irony of the artist talking away while "ordinary" people "just made art" was a great lesson and remains at the heart of the Open Studio.

All during the pilot month, Coyote showed up in various guises in different people's work, always having a great time (Figures 2, 3, and 4). In Native American tradition, Coyote is seen as a trickster and shape shifter. Another aspect I like about him is that he is a carrion eater, a transformer of dead material (Walker, 1988). He continually and playfully challenges the ego, helping us to be less pompous and self-involved. To work in this way, one must check one's professional persona, be it artist or therapist, at the door. Coyote's energy seems to me less and less welcome in art therapy as the field becomes more regulated, more professional, more self-consciously serious. Nobody wants to get paint on her dress-for-success suit before going into a meeting.

The Open Studio Project

At present, the Open Studio Project, Inc. resides in a storefront space with high ceilings and big windows that looks out onto a busy city street. It is located in a part of the city known for both its ethnic diversity and its indigenous artist community.
Synchronistically, this neighborhood has an art event every year when studios and galleries are all open for four straight days, called “Around the Coyote.” It is also an area in the throes of gentrification. Who knows how long Coyote will hang around? Old factories are being turned into loft condominiums, and coffee houses and trendy restaurants are springing up. Two blocks away are industrial buildings as well as restored mansions, buildings covered with graffiti, a shelter for the many homeless women in the area, as well as the homes of many poor and middle-class families. Inside the space the walls are paint sattered, and there are shelves piled with supplies and found materials. The “office” is a tiny galley behind the studio space where a computer sits next to piles of artwork and extra supplies.

The Open Studio Project (OSP) came into existence as the answer to a question posed by us in early 1993: “How can we, as artists, be of service to others?” Art therapy, as it has come to be defined and practiced, did not seem to be the answer. At the heart of this question is the wish for Eros, the wish to stay close to the fire, in contact with the life force. We did not ask, “How can we find time to make our own art while working as art therapists?” While that may be a perfectly valid question, it was not ours. Implicit in the phrasing of the question is the belief that our first responsibility is to be aware of and tend to our own needs, our personal fire. We believe that neglecting our own needs diminishes our capacity to be of service. Each of us recognizes a primary drive to know ourselves, others, and the world through our image-making. Each of us works in our art in a way that invites Coyote, constantly challenging concepts of who we are, what we are. Through image-making, we are being created, destroyed, and re-created continually.

After several years of conceptual development and a month-long pilot project in June of 1993, we opened for business at our present location in Chicago in February 1995. Practically speaking, OSP is a not-for-profit 501(c)3 corporation, meaning it is tax-exempt and able to receive donations and contributions which, along with fees for service, support the work, if not yet the workers. All programs are offered on a sliding scale basis. We offer workshops and classes to the public, to groups from social service agencies and schools, and to businesses. We have a core series of workshops which we are evolving that consist of very direct methods of drawing, painting, and sculpture using simple materials. There is a strong focus on developing awareness of one's response to process. Participants are encouraged to allow imagery to develop in its own way and to trust the image to be a guide. The major amount of time in every workshop is spend making art, with a brief time at the end for closure and sharing how the process felt. Content interpretations are not made. In core workshops, comments are restricted to one's own work and process, and quiet witnessing by others is encouraged. Resident artists participate fully in all workshops.

We also have occasional theme-based or materials-based workshops which have a more structured format and more specific goals. For example, a workshop called “Marking Passages” was designed to focus on transitions and changes in life stages with an emphasis on the decisions, events, and struggles that accompany change. “Printmaking” focuses on simple and direct methods of producing multiple images using printing plates constructed of cardboard and found objects as a way to enlarge one's repertoire. We emphasize the physicality of making art by using breathing, relaxation, guided imagery, and music, such as drumming and other percussive sounds, to produce entrainment and deepen process. Journaling for self-reflection is suggested for longer term participants. Drop-in time is available for those who wish to take their work further or for anyone wanting to experiment independently.
A Few Things We Have Observed So Far:

- Making art together breaks down barriers and boundaries between people, creating compassion and empathy. This happens most effectively when people are deeply engaged in authentic images. It seems to be true that viewing the struggles of one another through art causes shifts of perception on a deep level. This occurs not so much in insights gained through discussion as in simple witnessing.

- Our practice of making art alongside participants creates an energy that enables all of us to take risks and push further in our explorations as opposed to being an inhibiting factor. This applies to both content and technique.

- Adopting the same simple materials used in art therapy, or in elementary school for that matter, such as temperas and acrylic paints, cray-pas, tape and foil, and found object sculpture renders the image-making process accessible to anyone.

- Bypassing complex techniques, individuals move more easily into the realm of their own images. Remarkable elaboration and embellishments occur as individuals "make special" (Dissanayake, 1995) objects that begin as cast offs and end up speaking for the soul.

- Hanging our images in the space seems to cause people to relax and feel permission to express rather than fear their own content.

- Given the space, materials, time, and example, anyone can use the artmaking process to contact and tap into his or her own inner source of creativity and wisdom.

- The process works especially well if the group is diverse. The energy of too homogeneous a group tends to be less lively, regardless of whether it is a group of all mental patients, all art therapists, all women, all adults, and so forth.

Conclusion

We are at the beginning of a great learning process of experiential research. We are experimenting and watching what happens. We eschew therapy concepts and practices. No records are kept beyond keeping track of attendance. There is no pretense of confidentiality; the public walks by and sometimes stares intently in the window as people work. There are often dual relationships as friends and family members are welcomed to the space. Groups from agencies are mingled with people from the general public. Our responsibility is to create, share our energy, and provide simple instruction; the participant is responsible for his or her own experience. During all workshops we are equal participants. There is no emphasis placed on roles, lengthy introductions, or life stories. In the studio everyone is an artist on his or her own path. No particular emphasis is placed on uniqueness or originality. Referencing the images of others is encouraged: If someone likes an image or technique used by another, borrowing or incorporating is fine.

The studio process cannot be easily communicated in print. To see the fascination in the faces of children who see raw imagery on the walls and then settle down contentedly to make their own with industry and purpose is confirming. A common response when people come into the space is a smile and a sense of physical relaxation. There is a comfort that authentic imagery extends that says it's okay to be yourself in this place. The images themselves, as McNiff says, are medicine. The permission of expression that they grant is enlivening.

During our pilot project in 1993, we were working in a gallery space downtown which we transformed into a studio for a month. The space was located on the first floor of a building that housed several graphic design firms as well as a talent agency. One morning there was a casting call and parade of parents with cute children in tow stood outside our space waiting for the elevator. Some peeked in, including one family who had Grandma along who was afraid of elevators and unable to climb the three flights of stairs. They came in and asked if Grandma could sit with us to pass the time while the mother took her little girl upstairs for the audition. We agreed, and the older woman settled down with her newspaper while we worked alongside a group of adolescent boys from a group home. One was working on a large piece of kraft paper with charcoal, another was creating a pastoral landscape. As our visitor was clearly listening to my conversation with one boy about standing back to really see his 4' x 5' piece, I impulsively asked if she'd like to try, too. With delight, she put down the unread newspaper and an hour later her perplexed daughter found her gray-haired mother happily drawing away alongside a group of inner city boys whom she might have crossed the street to avoid if she'd encountered them elsewhere. This is what we are after, creating a space where the paradox of the uniqueness of the individual and the universality of our humanness can be lightly held, shared, understood, and celebrated, where Coyote can come in from the cold.

Today, like every other day, we wake up empty and frightened
Don't open the door to the study and begin reading
Take down a musical instrument.

Let the beauty we love be what we do.
There are a hundred ways to kneel and kiss the ground.

Rumi

The Art Studio: A Studio-Based Art Therapy Program

Mary K. McGraw, A.T.R.-BC, Cleveland, OH

Abstract

This paper describes the history and development of the Art Studio, a studio-based art therapy program established in Cleveland, Ohio in 1967. It includes the philosophical perspective of its founders who pioneered the use of art therapy with medically ill and physically disabled persons. It provides information about the unique co-operative relationship between a non-profit organization and county hospital which jointly support the program. Specific patient needs which are uniquely addressed by the Art Studio model are discussed and illustrated by brief case studies and representative artwork.

Introduction

Creativity brings and allows for personal freedom—the freedom to act and to be oneself. The Art Studio at MetroHealth Medical Center in Cleveland, Ohio reflects such freedom. In a creative environment that emphasizes the unique abilities of each individual, the Studio and its staff invite personal expression and growth at a time and in a place where it is not usually expected.

When people enter the Art Studio, they easily forget that they are on the seventh floor of a large metropolitan hospital. Original artwork hangs on the walls. The sounds of a popular radio station fill the air. Someone sips tea while watching another person weave with strips of brightly colored paper. A young man carefully considers his painting before signing its completion with his signature. Two people in the corner sort through shells and wood bits to be used in the collage on a table nearby.

On closer inspection, however, one realizes that most of the artists are sitting in wheelchairs or lying on carts. The painting is signed with a brush held in the artist’s mouth and the weaving is being done with the nondominant hand. Since 1967, more than 16,000 children, adults, and their families have participated in the Art Studio’s programs at MetroHealth and in a variety of community settings, such as the Studio’s program at Fairhill Center for Aging, which began in 1989.

A Pioneering, Innovative Art Therapy Program

Founded by Dr. George Streeter, Chief of Psychiatry, and Mary McGraw, A.T.R., the Art Studio pioneered the use of art therapy with medically ill and physically disabled persons. It is the oldest art therapy program of its kind in the country. Streeter and McGraw are artists who have been touched by the healing qualities of art in their own lives while coping with long hospitalizations and physical restrictions. They believe that the value of art-centered therapy lies in its nonverbal, image-producing nature, with its inherent ability to symbolically and metaphorically help a person discover, uncover, recover, integrate, and gain insight.

The Art Studio was, and is, innovative in its approach to both funding and the philosophy of its therapeutic arts program. A 1971 article by Elinor Ulman described an “art program in a long-term general hospital”:

In 1967 George Streeter, M.D., who heads the hospital’s Division of Psychiatry, joined with other amateur artists on the medical staff to make available to patients the rewards they themselves had found in the art process. It is a place where the emphasis is on a person and his painting, not a patient and his hospitalization. From the start it has been a separately funded, nonprofit organization. In both a practical and a symbolic sense, the Studio’s financial arrangements make it part of the community, which through art gives the patients something far more valuable than a mere diversion. (p. 145)

The Studio’s Board of Trustees works in collaboration with the Hospital’s administration to provide the resources necessary to support its programs. The Hospital’s commitment is expressed through its funding of two full-time positions and in-kind contributions of space, office supplies, and other logistical support. The five other staff salaries and all other expenses are the responsibility of the Art Studio Board and its administrative director, Darlene Montonaro. Income is raised through contributions from individuals, corporations, and foundations, as well as from fees for services and various self-help programs, such as annual benefits and sales of “WheelArt”—wearable art T-shirts, socks, and aprons created by “painting” with wheelchair tires. (See Figure 1.)

The collaborative relationship between MetroHealth Medical Center and the Art Studio provides a model for other...
hospitals and organizations interested in providing arts therapy services, particularly in the current fiscally restrictive health care climate. Though fundraising and financial stability are an ongoing struggle, with support from both private and public sectors and from the arts and human services, the Studio has been able to survive and grow when other valuable programs have been forced to close. In 1967, the Art Studio began with an annual budget of $9,000. In 1994, the budget for its hospital and community programs was over $200,000.

Hospital and community support over the past 28 years has enabled the Studio to creatively develop its services. Art therapy staff can now make an initial contact on an intensive care unit and continue through rehabilitation to a community-based art program. Under McGraw’s clinical direction, art therapists see a diverse patient population at MetroHealth and Fairhill, including brain and spinal cord injured, dialysis, oncology, pediatric, stroke, geriatric, chemically dependent, and psychiatric patients. In 1993, approximately 1,000 persons were seen for a total of 10,500 individual and group sessions.

A Broader Spectrum of Opportunities

The Art Studio’s administrative structure—indeed, collaborative, self-directed, adaptive, creative—has provided the support and continuity for the equally innovative philosophy upon which the Studio’s therapeutic arts program has been built. From the beginning, the Art Studio’s program was developed around a studio art concept. In that safe, creative space intentionally unrelated to pain, loss, or institutionalization, a person is invited, encouraged, nurtured, modeled, and shown how and where to rediscover himself or herself through art. In the studio the emphasis is on the art and artmaking—on the action, not the words. This focus is central to the Art Studio’s approach to art therapy, whether the goals are media exploration, skill building, or verbal processing for insight.

According to Streeter (1992), “Art offers uncontaminated opportunity for being yourself; for revealing your identity as a person ... the world of art therapy offers patients a chance to be that utilizes a broader spectrum of opportunities than words alone make available.” With the focus on creating art, the art recreates the person with his or her strengths, issues, and solutions. Control is left in the hands of the person, literally and figuratively; while necessary defenses remain intact. The spoken or silent words, evoked by the images and artmaking process, can then increase the potential for change and resolution.

The Studio’s founders recognized that physical and emotional illnesses and their treatment can cause pain, anxiety, depression, despair, and withdrawal. People need ways to experience and express these feelings. Clinical practice had demonstrated that traditional psychotherapy was often not appropriate for many of the patients with whom they worked. Words alone did not reduce the pain and confusion. For many, words were not available because of a medical or psychological problem, as in the case of an aphasic or severely traumatized person. And for many others, especially acutely ill or newly disabled patients, words about feelings or fears were often too confrontational or overwhelming (McGraw, 1989).

Many of the patients who participate in the Studio’s programs have good support systems and the ego strength necessary to incorporate what has happened. If they are provided with the resources to process and integrate the experience, they can make adjustments and return to optimum psychological and physical health. However, a greater majority of them have preexisting problems, such as personality disorders, dysfunctional families, chemical dependency, and chronic psychiatric histories. These problems have often led to and/or complicated the treatment of the current medical or emotional crisis.

The “broader spectrum” of art-centered therapy has been effective in meeting the needs of these patients at both the hospital- and community-based programs. Over the years, McGraw and her staff have identified specific patient needs which are uniquely addressed by art therapy based in a studio art model:

<table>
<thead>
<tr>
<th>PATIENT NEED</th>
<th>ART THERAPY</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Direct confrontation is difficult; defenses are necessary. Verbal interaction can be threatening.</td>
<td>1. Used as an indirect method of confrontation to deal with difficult issues; metaphorically release or transcend, often without words.</td>
</tr>
<tr>
<td>2. Must function according to others’ schedules in an environment that is often unfamiliar and anxiety-producing.</td>
<td>2. Able to function at own rate within a nonclinical environment that is less threatening.</td>
</tr>
<tr>
<td>3. It is urgent for patient to take initiative, have control, decide for self.</td>
<td>3. Puts action in hands, in control of patient, as much as possible. The nonscheduled optional model encourages self-initiative in the environment/situation which has taken control away from the patient.</td>
</tr>
<tr>
<td>4. There is loss, real and felt. All else in life may be contracting or limited.</td>
<td>4. There is opportunity to expand, to gain. It lasts beyond the moment and has a physical presence outside of the self.</td>
</tr>
<tr>
<td>5. With enforced inactivity, verbal contact is either the only form of expression or impossible as an expressive modality.</td>
<td>5. Provides an alternative, self-actualizing, nonverbal expressive modality.</td>
</tr>
<tr>
<td>6. Difficulty making new beginnings; not able to adapt.</td>
<td>6. Each session is a new beginning; the adaptive process is taught and learned through association.</td>
</tr>
<tr>
<td>7. Feels alone—the only one with these issues/problems.</td>
<td>7. Provides a shared experience among patient, art therapists, and other patients.</td>
</tr>
<tr>
<td>8. Out of touch with “self”—how I used to be; how I used to respond.</td>
<td>8. Process and product reflect self; provide a way to see “self.”</td>
</tr>
<tr>
<td>9. Can’t “look” directly at disability or issue; not acceptable.</td>
<td>9. Able to accommodate disability and the accompanying feelings without focusing on them; helps to make more acceptable; can be dealt with more directly in time, as needed.</td>
</tr>
<tr>
<td>10. Wary of any reference to psychiatry, even if needed; afraid/angry that people think problem is “in their head”; intuitively seek to protect psyche while body is in crisis.</td>
<td>10. Patient’s association to “art” can be less threatening; opens way to the building of a therapeutic relationship, which can lead to trust and ability to accept/seek psychological support.</td>
</tr>
</tbody>
</table>

Art-centered Therapy

The Studio very personally and intentionally responds to needs. According to artist/therapist Kathy Kuhn-Denis:
Patients as Artists

The Studio Art model is best seen through the words and images of the artist patients who have used it. While some patients are discovering new facets of themselves when working with art, others find they can still do something they thought might be lost forever. Frank was a 70-year-old man admitted for rehabilitation following a serious neurological disease that left him with weakness and some loss of feeling in all four extremities, poor balance, and questions about whether he would improve enough to live independently again. Frank “found” the Art Studio at his doctor’s suggestion when he discovered he had considered art as a career. Though he showed interest in the environment and was receptive to watching others, Frank was hesitant to try anything himself. His earlier art interest and skills made it more difficult to risk himself since he was afraid he could not even hold a pencil, let alone draw as he had before.

He did come back, showing both his interest and need. McGraw asked if she could do his portrait (Figure 2) to both continue building a therapeutic alliance that was based in art and to demonstrate her willingness to share her creative process. The portrait took two sessions to complete during which time Frank talked about his family, his job, and his interests and eventually began to experiment with the drawing materials left on the table near him. Though his first attempts were somewhat shaky and tentative, he had obvious drawing skills, which McGraw acknowledged. He wasn’t satisfied with the quality, but expressed surprise at his accomplishment and from that point needed no encouragement to participate.

He drew his room, other patients (Figure 3), and the hospital environment. Though he did not talk very much about his feelings or fears, he gained control of his life as he remastered his
art skills. He encouraged others in the Art Studio and in therapy, and he gave his work away to those he came to care about. The quality of his artwork improved along with his growing strength and confidence. Figures 4–7 depict the four views Frank saw as he looked out of the hospital's windows, perhaps toward his future. He gave the drawings to the Art Studio for its permanent collection when he went home.

Following his discharge Frank wrote to McGraw about his feelings:

Your art program recaptured for me a spirit that has been too long dormant and I can never thank you enough for your smiles, your conversation, your encouragement, and your skill in letting me concentrate not on worry, but on those things which might help my recovery.

Kevin was a 22-year-old man who had sustained a fracture of his C5-6 vertebrae in a work-related accident and was now a quadriplegic. Senior art therapist Kathleen Kern-Pilch worked with Kevin throughout his extended hospitalization.

A patient such as Kevin must cope with many losses—control of body functions; sensation of touch, heat, even pain; abili-
ty to eat, bathe, dress, live independently; job; and personal relationships. This dramatically altered life style must be addressed within the rehabilitation process, because the newly disabled person is desperately seeking some continuity between who they were and who they have become.

Initially, Kevin explained that he knew nothing about art, but wanted to do something that would help him develop hand strength and coordination. Although he was paralyzed from the neck down, he was learning to write again with the aid of a hand-splint and motion activated through the movement of his upper arm and shoulder muscles. Kern-Plich responded to his request and provided assistance toward his goal, setting him up to work and adjusting his paint brush and palette. As Kevin’s picture developed (Figure 8), it became apparent that he knew more about painting than he had indicated. Over the period of a few weeks, between intensive physical and occupational therapies, a peaceful impressionistic landscape emerged. Only after it was completed, did he talk to Kern-Plich about the experience when he presented the painting to her. In his own words, “Most everything that I loved to do I can’t anymore…. I had to see for myself if I could still paint or if that too was lost…. I’m not sure now what direction my life will take, but I don’t need this painting anymore.”

Other patients are facing life-threatening medical diagnoses such as cancer or end-stage renal disease. In 1979 the Studio began one of the first art therapy programs for patients undergoing hemodialysis treatment. Art therapist Rich Schultz is currently responsible for this program.

Maria was severely limited, living in a nursing home with little family support. When she began dialysis treatment, Schultz became her “third hand” (Kramer, 1986) since one arm had limited feeling and the other was partially paralyzed. Maria also had limited vision and was legally blind. Applying glue to small bits of colored tissue paper, Maria created wonderfully expressive, bright tissue paper paintings (Figure 9). While working with Schultz on her art, Maria’s blood pressure would rise to normal levels helping to medically stabilize her during dialysis treatment. Perhaps just as important, however, was the physical and emotional support that was experienced and felt as Schultz made actual contact during the artmaking process and helped to reduce her sensory deprivation. Maria told Schultz, “I now look forward to coming here only so I can do my art.”

Daisy was a 60-year-old female seen in outpatient art therapy by art therapist Dawn Knez. She was referred by her psychologist for “increased activity and opportunity for nonverbal expression.” She had recently been diagnosed with spinal stenosis (a narrowing of the spinal canal causing pain and weakness from pressure on the nerve roots), glaucoma, and reactive depression. Physical complaints such as the pain, decreasing mobility, and progressive visual deficit caused her much distress. Although she was aware that surgical intervention could improve her stenosis, she was frightened by the amount of invasion and the risk involved. Daisy attempted to learn all she could about available medical procedures, wanting to have her “eyes wide open.” After searching the library for literature and asking questions of physicians, she eventually decided to delay surgery until “absolutely necessary.”

Daisy responded very positively to involvement in art therapy, particularly learning and working in three-dimensional sculptural media. Daisy’s mask (Figure 10), created by applying plaster bandages over her face, strikingly depicts her anxiety and fear regarding her prognosis. Upon seeing its starkness during the painting process, she added hair, earrings, and gold paint (Figure 11). “I used to be glamorous, the life of the party,” she said, perhaps expressing her feelings pertaining to multiple levels of loss. When looking at this mask, one recalls her desire to have her “eyes wide open.”

The ceramic bird (Figure 12) that Daisy described as “nesting” was completed over three sessions. Significantly, she hollowed out its back, rather than underside, at a time when her own back was causing her so much pain and anxiety about possible surgery. When asked about this by her art therapist, she said, “Now I can put things in it, like tiny flowers; it’ll be nice.” Though Daisy avoided further discussion about her metaphorical surgical procedure on the bird’s back, the process itself was therapeutic. The image is powerful and her verbal response to Knez’s question about it is meaningful when one considers it in rela-
tionship to her decision to delay surgery until "absolutely necessary."

Daisy created a textural, boldly colored windchime (Figure 13) at the end of her art therapy treatment program. On the back of each piece she inscribed personally meaningful dates and accomplishments. For example, she included "I started art therapy on February 1." She acknowledged that she had felt hopeless at the start of treatment and explained that "doing things" helped her "feel like somebody" again.

Daisy had benefitted from her creative art therapy sessions and was encouraged by her art therapist and psychologist to continue activities that she enjoyed. She began a swimming class and participating in the Fairhill Art Studio "Discover the Artist" Program.

Eliza came to the outpatient brain injury art therapy program through a referral from the Child Life worker with whom she had faced many hospitalizations as a young woman. A brain stem tumor, diagnosed in infancy, necessitated ongoing medical treatment during her childhood and young adulthood including 60 surgical procedures. Her art therapist, Ky Wilson, had first met Eliza through her poetry when Ky illustrated a book of poems by hospitalized young people. Her well-crafted poems reflecting on life as a person coping with pain and physical limitations introduced Wilson to a powerful self-expressive artist.

Since so much of her life had been focused on illness, Eliza and Wilson decided to focus on her healthy side and strengths in their weekly art therapy sessions. Though the art therapy hour was a time when any problem could be discussed, the focus always leads back to the artmaking and its numerous avenues for positive self-discovery and resolution.
During the past 2 years, Eliza has used the Studio in a remarkably rich manner, both for developing new relationships with other art therapy staff and patients and for expanding her considerable talent for creative self-expression. She has made use of the “broad spectrum” available in the studio setting for personal reflection on her life situation, to study the history and techniques of art, and to explore new and intriguing media.

Eliza’s unique personal expression is seen in the thoughtful and reflective artwork she creates at home and brings into the Studio to process with Wilson. These generally small 8 1/2” x 11” mixed-media works seem to serve as vehicles for expressing, releasing, and sharing past and present pain and the extreme feelings of isolation illness can bring. The terrors of living a life in which dissociation is a main defense against severe physical and emotional trauma and people who don’t understand one’s feelings are often the subject of these works. When describing her pain, Eliza said, “It’s as though I’m an exposed electrical wire, a raw unprotected nerve that vibrates and jumps. The feeling is similar to how glitter affects the eye. I think that’s why I like to use glitter so much.” Eliza has also developed her ability to use humor to cast a cleverly mocking light on her difficulties. Figure 14, “Doctor At My Bed,” exemplifies the distant feeling a patient may have when dealing with a healthcare professional who can’t empathize and who creates more distance by not being “real.” Through re-creating the masklike smiling face, Eliza gains control of the painful memory by “facing” it and sharing the pain creatively.

Eliza has also used the Studio as a center for the study of art history. Her health no longer permitted Eliza to attend college classes, so she developed a plan to explore each major period of art history, concentrating on 19th and 20th century painting. Each week she and Wilson selected a painting movement to re-create through watercolors or acrylics. Eliza’s Impressionism study involved making a study in acrylics of Renoir’s “Road at Wargemont.” She showed her good humor and self-esteem through her title “Road at Wargemont, Revisited and Improved” (Figure 15). Her study of Renoir shows solid ability to re-create the composition, color, and feeling of Renoir’s artistry. This was an affirming, integrating experience.

Eliza also used the Studio setting for extensive media exploration. Since she has such an imaginative mind, the wealth of art materials on hand inspired her to create highly individualistic, mixed-media collages. For example, “Is That All There Is?” (Figure 16) combines balloons, found objects, colored glues, torn...
paper, and glitter to symbolize the leftovers of a party. She de- 
corated the frame with colored glues to incorporate the painting 
mood in the border. Eliza used the rich media symbolically to ask 
the question about life: "Is that all there is?"

As her skills in creative artmaking have grown, Eliza has 
reached out to fellow Studio artists, forming important bonds 
with volunteers, patients, therapists, and visitors. These bonds 
with other artists offer her the opportunity to share her gift of 
creativity, her insights, her love for the healing creative process, 
and her joy in knowing others through art. In her own words:

So many tragically traumatic and wonderfully beautiful experiences 
have occurred in my life that I haven't had much time to assimilate 
them all into myself. Life "keeps happening." Art helps me bring all 
this emotion and conflict to the surface (literally!) where I can begin 
to make sense of most of it and learn how to deal with the utter 
senselessness of the rest. I really know something important is hap-
pening as I create each piece because it feels like what I imagine 
giving birth feels like: painful, fervent, and all-encompassing but 
afterwards exhilarating, purposeful, and you want to do it again! It's 
incredible and eerie how art can bring out so much of my inner 
world. If God did not give me the ability to create art I would be 
much like a stomach unable to empty itself—eventually I would 
burst because life has force-fed me a lot :-( I tend to bite off more 
than I can chew as well.

Conclusion

Eliza's words speak eloquently to the healing nature of the 
creative process for all people and to the Art Studio's purpose for 
being. Just as Eliza, Frank, and Maria have had their needs met 
through involvement in the Art Studio's programs, so too have 
countless others. Though the Studio began its work in a rehabili-
tation setting with physically disabled and chronically ill 
patients, it has since expanded to make the arts available and use-
ful to people with other special needs.

The presenting diagnosis may differ greatly, but there is a 
common need to cope with traumatic events, to make sense of 
life-threatening, life-altering experiences, and to integrate and 
make inner and outer worlds congruent. The Art Studio has cre-
ated specialized programs to make its services more readily 
accessible to a specific population such as chemically dependent, 
sexually abused, brain-injured, or elderly persons, both at the 
hospital and at Fairhill. However, the model for each of these 
programs has been studio art which emphasizes the nonverbal, 
image-producing qualities of artmaking as central to therapeutic 
gain. Even when the goal is to increase cognitive skills or encour-
age discussion of feelings, the art process and its product are 
total to the experience. As Eliza said, "Life keeps happening," 
and art continues to help us bring all the emotion and conflict to 
the surface where we can begin to make sense of it.

Editor's Note: The author wishes to acknowledge Dr. George 
Streeter, Kathleen Kern-Pilch, Dawn Kneze, Rich Schultz, Ky Wilson, 
and all past Art Studio staff, trustees, and volunteers for their individual 
and collective contributions to this paper and the program it describes. 
The author is pleased to announce that the Art Studio established a 
Graduate Clinical Training Program in art therapy in April 1995 that 
incorporates the studio-based model into its education program.

The Intern Studio: A Pilot Study

Linney Wix, MEd, A.T.R., Albuquerque, New Mexico

Abstract

This article describes and discusses the Intern Studio Project, a two-semester pilot study. The Intern Studio Project consists of the provision of regular open studio time for art therapy interns in a state university graduate program. The studio enables them to make art in a community setting which enhances personal and professional growth. Psychological and artistic bases for the open studio approach in an academic setting are discussed. These psychological and artistic theories include the relational approach, Hillman's essentialist paradigm, and series and context theories. Students' self-reported experiences in the studio are included.

Introduction

During the academic year 1993–94, I conceived and developed the Intern Studio Project. This became a weekly studio arts experience for student interns in the graduate art therapy program at the University of New Mexico where I teach. After a difficult experience which plunged me into recognizing the necessity of arts-centered research for the field of art therapy education, I understood the importance of recentralizing art-making in my own professional process. I realized more deeply my belief in art as the structure of an art therapy education, not the icing on the cake, and I began to pursue modes of research based on nonverbal methods of inquiry. One result of this research is the Intern Studio Project, in which the art therapy intern's own art process and product are the focus of the research. Here, visual modes of dissemination, such as art exhibits and video tapes, are as important as the written word.

The Intern Studio Project offers educational and artistic experiences geared toward the prevention of "clinification" (Allen, 1992) of art therapists. It also models and teaches art as "the way" in contrast to art as "the tool" in art therapy education and practice. It provides a forum in which studio participants and facilitator practice the art of maintaining the centrality of art-making to their own life processes.

In this paper I will discuss the theoretical bases for the Intern Studio and describe the project and the role of artmaking in the development of the art therapy intern. The paper documents what happened during the two-semester pilot study and lays the groundwork for research into the effects of intern participation on intern experience and the effects of the facilitator's participation on the studio structure and on the facilitator's artmaking.

Theoretical Foundation

Allen (1992) discusses what she terms the "clinification syndrome," a process in which art therapists develop clinical skills while art production decreases. This results in a professional art therapist who cannot be differentiated from a social worker or a psychologist. The art therapist loses what has distinguished her or him in the therapy field—her or his art—and looks like any other member of the clinical treatment team.

Although the Intern Studio is not an artist-in-residence situation as described by Allen (1992), it may be another mode of preventing the "clinification" of art therapists. The Intern Studio allows for ongoing studio experience outside of internship and among peers. It provides interns a place to "dwell deeply and fully" (Allen, 1992, p. 23) in the art experience. It is another way for art to stay central to the art therapy experience. The studio can serve as a model for students before they enter the clinical world; furthermore, this experience may partially alleviate the loss of the artist within the therapist who must exist in the clinical or educational setting. Thus, this particular Intern Studio method may contribute to a decrease in the "clinification syndrome."

The writings of Allen (1992) inspired me to determine how I might incorporate the idea of an open art therapy studio into a university environment. However, my larger work both in and out of the Intern Studio has been and is currently influenced by a variety of other writers and artists whose ideas I appreciate as they mesh with ideas of my own. These writers include Gilligan, Rogers, and Tolman (1991), Beittel (1972, 1973), and Hillman (1991, 1992), each of whom has made a significant contribution to my own body of working ideas.

In describing their "relational" paradigm, Gilligan, Rogers, and Tolman (1991) differentiate the development of adolescent girls from the traditional model of developmental theory which posits separation as a goal and is based on the study of males. The relational paradigm suggests that "female" systems have a web-like structure of connectedness in which sustaining relationships is primarily valued. In the Intern Studio, these ideas about relationship are applied to artmaking. In the context of artmaking educationally, therapeutically, or in the community studio setting, the relational paradigm includes, but is not limited to, the person-to-person relationship. In the artmaking process, multiple relationships are constellated. There are the relationships between and with the media—with the chalkiness of pastel put to paper, the squeal of chalk on a board, the thick rubbing of oil pastels, the fluid brush-stroking of tempera onto paper, the pushing of acrylics onto canvas, the rubbing of hands across a paper on a monoprint plate, the textural qualities of paper, canvas, or board, the cool crispness of the clay felt by the hands. Each of these experiences provokes oral, tactile, visual, and olfactory responses. It is the sensory contact that matters here—the place of sensory connection with the materials. There is also the continuously changing relationship between the maker and her or his creative process, as well as the relationship between the
maker and the resultant art image. The act of making sensory contact, central to the hands-on art experience, embodies relationship. Additionally, in this open studio model, there are the relationships among the artists who are working separately, yet together.

The writings of Brittell (1972, 1973), ceramic artist and art educator, have supported my application of relational ideas to art making and specifically to the Intern Studio. Two of Brittell's concepts that are especially relevant are those of context and series work. Pepper's "contextualist world view" (as cited in Brittell, 1973), concerns "the event alive in its present ... the event in its actuality ... when it is going on now, the dynamic dramatic active event ... it is an act in and with its setting, an act in its context" (p. 75). In the Intern Studio, the "act" is making art; it is within the context of a weekly studio setting with other students who are interns. This context includes the "dynamic, dramatic" experiences of making art, expressing, feeling, laughing, looking—actually seeing our own work and that of others in process, as well as talking about color, form, technique, and content. By its very nature, the studio context is comprised of a series of art-centered acts involving relationship and the senses. The context also involves the ongoing processes of individuals in a group so that, besides the individual series of week-to-week artwork, a group image is present. Within this contextual framework, series artwork evolves according to each individual's focus.

It is in the process that we know experientially; it is in the effort to reflect and communicate that we know consciously, cognitively; and it is in the perspective of time, of the series, that we know change and are led to evaluate that change. (Brittell, 1972, p. 211)

Hillman's (1991, 1992) ideas on essential psychology also suggest a "series" approach. Central to the essential psychological view is the idea that from birth we each carry an image, much as an acorn holds an oak, that holds who we will become. What the acorn contains is not available to be seen until we look back at our lives when we are older. Then, the experiences of our lives make sense as they fit into the process of who we are. Thus, life can be conceptualized as a series. Likewise, in a series approach to art, no image stands alone. Each is connected to those that came before and those that are yet to come. Much as Hillman (1992) suggests that we have carried our future selves in the "image in the heart," each art image also emerges from the heart of another image. The Intern Studio functions in a relational model, from an essentialist model. Participants work relationally with one another, with materials and with process and from their individual "acorn" experiences.

The essentialist acorn idea, as it applies to the development of the image in series work, follows a relational paradigm. Just as who we are is related to who we were in childhood through the acorn image, art images are related to one another in series work. Each image carries the next image, and when seen in the series context, the inevitability of the emergence of each image becomes visible. Art is a great chronicler of life; reviewing a series of art images helps us see the unfolding of ourselves and our art.

In applying concepts from relational and essential psychological theories to the Intern Studio, I have observed how the imagination and hands-on art experiences feed each other. The word imagination is derived from the Latin imago, a "likeness of something" and imaginari, to "form an image in one's mind, to picture to oneself" (Ayto, 1990, p. 294). Hands-on implies a manual act; manual derives from manus, the Latin word for hand (Ayto, 1990, p. 337). Together, imagination and the manual act of making art result in the actual formation of things "never before wholly perceived in reality" (Merriam-Webster, 1984, p. 578). As individuals have engaged in their own acts of forming in the context of the Intern Studio, the studio has taken on its own particular formation as well.

**Studio Structure**

The Intern Studio met for 3 hours once a week over two semesters. (At this writing, the third semester of Intern Studio is just beginning.) During the first year of the project, five interns participated during the Fall semester, in the Spring semester, nine interns (more than half of the interns in the art therapy program) participated regularly. It has been limited to interns rather than being open to all students because the internship experience can be an especially difficult time for art therapy students. This is the period in their education in which they often neglect their art making as a natural part of the process of becoming an art therapist. Studio participants are in their second and third year of graduate study, thus, they have lost much of the community support that comes with being in first-year courses together. The art space and time provided by the Intern Studio Project serve as a container for intern art therapy students and their art making while functioning to prevent the "clinification syndrome" during art therapy training.

I know the "clinification syndrome" intimately. I know it in the clinical setting, where to be a primary therapist one could not also be an art therapist. There were a few years when, in mental health settings, I was caught in the hierarchical dominance of therapy over art. I also know a close relative of this syndrome in the university setting, where to attain academic status, I became more dedicated to the computer and words than to the studio and images. I allowed the terminology of my field to take precedence over the art making process. It was a hard lesson to learn that I am an artist and that what initially brought me to the field of art therapy was my own art experiences, and that it is from the place of experiencing art as healing that I can best work with others. My work must involve an engagement in my own art processes and the art processes of others. The Intern Studio Project provides a context for my art making and that of student interns. It also provides the context for research into the effects of art making on student interns.

