ABSTRACT

This journal focuses on art therapy from research, clinical, and educational perspectives. Current issues arrange information under six categories: editorial; commentaries; articles; brief reports; viewpoints; and reviews of books and videotapes. While most articles are not education-related, each issue generally contains some material relevant to education, e.g., exceptional children; art therapy training; art therapy faculty; Diagnostic Drawing Series for children, etc. (IA)

ART THERAPY
Journal of the American Art Therapy Association
Volume 1, Number 1, 1983 — Volume 13, Number 4, 1996

(Complete Set)
Volume 1, Number 1          October, 1983

• In Memoriam: Margaret Naumburg (1890–1983)

• Paul-Max Simon: The Father of Art and Psychiatry  
  John Monroe MacGregor, PhD

• An Art Therapist’s Personal Record  
  Don Jones, ATR

• A Critical Analysis of A Review of the Published  
  Research Literature in Arts for the Handicapped:  
  Frances Anderson, EdD, ATR

• Identifying Gifted Handicapped Children Through  
  Their Drawings  
  Rawley Silver, EdD, ATR

• Making Verbal the Nonverbal  
  Mildred Lachman-Chapin, MEd, ATR
ACKNOWLEDGMENTS

Much appreciation is expressed toward the members of the AATA Journal Planning Committee, who made this premier issue possible. We are grateful to Vija Lusebrink, ATR, Harriet Wadeson, PhD, ATR, Sandra Packard, EdD, ATR, and Anita DeVivo, who served on the selection committee for ART THERAPY. Ms. DeVivo was also a consultant for the new journal. Particular thanks is due to Steve Trigonoplos, Director of Press and Communications, American Association for Counseling and Development, who offered his guidance throughout the process, and Debra Bass, who served as production editor. Finally, we appreciate the hard work done by Scott Stoner, ATR, AATA Executive Director, and AATA staff, who supervised the production of our premier issue.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in theory, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

Volume 1, Number 1 October, 1983

The inaugural issue of ART THERAPY provides us the opportunity, as do all new ventures, to take a Janusian look at our endeavors, to see where we have come from and to predict where we will go. It is therefore fitting that the focus of this issue may be broadly described as being on art therapy literature, past and present. Some of these articles remind us of our beginnings or acquaint us with forgotten or unknown predecessors; others look at contemporary problems and issues. Taken together, they help us to see the launching of this journal in suitable perspective.

It seems ironic that the woman whom most art therapists consider to be the founder of the field died as this issue was in the process of a hard labor and delivery. Through her courses and writings, Margaret Naumburg influenced virtually all art therapists practicing today. That she had an earlier career as an innovative and influential founder and Director of the Walden School is not known by many who read her books in art therapy, yet she considered the philosophy she developed as an educator to be the foundation of her later work.

It was the publication of Naumburg’s detailed case studies that marked the 1940s as the beginning of art therapy as a distinct field. Yet, fully 60 years before, Paul–Max Simon, a French psychiatrist and an artist laid the groundwork for systematic studies in art and psychiatry. Dr. MacGregor’s careful scholarship introduces us to this important historical figure whose work may serve as a model for present investigations.

Naumburg, although far away and the best known writer on our subject, was by no means the only one exploring the therapeutic possibilities of art in the 1940s. During that period, there was an almost simultaneous but separate development of the three principle branches of art therapy—in education, in rehabilitation, and in psychotherapy. Viktor Lowenfeld, an Austrian immigrant, brought to this country a heritage of European ideas about the importance of children’s art. Apparently independent of Naumburg’s work, was that of Adrian Hill, an Englishman who published two slim volumes on art therapy with tuberculosis patients. Hill was a professional artist whose own bout with that disease gave him the idea of “painting out illness.” Hill, Lowenfeld, and Naumburg were relatively well-known, each one devoting considerable time to lecturing and teaching. The same forces that affected these writers must have influenced unconfessed others who, without benefit of specialized training or particular theory, were already working in a variety of hospitals and institutions. A few such individuals did write about their programs and patients but those articles were generally of an introductory nature and were scattered in a variety of professional journals.

Undoubtedly, Don Jones’s experience was similar to that of others who came to the notion of art therapy on their own and who practiced in isolation until the publication of the Bulletin of Art Therapy (as the American Journal of Art Therapy was first named) provided a rallying point. Mr. Jones’s sensitive paintings give us a glimpse of that lonely existence in the institutional world of 40 years ago, a world about which most of us have only read. The art work provides a document in the broadest sense—a record of experience as permanent as that supplied by any written narrative.

The other papers in this issue deal with more current issues. The article by Dr. Anderson reviews a decade of published research literature on the visual arts and the handicapped. He discusses the flaws in the studies and suggests suitable remedies. Her article reflects a contemporary pressure placed on us from those outside art therapy and art education—to conduct empirical research that can back up our theoretical claims. Dr. Silver’s article, like much of her previous published work, delves into a territory that is still rather new for art therapists. She gives us a model for future studies—to branch out and to investigate those areas in which the use of art is still relatively unexplored. The commentary by Associate Editor Mildred Lachman-Chapin raises some philosophical and methodological questions. How do we say what we do? Practicing a “nonverbal” craft in no way exempts us from having to talk and write about what we do and how we do it in clear and well-considered presentations.

Thirty years ago in an article on “The Arts as Applied Psychotherapy” Ernst Harms deplored the state of the literature and criticized the all-too-common “reports of individual experiences which are sometimes more sentimental than factual, outlets of needs and urgent demands, and even rather insincere and dubious journalistic elaborations and presentations with absolutely no meaning or possibility of application to the sphere of concrete work with mental abnormality” (Harms, 1944, p. 51). How would we answer Harms today? How far have we come in the intervening time? What is the state of art therapy literature? What accomplishments can we claim? Most importantly, what is our mandate for the immediate future?

Our intellectual and philosophical history is a longer one than many art therapists suspect. We must
chronicle that history, gather more information on our roots, evaluate our borrowings from neighboring fields. We must re-examine the ideas passed on to us from the early writers, test them, and, if necessary, discard them in favor of more cogent explanations. The case study, the staple of our literature to this point, needs to be buttressed by empirical research and more relevant theory. Now is the time to evaluate the art therapy literature with the clear objective of weeding out useless and simplistic ideas, developing a more precise vocabulary, and countering our critics’ charges.

The 1980s will be a critical period in our profession’s development. We will be forced to show how art therapy is both distinct from and similar to allied fields, for on such distinctions rests our future, our training programs, our positions, and our prestige.

Harms prescribed an antidote for the problems he perceived in the early literature: “The progress in any scientific endeavor depends upon the collection of data in its proper combination, thoughtfully coordinated and systematized. . . . All three activities have to go hand in hand and must be checked and double-checked and upon the advancement of one depends the advancement of the other” (Harms, p. 51–52). Application of the scientific method to human endeavors, however, is not without its own problems. With respect to empirical research our literature has lagged behind that of most therapeutic disciplines. We may make the most of this lag, however, by profiting from other’s discoveries of the limits (as well as the benefits) of the scientific method.

Our Janusian look must not be reserved for the beginning of new projects but must be our customary stance as we take stock of our successes and failures, always with an eye to improving the published literature, the foundation of our field.

GUIDELINES FOR AUTHORS: Please submit four (4) copies of manuscripts to: AATA Journal, 5999 Stevenson Ave., Alexandria, VA 22304. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8 1/2 x 11 inch bond paper, with at least 1 1/2 inch margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100–125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5 x 7 black-and-white, glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

Citations for journal articles should include author(s), journal name in full, date of publication, volume number, issue number and inclusive pages.

Citations for books should include author(s), title, city of publication, publisher’s name and publication date.

For each reference, the surname of the author and the year of publication must be cited in the text. For quotations, include page numbers.

Examples: Smith (1980) made a study . . .

In a study on children’s art (Smith, 1980) . . .

According to an article on children’s art (Smith, 1980, pp. 107-118) . . .

Manuscripts are welcome at any time.

October 1983, ART THERAPY 3
DAYENU: A Tribute to Margaret Naumburg

Judith A. Rubin, PhD, HLM, ATR
Past president
AATA

Judith A. Rubin, PhD, HLM, ATR, is an Assistant Professor in the Department of Psychiatry at the University of Pittsburgh, and is the Co-Director of the Creative and Expressive Arts Therapy Program, Western Psychiatric Institute and Clinic, Pittsburgh, PA.

There is a song usually sung during the Passover seder, in which Jews express their gratitude as a people for the many wonderful things done by the Lord on their behalf. After recounting each marvelous act, we chant “Dayenu!” (“It would have been enough!”). If God had done only this one thing, it would have been sufficient to merit our eternal praise and thanks. When I was asked to write something about Margaret Naumburg, the word Dayenu soon came to mind. The more I thought about it, the more I realized how very apt it was—as a description of the enormity of her contributions to the field of art therapy, and as a reminder of the gratitude and respect we shall always owe to her memory.

Had she done nothing more than to found the Walden School (1914), a place where freedom and discipline in all of the arts were fostered and were considered central to normal children's healthy development, that would have placed her among other significant educators who recognized and promoted the broadly therapeutic potential of the arts. Dayenu! She went on, however, building on her own broad study of psychoanalysis, psychology, education, philosophy, and other disciplines; she seized the opportunity offered by Dr. Nolan D. C. Lewis to try out the therapeutic potential of art with child patients at the New York State Psychiatric Institute. And she didn't just do that; she also wrote a series of descriptive books, often providing food and drink as well as support and direction. Because I now find myself receiving frequent requests for such guidance, I marvel even more at the willingness of Margaret Naumburg to play a nurturing role with so many aspiring art therapists. It is well known that she and thoughtful case studies, publishing them in a variety of journals, and finally collecting ... in a single book (1947). Dayenu!