The Intern Studio also has served as a container for the arts focus of my work. For me, the Studio contains the educational, therapeutic, and creative aspects of art. It is designed to instill and maintain, during the art therapist's education, the belief in art as "the way," rather than art merely as a therapeutic tool. For example, when art is used as what I call "the way," the art process and product are central to the image of the art therapy process; when art is used as a therapeutic tool, the art is more of a jumping off point for verbal exploration or an illustration for the verbal session. However, neither approach excludes verbal processing. In the former, the art is used as the core and focus of the discussion, with therapist and patient listening for metaphors and stories in and around the image. In the latter, the art leads to a discussion, generally of a problem the patient is encountering.
this leads to a departure from the art image. What I want students to learn from the Intern Studio is the former approach, where the art is central. An essential ingredient here is that the setting is the studio, not the office. The studio setting itself implies the centrality of art.

A focus of the Intern Studio is making art in community. As stated earlier, the idea of contextuality supports the community structure of the studio in that participants make art separately, yet together. One student stated, “I can work by myself here and yet get a feeling of community that gives a lot of support.” Another said, “My artwork is affected by working with other people. I like that. I have my studio at home, but this is different.” Yet another conveyed this idea when she said, “[In the studio], there’s a sharing of creative energy. It’s greater than the sum of its parts.”

In forming the initial studio, an open invitation was made to interns to join a studio art group designed to explore their ongoing internships through art. A time convenient to the majority of interested interns was chosen to maximize the potential for attendance; the structure of the studio calls for a commitment in attendance and participation in order to reap the benefits of art-making in tandem with the internship experience. The studio is held in an art therapy studio/classroom. Art materials are supplied by the interns themselves. Students do not receive academic credit for their commitment, but they do receive community support both for their art and for their internship struggles. As Kim Kelly (Figure 1), who completed one semester of internship before becoming a studio participant, said, "Setting aside a time was not a struggle. It was like buying myself ice cream... Last semester was harder. It was hard to understand the experience of watching other people do art when I wasn’t doing my own" (personal communication, 1994).

Internship, although often not discussed, is always present as a component of the lives of the students involved. Internship, then, is a part of the larger image; by this I mean that the image is more than the art product. For these particular students who are immersed in their internship placements and trying to make sense of it through their own art, the internship experience is a part of the image of their lives. Jenny Hubbard, a first-semester intern, observed:

"Psyche meets psyche in therapy. I bring internship into studio whether I’m conscious of it or not. What I do in studio grounds me (in my internship work) and is part of the overall image. From my internship setting to the studio, it’s a continuous loop of psychic activity.... When I make these spheres, it’s a way to keep the parts together as a part of a greater image. In making these spheres, a holding happens, and it’s a holding that holds the whole internship and me in it." (personal communication, 1994)

In the studio, interns choose the course of their artmaking. In the process of self-directing, the intern is also self-creating. Media, content, and method are self-chosen. Thus, relevance or irrelevance to the “loop of psychic activity” is also self-chosen. These artistic directions are important visual markers along the way to becoming an art therapist. As the interns make their art, their art makes them, and when they look at their art, then they have a new way of seeing their own processes. The acts of making with the hands and seeing with the eyes become central to the current life process, in this case, the process of training to be art therapists.

Figure 1. Kim Kelly with "And Then The Angels Came"

Student Experiences In the Studio

I came to conclude that the human use of art, wherein art is seen as an ultimate, a discipline, a move toward the expression of feeling through the work of imagination and the resistance of medium, requires a normative frame in which the “prescription” is self-chosen and self-monitored. Without centering on his own imagery and intentionality, and the uniqueness of each encounter as process, all aborts for the artist. (Beittel, 1972, p. 206)

Throughout her first semester of internship and studio work, Barbara Falconer prescribed the task of redefining art for herself. During the semester, she struggled with her traditional concepts about art and beauty in contrast to what she was seeing in her psychiatrically based art therapy internship. Her contact with patients and their art so profoundly influenced her ideas about art that she spent many hours in the studio, redefining art at the potter’s wheel. She stated that she had once worked for a period of time to create the “perfect” pot and that she had never achieved it. Now, here she was throwing pots and cutting them or deliberately throwing them off-center. She put the trimmings from the outside on the inside; then, what was inside was thrown up and left to emerge as part of the outside. As Falconer realized this, she came closer to her current image of the “perfect” pot (Figure 2).

Falconer’s understanding of the studio experience was as a meeting ground for “cross-imaging,” inside and outside, art therapist and patient. Intrigued by how patients and therapists end up working with similar images, she stated, “It’s a re-pysche-ling” (personal communication, 1994). In the relationships between
art therapist and patient and between internship and the studio experience, the psyche is recycled over and over in different media and different contexts.

The Intern Studio Project provides a container for the enactment of imagination in the hands-on making of art. In the making of ourselves as art therapists, the studio serves a vital function in containing the artist part of that formation. The studio, and perhaps only the studio, has the potential to hold the artist while she or he becomes an art therapist who does not leave her or his artist-self behind.

Third-semester intern Ingrid von Brockdorff stated,

Studio lets me let go of the business-y parts of internship. The art gives a place for all the stuff you see as an intern to go. When I wasn’t doing studio, I had to talk about it all the time. Now I’m wanting to put what I feel into an image around that talk. For me Studio has been a container for what would have been talked about. (personal communication, 1994)

Participants in the Studio Project agree that the studio has added a richness to their internship experiences that previously was missing. Each agrees that her or his own style of artmaking and verbal image work is echoed and heard anew in the studio setting through working together in the student intern community context. The Intern Studio has served as an anchor, allowing an environment for the multiple relationships that occur in the art therapy internship experience to be explored through art-making in a community studio context.

Conclusion

In its first year, the Intern Studio has helped to keep participants closer to what art therapy just might be about: art. The studio has allowed its participants to remain involved in the image instead of just in words about the image. It has kept interns in a hands-on place rather than being tempted to remain heady about a sensory-rich act that happens through the hands. Studio afternoons have provided art therapy interns an opportunity to maintain what has most often brought them to this profession—their own experiences with art’s ability to heal. When the art is made the center of the art therapy education, then the passion of the making is remembered by the maker and imparted to the patient. Studio participants have the opportunity to integrate their experiences into intern work or to use their studio art experiences alongside internship.

Pilot results of the Intern Studio have been encouraging and student feedback has been positive. As a result of the two-semester pilot study, there is an exhibit scheduled for the Fall of 1994 exemplifying the studio process of artmaking in this training program. Grant monies are being sought to support research on the studio method in the training of art therapists and to fund a video documenting the studio process as it unfolds. As a result of the pilot study, a summer course, “Studio for the Art Therapist,” was taught in response to pre-intern student requests.

In my own educational and early clinical experiences, I was taught to be a therapist to the exclusion of my artist. Art was my own private matter and responsibility. It still is, of course; yet, the studio has provided me with a different perspective as well. Through the Intern Studio Project, my art and that of participating students have been recentered in the art therapy training experience as a community matter and responsibility. As studio facilitator, I hope to use the hands-on artmaking experience to help students remember and center their artist-selves as a prerequisite for kindling the therapeutic art experience in others.

Keeping the Studio

Shaun McNiff, PhD, A.T.R., Beverly, MA

Abstract

In this paper, the studio is approached as a therapeutic community of images where the therapist functions as “keeper” of the space and atmospheric medicines which act upon the people who visit and participate in its creative ecology of forces. It is not physical suitability which determines the success of the studio. In fact, distractions and imperfections in the space may more accurately mirror the state of psyche and so induce the passionate engagement that calls forth soulful images.

I started my first job as an art therapist at a state hospital in early 1970. Before meeting staff and patients who lived in a huge Victorian brick and granite building constructed in the 1870s, I was introduced to an old wooden building in a field at the east end of the hospital grounds. There was an identical building at the other end, almost a quarter of a mile away. The empty building was to be used exclusively for my art therapy groups. It was called the Art Cottage and its partner at the west end of the hospital was the Music Cottage.

In keeping with the institutional treatment of the time, there was not much happening outside the context of drugs and other restraints, but there was considerable “space” being made available for art. I was untrained and the hospital offered no instruction in the practice of art therapy. The possibilities were as open as the empty rooms of the cottage. In retrospect this was a perfect way to begin. I met the space first, and it told me what to do: It wanted to be filled with images and people making art. The medicines of the process would find their ways through the souls of the people and things involved.

My noninstructions from my supervisors at the hospital were actually quite clear. Their actions said, “Put this place to work.” So my career began to take shape around the creation of a workplace, a studio for soul work. Rather than focusing exclusively on the individual problems of patients, I was oriented to a physical space which called for their involvement. We began with the need to fill a space with images and life. I could not do this alone. I needed them to establish the sense of the place and its function within the hospital.

The cottage had two large rooms with high ceilings, joined by an equally large foyer. It was situated at the crest of a large hill with fields below, the beautiful natural environment always reminding me how the post-Civil War mental hospitals were designed to expose people to the medicines of the physical world. The 1870s advanced the idea of humane treatment for emotional difficulties, and these practices grew from the American Renaissance of the mid-nineteenth century in literature, philosophy, religion, and utopian living. The cottage had windows everywhere, and on its south side an enclosed porch ran along the entire length of the building. The two cottages were probably built for tubercular patients who needed to be housed separately from the main building, and whose treatment was primarily focused on fresh air and light.

To inspire means to draw air into the lungs, to breathe, and semantically spirit derives from the Latin word for breath, the breath of the gods. The animating principle in both TB treatment and art is inspiration, the inhalation of airs and spirits. It is fascinating to imagine the therapeutic qualities of our art studio being connected in an elemental way to the healing methods practiced in the old TB cottage. Just as the tubercular patients needed good air, the soul benefits from stimulating airs, poetically known as an atmosphere, ambiance, aura. My first art therapy studio was set up according to this natural sense of what the soul needed—creative breezes, breaths, and emanations flowing from a place.

The emptiness of the large space was a stimulus for my work with the patients. As Gaston Bachelard said, “The simpler the image, the vaster the dream” (1994, p. 137). The space invoked freedom and endless possibilities for inhabitation. It pushed me to gather people and images. It served as an alchemical vessel for the transformations of the artistic process. Many things happened within the cottage, and it quietly accepted them all while sheltering everyone involved. It was an asylum within the asylum because of its separation from the main hospital complex. Patients arriving at the cottage literally passed into another world, populated by distinctly different qualities than what they encountered on the wards. Culture and soulful creation radiated from every part of the place.

Twenty-five years later, I see that my art studios are still keeping the rituals initiated by the first weeks in the Art Cottage. We always begin in an empty space which we fill with people and images. The place is transformed and ensouled as soon as the images arrive. Or as Allan Cussow says in A Sense of Place, “The catalyst that converts any physical location ... into a place, is the process of experiencing deeply. A place is a piece of the whole environment that has been claimed by feelings” (1971, p. 27). The same principle applies to our treatment of artifacts and art made within the studio. Guided by the values of deeply felt experience, we establish a community of creation through the most basic actions of working together and reflecting on one another’s expressions.

Participation Mystique

It is the images which carry transformative spirits into our studio groups. Their sensory qualities and energetic auras have a visceral impact on everything they touch. The environment transmits creative forces and becomes a primary agent of transformation. At the age of 23, I intuitively set out to make the space of the cottage into “a place” through creation and the intimate
relations it engenders. My lifelong practice within an art therapy studio was constructed in those first days of beginner's mind which atavistically accessed the ancient continuities of a participation mystique manifested through the rituals of community. A place presented itself to me, ready to be inhabited with a particular purpose.

My group therapy supervisor at the hospital was a consulting psychiatrist who felt that the most important therapeutic work occurred within communities of all kinds. He was deeply suspicious of the medical model, and we didn't have to look far in the hospital to see its failures. He was open to what was happening in the Art Cottage, and the two of us learned about this new, or very old, therapy through his questions.

We looked at the making of art from the perspective of community interactions, and he introduced me to the ideas of Maxwell Jones. I started a therapeutic community on one of the hospital wards and ran a number of different groups in locked areas of the hospital, but I see now that the most vital and inspirational work we did during those years was in the Art Cottage where the patients, the many volunteers, and my life were being influenced by the creative milieu. We had to get out of the hospital to establish a sanctuary of soul medicine which functioned according to a totally different vision of treatment. Within the hospital, institutional forces swallowed every attempt at change.

As with Jones's experiments with self-help, we discovered that empowering the patient-artists as decision-makers and creators increased their sense of belonging and responsibility. Jones felt that creative transformation was stimulated by a "social ecology" involving flexible and open interaction, listening, the sharing of decisions, learning from mistakes, trust in people, and a pervasive sense that "process was more important than the goal itself" (1982, p. 144).

The therapeutic community "cherished risk-takers" who spontaneously expressed feelings and established a group trust that made it safe for others to open up. It embraced intuition and the way people influence one another through creative contagion.

Ultimately, Maxwell Jones concluded there is "little difference between treatment and training" (p. 104). He said:

My growing interest in the process of change led me to realize that growth and creativity are, at least in part, a by-product of an open system.... There must be a "destructuring" of what exists. One has to take a risk and become insecure and vulnerable to reach this stage of transformation.... It is only through this "unknown" that a new order and a new combination or a new identity can be discovered. (pp. 150-151)

Just as Jones, a psychiatrist who began to call himself a social ecologist, pondered whether or not medical science was the proper vehicle for his community practice, I have been increasingly concerned with whether or not the work I do in studios today can be located within the idea of art therapy, which tends to align itself with the clinic rather than the studio, institutions rather than places, "populations" rather than communities, data rather than images. When the discipline is defined in a way that reverberates with the eternal healing functions of art and the participation mystique of community creations, I feel an intense identification.
What Places and Materials Do

I recognize that art's medicines are comprised of forces generated by distinct substances and physical spaces which are the most predictable elements within an art therapy studio. Different materials and environments will emit expressions in keeping with their structures. Although they are both involved in constantly changing and uncertain relationships with artists and groups, the materials and studio space have a relative constancy of expression. The free-flowing nature of watercolor evokes distinctly different psychic states than do thick oil paints. Sculpture made from wood and metal will arouse feelings distinct from a clay construction. The materials are carriers of emotions and psychic states that are unique to their beings. The same thing applies to studio spaces. A small, but well-organized workplace full of people will generate a crowded energy that moves creation in a distinctly different way than a large and open space. One is not necessarily better than the other.

For years I have said that research in creative arts therapy should stay closer to the studio where we can experiment with these different material expressions and spirits like physicists or chemists in their labs. Dutch art therapists, in keeping with old European beliefs that cures to internal ills are found in external things, were studying the therapeutic properties of materials well before the formulation of art therapy training in the United States. Because we have valued only what the art object says about the artist, we have overlooked what it presents in itself and how its expression has inherent therapeutic properties.

I don't protest art therapy's humanism, but I feel that a one-sided orientation to the person who makes the object obscures how the material and the artmaking space are the defining qualities of the art therapy profession. The studio and its creations, our object and image-centeredness, are what distinguish us from all of the other person-centered therapies. We need to research materials and environments and what they do to us.

After retiring from her practice of art psychotherapy, Helen Landgarten returned to her studio. I am especially intrigued with the yet-to-be discovered effects of her re-entry into a full-time life of painting. In keeping with what I said about the therapeutic studio, the artist cannot know in advance what she will engage, and she cannot anticipate the impact it will have on her future life or the practice of art therapy. The basic framework of consciousness when entering a studio is an attitude of, “What will arrive today? What will happen over the course of the next year?” The artist may start to work with an image in mind, but in order for the spirits of creation to start cooking, there must be a melting of control and a surrender to the spontaneous movements of expression which will always deliver contents outside our frames of mind.

Landgarten is making a clear statement about priorities. She came to art therapy as a distinguished painter, continued painting throughout her career, and now immerses herself in the life of the studio. I am not as concerned about making direct links between Landgarten's actions in the studio and the clinic, as I am in observing how a life in art therapy has only seemed to deepen her personal commitment to the studio and its spirits. I cannot explain how one place influences the other. My sense, though, is that there is a vital partnership between the two. The studio is the base from which she reaches out to therapy. It is the source of the vision to which Landgarten must maintain a vital connection. This is the model our profession needs to contemplate.

My personal experiences in the studio have always shaped my commitment to art therapy. I feel things in art that I want to bring to others, and as I see others absorbed in the creative process, it recharges my own artistic desires. The studio is an ecology of mutual influences.

I just returned from leading a week-long studio in New Mexico and stayed afterwards for two nights in art therapist/artist Howard McConeghey's studio. The artist was away, but his spirits were strongly present in the art space. Like Landgarten he has retired from the practice of art therapy to paint. I know that many more art therapists are doing the same thing. What unpredictable impact is clinical work with the arts having on a person's desire to be in a studio? What impact will the full cycle of this ecology in the long-term have on the practice and imagination of art therapy?

McConeghey's studio is in a separate building close to his house, apart from the living quarters by a garden. The place is a sanctuary, a temple of sorts. I have the same feeling about Landgarten's studio. Do we live our lives in art therapy as an expression of our longing for the studio? Does service to others give us the freedom to imbibe what Landgarten calls narcissistic self-expression? It is the indirect suggestions, the subtle messages and inspirations, that I feel when visiting both Landgarten's and McConeghey's studios. They want to be in the studio. I sincerely hope this desire sweeps through the soul of the art therapy profession.

I emulate art therapists like Allen, Landgarten, McConeghey, and Moon who maintain a passionate personal commitment to the studio. They keep me attuned to the basis of the work, to the importance of my own expression, to the mainstream of art. Art therapy thinks it is involved in a technical fixing of problems, but the real work has more to do with what the Romantic poets called flying sparks which jump from person to person, image to person, person to image, image to image.

A Therapeutic Community of Images

In my therapeutic studios, art leads the way. The images and movements are always a step ahead of the reflecting mind and its professions. My practice draws heavily from psychotherapy and depth psychology which help us access the medicines of images and groups. What I do today in studios with art therapists, artists, and what we call “healthy people” is not far afield from what I did in the mental hospital 20 years ago. I have stayed with the medicines of the studio, and I have brought them to a broader spectrum of participation.

As I reflect on what we did in the early 70s, I see that a community emerged from the making of images. I am doing the same thing today. Little has changed within my essential studio practice where rituals of community and creation continue to happen spontaneously through our actions in a particular place. For 25 years I have practiced almost exclusively within groups. After the first session of a studio, I am always in awe at the way the space is transformed and the soul is opened as soon as the images arrive.

Every studio repeats the experience of beginning in an empty space, like the Art Cottage at Danvers, which soon
becomes populated by creations. I keep telling participants that our group is composed of the many images we make, as well as ourselves. Even in small groups this rich multiplicity takes us into the realm of community. I have stayed with group practice in studios because year after year I see it working deeply on people. I keep saying how the group-mind is more intelligent, creative, and resourceful than any one of us. My therapeutic style involves a careful watching of the group process, in both art and interpersonal interactions, with a faith that soul will treat itself if given the proper environment and support. Like Maxwell Jones and other early group therapists, I work within an emanation model and “trust the process.” If we open ourselves, stay committed, and patiently wait, things will happen through the soul’s epiphanies.

The group-studio chemistry is based on the process of individual people performing the intimate and isolating rituals of painting within a communal environment. They are drawn together through what I call the “principle of simultaneity” in which the solitary activities of the visual arts are accompanied by the parallel creations of others. In addition to the shared energy of working, participants give attention to each other. We witness and receive the expressions of others and open to what the images have to say. It is this process of making art together and then bearing witness to the arrivals in a sacred way that establishes the healing imagination of the environment.

As a leader my primary functions are protection and inspiration. I “keep” the2 sanctuary and “maintain” the space for the participants. I set up an ecology in which the process takes people where they need to go. For years I avoided the term trust the process because it seemed like the most outrageous cliché, but now I see that it is the fundamental quality of the work. The freedom of the studio environment allows the soul to move according to its purpose.

I try to keep the structures and procedures elemental because I have found that depth and simplicity are bound together. If we overcomplicate the purpose of art, we interfere with the wisdom of the process. I keep returning to the image of the simple, empty space of the Art Cottage as the hypostasis of my work. I prepare an open studio that receives the participants who fill it with their art and souls. Within the studio each person goes on a distinctly personal journey, yet they paradoxically travel together and construct a therapeutic community of images.

Although I have worked alone with many patients in studio settings, my experience of the strongest creative medicine is associated with groups. When we gather to look at images and work with them, the atmosphere changes from that of a conventional art studio to one that conveys qualities of therapy and spiritual community. We look at the pictures through the eyes of soul rather than the more technical perspective of the art school. This way of viewing art does not impair aesthetic quality—to the contrary, it tends to make images more expressive, authentic, free, unusual, and passionate. There is a sacred sense of witnessing rather than an orientation to analytic judgments and labels. People respond to one another, and to the images, from the heart.

One person’s artistic expression stimulates an equally soulful response from another. The flow of the group holds an ongoing stream of creative emanations where one artistic expression follows another. Verbal explanations have their place in the studio, but they do not dominate the atmosphere. We find that responding to art with body movement, improvisational sounds, and performances gives everyone a much deeper and clearer sense of how the person is affected by an artwork. We also share dreams that come the night after painting to interpret our works in ways inaccessible to the reasoning mind. The introduction of dreams and other artistic expressions into the studio enhances the psychic environment and expands its resources.

In summary, in a therapeutic studio it is the overall presence, the soul of the place, which grows from the people and images while simultaneously acting upon them. As a keeper of the space my function is to maintain the presence. I do this through example, support, and constant guidance.

**Imperfect Environments**

Often the places where we work generate very unattractive auras and disturbing environmental forces. I have constructed many hundreds of nomadic studios throughout my 25 years of practice. I feel like a Bedouin traveler who keeps putting up and taking down his tent. In my travels I don’t think I have ever worked in an ideal studio. There is always something that could be better organized in the space. I have contemplated constructing an ideal place, but maybe I should not. The perfect studio could establish an unrealistic standard. It may be better for me to keep working with whatever materials I find in the different places I visit. In this way we demonstrate to others how the studio can be set up anywhere.

Groups repeatedly teach me how to maintain a spiritual presence amidst the din of a work area. If the keeper of the process relaxes, this helps everyone else to do the same. The reverse is also painfully true. Everything depends on our concentration and faith in the process.

Although I prefer to work in the best space possible, I have repeatedly discovered that the vitality of a studio has more to do with the creative presence generated than the physical features of rooms. Distractions and imperfections may even perversely feed the creative spirit because they are not unlike our often disheveled psyches. There may be a wondrous medicine released by filling an unattractive space with the soul’s expressions. We medicine the disquieted places, and this spatial transformation has a corresponding effect on us. The presence of the creative spirit can be felt everywhere when a group is fully committed to its work. A sense of passionate engagement is emitted that cloaks the space.

**Where Does Soul’s Studio Belong?**

I have never taken art therapy for granted, and I often wonder whether it is an appropriate “location” for my practice of soul-making. Years before I heard about art therapy, my interests were focused on the sacred functions of art, the relationship between creation and depth psychology, and multidisciplinary cooperation between all of the arts, the humanities, and sciences. Art therapy appeared in my life in 1970, and our interests merged. To the extent to which art therapy embraces the diverse and unpredictable ways of soulwork, I have felt deeply attached to the profession. Like many people involved in art therapy, I
have found that the art education context has a one-sided orientation to technique and cognition which overlooks soulful depths. My studios encourage an active cooperation between the two.

Art therapy has been most useful in providing me with a community of colleagues who serve the same archetypal function. Just as psychotherapy cares for individual souls estranged from religion, art therapy welcomes the expressions of ordinary people alienated from art. But these sanctuaries may be temporary. Soul is inventing new ways of attending to her needs and envisioning a creative future in which the arts once again act as contemplative disciplines in daily life. Even though the mainstream of the art therapy community appears to be increasingly committed to a sacred function of art, the pressures of clinical regulation, written examinations with multiple-choice questions and a general distrust of imagination, may ultimately restrict the free spirits of the studio so that they migrate to other places, more hospitable to the ways of soul.

If we are to keep the soul in art therapy, we must preserve the studio as the practical and spiritual base of our praxis. I would feel much better about the profession if the medicines of the studio were the foundation of a collective vision. But I see that the values of soulwork do not figure prominently in the official persona being constructed today. In place of our former efforts to establish professional standards by looking at the creative portfolios of art therapists and their experience in practice and supervision, they will now be assessed by written tests which have so little to do with praxis.

Art therapy is at an historic point of definition. For over two decades the profession skillfully maintained an inclusion and respect for every conceivable way of imagining what it could be. As the American Art Therapy Association now prescribes and evaluates courses of graduate study, nowhere in all of the regulations is there a requirement that art therapists be involved in an ongoing studio experience during their training and professional practice.

Don’t read this criticism as a plea for a new requirement. I prefer a discipline which is perfected through inspiration, like the spirits I describe acting on me as I walk into a colleague’s studio. The vitality of the place feeds my desire and encourages me to act in a similar way. In studios we learn through subtle suggestions and influences. The impressions are not always conscious but they work on us nevertheless.

The profession of art therapy cannot avoid benefitting from increased practice within studio environments where the unique medicines of the creative process can be cultivated. My purpose here has been to draw attention to how places influence the soul. Art therapy has overlooked the transferences between people and environments. The idea of therapeutic change has been restricted to what happens between a patient, a therapist, and the artwork with which they interact. My experience indicates that there are so many other forces at work within a milieu, and the notion of a therapeutic studio embraces this diversity of possibilities.

Led by the Space

In this paper I reflect upon the practice of art therapy from the perspective of the physical space, instead of from the more conventional assessment of a patient’s problem. When I look back at the beginning of my practice, the space is a formative force. I don’t wish to dismiss the treatment of symptoms and complaints; I am only trying to show how they can unconsciously deters the practices of a profession when it tries to accommodate itself to something other than its essential being. Rather than a genesis myth that says, “In the beginning was the symptomon,” art therapy might try imagining itself from a nonmedical perspective of, “In the beginning was the space,” or even, “In the beginning were the art materials and the people who used them.”

Symptoms are of course welcomed and they are vital players in the creative process, but they can be engendered from the perspective of art, or within the studio model versus the medical model. What does the space do to us? How does it move us to create an environment that becomes the primary carrier of the therapeutic process? As a therapist or leader, I am one of many agents within a more comprehensive gestalt or presence. The art studio functions like a spa, a watering place for the soul. The elements of the therapeutic studio are never limited to the patient, the artwork, and the therapist. As the therapeutic properties of the spa are discovered, people will come to it with a sense for what they need. Or they will come with an open and flexible mind, knowing only that they are in need, and that the therapeutic environment has many things to offer. The treatment will emerge through the process of a person’s interaction with the place.

We reframe the practice of art therapy by focusing on what the studio does, what the materials do, and how artworks created by ourselves and others affect us. When we look at art therapy through the eyes of the soul, we see an ecological field of forces, a total presence of creation, that simply does not fit the linear language and concepts of behavioral science. The mainstream of art’s medicine will always flow from the studio.

ArtStreet: Joining Community Through Art

Janis Timm-Bottos, MA, PT, RMHC, Albuquerque, NM

A psychotherapist, and especially an art therapist, should dive deep into the wrecks of psychic disasters, not merely skim the surface to look down from a distance at the battered, dismembered vessels on the bottom of the sea. (Wadeson, 1994, p. 153)

Perhaps because I do not swim very well, I was comforted by John Perry's (1993) lecture to our art therapy class several years ago. He said that we work according to how we are made. I was interested in his advice because I had been studying movement therapy for the past 15 years, working as a physical therapist, and through the Feldenkrais® Professional Training Program (Feldenkrais, 1977). I wanted to find new employment and a new way of working that bridged physical therapy and art therapy. I wanted to change the professional/client working climate that came with being an "expert," with the responsibility for fixing what was not working for someone else. I wanted to explore what was working in my own life and in those lives around me, and move, if possible, in that direction. I also wanted to have time to wait, if necessary, to hold and appreciate that which was not moving. Perhaps there are other art therapists who are "made" similarly. We don't swim that well in deep water or feel comfortable wading alone in the darkness of someone else's unconscious.

During winter break before my final semester in graduate school, Louise Kuhn and I wrote a grant to combine an open art therapy studio with the teaching of parenting skills at a shelter for homeless families in Albuquerque. NM. Louise, a nurse practitioner for Albuquerque Health Care for the Homeless, had been providing health care at this family shelter for about six months. The proposal was accepted and we began our ten-week parenting/art therapy classes. The course followed the developmental sequence of growing up, from infancy through taking care of ourselves, as adults. Our weekly discussions of particular phases of childhood were matched with appropriate art materials that served as catalysts to aid discussion. Often we just made art together and talked. The course ended with an unplanned art exhibit, "Roses Aren't Red," at the local library. This small project provided one avenue to the project ArtStreet.

During the period of the parenting/art therapy group, I attended a meeting of the Leadership Albuquerque Group Project as an art therapist who worked with "the homeless." The civic group, made up of leaders chosen from around the community, was interested in a project that promoted economic development within a community of homeless people. This project, chosen to produce a tangible result that would benefit a specific group, invited street people to meetings for relevant input. The consistent members happened to be artists who were homeless.

The group discussed a community-wide art marketing event and a permanent art gallery space, where artists who were homeless could sell their work. One way to explore ideas was to make art together during our meetings. It became my job to provide art materials, a direction in which to move, and witness the emergence of very powerful art-making. The diversity of the group and their visual art contributions enriched the discussions by identifying strengths that were not available through verbal sharing. Eventually, more grants were written by others and "ArtStreet: Joining Community Through Art" was created.

ArtStreet is a group of artists, art therapists, and interested community members who want to use art to build community and increase personal self-esteem, self-sufficiency, and hope among individuals and families who are dealing with homelessness.

ArtStreet found its home with the Albuquerque Health Care for the Homeless. The spacious art studio receives its funding, in part, from Save the Children Foundation. An Albuquerque Community Foundation and a private local foundation grant help to provide abundant materials at each studio session. Although all materials in the studio are available at each studio session (which run about 6 hours, 3 days a week), there is also an area set up to help guide newcomers. Materials change monthly: examples include printmaking, paper making, bee's wax sculpture, felt making, and photography. Artists from the community share their expertise in those specialty areas and everyone is invited to share ideas and skills. I am present to witness the process of artmaking, facilitate the practical workings of the studio, and plan, arrange, and install art exhibits. The directive in the studio is simple: Using the materials in this room, make something.

Within an environment of an open art studio, we can learn to value and respect our diversity. We work, as Perry reminds us, according to how we are made. Spending time, slowing down enough to value how one is physically made, can be as difficult as finding time to do art work. This self-knowledge reaps many rewards. An art therapist can draw rich metaphors from guided movement experiences that teach, for example, how your scapula learns to individuate from your shoulder complex by gradually differentiating from a global, unorganized motion, or how your stiff, stuck neck finds respect in the community of other effort-
lessly moving parts. One important lesson from Feldenkrais Training (Feldenkrais, 1977, 1981) is how my body's movements, with all its habits and pathology, is similar to a diverse community of people who come together with the same intention: to move and make something. Each person, each movement, functioning optimally or not, has a different important contribution.

At this point, our small community consists of about 25 people who have been art making for 8 months, approximately 20 hours a week. Last month, 290 artists signed our ArtStreet Record book. Since ArtStreet opened, a small core of “regulars” have attended all three weekly sessions. Others are in transition between homes, staying at nearby shelters; coming consistently for 6 or 8 weeks, and then not returning. Others come once and return several months later. We invite all ages, especially mothers and children. ArtStreet “regulars” take time from their own work to help new families feel welcome.

Our grant from Albuquerque Community Foundation includes funds to pay artists who are homeless to teach classes and workshops. Mareshah B. Henderson, a skilled multimedia artist and professional photographer was our first mentor artist to teach a public Saturday workshop. The workshop, “Cardboard Sculpture,” was enjoyed by all, including a brownie troop. She does not have a home and has had serious health problems, but her art has found a safe haven at ArtStreet (Figure 2).

Miguel came to ArtStreet to finish a drawing. A woman on the street saw how well he drew faces and asked him to draw a portrait of her son who recently died in a gang fight. He sat at the table with the photograph and told us this story as he added color to the boy's cheeks. The next day he painted a wood sign for ArtStreet (Figure 3). He proudly hung it outside on the fence and received food voucher payments for his work. Miguel hasn’t had a home for a long time. He must take medication for a serious blood disorder that makes his body fragile to the elements. He has consistently struggled with his art work, fighting to appreciate the abilities and style he developed without formal training. Recently, Miguel has received support he needs to seek rehabilitation to continue his recovery from life long addictions and threatening life styles.

Sassy, formerly homeless, works for Health Care for the Homeless as a family advocate. She has an endless supply of creative energy which she shares freely with others. One day, she taught us to sculpt using white bread and glue. Her office, near the studio, is decorated with her own artwork. She was a featured artist at “Roses Aren't Red.”
Prevent Forest Fires.” She is co-creator of “Family Lunch, Art and Play” held at ArtStreet and funded by a grant from a private local foundation. Families who are staying in the shelters are invited to have lunch and make an art project with the children. The nutritious lunches are provided by a day school cook who donates her time and food each Wednesday. For children who are recently traumatized and uprooted, the studio provides a place to unwind and play freely and safely. Ms. Kahn and I frequently combine skills. This collaboration enables Louise to occasionally take time from her schedule to make her own art. She has exhibited in all three ArtStreet exhibits.

Kate Rogers, an art therapist who recently moved to Albuquerque, decorated a tennis shoe for our spring exhibit, “Hats and Shoes: Community Sole Work.” Kate brought her adolescent art therapy group, who had decorated their shoes, to see the shoes displayed along with 200 other shoes at the downtown show, ArtsCrawl.

Shirley heard about ArtStreet from other women who were staying at a domestic violence shelter. During her first visits to the studio, she was very quiet. Using old shoes, she began a series of provocative sculptures. While some artists at the studio questioned the violent nature of her art statements, others supported her candid expression. Discussions about “what is beauty?” naturally arose. We agreed to allow everyone’s voice to be heard. Sometime later, I suggested to Shirley that, in addition to coming to ArtStreet, she might want to work privately with an art therapist where she could have individual time to talk about her powerful artwork.

Community art making in an open studio environment is a way I have decided to work. The importance of this work is found in the experiences of people who came through the studio doors looking for a community to validate their abilities to make something. This approach is not limited to “art therapy for people who are homeless.” We have adapted according to funding sources and dealt with serious issues of homelessness and embraced the “homelessness” lurking in many souls. Most important, this special environment has nurtured creative expression for everyone who has had the courage to make art.

Perhaps there is a biological human necessity satisfied in this act of community art making. Ellen Dissanayake wrote, “Art can be considered as a behavior (a ‘need,’ fulfillment of which feels good) like play, like food sharing, like howling, that is something humans do because it helps them survive, and to survive better than they would without it” (1992, p. 34).

There have been days at ArtStreet when someone has reminded me to slow down, find space, and make something, because I needed “a little art therapy.” Living in a desert landscape and being a lousy swimmer motivates me to find options for working, besides making a living by diving alone toward the bottom of the sea.

Marsha McMurray-Avila worked weekends to finish painting her door in time for the exhibit “Doors of Albuquerque.” This collection of 25 painted, decorated doors was exhibited at the KiMo Gallery in downtown Albuquerque (Figure 4). Marsha, an experienced grant writer, is executive director of Albuquerque Health Care for the Homeless and former member of the original Leadership Albuquerque Group. When Marsha works in the studio I help protect the precious time she has with her own art making by reminding others that it is not time for work-related conversations. There are exceptions to this, however. One day our funding agencies arrived with a feast to share and time to make art together. Marsha spoke to the agencies about her experiences at ArtStreet, and, the following week, we were invited to apply for a continuation of funding.

Karen Barnes and her two middleschoolers arrived on their own at the studio with help from a social worker. The family attended the original parenting/art therapy class at the shelter in the county where they lived. The children sold their first painting, titling it “Roses Aren’t Red.” This later became the name of an art exhibit. As a family they worked on a door titled “The Hidden House.” The social worker sometimes stayed and worked, played, and ate with us in the studio.

Louise Kahn exhibited and sold her door, “Only You Can

Author’s Note: I would like to thank my teachers: Pat Allen, Linney Wix, Josie Abbenante, and to Gaby Yaron (who is recently deceased). I would also like to thank the American Association of University Women.

Associate Editor’s Note: Ms. Timm-Bottos invites you to respond to her work and the ideas presented in this paper. Correspondence may be sent to: Janis Timm-Bottos, ArtStreet, Health Care for the Homeless—Women and Children’s Outreach, 805 Tijeras N.W., Albuquerque, NM 87102.

A Consideration of the Studio as Therapeutic Intervention

David Henley, MA, A.T.R., Hampton, NJ

Introduction

While practicing art therapy at a residential therapeutic school some years ago, I encountered a child who suffered years of parental abuse, leaving him in an autistic-like “feral” state (Candland, 1993). Probably disturbed from early childhood, his parents locked him in the basement during daylight hours, then set him free at night, when he would roam the streets of the city. By dawn he would return to his lair, often with an array of mechanical junk in tow, with which he evidently played and worked during his long hours of solitude. He was eventually rescued and placed in a state psychiatric institution where he remained in solitary because of his wild, uncontrollable state.

When later placed at the therapeutic school, he continued to display extreme shyness toward people. His feral state was akin to any wild animal whose adjustment to captivity was a tortuous ordeal. Biting, spitting, snarling, and defecating were all part of the “fight or flight” reactions against those who approached him intrusively.

In formulating his treatment goals for art therapy, it was obvious that habituation to the studio environment with a minimum of intrusion was paramount. Hence, some form of sheltered, therapeutic space was needed that provided a protective stimulus barrier from the studio-at-large. The first intervention, then, was to create such an environment, one that was reminiscent of his original basement world, where left in silence, he could interact with his familiar objects while also becoming increasingly exposed to the doings of others. We partitioned off a small corner of the studio that was subdued in lighting and traffic yet contained a portal which allowed him to observe the studio community.