But that was only the beginning. She continued her research into the use of art in therapy with other populations, first with schizophrenics (1950), then with neurotics (1953). Each time, she published book-length case studies, along with her developing theories about art therapy. Being the scholar she was, she also included chapters that put her work into perspective against that of others, educating her readers about the multiple roots and manifold possibilities of art therapy. One such book would have made her a pioneer in our field; two would have been sufficient to establish her reputation; three would have been a most generous contribution. But Margaret Naumburg, at an age when most people start winding down, went on to write a fourth book, in which she tried to define for herself and for others the nature of what she called “dynamically-oriented art therapy” (1966). As in her earlier volumes, she included material on history and relationships with other disciplines, as well as beautifully written and vividly illustrated case studies. Dayenu!

Had she done nothing more than to write these four books (the first three for a while the only books on art therapy in this country), that would have been enough. But she was also extremely generous—nurturing individuals in the era before formal art therapy training programs, giving sound and supportive guidance about relevant readings, courses, supervision, and psychotherapy experience. She gave freely of her time, which I am sure was much in demand by the time I met her (1963); and was, in addition, most hospitable—could be difficult, demanding, and temperamental; I hope it is equally well known that she could be warm, caring, and giving. Dayenu!

She went beyond training individuals, many of whom came to her for
supervision from far as well as near. She also initiated what may have been the first formal university courses in art therapy, in the Psychology Department at New York University and later at the New School for Social Research. She was, in addition, a tireless crusader on behalf of this new discipline that she had helped to create. She gave lectures and short courses all over this country and across the seas, eager to spread the word about this idea in which she believed most passionately. It may never be possible to enumerate those individual art therapists whose careers were strongly shaped by her writings, courses, or personal contact. Similarly, it may not ever be possible to know how many institutions offering courses or training programs in art therapy were first alerted to its potential by this articulate traveling salesperson. Dayenu!

I am certain no one ever questioned that she should be the recipient of the first Honorary Life Membership Award of the American Art Therapy Association, presented at its first meeting. I remember her talk that year, a sharply reasoned and eloquent plea for art therapists to be trained, like other clinicians, in sound principles and techniques of interviewing. She always was concerned with improving the quality of work done in the field, never content to rest on her laurels. Through her writing and teaching Margaret Naumburg provided a model of excellence in a field that could easily be diluted by mediocrity and superficiality. Her own standards were very high, her thinking deep and complex, and her contributions to the “peoples” of art therapy worthy of many Dayenus. We should feel the deepest admiration, respect, and gratitude for a woman we can proudly call “the mother of us all.”

The Legacy of Margaret Naumburg

Patricia Buoye Allen, MA, ATR

Patricia Buoye Allen, MA, ATR, is an Assistant Professor in the Art Therapy Graduate Program at the University of Illinois at Chicago and is in private practice.

There is an enormous temptation, upon the death of someone as venerable as Margaret Naumburg, to idealize her and to focus only on her tangible achievements and contributions. Such an idealization seems analogous to erecting a monument in stone: a certain aspect is caught and frozen, larger than life, to serve as a continuing inspiration for the survivors. Yet, when I reflect on my relationship with Margaret, I am intrigued less by her greatness than by the richly complex and contradictory aspects of her human nature.

I came to know Margaret in Boston where she lived in the early seventies, ostensibly in retirement. She became my teacher and a great deal more. I was her disciple, supplicant, and companion for several years.

Traditional boundaries of student and teacher did not apply. We might drive to the ocean or shop for clothes as often as we discussed art therapy. The living room of Margaret’s small Brookline apartment, stacked with books and papers that she never found room for, was as familiar to me as my own.

Margaret’s interests were wide-ranging. She fostered in me the view that all disciplines, whether artistic or scientific, traditional or esoteric, have the potential to contribute to one’s own discipline. Although we identify her as the original art psychotherapist, to her art therapy was not a narrow offshoot of psychoanalytic psychotherapy. Rather, it was the practice of understanding human nature by employing a fruitful conjunction of the psychological, historical, spiritual, cultural, and artistic aspects of human experience.

Although her name is synonymous with dynamically-oriented art therapy, Margaret’s approach was actually quite eclectic. She underwent Jungian analysis in addition to psychoanalysis during her career and was most attuned to the universal archetypal layer of symbolism. Her knowledge of world culture, art history, and of religion, especially Eastern religion, was considerable. At a certain point, when I was undergoing considerable stress due to the concurrent demands of school and work, Margaret suggested that I attempt meditation at the Buddhist Temple in Cambridge. She correctly assessed my need for centering and greater
inner focus that was answered by the discipline of meditation.

Margaret was also interested in the potential relationship between biofeedback studies and art therapy. It was a source of great pain and disappointment to her that, due to her age, research opportunities at the local universities were not available to her.

Another area in which Margaret was quite knowledgeable was psychic research. She believed implicitly in the existence of psychic phenomena. In fact once, when I left Boston somewhat suddenly to take a position assisting in a research project in Washington, D.C., Margaret consulted a psychic friend of hers about this development. She later told me that she knew I would return soon and indeed I did so in order to take my first job in art therapy in a summer program for disturbed children.

Margaret introduced me to a process of self-exploration that she considered vital to an art therapist’s development. It involved a commitment to using one’s own art for self-understanding, following a sequence of steps. After I had completed a free painting or scribble drawing, she instructed me to write in a looseleaf notebook any thoughts, feelings, or associations that came to mind. These included both the personal and the universal aspects of symbolism. The page was folded in half length-wise and the large margin reserved for later associations and insights. I have continued this process, although sporadically, for 10 years. It is an invaluable aid both to my art therapy work and to my personal growth.

Margaret was my mentor in the truest sense. Her participation in my life was the major influence at the formative time when I began my career. Her support and belief in me, as well as her teaching and emphasis on personal and professional discipline, have been the foundation of my development as an art therapist. Yet, as with any mentor, there are contradictions. For all of Margaret’s vast knowledge and creativity, her serendipitous openness to ideas did not extend to people. She had few kind words for any other practitioners of art therapy. In fact, she advised me to focus my energies on my work rather than on personal relationships with others, which she felt would inevitably be disappointing.

It has always seemed highly paradoxical to me that a woman with the extraordinary insight into human behavior that Margaret showed in her clinical skills and writings would be so adamant about the dismal potential for human relationships. Perhaps this was the result of attitudes that she encountered in the era in which she herself lived as a determined, intelligent, professional woman struggling to create a new discipline and to gain recognition.

I shall never know with certainty the reasons for Margaret’s advice to me not to bother with relationships, although I felt the echo of past pain in her words. For her and for all of us, the exclusive focus of her will and energy on her work produced the seminal writings and principles of art therapy. It seems a bittersweet legacy, containing within it not only the gift of art therapy but also the seeds for thought about the personal sacrifices women have often made in the process of contributing their knowledge and insight to society.

Paul-Max Simon: The Father of Art and Psychiatry

John Monroe MacGregor, PhD

John Monroe MacGregor, PhD, is a lecturer in the psychology of art, Ontario College of Art, Toronto. This article will appear as a chapter in Dr. MacGregor's forthcoming book, The Discovery of the Art of the Insane.

The enormous productivity of Cesare Lombroso, the range of his interests and knowledge, as well his contribution to criminology and anthropology, have led to a temporary overestimation of his achievement in the investigation of the pictorial productions of the mentally ill. His fame and notoriety—even in his own day—have obscured the fact that the first psychiatrist to undertake a serious and extensive survey of the drawings and paintings of the insane was a little-known French alienist, Dr. Paul-Max Simon. Simon’s contribution is to be found in two articles: “L’Imagination dans la folie” (1876), and “Les Écrits et les dessins des aliénés” (1888).1

This article, devoted to Dr. Simon and his work, corrects the erroneous belief that Lombroso’s investigations preceded those of Simon, and attempts to establish Simon’s right to the title, Father of the Study of Psychiatry and Art.

It might have been preferable to examine Lombroso’s work prior to a discussion of that of Simon, simply because the unusual nature of Simon’s achievement is best understood against the background of the Romantic conception of genius and in contrast to the later and more simplistic views of Lombroso. The persistence of Lombroso’s perverted conception of genius, as well as his generalizations about “insane art,” continue to prejudice the reader of psychiatric and psychological investigations of art to this very day. It remains necessary to perpetually sly the Lombrosian dragon before beginning any serious discussion of the art of the mentally ill.

Simon’s Contemporaries

The few existing references to the origins of this field of investigation have described Lombroso as the innovator who first studied the art of the insane. This error resulted from a failure to recognize the date of Lombroso’s earliest publications dealing with the art of the hospital-ized insane. For this article it is important to establish the year in which Lombroso first published the chapter on the art of the insane, entitled “L’arte nei pazzi,” which forms part of his book Man of Genius.

Man of Genius first appeared in 1864 in a far shorter version and with a different title, Genio e follia. This essay appeared again in 1872 and 1877. Then, in 1882, a fourth edition appeared, much enlarged, and bearing the new title, L’uomo di genio (Man of Genius). The crucial chapter on art of the insane was a new addition to this revised edition. It was included because in 1880 Lombroso had published, with Maxime du Camp, an article entitled “L’arte nei pazzi” in the periodical, Archivio di psichiatria e scienze penali (Lombroso & du Camp, 1880). It was this article that was then added to the revised fourth edition of L’uomo di genio. As a result, Lombroso’s work with the pictorial productions of psychotic patients, usually understood as beginning in 1864, actually began in or around 1880, some 4 years after the publication of Simon’s pioneering article, “L’Imagination dans la folie” (1876).