After several months of elected confinement, he began to make forays into the surrounding space. These tentative explo-

Figure 1. Henry Darger’s apartment studio approached the cluttered space cultivated by my feral client.

rations became a ritual for him: Upon entering the studio he would go immediately to his “home-base.” Once he inventoried all of his precious found objects he would scope out the scene, then emerge, all the while making visual contact with his corner space. Such “checking back” behavior perhaps insured his space’s continued existence or “constancy” (Mahler, 1975), for it was to this cluttered corner that he remained emotionally tied. Its sanctity enabled him to satisfy his curiosity and “practice” exploration in the Mahlerian sense, all the while remaining libidinally tethered to this powerful psychological and physical territory.

This practicing period was facilitated by presenting him with machines and other objects that he could not resist approaching and exploring. While investigating the drill press, the potter’s wheel, or the spring-loaded centrifugal casting machine, he revelled within his element. These prized objects became an extension of his territory and, as such, were defended against unsuspecting intruders.

Eventually his need to return to his cloister became less intense and frequent, leaving the space more as a depository for his findings than a dwelling. He began to co-exist, albeit uneasily, with the cohabitants of the studio. Once habituated, he continued to endow the studio space with ritualistic, seemingly magical significance. He began to record his impressions of his space, producing a prolific portfolio of sketches which assumed savant-like qualities (Henley, 1989).

A year after he was successfully weaned from his space, I was asked to help install some of his drawings in his residence hall at the therapeutic school. Upon entering his private room, I was astonished to find a place that was almost identical to the one I had provided him in the studio. This was not just a room, but a veritable midden: Strung about were piles of broken appliances that were garnished by a string of blinking white lights. A torn poster of Rotherhol’s last show at the Tate Gallery was mounted between two doors which had been wreathed in found bits of cigarette filters, tampon applicators, cotton batting, and so forth, all wired to the moldings as though they sanctified these passages. Broken chairs were stacked upside down in a line which resembled the ramparts of a castle wall. Stacks of discarded albums and other flat material stood around with a presence that suggested that these and other inanimate objects made good company (one recalls the geneticist in “Blade Runner”, who engineered his own menagerie of animated characters to relieve his lonely existence).

As an installation, the room seemed like a votive shrine to his original spaces which were reconstructed as though honoring or recalling a dear but now lost love. The extraordinary investment in this re-creation seemed to be accorded with “transitional” significance: To wield its power, nothing less than an exact recreation would suffice. For this individual, his manipulation of the environment was indeed the “good enough” mother in every sense and, as such, became a most powerful therapeutic and aesthetic force in his treatment (Winnicott, 1965).
The space in which art is made has long been considered a potent force which impacts the form and content of an artist's expression. From the Paleolithic cave painters to modernists such as Pollack and DeKooning to the outsider artist Henry Darger (Figure 1), the studio has provided both inspiration and sanctuary. And, although not every studio is imbued with the significance illustrated in my case example, the studio will more often than not remain central to the arousal of creative fervor.

In other writings I have explored the effect of the studio upon creative motivation, particularly in cases whose artists are of a delicate disposition (Henley, 1982). In this paper, the idea is carried further and asserts that an enriched studio environment is part of a constellation of interventions that are indispensable to art therapy.

The Studio as the "Third Hand"

The studio which facilitates artistic expression in clients may be considered a nonverbally-based therapeutic intervention which has been described by Kramer as a metaphorical "Third Hand" (1986). In practice, the Third Hand may take the form of offering the right size brush to paint delicate facial features, not solely for aesthetic purposes (though these are considered), but mainly to address therapeutic concerns, that is, to maintain better control, minimize unintended distortions, reduce frustration, and evoke subtle facial expressions that reflect different affective states. It may entail performing rescue actions to preserve a clay sculpture, whose impending collapse may be considered a countertherapeutic metaphor for the patient's life situation (though not all artistic failures are countertherapeutic and in need of rescue).

Kramer asserts that such support must be forthcoming in ways that are not overly intrusive—do not distort the client's intentions or impose creative ideas that are inaccessible. By intervening through media and technique, client issues can be broached without confrontation through solely verbal means. The art material functions as a buffering agent, which respects repressed material and its delicate defenses while effectively accessing unconscious or preconscious material pertinent to therapeutic work. And, although Kramer does not identify the environment as a major intervention per se, I am suggesting that the studio space satisfies her criteria as a Third Hand resource that constitutes the very vehicle which sets the stage for further intervention and therapeutic change.

The studio constitutes the initial and perhaps most impressionable experience of the art therapy process. How the space is set up communicates much about the art activity to follow. It conveys to clients, colleagues, administrators, and others something about the values that the art therapist promises to bring to the process. Quality art materials, stimulating visual aids, adequate work spaces, flat files for storage, and tackable surfaces for exhibition all communicate that the client's artistic efforts will be taken seriously. With such basics provided, the stage is set for developing the client's identification with the art process which includes robust playful exploration of media as well as more sophisticated attempts involving thematic and stylistic risktaking. In creating a rich, pro-art ambiance, the transition from the everyday and concrete to the sensual, metaphysical abstract is facilitated (Dissanayake, 1989) (Figure 2).

For many artists, entering the studio signals an end to preconceptions and judgments over moral, social, or cultural protocols. Self-expression can assume wildly eccentric form, accommodating the artist's idiosyncrasies and pathologies while encouraging a productive work ethic. As a container of potentially overpowering affects, the studio provides the kind of "holding" that Mahler found necessary to facilitate the kind of exploratory behavior described in the opening vignette. With his secure home base, extreme approach-avoidance reactions, which so debilitating the feral boy's capacity to function, eventually gave way to more autonomous, individuated behaviors. As this client expanded his frame of reference (Lowenfeld, 1982) toward more flexible, expansive interactions with his environment, these adaptations became slowly generalized into his everyday environment, as well. Again it was the studio space more than his alliance with the art therapist that assumed the role as the "needs provider."

The Role of the Art Therapist as Environmental Intervention

A critical component of the therapeutic environment involves the way in which the art therapist adapts the space to suit the needs of the client. One such adaptation involves managing stimulation levels to facilitate motivation and in-depth imaginative responses during the art process. Elsewhere, I have explored the critical balance between enriched stimulation levels and those that are a "blank slate" or minimally stimulating (Henley, 1994). For this feral child, this balance oscillated between the need for sheltered space and tantalizing stimuli which lured him beyond his autistic orbit. For many client populations, this dynamic balance is crucial, requiring that the art therapist modulate stimulis as a finely tuned intervention.

Though one cannot generalize, those with attention deficits, sensory impairments, or emotional handicaps might require more subdued or protected settings while those who are environmentally impoverished or suffer from depression may benefit from higher stimulation levels. Hence, the introduction of art room props, visuals, music, light, or other sensory stimuli can be adjusted according to client need.

The art therapist's very presence constitutes another form of nonverbal, environmental intervention, particularly if he/she
actively participates in the artmaking. Creating art alongside the client can further the studio ambience, creating a sense of artistic community, recognizing that a parity exists between every studio member as each person struggles with his or her own creative process. By working in the presence of clients, the art therapist models important artmaking behaviors which clients can begin to identify with and incorporate. Haeseler (1989) points out that such modeling demonstrates how strong affects can be evoked without becoming overwhelming.

However, it is critical to this concept that the art therapist be acutely aware of how his or her own work impacts the ecology of the studio (Haeseler, 1989). The art therapist must monitor the projection of his or her own unresolved conflicts or other facets of work, which might require repressing disturbing form, content, or style that ordinarily might be taken for granted. Otherwise, the artwork may constitute a countertherapeutic presence which might confuse, disturb, or depress a client who cannot access or use such art expression.

Instead, the art therapist must adopt a benign presence, one that approximates Mahler's ideal of the mother during the separation and rapprochement phases of development. Such benign, yet supportive, presence allows for exploration including those frustrations that naturally accompany the art process. When motivation, aims or tolerance for frustration weakens, the art therapist's continued modeling of artistic problem solving may act as Mahler's "refueling" mother who validates, empathizes, and mirrors back to the client an attuned, supportive presence.

Some writers have identified the "art therapist as artist" model as an alternative to traditional clinical models. One such discussion by Pat Allen (1992) views the artist-in-residence model as a means of taking art therapy beyond the institution, into more normative community settings. She describes her involvement with two art therapy students whose internships involved painting in an open-studio environment along with clients who suffered a range of emotional problems (1992). The student artworks which are depicted in Allen's article include an abstract pregnant nude and a nonobjective, expressionistic design, reflecting both interns' sophisticated styles as well as content that could be construed as being issue-laden. It is apparent in one intern's thesis that they worked as most artists do, with a quiet self-absorption and preoccupation that precludes involvement with others. Their markedly art-school styles are probably quite out of reach of the naive capabilities of their clients and thus remain inaccessible to emulate.

It is questionable whether the two interns maintained a conflict-free presence in the environment that would be required if they intended a Third Hand intervention. Given the high-powered, provocative quality of the art, the effort may have proved unsettling or intimidating to others in the group, perhaps diminishing the motivational or therapeutic effectiveness of the atmosphere.

While the artist-in-residence is potentially a useful and needed addition to an inclusive community-based approach to artmaking which may indeed possess therapeutic qualities, this seems quite distinct from art therapy, where each action or non-action must be supported by a therapeutic assessment which validates the use of interventions.

Conclusions

As a field, it is clear that art therapy is increasingly expected to survive in sterile or impoverished environments. Here I echo Allen's assertion that the art therapist must take a pro-active stance to requisition the proper resources that are conducive to artmaking. This can only occur through energetic means such as insinuating, exhibiting, and politicking in ways that educate mental health professions about the proper conditions that are necessary to ply our craft.

The art therapist too must take the initiative and muster the ingenuity and resourcefulness that transforms a less than perfect space into one that is "pro-art." This may include recycling furniture, scavenging art materials, decorating with props and art world visuals, anything that communicates to the administration that, in addition to our expert clinical and educational skills, we are resourceful scavengers by nature. We are able to create much from very little, and yet, there are basic needs indispensable to our craft that are nonnegotiable.

Such a lesson was driven home in the case of our feral-child who had languished in a state institution because a residential school considered its facility ill-equipped to handle his wildness. Eventually, the school consented to a trial placement, at which time the facility was adapted to meet his unique emotional needs. Upon being visited in his newly arranged "play pen," as the director of support services termed it, all were impressed by this child's adaptation to the space. This was evidenced by an eventual decrease in aggressive reactions and noxious habits. With systematic desensitization, judicious sensory stimulation, and a self-directed pace, this child drew from his environment the nurturance to heal. Eventually he moved on to a community group home where, I suspect, references to his earlier spaces persist both in memory and in his extraordinary art.

The Base and The Mark: A Primary Dialogue in Artmaking Behavior

Lenore Steinhardt, MA, A.T.R., Ramat HaSharon, Israel

My approach to art therapy is composed of beliefs and principles which I acquired through involvement in the fields of painting, art history, and art therapy. I began as a painter and student of art history and art theory. As a painter, I never asked myself the question, "Where does art come from?" When I became an art teacher, this question became important in helping others contact their personal sources of creativity and experience making art with ease and pleasure and out of an inner need.

The artistic theoretical base proposed by Wassily Kandinsky in his book, Concerning the Spiritual in Art (1911), provided a good framework for teaching artmaking behavior without specifically teaching art. Kandinsky advocated making art which embodied an expression of the artist's inner spirit and need, rather than reproducing external nature. He drew connections among color, form, movement, sound, the senses, and emotions. Thus, one might paint an abstract image of one's family by expressing in color, form, size, and placement one's intuitive perceptions of each person. This image might be emotionally accurate and achievable, avoiding frustration and disappointment caused by failure to make a visually accurate portrayal.

Later on, as an art therapist, I emphasized the value of spontaneity, play, and fun, and simple curiosity as necessary attitudes if we are to enable art to become a bridge between inner and outer worlds, to allow our images to emerge truthfully. Object Relations theory and D. W. Winnicott, in particular, provided the theoretical base for understanding the need to be creative, to create transitional objects in order to overcome the loss of the original object.

But, in addition to our need to create transitional objects, we also begin our first graphic dialogue with the environment by making marks on the surface of things: on food, dust, vapor, earth, sand, using parts of our body. Creativity alone cannot explain this need. Children make marks, urinate on earth, move objects, and gradually realize their motor movement has made the calligraphy, the mark, which is proof of their existence. Later, when motor control is more developed, we leave permanent marks on trees, benches, stone, and walls, as we scratch our names or our symbols on them with chalk, sticks, stones, and knives. And, we learn to write. Jan Dubowski, an English art therapist, describes the development of mark-making activity in children (1984). Early mark-making is spontaneous and develops in play. Eventually, the child learns to control marks and make comprehensible images which others can understand. The graphic image becomes a nonverbal communication with others.

What is this need to make a mark, to leave a visual image? Many things exist in our lives, but we are not interested in drawing everything. Choosing to draw something specific makes the chosen image special, and we choose to draw what to us is especially interesting.

Ellen Dissanayake, a contemporary art historian, has written about this human need to "make special." In her books, What Is Art For? (1988), and Homo Aesthetica: Where Art Comes From and Why (1992), she proposes that art must be viewed as an inherent universal or biological trait of the human species, as normal and natural as language, sex, sociability, aggression, or any other characteristics of human nature. She sees art as a behavior that developed in humans as they evolved in order to help them survive. Art has always existed in all of human history, in every human society. It is a psychological or emotional need and has psychological or emotional effects.

In making our art-marks, we invest thought, time, and effort in "making special" the chosen subject. One invests in "making special" in order to differentiate this image from the ordinary. In much the same way, so-called primitive people decorate and prepare themselves for rituals, thus making them special and quite separate from ordinary daily activity. Rituals are special events shared by a group, connecting them in a common meaningful experience (Dissanayake, 1992).

The special image created in art therapy in the presence of a therapist, or therapy group, brings special things to the surface so they can be shared and understood, controlled and resolved. Schavarien (1992) writes about the picture as a scapegoat or talisman. The picture may become our scapegoat onto which we cast all our unwanted parts and drive the picture away. Or, the picture can become a talisman which holds for us our luck. We "make the picture special" so it can serve us therapeutically.

Winnicott (1971) says it is essential for the developing child to spend time playing in order to get in touch with his own life source. Through play he creates his own goals and satisfies his curiosity. The child who cannot play loses contact with the self and is left with a feeling of emptiness, a feeling of not being. The experience of free play builds and strengthens the ego. A sense of differentiation begins with the child learning to know what is his own and what is external. Thus, in this process of ego building, choosing a goal in free play makes the goal special, appropriate, and essential for that moment.

I believe that patients and students of art therapy must experience being in the magic space where transitional objects and creativity meet, where movement and control and mark-making and goals are played with together, enabling us to return to essential processes of self-discovery which may have been damaged by social or environmental influences.

We first make marks out of curiosity and validate our existence. With increasing skill, we control our artmaking. But let us go back to our first "environmental art," marks made in sand,
vapor, snow, dust. Do not we still do it? Do we not see a dirty window and write our name, leaving the mark to be discovered by someone unknown? Can we include food, earth, sand, and objects as art therapy starting points leading to clay and paint? 

My studio includes a sandplay area where patients use sand and miniatures when it suits their needs to build a picture in an immediate spontaneous way (Kallf, 1980; Weinrib, 1983; Ammann, 1991). This relates to early experiences of sand, earth, and water, and to using objects to construct images. Art materials include gouache, oil pastels, chalk pastels, clay, plastelene, and various sizes of paper. The patient may work on a large table, on an easel, or on the floor.

But, there is an additional aspect to making marks. Making marks connects two things: a surface, or base, on which to make the mark, and the mark itself. This relationship between a surface and marks made on it is a metaphor, a metaphor for ourselves, as a surface, or base upon which life has left marks. Parents, relatives, friends, teachers, society, and the environment have made marks on us of different forms, sizes, and colors. Some marks are pleasant, valued, used for good growth and flow. Some marks are painful and continue to hurt.

Art, as a surface with marks, is the mirror we make of our experiences. Very often, in therapy, our patients use us in subtle ways, as a base to make their marks. They do to us what has been done to them and make us feel as they feel. This is what we do to our art: We make the image feel as we feel.

I replicate this process of life through art. I am the base, I am the sand, the dust, the stone, or the paper, and I make marks as they were made on me. But, then, with more understanding and more control, I begin to make the marks on myself that I want, that I choose. That can change my future.

In my studio, I work with children, adults, couples, and families. Patients may be referred after years of verbal therapy. Sometimes a family is in family therapy while I work with the child. When the art process is dominant, my verbal interventions may be directed only towards the art. If the patient wishes to talk, I may then give verbal interventions.

On a small bulletin board are photos of nature taken on trips to distant places and art postcards from the best museums. On the wall hang two small landscapes that I painted long ago. No patient work is hung. Perhaps I choose pictures which interest me as a quiet way of making my mark on the space without my actually making art during the session.

Editor’s Note: A modified version of this paper was given at the Art Therapists Panel, ICET Conference, Haifa, Israel, May 1994.

The Reenchantment of Art Therapy

Jim Young, Santa Fe, NM

The first 25 years of the American Art Therapy Association (1969–1994) have been nothing if not exciting. The journal of the American Art Therapy Association (Volume 11, 1994) visited with some of the Association's influential members to glean their retrospectives and their visions of the next quarter century. Their responses reflect the turmoil and excitement of the past as well as the hopes, doubts, and uncertainties of the future.

Janie Rhyme (1994) acknowledges that the ever-increasing diversity of the Association's members could well signal its breakup. Rhyme, at the age of 81, said that we would do well to let go of the past and focus on the era we work in today.

Bob Ault (1994), the AATA's first president-select and second president, recalls the common vision that united art therapy's founders: "Absolute belief in the value of the importance of using art making and imagery in the treatment of patients" (p. 252). Ault's admonition is that we not lose our understanding of and faith in the art process. We have tended to "psychologize" the art therapy process, Ault claims, in our attempts to make art therapy legitimate while conforming to the demands of higher education. His dream of art therapy's future is that it will find its place in health promotion, thereby serving the general population with new adaptations. The future will find us returning to the "widespread use of the oldest civilizing agent of all, the arts" (p. 253).

Judith Rubin (1994) claims that art therapy will grow in new directions in the next 25 years, with schools in particular. Rubin also sees more collaboration with other expressive modalities. She foresees that art therapy will become less "suspicious or stingy with others" (p. 254), cooperating instead of competing while avoiding the "twin traps of restrictiveness and rigidity" (p. 254). Rubin's most urgent plea is to allow art therapy to ennoble us spiritually. To that end she sees "therapeutic art activities" being made available in malls, libraries, churches, and community centers. "We can and should contribute to healing the soul of the community" (p. 254).

Debbie Good (1994), like Ault and Rubin, calls for art therapists to remember that art itself is the wellspring of art therapy's power. When we lose sight of the art, we become "a disconnected community that lives in its head" (p. 257). Good counsels that "intellectualizing our way through life" isn't working anymore and that by "living our lives through our passion we can bring compassion to others" (p. 257).

Cathy Malchiodi (1994) berates art therapists who give lip service to the word "art" while negating the importance of studio art experiences. She points out that art therapists frequently claim, "I just don't have time to make art" or "My creativity is reflected in how I do therapy" (p. 258). Malchiodi laments that "we seem to have come to the convenient conclusion that quick sketches of feelings and badly cut and pasted magazine pictures can approximate art, and that art making is a 50-minute process without much depth" (p. 258). The neglect of our own art as art therapists, she says, is damaging to the profession itself. "Let go of the past," she says, and honor the efforts of the new generation of art therapists who are "blazing new trails and still defining the field of art therapy" (p. 259).

Where Does Art Therapy Really Come From?

Before looking into the future of art therapy, it is appropriate to examine the authentic roots of art as a healing force. Joseph Campbell (1988) wrote: "The artist is the one who communicates myth for today" (p. 99). The artist's problem, according to Campbell, is making the inner and outer worlds of today meet.

Ellen Dissanayake (1992) says that art is "species-centric" and therefore a common need for humans. She calls mankind "homo aestheticus" because of our need to "make special" our tools, rituals, and even our play (p. 223). The arts have been a community-based phenomenon for all but the recent two to four centuries of human existence. Dissanayake (1992) points out that we have recently become consumers of art and no longer participants: "We may forget that formalizations inherent in ritual ceremonies have provided important occasions during which humans throughout their history have experienced the arts, which themselves were emotionally saturated integral reinforcers of important communal beliefs and truths" (p. 139).

Not all the world has lost the significance of art as a community affair. In Bali today (Charle, 1991) the arts are not practiced in a void: "If Bali were a museum, its temples would be dead, its dancers sitting on the sidelines, its musicians silent and its gods forgotten" (p. 11). The Balinese, while embracing modern technology and ways, have not abandoned the arts but have embraced them. The Balinese have no word for art and yet almost all Balinese are artists. Art is worship of life, and life is the realization of a divine order.

In American history, the Shakers believed that God dwelt in the details of their handwork. All work aimed at perfection (Burns, 1887), which prompted Thomas Jefferson, in 1808, to say of them: "If their principles are maintained and sustained by a practical life, it is destined eventually to overthrow all religions" (p. 15).

In Hasidism (Braman, 1994), often compared with Zen Buddhism, there is the notion that the intention or "kavanah" of an artist working with his or her materials could release "God's emanations cast within the material world" (p. 2). The result of such release is a form of uplifting or healing known to all artists.
The Reenchantment of Art Therapy

Art therapy today is facing its own “postmodernism.” Having grown up over 25 years in the shadow of the medical model, art therapy is struggling to accommodate change and to fulfill its role in society. Art therapy's leaders and founders have thrown down the gauntlet; the challenge has been offered to future generations of art therapists to meet the needs of the community while maintaining faith in the healing power of art.

The medical model, which has largely influenced the brief history of clinical art therapy, serves mainly the pathological needs of the mental health system. It does not yet serve general...
health maintenance, and it deals mainly with "identified patients" and their family systems. There is a huge population that has mental health needs yet are not "sick" enough to have diagnostic labels. There are also increasing numbers of people interested in self-actualization (Maslow, 1968) and optimal health (Csikszentmihalyi, 1990).

Ault (1989) advocates for the expansion of art therapy to meet the needs of the community at large. Ault runs an art school in Topeka, Kansas. He observes that 25% of art class participants come seeking mental health services in the guise of art classes. "These are not individuals who have been identified as patients or as suffering from mental illness, nor are they the sort of people who generally seek mental health care services from a therapist," Ault says. "They did not identify themselves as patients, yet they exhibited levels of personality and relationship dysfunction that often interfered with or inhibited their lives" (Ibid., p. 223).

Ault calls these people "unidentified patients." They come seeking help, though this is unacknowledged, and often experience real changes in their lives without any talk of therapy. Ault found that these people could be served by encouraging "minor changes of attitude and process," maximizing thereby the "therapeutic aspects of the art experience" (Ibid.). Acknowledging that while remaining in a generally acceptable norm, "we all range up and down in our daily lives on a scale of healthy to pathological" (Ibid., p. 224). Ault poses the question: "What happens to those who are moderately ill or have compensated somehow to cover, deny, or minimize these unresolved conflicted forces within their lives?" (Ibid.). He refers to this population as "the great American wasteland" (Ibid.).

The parallel between the art and art therapy begs attention. Art's original purpose was to serve community healing needs. Later, art, under modernism, served only a small segment of the population. Now there is a movement toward the rebirth of folk art. Art visionaries today (Dissanayake, 1992; Cleveland, 1992; Gablik, 1991) are calling for art to be restored to art for life's sake, not art for art's sake. Fox (1988) calls for a general revival of personal arts as necessary for spiritual rebirth and the remaking of a "living cosmology" for today (p. 179).

In art therapy, Ault states, we now need to leave the limited domain of clinical treatment and begin mainstreaming the clinical-based processes into the normal population. This will lead, he predicts, to the further acceptance and understanding of the therapeutic dimension of art on all levels of society. Ault sees this movement taking place as art itself moves out of the commercial vise that is contributing to its removal from the general population.

May (1975) poses an interesting question: "What if imagination and art are not the frosting at all, but the fountainhead of human experience?" (p. 124). McIlvain (1992) sees art as the ultimate medicine and calls for the expansion of art as a healing force in the community, "beyond the narrow perspectives of scientism" (p. 43). He claims that it is "art's desire to connect psyche, the dream, the suffering soul, and the daily lives of people" (Ibid., p. 53). To do this, art must fully enter the life of the community.

Art Therapy: A Vision of the Future

Art therapists of the future will play a major role in bringing art back to the communities as a healing force: "Therapeutic studios" will become the dominant form of private practice, in which artists will share their art in a therapeutic way with young people, elderly, handicapped, and "normal" people who wish to experience greater harmony between their conscious and unconscious lives. Art therapists will be honored as healers. No longer practising art mainly in institutional settings, these special artists will contribute to the soul of the community, enhancing life for all who interact with them.

As budgets are cut for school art programs, due to the high cost of administering large scale education, the arts needs of young people will be identified and "made special" by art therapists. It will be generally acknowledged that a dramatically improved mental health picture in the nation has been created by the expansion of art therapy, in its many new applications, helping people return to personal intimacy and making better life decisions.

Art therapy will be called by many names: integrative art, community art, life art, transitional art, educational art, rehabilitative art, and others. The term "therapy" will be unnecessary as the therapeutic uses of art will be assumed and understood by all. No longer will there be therapist/client or therapist/patient hierarchical relationships. Art therapists will be facilitators as well as full participants in community art therapy applications.

Sociologists and historians, sensing the shift in society's values due to the open and widespread practice of therapeutic arts, will be writing about this new paradigm shift. Freedom as a total sense will be experienced by masses of people, leading to greater understanding of our spiritual nature. Following such experiences, through immersion in creative processes, people will invest more time and energy in their own education toward self-actualization. Jobs and careers will give way to life styles. People will curb their wants and realize true needs. Leisure time will increase, and community will flourish as a result of each person's desire for service and sharing of precious new values.

Art therapy's 50th anniversary celebration (held in Santa Fe, capital of the nation's indigenous arts) will be simulcast to schools, libraries, and community organizations across the country. Gone will be the former days of art therapists' search for identity and resulting arguments about the form and content of art therapy. AATA's speakers will be warmly received as representatives of the rebirth of the healing power of art through its hundreds of new therapeutic forms.

Magazine Photo Collage: A Multicultural Assessment and Treatment Technique

224 pp., 96 black & white illus. $29.95, cloth. ISBN 0-87630-706-3.
Reviewed by Nadia Ferrara, MA, A.T.R., Montreal, Quebec, Canada

Art therapy textbooks on assessment are rare and greatly in demand. Helen Landgarten’s *Magazine Photo Collage: A Multicultural Assessment and Treatment Technique*, a textbook for students and art therapists, brings evaluation to the foreground and describes how to use a Magazine Photo Collage (MPC) procedure for this purpose. At the same time, it is multiculturally sensitive in its demonstration of uses for the MPC with various populations.

Landgarten recognizes that we live and work in a mosaic society filled with diverse cultures. She presents a nonculturally biased tool, the MPC, and shows how it can be effectively applied to various ethnic and cultural groups, including Asians, African-Americans, and Hispanics. Her method uses pre-cut images from carefully selected, culturally appropriate magazines. These are separated into two boxes and offered to clients. The first box contains pictures of a variety of people from various cultures, and highlights differences in age, sex, and economic condition. The second box offers “miscellaneous items” from a range of photographs that focus on themes related to chemical dependency, physical and/or sexual abuse, eating disorders, and other relevant issues. As a resource for collecting pictures, Landgarten provides a list of “culturally slanted” magazine publications useful for their particular ethnic imagery.

The MPC is a nonstandardized, projective tool. It is described as beneficial for assessment and treatment stages in therapy because “clients can identify with the images and voice their projections onto their self-selected pictures” (p. 1).

In the assessment phase, collage focus is on the manifest content, specifying that the therapist select pictures that reflect the client’s ethnicity. Thereafter, in the treatment phase, the clinician may use the MPC to make an intervention or to offer an interpretation, taking into consideration its latent content and, as emphasized by Landgarten, its unique metaphorical language. The clinician gathers the client’s free associations in order to understand the symbolism in the collage.

The MPC assessment technique includes four tasks that use the two boxes of magazine pictures. Tasks are presented to the client using specific instructions. In the first task the client selects pictures from the miscellaneous box and writes his or her thoughts about each image. The task is opened and the miscellaneous box of pictures is used because of its nonterrorizing nature. No limits are placed on the number of pictures selected. Landgarten carefully outlines what to look for in assessing art-related behaviors (eg., how are the photographs handled, glued, etc.).

In the second task, the client is asked to choose pictures of people and, on a separate paper, writes what the people are thinking and saying. This task “reveals clients’ perception about trust, regarding either themselves, someone in their life, or possibly the therapist” (p. 10).

During the third task, either box is used to select pictures that represent something “good” and something “bad.” Choices may give clues about the client’s idea of positive and negative images.

The fourth task involves choosing one picture from the “people” box, writing what is happening to the person, and how the situation could change. This task may highlight the client’s attitude, coping mechanisms, and problem-solving skills.

All four tasks are illustrated with case vignettes that show how to use the MPC during assessment and treatment phases of therapy. In the treatment phase, the MPC can be introduced at any time for any treatment goal. Some MPC objectives are designed to manage cultural differences between client and therapist and encourage development of cultural self-identification and self-awareness.

Certain art behaviors may indicate a client’s strengths and problem areas. The manner in which images are looked at, handled, and placed on paper are important to observe. It is also important to observe how the MPC is created, whether in an extremely cautious or regressive fashion. According to Landgarten, “The photos in the MPC are projections of the client’s self, symbolic of significant persons in their life, and/or a transference statement” (p. 20). Verbal responses and free associations are also very important and may confirm or contradict the therapist’s observations.

Facets of the MPC strongly resemble underlying elements of phototherapy, although there is no reference made by Landgarten to phototherapy literature. Weiser (1993) describes how interacting with personal snapshots and albums as representational objects, symbolic self-constructs, and metaphorical transitional objects can reveal deep forms of awareness. According to Weiser, “Photographs … have the power to capture and express feelings and ideas in visual-symbolic forms, some of which are intimately personal metaphor” (p. 6). Landgarten uses clinical vignettes to illustrate her ideas. For instance, one of the goals in a “positive life review” process with an 85-year-old Asian woman was to encourage her to become independently creative. Her collage work became a significant self-object. Both Weiser and Landgarten stress that clinicians...
should proceed with caution when interpreting the unconscious content of the collages as well as the photographs. The images in both can create bridges to one’s inner world in ways that words often cannot fully represent.

Landgarten’s inferences about process and artwork do not seem to be founded on acknowledged theoretical approaches, creating, for this writer, a sense of uncertainty and ungrounded speculation. For example, in the case illustration of an 11-year-old Hispanic boy with attention de-‘disorder, no attempts are made to relate current clinical concepts about the disorder to interpretations of the artwork. This is not a recommended model for students to follow because a significant aspect of art therapy training includes learning to base clinical inferences on the client’s background, culture, unique interpretations, behavioral observations, and related theory. Linking relevant literature to research is an essential component of the interpretive process.

Collage work clearly can be evocative. The MFC facilitates self-disclosure and helps establish a relationship between overt and latent content. According to Lamy (1986), “The effect of the [collage] process is to increase the emotional involvement since the person is less concentrated on achieving aesthetically pleasing results but rather on the symbolic content …” (p. 60).

While the MFC is a valuable therapeutic instrument, its limitations, which are important to consider, are not outlined by Landgarten. One potential disadvantage of collage artmaking is that it uses ready-made materials rather than an empty space which can be transformed. Collage work may promote dependency on the available materials and lead to avoiding development of one’s creative process (Lamy, 1986). However, collage can be effectively used as a tool to guide the client towards work in drawing, painting, or clay sculpting, gradually developing dependence on one’s own creative resources.

Because it is not a standardized tool, the MFC is best when introduced with other standardized assessments. It can also be used as an adjunct to diagnostic art evaluations. This is the first book focusing specifically on magazine collage, and Landgarten has made a valuable contribution to the field by adding a new dimension to art therapy and multicultural assessment. These important contributions warrant further development and research.

Integrative Approaches to Family Art Therapy

262 pp., 95 black & white illus., $29.95, paper. ISBN 0-9613309-5-3

Reviewed by Linda Sibley Seaver, MPS, A.T.R., Bedford Village, NY

This is the chronicle of a weaver and her tapestry of many colors. Shirley Riley achieves the promise of her title by demonstrating clearly the successful integration of art therapy with several distinct approaches to family therapy—structural, systemic, and strategic, and social constructionism/narrative. While affirming the role of both language and visual metaphor in the healing process, Riley places renewed emphasis on the narrative, the family’s story of their problem. In an introduction to each section, co-author Cathy Malchiodi, offers observations that place Riley’s work in context. She states that it is “[t]he integration of art making into family therapy that yields … a clearer understanding of family dynamics, roles and rules, ways to reinvent communication and behavior patterns …” (p. 12). Therapy with Riley, an experienced and gifted clinician, also appears to be a lot of fun.

Riley writes for an audience of professional art therapists and family therapists who are most often psychiatric social workers, but also include psychologists and psychiatrists. Malchiodi’s notes in her introductions for teachers and supervisors of graduate art therapy students, offer further points of discussion.

Riley’s social constructionist theoretical stance is clearly the latest in an intellectual odyssey. The family and the therapist together will dis-solve the problem by their collaborative efforts. The narrative is central and authority is shared, although the therapist retains responsibility for introducing art tasks that allow the family to illustrate their story.

To her credit, Riley has investigated and mastered the thinking and practice of the systemic, strategic, and structural theories of family therapy. Each of these represents a considerable body of literature and each requires many hours of practice in session to master. The interlacing of art therapy with each of these schools of thinking is Riley’s generous contribution to the field. This mastery allows her the flexibility to apply the most useful approach, whatever the presenting problem, whatever the cultural and socioeconomic background of the family. Malchiodi early on refers the reader unfamiliar with family therapy to more comprehensive foundation books in the field. Without this knowledge, one would not fully appreciate Riley’s dexterity and skilful interventions.

This book is divided into three sections. In “Family Art Therapy—Integrating Theory with Practice,” Riley begins with the significance of the family’s illustrations of their story, the reason they came for help. Joseph, an abused 11-year-old, told Riley the story of being forced to kneel on dried beans as a punishment. Through art, she helped the child transform this image by making paper beans, expanding, and playing with their symbolic meaning. At one point, Riley offers Joseph a handful of real dried beans to carry in his pocket as a reminder he now has the power over them and not the other way around. This vignette shows art therapy at its best. The author investigates the creation of reality and meaning in the therapeutic process.

A basic concept of the social constructionist view is that the therapeutic session is time spent in conversation, co-constructing a new outcome to a problematic situation presented by the client(s). Therefore, “unless the concept of ‘language,’ the dialogue that arises from exploration of the art product, is attended
to and understood, the desired outcome of therapy may be at risk” (p. 65). However, in addition:

The author regards the art product as an illumination of the world view of the client(s). The art product is a visual guideline which informs the therapist in which direction to proceed and encourages new possibilities for resolution of the dilemma under discussion. Therefore, how that art product is discussed is the core of successful therapy. (p. 65)

Chapters II and III are ponderous reading. Fortunately, this challenging theoretical or postmodern construct closes with a concise and lucid summary. The case material that follows is excellent with an immediacy that makes engaging reading. Black and white photographs throughout are clearly reproduced and close to the text.

In “Schizophrenia as a Solution to Family Disorders,” Riley displays exquisite sensitivity helping a couple solve their marital conflict and deal with their schizophrenic daughter’s role in the family. Asked to “take a vacation together” on a large sheet of white paper, the husband drew a black line down the middle. His wife responded with hurt and rage and in tears: “That’s what you always do! Keep us apart!” In shock and disbelief, he denied that desire, wishing to change the black line. Riley allows the misery to fill the room before she silently reaches to touch the white oil pastel, gently hinting at a possible solution.

Message received, the husband whitened over the black division and expressed his wish “to have this symbolic gesture translate into reality” (p. 75). Further discussion elaborates her integration of the structural theory in order to help this family.

In describing work with a couple concerned with a dying marriage, where the issue of age difference was the presenting problem (she was six years older and always would be), Riley effectively chooses not to be helpful and therefore swallowed up by the double bind. After empathic listening, she assigns homework for the next session: the couple must bring copies of their birth certificates with them. The art task Riley presented at the following session was a collage made of the two copies cut up and rearranged. The couple’s work resulted in an attractive, jumbled collage where their separate documents were united. They seemed to simultaneously understand what they were destroying and what they were creating. They needed very few words to do this. The couple touched hands, chuckled a lot, encouraged each other’s participation in the collage process, and smiled at their completed project. (p. 124)

By taking their presenting problem seriously and responding with an art task that defied logic, Riley frees herself and the clients to move through the impasse and begin work on further treatment issues. She states,

The metaphoric power that lies in an art task gives the client(s) an opportunity to take charge of creating new possibilities in their problem-solving skills. What deeper level meaning this creative process speaks to in the client may never be fully understood by the therapist. (p. 125)

The case material presented in “Multi Family Group Art Therapy: Families with a Disabled Family Member” displays Riley’s versatility and depth of experience. She demonstrates courage, faith, and a sense of adventure in conceiving and leading a multifamily group, “three fathers, three mothers, four boys, three girls, three co-therapists, and myself” (pp. 148-149). The group is observed by eight to ten staff people in the same room while two cameramen and two assistants record the event on video! This description alone makes one smile. Amidst the anxiety, joy, and inevitable confusion, Riley describes a clear and well-planned series of six one-and-one-half hour sessions with three families, each with a member with a disability. Every session has an interpersonal goal, an art task, and a time for processing art, observations, and feelings. She deftly interweaves the third family with the first two by the simple technique of tracing one’s hand, cutting it out, and arranging it on a wall mural. The hands of the first two families surround the new members and welcome them to the group.