Simon’s only significant predecessor is now seen to be the physician, Ambròise-Auguste Tardieu (1818–1879), who had published a brief discussion of the work of two patients in 1872. The uniqueness of Tardieu’s early contribution is established by the fact that a patient’s drawing was reproduced in a psychiatric publication accompanied by the patient’s explanation of its meaning, and, perhaps more importantly, by a detailed de-

---

1 “L’Imagination dans la folie: Etude sur les dessins, plans, descriptions, et costumes des aliénés,” was published in Annales médico-psychologiques in 1876. No reproductions of the works discussed accompanied the text. “Les Écrits et les dessins des aliénés” was published 12 years later in Archivio di antropologia criminelle, psichiatrica e medicina legale in 1888. This article included a lengthy discussion of the writings of the mentally ill, both in terms of graphological analysis and content. The discussion of drawings was essentially identical to that of 1876, except that several new cases had been added, a new section on “délire érotique” was included, as well as a discussion of a number of prominent artists who had become insane. The text was now illustrated. All quotations from Simon’s writing are from the article of 1876 unless otherwise indicated.
No matter how hard you may try to imagine fantastic and impossible things, or the most bizarre images, you will never succeed in conceiving of the type of insane image which presents itself on canvas at the hand of a madman. Those nightmare creations which make you dizzy (Tardieu, 1872, p. 94).

Tardieu's interest in patient art and his overly dramatic view of the material was seemingly inspired by his encounter with a patient whose work he followed over a long period of time. His regrettable brief reference to the work of this individual is important because it represents the first effort to describe the style and subject matter of drawings and paintings in the context of a specific case. He wrote:

For many years I have been able to observe a patient who though he had no talent whatever, spent all of his life in painting. I have seen more than five hundred of these pictures, some of quite large size. They reveal the wildest associations of color, green or scarlet faces, unusual proportions, yellow skies, extravagant effects of light, monstrous beings, fantastic animals, senseless landscapes, unrecognizable architecture, infernal flames; all expressing through unique forms, dreams of the most indescribable nature (ibid).

It is evident that these powerful images produced in such large quantity by a single artist molded Tardieu's conception of the artistic productions of the mentally ill. What would we not give to have those 500 paintings today! His description of them seems to range over much of the art of the 20th century, calling to mind the creations of one major artist after another. The work of this anonymous patient inevitably awakens thoughts of the Fauves, of Gauguin, van Gogh, and of the Surrealists, all of whom were so soon to trouble the sleep of French art and to make the critics "dizzy." Was this patient who spent his life at the easel perhaps another Rousseau? We will never know; no reproduction of his work was provided in Tardieu's text and his name was never mentioned.

Before condemning Tardieu for lack of perception or sensitivity, it is essential to remember the prevailing aesthetic criterion of his day with its insistence on a rather restricted naturalism. The experience of the Impressionists, whose first exhibition was to open 2 years later in 1874, indicates how conservative even the most advanced critical opinion was. They too were labeled insane and their art degenerate. Tardieu lacked tolerance for distortion in the service of expression, a tolerance that we have only developed as a result of inno-

The first report of the production of a drawing made "under the eyes" of a physician was made by Simon.
suggested, for example, that the majority of patients display a preference for erotic or obscene subject matter, a generalization that was later challenged by Paul-Max Simon.

It is Dr. Tardieu’s second case that is of unique importance to us. He reproduced, without comment, a drawing made by one of his patients (Figure 1, Tardieu, 1872). Although he took the unusual step of including the patient’s explanation of his own drawing, not because he felt the patient’s description was of significance in understanding his behavior, but because the written description confirmed his own diagnosis. We are brought closer to the reality of the individual who produced the drawing, and we are able to sense the intensity of the needs that forced him to go on drawing to the point of exhaustion. He describes his work as the result of divine guidance, an example of automatic drawing analogous to the more familiar phenomenon of automatic or mediumistic writing. The artist’s description is presented below:

The Soul of The Earth

On several occasions during the last three weeks I have put pen to paper at God’s disposal. He guided it in producing the drawing of which an example is here provided. It is in this way that I was able to perceive the aromas. Because the aromalized magnetism of Mrs. H. is a compound which does not occur on Earth, except in her organization and my own, the Soul of the Earth could not induce the fluids to leave her head, except by directing them towards me. Also, in order to deceive them, it was necessary to draw Octavie’s head on the paper, signaling them to approach. (These instruments of a super-human mentality are almost thinking beings.) In truth, this rough portrait sketch was completed on the left side by a sphere which quickly repelled them. The Soul of the Earth caused me to follow their movements with my pen on the paper, and the electricity of the ink absorbed the fluids which had already been more or less completely denatured. If you examine the drawing which our ray-god-of-souls himself traced upon the wood, you will see that the feminine aroma is still recognizable in the several jets which emerge from Octavie’s head and breast. Each of these ring-like forms represents, more or less exactly, ten fingers of a ray-god-of-souls; this however, is no longer the superior feminine aroma, as it issued, all jagged, from our speaking trumpet. Those fluids which are neither utilized nor neutralized decompose. Almost all those which emanate from Octavie’s head in the engraving, retain nothing of the aroma referred to as feminine, but the straight line corresponding to ‘s sudden escape after six groups of tight convolutions, at which point it is functioning normally. The others obviously aspire to the coiling up of the neutral electricity. These latter were obscured in my drawing. As for the others, still alive, I was often obliged to follow their movements with my arm even beyond the edge of my table. I directed them, following the instructions of the Soul of the Earth, towards the fire in the chimney, a hearth of energy where they disappeared. The best preserved of all the aromas, among those which I have included in my drawing, is the aromalized magnetism, a shower of leaping crescent forms. They originate from the reduction to which my wife’s spiral had to submit in order that the lid would remain on her head.

This aroma, of exceptional strength, was the most trying for me to follow. The engraving included in this book reproduces one of the least intense aroma therapy sessions. It has happened on occasion that in carrying out this exercise, the piece of paper has been entirely covered with ink, and has been torn to pieces beneath my pen, leaving my arm totally exhausted (Tardieu, 1872, pp. 101-103).

This lengthy and complicated description by a severely disturbed patient of the creative process involved in the making of his drawings is one of the most interesting documents in the study of spontaneous or automatic expression in the 19th century. Curiously, no later references to it occur in the literature of the period. The drawing consists of a variety of elegant curved, zig-zag, straight, and convoluted lines proceeding from the head and breast of a female figure designated by the patient as “Octavie.” These calligraphic lines are explained as representations of different kinds of aroma, or possibly of magnetic currents; the term used is magnetisme aromaliste. Executed at the bidding of a super-human being, “the Soul of the Earth,” the drawing seems to have had the function of influencing or attracting the magnetic odors. In this respect, the act of drawing can be seen

Footnote: The translation presented considerable difficulty in determining which of a number of possible meanings the patient may have intended for many of the words.
to have had a magical purpose. Despite the occasional obscurity of the passage, one senses an effort on the patient's part to account for his activity in a coherent fashion. His experience of intensely felt external compulsion suggests the reality of the forces that prompted him to draw. His efforts to describe what was happening to him may imply that he was concerned to make contact with the people around him.

Again and again these artists, dismissed as mindless, tried to explain the significance of their work and the inner promptings that led to the creations. The failure of physicians such as Tardieu to take these explanations into account explains the long delay in attaining even a minimal degree of insight into the relationship between the life experience of these individuals and the graphic productions they inspired. For much of the 19th century the most valuable writing about the image-making activity of the insane was that done by the patients themselves, although the importance of this readily available material went unrecognized and, for the most part, unpublished. The contribution of intelligent patients to the understanding of psychotic expression was to provide the most promising source of insight, once investigators found the courage to listen. But the psychiatric stance of physicians in the latter half of the 19th century stood in the way of understanding, or even of truly seeing or listening. Although burdened with this "scientific" point of view, Paul-Max Simon nevertheless was to achieve far more than his predecessor, Tardieu, in his systematic attempt to understand the art of the insane.

Simon's Background and Training

Paul-Max Simon, Médecin adjoint at the asylum of Blois, and later Director of the Asylum of Bron, is a figure about whom little is known. (A complete Simon bibliography can be found in the catalogue of the Bibliothèque Nationale Paris, 173:275-279.) His studies of the art and literature of the insane convey the impression of an original, highly organized and sensitive mind able to function in new and rather chaotic territory.

His involvement with the art and literature of his patients was the outcome of his curiously old-fashioned medical ideals, combined with a scientific orientation that was surprisingly forward-looking. Although it would be erroneous to assume that all 19th century alienists emerged from the same mold, it is important to obtain some insight into the self-image of a physician whose clinical interests were as unconventional as Simon's.

Simon's identity as a doctor was constructed around his idealized image of the physician as a "médecin-gentleman." Thoroughly trained in his chosen calling, this physician "worthy of the name" was to be an "homme du monde."

A man of the world, and of the best society, a refined spirit, appreciative of things artistic and literary, whichever suits him. In sum, a person of superior nature, and of inherent distinction, subtle, but with the large heart and ardent faith of a true Christian (Simon, 1893, p. 202).

Simon's insistence that his ideal physician be "a man of letters" derived from his own extensive involvement with literature. An artist himself, Simon was less inclined to associate creativity with pathology. Between 1864 and 1903, Simon published a series of novels, short stories, and literary investigations that drew upon his experience as a physician working with the mentally ill. One might almost speak of a second career, or, were his varied abilities not so well integrated, of a split personality. Unusual even among men of letters in France at this time, Simon had an extensive acquaintance with English and American literature, publishing a number of critical studies in this area. The most important of these, his book on Jonathan Swift, is subtitled "A psychological and literary study" (Simon, 1893). His discussion of Swift's life and work, based on a surprisingly detailed knowledge of the critical and biographical literature, is exceptional in presenting a generous and human picture of Swift, free from any of the weaknesses of pathographic investigation. Despite the fact that Swift died insane, Simon insists on the absolute sanity of his writings, and on the mental stability of the man until the final years of his life. Having arrived at a tentative diagnosis of Swift's condition as epilepsy, possibly complicated by Menière's Disease, Simon (1893) concluded:

The intellectual value of such men is neither denied, nor even contested, and I repeat, the disease from which they suffer [epilepsy] in no way prevents them from accomplishing their work. None of them was as a result of it either less wise as a politician, less of a genius as a tactician, or a less great writer (p. 104).

The distance between this point of view and that expressed on every page of Lombroso is infinitely great. Simon's goal was "to portray the man as a living personality," and not in terms of a literary ideal or of a stereotyped and romanticized conception of artistic genius.

Simon's memoirs, Temps passe: journal sans date (1895), provide a detailed account of his friendships with prominent writers of the day. If Lombroso's contribution was marred by the distorted influence of Romanticism, Simon's was undoubtedly enhanced if not engendered by his involvement with Realism as a mode of perception. One of Simon's friends was the writer Gustave Flaubert (1821-1880). When as a young man Simon told Flaubert of his decision to become a doctor, Flaubert was furious. He was only reconciled to the idea when Simon explained that his
intention was "... to become physician to an asylum in order to have at my disposal the numerous scientific facts which are readily available in a vast institution for the insane ..." (Simon, 1895, p. 11). It is clear that Simon's style as a writer, as well as his clinical outlook, was influenced by Flaubert's obsession with objective observation. Writing of his friend many years later, Simon described his attitude toward the task of the writer:

An essential characteristic of the writer, particularly of the novelist was, according to Flaubert, impersonality. The novelist must see things from afar, hovering above it all, exposing no cause as his own, affiliated with no theory or point of view: observation, artistic truth, and nothing more (p. 14).

This is precisely the attitude at work in Simon's case histories, in his objective descriptions of his patients' fantasies or artistic productions.

Simon's Philosophical Position

Simon's attitude toward genius is a further expression of the Realist position. His goal in writing his memoirs was to function as "a simple spectator." Describing his many encounters with men of unusual ability, at times approaching "genius," he never succumbed to destructive ness or petty gossip. He deliberately avoided psychological speculation about genius, and looked upon the activity of pathographers with distaste:

I am always astonished by the relentless eagerness with which they pursue men of genius. It seems that they feel a personal hatred for them; the revenge of the mediocrity of the eternally envious crowd. This is still more odious and despisable because, although geniuses assuredly suffer from all the weaknesses of other men, most of them are kind, generous, and charitable, to the point of self injury (1895, p. 29).

Without mentioning the name of Lombroso he criticizes his approach. "In recent years, an effort has been made to see genius, and even talent, as a derivative of insanity. As proof of this position they refer to the originality of the majority of great men. Is this convincing? No" (p. 36). In opposition to the imaginative inventions of pathography, Simon was devoted to the scientific method, and to accurate observation. He speaks in his memoirs of the danger of:

... wanting to leave the circle of direct observation in order to throw oneself into the unbounded fields of speculation; of wanting to include everything in an overall view of the whole, and of thereby losing one's way; believing oneself to be standing on the solid ground of experimental philosophy so precisely defined by Newton, and of venturing, all unknowing, into the territory of pure metaphysics (1895, p. 29).

Simon's accomplishment resided in his ability to limit himself to the role of observer. It was not given to him to go further.

Although the existence of spontaneously produced drawings and paintings by mental patients had often been commented upon throughout the 19th century, it was Simon who recognized their unique importance, and who first developed systematic methods of studying them. The originality and difficulty of this step cannot be overemphasized. It is one thing for a physician to mention that his patient is indulging in a symptom of one sort or another, to characterize this form of behavior as bizarre or "insane," and then to pass on, unaware that this activity might possess a significance of its own, or that a closer examination of it might even provide a key to the deeper understanding of the human mind. To go further demands a tolerance of chaos, an ability to co-exist with deep and pervasive irrationality, and to "listen" attentively to words and images that by their very nature can at times inspire fear and even revulsion. It is no small matter to take as an object of study a subject traditionally seen as unworthy of attention, or as the insignificant and meaningless product of a sick mind. Simon's achievement lies in his decision to enter into this chaos and to begin the task of imposing order.

Two sources motivated him in his decision to proceed with such an undertaking, and provided him with his methodology. Studies of the literary productions of the mentally ill, and graphological investigation of the links between handwriting and personality had awakened his interest in the possibility of utilizing a similar approach to both the content and the formal aspects of so-called insane art.

The primary task that Simon set for himself was to attempt to describe and classify the drawings in his collection in terms of the standard nosological groupings in use at the time, making extensive and careful use of case material to illustrate and confirm the observations. This preoccupation with classification and diagnosis can be seen as a logical extension of the systematic effort to describe and classify all types of symptomatic behavior and ideas that characterized much of 18th and 19th century French psychiatry. It should be remembered that our discussion of the origins of the psychiatric study of art in the 19th century is concerned, for the most part, with what Henri F. Ellenberger has termed official or non-dynamic psychiatry. In his brilliant book, Ellenberger (1970) traced the early development of a whole new school of French psychiatry that undeniably represented the path into the future. It is significant that the men who made the earliest contributions to the investigation of

---

Simon had discovered that these random scralls were in fact a language.

---

3 Well before Freud had made such studies acceptable, Simon published a book entitled Le Monde de rêves (1882). Having decided, as a result of his studies in art and psychiatry, that hallucinations were a significant factor motivating the artistic productions of his patients, he proceeded to investigations of both auditory and visual hallucinations: Les Invisibles et les voix (1880) and Sur l'hallucination visuelle (1880).
the psychopathology of art did not belong to this promising psychiatric underground. As we will see, the preoccupation of official or neurological psychiatry was less with the development of methods of therapy or cure, and more involved with the systematic description of disease entities. On the other hand, it is this attachment to objective description and classification that distinguishes Simon and separates him from scholars such as Lombroso, whose manipulation of facts betrays a deep fear and hatred of genius, as well as a need to keep the insane as far from himself as was necessary to avoid any possibility of contamination. This was the ultimate purpose of the concept of degeneracy. Lombroso’s orientation was derived from the Romantic attitude to genius and to insanity. But his conception of genius as a form of psychosis interfered profoundly with his examination of the visual images produced by his patients.

Simon was surprisingly free of the Romantic preconceptions that were to hinder Lombroso. He was under no obligation to glorify the pictures that he collected in the hospitals in which he worked as the creations of genius. He never used the word art in referring to the drawings or paintings of the mentally ill that were available to him, and, in fact, he constantly refers to their lack of artistic significance. It is to his credit that he sought to investigate the expressive activity of his patients in the absence of any belief in their artistic ability. In this respect, as in so many others, he reveals the objectivity of the scientific observer. Although it is doubtful that his interest in the drawings of these people was motivated by any therapeutic considerations beyond diagnosis, his approach to the drawings represents the beginning of a method of investigation still utilized today. His conviction that drawings betray characteristic features that can be used as a means of psychiatric diagnosis remains one of the essential assumptions implicit in modern diagnostic techniques that utilize drawings—the Draw-A-Person Test, the House-Tree-Person Test, and the Draw-Your-Family Test.

One of the most extraordinary features of Simon’s research was his insistence on discussing not only the paintings and drawings of the patients, but also the improvised costumes they wore. He even carried his study into the patients’ inner world, collecting and describing imaginary visual experiences reported by his patients, visions and hallucinations that he understood as the basis for many of the pictures they produced. Simon was aware that there was a common source underlying all of the patient’s imaginative creations. The lengthy presentation of “verbal descriptions,” what he referred to as “artistic conceptions not embodied in drawings,” indicates his belief that these purely mental images are the origin of the less complex, but more concrete, costumes and pictures. Simon was the first to convincingly establish a connection between the ideas and delusions of the patient and the graphic productions that attempted to serve as the externalized expression of those ideas. The patient was now seen as attempting to communicate, a discovery that gave a new significance to the “random scribbles” of the insane.

The recognition of the element of communication as an aspect of the patient’s image-making activity may have come about as a result of Simon’s involvement in the creative process as an observer. The first report of the production of a drawing made “under the eyes” of a physician was made by Simon! It survives in a note that accompanied a set of drawings sent by Simon to Lombroso. The drawings, which Simon refers to as “Arabesques,” were done by a 26-year-old patient in the Asylum of Vaucluse suffering from what Simon describes as “folie circulaire” (manic-depressive psychosis). Simon describes how he watched the patient for 10 minutes, during which the two drawings were produced.