She increases self-observation by reconfiguring the family groups with the art task of creating an ideal world. This single session illuminated the human trait of preference for familiar burdens rather than seeking change and avoiding challenges created by new forms of stress. This realization instilled in families a willingness to work on their own problems, rather than being jealous of other families and what appeared on the surface to be an easier life-style. (p. 152)

Most importantly, the handicapped child, was “rapidly absorbed in this therapeutic approach, reducing differences and enabling parents and the children to focus on problems and feelings in a way that gave permission for change” (p. 157).

Last, but not insignificantly, all three families enjoyed the process of having fun together, a rare occurrence where concern about chronic disabilities can easily eliminate essential pleasure. The use of videotape, common to family therapists, but less so to art therapists, provides evidence to health care administrators, supervisors, and insurers that brief multi-family group art therapy is not only cost-effective but provides a host of therapeutic benefits.

The broad issues Riley addresses in “Family Art Therapy and Postmodern Society” provide the context within which we all work. Family therapy has always taken seriously cultural issues such as feminism, ethnicity, domestic and societal violence, and economic pressures that impinge on family organization. Malchiodi and Riley explore the application of art to families struggling with environmental and interpersonal traumatata. Parentified grandparents and grandchildren use art to sustain connections. Both children and adolescents use art to express fear, panic, and anxiety following the Los Angeles riots that marked a community’s response to the Rodney King decision of 1992. Photographs of their drawings should be enough to convince the most doubtful health care provider about the value of art to mediate posttraumatic stress. Proper training in child abuse reporting procedures in addition to precautions that insure the therapist’s physical safety on the job are essential for professional performance.

Comfortable as a team member, Riley earlier made a psychiatric referral for a young girl in need of medication. Her ethical responsibilities to her patients are not compromised by her need for control. Riley serves us well by reminding us to attend to these topics.

Unfortunately scientific research is a weakness of both fields of family and art therapy. Riley’s book offers direction for much needed data. In the introduction the authors refer the reader to Hanna Yasa Kwiatkowska (1978) who wrote from her experience...
at the National Institute for Mental Health (NIMH) and offered research protocols and a format for family art evaluations. Helen Landgarten (1987), has also written extensively about family art therapy, but her greatest strength is long term treatment, allowing the reader to follow cases over time.

Managed care has brought enormous changes to the system within which all art therapists and family therapists operate. How we think, how we plan treatment goals, and how we understand the possibilities of care are all affected by the new shape of medical politics where government, insurers, and medicine vie for control. The demand for health cost containment more than any other single issue begs for research like Riley's multifamily group art therapy.

Generous references and suggested reading listings appear at the end of every chapter. The bibliography is discriminating and useful with a breadth and depth of psychiatry, psychology, art therapy, and family therapy. A glossary of family therapy concepts would have been a useful addition for those new to the field.

Regrets about this volume are few. Originally written as separate articles for journals, such as this one, there are awkward transitions and repetition that a good book editor could have eliminated. The challenge of the concepts within the early chapters on theory is more than overcome by the scope and creativity in the clinical work. The authors chose not to include a discussion of the difficulty inherent in making the shift in thinking from an individual psychodynamically-oriented belief system to a multigenerational family belief system. Art therapy's deep roots in psychoanalysis and art education can make this transition cumbersome, but, as Riley illustrates, the work is more than worth the effort. The directed art task and the use of homework, both common to family therapy, could be seen as intrusive countertransference. Riley's art tasks flow from her understanding of the family's organization, verbal and visual pictures of the circumstances, and mutually agreed-upon goals.

Family art therapy literature is rich, yet sparse; too few of us are writing about what we do. Riley contributes by showing how art therapy applies to many family therapy approaches. Theory and application are successfully interwoven to help many patient populations with various treatment issues. Multifamily art therapy groups are effective for healing, saving time, and money. Videotapes document the creative process for research and training. Through all of this, Riley displays the compassion and wisdom of an experienced clinician who has refined her skills, intuition, and power to listen on many levels. Her tapestry will never be complete because she continues to enjoy this creative process. Offering her clients and readers a golden thread, Riley writes, "There is a lot of looking, seeing, speaking, and hearing left to be done" (p. 5).

PhotoTherapy Techniques: Exploring the Secrets of Personal Snapshots and Family Albums

384 pp., $39.95, cloth, U.S.A.; $52.50, cloth, Canadian. ISBN 1-5554-42-552-6

Reviewed by Julia Gentleman Byers, MA, A.T.R., Montreal, Quebec, Canada

"Someone once told me a photo was paper with 'emotion' all over it, of course he meant emotion, but the malapropism stayed with me (p. 4).

"A photograph, then, has the special quality of being simultaneously a realistic illusion and an illusory reality—a moment captured yet never fully captured. We use film to stop time, which cannot be stopped" (p. 4).

PhotoTherapy Techniques is a long-awaited and much-needed text. The author, Judy Weiser, explores how photographs, when analyzed and understood, can reveal people's perceptions of reality. Weiser's book helps readers look at their own and their clients' "perceptive filters." Her book is written for a wide audience: those with a background in mental health psychotherapeutic approaches (including art therapy), as well as people working in special education, English as a second language, clergy, summer camp personnel, and so forth. The author also states that the text may have strong implications for those interested in fields of visual literacy, crosscultural studies, anthropologists, and sociologists, because the book's central thesis—how visual information is coded, represented, and placed in context—has meaning and applications that reach far beyond the fields of art therapy and photography. Weiser also suggests that the book may be used by the general public to enhance self-knowledge and personal growth. However, she wisely cautions against using the exercises on anyone else, other than the self-inquirer, without professional training in therapeutic models.

Weiser begins the book by describing the powers of phototherapy. She reiterates her psychological electricism in her approach to phototherapy, emphasizing that it is both "photo in therapy" and "photo as therapy." She then goes on to define five main approaches to phototherapy which include: (1) photo-projective techniques, (2) self portraits, (3) photos of the client by others, (4) photos taken or collected by the client, and (5) album and photo biographical snapshots. Within each of the chapters sections, Weiser uses anecdotes from her own practice and offers starter exercises. However, she states clearly that the book is not intended as a "how-to" guide to phototherapy but rather a study of the collaborative therapist-client approach. Weiser also states that her book does not (attempt to) provide a comprehensive literature review, but she does make references to other authors and practitioners who have inspired her in the integration of theory and action.

Weiser's ability to describe the camera as a metaphor for the
human experience of perception is very creative and insightful. Words like “focal lengths,” “spaces,” “perception,” and “filters” take on new meanings and tones. In this light, it is surprising that Weiser does not deal with active darkroom techniques. The darkroom experience seems a potential way to explore the shadow side of the personality. The rationale for this omission may be attributed to Weiser’s experience using primarily Polaroid pictures and snapshots, the lack of technical facilities, and the resistance of many people to explore the “art” of photography in a more in-depth way.

After clearly outlining the five principle areas, Weiser then explores more in-depth applications of each technique. In projective phototherapy techniques, emphasis is on both the active and passive aspects of projecting, decoding, deconstructing emotional content from stimulus images as the client is assisted in exploring his/her construction and association of meaning and feeling which they believe to be originally residing in the photographic artifact. (p. 61)

Weiser’s anecdotes are clinically sound and very moving. She describes a client who noticed “a photo that really caught his eye” hanging on the therapist’s wall. The photo was of a white-faced mime. (Weiser promotes photographic images which can be spontaneously chosen by clients to encourage initial projection in the early stages of therapy.) This client recounted taking his son to a circus where he had to leave when a white-face[d] clown came out. It was his son’s initial disappointment which caused him to explore the incident. At first he thought his reaction was merely claustrophobia. Through this “new” photo he realized that he again “felt panic and the need to flee.” His first reaction in therapy was recalling his experiences of sadness and decay in Vietnam during the war. Later, as other similar associations and events occurred in real life, he regained another layer of insight. The client became able to connect powdered Halloween face makeup to powdered lime dust left on children’s bodies in a village he helped eradicate as a soldier. Thus, the therapist was able to pursue continued work to resolve repression of thoughts that caused him discomfort in his current life.

Weiser also describes how a therapist can use found photos (magazines, birthday cards, etc.) to evoke responses. This approach appears similar to Landgarten’s (1980) use of collage box material in art therapy. However, from Weiser’s description, the client doesn’t necessarily create new images. Rather, the therapist uses the images to simulate discussion or further phototherapy techniques. For instance, Weiser describes a family who came into therapy having difficulty recognizing their roles and responsibilities in the events leading up to the suicide attempt of their 16-year-old son. The therapist showed the family five photos, asked them to write down their different reactions, and then had the family members share those reactions. The exercise helped show that no one could be wrong in the absolute sense. Subsequently, the family was able to explore their feelings underneath differing perceptions. Weiser appropriately cautions that the layers of defense in each person’s capacity to uncover painful material must be executed and lifted slowly. She cites the example of “Mathew” who explored one photo image over 2 1/2 years to resolve undiscovered childhood abuse. At the end of this section, the author provides stimulus exercises in eliciting and questioning techniques to focus on underlying themes and issues.

The next section of the book focuses on working with self-portraits. Weiser tends to design interventions to activate self-esteem, self-confidence, and self-acceptance (not barriers) between clients and others. For instance, she might tell a client, “[P]retend for a moment that you have won a free portrait sitting at the best place in town.” The exercise helps the client to use his or her own perception. These types of exercises provide an opportunity to discuss and explore what happens when clients plan and then pose for snapshots of themselves. Further interactive “debriefing” of the experience in actually making that image is created. Weiser also demonstrates how “self-portrait Polaroids made in the therapist’s office [might help clients] who are resistant [and] repressing difficult material.” “Polarized” Polaroid exercises are used to explore dualities and ambiguities. As Weiser states: “[I]t is not possible to view an image of oneself knowing that it is oneself and see it as if it were a stranger. There is always privileged knowledge that cannot be removed from the perceptual process” (p. 145). However, caution must be used in applying these concepts and ideas to personalities whose self-image is fragile.

The intent in the next part of the book is to explore the connections in “seeing” other perspectives. As Weiser begins, “[T]he key word in speaking of photograph[s] is take ... and in a sense photographers take us, we become partly theirs, at least metaphorically. Their ‘having us’ is a demonstration that some sort of relationship or interaction between us has occurred” (p. 187).

Weiser says that the camera records everything that its viewfinder “sees,” but the implication is that people tend to see selectively, especially when focusing on a person of interest. These implicit metaphorical associations to the “camera” as a pseudo person have been made throughout the book, attributing photography as a verb as well as a noun. “A camera does not just record, it also mediates” (p. 3). “The camera pointed at her” (p. 54). “My camera has pointed out to me ...” (p. 230). “It all depends on the trust of the photographer ... the power of the camera ...” (p. 197). Although not explicitly stated in the book, from a psychoanalytic perspective one might speculate on the potentialities of the “invasion” of the camera as having transferential elements in the therapeutic encounter—similar perhaps to the Gestalt empty chair concept and the Winnicottian concepts of the transitional phenomena and the transitional object. The power of an object which is used to “see” through experience has vast analytical implications for discourse.

Then, from a multilevel framework, Weiser approaches the “debriefing” of photos of the client taken by another. Through the case illustrations of Penny, Eva, Maureen, and Joseph, the therapist describes the importance of the level of actual visual content in the picture. She then probes the meanings of the detail for the client and how original meanings can change over time. She also includes the role of the photographer in relation to the client, whether that relationship is old or new. Finally, with all her clients, she poses the question of what should be done with the images after the therapeutic experience. These anecdotes serve to illustrate secret messages in interpersonal rela-

---

"Judy Weiser responds, "Ironically, this was one of the sections addressed in the original manuscript which [the] editor cut due to length-of-book constraints.""
tionships. The author carefully reattributes family system perspectives of family power alignments, triangulation, emotional cutoff, mirroring, and other behaviors.

Subsequently, Weiser also brings in other applications of theory and practice. In the last stages of AIDS-related diseases, Weiser feels very strongly that it is one thing to have photos of special people, places, or things, but it is also different and much better to have photos of oneself. Depending on the therapeutic focus, Weiser states that "taking charge of what is being done to one's body is often the first step in seizing the will to live. Encouraging these types of patients with photographs of their physical and emotional changes is a step toward self-recognition and the ability to react to what is happening."

Finally, the author explores in-depth metaphors of self-construct. She shows how photography assignments can bridge generational, cultural, class, racial, sexual, and even political differences (i.e., shooting pictures instead of guns). Weiser discusses how the control and power over what to frame in the viewpoint increases clients' feelings of empowerment. She also shows how a "collection of photos given to a person [by] another can serve as a very powerful retrospective summation of a person's life, positively reframing unsettling fixed negative experiences. Especially for the geriatric population, the collection of photos can be used for life-affirming and memory-evoking purposes."

In her summarizing chapters, Weiser looks at photosystems and personal family systems from a structural perspective. What is noticed in albums is not only the overt content, but selective forgetting, which is really selectively constructed narratives. Weiser "changes the picture" as she demonstrates the intergenerational messages and expectations in her own family system. Weiser bravely uses her own narrative to explore and understand the meaning certain photos had for her, to demonstrate her application of the theoretical underpinnings of systems approach, and how photos have made her personal life more insightful. This rare blend of the personal in a text is honest and refreshing. In most psychological books, it is uncommon to find the therapist exposing vulnerability and naivety, but Weiser is fluently able to use herself as an object.

Weiser concludes with reiterating the sense of wonder and awe at the magic inherent in the photographic process. Photographs give the opportunity to witness paradoxes and coexist in mutual contradictions. As the author states in using phototherapy techniques, people can "get a picture" of their lives that is worth more than a thousand words. It seems that through photos as a tool in therapy the client is able to use both the "camera" and the therapist as an auxiliary ego.

Judy Weiser bridges her experience working with First Nations peoples, in family and conjoint therapy, in crisis intervention (divorce, bereavement, and long-term terminally ill, such as AIDS sufferers), in a very sensitive and creative manner. Her book reads as an informative journal full of rich examples of applications. This book is what its title promises: an exploration of the secrets of personal snapshots and family albums. As she reiterates at the end of her book, readers must be comfortable with concepts such as selective perception, situationally-based reality, synchronicity, ego centricity, ethnocentricism, and be fluent enough with one's own theoretical underpinnings to recognize where these things may be affecting communications with clients. The recommended readings are very timely and apro-

priate. This book affords everybody the opportunity to, as Jung once said, trust that which has meaning.

PhotoTherapy Techniques: Exploring the Secrets of Personal Snapshots and Family Albums

384 pp., $39.95, cloth, U.S.A.; $52.50, cloth, Canada. ISBN 1-555-42-552-6

Reviewed by Stephanie Zupenko Dudek, Montreal, Quebec, Canada*.

Weiser is a practicing phototherapist and a professional photographer. Early in her career as a photographer and as a psychotherapist Weiser realized that personal snapshots and personal albums constituted dynamic stimuli that "permitted connections with unconscious and deeply-based memories, thoughts, and feelings which verbal therapy had not been able to reach" (p. XIII). She began using them with her psychotherapy patients and quickly realized the enormous benefits of doing so.

This book is meant to be a guidebook, and it offers a set of techniques for already competent therapists to add to their professional repertoire of counseling skills (p. XV). Chapter Two provides an overview of therapeutic techniques, namely: 1) the projective process, 2) working with self portraits, 3) working with photos of clients taken by other people, 4) working with photos taken or collected by clients, and 5) working with the family album and other autobiographical photos.

The projective process is aimed at exploring client perceptions, values, and expectations. The chapters are amply illustrated with appropriate photos and followed by sample exercises which consist of instructions on how to proceed, what questions to ask, and so on. Weiser also provides examples of actual cases, and her interpretations of the therapeutic process are useful regardless of the therapist's particular theoretical orientation.

The book is well-written, readily accessible to her audience, and potentially useful to therapists of different theoretical persuasions, using different techniques of psychotherapy. The techniques are the result of a caring, involved human being who is obviously passionate about what she is doing and would like to share her skills with as many people as she can reach. This book is a gold mine and is recommended as useful and instructive to persons engaged in the phototherapeutic enterprise. It is, as Weiser says, "a set of flexible tools with which to construct a process tailored to each client's individual needs and goals" (p. 345). Congratulations Judy Weiser, and thank you.

Diane Rode, Executive Producer of Through Our Eyes Productions, describes this company as a patient collaborative video production company where pediatric patients (ages 9–20), who have experienced and mastered aspects of chronic illness and medical interventions, function as video producers to document their experiences. The patient producers work with creative arts consultants to use media and other arts modalities to create their own “living with illness” videos. These videos (five, to date) are used to inform and educate fellow patients, families, health care providers, and the community at large regarding the nature of illness and recuperation as experienced from the point of view of young people living with specific conditions. (Rode, 1994)

The children and adolescents are involved in every aspect of the video-making process, from concept to script, camera work, music, and editing. They are involved in the therapeutic group processes necessary to collaborate in a creative project. Most importantly, they process all aspects of their illnesses that come through so beautifully in these films: physical, emotional, and relational.

To review these films, it is necessary to address them from two different points of view. In the Mt. Sinai Child Life Program, video is used as an art medium; these films reflect some of that work. The viewer can appreciate the films as the creative healing process. Second, these films are informative and creative documentaries about their specific subjects. This review discusses two of the five films in this body of work.

In The Shattered Sugar Bowl, children with diabetes open the video singing a calypso tune titled “Blood Sugar High, Blood Sugar Low,” taking turns singing their own improvised lyrics to the tune. Vignettes of the group of children in creative arts groups demonstrate the use of music, art, sandtray, dance, and drama. The children film each other throughout all of this, and they interview staff and each other about their medical conditions.

They follow each other with their cameras to supermarkets to discuss food choices, to their homes where they discuss their everyday lives living with their condition, and they interview the “person on the street” about diabetes. The children speak about the physical and emotional experiences of their illness from diagnosis to treatment. Their self-treatment, such as taking their own blood sugar counts and giving themselves injections, is shown, described by the children, and demystified.

This Flower Comforts You is made by five girls who are undergoing kidney dialysis treatment, typically three times each week for a number of years. The video is a collage of vignettes of the girls speaking about their experiences through music, poetry, and their artwork. They interview each other, their doctors, nurses, and social workers, and they film each other going through their days which include quantities of time at the dialysis center.

The importance of the creative arts therapies is clearly shown in this film; the film itself is an expressive art piece. Poetry such as “Dear dialysis machine” poignantly explores the girls’ ambivalent feelings about treatment. They show collage and poetry titled “How I feel about my kidney failure.”

This film very clearly expresses the feeling and lives of the patients and an enormous amount of information about the illness and treatment. As the girls receive treatment, they describe what is happening and how it feels. One girl who had a successful transplant is part of this group. She describes her experience and what her life is like now. Another girl had an unsuccessful transplant and speaks about that as well.

There are poignant, funny, and informative aspects to these films. The children/adolescents become empowered by being able to film and interview the doctors, to be the ones in control in a situation that is, for the most part, uncontrollable.

While these are not “how to use video as a modality” films, they can be quite inspiring to creative arts therapists. (For example, after I showed these films to a graduate art therapy class, one student brought her camera into her field-work setting and made a video with her group.) These films were made primarily as a group process art piece. However, as informative documentary videos they are appropriate for viewing by Child Life departments in medical settings, by educators of doctors, nurses, social workers, and other medically related caregivers, and by anyone interested in using video as a medium.

The films have a professional quality that is enhanced by their homemade aspect. The viewer can genuinely feel the involvement of the children. The music, most of it made by the children, enhances the videos’ mood. Clearly, the editing process, which was done by a professional video editor working with the children, keeps the integrity of the project intact.

The “stars” of these videos are the children, who are so open and honest about their feelings and joyful in the creative process. They must feel a good deal of satisfaction in being. To “normalize” an illness for the newly diagnosed children who will watch these films in years to come.

In a sense, these are not films about art therapy. They, as films, are art therapy. The viewer experiences many levels of engagement with these films: as a voyeur into a group’s therapeutic process, emotionally experiencing what these children go through, learning all there is to know about diagnosis and treatment from the child’s perspective, and as a witness to the creative spirit in all its glory.

1996 Engagement Calendar to Support Pediatric Art Therapy

Robin Gabriels, MA, A.T.R., LPC has announced that a 100-page, full-color desk-top calendar filled with young patients’ art is being produced by the National Jewish Center for Immunology and Respiratory Medicine in Denver, Colorado. The proceeds from calendar sales will fund the pediatric art therapy program at the hospital. The art therapy services at the National Jewish Center include individual and family therapy and assessment for patients of all ages. In addition, art therapists offer topic-specific groups such as parent/child interaction, social skills, chronic illness, medical play, body image, self-esteem, single parenting, and multifamily work.

The calendar is an excellent gift idea for family, friends, or business associates. AATA members receive a special rate of $12.00 per calendar plus shipping charges ($2.50); all others may order the calendar for $15.00 plus shipping. Special bulk rates for purchase and shipping are also available. For more information, please write to: National Jewish Center for Immunology and Respiratory Medicine, 1400 Jackson Street, M112 c/o Melissa Bice, Denver, CO 80206, or call 800-423-8891, ext. 1122.

Michelle, age 15: “I did it because I was hoping I could go home some day and go to the pond on a sunny day and watch the animals swim.”

The Art of Cay Drachnik

After 20 years of working as a clinician and in governmental affairs on behalf of art therapy, art therapist Cay Drachnik, A.T.R.-BC, HLM, has returned to painting and exhibitions of her work. Her training as an artist has included studies at the Kansas City Art Institute and later work as a fashion illustrator in Washington, D.C. Recently, she has continued her art studies with painters Jerald Silva and Gary Pruner. She currently exhibits her watercolors throughout northern California, in shows, museums, and galleries.

Cay has won numerous awards for her work over the last 3 years, including the 1993 California Arts League Best in Show; Art of California magazine Bronze Award; the 1993 Northern California Arts League Merit Award; First Place in Watercolor, Lodi Art League; 1995 Best in Show, Lodi Art League; 1995 California State Fair Merit Award; and the 1995 California Art League, 2nd Place in Mixed Media. Cay’s work will also be included in a group show at University of California at Davis Faculty Club Show in October 1995. In her spare time, Cay has been conducting art classes for children 7 to 13 years old at the Sacramento Fine Arts Center.

Cay Drachnik with one of her water color paintings at her home in Sacramento, CA.

What’s New In Ancient Geological Products For Art Therapists

Rock Art Boards
Using the methods of the Ancients who carved hieroglyphics and petroglyphs into stone, this unique form of expression allows the individual to scratch their picture into 5” x 8” sandstone Rock Art Boards—and when they’re done, the user has an attractive piece of art. Easy to do, this expressive, tactile method of illustration is appropriate for children, adolescents and adults. Rock Art Boards with the wooden carving styluses are packaged ten for $10.00.

QuickSand Creativity Kit
Make incredible shapes and figures quickly and easily. With the sculpting tools provided and illustrated creativity guide any individual can find expression in three dimensions!

It’s an excellent hands-on activity. Mix with water, pack and dry, and you’re ready to create fantastic sand sculptures. No additives needed!

Quicksand is totally reusable; this all-natural product cleans up quickly and easily. The 8-lb. bucket of Quicksand is $13.00.

All-Natural Jurassic Playsand
Our 200-million year old pure, duct and dirt free sand that the dinosaurs walked in is perfect for therapy.

Jurassic Playsand is all-natural, with a warm, cinnamon color, and is smoother, softer, and sticks together better than any man-made sand. Best of all, it’s totally safe — there’s no silica dust to breathe. The cost is $15.00 per 50 lb. bag, which we can ship anywhere in the USA.

Sand Trays
We offer a deluxe sand tray for dry or wet sand therapy use. The tray is 3” deep and a standard 19.5” x 28.5” size. The inside is painted a water-resistant sky blue, and has white melamine sides with durable trim.

Sand trays cost $75.00 each; add $15.00 for activity top. Our 50 lb. bag of Jurassic PlaySand, for $15.00 extra, will fill your tray to the mid point. Custom trays to fit your space requirements also are available. Shipping on all orders is additional.

These wonderful products and the geologists who discovered them are at:
Salix Corp., where natural products for use in therapy, art and education are brought from the earth to you.

Credit card phone orders accepted; fax or mail your order to: 60 E. 600 South / Salt Lake City, UT 84111 / Phone (801) 531-8600 / Fax 531-8603

2154
People who have been abused often keep their memories locked in a strongbox of dissociation, hidden even from themselves. Showing how these individuals simultaneously reveal and camouflage dissociated and repressed information in drawings, this ground-breaking book explores the complex messages in art and the graphic communications that are characteristic of those with multiple personality disorder.

Includes analysis of over 180 patient drawings, paintings, and collages. Twenty-one are reproduced in color.

Books sent on approval • Complete catalog sent on request • Prices subject to change without notice

2600 South First Street Springfield • Illinois • 62794-9265
ADDITIONS
Presenters: Lynn Jones, Holly Feen and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley and James Consoli
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The art therapy gives a “voice” to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN SCHOOLS
Presenters: Janet Bush and Sarah Hite (third presenter to be announced)
This symposium will provide participants with the administrative procedures for implementing art therapy services and programs in schools. Topics will focus on the uses of art therapy in schools; roles and responsibilities of school art therapists; techniques and strategies for working with students; training and preparation of school personnel; and the funding and marketing procedures required for school art therapy programs. Participants will be prepared to transfer techniques and strategies for implementing art therapy services and programs to school settings.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Callanan and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

GOING FOR THE GOLD: GRANTS AND RESEARCH IN ART THERAPY
Presenters: Frances Anderson, Vija Lusebrink and Doris Arrington
Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90’s. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal “in process”.

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchiodi, Julie Epperson and Deborah Good
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. “Children at risk” are defined as those who are directly affected by family violence, physical and sexual abuse, neglect homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitation which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchiodi and Anita Mester (third presenter to be announced)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigm for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterburg, Simonton, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical threatening illness will be addressed.

adolescent art therapy
Presenters: Kris Sly-Linton (three other presenters to be announced)
The Adolescent Art Therapy Symposium will cover a wide range of topics designed to address a specific focus area requested by the sponsoring organization. This is a somewhat unique approach to the traditional symposia format but considering the multiplicity of problems regarding the treatment of adolescents today, it was felt this would be a way to make each symposium more pertinent to the intended audience. The four person team headed by Kris Sly-Linton, A.T.R.-BC, was coordinated to include professional art therapists that can provide the expertise required to address the following areas: Special Populations of Adolescents, Program Focus, and Teens and Family Systems.
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the Journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

* Tuberculosis: Art Therapy with Patients in Isolation
* Art Therapy on a Hospital Burn Unit
* The Children's Diagnostic Drawing Series
* Essential Legal Issues for Art Therapists in Private Practice
* Diagnosis or Dilemma: Drawings of Sexually Abused Children

Art Therapy is available to AATA Members as part of their membership. Non-Members may subscribe at the following annual rates:

- Individuals: $50.00 (U.S.) - $74.00 (Foreign)
- Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:

- Members: $12.50 - Non-Members: $23.00

THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board elected by the membership. AATA has established standards for art therapy education and practice: AATA committees actively work on governmental affairs, clinical issues and professional development. AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films, and awards.

PURPOSE
• The progressive development of the therapeutic use of art.
• The advancement of standards of practice, ethical standards, education, and research.
• The provision of professional communication and exchange with colleagues.
• The provision of legislative efforts to promote and improve the status of professional practice.
• The promotion of the field of art therapy through the dissemination of public information.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:
Publications
• Art Therapy: Journal of the American Art Therapy Association (published quarterly).
• AATA Newsletter (published quarterly).
• Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, films, and the membership directory.
• AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
• Mailings of professional interest.

Services
• Insurance, including professional liability, major medical, life and disability through Maginnis & Associates.
• Access to national experts in art therapy.

AATA Conferences
• Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
• Governmental affairs activities including Congressional review and monitoring.
• State legislative and regulatory activities.
• Promotion of recognition and reimbursement of art therapists by third-party payors.
• National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
• Development of model job description and recommendations for licensing standards.
• Development and implementation of national Education Standards for approval of graduate level Art Therapy programs.
• Development and implementation of nationally recognized Standards of Practice and Code of Ethics of Professional Art Therapists.

GENERAL INFORMATION
The American Art Therapy Association, Inc. (AATA) and the Art Therapy Credentials Board, Inc. (ATCB) are administratively independent. Membership in AATA and registration (A.T.R.) with the ATCB requires separate applications and approval.

For NEW Associate, Student, and Contributing members only: please follow the chart below when submitting membership applications:

The membership year is the calendar year:
January 1 - December 31

Applications received between:
Jan. 1 - May 31: Full dues payment; membership expires December 31 of same year.
June 1 - Sept. 30: Half year dues plus $5.00 payment; membership expires December 31 of same year.
Oct. 1 - Dec. 31: Full dues payment; membership for the remainder of the current year and the next full year.

CATEGORIES AND FEES
Professional - By application review process only; approved members may vote, hold office and serve on committees.

• Professional Member - Individuals who have completed educational training in art therapy; dues are $85.00/year.
• Credentialed Professional Member - Individuals who have been dually approved for Professional Membership by AATA and Registration (A.T.R.) by the ATCB; AATA dues are $85.00/year. Annual A.T.R. Maintenance fee is billed separately by the ATCB.

Associate - Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. Such members may not vote, hold office, or serve on committees. Dues are $35.00/year.

Student - Individuals who are currently taking full time course work in art therapy or a related field. Requires a current statement from the institution of learning indicating full time status and course work content (6 graduate or 12 undergraduate credits.) Student members may not vote or hold office, but may serve on the Student Sub-Committee of Membership. Dues are $35.00/year.

Contributing - Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120.00/year.

Retired - Individuals who are at least 65 years of age and who are no longer practicing. Retired members receive publications and reduced fees, but may not vote or hold office. Dues are $35.00/year. Application provided upon request.

Foreign AATA members MUST include an additional $17.50 above required dues when submitting payment to cover the cost of foreign postage.

MAKE CHECKS PAYABLE TO AATA
ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to each copy of your manuscript:

Name:______________________________________________________________

Degrees/Credentials:__________________________________________________

Address:_________________________________________________________________

Phone numbers: Home_________________________ Work_________________________

Type of Submission (check one):

☐ Article  ☐ Viewpoints  ☐ Brief Report

☐ Film/Video Review  ☐ Book Review

Title of Submission:_________________________________________________________________

Checklist:

☐ Five (5) copies, typewritten on 8 1/2" x 11" paper.

☐ Black and white photos of original artwork plus four (4) photocopies of each.

☐ Abstract of 75-125 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature_________________________________________ Date________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy* uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. **Manuscripts that do not conform to these guidelines will be returned to the author without review.**

**Manuscript Categories**

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
6. **Comments.** Brief comments on articles published in *Art Therapy*, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each manuscript to Editor, *Art Therapy: Journal of the American Art Therapy Association*, c/o AATA, Inc., 1202 Allison Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original articles that are not under consideration by another periodical or publisher are acceptable.
3. Manuscripts must be typewritten on 8 1/2" x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 75-125 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors' names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author's responsibility to secure such permissions; a copy of the copyright holder's written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any manuscript accepted for publication in *Art Therapy* will undergo at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Telephone (708) 949-6064; FAX (708) 949-6064. Non-members may subscribe to the following annual rates: $40 (U.S.) and $64 (Foreign); institutions: $57 (U.S.) and $80 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060 (708) 949-6064.

This journal is abstracted in: Resources in Education (ERIC), INNOVATIONS & RESEARCH, Art Bibliographies Current Titles and Art Bibliographies Modern.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

Editorial

Does a Lack of Art Therapy Research Hold Us Back?

Cathy A. Malchiodi, MA, A.T.R., LPAT, LPCC, Editor

In the Viewpoints section of this issue of Art Therapy, Terry Tibbetts presents the following provocative idea: a lack of empirical research in the field of art therapy has stymied the growth and recognition of the profession. In his opening statement, he notes that

"Art therapy as a clinical intervention continues to be both underutilized and misunderstood by many mental health providers. I suggest that one of the major reasons for this failure to be taken seriously as mental health professionals is because art therapy, as a discipline, has failed to generate empirical data that would support our claims to clinical effectiveness."

It is true that there is a lack of research in the field of art therapy, both quantitative and qualitative. The vast majority of papers submitted to this peer-reviewed publication concentrate on clinical observations, theoretical explorations, and practical applications, not empirical or other types of research. When research articles are submitted, they often focus on surveys of what other art therapists are doing or thinking, rather than on clients' experiences, or focus on the content of art expressions (i.e., art-based assessments). While the latter is important to increasing art therapists' understanding of the meaning of client art, these studies often do not examine the process, efficacy, or outcome of client treatment issues important to defining how art therapy works and how (and if) it is of value to clients.

Also, the particular type of research (i.e., empirical) that Tibbetts cites a lack of, may not be the only path to reliable data on art therapy. Some have noted that the lack of art therapy research may be due, in part, to the lack of methodology compatible to investigation of art processes and art products (Junge & Lanesch, 1992; Wadeson, 1992). There may be other methods of research that may be more appropriate to the field of art therapy, including qualitative models such as a structured case study research, anthropological, and phenomenological methods.

There are many obvious reasons why there is so little published research available on art therapy. First and foremost, most art therapists train to be master's level clinicians, not researchers; it is unrealistic to expect that most students in art therapy master's programs will be able to generate research of depth and quality. Academic programs generally focus on clinical training (i.e., teaching students to become responsible and effective therapists to the clients they serve), with little time left to dedicate to teaching students the intricacies of research. Art therapy educators have struggled for many years with the need to effectively teach research methodology within two-year graduate training programs and often cannot devote more than a single semester-long course to this topic. The study of research and the completion of research projects competes with other areas of learning (i.e., multiculturalism, professionalism, ethics, legal issues, studio classes) that may be more important to the practical knowledge of art therapy students. Also, with many programs adding coursework to meet counseling licensure laws, there seems to be less and less time for research coursework. As Wadeson says in her response to Tibbetts in this issue, "It is one thing to desire research in art therapy. It is quite another to set up conditions to facilitate it."

Since master's level clinicians cannot be expected to contribute significant research, often professions depend on their doctoral level people and educators in higher education to pursue and contribute research data to the field. Art therapists with doctoral degrees or currently in doctoral programs, are often involved in research, although not necessarily related to art therapy. Since many art therapists undertake doctoral degrees in psychology or fields other than art therapy, they may complete research in areas outside the field, if at all.

In higher education, there is an expectation that professors conduct research and publish that research in peer-reviewed publications. While some art therapy educators are conducting research and writing scholarly papers for publication, the majority are not contributing to the field in this way. Many art therapy educators, particularly those with appointments at small colleges, do not have significant track records in publication and scholarly research. Responsibilities to teach extended course loads and recruit students to keep enrollments adequate, as well as the desire to do clinical work or studio art, may effect art therapy educators' time and interest in research and writing (Malchiodi, 1993). However, in the near future, art therapy educators' lack of devotion to peer-reviewed publication and research may have powerful ramifications on the growth of the field (and eventually on the continued numbers of applicants to art therapy programs).

In his opening statement, Tibbetts says that "Although art therapy as a professional discipline has been in evidence since the mid-1950s, it has achieved, as we move into the 1990's, only limited acceptance in the larger mental health field." In reading this statement, a related question comes to mind—is it "art therapy" that is not accepted or is it "art therapists"? There is evidence that art therapy is widely accepted in many sectors of men
tional health and healthcare in general. For example, the American Counseling Association, a 60,000 member-plus organization, has called for special workshops on the use of arts in therapy at its upcoming international conference, and recently published a text on the use of creative arts therapies (including art therapy) in counseling. When one looks at the fields of mental health, medicine, and the arts, it seems that everyone is doing what might be considered art therapy, whether a registered or board-certified art therapist or not. There are and there will be increasing numbers of those who use art in therapy and/or assessment, underscoring the recognition by others outside the field that art therapy is an effective, viable, and successful treatment.

If art therapy is being embraced and used by other professionals and in a variety of settings, perhaps it is art therapists who are not accepted, rather than art therapy per se. If more art therapy research is generated, will art therapists find more recognition in healthcare and will more art therapists find jobs? That is an experiment that has yet to be run, so we can only speculate on the outcome at this point in time.

Is it just a lack of art therapy research that has held us back? Perhaps it has played a significant part of the woes of art therapy, but there may be more basic problems at the foundation of the profession's dilemma. Before we can do meaningful art therapy research, we have to be willing to identify and face the real questions about art therapy that need to be answered. Although we probably all believe that artmaking is inherently therapeutic and that the creative process is healing, the investigations necessary to support these simple beliefs have not been completed. We also need to acknowledge and address the question: what does an art therapist contribute to the therapeutic process that another clinician cannot? These are questions that we may take for granted or perhaps wish to ignore, but need to be honestly examined and answered, if only in an effort to serve our clients in the best way possible.