Simon’s Findings

There is little to be gained today from an examination of Simon’s various nosological classifications and the type of drawing he associated with each. Changes in psychiatric terminology and in the conception of the various disease entities have consigned the majority of Simon’s conclusions to the realm of purely historical interest. Simon added nothing new in the way of diagnostic categories. Following the standard system of classification of his day, he discussed the drawings under the following headings: Lypemania, distinguishing four sub-varieties—lypemania generalis, aiguë, stupides, anxiouë; manie chronique; megalomania; paralyse generale; demense; les imbeciles; and in 1888, delire erotique. His method of approach, however, and his general attitude to the drawings were eventually to influence later workers and are therefore of considerable importance in reconstructing the first efforts to explore the graphic productions of the mentally ill. For the purpose of discussing Simon’s methodology, we will confine ourselves to an examination of his conclusions in regard to the drawings of patients suffering from delusions of persecution and manie chronique, a continuing psychotic state, in most cases to be equated with one form or another of schizophrenia. All discussions of the drawings of the mentally ill in the 19th century restrict themselves to the work of clearly psychotic patients, including under this classification the drawings of people suffering from organic brain diseases, particularly syphilis of the brain (paralyse generale), epilepsy, and mental retardation. The neurotic illnesses were not included in any discussion of patient art in this period.
Les Persécutés

Simon was particularly interested in the production of patients who experienced delusions of persecution as an aspect of their illness. In his two articles he grouped these individuals together, classifying them as les persécutés. He distinguished these cases from those in which ideas of persecution were accompanied by megalomania, in the conviction that delusions of grandeur usually represented a later development in the course of the illness.

Megalomania includes a whole series of forms of insanity among which the patients’ delusions of grandeur are obvious to even the most inattentive observers. This form of delusion commonly follows upon the development of ideas of persecution; at times, however, ideas of persecution only become apparent as a secondary factor (Simon, 1876, p. 370).

From the case descriptions provided by Simon, it seems that the majority of his patients were suffering from some variety of paranoid schizophrenia.

In his discussion of the drawings of les persécutés, Simon was concerned primarily with subject matter. The only observation contributing to the analysis of form is the statement that the pictures are usually complete compositions or little dramatic scenes.

The artistic productions of Les persécutés have a completely unique character, closely related to the ideas which this type of patient ordinarily displays. They are commonly pictures in the complete sense of the word, little compositions, of doubtful value of course when considered as drawings, but very interesting for the physician and the psychologist (Simon, 1876, p. 360).

Simon’s major theoretical contribution was his recognition that the subject matter of many of the drawings could be related to the specific ideas that preoccupied the patients. He emphasized that the subject of the drawings is closely related to the patient’s delusional system. “You can see that they are closely related to the delusions of the patient, that they are nothing but what one might call the images of his expression (l’expression imagée) (Simon, 1888, p. 337). His recognition that the drawings were an externalization of their delusional preoccupations was to attract the attention and interest of future students, including, of course, Lombroso.

The cases presented as characteristic examples of les persécutés are disappointing as depictions of the terrible persecution of which these patients believed themselves to be the object. They are of two kinds. In the first type the patients illustrate “their misfortunes, the torments which they have endured, and the persecutions of which they imagine themselves to have been the object” (Simon, 1876, p. 360). The case of Monsieur Dupont best represents this illustrative tendency. “Sometimes it is a court of law before which an accused man is pleading, who is no one else but the patient himself. At other times, a landscape surrounded by rocks among which one sees an injured lion, birds, and animals of bizarre form surrounding the composition which is surmounted by the scales of justice. Here too, the patient is to be found at the center of the picture” (Simon, 1876, p. 361). In the article of 1888, an extremely interesting picture by
Dupont was reproduced. It depicts the figure of Death, armed with a scythe, slaying the evil and perverse people of the world, presumably to be identified with the enemies of the patient (Figure 2, top; Simon, 1888, p. 337). The picture is accompanied by an extensive written commentary, which, unfortunately, is not clear enough to read. The subject, well known in the history of art, is the so-called triumph of death. In the famous fresco in the Camp Santo in Pisa, Death appears with a scythe cutting down wealthy citizens and wicked members of the clergy. In that version Death is depicted as a witch flying in the air, rather than as a skeleton. Death as a skeleton is typical of the “Dance of Death” engravings that could easily have been available to the patient.

The illustration of Dupont’s work makes it clear that French patients were also influenced by visual material in their environment. Here too the historical style of the period is as evident in the work of psychiatric patients as it is in the work of recognized artists. We are reminded as well of Lombrisco’s speculations concerning a possible stylistic “regression,” which he referred to as an “atavistic tendency” in the productions of some patients. Investigation of the sources of the patient’s imagery, particularly of the religious images that formed a part of his home environment, might have suggested a simpler solution to the problem of this curious reversion to earlier styles.

A passage in Simon’s memoirs makes it clear that his knowledge of the history of art was more than sufficient to enable him to recognize the contribution of religious art to his patients’ imagery.

Christianity, that great revelation of the quality of all men, had sculpted on the porches of its cathedrals, or painted on the walls of its cloisters, various scenes of that terrible myth in which one sees kings, potentates, popes, manants, and all the skeletons of those obsessed with hopeless desires. Physicians participate every day in the realization of this fiction in art (Simon, 1895, p. 116).

In this scene an aspect of his own reality, although it was not that of the patient. It was this ability to use his own subjectivity to sense aspects of an inner reality within seemingly alien images that was to lead to the possibility of much deeper understanding.

Dupont’s personal style is related to children’s drawings of the period. This is to be seen in the choice of either full frontal views or profiles, the raised arms bent at the elbow in every case, as well as the emphasis on rows of buttons, aprons, and pockets, all of which appear in contemporary children’s art. It is a style that in terms of its simple and direct narrative quality recalls the popular engravings of the period—inexpensive prints that were widely available.

All of the remaining cases displaying delusions of persecution exemplify a second feature that Simon felt was characteristic of this group of patients, the use of symbolism or allegory. Lombrisco later associated this feature with all of the drawings of the insane. Simon distinguished two different types of symbol; those that possess a generally understood meaning—“Again, sometimes it is traditional emblems which they represent: the lion as a symbol of strength, the scales representing justice, symbols of salvation, etc.”—and symbols whose meaning was known only to the patients (Simon, 1876, p. 360). The crucial point is that he realized that they did possess meaning at least to the individual who made them. The investigation of recurring symbols was to provide the first indication that the drawings of patients might possess a symbolic significance which, with effort, could be interpreted and understood. It was not possible for Simon to proceed very far in this direction; however, the majority of the images that he encountered belonged to the second type of symbol, those with a meaning known only to the patient, if even to him or her. For example, he described a case in which the patient produced writings interspersed with crosses, triangles, and signs of every sort to which their creator attached private meanings.

The use of diagrams as a means of representing symbolically one’s experience was illustrated by Simon by the case of a musician confined in the asylum of Bron. He described the man as “representing the circumstances of his life by a sort of emblematic schema” (Figure 2, bottom; Simon, 1888, p. 337). Here again, he was aware that the patient’s intention was to convey something about himself through the use of symbols.

Mégalomanie

In the discussion of cases characterized by delusions of grandeur—mégalomanie—Simon’s formulations are of greater interest. He was aware that this symptom could occur in a number of different psychiatric illnesses. He shows an unusual awareness of the relationship between delusions of persecution and megalomania, and he attempted to formulate a principle that would indicate the influence of this relationship upon the drawings of patients.

In that delusions of grandeur form the basis of the delusional ideas of the patients with whom we are concerned at the moment, it is natural to assume that their drawings would deal with ambitious schemes, designs for palaces, cathedrals, machines, and gardens, and these are in fact the ordinary subjects of their compositions (Simon, 1876, p. 371).

Simon suggested that the relative intensity of the delusions of persecution was closely related to the uniqueness and elaborateness of the patients’ artistic conceptions, taking into account the imaginative powers prior to the onset of their illness, as well as their earlier experience and possible training in art.

Careful formulations such as these demonstrate Simon’s superiority to Lombrisco. Free of the assumptions relating insanity and genius, free of the necessity of demonstrating the emergence of genius in response to the onset of mental illness, he could examine the productions of his patients with far greater objectivity. He did not exaggerate the talent of these individuals. Rather, he indicated clearly the necessity of studying their work in an effort to obtain greater
understanding of their illnesses and of their personalities prior to its commencement. He speaks of the “imagination of the patient which forms the subject of our investigation.” In a very real way he had begun the task of exploring the relationship between the patient’s inner experience, his or her ideas and internal images, and the drawings in which this inner reality found expression.

Les Ambitieux

The analysis of the drawings of les ambitieux concerns itself more specifically with formal problems. He postulated a relationship between the systematized, reasoned quality of their delusional ideas, and the clarity and precision of the drawings.

We observe in all the drawings, as in the form of insanity which engenders them, a regularity, a logical character, and if I might risk saying it, of correctness, despite the fact that the conception which they reproduce is thoroughly mistaken and completely fantastic (Simon, 1888, p. 341).

It would be easy for me to show by a greater number of examples the ambitious character of the drawing, its coordination, and if I might put it thus, the correctness of the lines from which it is formed, remain constant (p. 341).

An extremely interesting case displaying these features is presented in the article of 1888. The patient, resident in the asylum at Bron, had been trained as a draftsman prior to his illness.

He is an inventor, and since he has been at the asylum of Bron, he has presented me with a number of designs, drawings of machines sufficient to compose a voluminous album. In that this patient was in earlier days a competent draftsman, his plates, characterized by the most complete insanity, are at the same time characterized by an absolute correctness of execution, offering to the eye a markedly harmonious effect (p. 340).