Editor's Note: Special thanks go to LEVYB (Barbara Levy), Larker (Carol Lark), JWalk212 (James Walker), and SaK212 (Leslie Powell-Knowles), my cyberhuddles, for sharing their ideas on this topic in the Creative Arts Therapies Folder on American Online, and to Linda Gantt, PhD, ATRA.

Art Therapy: Bridging Barriers with Native American Clients

Abstract

This paper describes field observations while working for two years full-time on an Indian reservation. The introduction provides a brief background and sets the scene and impetus for sharing. In the second section, three issues which were found to be central to effective therapeutic relationships are discussed: trust, common ground, and mutual respect and understanding. In the last section, client art is discussed as it relates to Native American spirituality, values, and personal growth.

Introduction

In 1990 I embarked on what was to be a 2-year journey working as an art therapist for the Penobscot Indian Nation. I brought with me a world view which embraced the oneness of all beings, our inseparable link with nature, the universal "language" of art, and the interconnection of mind, body, and spirit. Everything I had read, or been exposed to, which addressed the spiritual perspective of Native Americans led me to believe that my world view was congruent and, therefore, acceptance by clients would be a natural consequence. Nothing I had read or studied prepared me for the hidden challenges of multicultural work: the extensive distrust of non-Indian people, the deep-seated anger, or the way non-Indian employees were treated differently from Indian employees despite their sincere commitment to helping roles.

My interest in Native Americans had grown over a 3-year period during which I had an increasing number of dreams of Native symbols and power animals, together with indications that I would move to the state of Maine. I did not know why I was to pursue this path, only that I was being led to move 250 miles North to be with Native people. The rest was to unfold. While this background may be judged unnecessary "mysticism" by some, readers are reminded that such judgements arise from specific value systems; value systems which, in my experience, may well be incongruent with Native world views. In fact, in many instances, it was my belief in, and openness to, the importance of messages received through visions and dreams, as well as visual symbols, which allowed therapeutic alliances to be formed.

After my work began, I made attempts to network with other art therapists who were working with, or had interest in working with, Native Americans. However, I found very few art therapists working with Indian people. Moreover, experiences undoubtedly differ from tribe to tribe, the experiences chronicled in this paper involve one Northeastern tribe where participant observation took place in the heart of the community. Working as a full-time staff person on the reservation, in an Indian-run facility, provided a vantage point that was closer to the People (as they refer to themselves) and their ways than would have been possible, for example, in an out-patient hospital within the dominant culture.

The Penobscot Nation is a federally recognized tribe of approximately 2,033 Native people, about 462 of whom reside on the reservation and are eligible for counseling services through the Indian Health Services, a nationwide program for recognized tribes. (Indian Health Services, Public Health Services, and the Alcohol and Substance Abuse Program fall under the U.S. Department of Health and Human Services.) The Penobscot community is close-knit and includes two churches, a community building which houses the tribal government, police and fire departments, a new elementary school, social services center, variety store, and ice arena. The health center is Indian-managed and falls under the authority of the tribal government. There is a racial mix of staff members.

Art therapy was offered through the community health center, a modern out-patient facility which houses medical, dental, nutrition, and counseling services, day care, and meals for the elders. Counseling and art therapy services were supervised by three consultants including myself and a substance abuse counselor. The psychologist who conducted initial assessments also diagnosed and assigned clients for counseling and art therapy. A multidisciplinary treatment team met weekly and made recommendations for clients in a process similar to ward rounds in in-patient treatment. The team included the psychologist clinical supervisor, unit coordinator, counselors, art therapist, doctor, nurse or physician's assistant, pharmacist, nutritionist, social worker, and school liaisons.

Clients were integrally involved in both defining their presenting problems and planning their treatment. Health center clients voluntarily came for services which were free of charge, although occasionally clients were court-ordered into treatment. Language was not a barrier because the Penobscot people use English as their primary language. Efforts are underway, however, to recover the Penobscot language.

The Penobscot people are proud of their community health center and do not appear to hesitate to use the many services offered. While some readers may view those services as Eurocentric, it is an error to assume that all Indian people wish to return to the sole use of traditional medicine and healing. As you read this paper and consider its points, I encourage you to critically identify and examine your assumptions. In my work with Native people, I have found that there are bidirectional assumptions which continue to create feelings of anger and frus-
tration. If we are to overcome discrimination, we must be willing to communicate from a here-and-now stance, setting assumptions aside.

Readers are referred to the many informative texts (American Friends Service Committee, 1989; Freesoul, 1986; McCua, 1990; Meadows, 1991; Wall & Arden, 1990), written by or in conjunction with Native Americans, that address the Native American’s love of and reverence for the earth, nature, and the universe. An understanding of this sacred relationship is important for any art therapist or counselor working with Native peoples. Although Native Americans are not a homogeneous group (having much diversity in geographic location, customs, language, and even their level of comfort with the terms by which they are referred to such as Indian, Native American, Aboriginal People), their connection with the earth is a shared commonality. In their view all peoples of the earth are inseparably linked through the Earth Mother. To Native Americans spirituality grows from this connection, which is central to their world view.

Central Issues to Therapist Effectiveness

Concordance in the Therapeutic Relationship

“Goodness of fit” between therapist and client is often discussed in art therapist and counselor training (Borden, 1979; Gelso & Carter, 1985; Luborsky; Christ, Mintz, & Auerbach, 1988): the degree of concordance between client and therapist in the therapeutic relationship is integral to therapeutic gains. In may experience goodness of fit is a lofty goal for art therapists or counselors working with Native Americans, but one well worth pursuing. It is lofty due to the hidden challenges of multicultural work, for which one can never be fully prepared, and which cannot be controlled. It is lofty because despite the preparation the art therapist may have made, the experience can never be understood until undertaken.

Goodness of fit or concordant therapeutic alliance is affected by three factors: (1) the close-knit nature of the Native American family and community groups; (2) the counselor’s understanding of, and respect for, Native spirituality and values; and (3) bidirectional race hatred which continues in the present generation. These three are central to effective working relationships and present a major challenge for therapists working with Native American clients. Underlying these issues are the accompanying issues of the need for client trust, the need to establish common ground, and the need for mutual respect and understanding. Again, it is important to understand that Indian peoples are not a homogeneous group, and, therefore, the diversity among tribes requires us not to box Native spirituality, customs, or values into a neat package to satisfy our own purposes.

Issues Related to Trust

The concept of the importance of family and community is expressed in the preambule of Wisdom Keepers (Wall & Arden, 1990) in prose attributed to The Peace Maker, founder of the Iroquois Confederacy, circa 1000 A.D. “Think not forever of yourselves, O Chiefs, nor of your own generation. Think of continuing generations of our families, think of our grandchildren and those yet unborn, whose faces are coming from beneath the ground” (p. 7). Native Americans honor the voice of the ancestors and hold dear the children and future generations.

Native teachings, which have a long oral tradition, pass down through parents and Elders and are often clutched tightly to keep them safe. The Shinnecock Elder, Starleaf, has said, “So much has been taken, so much has been lost. We hardly know our own language or culture anymore…. In exchange for all he’s taken from us, all White Man gives us back is welfare…. That’s rape—raping someone’s way of life, raping someone’s culture and heritage….” (Wall & Arden, 1990, p. 45). The decimation of Native American culture has left its people a legacy of pain which makes sharing difficult and trust even harder. Hallowell (1991) says this pain manifests in feelings of “self-hate, shame, rejection, emotional deprivation, abandonment, and an inability to trust” (p. 5).

To the art therapist, the value placed by The People on family and community can appear as a barrier when coupled with inherited pain and issues of distrust. The art therapist must have more than a sincere desire to know and understand. Expecting an Elder to share the gift of knowledge about the culture is a set-up for disappointment. Dufrene (1991) mentions “the secrecy associated with many traditional Indian customs” (p. 20). This secrecy also becomes a barrier to the therapist’s learning about and coming to understand the culture and often the family system. At the same time, we are entreated (Dubray, 1985) to become well informed, we are forced to fall back on written accounts of the culture, not all of which are historically or otherwise accurate and many of which are written by non-Indian people or focus on Western tribes and often do not make clear the great diversity among tribes. In my experience a great deal of anger is directed at the therapist for not understanding, while information is simultaneously held in a closed environment and protected from assumed harm.

Trust develops in the therapeutic relationship when the art therapist is open to, and nonjudgmental of, Native American world views. Without communicating a basic respect for Indian ways, the art therapist cannot hope to have material of any importance shared by clients. Seeking to understand the historical background of the specific tribe from which your client comes is paramount. At the same time, art therapists must recognize that The People’s self-hatred, shame, experiences of rejection, emotional deprivation, and abandonment all impact the bond of trust we seek to establish. Indian people question how they can entrust their deepest feelings and experiences to therapists, especially white therapists, whose race caused their pain and took so much away. Their question is an ever-present challenge to the art therapist’s skill and stamina.

Issues Related to Establishing Common Ground

Where does the art therapist begin to develop an approach to therapeutic art tasks? Only by seeking to develop an understanding of Native American spirituality and values, can we hope to find a beginning place that is congruent with the client’s way-of-being in the world.

To understand Native American spirituality is to know the meaning of the concept of “first cause” (Wall & Arden, 1990). This is what some refer to in the East as “the oneness of all being.” To The People, it means that all things are part of the whole: all animals, birds, insects, plants, and trees as well as man.
Indians of Maine and the Atlantic Provinces (Maine Historical Society, 1977) notes that myths were developed to explain Native beliefs, the personality of and relationships among the vegetable and animal kingdoms and man. While it may be perceived that such myths developed in all cultures, it is not true that all cultures consider the oneness of all beings to be a sacred bond. It is difficult at best to attempt to explain the depth that such a sacred bond takes, for it is something felt and fully incorporated into the Native Americans’ life. Like the Tao, it cannot be accurately described, only experienced. And, in another sense, though non-Native people can develop such a sacred bond, it can never be the same unless it is experienced as a Native American.

Myths and folklore “derived from the belief in the unity of man with his natural world” (Maine Historical Society, 1977, p. 21). Native American art was sacred and also derived from this belief. “Their perception of the natural world, the arrangement of the universe, the seasons of cold and warmth, God...the duality of good and evil and life after death governed their concepts of land tenure, their art, their ceremonies, their subsistence and about every conceivable pattern of daily life” (Maine Historical Society, 1977, p. 69). The Indians in Maine and the Maritime provinces were known to have produced rock drawings or petroglyphs, as well as decorative and symbolic art. The artists indwelling spirit was believed to receive strength from the spirit world, when it was called upon for assistance.

The Medicine Wheel or Sacred Hoop is a fundamental symbol of Native American culture and its value system (Doore, 1988). The Medicine Wheel reflects the microcosmic and macrocosmic nature of the circle: the circle and connectedness of the family, the community, ceremony, and all humans; the circle or cycle of the seasons, the constellations, the planets, and life, of which man is only a part, that is, part of the One. The Medicine Wheel reflects the four worlds: mineral, plant, animal, and human. “Sacred” is defined as “A sense of respect and reverence for the larger systems and energies that govern our lives.... (Shamans know that) we are completely surrounded, completely enclosed by that energy” (Doore, 1988, p. 130).

Again, art therapists must work to develop both an openness to and understanding of the sacred connection that Native Americans consider in every part of their lives. Today, the Sacred Hoop or Medicine Wheel is often used as a model to teach mental, emotional, physical, and spiritual interrelatedness. Within the model of the circle, well-being can be sought, explored, and embraced.

The circle becomes a starting point—a place of entry, a place of relative comfort to approach art tasks, a place from which a therapeutic alliance may be formed. The circle of the Medicine Wheel is sacred to Native Americans, and those things sacred are regarded as somehow “capable of linking us more closely to a spiritual dimension of life” (Doore, 1988, p. 153). The spiritual dimension can be contacted through art and mandalas as well as song, ceremony, and sacred places.

The Importance of Mutual Respect and Understanding

When Columbus came to the new world, he thought he was in the Indies and so he called The People “Los Indios” (Indians) (Lord & Burke, 1992). I have often heard Native Americans refer to Columbus as “that guy who got lost”; it is clear that they would have preferred for him to stay lost—somewhere else.

The “rape” of the Native culture has been followed by grief, rage, shame, and acculturation, leaving many trapped between two worlds (Dufrene, 1991; Hallowell, 1991; Medicine Eagle, 1991). Discrimination toward Native people continues and is experienced as a deep wound that continually festers. Discrimination coupled with acculturation, which varies in degree from tribe to tribe, adds frustration to the pain. This is manifested in rage, sometimes easily discernible, sometimes subtle and disguised. At times it takes on the appearance and feel of reverse discrimination. This creates a most difficult and often painful environment in which art therapists must work. No matter how attuned, sensitive, or understanding of the origins of inherited rage one may be, discrimination feels the same to all people who experience it.

While writing this article I became aware that discrimination has to do with an imbalance of power and that white society holds the power. However, we have to be cautious about our assumptions. The Penobscots are a federally recognized tribe and a sovereign nation, although tribes differ as to how sovereignty is experienced. The Penobscots have their own school, social services, police and fire departments. They travel on Penobscot nation passports, have their own court, and their own government. The Council circle has been replaced, by agreement, with the governmental structure of Governor and Council who now sit at a rectangular table. The tribal government has full authority over personnel. Indian employees may attend and speak at Tribal Council meetings where major decisions are made that affect all employees. Non-Indian employees, however, are barred from Council meetings.

Moving beyond unconscious behavioral responses (Dufrene, 1991) is a tremendous challenge and, I believe, a slow, evolutionary process. Being caught between two worlds, Native people can’t become whites (Deloria, 1982) and are infuriated by the “wannabees,” those members of the fictitious tribe who seek to understand and embrace Native ways, often the same people who are moved to try to assist in healing the wounds. Mutual respect and seeking to understand one another are necessary starting points in therapeutic joining, and art media can be used to communicate both feelings and needs.

Art Therapy: Breaking Barriers, Building Self Knowledge

Art therapy is a vehicle for expressing those things that are most important to Native people. In my work with the Penobscots, spiritual/religious and cultural beliefs continually emerged as personal statements which reflected both individual experience and the embracing of the values of the family and community groups. Art therapy can allow the free choice and expression of Native American spirituality and, in doing so, strengthen one’s sense of self.

Methodology includes emphasis on the client’s interpretation and unconditional positive regard on the part of the art therapist. The therapist must be willing not to interpret or judge through his or her own cultural filter and must also be aware that the symbols of one’s racial or cultural background may differ from that of Native American clients. The willingness not to
interpret and the awareness that some symbols may have different or special meanings to Indian clients provide the safety needed for material to be revealed. The therapist will be constantly challenged by the need to balance his or her own desire for "deeper" material, with a firm understanding that Native American "secrets" are not easily handed over and even broadly expressed concepts of Native American spirituality and values are an honor for the therapist to know.

While expressing, exploring, and clarifying personal beliefs, values, and experiences, clients begin to see how their view relates to their culture and how they fit into it. This is a functional way to recover identity, by seeing one's self as an Indian man, an Indian woman, or an Indian child belonging within the community and living in ways that honor one's heritage. Refinding or remembering one's place in the family/community circle helps to take clients out of isolation and provides a sense of belonging. This belonging and joining with others is important, not because a non-Indian therapist may identify it as such, but because in Native American culture the group and consensus are strongly valued (Wall & Arden, 1990). It is equally important because varying degrees of acculturation, defined as modifications in the culture which have resulted from the influences forced upon it, create conflict for Native American clients that is often presented during a session. Such was the case with the Penobscoets who, having lost so much of their culture, are struggling to reestablish Indian traditions and values, while continuing to walk in both worlds.

In the art expressions of the Penobscoets people, aspects of Native American spirituality such as the Medicine Wheel, sweat lodge, herbal usage, power animals, and spirit guides appeared and reappeared over the 2 years during which I worked with them. The reader is reminded to consider that entering "Indian Country" and labeling such beliefs as "mysticism" would be a value judgement and would set up an incongruity that would negatively affect the art therapist's ability to establish trust and a therapeutic alliance.

Art therapy was conducted in both individual and group sessions. However, no one expressed interest in group work. One-on-one sessions were based on individualized treatment plans written by the client and therapist and designed to address presenting problems that clients had selected. A woman's group was formed and met 2 hours, once a week, for 8 weeks. At the end of the eighth session, participants completed evaluations which included responses to what was most enjoyed and what was least enjoyed, and suggestions for future groups.

To safeguard against the therapist imposing white society values on group direction, a planning meeting was held to identify art tasks or themes that participants wanted to explore. This was also done in keeping with the value Native Americans place on consensus. As a result, each session included time for introducing the art project, artmaking, processing, and closing segments. Groups started with an opening circle of greeting, followed by relaxation exercises, which were quite popular. Group work included creative journaling, shield making and mandala drawings, beadwork, mask making, guided imagery, and visualization exercises designed to allow maximum room for the client's personal guidance or cultural connection to come forward. Readers may find it of interest that the Penobscoets expressed openness to adopting Indian traditions from other tribes. Because so much of their own ways have been lost, they affirm their Indian identity through connection with other tribes and a kind of melding of traditions.

"Creative journaling" (Capacchione, 1979) was introduced to encourage art-making and personal exploration outside of formal group time. Wherever possible, cultural connections to art exercises were provided through the presentation of examples in articles, books, and art photography. The value placed upon the circle in Native American culture was formally discussed prior to the shield making and mandala drawings. Articles and examples of Native American-made shields and the use of the circle were provided. In addition to discussion and information presented about the many Native American tribes who were mask makers, a field trip to an art and antiques shop provided inspiration. The owner, a worldwide traveler, had collected masks from many cultures which gave examples of using a variety of materials in exciting ways. Guided imagery and visualization exercises included discussion about shamanic "journeying." Some of the participants had had this experience, as well as exposure to visions which came through Vision Quest or Sweat Lodge ceremonies.

The works included in this paper were made in both individual and group sessions. The reader is encouraged to study the references listed for in-depth information about the Web of Life, Medicine Wheel, Sweat Lodge ceremony, power animals, herbal medicine, and spirit guides. While some may consider these to be only broad concepts of Native American spirituality, they are integral to the therapist's understanding of the Native world view. Any information shared in session must be treated with due respect; to push for more according to the therapist's need would break the bond of trust and most likely result in the client terminating. In addition, while the reader may desire more details regarding information shared by clients in the following examples, this is not possible. Of the total Penobscot population, only 462 people reside on the reservation, a small island in the Penobscot River. Since everyone knows or is related to everyone else, to reveal more would compromise client confidentiality.

In work that one client titled "Strength of the Women's Circle" (Figure 1), a young mother recovering from alcoholism and a recent separation from her husband expresses a celebration of women. The circle, she said, "is where we as a tribe can draw out our strength." The face "radiates serenity slowly awakening." At the same time she identified with joining the circle, this client was able to "see" that not all of the stars are totally connected, a reflection of her seeking to release self-isolation. The value Native Americans place on the circle and community is illustrated in this oil stick painting.

In Figure 2, titled "The Lodge," the sacred Sweat Lodge is seen in the center of the circle. The client indicated that the cross represents the four directions of the Medicine Wheel (American Friends Service Committee, 1989; Freeman, 1986; McCaa, 1990). The radiating lines on the top of the drawing, which were executed in glowing, orange tones, represent morning's light. The bottom half of the drawing shows blue Northern lights against a purple sky. The Native woman who drew this piece described its personal meaning: The stars give one the feeling of being out there, also a deep connection to the universe, a deep reverence of our Great Creator, the Maker of all living things. ... We gather together in one sacred prayer, in one small space. Holy grounds, the sweet smell of our medicines...
great relief of letting go of whatever it is we need letting go of... Thank you Creator for the gift of the Sacred Lodge.” In this pastel drawing, the client has clarified her spiritual values, as well as created a means of communicating and sharing them. The Web of Life is beautifully represented as is the Sacred Lodge.

In the “Shield” (Figure 3), the stars express a reflection of the universe and a Native Woman kneels with up-lifted arms. The feeling is one of being centered and reverent. The artist shared that “the shield was made to honor women for their role in providing the structure for cultural continuity.” This coming together of circles of women who work diligently toward cultural nurturance and peace is also discussed in Buffalo Woman Comes Singing (Medicine Eagle, 1991). The shield was made of cloth stretched over a wooden hoop. Felt was embroidered to the background, and paint was added for accents. Again, this client has found a way to state her personal and cultural values through art therapy and to share them, thereby allowing communication to open.

Figure 4 ("Medicine"), a facsimile of the original art, depicts medicine or herbs and plants considered sacred. This is perhaps an example where a therapist's interpretation, coming through his or her own cultural filter, could go awry. The two curving...
forms, which may appear to be a woman’s reproductive system or fallopian tubes, are intended to depict the Fiddlehead plant, a popular, edible plant. Its rounded ends are often seen in the curved designs of Penobscot art. The braided line crossing over the Fiddleheads represents Sweetgrass, burned in ceremonies, and in the upper left is a sprig of Cedar (Meadows, 1991, p. 78). This client deeply valued Sweat Lodge ceremonies and community activities which supported the culture.

“Rage” (Figure 5) was formed from clay and natural materials during a series of group mask-making sessions. The client talked about the revelations it brought: “Working on my mask was an experience of acceptance of my anger. I had no idea what my theme was to be, and out came this angry face. My anger has been a part of me I’d rather disown. I was able to look at what I didn’t want to before. People who viewed my mask noted that they could easily understand and identify with how that feels, and that helped me not to feel alone with my anger.” Created in red clay, brass-tone beads, shells, and bones, the mask has penetrating green eyes which tend to draw in the viewer and requires contemplation. Indeed, this client gained group support and a sense of belonging from verbally processing the art in the session.

In “The Leap” (Figure 6), the circle is once again seen as a holding place for important material. The deer is the client’s power animal and guardian (Carson & Sams, 1988). The deer also represent different stages of her growth. The client explained, “The deer on the bottom tells how frightening change can be, how we can become paralyzed by fear. The middle, slightly larger deer is more mature and ready to take the blind leap. The elder deer is looking back toward the direction from which she came.” This client was following a path of personal growth which included shamanic journeys (Doore, 1989), Sweat Lodge ceremonies (Freesoul, 1986; McGaa, 1990), meditation, and regular art therapy. The more she “listened,” the more messages she received, and the more confident she became in trusting her inner guidance.

Conclusion

The special challenges of multicultural work require art therapists working with Native Americans to develop knowledgeable and well-timed approaches. This happens when the art therapist has prepared, as much as possible, by developing an understanding of the areas of trust, common ground, and mutual respect and understanding affecting their ability to form concordant therapeutic alliances.

Clients develop trust slowly, which is often difficult and frustrating for both the therapist and the client. But those who are willing and ready will make their way to the art therapy room in their own time. Also, bidirectional racial hatred will take a long time to heal at the present rate. Mutual respect and understanding must be sought and exercised by each of us at every opportunity. As therapists, and as individuals, we must continue to seek as many avenues of open communication as we can.

Art therapists can honor the sacred circle and put it to good use as a starting point and safe haven for the unfolding of the client’s world view. With as much accurate information about Native American culture as can be gained, we can begin to move forward and formulate art experiences that build on the strengths of Native values. The use of the circle, natural materials, and the acknowledgement of the long history of Native American art-making encourages expression. Unconditional positive regard and supporting clients to freely interpret their own symbolic speech opens the way for understanding, sharing, and transcending barriers. As clients explore their values and conflicts through art therapy, they begin to put together the fragmented pieces, and they gain a sense of connection, wholeness, and serenity.

“Art Is All the Feelings Trapped Inside”: An Interview with Marilyn McKeon

Susan Spaniol, EdD, A.T.R., LMHC, Newton, MA

Abstract

This article is based on an interview with untrained artist Marilyn McKeon about her creative development, motivation, and process. It attempts to relate both her personal understanding of why she makes artwork and her experience of how she makes artwork in her own voice. Ms. McKeon's description of her use of artmaking for self-expression, self-understanding, and self-healing suggests that her creative process is motivated by a natural striving for mental wellness. This conclusion is consonant with the viewpoint of Hans Prinzhorn (1972), who amassed a large collection of spontaneous artworks by untrained people in European mental hospitals. Prinzhorn theorized that the creative process is based on fundamental esthetic instincts common to all, contradicting the popular association of spontaneous art-making with mental illness. It is also consistent with the phenomenon of so-called “Outsider Art” by people who live or work outside the mainstream of contemporary culture and who produce art in response to “inner necessity” rather than conforming to the changing styles and movements of contemporary culture (MacGregor, 1989).

Introduction

This is not an article about art therapy. Rather, it is an attempt to relate the story of one woman’s spontaneous use of art for self-exploration and self-expression in her own words. Because it is possible to discover the general in the particular, I have focused on the experience and meaning of artistic activity to one person to illustrate the integrative and healing power of visual imagery.

When I first met Marilyn McKeon at the opening of the exhibition “Art and Mental Illness: New Images” at Boston University, her three drawings were focal points at the entrance to the gallery. Selected by a jury from over 500 submissions, these works were characterized by a rich luminosity and haunting subject matter that would continue to draw the attention of gallery visitors throughout the exhibition. When I decided to interview artists about their creative processes the following year, I was eager to visit Ms. McKeon to explore her approach to artmaking and see more of her drawings.

Located at the end of a dead-end street in a close-knit neighborhood, Ms. McKeon’s home is respectable and modest. The front door is adorned with a plaque of a painted wooden duck, a wreath of dried flowers, and a Desert Storm bumper sticker urging Americans to support their troops. We met in the living room, which is decorated with flower pots filled with plastic flowers, a ceramic jar containing a ceramic dog and cat, and two conventional, mass-produced landscapes of the type often sold at roadstands. The home belongs to Ms. McKeon’s father. Now in her mid-forties, she moved back with her teen-aged son after her mother’s recent death.

Creative Development

Visual art was unimportant to Ms. McKeon as a child. She remembers making “stained glass windows” by drawing meandering black lines on paper and filling them with colors. “I had hardly any talent at all. It was just like doodling to me,” she admits. She did not make art again until she was almost 30 and living with an artist, although she describes her work at that time as “just scribbles and colors and things like that.” When her first husband left her several years later, she expressed her sense of loss through an outpouring of poems, “about 2,000 of them.” But, as a “born-again” Christian, she decided they were “idols” and threw them all away, saying, “Easy come, easy go.”

The next year, a close friend saw her doodling and said, “You’ve got some art talent there. I want you to use it.” She told Ms. McKeon never to stop drawing. From that time on, she became a prolific visual artist, and her friend remained her mentor. Ms. McKeon explained, “She’s the only one in my life right now. She’s like a mother to me and I love her for that.”

Although she spends many hours a week making art, Ms. McKeon does not identify herself as an artist. She submits work to group exhibitions only when urged by her friend and does not care whether anyone sees her work. She is uninterested in past art history as well as current art trends, and has no desire to increase her technical skills or range of media. “I don’t even want to think of myself as an artist. I don’t know anything about art as far as art history goes. I don’t want to go to art classes. I just like doing what I’m doing now and that’s it.”

Creative Motivation

Art-making is a mode of self-exploration that helps Ms. McKeon uncover memories and recover feelings. It is also a process of self-expression that allows her to act out painful emotions, attain a cathartic sense of release, and experience a repertoire of varied emotions.

Ms. McKeon describes her memory as poor for both recent events and more distant memories. She reports that even when she can recall painful experiences, she has difficulty talking about them. “I think art is all the trapped feelings inside,” she theorizes. “I suffer from agoraphobia and I think that a lot of my fears come right out on the paper—all kinds of emotions. It’s very good therapy for me. Sometimes I just want to sit down and see what I
come up with. I'm really questioning what's inside—to experience what's inside when I'm not feeling anything. When I draw and color, I start feeling things.

Through her artwork Ms. McKeon vicariously experiences emotions she cannot feel in her life. Describing her blunted reaction to her mother's recent death, she shows me a picture of "Princess Marilyn" mourning the death of her dog with tear-filled eyes. "I still haven't cried over my mother since about two days before she died, when I wept and wept. It was terrible, but I haven't cried yet. Not at the funeral or the wake—nowhere. But a lot has been coming out in my pictures about mothers and daughters. Since I've started on my art, I've had a lot of losses. And a lot of bad things have happened to me—extremely bad—and a lot of that comes out in my pictures. Anything I'm feeling comes out in the people and objects I draw in my pictures."

Opportunities to experience life and react to life are especially rare for Ms. McKeon because she rarely leaves home. Artwork provides a safe arena in which she can act out strong feelings. "I can be violent and I get violent a lot in my pictures. I feel angry feelings, sad feelings, happy feelings, even fear in my art." It also gives her a vehicle for experiencing a broad spectrum of emotions, from the painful and terrifying to the pleasurable and joyous. And finally, it provides her with a sense of relief and release. "If I didn't have my artwork," she confided, "I'd be very, very messed up."

Creative Process

The process of art-making itself is sometimes more meaningful to Ms. McKeon than its products. Like the Surrealists, she relies on spontaneity to tap her unconscious storehouse of memories and emotional responses. She begins drawing without a deliberate plan or idea about subject matter. "I start with a pencil to let my feelings out, and whatever comes, comes out. It's not like I'm going to draw a picture of you. I couldn't do that if I wanted to. I just draw whatever comes, what feelings come out. Sometimes I don't even know what the picture is until it's finished."

Ms. McKeon's artworks are often outlined with emphatic black lines and filled with strong, vibrant colors, which give them the luminous quality of stained glass windows. The subject is usually human figures in exotic clothing with decorative adornments (Figure 1). Oriented in relation to the overall design of the drawing rather than to a groundline, the figures often seem to merge with the space that surrounds them. The overall design quality is enhanced by rhythmic repetitions of designs that fill all the empty spaces of the drawing, creating the effect of an intricate tapestry woven in rich, glowing threads (Figure 2).

The most frequently drawn figures are exotic maidens (Figure 3); many are veiled; quite a few are pregnant. Describing them, Ms. McKeon says, "It just seems I draw a lot of them with veils over their faces or something, and closed mouths, trapped and frozen and feeling like that. Lately I've been starting with pregnant women, trying to give the impression of being pregnant." While her females are often exotically beautiful, her male figures can be menacing. According to her, "A lot of abuse comes out in my pictures." Although the subjects of some of her pictures are unpleasant, others can be humorous. For instance, she did a drawing called "The Sarcastic Poet" which depicts men who "have their mouths wide open, and they're putting their feet into it." And finally, many of her artworks are religious, with the cross appearing repeatedly as a motif that is both decorative and symbolic.

As an example of her approach, Figure 4 depicts a woman with sharp black lines running through her face. Ms. McKeon explains, "She's so frozen with fear that her face is cracking. It's like ice." Despite the vividness of the verbal metaphor and the drawing, she began drawing without any plan. "I started with her face. Basically I pencil it and then color it in. Sometimes it comes out different because I erase the penciling and do other pencil-

Figure 2 Masked Pin-Wheel Girls, prisma color, watercolor, magic marker, and oil pastel, 14" x 15"
ing, but I don’t plan all that. I hardly ever plan. It just grows.” Yet she has a specific, deliberate goal: to give form to her illusory feeling and thoughts.” Even as I’m doing my art I tune in, like to the expression I’m using on the face. I really try to narrow in on the feeling. I try to express something. It takes more time because I want to prove something that I want to express.”

Although Ms. McKeon’s approach is spontaneous, her handling of formal elements in her drawings is conscious and deliberate. She tries to make her artworks “structured and organized,” approaching drawing “like a math problem, especially algebra, because I try to balance shapes and coordinate colors. My thinking is formal.” It takes from five to nine hours for her to finish a drawing, and she often makes several a week.

When a drawing is complete, Ms. McKeon feels “pretty good” because she has “accomplished something and gotten [her] feelings out.” For her, “getting [her] feelings out” seems to describe a cathartic experience. “Sometimes I hate it [the drawing], and that’s all right. I feel a little bit better because I got the feelings out. That’s very important. And then I just study it—the picture itself—to see what it means to me. And see what feelings I got out from the past that are trapped inside so I can’t remember them on the surface. They’re subconscious. I feel relieved after I do a picture. Relieved and clean inside.”

Thus, despite long hours of intense labor, innate talent in the visual arts, and creative products of haunting beauty, Ms. McKeon does not consider herself an artist. She is indifferent to sharing her drawings with others, and she has no interest in developing her art in new directions. For her, the process of drawing is primarily a means of self-healing—a way to experience emotion, retrieve memories, and explore the outside world through her imagination.

A So-Called “Outsider Artist”?

The pleasure and fascination I experienced looking through stacks of Ms. McKeon’s spontaneous drawings reminded me of my first exposure to artworks from the Prizhorn Collection almost a decade earlier at a presentation given by Rudolf Arnheim in the Boston Museum of Fine Arts. The Prizhorn Collection of Art includes 4,000 artworks done spontaneously by untrained patients who lived in isolated European mental asylums at the turn of the century. They were amassed by Hans Prizhorn (1925), an art historian as well as a physician, who was puzzled and amazed by the prolific artmaking of many patients who seemed to experience a strong need for self-expression. Long before the days of art therapy, it was not uncommon for people to go to great lengths to obtain drawing materials, confiscating paper from wastebaskets, opening old envelopes, and stealing toilet paper to use as drawing surfaces. Many of these untrained artists would draw daily for hours at a time. They are often referred to as Outsider Artists because they lived and created outside the culture of their time. Not only are their artworks similar to one another’s in many respects, they also share aspects of Ms. McKeon’s drawings.

The subject matter of so-called “Outsider Art” is comparable to Ms. McKeon’s. Art works by these artists often seem mysterious due to the private, nature of their symbols, which seem to correspond to inner experiences rather than external reality. Their powerful effect often derives from frequent use of religious symbolism, sometimes in combination with visionary or apocalyptic themes. While this subject is meaningful to the artist, it may not be understood by others because of its personal origins and function.

The style of so-called “Outsider Art” is also similar to Ms. McKeon’s. It is distinctive in its use of space and color and its
overall organization and composition. Chief amongst its distinguishing characteristics is the density of its ornamentation. Surfaces are flat rather than modeled, and empty spaces are filled with various details, giving them an opulent, mosaic-like appearance. Perspective is often rendered form different viewpoints in a single picture or may be lacking completely.

The creative process of Prinzhorn's artists was also similar to Ms. McKeon's. Rather than starting with a mental blueprint, the artists drew people or objects in a form of automatism or stream of consciousness. Styles of artwork remained static instead of evolving in response to explorations and discoveries with the media. Once works were finished, the artists rarely wanted to share them with others. In fact, they often took their artwork aside or discarded it because they were emotionally invested in the process, but not its products.

Art by people working outside the culture, especially those with mental illness, was often dismissed as mere scribbling until the 20th century. Due largely to the powerful images in Prinzhorn's collection, so-called "Outsider Art" that originates outside the mainstream of the culture is becoming a significant force in the contemporary art scene. During the past decade numerous exhibitions of "Outsider Art" have been held in the United States in well-established museums and galleries, such as the exhibition "Parallel Visions: Modern Artists and Outsider Art" at the Los Angeles County Museum of Art in 1992 and 1993.

The growing popularity of art by people who have experienced mental illness confronts the art world with provocative questions about the nature of art, the nature of mental illness, and the relationship between them. These questions—which probe the fundamental meaning and source of art—were recently addressed by John MacGregor (1989), an art historian trained in psychiatry and psychoanalysis. In his scholarly book, The Discovery of the Art of the Insane, MacGregor explores the history of art by people with mental illness. Like Prinzhorn before him, MacGregor's extensive training in art history as well as psychiatry renders him well-qualified to study both aesthetic and psychological aspects of spontaneous artworks by untrained people with mental illness. Both scholars demonstrate how private art by these people often reflects the esthetic sensibilities and strong sentiments of their times. Each demonstrates how these artists employ the vocabulary of visual art to create powerful images that express universal human experiences common to all.

The Universality of Artistic Expression

While Prinzhorn's theory was criticized in Freudian circles for failing to analyze underlying unconscious motivations, his emphasis on the universality of the art in his collection was consistent with the Jungian notion of the archetype (MacGregor, 1989) and the collective unconscious. He suggested the possibility that "our patients are in contact, in a totally irrational way, with the most profound truths, and have produced, unconsciously, pictures of transcendence as they perceive it" (Oskar Pfister cited in MacGregor, 1989, p. 203). Like Jung, Prinzhorn accepted the notion of the unconscious, but he emphasized its creative and visionary powers rather than its pathology.

In his discussion of Prinzhorn's remarkable collection, MacGregor places art by people with mental illness within an historic context. He describes how the age-old stereotype of the artist as a mad genius reached its zenith in the 19th century with the Romantics' preoccupation with madness as the supreme source of creative inspiration. He recounts that many artists of the period sought inspiration through altered states of consciousness, heightened emotionality, and eccentric behavior. He reflects how, similarly, 20th century artists often strive to reflect their reactions to their inner worlds rather than depict the appearance of reality.

By supplying a historical context for art by untrained people with mental illness, Prinzhorn rejects the reductive analysis of art as clinical evidence, and passionately promotes it to the ranks of the finest art. He concludes his book with the admonition:

Whether we call a person an artist or a madman matters little. In this century the two terms have been curiously interchangeable. What is essential is that the creative freedom of both is maintained and protected, that within our society a way is kept open for those unique and courageous individuals who, shunning the surface and the light, seek, at the bidding of inner necessity, to descend into the darkness in search of themselves. (p. 318)

Conclusion

Prinzhorn's universal view of the origins of creativity and Jung's universal view of the origins of symbols unite Ms. McKeon's creative process with fine art done through the ages and with mainstream artists of our time. Their viewpoints suggest that the drive to make art in people with and without mental illness may be due, in part, to a natural striving for mental wellness. Their perspectives also foster appreciation of the complexity and depth of the human mind in general and link exceptional art to the rich mental heritage of all people.

Editor's Note: The author, Susan Spaniol, EdD, A.T.R., is an Assistant Professor in the Expressive Therapies Program at Lesley College's Graduate School of Arts and Social Sciences, Cambridge, MA. The article featured in the article, Marilyn McKeon, reviewed it before publication and requested the use of her full name.

Surviving Elimination of a Graduate Art Therapy Program: Art Education Revisited

Lucy Andrus, MS, A.T.R., Buffalo, NY

Abstract

Art therapy education may be in jeopardy with a number of state schools closing their programs in the past few years (Malchiodi, 1993). This paper examines one such program and the impact of its closing on the art therapy faculty. The discussion focuses on surviving such an event while retaining status as a member of an art education department. In this paper, the author shares reactions concerning the closing of a training program, discusses insights gained from this experience that have meaning for the profession at large, and describes steps taken to retain her academic position that involve a return to art education roots with an art therapy perspective.

Introduction

Until its closing in May 1994, I was the director of an AATA-approved graduate clinical art therapy program housed in the Art Education Department of Buffalo State College. The program was staffed by two full-time, tenure-track A.T.R. faculty and part-time A.T.R. faculty who taught one to two courses each semester. Publicly, "budget constraints" was the reason given for eliminating the program. After 2 years of talk by the administration of phasing out the program, the Art Education Department, consisting of seven art educators and two art therapists, was forced to decide how and where to allocate available departmental resources.

Although the Buffalo State program, with limited resources and faculty, was smaller than some other graduate programs on campus, enrollments were healthy and rising. It enjoyed the long-standing respect and support of the community, to which it provided a high level of service. Buffalo State College was the only school in the State University of New York (SUNY) system to offer graduate art therapy training, and the only school, public or private, within a substantial geographic area to offer affordable training. Furthermore, the demand for art therapy services in this region continued to grow and the trend of employing students upon (and often before) graduation had not abated. Thus, as Malchiodi (1993) pointed out, despite the "robustness" of a program and its contributions to the community, any art therapy training program is vulnerable to similar fate at any time (p. 126).

The intentions in this paper are threefold: (a) to discuss the practical aspects of surviving the elimination of a program, (b) to share what it was like living through the phase-out of a graduate program with a successful track record and a 15-year history, and (c) to focus on the process of returning to art education that may have relevance to the profession at large. In light of the fact that a number of programs have closed their doors and more are threatened with closure, it is important to think about available options for art therapy faculty who have not been eliminated along with their programs, who want to remain in higher education, and who do not wish or are not able to leave their schools for similar positions elsewhere. For many art therapy educators with families and children, relocation is not a viable option.

Having earned continuing appointment (tenure) in 1993, I am somewhat more secure than my untenured colleague. However, program elimination can affect even faculty with continuing appointments. Although I have experience and a Master's degree in art education, I find that I must still prove that I can readily return to my art education roots without the need for an additional degree.

I have not waited for others to decide my fate. From the time I was informed about the phase-out of my program, I considered ideas about what I could do to save my job. The lengthy period from announcement of the intent to phase out our program to its actual closing proved a blessing in disguise, allowing me time to struggle through the grieving process. While renewing ties through the National Art Education Association (NAEA), I began to develop a modified role and identity in art education, while maintaining my status as a clinical art therapist.

Student and Community Adjustment to Program Closing

One thing that helped me accept the program closure was to help others (students, graduates, field supervisors, agencies) adjust to this major change. Students who were partially through the program were assured that they could finish their studies and were given 2 years to do so by the administration. Most of the students who had just been accepted into the program when its phase-out was announced and could not finish in the allotted 2-year period decided to seek training elsewhere. A small handful did not have the option to relocate or attend other programs were given special advisement and support by the art therapy faculty to remain at the college and complete a Master's degree in a related field; they would eventually obtain postgraduate clinical art therapy training elsewhere.

Most area art therapists had come to rely on our graduate program to fulfill many roles on behalf of the art therapy profession in Western New York State. The program functioned as a center for art therapy education and training, as disseminator of information about the profession at large; as a community liaison, sponsor of professional seminars, workshops, and other continuing education opportunities; and as general supporter and net-
working agent for area art therapists. Fortunately, the established network of art therapists and allied health professionals did not disappear with the graduate program and formed its own groups for support and promotion of the profession.

The strong reactions of undergraduate students planning on careers in art therapy were unanticipated. These students held meetings, wrote letters to the administration, and protested the closing of the art therapy graduate program. Knowing that the decision was final and that their complaints would essentially fall on unresponsive ears, I was especially attentive to this group, acknowledging their anger and helping them channel this angry energy in a constructive manner. I tried to instill hope that their career aspirations were attainable in ways other than attendance in our graduate program, particularly for those whose finances and mobility were limited. I spent extra time disseminating practical information on other education and training opportunities. It often felt strange to be promoting other programs as the door shut to our own, but mostly I felt grateful that the profession of art therapy had grown to the point where there were other programs in existence to which I could refer applicants.

**A Return to Art Education via Art Therapy**

The Art Education Department at Buffalo State College continues to offer an undergraduate minor in art and some graduate art therapy courses as well as the art education major. I now teach both art therapy and art education courses. In assuming this dual role I now find myself trying to keep up with the trends, literature, and conferences of two distinct professions; this is proving to be an engaging challenge. For example, today's focus on diversity and multiculturalism in art education resonates with art therapy's attention to similar issues in clinical practice. Reading the pertinent literature in both art education and art therapy has enriched my perceptions and understanding of each discipline's unique perspective. In turn, my classroom teaching is more amplified and more broadly informed.

Over the years art therapists have noted the relation between art education and art therapy (Anderson, 1980; Drachnik, 1978; Gonick-Barris, 1978; Kramer, 1980; Ulman, 1978). Some art education journals devoted entire issues to exploring this relationship (Mallmann, 1980; Rogers, 1978). Indeed, the profession of art therapy has strong roots in art education. Most art therapists are familiar with the work of art education leader, Viktor Lowenfeld, who began to build the bridge between these two disciplines back in the forties, particularly through his work and research on the therapeutic aspects of art education for children with disabilities (Lowenfeld, 1975).

While this early exploration of the relationship between art education and art therapy produced valuable ideas and some initial alliances, the relatively young profession of art therapy focused on carving out its own niche in human services. Thus, defining and developing art therapy's own professional identity during the late 1970s and a half has taken center stage, and investigation of the connections between art education and art therapy has been de-emphasized in the process.

In the meantime, the field of art education experienced its own growing pains resulting in major change during the late seventies and early eighties, as the Lowenfeld-inspired paradigm for art education, which centered on children's creative self-expression through artmaking, shifted to discipline-based art education (DBAE). This new comprehensive approach to teaching art derives instructional content from four basic art disciplines: art production, art history, criticism, and aesthetics (Dobbs, 1992) and has resulted in de-emphasis in the art education domain of Lowenfeld's "art education therapy" ideas, therapeutic art, and the centrality of the psychological importance of art in the lives of children. These efforts to shape professional identities and define methodologies, occurring roughly simultaneously, are yet another similarity between art education and art therapy.

Certainly, my own particular situation forced me to rethink connections between these two related disciplines, both historically as well as for current relevance. Consequently, I began to see evidence suggesting that perhaps the time was right for the professions of art education and art therapy to reexamine their relationship and areas of mutual concern and interest. Rereading the literature from the late seventies and early eighties has been beneficial in many ways, including helping me to maintain a clear boundary between art education and art therapy. In the process of my investigation, I became able to articulate more distinctly the ways in which my department needed me, ways in which I could contribute to its mission and programs.

**Common Ground**

A number of factors at work today support the need for art educators and art therapists in higher education to again engage in professional dialogue. Three factors emphasize the philosophical and ideological connections between art education and art therapy: (a) the provision of services for children with disabilities, (b) preparation of art educators to teach children with special needs, (c) sensitizing art educators to teach children with unclassified special needs.

**Factor 1**

Since the implementation of Public Law 94-142 in the late seventies (the Education of All Handicapped Children Act), and the flurry of exchange between art therapy and art education that closely followed, the number of children in the United States requiring special education has grown dramatically. Recent studies reveal that 7.1% of students nationwide are classified as disabled (Ward, 1993). In New York State, the most currently available figure is 10%. Given the growth of special education referrals, coupled with the current inclusion movement in special education where children with disabilities are increasingly integrated into regular education programs, art teachers can expect to be responsible for growing numbers of children with special needs. Thus, as Di Chiara advises, the critical issue is "determining the most expedient way to prepare teachers to meet this challenge" (1994, p. 46). These words recall the prediction of Anderson (1980), who stated that the time was fast approaching when courses in art therapy would be a required component of teacher preparation programs in art education. The implementation of the Individuals with Disabilities Education Act (IDEA), a 1990 reauthorization and updating of the original PL 94-142, which has re-energized the movement to include children with disabilities in regular classrooms, also underscores the need for experience in teacher preparation.

A great number of art teachers currently employed in
schools have little or no background in working with children who have special needs. With the inclusion of special needs children increasing in many public schools, it is incumbent upon higher education to plan and implement appropriate curricula in exceptional education within their teacher preparation programs. A 1983 survey of colleges and universities offering degrees in art education in New York State indicates that only four programs required any coursework in exceptional education (Campbell & Russell, 1993). Evidence indicates that the educational preparation of art teachers for working with children who have special needs is woefully inadequate. Who better to fulfill this crucial training need than art therapists who are members of an art education faculty?

Some educators and administrators may argue that sending their art education majors to another department for a course in exceptional education adequately addresses students’ training needs. This may be a good beginning, but it is neither satisfactory nor expedient. My concerns with this approach are twofold: Who interfaces the “art part” with the exceptional education part, and how? And what, if any, preservice experience do students receive that puts them in the field working with or at least observing children with special needs? Most educators will agree that preservice experience for student teachers is critical to their training. Furthermore, if what students learn about teaching exceptional children does not correlate with what they learn about teaching art, then much in that exceptional education class will lose its meaning and quickly fade for want of relevance (Andrus, 1994). A qualified art therapist with background in special needs could be the ideal faculty member to train art education students to work with children who are exceptional. Also, since the art therapist shares common ground with the art educator, he or she will be particularly adept at creating that essential interface. Many art therapists also have a special education background.

At Buffalo State College we urged the requirement of a course on art and special needs for art education majors within our department. Such a course already existed as part of the art therapy minor core and art education majors could take it as an elective. To make it a requirement appropriate for art education majors entailed updating course content, expanding and focusing course material to more purposefully address the needs of special teachers, and augmenting the fieldwork experience. The preexistence of this course was advantageous and timely, and may have lessened potential resistance to making it part of the art education required core.

Having developed the art and special needs course curriculum, I understand the advantages of placing these responsibilities in the hands of an art therapist. For example, through their experiences in this course, students are challenged to examine their stereotypical notions about persons with disabilities. Not surprisingly, most of the students’ beliefs prove to be grounded in fear of the unknown, something which can be radically altered through the one-to-one encounters which the fieldwork component of the course provides. Art therapists understand that much of the students’ anxiety is based on unconscious fears. Because emotional support is needed in helping people acknowledge and confront these kinds of fears, having a course instructor who is also a therapist is especially beneficial. When the instructor is willing to accept and tolerate diverse opinions, students are more willing to engage in discussion of these sensitive areas; consequently, students are able to work through negative feelings and constructively address personal prejudices. If we don’t create this kind of experience for teachers in training, I have great concerns about what fears and stereotypes they may carry with them and how these attitudes and attending behaviors will affect the learning experience for children in the schools.

Also, I am in the process of establishing an on-going relationship with urban public schools in the Buffalo area to enhance the fieldwork experience for students taking the art and special needs course. This encounter, in turn, led me to write a grant proposal which was funded for development of a collaborative fieldwork project to be implemented through my department’s art and special needs course.

Another avenue that we have pursued is the inclusion of a concentration in art for special needs within the graduate art education degree program. This concentration will prepare art teachers who will specialize in teaching children who are exceptional, but who do not wish to obtain clinical art therapy training. These “special art educators” will share some of the overlaps with art therapy previously mentioned, such as the ability to integrate art into the Individual Education Programs (IEP) of their students.

**Factor 2**

Education has yet to seriously consider the growing numbers of students with unclassified special needs in today’s classrooms (clientele all too familiar to art therapists). Although these children exhibit very real “special needs” that impede the learning process, they are not recipients of a special education classification by Committees on Special Education and therefore do not receive intervention. This segment of the school population may include children who are abused, children who live with violence on a daily basis, children experiencing depression, or those who are neglected and come to school chronically tired and hungry. Others come from backgrounds where substance abuse, teenage pregnancy, marital strife, or other critical problems dominate family life. Many of these students, often referred to as “at risk,” are ill-prepared to profit from teaching. Evidence suggests that the number of such students is on the rise (Vogel, 1994; West & Whitehead, 1993).

The presence of these children together with those having special education classifications clearly indicates that today’s classrooms are filled with increased numbers of children who require adapted methods of teaching and learning. Arts teachers, who usually receive a majority of mainstreamed students in their classrooms, need appropriate preparation now more than ever. It will no longer be possible for teachers without some background in special needs to stumble through as was often the case when PL 94-142 and mainstreaming were initiated. As St. John has stated, art teachers “cannot assume expertise merely because an exceptional student has been placed in the art class” (1986, p. 15).

Who better in this respect than the art therapy faculty member to develop and teach the appropriate material to art education majors? I began to see important connections between the college’s mission statement and ways we could prepare art education majors to work with children who are “at risk.” Buffalo State College, located in an urban setting, places great importance on developing ties with the surrounding community, par-
ticularly through the inner-city schools. As director of the graduate art therapy program, liaison with the community was an integral part of my activities, and many of our students had worked in settings serving persons with special needs. Tying into the college's urban agenda in terms of the public school setting would be treading familiar ground in many respects; it would also be a shift easily accomplished by the art therapy faculty.

Factor 3

The third factor involves sensitizing art educators to teaching children with unclassified special needs. I teach courses on art for children with special needs, one of which is required for undergraduate art education students; the other is an elective for graduate students. In teaching these courses, I must consider what my art education students are experiencing in their fieldwork and the kinds of material they are bringing into group fieldwork discussion. In these discussions, with both undergraduate students who are doing fieldwork and graduate students who are actually teaching, I spend as much time addressing issues arising from children's struggles with the kinds of problems mentioned previously (violence, homelessness, etc.) and how those issues affect the teaching/learning exchange as I do talking about art education concerns. Almost all these teachers are working with children who manifest behavioral, emotional, or other "special needs" problems that influence the way lessons proceed and that requires teachers to alter their instructional approaches.

How are these unique areas of need in art teacher training being addressed? Who is teaching the art education major how to deal with the chronically sullen teenager in the back of the room, whose withdrawal and isolation are mobilized in response to the family disruption caused by an alcoholic parent and whose low self-esteem and low confidence consistently prevent him/her from engaging meaningfully and spontaneously in the art lesson at hand? Who is helping the art education major to deal with the 8-year-old whose consistent response to every art lesson is some variation of the refrain, "I can't do it. I'm no good at art. Will you do it for me?" Who is teaching the art teacher what to do when she or he receives children's drawings or paintings that consistently show inordinate levels of violence and aggression, images related to death and dying, literal acts of abuse, or any other number of disturbing elements? These examples are drawn from the real experiences of my student teachers.

Due to the nature of nonverbal communication and self-expression through art, art teachers are often the first to see signs of psychological distress in children as revealed in their images. I know of more than one art teacher whose sensitivity and awareness may have literally saved a student's life, or, at the very least, resulted in a much-needed therapeutic intervention.

Because of my art therapy background, I can address many of the needs stated above through supervision of the fieldwork and during class discussions. To help students reflect on their experiences in the field, I employ some of my art therapist skills, using expressive artmaking methods as the jumping off point for students to discuss their concerns and questions. This part of the students' supervision is analogous to the way countertransference is addressed in clinical supervision of students in art therapy programs. The art therapist/instructor, whose training encompasses the study of visual language and the use of metaphor and symbolic meaning in images, has visual as well as verbal information from the students concerning their fieldwork experiences. Such an enhanced view contributes to the accuracy and effectiveness of feedback given in supervision. This aspect of my teaching keeps me close to the "art therapist" part of me and greatly enriches the students' learning as well.

With art therapy faculty more actively involved in art education programs, students are graduating with a greater understanding of issues affecting today's children, issues that surface in the classroom and which cannot always be ignored. Happily, we are also increasing students' awareness about art therapy and art therapists and are planting the seeds for these future professionals to establish mutually beneficial relationships with each other. More than one art education student has sought consultation with an art therapist or recommended the involvement of a qualified art therapist for assessment purposes.

Art therapy educators can bring a unique perspective to the training of art teachers, especially today when more therapeutic teachers are needed in the classroom. This is not to say that teachers without additional training and expertise should make clinical interventions that are the domain of one who is trained to do so. (For more insight into this concern, the reader is referred to St. John's informative article, "Art Education, Therapeutic Art, and Art Therapy: Some Relationships," 1986, published in Art Education, the journal of the National Art Education Association.)

Conclusion

Increased awareness and understanding of the issues discussed in this paper on the part of administrators and members of my department have strengthened my position by providing an initial, well-defined agenda for service that is perceived as valuable to the art education programs at Buffalo State College. This has made survival of the elimination of the art therapy program possible as well as productive. My art therapy colleagues and I have currently been assigned responsibilities for coordinating and supervising student teaching and general departmental advisement of students entering the art education program. Perhaps the administration recognizes the unique skills we bring to such tasks which require abilities that are second nature to us. Furthermore, although the disciplines involved are distinct from one another, making the transition from supervising clinical art therapy interns to supervising art education student teachers can be accomplished with relative ease. With art as the common ground between these two areas of specialty, I am reminded that by adapting approaches as needed, the ability to be an effective art therapy supervisor has multiple applications to art education.

I am also discovering new opportunities for involvement on a college-wide basis, expanding my connections in the process. During a campus conference on excellence in teaching and learning, I recently presented the results of my preliminary research using expressive artmaking methods to study attitudes of undergraduate students towards student teaching assignments. This presentation led to an invitation by a faculty member in the Fine Arts Department to conduct an expressive artmaking workshop for his painting students. These experiences were not previously possible due to time constraints imposed on me as director of a graduate art therapy program. It seems ironic that in some ways, the work I am doing now may result in greater
awareness and advocacy of art therapy within my college community.

Some art therapists reading this may be wondering how I preserve my work and identity as an art therapist-clinician. In addition to the ways already mentioned, I have maintained a small private art therapy practice which has served several purposes. One, of course, is my own desire to practice art therapy, but other purposes have included the need to keep my skills fresh and relevant in the classroom. Working with clients reaffirms my identity as a clinician, the “art therapist” part of me.

It will be no surprise to many art therapists that it took the crisis of losing my program to get me back into my own personal artmaking. Throughout the phase-out period, I found myself unable to ignore the urge to put color and shape on paper. I sat in my kitchen, with large sheets of paper taped to the refrigerator, moving tempera paints around with brush, fingers, and sticks while my daughter painted happily next to me (Figure 1). During those times when I felt more overwhelmed than usual, I did not paint; I tore and arranged pieces of marbleized paper to form small collages and framed them immediately. These small, intense images felt to me like “interiors,” preserved parts of me that I could go into when I needed to fall back and regroup (Figure 2). Now, teaching an art materials course, I am constantly playing with art media and processes, often arriving at new ideas for therapeutic techniques as well as for art education purposes.

As much as I regret the loss of the art therapy graduate program, I am truly beginning to find enjoyment in my new work which, in some very elemental ways, is not so “new” at all. Maybe I am able to embrace these new avenues of work because I am at a time of life when change feels right and even necessary; and I can bring some part of my vision of art therapy and my art-therapist-self to others in new and unique ways. I also am satisfied with these new endeavors because I care about what is happening to the children of our country, seeing possibilities for making a difference through educating future teachers and encouraging them to find better solutions to problems.

It is possible to productively survive the closing of an art therapy program without losing your identity as an art therapist and while continuing to make valuable contributions to your place of employment. It is also possible to expand your own horizons in the process and reap rewards that are not so easily seen when the initial darkness pervades. The path I have chosen is just one possibility. So far, it has been an interesting journey, one whose value becomes clearer with each step.

---

LA '94 Earthquake in the Eyes of Children: Art Therapy with Elementary School Children Who Were Victims of Disaster

Jasenka Roje, MA, Los Angeles, CA

Abstract

This paper discusses art therapy interventions with latency age children who were victims of the Los Angeles earthquake in 1994. The author worked with 25 children at the site of an elementary school in the area hardest hit by the earthquake and offers clinical observations about issues most relevant to the trauma, symptomatology, and defenses exhibited by children during treatment. In the course of therapy children were encouraged to tell their earthquake story in words and in pictures, to explore their current and repetitive thoughts, and to work through their feelings toward the resolution of the trauma. The use of art was instrumental in accessing children's internal processes and helping them return to normal functioning.

Introduction

On January 17, 1994, a powerful earthquake shook the Los Angeles area and left devastation behind: wrecked highways, destroyed buildings, power failure, fires, and thousands of people terrified to go back to their homes. This traumatic event was soon declared a national disaster.

Saylor defines disaster as follows: "destruction of property, injury and/or loss of life; has an identifiable beginning and end; adversely affects a large number of people; is 'public' and shared by members of more than one family, is out of the realm of ordinary experience; and psychologically is traumatic enough to induce distress in almost anyone, regardless of premorbid function or earlier experiences" (1993, p. 2). Disasters have a significant impact on children and 30% to 50% of the children become emotionally affected after disaster. "For them, the disaster feels like an unknown, fearful force which has shaken their world and made them feel less secure" (Farberow & Frederic, 1978, p. 6).

In the aftermath of the earthquake, FEMA (Federal Emergency Management Agency) secured a grant for mental health agencies to do on site debriefings and crisis intervention with the earthquake victims. Several mental health agencies, including Family Service of Los Angeles, arrived at elementary and junior high schools in the area worst hit by the earthquake and provided counseling for children, faculty, and staff.

In the course of 3 months at Reseda Elementary School, an area in the San Fernando Valley close to the earthquake's epicenter, I worked with about 25 children ages 4 to 11, whom I saw mostly individually, in small groups, and occasionally with their families. To paraphrase Auerbach and Spirito (1986, p. 196), working with schools was potentially an effective way to deal with children's response to disaster, especially because families were disrupted and often living in temporary quarters. It also provided an opportunity to work in close association with teachers who were able to monitor children's behavior and alert the clinicians.

Therapeutic Issues Relevant to Earthquake Trauma

Gillis (1993) mentions several issues which may arise in the event of a natural disaster: immensity of loss, concerns about future safety, seeing adults paralyzed with fear, rescuers who arrive too late, and above all, difficulty in maintaining an inner sense of security under those conditions.

The common issue among the children at Reseda Elementary was the issue of safety, often associated with feelings of loss of control. Almost all of the children reported feeling unsafe in their homes. They were afraid to go to sleep because they feared waking up under the rubble of their bedroom walls. These children drew pictures of their homes with cracks in the walls, broken chimneys, and their family's possessions damaged, broken, and scattered. A 7-year-old, John, took a long time to draw a picture of his house with a large crack in the wall which he feared would collapse in an aftershock (Figure 1). Drawing the house with deliberate precision provided an opportunity for John to restore metaphorically the loss of control he was experiencing before the immensity of this devastation. Four-year-old Dav...I persistently drew vertical lines with circles (Figure 2), the

Figure 1 "My House After the Earthquake" (John, 7)
last skill he acquired before the earthquake. Even when asked to draw a different picture, he still produced the same pattern of lines indicating his need to maintain an inner sense of control. Another issue related to safety was the issue of abandonment. Due to the great destructive power of the earthquake, which affected both children and adults, trust in the adult world to provide safety and comfort was somewhat shaken. Many children persistently exhibited symptoms of trauma even months after the initial shock, mainly because their parents were symptomatic themselves. Many parents reported feeling lost, confused, and frightened. These parents were unable to attend to the emotional needs of their children and often neglected older children in order to focus on the younger. One of the mothers was so terrified of the earthquake that she failed to empathize with her son, a behavior she had not exhibited before. The more she neglected her son’s demands for comfort, the more he clung to her until finally refusing to leave her sight. An 8-year-old boy, Jerry, illustrated his feelings of abandonment in a compelling drawing where he yells HELP MOM, but there is no one to help him (Figure 3).

The children also had thoughts of permanent loss or death. Several children had concerns for the future because they were confronted, perhaps for the first time, with questions of death and dying. Laura, an 8-year-old girl, illustrated how she felt during and after the earthquake (Figure 4). After she identified her feelings as fear of destruction, sadness about losses, and happiness her family was still alive, she drew another shape distinctly different from the rest saying, “When I got out on the street and everything was dark I thought that I was dead. This is my feeling of being dead.”

Symptoms of PTSD Exhibited by Child Victims of an Earthquake

The research of Guerin, Junn, and Rushbrook (1990) suggests that, according to parents’ and teachers’ reports, children who are victims of natural disasters experience increased clinging, difficulty separating from parents, disobedience, difficulty concentrating, and increased activity levels and aggressiveness. Indeed, as the clinicians arrived on site several weeks after
the earthquake, teachers reported increased behavioral and emotional problems with a fairly large number of children. Younger children mostly experienced separation anxiety and somatic ailments, whereas older children exhibited conduct disturbances and difficulty concentrating in class. The disturbances were exacerbated in those children who had premorbid functioning difficulties.

Keppel-Benson and Ollendick (1993) outline symptoms of PTSD in children as follows: (a) recurrent dreams and flashbacks demonstrated in repetitive play reenacting the trauma and/or intrusive memories during quiet time; (b) avoidance of thoughts, feelings, and activities associated with the trauma; and (c) increased arousal symptoms with difficulty sleeping, difficulty concentrating, and hypervigilance. In addition, DSM IV notes a sense of foreshortened future, "omen formation," disorganized behavior, and various somatic complaints.

Commonly reported by the children at Reseda were memories of trauma and nightmares. Since the earthquake hit during the night, the majority of children reported that bedtime was the most difficult time of the day and almost all children avoided sleeping alone. These children found it difficult to settle down because of their recurrent memories of the earthquake. As illustrated by 7-year-old Connie (Figure 5) who re-experienced in her drawing the feeling of being trapped in the darkness, the memory was still very vivid in her mind even several weeks after the earthquake. In contrast to memories of the earthquake, nightmares were more generalized and appeared usually as dreams of monsters, ghosts, or impending doom.

Many children experienced intrusive thoughts during quiet time at school or at home. Teachers reported increased talking or teasing during quiet reading, and many parents complained that their children feared to be by themselves even when going to the bathroom. Several children kept their doors open when using the bathroom or engaged in a conversation behind closed doors fearing to be left alone with their intrusive thoughts.

Avoidance of thoughts and feelings associated with the trauma was also frequently observed, mostly as avoidance of earthquake-related activities. Quite a few children avoided drawing pictures of the earthquake or talking about their earthquake experiences and chose to do other activities instead. Also commonly reported was hypervigilance. Both children and parents often complained that every sudden move or noise made their "heart stop" because it reminded them of the earthquake.

All of these symptoms occurred frequently at first and in time gradually subsided. Yet, recovery was somewhat prolonged due to an idiosyncratic feature of earthquakes, the continuous occurrence of aftershocks.

Therapeutic Goals and Objectives

The primary goal of therapy was to help the children regain their inner sense of security and trust in the world by letting them express the feelings they were unable to process with their parents or caregivers. Individual or family therapy was indicated to best achieve this objective. Another goal was to help the children resume normal life as soon as possible. By talking about what kind of responses were normal in the event of an earthquake, the children were encouraged to share their feelings with other students. A group setting best achieved this objective. It was the therapists’ hope that both individual and group therapy would help the children regain control over their lives and restore trust that could be projected into the future.

Therapeutic Use of Defenses

An initial therapeutic intervention involved letting the children tell about the trauma under controlled conditions. Especially in the beginning, many children re-created circumstances which occurred immediately after the earthquake. Telling their "earthquake story" served to vent the stress feelings with reduced intensity and at the same time created an adaptive defense by allowing children to add a positive aspect to the stories of terror and loss. As children needed to feel happy even in the darkest moments of their lives, they often made comments like, "But I was so happy that my family was not hurt," or "I was happy that my dog (cat, bird, fish) was O.K.," or even "I was really happy that I didn't have to go to school."

However, a few children appeared disinterested or restless when asked to tell their earthquake story and kept looking for other outlets. I interpreted this reluctance to talk about the earthquake as a defense and allowed these children to work through their defenses and to use them adaptively. The following are some examples of the defenses identified during treatment and used therapeutically to promote healing:

Denial—Children sometimes refused to talk about the earthquake or to draw pictures relating to the trauma because they "were not scared." Rather than re-experiencing the trauma in art, these children chose to play their favorite games or draw pictures which related to safer, pretrauma times. One 10-year-old ignored my directives to draw a picture of the earthquake because "it was boring" and asked if I was interested in soccer. Together we created a board game and played board soccer during several sessions without ever mentioning the earthquake. In time he started to regard me as his soccer pal and only then began to talk about his feelings.

Identification—Several children chose to draw dinosaurs or familiar heroes from movies and TV instead of earthquake-related subjects. Their omnipotent heroes who could defeat anything they choose became therapeutically important tools in
restoring children's own omnipotent feelings destroyed in the earthquake. One 7-year-old boy persistently drew and modeled in plastic clay his wrestling heroes. One of the wrestlers was particularly powerful and ignored such "stupid things" as the earthquake. He never showed his feelings and was only interested in wrestling, always winning in the end. I commented that his hero didn't look very human by not showing his feelings and he replied, "That's the best part."

Regression—In some instances children were allowed to regress because too much pressure was building up at home or in school. One 6-year-old boy appeared frozen and unable to function in class. His attention and concentration had considerably diminished in comparison to premorbid functioning. After talking to this boy, it appeared that his mother was preoccupied with his younger sister, expecting her son to stay out of the way and thus emotionally abandoning him. Since this child didn't show much interest in drawing or play-acting the trauma, he was allowed to regress by doing scribbles. This activity helped him re-experience an earlier time when he was getting more attention from his mother. With a spark in his eye, he would ask the therapist "When are we going to make a mess again?"

Displacement—Sometimes avoidance of earthquake-related subjects had an unusual twist. Several children reported seeing suspicious shadows or hearing strange noises when alone and they attributed these occurrences to burglars or supernatural powers. One 8-year-old girl drew a burglar with a flashlight looking through her bedroom window and reported seeing the burglar every time she went to bed. Another 8-year-old drew a shadow of a hand appearing in his living room and following him around the apartment. It appeared that these children displaced their fear of earthquakes onto something equally frightening, but perhaps more manageable and more familiar.

Escape fantasies—Often, children created corrective experience of the trauma by drawing or modeling figures who were immune to earthquakes because they could fly or move fast from one place to another with specially designed devices. Figure 6, for example, shows a creature named "Rainbow Head" with a propeller on top of its head which helps him leave the land and hop above the rainbow whenever he chooses. This indulgence in fantasy of escape (Herl, 1982) helped restore some control over the immensity and unpredictability of the disaster.

On occasions, escape fantasies were supported by fantasies of revenge. One 7-year-old boy created a house on balloons which could detach in an emergency and fly up in the air. During the earthquake he could thus laugh at the "stupid earthquake" for trying but not succeeding to hurt him anymore.

Safe place fantasies—As part of the healing process children were encouraged to create a safe place for themselves in both drawings and play. This directive provided an opportunity to create an imaginary place where a child could hide in fantasy from intrusive thoughts and feelings. Eight-year-old Megan made a plastic clay bunny who was very scared of earthquakes but found a magic mushroom where she could hide when the earthquake hit (Figure 7) and her friend Rebecca, also 8, created an imaginary island where she would hide with her boyfriend under a nurturing apple tree (Figure 8). Some children, like Laura, included their families in their safe place (Figure 9), but many drew places where they were alone or accompanied by their pets. These images appeared to indicate how supported children felt.
by their parents or caregivers. One 9-year-old boy drew a picture of a tree with two street lights as his safe place. Puzzled at first by his choice, I noticed later that the picture was a view from the window where he was sitting. Apparently, the therapy room was the safest place this boy could think of.

Humor—On occasions, humor was introduced as a defense. Children enjoyed producing an earthquake at will by suddenly shaking the table and then laughing at the “frightened” therapist. Or, they were encouraged to tell funny earthquake stories. One 6-year-old told how he couldn’t find his shoes in the dark and ended up wearing two different shoes. Another 6-year-old said he didn’t realize what was happening when the earthquake hit. He thought his older brother was shaking his bed and kept yelling: “Stop it, stop it.”

Intellectualization—Educating about earthquakes prompted some children to intellectualize about the event and become “experts” on the subject. This helped them manage their fear by knowing what to expect and by teaching others. One 10-year-old proudly reported how he impressed his family with his newly acquired knowledge about earthquakes in California, which in consequence made him feel more in control and improved his coping.

Use of Art in the Process of Therapy

Art therapy, combined often with play, was the therapy of choice. This included drawing pictures, creating figures in plastic clay, and telling stories relevant to the trauma. Crayons, markers, color pencils, and color plastic clay were preferred materials. These materials offered more control than some looser materials like watercolors, paint brushes, or clay (Landgarten, 1981). Younger children liked crayons and pencils while older children preferred markers, and almost all of the children enjoyed making figures in plastic clay and then playing with their creations.

The process of therapy followed the basic guidelines of crisis intervention with child victims of disasters. Gillis (1993) points out that early intervention provides the key to successful resolution of trauma and suggests the following: Discuss the facts around the event and clarify misconceptions, explore personalized meanings to the traumatic event, encourage expression of trauma if the child is avoidant, and allow the child to tell and retell the event. The goal is to restore previous functioning and help the child emerge from being a victim to being a survivor.

Initially, the children were allowed to vent through reenactment of the event in pictures followed by talking about what they saw, what they did, and what they heard on TV. The first directive was to “draw a picture of the earthquake the way you remember it.” Nine-year-old Annie drew the house shaking while she was yelling for help (Figure 10), 8-year-old Maga drew jumping from the second floor of her apartment house into a mattress held by firemen, and 6-year-old Betty drew the safety of the family truck where her mother put the children after the quake (Figure 11). Five-year-old Eddie made a picture of a round black shape (Figure 12) and his parents commented that, immediately after the earthquake, Eddie drew several pictures identical to this one. This 5-year-old could not verbalize how he felt, but his drawing expressed that his world had disappeared into this black hole. Two weeks later when asked again to draw the picture of the earthquake, Eddie drew his bedroom instead of the black hole (Figure 13). His world had now reappeared and his contact with the environment was reestablished.

As children told about the event, they were encouraged to elaborate and draw more pictures. Pet stories were favored because pets were often in children’s care and even more helpless than their young caretakers. Children frequently commented on their pets’ acute sense of danger and showed empathy for...
their pets’ feelings. These stories allowed them to feel useful and competent in face of disaster. Eight-year-old Laura, in her picture of the family, drew her mother holding the baby and herself modeling after the mother by holding her pet bird (Figure 14).

Next, the therapist asked the children about their thoughts during and after the earthquake, how intrusive these thoughts were, and how often they occurred. The directive was to divide the paper in three parts and “draw a picture of what you think most at home, at school, and at night.” By extending this directive the children were also asked to draw something which they cannot “shake off” from their mind. This provided an opportunity to explore their obsessive thoughts and also gave room for humor by gluing the picture onto their forehead and trying to shake it off.

When asked what they thought when the earthquake hit, the majority of the children said they knew it was an earthquake, but several of them believed there was a monster, a dinosaur, or even a vampire shaking the house. Some children expressed thoughts that the earthquake was the work of the devil, and these thoughts were often supported by their parents’ beliefs and shows on TV foretelling the end of civilization. The therapeutic task was to educate about earthquakes and inquire about thoughts of guilt possibly ensuing from internalizing the trauma. Most of the children acknowledged and accepted the reality of earthquakes, but a few persisted in their beliefs that the earthquake was God’s way of punishing them.

Sometimes the earthquake trauma was linked to previous traumas or losses. When asked to draw what she was thinking most when she was alone at home, 8-year-old Maga drew a tree in front of her house from which, she said, the voice of her dead grandfather was calling her. The earthquake triggered an earlier loss, the death of a grandfather who used to take her out and buy her candies.

The following directive was designed to encourage expression of trauma by acknowledging and validating feelings of fear, loss, helplessness, abandonment, and often anger (Landgarten, 1981). The directive was to “draw a picture of being scared, being sad and being mad.” After the children had acknowledged their feelings in pictures, they were asked to “draw a picture of how you were feeling in the earthquake.” The pictures allowed children to express feelings which were verbally censored. Annie was sad that everything was broken in her house; she was mad at the earthquake and happy when it was over (Figure 15). The picture of anger, however, which she tried to repress verbally, was
quite powerful in the drawing. On the other hand, her expression of happiness, which she was eager to share, was verbally extensive but poor in its visual counterpart.