Simon was intrigued by the unusual functions implicit in these extraordinary designs, and explained in the inscriptions that accompanied them. He describes these plans in detail, reproducing one of the many drawings, “an hermetically sealed apparatus for cooking, at high pressure—of several atmospheres,” a 19th-century pressure cooker (Figure 3, top left; Simon, 1888). The drawing is essentially architectural in conception, and the execution the work of an adequately trained draftsman of the period. Simon was always careful to distinguish between patients who had prior training and those whose fantasies surpassed their expressive ability. “The unaccustomed hand of our patient could not manage to trace the dreams which presented themselves to his imagination” (Simon, 1876, p. 375).

Manie chronique

Simon’s scrupulous objectivity, so typical of the French neuro-psychiatry of the period, comes to the fore in his analysis of the drawings of patients diagnosed as suffering from manie chronique. The bizarre productions of these severely ill people so intrigued Tardieu that he was led to characterize the whole of the art of the mentally ill on the basis of the work of this group of patients. For such investigators, the element of the bizarre represented a barrier beyond which they could not go, nor did they realize that a possibility of further understanding would ever arise. They were content merely to describe or ridicule. Simon recognized that Tardieu’s description referred exclusively to the work of chronic maniacs, and that even then it was a one-sided exaggeration. Simon’s investigation represents the first effort to unravel these images and, by looking at them intensively and with real curiosity, to penetrate their meaning.

It is possible to observe him searching about for a means of access. His first move in this direction was the realization that disturbances of speech were related to disturbances in pictorial rendering. French psychiatry at this time excelled in precise descriptions of language dysfunctions. “In the same way that among these patients disorders of speech are at times extremely evident, the combinations of lines in their drawings can often be extremely complicated, or the colors which they use to illuminate their pictures can be absolutely untrue to nature” (Simon, 1876, p. 366). This insight is an example of Simon’s inclination to look for common origins behind a number of symptoms, the same inclination that had led him to study costume, imaginative descriptions of things visual, as well as graphic productions, as related phe
nomena. He resisted the temptation, which confronts any investigator of such confusing and chaotic material, of simplifying the terrible complexity of the masses of drawings with which he or she must deal. For example, he admitted that some "maniacs" produce drawings that are unexceptional, displaying no obvious distortions of form. "It can occur that chronic maniacs produce drawings in which the correctness of the lines, and the neat and finished quality of the drawing is fully apparent, especially when they attempt no more than the depiction of a single object" (1876).

In the context of manie chronique Simon presented a single case, that of Monsieur H. His description and analysis of the case and the paintings related to it were unusually thorough. In this respect, therefore, the case represents the first investigation into the creative activity of a single patient. In the article of 1888 three drawings by Monsieur H. were reproduced. Simon's interest in the drawings of H., and his decision to reproduce several of his pictures, were motivated by the realization that the patient was able to produce drawings that differed from one another in style. To admit that a single patient was capable of a variety of styles was a unique, but at the same time disturbing, discovery, in that it brought into question the essential hypothesis motivating the study of the graphic production of the mentally ill, namely the conviction that specific syndromes exerted a consistent influence on both the form and the subject matter of the drawings.

Simon described the types of drawings produced by H. very clearly.

He draws voluntarily. The drawings which he does and which he gives us quite punctually, consist sometimes of badly arranged geographical maps, crossed by lines of all sorts and mixed together with useless references and bits of verse (Figure 4, left side; Simon, 1876, p. 367).

His patient was also capable, however, of highly ordered and coherent drawings or plans. "At other times, the figures drawn by our patient represent some sort of design, for example the design of a machine which he has invented. These drawings are then more clear, correct, and complete, although the idea remains generally eccentric" (1876).

Simon's aesthetic, and his taste in drawing, were formed in an overtly academic mold. His drawing instructor at the Lycée in Rouen was a distinguished student of Ingres. He recounts how "not a week went by that he did not repeat a motto which Ingres had been in the habit of saying: 'Look after your line, make the contour correct, exact, irreproachable; and then...spit on it'" (Simon, 1895, p. 161).

Simon's attempt to account for the variations in formal coherence, although essentially speculative, is of great importance in that it reveals his awareness of the close tie between the structure of the patient's ideas and the form that the patient utilizes. The first hint of a theory of conflict of ideas as the source of a conflict of superimposed images within a single picture can be seen emerging here. The complexity of these drawings finds its explanation, according to Simon's hypothesis, in a "double series of ideas, mixed together, or separate," which at times overlap or fuse in the mind of the patient, producing the incoherent style of drawings. At other times a single conception will seek to find expression and the drawings that result are characterized by clarity and logic.

In certain drawings of this patient whose work we are describing, one sees great incoherence, but this incoherence is not absolute. The lines, while often criss-crossing one another and confused, in the most incoherent of his compositions, reveal, in fact, in the spirit which has conceived them a double series of ideas: mystical ideas and scientific ideas. Moreover, in other drawings, these latter ideas are to be found without any admixture, at which time we encounter the inventor. A plow of special design drawn for us by H., or a model for a revolving cannon which is at the moment before our eyes, shows us very particularly this patient in this latter guise (Figure 4, lower right; Simon, 1876, p. 367).

How far we have come from Lombroso with his list of typical features of "insane art." Despite the simplicity of his theories, Simon's attempt to analyze even the most complex and seemingly meaningless images reveals a conviction that within these drawings, often no more than tangles of overlapping lines, there lay levels of meaning whose implications could be disentangled and un-
nderstood. His conclusion is stated as a general principle:

However great the disorder and the confusion of the lines in the drawings of chronic manics, it will ordinarily correspond exactly with the extent of the insanity of the patient: the chronic mania with multiple delusional ideas being more disordered in his productions than the chronic mania with a single series of dominant delusional ideas. As for the patient suffering from acute mania, characterized by complete incoherence, excitement, and extreme restlessness, he is able to furnish us with very little in the way of drawings which can be studied (1876, p. 367–368).

It is amusing to note that the paintings of the Impressionists were considered suitable evidence for the critics to arrive at a diagnosis of insanity.

Evaluation of Simon's Contribution

Almost 100 years have passed since Simon published his pioneering study. His work has inevitably been superseded and, in the light of accumulated evidence and experience, it is not difficult to criticize some of his findings and failures. The difficulty for us lies in trying to reconstruct the confused situation that confronted him and in realizing the total originality of what he was attempting to do. In one sense, his research represented a logical continuation of the scientific preoccupation with accurate observation and description of symptoms, and the effort to classify them into systematized groupings that was characteristic of 19th-century French psychiatry. Simon's main theoretical contribution was unquestionably the recognition and the clear enunciation of the relatedness of inner idea and outer image, of delusional thinking and pictorial subject matter, of confused or limited thinking and confused or puerile form, of symptom and symbol. Both Lomboroso and Simon recognized the symbolic quality of some of the pictures they were examining, but beyond that they did not, and could not, go. There seemed to be little possibility of penetrating the private language of the patient's personal symbolism, just as there was little recognition that symptoms might have meaning. One does not really discover in the studies of either Lomboroso or Simon a concern with the patient's products as an effort to communicate with them, or as expressions of an organized self-image. Simon had discovered that these random scrawls were in fact a language. The task of translation was left to others.

Simon was one of the first psychiatrists to form a large collection of paintings and drawings by the insane. His intention was to impose order upon this mass of chaotic material, and to try to discover ways of linking this visual evidence with the systems of nosological classifications in use at the time. In this task it must be admitted that his success was limited. Using Simon's descriptive classifications it is quite impossible to divide a group of drawings made by a variety of patients into categories related to the syndromes identified by 19th century physicians. Undoubtedly, this is attributable at least in part to Simon's inability to reproduce a sufficient sample of drawings. His system suffered from the artificiality and over-simplification of the nosology of the period. The most we can assume is that it worked for him.

Simon might be criticized for his failure to deal openly and adequately with the overt sexual imagery that is not uncommon in the drawings of the insane. In both of his publications he revealed a rather prissy attitude to sexual matters, an accusation that could not be leveled against Lomboroso, and which was not characteristic of the age. As Ellenberger (1970) in his discussion of the scientific milieu around 1880 pointed out, "contrary to present day assumptions, sexual matters were treated frankly in medical and anthropological literature. They also were discretely hinted at in literature" (p. 257). An incident in which Simon actively interfered in the production of obscene drawings might be held up as an example of his lack of scientific objectivity.

I should also mention in connection with this repugnant subject a patient under my care obsessed with licentious hallucinations. Incapable of drawing, he had drawings executed for him by another patient, drawings of the last word in obscenity. It is hardly necessary to add that, once informed of these very specialized works of art, I put an end to these licentious compositions (Simon, 1888, p. 351).

In 1876, however, he did indicate his conviction that sexual themes were especially prevalent in the drawings of les personnels, les déments and les imbéciles. He challenged Tardieu’s contention that such subject matter was extremely frequent. In fact, his decision to avoid discussion of the subject was based not on prudery but on his awareness that he had insufficient information. "I have not observed a sufficient number of examples to permit me to express an opinion on this point with any degree of certainty" (Simon, 1876, p. 390). He recommended that further study would be necessary. "It would be useful to investigate whether the characteristic of obscenity in drawing is more prevalent in specific forms of insanity" (1876). In his second publication he added a new diagnostic category, "erotic delirium," and he discussed sexual representation in much greater detail. It is probable that he was influenced in this direction by the publication of Lomboroso and du Camp’s article, “L’arte nei pazzi,” in 1880. Following Lombaroso’s emphasis on hereditary degeneracy, Simon was led to state:

Today, having been able to study the facts more closely, I am inclined to believe that this sort of patient generally reveals traces of an hereditary
defect. I have collected information on several of these patients which permits me to put forward the opinion which I am presenting here; but concerning several others, I have not been able to obtain sufficient information (Simon, 1888, pp. 351-352).