Those children who were unable to draw a picture of their feelings because the idea was too abstract or because they had a hard time acknowledging their feelings were encouraged to express metaphorically by creating their favorite real or fantastic creature and telling how the creature felt in the earthquake. After completing their pictures (or stories) children were then asked to identify behaviors associated with the feelings. Some said, “I couldn’t move, I was so scared” and others “I was yelling,” “I was crying,” or “I covered myself over the head with my blanket.” Some children felt so angry they wanted to “kick that mean old earthquake” and some withdrew into saddening silence when they realized the extent of devastation. Part of this last directive was to help children manage their feelings after they had matched them with the behaviors. Some helpful behavioral and cognitive techniques were then used to reverse the negative thoughts or behaviors into positive: self-monitoring, problem solving, and talking positively to oneself (Meichenbaum, 1975).

**Conclusion**

After three months of our stay at Reseda Elementary most of the trauma related issues had been addressed and processed. However, we realized that there was still a need for continuing support because of long-standing problems which had surfaced during treatment. Many children resisted termination and expressed it by an increased production of “angry looking” sharks, snakes, and guns. One 8-year-old built a plastic clay base into which he inserted several pencils representing a powerful long range cannon. During the last session he kept shooting at the therapist and shouting: “You are dead, dead, dead.” These children felt angry, disappointed, and let down because their problems were only skirted and there was a long way yet to go.

Nevertheless, most of the children who were treated were able to resume normal life and return to their premorbid functioning.

Thinking back, several components influenced the recovery process. Since therapists arrived on site three weeks after the original shake, some of the debriefing was already done successfully by the teachers and by the children themselves. Therefore, not all children were symptomatic and quite a few were able to continue with their daily routine. And those children who exhibited symptoms of PTSD because, for various reasons, they were not successfully debriefed early on, in most cases responded fast to therapeutic interventions. However, children with ongoing problems which were unrelated to the earthquake trauma, continued to be symptomatic. Work with these children often uncovered emotional abandonment or neglect by care givers, physical abuse, and in one instance some evidence of sexual abuse was also detected in the drawings. Recovery became increasingly complicated with the emergence of such additional problems.

It appeared that children who responded best to the interventions were those who, according to the teachers, were generally better adjusted in school. These children were more cooperative, listened, and followed directives. After only a few sessions in group therapy, they were able to return to their classrooms relatively symptom free. On the other hand, children with ongoing problems at home or in school responded with more resistance and more behavioral problems. These children were treated for a longer time, mostly in individual and, when possible, also in family therapy. Finally, children who couldn’t be helped because they required more intensive long-term therapy were referred out to community mental health clinics.

Art therapy proved to have been a successful treatment modality in the recovery of earthquake trauma. It enabled children to express internal processes which they had no verbal awareness of and it facilitated working through the defenses in order to identify underlying conflicts which hindered recovery.

In conclusion, working with art materials was a fun activity which all children appreciated and which helped disarm their initial resistance, if there was any. Through these children’s eyes art became a mighty tool to fight the terrifying experience of the Los Angeles ’94 shaker.

Use of a Drawing Task in the Treatment of Nightmares in Combat-Related Post-Traumatic Stress Disorder

Charles A. Morgan III, MD and David Read Johnson, PhD, RDT, West Haven, CT

Abstract

Treatment of nightmares in two Vietnam veterans with post-traumatic stress disorder (PTSD) was conducted comparing a drawing task with a writing task. Our hypothesis is that the isomorphism between visual imagery and the visual modality of nightmares may provide a more effective means of transforming and integrating the traumatic material into normal cognitive schemas. In a 12-week intervention in which drawing and writing were alternated, both subjects reported reduction in frequency and intensity of their nightmares in the drawing condition. This study provides support for more extensive study of art therapy methods in post-traumatic stress disorder.

Introduction

Art therapy has been used successfully in the assessment and treatment of post-traumatic stress disorder. Art therapy techniques have increasingly been used to help mental health professionals diagnose and assess the degree of severity of trauma, from child abuse to acute stress (Blain, Bergner, Lewis, & Goldstein, 1981; Manning, 1987; Schonstein & Derr, 1978; Sidon & Rosenthal, 1987; Spring, 1993; Wohl & Kaufman, 1985; Yates & Beutler, 1985). Recently, reports of art therapy in the ongoing treatment of trauma victims have suggested that the acceptance of and working through of the shifts in self-representations resulting from trauma are greatly facilitated by the art process (Johnson, 1987; Kelly, 1984; Malchiodi, 1990; Naitso, 1982; Peake, 1987; Simonds, 1994; Stember, 1977, 1978). The transformation of mental images of traumatic events into visual expression via drawing allows trauma victims to communicate their inner pain nonverbally and less directly than through words. The play of form, color, and style allows metaphorical and partial expressions of trauma, in contrast to the direct representation of the event often called for by linguistic communication. The “canvas” provides a transitional space in which memory and current reality can mix within the perceived control of the subject, so that the ability to integrate previous self-images with the traumatic event is enhanced.

The reported effects of art therapy include improvements in self-esteem, integration, and stress reduction. None of the published reports indicates that art therapy can be a focused treatment for a specific symptom of post-traumatic stress disorder, such as reexperiencing, avoidance, or hyperarousal. Only Golub (1985) has reported on art therapy with Vietnam combat veterans. In that article he mentions one veteran whose recurrent nightmares ceased after rendering them in painting. Similarly, there have been few studies of nightmares among combat veterans with post-traumatic stress disorder (van der Kolk et al., 1984).

This pilot project examines the question whether art therapy, specifically a drawing task, can be targeted to impact on a specific and pervasive symptom of PTSD: nightmares. Due to the visual nature of the symptom of nightmares, it is hypothesized that the victim has recorded the traumatic event in visual form, which during sleep is released into consciousness, waking the subject. If, at the moment of waking, the patient immediately draws the nightmare, the possibility exists that the contents of the event are most available to consciousness and, therefore, can be integrated into the person’s overall cognitive schemas.

We became intrigued by informal reports from patients of this effect after initiating an art therapy module in our inpatient PTSD program (Johnson, Feldman, Southwick, & Charney, 1994). Veterans in our program participate in weekly art therapy groups over a 16-week period. Individual art projects as well as a community art show are also important elements in their treatment.

In order to test the effect of drawing on nightmares, we conducted a structured intervention using two conditions on two subjects who were suffering from combat-related nightmares. The first condition consisted of drawing the nightmare immediately after waking. The second condition consisted of writing a nightmare immediately after waking. Both conditions involve the concretizing of the experience. The art task allowed the actual stimulus to be represented in nonverbal form, closer to the manner in which it was originally recorded. We were interested in whether differences in the modality of expression would result in measurable differences in outcome.
Subjects

Both subjects volunteered to participate and were Vietnam combat veterans (ages 42 and 44) who met DSM-III-R criteria for Post-Traumatic Stress Disorder (PTSD), by means of the Structured Clinical Interview for Diagnosis (Spitzer & Williams, 1985). Each was an inpatient in a 16-week PTSD program and reported the presence of combat nightmares that occurred four or more times in a one-month period prior to the trial. These nightmares were of real combat experiences. Both subjects were high school graduates with average intelligence and no prior experience with art therapy or art beyond elementary school. Neither had any learning disability or problem with written or verbal expression.

Description of the Nightmares

**Subject #1**—"I am flying the chopper down to the LZ (landing zone). It is a hot area, under fire. I have to go down to rescue my men. As I touch down on the zone, more enemy fire breaks out. A woman sniper pops up from a rat tunnel just in front of the co-pilot and fires. She kills my co-pilot, then turns on me and fires. It just misses me and I take off. I can see her face clear as day, then I wake up sweating and my heart pounding."

**Subject #2**—"We are out on patrol and come into this village. We are pretty sure something’s up because there are no kids around. All of a sudden one of the guys in my platoon gets hit. Goes down. We open fire. Then they come out. Everybody goes crazy and sets everything on fire, the old men, women, everybody... I wake up screaming and my bed is torn up. I am covered with sweat."

Method

Subjects were told that they were to participate in an experiment that was to test the effects of both drawing and writing on an individual’s ability to go back to sleep after having been awakened by a distressing nightmare. Each was informed that the test involved four 3-week intervals devoted to drawing or writing in an alternating ABAB or BABA format. Every effort was made by the authors to show no bias toward either condition.

During the writing intervals, subjects were instructed, in the event of a nightmare, to write the nightmare “in as much detail as possible,” as soon as possible upon awakening. They were provided pens and a notebook for this purpose. Other than the restriction of not drawing the nightmare, subjects were free to stay up or return to bed.

During the drawing intervals both subjects were given a drawing tablet, a set of oil pastels, and a pencil to be kept at the bedside at all times. Subjects were instructed to draw the nightmare “in as much detail as possible” using the oil pastels. A subject could decide to draw the nightmare in its entirety or to draw the traumatic scene that had awakened him. As in the writing intervals, after having completed the drawings, subjects were free to do as they pleased with the exception of writing the nightmare.

Each week throughout the 12 weeks, subjects rated four variables. Frequency of the recurrent nightmare, Intensity of nightmare, and Startle upon awakening from the nightmare were rated on 5-point Likert scales (0 – 4). Difficulty going back to sleep after a nightmare (more than 1 hour) was indicated by a yes/no response. An overall measure of Nightmare Severity was created by multiplying frequency by intensity of nightmares.

Results

**Quantitative findings:** Table 1 lists the raw data for each subject for each week. Both subjects experienced fewer and less intense nightmares in the drawing condition compared to the writing condition. Difficulty returning to sleep and startle upon awakening were also improved, compared to the writing condition. A two factor ANOVA showed no significant differences between the two subjects, but significant differences in the measure of nightmare frequency, intensity, and severity; sleep difficulty; and startle (see Table 2). In addition, changes within each 3-week period indicate a cumulative effect (positive or negative) of each intervention (see Figures 1 and 2).

**Qualitative impressions:** Both patients reported a sense of frustration and difficulty during the intervals of writing.

nightmares. In fact, both gave up the writing task in their last week. “I couldn’t write fast enough.” “It was more annoying to write.” “I pushed too hard, the pencil broke...the words just didn’t do it right.” “I just got more upset inside.” Subject #1 reported that during the drawing intervals, “I’m not sweaty and jumpy when I wake up. The nightmare wakes me up, but I’m calmer. More relaxed. I can go back to bed and go to sleep.” Subject #2 similarly noted, “It’s weird. I don’t jump out of the bed anymore.” “Writing? Well, I don’t seem to be any good at writing. I get too tight inside. I tried it but it doesn’t come out, I just get mad. I did it for 10 days but after that—no way! I don’t see any difference. I don’t know. I still sweat and pace around a lot.”

Unexpected findings were the development and increase in aerial perspective in the nightmare and an increased sense of self-awareness while dreaming. “It’s not like it happened. I’m seeing it for the first time from the air. I can see it all happening to me just like the situation always was, but I’m up in the air.” “It’s weird, I know that I’m dreaming while it’s happening to me. I never did that before. I say to myself this is a nightmare about Vietnam.”

Both subjects also experienced a change in their nightmare’s chronological pattern. “The nightmare starts sooner than it used to. Instead of being at the ambush, I start way back at the base-camp. I wake up way before I get to the ambush.”

Discussion

This pilot project attempts to explore the specificity of art therapy in the treatment of nightmares in post-traumatic stress disorder. The evidence illustrated by these two subjects is intriguing and raises the question as to the mechanisms involved in the therapeutic effect. Victims of trauma often show difficulties in processing emotional states, usually referred to as alexithymia (Krystal, 1979). Representing emotional states through language may be impaired, thus preventing writing from being an effective means of processing the traumatic material in the nightmare.

Consistent with paradigms of cognitive development, however, traumatized individuals may be able to symbolize thoughts and emotions in other ways—specifically through imagistic, iconic, or symbolic modes rather than a lexical one (Werner & Kaplan, 1963). Therefore, we suggest that art therapy provides an isomorphic arena for the expression of the traumatic material.

Nightmares, traumatic or otherwise, are not a new or unknown clinical phenomena. As long as children have had nightmares, mothers have been confronted and challenged with these distressing experiences (Hartmann, 1984). Healthy mothering provides several important things to the distressed child who has suffered a nightmare: a sense of reality testing (that it is only a dream); a sense of mastery (mother can help check under the bed, shut/lock the window, closet, etc.); an opportunity to share (or not be alone with the trauma), and solacing. Art therapy may provide these elements as well. A sense of reality testing is supported by the task of drawing the nightmare, which distances the person from the immediate experience. The mastery element is inherent in the production of the affectively charged drawing—which can be, in concrete fashion, "put away," decreasing the person's sense of helplessness. An opportunity to share the trauma, which is often "beyond words," is present when the subject shows the drawing to the therapist. Solacing (an empathic stance and a containment of the anxiety linked to the imagery) is provided when the therapist is present.

This study suggest that drawing may offer a significant, non-invasive alternative to existing forms of treatment for night-
mares. Many questions remain unanswered. First, this study needs to be conducted on a larger sample of patients and among different types of patients with PTSD. Second, the significance of the development of an aerial perspective should be explored. Does this reflect, in a concrete way, the attempt to gain perspective on one's experience, being the visual counterpart of subjective awareness in the nightmare? Finally, other modes of expression (e.g., painting, sculpture, voice, movement) might be studied.

Editor's Note: Dr. Morgan and Dr. Johnson may be contacted at the National Center for PTSD, VA Medical Center, West Haven, CT 06516.

Art Therapists’ Employment Experience in a Shifting Economy

Michelle Winkel, MA; Maxine Junge, PhD, LCSW, A.T.R.; Debra Linesch, PhD, MFCC, A.T.R.; and Nina Mathews, MFA, MA, Los Angeles, CA

Abstract

This paper discusses a study of job search and employment experiences among graduates of a graduate art therapy training program. Results reflect an employment rate of 93.7% with a relatively high level of job satisfaction. Considering the increasing constraints of the mental health system and job market, these results suggest that there is more cause for optimism than seems apparent. The nature of survey participants’ job search, employment, employment stability, availability of supervision, and employers’ attitudes are described.

Introduction

Like art therapists nationwide, clinical art therapy faculty and students at Loyola Marymount University, Los Angeles, are concerned with the job market in our current changing economic times. To address these concerns, a survey was conducted which covered graduates from 1988 through 1993. The purpose of this study was to investigate the experience of recent graduates in this job market. The nature of the job search and satisfaction with secured jobs were also addressed. In a field that is still considered relatively new and innovative, art therapy might be one of the first areas adversely affected by recession, downsizing, and funding cuts. Conversely, though the flexibility of the profession may offer other advantages in these changing times.

Since economic recovery arguably began in 1991, there has been only a 2% increase in jobs according to Merrill Lynch economists (The Wall Street Journal, 1993). Unemployment in the United States was approximately 7% for 1993. However, the Labor Research Association stated that gross employment figures including the decline in the unemployment rate from 7.6% in June 1992 to 6.8% in October 1993 do not reflect the deteriorating quality of job opportunities (The Wall Street Journal, 1993). Although these statistics are based on employment in all fields, they present a basis for understanding the national context for exploration of the clinical art therapy field.

For purposes of this study, Landgarten’s Ten Year Follow-Up Survey of Art Therapy in the Greater Los Angeles Area (1984) and the previous studies done by Landgarten and her colleagues (Anderson & Landgarten, 1974; Houseman, 1976; Landgarten, 1974a, 1974b; Siegel, 1979) provide relevant background. To investigate the status of art therapy within the mental health field in the Los Angeles area, Landgarten conducted several surveys beginning in 1972 and culminating in 1982 with her 10-year follow-up study. The surveys included information about current employment for art therapists, the nature of art therapy jobs at mental health institutions, the credentials of those who employed art therapists, and future hiring plans for art therapists at institutions. The 1982 survey—a questionnaire polling 245 mental health institutions in the greater Los Angeles area—concluded that future hiring plans for art therapists were positive. Landgarten’s study demonstrated that art therapy, as of 1982, was becoming an accepted mental health modality. Over a decade later, we are still interested in the mental health field’s response to art therapy. However, our study focuses strictly on the individual art therapists’ employment opportunities and experiences.

Methodology

A questionnaire (Schweigert, 1994) was selected as the most suitable method of data collection. It was designed with 34 closed and open-ended questions. One hundred thirteen alumni graduating in years 1989 to 1993 were mailed the questionnaire, a return-addressed and stamped envelope, and a token pencil to encourage response rate. Results were tallied manually in order to incorporate personal perspectives expressed in the open-ended questions. Numerical figures were averaged and correlated with appropriate variables.

Results

Of the 113 questionnaires sent out, 64 were returned, for a 56.6% response rate. This number included 57 women (89%), four men (6.3%), and three respondents who did not state their gender (4.7%). The majority of participants were White/Anglo/Caucasian (94%), with one African American (1.6%), one Asian or Pacific Islander (1.6%), one Hispanic (1.6%), and one who did not state race. The 30 to 40-year-old age group was the largest with 26 (40.6%). Forty to 50-year-olds comprised 25% (16) of the respondents, and the 20 to 30 and 50 to 60 age categories each accounted for 17.2% (11).

Employment Status

Of the 64 graduates responding to the survey, 60 (93.7%) were employed, four were not (6.3%). Of these four, one woman left her last job by choice to stay home with children, one had been job hunting for a week after moving out of state, one had been actively job searching for 3 months, and one stated the “pay scale makes it a luxury for me to work in this field now.” She
implied that she was no longer looking for employment in art therapy due to unsatisfactorily low salaries.

Of those employed, workloads varied: 26 respondents (40.6%) worked full-time (40 hours or more per week); 20 (31%) worked 25 to 40 hours per week; 13 worked 10 to 25 hours per week (20.3%); and two alumni worked 10 hours or less per week (3.1%).

Forty-three of the 61 employed respondents (71.7%) were satisfied with their workload whereas 21 (35%) would prefer a change of schedule. Thirteen people said they would like to work more hours, and eight would rather work less. Those who would like to work more hours included three who worked 10 hours or less, six respondents who worked 10 to 25 hours, and four who worked 25 to 40 hours. Five of the eight respondents who preferred a lighter workload worked 40 hours or more per week. Three worked 25 to 40 hours.

Thirty-seven employed alumni had one job, 20 alumni divided their time between two jobs, and three people had three jobs. Monthly income of those who worked 40 hours per week or more average $2,606. Monthly incomes of part-time workers were not calculated due to the variability in the number of hours worked by each person.

**Job Responsibilities**

Direct individual and direct group therapy were the most common responsibilities on the job. Eighty-three percent of those employed performed these activities (50 respondents). Forty-four art therapists (73.8%) were responsible for case documentation, 34 respondents (56.7%) did direct family therapy, and 19 (31.7%) were involved with administration. These responsibilities were not mutually exclusive; most performed several of these responsibilities. Other job responsibilities included program development, supervision, assessment, public speaking, communication with schools and probation officers, crisis work, marketing, social work, childcare, and teaching art.

Thirty-eight respondents (63%) worked at the same job since graduation. The clients with whom respondents worked covered the spectrum in mental health in terms of age and levels of emotional, physical, and mental functioning. Types of workplaces included schools, residential treatment facilities, inpatient and outpatient hospital services, and multi-ethnic community agencies. The respondents practiced art therapy with individuals, groups, and families. Job satisfaction did not correlate with the client population with which respondents worked. However, several people said they would prefer to work with higher functioning clients and that they were working towards that goal.

**Job Satisfaction**

Job satisfaction was measured on a seven-point Likert scale, with 7 as "very satisfied" and 1 as "not at all satisfied." For the 60 employed respondents, the average was 5.0; respondents were more satisfied than not with their employment. No correlations were observed between age, salary, or graduating year and job satisfaction.
Employment Stability

Job security was described in terms of estimated longevity. Thirty-five respondents viewed their job(s) as secure (58.3%), 14 suspected their jobs were not secure (23.3%), and 10 did not know (16.7%). Five people did not comment.

Thirty-six received medical benefits, 31 had dental benefits, 13 had pension plans, five received eye care, four got vacation pay, two received life insurance, two had available childcare. The participants were also asked if they were provided with supervision and if so how much. Thirty-three respondents received individual supervision for one hour per week from a licensed clinician, 11 got more than one hour per week individual and/or group supervision, and 7 had group supervision at least one hour per week. Unfortunately, many respondents needed to seek art therapy supervision outside their employment because they were not offered any on site. Eighteen participants reported that they were provided with art therapy supervision. It is possible that some respondents went off site for this supervision, but this was not clarified in the survey. Thirteen were provided with one hour per week individual supervision by a registered art therapist; four people received 2 hours per week; and one person received one hour per month. It may be assumed that the lack of art therapy supervision in the institution indicates the lack of senior art therapists on site. The good news is that art therapists are being newly hired; however, the bad news is they may be the only one without a more senior person as a role model.

Job Search

To assist in their most recent job search, respondents used a wide range of contacts. Newspapers (33 respondents; 21.1%), practicum connections (29 respondents; 45.3%), and friends or family (26 respondents; 40.6%) were the most common. The alumni job bank was utilized by 16 respondents (25%). However, the alumni job bank was also criticized as nonexistent by several respondents. Other sources of contact included publications, talk shows, employment agencies, professors, Southern California Art Therapy Association (SCATA) newsletter, psychologists at sites, supervisors, and the phone book.

Length of job search for those employed varied from 1 week to 6 months, with an average of 3 months. For those graduates unemployed at the time of responding to the questionnaire, they had spent 3.87 months actively job hunting. Types of jobs that alumni applied for included art therapy jobs (48; 75%), counseling (41; 64%), social work (25; 39%), education (6; 9.4%), family therapy, recreational/activities-therapist, program development, psychology, and case management.

Reasons for Not Being Offered Employment

In an open-ended question, participants were asked what reasons were given when they were not offered a position. Some applicants stated they were perceived as not adequately qualified: Several employers wanted social workers (MSWs or LCSWs), and some applicants were rejected because they were not licensed at the time of the interview. Some employers were looking for bilingual (Spanish/English) therapists, salary demands were said to be too high, agency funding was cut, and one employer wanted an arts and crafts director. During the job search, respondents reported sexism (6), ageism (4), bias against art therapy (3), homophobia (3), and preference for ethnic minorities (4). Others felt that employers were biased against MFCTs (Marriage, Family, Child Therapists) and/or interns.

To gain an understanding of employers in our field, respondents were asked about their experiences during interviews. On a seven-point Likert scale, the employers’ level of interest in art therapy was rated at 5.5. Most respondents stated that they have educated these employers about art therapy through case presentation, publications, and information about assessment and treatment, for example.

In this difficult job market, respondents believed specific personal work experience was most beneficial (43; 67.2%). Credentials in MFCT (39; 60.9%), A.T.R. (36; 56.3%), combination of MFCT and A.T.R. (35; 54.7%), and PhD (22; 34.4%) were also considered important. Publications, specialized training in child abuse and substance abuse, experience with geriatrics, teaching credential, fluency in Spanish, and determination were also considered important.

Decreasing mental health budgets (30; 46.9%) and the recessive economic climate (28; 43.8%) were faulted for major difficulties in finding employment. Others attributed difficulty to the lack of understanding about art therapy (17; 26.9%) and lack of appreciation for MFCTs (19; 29.7%).
Recommendations for Future Clinical Art Therapy Graduates

In another open-ended question, participants were asked what they thought would support future graduates in their job searches. Participants discussed the need for convincing and concise résumés and cover letters, practiced interview skills, and the willingness to "sell" art therapy to employers. Others suggested the importance of gathering short-term work experience, geriatric experience, and administrative and case management skills. Pionering art therapy in states other than California and in other countries was proposed as an alternative.
Discussion

Despite the difficult economic climate nationwide and particularly in California, respondents to the survey were more satisfied than not with their employment situations. Some respondents were having or had problems finding work, and others were searching for a heavier workload. Clearly the recession has not bypassed the art therapy profession; however, proportionate to unemployment rates nationwide, this group of respondents had not been affected more than the average (6.3% unemployment among respondents compared to 7% nationwide).

The response rate of 56%, although quite high, still suggests that many graduates chose not to return the questionnaire or did not receive it. To gauge reasons for this lack of response, speed of response was compared with job satisfaction. Questionnaires received 3 weeks after mailing were equally as positive as those received within a few days of mailing. This suggests that non-respondents are not all unemployed, cynical, and unsatisfied. However, this is impossible to measure, given the small sample.

It was anticipated that recent graduates would have more difficulty with the job search for a few reasons. They have less clinical experience, are not licensed or registered, and are struggling with the economic climate of the last few years. Also, there are more art therapists competing for jobs with each graduating year. Hopefully, more jobs are being created as the profession becomes more well-known and respected. This notion is supported by the results. Surprisingly, the rate of employment for more recent graduates was comparable to that of earlier graduates, although their workloads were lighter.

It is fairly common to work at two jobs (33% of those employed), perhaps because of a scarcity of full-time positions. However, there is no correlation between graduating year and number of jobs held by one person. It might be anticipated that recent graduates would be more likely to have one full-time position by climbing the ladder of part-time jobs in an agency, but this is not the case. More recent graduates desire to increase their workload (numbers of hours per week) than earlier alumni. This is not to imply that they are harder workers; they simply do not have 40-hour-work weeks like earlier graduates. Conversely, more alumni from earlier graduating classes want to work less hours per week. This factor is unrelated to the respondents' ages, and perhaps indicates an understandable level of burnout.

Employment stability and benefits (medical, dental, etc.) are more secure than not for the respondents, although marginally: 58.3% of those employed feel their job is secure. Presumably these figures are partially dependent on the recession and will shift as the economy improves.

The lack of art therapy supervision available to respondents at their places of employment is disconcerting. It is reflective of how few agencies have registered art therapists on staff to provide supervision. It also suggests that employers are not supplying the funds necessary to send graduates off site for supervision. (A more hopeful assumption might be that art therapists often work at sites where previously an art therapist has never been hired.) Several respondents stated that they paid for their own supervision until licensure, which is a considerable cost. Others who did receive supervision (A.T.R. and M.F.C.T.) said that due to funding cuts, they were not provided with any supervision as soon as they got licensed (although it is traditional to be supervised only until licensed). Almost one-third of respondents do not receive M.F.C.T. supervision. It is probable that most of this fraction are already licensed. No one stated that they needed to pay for their own M.F.C.T. supervision.

It would have been beneficial to plot employment and satisfaction rates by geographical location of workplace, but unfortunately this survey did not request respondents to specifically state where they were employed. The sole Canadian respondent expressed great satisfaction about her work situation. Several San Diego residents discussed their difficulties finding work in that region.

In conclusion, while the participants of this survey are experiencing the pressures of an unstable job market, the sentiment among employed graduates is generally positive. Although the results of this survey cannot be generalized to include other art therapists, it is anticipated and hoped that art therapy graduates in other urban centers in the United States and Canada are experiencing similarly positive results in the job search and employment.

One respondent in the study asked that "faculty continue to instill in students the faith in the power of art therapy so they won't confuse a rotten job market with the validity of their call." The largely unanticipated positive experiences of more recent program graduates indicate the possibility that the job picture may hold more potential than common wisdom would dictate, and it may be that the power of the calling of art therapy, instilled by their education, helps many art therapy graduates cross the bridge into a successful professional life even in the most dire of times.

Editor's Note: Graduates of the Loyola Marymount University Department of Marital and Family Therapy (Clinical Art Therapy) receive a degree in Marital and Family Therapy and are eligible to become licensed as Marriage and Family Therapists in the State of California.

Outpatient Art Therapy with Multiple Personality Disorder: A Survey of Current Practice

Anne Mills, MA, A.T.R., Alexandria, VA

Abstract

The findings of a 1993 questionnaire completed by 46 North American art therapists are reported. The survey focused on the outpatient treatment of multiple personality disorder by art therapists in private practice. Respondents answered questions regarding their position as primary vs. adjunctive therapist, their role in diagnosing, fees and third-party payment, and activities occurring during art therapy sessions. Treatment issues that respondents indicated were of interest to them included pacing and containment through art and managing the client’s chronic suicidality. Other issues of concern to the respondents included self-care of the therapist and enhancing self-efficacy through professional development.

Introduction

Beginning in the summer of 1993, 96 questionnaires and self-addressed, stamped envelopes were sent to art therapists in private practice who were treating clients diagnosed with multiple personality disorder (MPD; now known as Dissociative Identity Disorder). In all, these surveys were distributed to 29 American states and two Canadian provinces. A total of 46 questionnaires were completed and returned.

Clinicians had been placed on the mailing list as a result of having contributed to the literature on dissociative disorders, personal contact with the author (e.g., at conferences and professional meetings in the United States and Canada), listings of art therapists in the membership directory of the International Society for the Study of Multiple Personality and Dissociation, and responses to a notice regarding this survey in the AATA Newsletter. The questionnaire also invited respondents to submit names of other art therapists in private practice treating MPD whom they might know. The author believes that this sample is representative as the mailing was broadly distributed and exceeded the number of AATA members who identify MPD/dissociation as one of their top three areas of specialization (n=76, in La Brie & Rosa, 1994).

The survey was designed so that respondents could choose whether or not their submission was anonymous. Some gave up anonymity in order to receive the questionnaire results. Many expressed a strong need to know more about how others do this type of work and wrote about subjects on which they wanted more information or a chance to share their thoughts (see Issues of Interest section).

Some respondents did not complete all parts of the survey; this accounts for some totals not adding up to 46.

Characteristics of the Respondents

A large proportion of respondents (25 out of 46) indicated they considered treating the dissociative disorders population to be a clinical specialty. Those who identified themselves as specialists were distinguished by two factors: number of previous clients diagnosed with MPD, and number of persons "to whom I have provided services throughout their completion of integration."

Non-specialists typically had worked with one to five people diagnosed with MPD, while half of the specialists had worked with up to 20 such clients; the remaining specialists reported working with 21 to more than 100 individuals with this disorder. Additionally, those who considered the treatment of dissociative disorders their clinical specialty were twice as likely to report having clients who attained integration. The majority of clinicians, however, had never worked with a client through the integration process.

Both specialists and non-specialists had an average of four-to-five years of experience in the treatment of individuals diagnosed with MPD (both inpatient and outpatient, excluding undiagnosed individuals). A few art therapists in each group had over 10 years of such experience. The number of years of general experience as an art therapist did not seem to predict the likelihood of specializing in this clinical area.

Before beginning a private practice, most respondents appeared to have waited for two years or more after attaining the A.T.R. registration, or to have had clinical degrees beyond art therapy. Of the respondents for whom this is not true (n=18), seven appeared to have begun private practices prior to achieving registration or other clinical degrees.

Characteristics of the Respondents' Practices

Approximately half of all respondents treated persons under the age of 18 who were diagnosed with dissociative disorders. Counting all their present clients (including supervisors, group members, and all age groups), respondents had an average of 18 individuals in their private practices. On average, one-third of
these clients were diagnosed with multiple personality disorder, and an additional 20% were diagnosed with another dissociative disorder. Thus, one-half of the respondents' clients typically had severe dissociative disorders. About one-quarter of these clients reported ritual abuse. Respondents indicated that 15% of their clients reported mind control; however, several art therapists indicated that they were not familiar with that term. This finding might have been larger, perhaps, if this concept were more widely known (for definition, see Hasan, 1988).

To establish if the art therapy practice was geographically isolated—from competition or support—the questionnaire asked if, generally speaking, any other therapist within 50 miles also offered the services the respondent offered. This was deliberately phrased in such a way that respondents could interpret it as related to art therapy and/or dissociative disorders work, and it is clear from the responses that it was interpreted variously. Two-thirds of the respondents responded affirmatively, and many respondents identified themselves with psychotherapists treating MPD rather than with other art therapists. Perhaps this is due to the relatively small number of art therapists who treat MPD.

The challenges of working with this difficult population (about which few art therapists have been educated during their training) in the face of varying types or degrees of isolation provoked a question about professional development. Ways of pursuing continuing education were listed, and respondents endorsed those they had used during the preceding year. “Study through books or audiocassettes” was most frequently chosen, followed by MPD specialist conference, MPD therapist peer supervision, MPD therapist support group, and paid supervision. Consultations with experts on MPD, treatment team meetings in agencies, and research were also reported by respondents. All respondents had availed themselves of some form of professional development.

Contributing to the Diagnosis

For every respondent who denied that he or she “customarily diagnoses, or contributes to the diagnosis of these clients,” three indicated they did contribute to diagnosis. Respondents were asked to specify the diagnostic methods they employed. The sole art assessment mentioned by respondents by name was the Diagnostic Drawing Series, which was used by seven clinicians (Mills & Cohen, 1993). The most mentioned non-art assessment was the Dissociative Experiences Scale (Bernstein & Putnam, 1986). Behavioral assessment was informal; several respondents noted watching with heightened attention for changes in the client’s personal presentation (specifically, voice, eyes, and movements) and differences in art and handwriting styles.

Primary Versus Adjunctive Therapist

The survey asked if one’s status with private practices—clients diagnosed with MPD was predominantly as primary therapist, consultant, adjunctive therapist, or some other category. Primary and adjunctive were endorsed equally (n=19). Two respondents described themselves as both primary and adjunctive; perhaps this could be accounted for by different roles on separate cases, or changing roles at various stages in treatment. Respondents attributed moving between primary and adjunctive roles to difficulty finding someone to whom to refer (e.g., with more experience treating MPD than themselves; who accepts Medicaid; who recognizes the diagnosis). One respondent who worked as a primary therapist wrote, “I would happily be an adjunctive therapist in collaboration with a person who does body work. I believe body work is essential to recovery. Often MPDs have had years of psychotherapy and [still] need the release provided in art therapy and body work.”

Regarding adjunctive work, one person wrote, “I will not accept patients who do not have a primary therapist [who is an] MD or PhD.” This may be a way of dealing with not being licensed to provide psychotherapy in areas where this activity is regulated by law. Another said, “I'm not ready to be entirely responsible for such clients.” A primary therapist’s legal responsibility to his or her client is considerable; if that client has a severe dissociative disorder and is chronically suicidal and the therapist is not licensed to provide psychotherapy, the therapist is imperilled professionally (Webster, 1994; Wirtz, 1994).

The category “other,” usually described as being a co-therapist, was endorsed slightly less than “primary” or “adjunctive.” A respondent noted “actively doing [the same] work which psychologist or psychiatrist does” but “concentrating on art psychotherapy…We cover for each other…and jointly make decisions on hospitalizations.” It is notable that the literature on outpatient cotherapy is small; these respondents might be pioneers in a new form of providing care.

No one endorsed the category “consultant.” This may suggest the numerous non-art therapists who appropriate the use of art in treating MPD clients fail to use art therapists for consultation. One respondent wrote, “There are other professionals [who] implement art activities in their sessions and label these interventions ‘art therapy.’ I know of a local artist who has been hired to provide ‘art therapy’ in a partial [hospitalization] setting with no training.” Some art therapists offer casual, free consultation to colleagues to build rapport, interdependency, and a referral base. This may be an unexplored market for private practitioners but raises ethical issues by seeming to sanction the use of art in therapy by untrained individuals (Mills, Dougherty, Rubin, & Schoenholtz, 1992).

Content of Sessions

The questionnaire asked which activities are “customarily incorporated into your sessions with clients diagnosed with MPD.” The first number after an item represents all who endorsed it; the second number, in brackets, represents the number of times the activity was identified as “the single approach that predominates in most sessions with these clients.” Categories have been arranged from most to least endorsed: art therapy/art psychotherapy, 44 [31]; verbal psychotherapy, 37 [4]; imagery or storytelling, 28 [2]; psychodrama, 28 [0]; sand tray/sandplay, 18 [1]; hypnosis, 15 [0]; play therapy, 12 [0].

Several respondents clarified that art psychotherapy, not art therapy, was their predominant form of treatment.

The importance of writing as therapy (journaling, therapeutic letters) was noted by two respondents.

The endorsement of hypnosis seemed quite high, given that much of the instruction in it is open only to licensed Master's
level clinicians or those with doctoral degrees, and, therefore, may be difficult for art therapists to pursue. On the other hand, art therapists may be expected to have a special interest in clinical hypnosis and to excel in its practice because of their study of imagery and metaphor. Two respondents added variations of relaxation training, as distinct from hypnosis. One wrote, "Hypnosis NO." At the time of the survey, verbal psychotherapy and hypnosis were the most commonly used treatment modalities for patients with MPD, followed by medication and art therapy (Putnam & Loewenstein, 1993).

**Fees and Session Structure**

For art therapists in the United States eligibility for third-party payments is not clear-cut. Unlicensed respondents noted they could receive such payments under certain circumstances, including: if the insurance company paid counselors, or if payment was not mandated on being licensed; if the insurance company has registered or contracted with the state; if arrangements were made or endorsed by a psychiatrist or clinical director, or art therapy was provided by doctor's order; if supervision was provided by a psychiatrist or licensed psychologist; or if the provider was considered a specialist in the MPD field.

Most respondents (n=29) indicated they met once a week, on average, with clients who carry this diagnosis. This finding is noteworthy because it differs from the twice-a-week structure common to the verbal psychotherapeutic treatment of those with MPD (Putnam & Loewenstein, 1993). Most of the remainder of the sample averaged two sessions a week, and sometimes more, especially in the early stages of the work. Surprisingly, neither being in the role of primary therapist nor eligibility for at least some third-party payments seemed to necessarily increase the frequency of meetings. On the other hand, a small number of adjunctive art therapists who were not eligible for third-party payments (thus, clients were paying directly for services) reported twice-weekly meetings with clients diagnosed with MPD.