In this passage we seem to encounter the seductive intensity of Lombroso's theories as Simon, the man of science, was about to succumb. His sole concession to such subject matter was the inclusion of a single plate drawn by a lady whose preoccupations scarcely deserve the title "eroticus," especially if one considers the vogue for Spanish fashions that swept France during the reign of the Empress Eugenie (1853-1871).

Things Spanish enjoyed enormous popularity in France during the reign of the beautiful Empress Eugenie. Not only were Spanish dancers and bull-fighters welcomed in the French capital, but Spanish themes were common in novels and plays, the annual Salons were filled with paintings of Spanish subjects, and details of Spanish dress came and went in the changing world of fashions (Hanson, 1966, p. 71).

Small wonder then that the preoccupation with Spaniards had reached the hospital at Dijon, and that the art of the patients had begun to reflect the art of the Salon.

Passionate preoccupations of a less condemnable type find expression at times among the insane, especially among the ladies, in drawings about which a word might here be said: I speak of the amorous preoccupations which frequently lead the insane, and hysteric too, to draw, or rather to copy, portraits of young men of more or less perfect beauty. At times it is the conviction which they have of a resemblance to a beloved person which leads them to choose them as their model; at other times it is merely the satisfaction to be derived from copying a beautiful face. I have encountered several cases of this type, and I am reminded, among others, of a patient at Dijon who drew, or copied, with some facility, a vignette representing an individual in Andalusian costume. Beneath it he had inscribed these lines which indicated the preoccupations of the author clearly enough: 'It's a pleasure to suffer for so beautiful an actor' (Figure 5, lower right; Simon, 1888, p. 362).

For the art historian Simon's work is of particular interest in that it represents an effort to come to grips with the difficult problems inherent in the analysis of nonverbal forms of expression. Simon's ability to write dispassionately and analytically about comparatively bizarre material could have served as an example to the art critics of his day who displayed far less objectivity and seriousness in their confrontation with the Impressionists. It is amusing to note that the paintings of the Impressionists were considered suitable evidence for the critics to arrive at a diagnosis of insanity. The passage that follows is taken from a review of a group show arranged by the painters in 1876:

The rue Le Peletier has bad luck. After the opera fire, here is a new disaster overwhelming the district. At Durand-Ruel's there has just opened an exhibition of so-called painting. The inoffensive passerby, attracted by the flags that decorate the facade, goes in, and a ruthless spectacle is offered to his dismayed eyes: five or six lunatics, among them a woman, a group of unfortunate creatures stricken with the mania of ambition, have met there to exhibit their works. Some people burst out laughing in front of these things, my heart is oppressed by them. Those self-styled artists give themselves the title of non-compromisers, impressionists; they take up canvas, paint, and brush, throw on a few tones haphazardly and sign the whole thing ... It is a frightening spectacle of human vanity gone astray to the point of madness (Wolff, quoted in Rewald, 1973, pp. 368-369).

One can't help but wonder what Simon would have thought of all this. Simon's lack of involvement in the genius-insanity controversy, and his almost total avoidance of any problems relating to aesthetic evaluation of the drawings he was studying, makes it difficult to arrive at a clear idea of the nature of his aesthetic standards, or of his involvement with the visual art of his day. A wide and clearly demarcated gap separated the drawings of the mentally ill from the "fine arts," a division that is far less apparent today. As a result, Simon was able to dismiss the pictures as of no artistic importance. As pointed out earlier, he avoided altogether using the word art, although he di...
fer to the non-pictorial descriptions of his patients as "les conceptions artistiques." He used evaluative terms rarely, referring occasionally to a drawing as badly drawn, or as executed "avec correction." We also find references to pictures being "very agreeably composed." One of his most interesting hypotheses, created in the context of a discussion of the improvised costumes worn by some severely disturbed patients, is the idea that there is "among maniacs a disturbance of taste, just as there is a disturbance in behavior" (Simon, 1876, p. 368). All of these evaluative judgments place Simon's aesthetic conceptions quite clearly within the academic and more conventional standards of taste of his period. He reveals an unquestioning acceptance of the belief that standards exist by which art can be judged and separated off from non-art. His 20th-century successors were not as fortunate in this respect.

Perhaps the best clue to Simon's personal preferences in art, and an indication of just how conservative they were, is provided by the one reference to a famous artistic personality that occurs in his article. Describing the work of a patient diagnosed as suffering from paralysis générale, Simon told the story of a young soldier who displayed a whole range of delusions that he was a painter, he intended to ornament the walls with frescoes.

Ch...imagines himself, in fact, to have artistic talents equal at least to those of Horace Vernet. This belief led our patient to execute a drawing of a horse which was the most insignificant daub in the world; a child in his most imperfect attempt could not produce anything more insignificant. A curved line, with several strokes at either end of it representing the mane and the tail! There you see what the efforts and the pretensions of the poor paralytic resulted in, this man who, in his madness, sought to emulate one of our greatest painters of battle scenes (Simon, 1876, p. 380–381).

It is the last phrase that seems to suggest that one of Simon's artistic heroes may have been called to mind. Horace Vernet (1789–1863), like his father Carle, was indeed a specialist in the painting of horses, and might well have appealed to a conservative physician whose knowledge of painting may not have extended much beyond the doors of the Salon. The description of the drawing of "Ch." as "la chose la plus nulle du monde" could be mistaken as a vicious attack on the art of the mentally ill. What Simon is trying to do is not to attack the young soldier, whom he in fact referred to as having an open and sympathetic character, but rather, to differentiate as clearly as possible cases of psychically induced delusions of grandeur from the organic diseases that resulted in a complete collapse of graphic control. Although this patient might display megalomaniac delusional ideas, his ability to depict them had deteriorated to the point of utter puerility. It was this aspect of the drawings of patients diagnosed as suffering from paralysis générale and imbécilité that led him to make comparisons between the drawings of these individuals and the art of children, thereby introducing yet another topic that would continue to stimulate discussion up to the present.

In this analysis of Paul-Mar. Simon's approach to the graphic production of the mentally ill, the intent was to remove him from the shadow of Cesare Lombroso, and to restore him to his rightful position as the creator of a significant new field of scientific investigation. Lombroso's influence was soon to make an impression upon a far wider public, overshadowing Simon's work completely with an endless series of pathographies of genius, biographies that displayed Lombroso's extraordinary gullibility, or carelessness, in regard to the facts. Simon's more modest undertaking, which owed less to Romantic conceptions of genius, and more to the descriptive psychiatry of his day, can be understood now as far superior to that of Lombroso, an achievement which in its seriousness and objectivity was to provide an admirable prototype for all later explorations into the psychology of psychotic pictorial expression.

Subscribers to *Art Therapy* and Members of American Art Therapy Association

ENJOY REDUCED RATE!

A quarterly, international, multi-disciplinary journal for professionals and students in all areas of the arts in psychotherapy, mental health and education, THE ARTS IN PSYCHOTHERAPY publishes original articles (including illustrations) by art, dance/movement, music, poetry, and drama psychotherapists and by psychiatrists and psychologists which reflect advances in theory, research and practice with no restrictions on philosophical orientation or application.

AN IMPORTANT SOURCE for news and summaries of national and international conferences and current educational information relevant to the creative arts in therapy, THE ARTS IN PSYCHOTHERAPY contains book reviews, welcomes letters to the editors, dialogue among contributors; has International Editorial and Advisory Boards of highly respected specialists who represent a wide spectrum of experience. It appeals to scholars and practitioners of the arts in psychotherapy and to psychiatrists and psychologists.

THE EDITORS WELCOME ORIGINAL MANUSCRIPTS.

american journal of ART THERAPY

Art in Education, Rehabilitation, and Psychotherapy

This independent quarterly, published since 1961, deals with the visual arts as they contribute to human understanding and mental health. Its contents include new theoretical formulations, bibliographical information, a job information exchange, and news of opportunities for training and of international developments in the field.

Topics treated in recent articles include:

- transference and countertransference in art therapy
- self-expression of a disturbed adolescent
- art therapy and cultural difference
- art in strategic family therapy
- art as therapy in a public school
- the combination of art and play therapy
- art therapy with the severely physically disabled
- the place of art in art therapy
- research into hospitalized children's self-images.

AMERICAN JOURNAL OF ART THERAPY, P.O. Box 4918, Washington, DC 20008-0118
An Art Therapist’s Personal Record

Don L. Jones, ATR

Don L. Jones, ATR, was one of the five members of the Ad Hoc Committee that formed the American Art Therapy Association and served as the organization’s president from 1975 to 1977. He is the Director of Adjunctive Therapy as well as the Director of the Clinical Internship Program in Art Therapy at Harding Hospital, Worthington, Ohio.

This article records the process of looking backward and looking inward for the roots of my interest in art therapy. I hope that such recollection and review will provide a perspective from which to look ahead. These reflections relate to the period between 1943 and 1946, during which I worked as an attendant in a state mental hospital. It was this experience and the paintings I did in response to it which were the origin of a compelling and continuing involvement in art and psychiatry.

Background

The economic crisis of the Great Depression of the 1930s wrought havoc on the state mental hospital system. Standards of care fell as budgets were cut, and overcrowding increased. Progressive ideas of treatment were forgotten; the patients were dehumanized and the staff demoralized. The low state into which those hospitals fell was documented by the U.S. Public Health Service. These detailed findings, first set down in confidential reports, then later published, revealed conditions of inhumanity and neglect of which the public continued to be unaware.

This depressing state of general deterioration of standards was accentuated by the advent of World War II. The Veterans Administration and state hospitals lost most of their professional staff, and lay personnel deserted for more lucrative wartime industries. Morale in the institutions and the level of care plummeted further.

Figure 1—The author serving meals on “Senile II.”

Editor’s Note: While Margaret Naumburg and other writers were beginning to lay down the theoretical foundations for art therapy, Don Jones was discovering for himself the therapeutic value of art through his experiences as an attendant in a state hospital where little more than custodial care was given the patients.

Mr. Jones’s paintings provide a glimpse of a world many younger art therapists have never seen. Two major influences have dramatically altered mental health treatment since the 1940s: the development of effective psychotropic drugs that make patients more accessible and capable of participating in other types of therapy and the mental health movement whose members have led the way for more humane treatment.
It was at this time and under these circumstances that some 3,000 conscientious objectors, drafted by the Selective Service, volunteered to staff many of the state hospitals. Under the Selective Training and Service Act of 1940, the U.S. Congress had made provisions for conscientious objectors to perform work of national importance under the auspices of a Civilian Public Service program.

After being drafted out of college into a brief labor camp assignment and a 6-month stint as a human guinea pig for the Army Medical Corps, I volunteered for “detached” service and was assigned to the Civilian Public Service Unit No. 63 at the Mariboro State Hospital in New Jersey. It was there that I entered the world of psychiatry as a young artist with a 19-year-old’s idealism.

The Hospital Setting

The hospital housed 2,800 people in cottages of approximately 150 patients each. In addition, there were two buildings (one for males and one for females) for “disturbed” patients; about 90 patients lived on each of the three floors in these buildings. There also was a building for patients with tuberculosis and a small infirmary.

The attendants worked 12-hour shifts, 6 days a week. Being the only staff member on a ward, an attendant had to be a “jack-of-all-trades,” serving meals (Figure 1) as well as providing some stimulation. Working the night shift (7 p.m. to 7 a.m.) usually entailed additional responsibility; I would cover three cottages and three floors of the “disturbed” building by myself. Figure 2 shows a typical scene from a ward euphemistically called the “Rosegarden.” I used to move all the furniture to the middle of the day room and then sing and make noise to encourage these vegetating people to get up and move.

We did not have the psychotropic medicines available now, let alone the luxury of time or materials for art therapy. The activity areas previously set aside for woodworking and crafts had all been closed.

Subjective Reactions Recorded in Art

A multitude of indelible images from that experience are imprinted on my psyche. There were:

“sick people shackled, strapped, straight-jacketed and bound to their beds ... curable cases sinking into chronicity ... wards upon wards of patients sitting in idleness and stripped of human dignity. In some of the wards there were scenes that rivaled the horrors of the Nazi concentration camps” (Deutsch, 1949, p. 448–450).

It was these scenes, which Albert Deutsch described in words, that I described in my paintings. Some of those paintings accompany this article.

It was my previous experience with art that now provided me asylum and a means of survival. I developed a growing awareness that creative expression often serves those who are under severe stress. I found myself painting in the process of working out and living through the human misery that I shared with these patients. I discovered and collected the artwork of the patients, which they produced not only out of boredom or on demand but out of inner impulse and psychic necessity. The walls, the halls, and even the tunnels and passageways beneath the buildings were covered with elaborate, spontaneous scribblings, depicting pain, tumultuous anxiety, and abandoned hope. It was more than graffiti—it was soul language! I looked and learned and tried to interpret, and, ultimately, began to understand and to communicate with these deserted, desolate aliens. The vaguely conscious thought of using art as therapy began with me here in this singularly lonely situation.

The Paintings

- Communication with this repressed patient seemed impossible but I would sit beside him and talk. After a year, he answered (Figure 3).
- I discovered that some patients on the “disturbed” ward had been locked in security rooms for several years. I told them that their doors would be unlocked. Gradually, they risked coming out. I could not imagine that they would be afraid of me (Figure 4).
- Caring for the most severely impaired was a special problem, but even some of the most disturbed
patients were compassionate and helpful to others in these difficult circumstances. It is a lesson I have remembered (Figure 5).

- This man ultimately escaped from the hospital by breaking through a brick wall. During the long night shift alone, I often wondered why he did not simply take the keys from me. But I trusted him and apparently, he felt something for me (Figure 6).

- The malaria treatments given in an attempt to arrest this man’s syphilis were too late to prevent blindness and neurological impairment. I felt sad for this cultured gentleman and knew he would be forgotten. So, I asked him to sit for a portrait. I remember him well (Figure 7).

- This is a self-portrait at age 19. I also made many pencil portraits of patients as a device for getting them to sit still and talk with me (Figure 8).

The Beginnings of Reform

Out of this experience too, came a book about the work of the conscientious objectors called *P.R.N.* (*pro re nata*—in hospital parlance, a medicine that is given “for the emergency”). Its preface states:

> So, we became the “PRN’s” of the hospital community, filling in wherever there were shortages. Three thousand men have volunteered for this role in over fifty hospitals. Their duties have filled a variety of capacities...on the wards...in the labs...in the kitchens, the offices. We came to Marlboro closing a gap, but our vision has broadened during the time spent here, so that we hope our concern for the welfare of the mentally sick will be lifelong rather than merely...PRN” (Civilian Public Service Unit No. 63, 1945).

_**P.R.N.**_ was an educational monograph, designed both to train conscientious objectors who staffed the hospitals and to inform the general public about more enlightened methods of patient care. This book on the New Jersey State Hospital was illustrated with photographs and some of the patients’ art work I had gathered. It portrayed the hospital in an objective light and reflected the impact of the conscientious objectors. Through study groups in psychology and mental health, we were able to formulate guidelines for attendants and to raise the level of care.

At the same time, we participated in documenting and reporting instances of hospital neglect and abuse. These constructive public exposés contributed to the beginnings of reform in the state hospital system. As Deutsch (1949) notes, “Scores of these conscientious objectors—sensitive to the suffering of the patients under their care—kept careful notes of incidents and observations in diaries and reports. These notes were later collected by a central group in Philadelphia and published in various forms by the National Mental Health Foundation, which was organized in 1945, primarily by idealistic ex-attendents” (p. 451).

An Invitation from the Menninger Foundation

An unpublished manuscript, _The Tunnel_ (Jones, 1947), illustrated with my own cathartic paintings of the Marlboro Hospital, later came to the attention of Dr. Karl Menninger. As a result, I was invited to hang these paintings in the Menninger Foundation museum as well as to start an art therapy program at the Menninger Foundation Hospital. A sophisticated art therapy program had been
developed as early as 1934 in Topeka, Kansas, at the Winter Veterans Administration Hospital (Huntoon, 1949) under the leadership of Mary Huntoon and Ruth Shaw (who had initiated the use of finger painting as therapy). At the time I joined the Hospital in 1951, however, the VA art therapy program had been defunct for over a decade.

Art was a part of the milieu therapy at the hospital. An active art-and-activities program was developed with the helpful support of Drs. Karl and Will Menninger. "Dr. Will," influenced by his studies with Ernst Simmel in Berlin, used art as a cathartic activity. There were others who affected me during that period including Gunter Ammon, MD, a psychoanalyst now practicing in Berlin, who introduced me to German literature on the relationship of psychoanalysis and art and Ben Horlacher, a personal friend, mentor, gifted ceramist, and natural therapist who left his imprint on hundreds of patients at the Winter VA Hospital. Later, Robert Ault who was to serve with me on the Ad Hoc Committee that formed the American Art Therapy Association, joined me at the Menninger Hospital where we established a Creative Activities Program.

Epilogue

After 16 years at the Menninger Clinic, I was invited to become Director of Adjunctive Therapy at Harding Hospital in Worthington, Ohio. Art at Harding Hospital is an integral part of the therapeutic milieu that emphasizes group and individual psychotherapy as well as provides "art as therapy" in painting, ceramic, and sculpture studios.

One of my surprises in coming to Ohio in 1967 was discovering the first art therapy department and training program to be approved by the state Mental Hygiene Department. It was run by Bernard Stone, under the supervision of Dr. Pedro Corons, a psychiatrist, and Dr. Curt Boenheim, a psychoanalyst. Combining my interest and energies with them and others in the state we formed the Luckeye Art Therapy Association.

After years of working in relative isolation, practicing art therapists, invited by Myra Levick, met in Philadelphia to lay the groundwork for a national association. That first meeting in 1967 proved to be a turning point for me personally as well as for the field.

Today, I am an art therapist as well as a professional painter and sculptor. When I first entered the world of psychiatry as a young amateur artist, my eyes were opened to experiences I could barely absorb or understand. I painted from intuition and impulse. These pictures remain alive for me; they serve as a constant reminder of what must never be again. They are milestones measuring the distance we have come in the treatment of mental illness and stand in stark contrast to the contemporary practice of mental health and art therapy.

Civilian Public Service Unit No. 63, 1945. P.R.N. in a Mental Hospital Community. New Jersey: Author.

Frances E. Anderson, EdD, ATR

Frances E. Anderson, EdD, ATR, professor of art at Illinois State University, Normal, Illinois, is a founding member of both the Illinois and American Art Therapy Associations. The author of a number of publications in art education and art therapy, she recently completed a curriculum, “Arts for the Handicapped,” which will be published by Abbeyville Press, New York. Her co-author on that project is José D. Colchado of San Jose State University. This critical analysis was funded in part by Illinois State University’s Summer Research Program in 1982. Other support, including library access and office space, was provided by the Mary Inghram Bunting Institute of Radcliffe College where the author was a Visiting Scholar during the summer of 1982. The author wishes to express gratitude to both institutions for their support, without which the project could not have been undertaken.

Criteria for