Art therapists who met with clients less often than once a week indicated this was due to either the clients' inconsistency in attendance or financial straits. The survey did not address the adequacy of benefits, such as the not uncommon situation of a client exhausting his/her insurance benefits before treatment is complete.

The length of the art therapy session usually offered clients with MPD was what the survey called "the standard 45- or 50-minute hour." However, one-third of the clinicians offered 60-, 75-, or 90-minute sessions, and some described these lengths as approximate. Respondents noted these longer sessions met objectives that include: planned double sessions for "abreactive work" or the use of hypnosis, sometimes alternating with 50-minute sessions; doing the session with a cotherapist; and allowing sufficient time for verbal preliminaries, artwork, and "brief reorientation."

Licensed respondents (defined as those who have obtained licensure, sometimes with additional degrees) charged an average standard fee of $70 a session. Unlicensed respondents, including those who sometimes received third-party payments, charged an average standard fee of $60. There was a much broader scatter between the fees of the unlicensed art therapists (from $10 to $100, but with most between $45 and $75) than among the licensed ones (distributed fairly evenly from $45 to $95). Fifty dollars and $75 seemed to be nodes at which both licensed and unlicensed art therapists clustered their fees. It is also interesting to note that years of experience in the field, or in private practice, had little correlation with the fees set. On average, the fees of unlicensed art therapists were the same whether they were registered in 1983 and before, or in 1988 and after.

All respondents except four offered sliding scale fees. The average discrepancy between the standard fee and what the survey called "lowest fee negotiated" was $34. However, some respondents indicated they had reduced their fees as much as $60 or more. As a result, some fees were below $20. Other special fees mentioned were pro bono work, $20 for a limited number of indigent clients, $35 for Medicare/Medicaid clients, and $90 for a home visit. Because of the need for a secure treatment frame and MPD clients' potential for violence toward themselves and others (Kluft & Fine, 1993, pp. 26, 169), it is presumed that the home visit service mentioned above would not be offered in the treatment of individuals with dissociative disorders.

About half of the respondents had a different fee structure for initial sessions. Some charge more (on average, $20 more), while others waived the fee if client and therapist decided not to work together.

Numerous art therapists indicated that they offered group as well as individual treatment to dissociative disorder clients, and that clients can be in both at the same time. It has been suggested elsewhere that sharing the therapist with other group members places an intolerable burden on these clients (Comstock, 1990). The reaction of trying to do more or offer more to try to help is a fairly common complication in the treatment of dissociative disorders. Respondents' remarks did show an awareness of the overwhelming unmet needs of these clients, who often report not being able to find adequate care. This may parallel respondents' statements about lacking the support they need in order to do this difficult work.

**Issues of Interest to Respondents**

The questionnaire asked, "Which issues particularly interest you, at this stage in your work?" The first number after the item represents all who endorsed it; the second number, in brackets, represents the number of times the issue was identified as "the single issue which is currently of most interest to you." Categories have been arranged from most to least endorsed: pacing and containment in art, 22 [8]; avoiding burnout/secondary PTSD, 24 [2]; enhancing efficacy through training/licensure, 22 [3]; spiritual implications of abuse, 22 [2]; keeping the art therapy on track, 18 [6]; managing client's chronic suicidality, 18 [5]; legal/ethical issues in treatment, 22 [1]; ensuring therapist's safety/privacy, 18 [1]; dealing with primary therapist, 17 [1]; incorporation of art in therapy by non-art therapists, 13 [2]; credibility vs. skepticism re: client's allegations, 13 [1]; business matters (records, billing, referrals), 10 [2]; dealing with the issues of therapist as survivor, 10 [0].

Below are additional contributions solicited from respondents that have been paraphrased and clustered in paragraphs, according to theme. The numbers separate comments from different respondents.

How do structured versus unstructured art therapy sessions
affect MPD clients? (2) How to use the media for containment. (3) How to keep the focus on the art when one finds oneself doing more psychotherapy. (4) How to incorporate hypnosis and abreaction into the art therapy process. (5) Switching between alters is noted in response to certain media; rapid switches are occurring during the art process. (6) The client’s journey via the art process. (7) The concept of MPD is itself metaphorical; it develops out of the human capacity to create and represent. How does this relate to art creation?

What is the process of integration? (2) What art therapy research exists on the diagnosis and treatment of MPD? (3) Am I doing any good? Would further training (e.g., hypnosis) help me do my work better? (4) How can we best help ourselves and our students understand the principles of working with dissociative clients? Could a therapist support and referral system be developed?

What do object relations and attachment theory have to offer as models for working with the MPD experience? (2) How to help the client build a support system, especially when partners or friends are resistant. (3) How separation from the therapist during a planned hiatus can be a positive experience; how this affects timing in my work.

Neurological ramifications of art therapy as primary therapy. (2) Psychobiology of dissociation as it relates to the images, especially those that arise in a fragmented way. (3) MPD being misdiagnosed as learning disability or as a stressor for the client. (4) My concerns about the medical model of therapy, especially regarding medication.

The development of the therapeutic relationship. (2) Transference, countertransference, projection, and projective identification.

Especially where allegations of severe ritual abuse are involved: How does the client answer her/his own questions about the meaning of workings of God? (2) The credibility of both the client and therapist are at risk in this work. (3) There is a range of acceptance of MPD as a viable diagnosis depending on the hospital, or even on the shift.

Perhaps the naming of these important issues will stimulate further discussion in the literature.

Summary

A picture emerges of a profession whose practitioners explore creative ways to provide appropriate services to MPD clients by incorporating cotherapy, group therapy, and longer but less frequent sessions, into the treatment frame; whose proponents readily reduce their already modest fees for client in financial difficulties; and where the motivation to pursue continuing education is professional responsibility, not better compensation. Art therapy with multiple personality disorder clients in private practice seems to be an embattled subspecialty where the clinician lacks the support of colleagues doing the same work with the same tools, and whose knowledge of how to best treat these troubled clients is imprecise.

Nevertheless, many would agree with the respondent who wrote that art therapy "readily speeds [the processing of] information, healing, [and] integration. I do not know how other professions work with MPD without art therapy."

Art Therapy at the Crossroads: Art and Science*

Terry J. Tibbetts, PhD, A.T.R., San Gabriel, CA

Although art therapy as a professional discipline has been in evidence since the mid-1950s, as we move into the 1990s, it has achieved only limited acceptance in the larger mental health field. While some inroads have been made in isolated settings (e.g., alcohol abuse programs in private psychiatric clinics), art therapy as a clinical intervention continues to be both underutilized and misunderstood by many mental health providers. I suggest that one of the major reasons for this failure to be taken seriously as mental health professionals is because art therapy, as a discipline, has failed to generate empirical data that would support our claims to clinical effectiveness.

Such a failure to generate empirical evidence of our effectiveness as a professional discipline appears to reflect two separate but related factors. The first is an overly narrow focus on clinical or artistic issues. Most clinically oriented art therapists tend to view empirical research with the same enthusiasm they reserve for going to the dentist. Instead, they focus on therapeutic work and view themselves as clinicians rather than researchers. This "either/or" dichotomy is highly limiting and, at some level I suspect, reflects our own sense of inferiority as second-class mental health clinicians when comparing ourselves to the "real" mental health professionals (such as social workers or psychologists, who are expected and trained to be both scientists and practitioners).

Contained within this clinical group are the art therapists who view research as simply irrelevant to art therapy, taking the stance that "art is inherently therapeutic." And, since this is so allowing clients to simply "do art" will invariably result in therapeutic growth. Accordingly, most research efforts are, in the long run, unnecessary. Given such an attitude towards research, it is little wonder that the mode number of professional journal publications by registered art therapists (A.T.R.) is zero. Nor should it be surprising that one of the few issues that arouses their fanatical frenzy is whether or not studio art courses should be a prerequisite for the A.T.R.

The second factor is that there is almost no institutional or programmatic support for the small minority of art therapists who are interested in systematically examining the efficacy of art therapy in the clinical setting. Very few graduate programs—whether AATA-approved or not—place an emphasis on research. My own A.T.R. program required only one undergraduate-level 10-week course in basic research design, and the quality of the program's completed theses, to be as charitable as possible, was variable.

As a result, most art therapists are either uninterested in or poorly equipped for publishing professional-level empirical studies on the efficacy of art therapy. Without this kind of research support and empirical backing, we run a very real risk as art therapists of being dismissed as "ashtray makers" or "scarf therapists" by our professional colleagues simply because they do not understand what is so special about what we do. Also, because we have no hard data to back up our claims to professional parity, we lack, in sum, any empirically validated ticket of admission. A review of almost any issue reviewed in an art therapy-oriented journal will reveal that the overwhelming majority of articles are theoretical, historical, or case studies. Research data are sadly lacking.

One of the very few empirical studies undertaken in art therapy was published by myself and another A.T.R. (Tibbetts & Stone, 1990). Its emphasis was on evaluating the efficacy of short-term art therapy with adolescents identified by the educational system as having serious emotional disturbances. The results of this study were quite interesting. Among other findings, it appeared that short-term art therapy was most useful for adolescents with depressive disorders, and that its effectiveness appeared primarily related to strengthening the adolescents' sense of identity and increasing their ability to rely on and trust their own feelings and beliefs. Adolescents with anxiety disorders and issues involving emotional rejection by others were also found to benefit significantly from the use of short-term art therapy. By contrast, the use of art therapy was least clinically effective in reducing feelings of anger and aggression. Further, while art therapy resulted in significant affective shifts, only minor changes were noted over the same period of time in overt behaviors monitored in the classroom setting.

These results suggest a number of starting points for further research, some of which appear to challenge assumptions we often make as art therapists. For example, it may well be possible that art therapy is not the intervention of choice for emotionally disturbed adolescents who demonstrate severe behavioral acting-out as a concomitant of their disorder. My point, however, is not whether it is or it is not—rather, my point is that this question will not be answered by clinical art therapists who base their responses solely on their "years of clinical experience with this population." It will be answered only by further empirical research that looks more closely at identifying the relevant variables that define successful and unsuccessful art therapy with different populations.
professionals, I have found that invariably the psychologists and
social workers (those trained as both practitioners and scientists)
ask the empirical questions: Was the fact that the form of art
therapy used was Gestalt-oriented a factor in the findings?
Would the use of younger students have yielded the same
results? What kind of results would have been found if only
behaviorally disordered students had been used? Would longer-
term art therapy have changed the results? Would the use of a
non-A.T.R. professional (e.g., school counselor, school psycholo-
gist, or artist) have yielded the same results? Would group art
therapy have been more effective in reducing the aggressive
responses?

Of more interest to me, however, is the fact that these ques-
tions have not been asked by most other art therapists, the ones
who should be most interested in the findings and implications of
the study. Although the findings of the study were better than I
had suspected they might be (and were much worse than my co-
author had believed they should be), initial reactions to the study
from other A.T.R.s were almost unanimously anecdotal. It quickly
became clear that most art therapists were unable to review the
study findings in any meaningful way other than by sharing
cases from their own practices that either confirmed or negated
the study’s findings. One A.T.R. (who had not read the study)
expressed a typical reaction, “I really don’t care what the data
show. Art is therapeutic for all populations. If your data don’t
show that, your data are wrong.”

This kind of response is unfortunate and underscores why,
as art therapists, we lack that empirical ticket of admission into
the world of mental health parity. As art therapists, we are simply
not equipped by interest or by training to be scientist-practi-
tioners. Until we are able to collectively recognize the import-
ance of research to the growth and professionalization of our
discipline, and to insist that our graduate programs install a
recognition of this importance into the next generation of art
therapists, we will continue to be perceived as the ashtray mak-
ers of mental health.

sion.

Invited Response

Harriet Wadeson, PhD, A.T.R.-BC, HLM, Evanston, IL

I certainly support Terry Tibbetts’ plea for the encourage-
ment of research in art therapy. I have tried for a number of years
to help enlighten our membership about both the potentials and
problems in undertaking art therapy research. Clearly Tibbetts’
article emphasizes the need for art therapists to explore our rela-
tionship to research, both as a profession and as individual art
therapy practitioners. Toward that end I would like to comment
on a few of the article’s points.

First, the author states that art therapy is not taken serious-
ly because of our failure “to generate empirical data that would
support our claims to clinical effectiveness.” This claim must be
viewed in the context of outcome studies for other kinds of psy-
chotherapy. Until relatively recently there were few such studies,
and where they did exist, they indicated that comparable untreated
patients recovered as well as those who received psychother-
apy. More recently, large scale investigations have been under-
taken by the National Institute of Mental Health to investigate
the outcome of various treatments for depression.

In any case, although empirical support for positive art ther-
apy outcomes would certainly substantiate art therapy’s effec-
tiveness, I do not agree that it is our failure to produce empirical
studies that has compromised our position in a field where few
such studies exist. Furthermore, it is important to understand the
limitations of outcomes studies. Such investigations require def-
initions of positive outcomes. Some outcome criteria may be
measurable—for example, improvement in school performance,
decrease in hospitalizations, decrease in substance abuse, and
decrease in employment absenteeism. But for the most part, art
therapy is often directed toward an improvement in quality of
life. That is not usually measurable or even defined. Self reports
probably give the clearest indication, but many researchers find
such measures too vague and too easily confounded.

In my experience, art therapists have been hired (the bot-
tom line for being taken seriously) not because an administrator
has read an article but, more often, because of a personal contact
with art therapy. Students get hired because they demonstrate to
administrators that they can provide a valuable treatment asset to
the facility. An administrator who has valued an art therapist’s
work will want to hire an art therapist in the future.

Tibbetts states that clinically oriented art therapists “view
themselves as clinicians rather than researchers.” This does not
seem surprising. Tibbetts deplores this “either-or” dichotomy
and states that we should “insist that our graduate programs
install a recognition of this importance [of research].” As an art
therapy educator, I realize how little time we have in a 2-year
Master’s degree program to train a clinician. I believe that like
the other mental health professions to which Tibbetts compares
us (psychology, social work), we should expect our doctoral can-
didates to produce research. Even not considering the missteps
that may occur along the way, it requires more than 2 years for
students to learn to design and conduct research, to develop a
research hypothesis, to identify and establish a client population
then conduct a pilot study, and to collect data, then analyze it and
draw conclusions. It’s one thing to desire research in art therapy.
It’s quite another to set up to conditions to facilitate it.

As in other disciplines such as psychology and social work,
not every clinician is a researcher. The sort of fulfillment that
draws one to the work of art therapy is very different from the
satisfaction derived from conducting research. It is not surprising
to me that some art therapists might eschew undertaking
research projects. One might argue, however, that a Master’s
degree program could teach research methods in such a way as
to instill an appreciation of research without requiring students
actually to engage in research. I believe this would be a very dry
exercise. One learns research by doing it.

So, what’s the solution? As I mentioned earlier, doctoral pro-
grams. The student could gain a sound research foundation, have
time to plan and conduct research, and make a contribution to field.

I believe there are many more possibilities than the outcome studies Tibbetts (and many other art therapists) have wanted. In the images our clients produce we have a unique array of data. Unfortunately, we do not know what to do with it. It has much to tell us about the human condition if only we knew how to read it. I have made some primitive suggestions (Wadeson, 1992), but we need much more extensive work in developing methodologies to explore the knowledge images hold. We are more adept in the more clinical realm of encouraging our clients to connect with their images than we are in empirical investigations of them.

My direction in the "crossroads" Tibbetts examines would be to encourage those wishing to pursue art therapy doctorates to blaze a new trail through the uncharted territory of art therapy data. New methodologies could go far beyond identifying and/or counting visual characteristics. We need unique ways to approach our unique art therapy data. If we develop methodologies that are more consonant with the nature of our art therapy work, more art therapists might become impelled toward research.

Invited Response

While it is true that there is a lack of empirical data on art therapy, I found the tone of Tibbetts' article to be quite simplistic and, at times, demeaning in the author's generalized attitude toward art therapists. If it is the author's intention to alert art therapists to the need to publish statistical data, such a judgmental approach, in my opinion, will be ineffective in accomplishing this goal.

Furthermore, the author's assumption that art therapists are second-class citizens simply because we lack this data and are, therefore, not accepted by "scientist-clinicians" seems to be a rather large leap in logic and may not necessarily be correct. The author's thesis that the lack of empirical research has led to our "credibility problem" breaks down if we realize that other psychotherapists, such as contemporary psychoanalysis, do not suffer from the same second-class citizen syndrome, but also suffer from a paucity of empirical data. Therefore, it cannot simply be the lack of such data that creates this situation.

This raises several larger questions: Is the true value of what we do as art therapists actually measurable through scientific, quantifiable data? Do we want to be absorbed into such a purely scientific community? Or, is what we do very special and different from other "scientific" therapies and, therefore, in need of new and different venues of application as well as tools of measurement?

I believe that these questions begin to speak to the true dilemma for our field. It is not simply that we, as artists, aren't competent to conduct scientific research, but rather that we, as artists, are sensitive to the complexity of these issues and strive to maintain our unique identity. If we try to quantify something that defies such measurement, we may be contributing to the diminution of our credibility.

For many people art therapy is not simply a way to cure illness but rather a vehicle of self-actualization and deep emotional integration. As art therapists in private practice, we often don't see our clients as ssk patients, but rather as people who are seeking ways to grow emotionally and spiritually. If we simply follow the existing scientific clinical structures, we have to apply categories of mental illness and dysfunction which often don't really fit our clients. We may even have to choose a "diagnosis" from the DSM-IV to enable our clients to receive reimbursement for our services, which may feel like putting a round peg into a square hole.

These are the deeper issues and Tibbetts' article seems to be lost on the superficial tip of the proverbial iceberg. What we are really describing here is a professional "identity crisis." How do we convey the value of what we do without losing our uniqueness and, therefore, undermining the credibility and effectiveness of our profession? Unfortunately, there is no simple solution to this complex problem. I don't believe that simply producing empirical data will be the miracle cure for our dilemma.

Additionally, the author's tone of frustration cannot possibly serve any productive purpose towards resolving this complex problem. What we need is a slow and thoughtful process of evolution which recognizes and respects the power of art therapy as a specialized field of practice which may very well be better understood as an "artform" rather than as a scientific "cure" for a mental disease.

Associate Editor's Note: Dr. Tibbetts suggested that two art therapists be invited to respond to the paper. Dr. Wadeson and Mr. Wolf were invited to respond in writing. Dr. Tibbetts was also asked to reflect on the article, written 5 years ago. Readers are invited to respond in letters to the Editor or the Viewpoints section of this journal.

Further Reflections on Art Therapy and Ashtray Making

Terry J. Tibbetts, PhD, A.T.R., San Gabriel, CA, 7/31/95

In reviewing this article before its reprint in Art Therapy, I am struck by how little seems to have changed in the 5 years since it was written.

There is an old saying that if you always do what you've always done, you'll always get what you've always gotten. In the past few years, from my perspective, not only has art therapy as a field continued to avoid a focus on empirical validation of its efficacy, but we actually seem to have gone backwards. The single major change in obtaining the A.T.R. is that we now require proof that an applicant has taken studio art courses. This may be an ego-enhancing reminder of how we (as art therapists) believe art therapy is qualitatively different from other therapeutic approaches, but it says little to the larger mental health system about our commitment to clinical excellence—"Well, maybe I did miss that client's suicidal symptoms, but, by golly, take a look at the quality of these ashtrays. Took me five classes to get 'em right, but look at 'em now."
Some of my colleagues point to the establishment of the Art Therapy Certification Exam as an example of the field's increasing professionalization. I do view this as a step forward—in creating such an internal quality control mechanism, we are making the statement that we believe ourselves to be a distinct and competent profession. However, it seems to me that this somewhat misses the point. Professionals have a commitment to human change through the systematic application of empirically derived and research-based interventions; artistically oriented art therapists have a commitment to human change through the building of an awareness of and appreciation for the intrinsic meaning of one's own artwork and the healing power of aesthetic creativity. And, while there is a creative tension between the two approaches that can be used in a productive fashion, I am not sure that it is either valid or useful to claim that one can serve both masters equally well.

In fact, are we a profession? Or, are we simply a discipline? Or, maybe just a field of specialization? Do we even know, or have we even thought it through? In California, for example, art therapists can easily be licensed as Marriage and Family Therapists. Yet, in the State art therapy organizations this causes much wailing and gnashing of teeth. At the present time, there is a tremendous amount of energy being spent on attempting to get new legislation introduced to allow art therapists to be "registered" (not unlike the process used to register occupational therapists). I am not sure that this is why I went through an art therapy graduate curriculum, fieldwork, and internship, so I could be thought of as the equivalent of an occupational therapist (don't they make ashtrays, too?).

A few years ago, I worked as a coordinator of a quality assurance unit for the State Department of Mental Health. In a review of a local mental health agency, our unit cited the clinic for allowing their clinical psychologist (not an A.T.R.) to write in his notes that he was providing "art therapy" to a client. He was furious and contended that he did not have to be an A.T.R., and, in fact, because he was licensed as a psychologist, "I can provide any type of therapy I feel comfortable with." Perhaps. But did he take those five ceramics courses? More importantly, how would each one of us respond to his assertion? And, on what professional/empirical basis would we justify our responses?

Peterson (1976), in an incisive and well-reasoned article, discussed a similar dilemma in the development of clinical psychology. In his article he identified several conditions which any human service field had to meet to be considered a profession and noted that "the fundamental attitude of the professional practitioner...resembles that of the scientist" (p. 573).

I may be wrong, but I believe that many AATA members would reject that statement. As a field we have never explicitly worked through the issue of whether we are artists first or scientific practitioners first, and I suspect that any dialogue on the issue would be extremely heated (although hopefully productive). Until such an exploration occurs, however, I submit that we will not be asked much by mental health professionals about client dynamics—but we'll sure be asked a lot of questions about ashtrays.

Art Therapy Research: Learning from Experience

Debra Linesch, PhD, A.T.R., Los Angeles, CA

Introduction

This abbreviated description of a research project explores the experiences of five art therapy researchers. Both verbal and artistic descriptions of the art therapists' experiences are used to gain understanding of the specific issues that arise for art therapists engaged in research. The paper demonstrates a research protocol that addresses issues which emerge throughout the exploration. In this way, the content and findings of the project are interconnected with the methods used. The entire project is motivated by my concerns regarding the historic struggles the field of art therapy has had with scholarship.

The approach to research used is qualitative, making use of phenomenological and hermeneutic methods. In-depth, open-ended interviews are used to explore therapists' experiences with research. Four questions define and specify the intention of this research:

1. How do the art therapists' personal backgrounds and training prepare them (or not prepare them) for becoming involved in research?
2. How does the art therapists' clinical work integrate (or not integrate) with their research interests?
3. What obstacles to research involvement are experienced by art therapists?
4. What supports the art therapists' interest and involvement in research?

Review of the Literature

Little discussion has appeared in the field's journals debating the epistemological and methodological approaches to scholarship. Kwiatkowski (1978) is the first art therapy theorist to directly address the issues of research, claiming that even though the clinical judgments art therapists make are impressionistic, these judgments can be systematically organized and can offer solid conclusions. Her caution regarding inevitable difficulties concerning quantification reflect the attitudes of many art therapy clinicians and would-be researchers who believe the very nature of the art process resists the research process despite their yearning for the validity and respectability that proper research design would offer the field.

Wadeson (1980) focuses more extensively on the issues of research than previous art therapy theorists and recognizes the complex problems in methodology in the field. She acknowledges the need for art therapists to "refine, modify and adapt them traditional science methods to the peculiar problems posed by this field" (p. 138), and goes on to say, "Art therapists may even have to develop new methods" (ibid).

Rubin (1978) acknowledges the field's historic hostility toward research as well as the inherent difficulties in research design that involve artistic productions, but articulates clear and early encouragement for clinicians to openly approach the inquiry process.

In 1984 Rubin, taking another look at the research problem in the field of art therapy, concludes that there is an inherent difficulty in the field's attempt to find reliable and meaningful ways of scoring the products of art therapy. Although she agrees that art therapists need to become capable of doing meaningful research so the stature of the field grows, she acknowledges that options outside the quantitative sphere exist: "We may have gotten caught in the empiricists' numerical web, refusing to recognize the phenomenologically subjective nature of the creative experience" (Rubin, 1984, p. 184).

In his book about the education of creative art therapists, McNiff (1986) takes a strong stand regarding the compatibility between nontraditional, qualitative research methodologies and the inherent approach to knowing that is part of the art therapy process. He exhorts educators to consider research as a post-Master's degree experience and repeatedly emphasizes how traditional behavioral science methods do not always apply to the work of art therapy.

In a published dialogue, Junge (1989) and Rosal (1989) directly address the issues of methodological approach. Rosal encourages the introduction and expansion of single-case research, while Junge articulates her belief that a whole spectrum of research approaches would most likely benefit the scholarly struggles in the field. In 1993, Junge and Linesch discussed the specific compatibility between the scholarship struggles in the field of art therapy and the new post-utlial being made available in the expanding human science methodological spectrum. Also, using a questionnaire (Linesch, 1989) to assess what kinds of approaches to research are being taught in art therapy training programs, I explored my concerns that specific methodologies for art therapy research are not being considered.

Research Approach

The research approach selected for this exploration is qualitative, based on my commitment to make the methodology compatible with the theories and clinical practice of art therapy. It is helpful to define qualitative research more comprehensively than simply a reaction against reductive or quantitative research. Qualitative research is a set of inquiry processes that offer rigorous but open-ended opportunities to explore human experiences in depth. By avoiding the reductive tendencies of quantification, qualitative approaches respect the complexity of human experience and allow for the emergence of meaning and understanding.

Based on the intent to explore the experiences of art therapists who do research, I narrowed the approach of this inquiry to
a phenomenological mode. The phenomenological approach (Giorgi, 1985; Ihde, 1986) involves the lived world of experience from which meaning emerges based on description (usually through language) and analysis of that description. Phenomenology and its attendant methods support exploring understandings rather than proving or validating existing theory or knowledge. Although I understood my overall approach as qualitative and the scope of my inquiry as phenomenological, it is more specifically within the methods of hermeneutics that I found a methodological home for my exploration. Hermeneutics (Gadamer, 1960; Palmer, 1969; Ricoeur, 1981), a theory that claims all understanding is contextual interpretation, offered my inquiry the opportunity for interpretive engagement in a manner that is similar to the therapeutic engagement I experience in art therapy.

Methods and Procedures

Five practicing art therapists known to be interested and involved in research processes were interviewed for this endeavor. Four of the five were graduates of a West Coast art therapy program and the fifth graduated from an East Coast art therapy program. All five were working as art therapists in the Southern California area and had been involved together in a continuing education workshop to support and facilitate their participation in research endeavors. All four of the West Coast graduates had been engaged in research: one had published prolifically about Jungian theory and was working on an integration of art and sand tray therapy; the second had pursued a detailed examination of 11 years of her paintings as a recovering cancer patient; the third had used a questionnaire to explore professional transitions experienced by art therapists; and the fourth had been involved in an exploration of the imagery of a ritually abused client. The fifth participant had expressed an interest in becoming a researcher and was attending the workshop to support this career goal.

Using Mishler (1986) as a resource for interview style, I developed an interactive interview process, fully embracing my own subjective experiences as support for the development of my understanding of the art therapists’ experiences. I listened to the respondents’ answers for meaning and paid attention to my own internal stirrings, attempting to allow an overall conceptualization or mapping of the interview to surface and let it resonate with my own personal experiences as a way to come to understand it. I asked the respondents to draw the material we had discussed in an attempt to diagram and come closer to interpretable and shareable metaphors. Indeed, metaphors become integral to the interview process as intersubjective connections that supported the deepening understanding of the meanings within the dialogue.

Once the interviews were complete, they were carefully transcribed, replayed, and rechecked for accuracy. Drawings created by the respondents were appended to the transcripts, and together this became the research data. Interpretive procedures from both phenomenology and hermeneutics were used to analyze the art incorporating an iterative use of patterns and metaphors to amplify understanding. The detailed protocol I used for this methodology proceeded through seven steps. Illustrations of each step are included to clarify the procedures.

1. **Listing expressions (or horizontalization)**

   The first step in the process of interpretive data analysis involved careful examination of the verbal description of the experience. Repeated examination allowed identification of expressive units (clusters or groups of words that combined to create discreet meanings). The process of horizontalization gave equal value to each expressive unit, in effect breaking down the data into reusable fragments that could be used in a meaning-making reconstruction. For example, Table 1 lists the first 10 expressive units that were identified in the interview with the first art therapist (B).

   **Table 1 Listing the Expressive Units**

2. **Identifying metaphorical structure**

   The second step involved fundamentally phenomenological analysis made in an attempt to determine the structures that represented the essential components of the respondent’s experience. To evolve a structural understanding I diagrammed and redidagrammed my overall understanding of the interview and identified categories (or groupings of the expressive units identified in Step 1) that combined to present a metaphorical framework for the test. For example, in my analysis of the first interview I arrived at a metaphoric structure (based on my understanding of B’s words and her imagery) that included 12 categories depicting her development from an early perception of a split between scientist-self and artist-self to maturing integration.

3. **Clustering the units of expression**

   My next step was to sort or cluster the units of expression into the categories I had identified (components of the structural metaphor created in Step 2). The process of clustering the expressions involved formally organizing the categories of meaning and resolving decisions about which expression best fit in each of the categories.

   Table 2 illustrates the results of this arduous step with the data from the first interview.

4. Structural description

Once the units of expression had all been categorized within the metaphorical structure that illuminated the essential meanings of the described/drawn experience, all the essential categories were linked together and created a reconstructed narrative of the text which I called a structural description of the experience. An excerpt from the beginning of the resulting narrative illustrates the results of this step.

1. Early Experiences

A. Science Fairs

When asked about her earliest experiences in research, B discussed her childhood interest in science and her first formal introduction to research when she was encouraged to enter a science fair in which her project involving paper and pencil testing of other kids won an award. She described how the project taught her about getting data, making correlations, and following the scientific method.

B. College

She proceeded to discuss her psychology major at UCLA, and when asked if her orientation as research or clinical, she described how she learned everything—statistics, experimental psychology, reliability—and although she didn’t participate in faculty research, she was intrigued by the scientific world and its methods. She was especially interested in learning about misinterpretations, how statistics don’t mean anything without understanding how material was collected and about contamination.

C. Art Involvement

When asked if she was doing artwork at the time, she said yes, but described her creativity as disconnected, diametrically opposed to her interest in science. When the idea of two sides to herself was suggested, she spoke about how she separated her rational self from her intuitive self and how she saw herself as a split person.

5. Textural analysis

The next step was to subjectively and creatively describe my own personal understanding of the interview text. In the methodology my creative process was manifest in the embellishment and rewriting of the above-mentioned structural description, a process by which the textural analysis was created.

An excerpt from the beginning of the resulting narrative illustrates how the description of B’s experiences changed as I engaged more creatively with her descriptions. (The words and phrases that are most representative of my own subjective and personally contextual interpretations are italicized.)

`B talked nostalgically about her childhood experiences with the scientific method. As she described her early interest in biology her enthusiasm for her lifelong curiosity was evident. Her early competitive success in a science fair emerged as a significant life experience that catalyzed an interest in scholarship. B described her voracious appetite for knowledge as she began UCLA. Her ongoing yearning to know motivated her sustained interest in the scientific world and in particular her curiosity about methodology and its misapplications and limitations. B defined her early involvement in artwork as separate from her interest in science, in fact representing a facet of herself that was completely split off from her intellectual side. The idea of a large and complicated internal schism emerged.`

6. Structural/Textural integration

The next step involved integrating the structural description (that had been carefully extracted from the analysis of the narrative text in Step 4) with the textural description (that had been a result of my creative and subjective responses to the structural analysis of Step 5). The result was a combination of what was said and what was interpreted which seemed to come close to essential understandings of the experiences that were being explored. An excerpt from the beginning of the resulting narrative illustrates this combination of communication and interpretation.

1 Early Experiences

When asked about her earliest experiences in research, B discussed her childhood interest in science and her first formal introduction to research when she was encouraged to enter a science fair. Her voracious appetite for knowledge emerged as the dominant force in her early life. She discussed her psychology major at UCLA and her sustained interest in the scientific world, particularly the misapplications and limitations of methodologies.

When asked if she was doing artwork at the time, she described her creativity as diametrically opposed to her interest in science and the idea of a large complicated internal schism emerged.
7. Integration of respondents' reactions

In an effort to return to the originators of the description, I submitted all three narrative summaries (structural, textual, and structural/textual) to the respondents and elicited their feedback.

Responding to the interpretive understanding I developed of her statements, B wrote:

*What I think impresses me most and what lends such emotion to what you have produced here is how perceptive (for want of a better word) your observations are and how uncanny (there's a better word) your analysis is, in the sense of having gleaned so much that is fundamental to my life struggles, so neatly and so accurately from a rather short exchange of words on one afternoon...and what is especially touching to me is how obviously you were touched by this entire process.*

Results

The five interviews analyzed in this research discuss the experiences of five art therapists participating in research. During the interview process I offered the respondents no definition of research, no parameters for what research involvement meant, nor any specific guidelines about how to interpret my encouragement to simply discuss their experiences. As a result, the research experience was broadly, subjectively, and quite differently defined by each respondent. In some ways this lack of a concise definition for the very phenomenon I was investigating was problematic in the data analysis process. However, since this endeavor was fundamentally about facilitating open-ended discussion to catalyze understanding, I allowed this definitionless state to exist as fertile ground for the emergence of new understandings of the research experience in the field of art therapy.

It is beyond the scope of this paper to present the detailed data analysis supported by the seven-step protocol. Within the meticulous procedure, exhaustive efforts were made to get as close to the meanings of the texts as possible. One quote from the journal I kept throughout the process illustrates the intensity (both emotional and intellectual) of the procedure. Responding to my own weariness and frustration with the painstaking details of qualitative data analysis, I wrote:

*I am overwhelmed by how intimately connected to (her) language I am. What a privilege to look deeply into another person's meanings. I am exhausted by this meticulous work but feel so close to new kinds of understanding—not only of (her) words but of my own interpretive context as well.*

From the data analysis emerged five art therapists' stories full of life and meaning that can help inform future scholarship in our field. Rather than tell their stories (contained within the original research project), the remainder of this paper focuses on implications. The study questions introduced earlier are used as a framework for the discussion.

1. How do the art therapists' personal backgrounds and training prepare them (or not prepare them) for becoming involved in research?

The interview data suggest that, as in any other facet of life, research involvement is reflective of one's own history. All five respondents thrive or suffer (sometimes both) as researchers because of their personal backgrounds. This connection between early (often familial) attitudes about inquiry and later success as a researcher is a theme throughout all the dialogues.

One of the participants identified how the conflicts between her fami,"'s "male orientation" and her own sense of being process-oriented (i.e., feminine) contribute to her ambivalence about research involvement and, consequently, hinder her whole-hearted participation.

Another who has always seen herself as an artist has always thought that identity prevents her from participating in research of any form. The ambivalence she feels about research involvement hinders her whole-hearted participation. Implicit in these findings is the suggestion that in order to fully engage in the kinds of qualitative research to which art therapists gravitate, the participants must explore and be aware of their own personal history and attitudes about inquiry and epistemology.

2. How does the art therapists' clinical work integrate (or not integrate) with their research interests?

All five respondents in this research process expressed that their interest in scholarly exploration is directly sparked and supported by their contact with clients. Although one respondent initially claimed that her clinical work kept her too busy to consider becoming involved in formal research, as she talked she became aware of many potential exploratory projects that had grown directly out of her work and sparked her interest and enthusiasm.

Another, certainly the most experienced researcher interviewed, clearly articulated the connection between practice and research that all five participants either yearned for or achieved in varying degrees. This sense of scholarship as a natural growth from the art therapists' clinical experiences suggests that research approaches within the field of art therapy must respect and perhaps mirror the ways art therapists come to know their clients.

3. What obstacles to research involvement are experienced by art therapists?

All five respondents originally held the preconceived idea that research in the field needed to be traditional, quantitative, and reductive. This idea seemed to both dominate and discourage the desire to do research and was reinforced by the interconnected idea, also held by all five respondents, that the art process somehow resists the research process.

Thus, this two-pronged belief system appeared to limit all five participants' attitudes and enthusiasm regarding formal research involvement. One expressed her frustration that the art process was too subjective and consequently evaded the legitimacy and validity that "proper" research required. One reflected her ambivalence about trusting the art process as a research method, an issue that was directly related to her difficulty in valuing her own beliefs. Another, who had previously published extensively, described being disarmed and overwhelmed by the male orientation of traditional research and the narrow medical models typically followed by published art therapy research.

4. What supports the art therapists' interest and involvement in research?

The interview data obtained in this research project support the idea, reflected in art therapy literature (Rubin, 1978; Wadeon, 1980), that student and clinician alienation from research could be ameliorated with support, involvement, mentors, and broader definitions of research. All five respondents
discussed different kinds of supportive experiences they had in the past that had helped them engage in research. One explained how early relationships with research had facilitated her scholarly interest, and another emphasized the importance of the support she received from other women as well as the opportunity to learn about nontraditional models of research. She also alluded to the importance of integrating art processes with research experience.

Overall, the interviews indicate that involvement with mentors, group support, and awareness of a broader spectrum of research approaches could do much to minimize the kinds of resistance to research seen in these particular art therapists.

Summary of Findings/Understandings and Meanings
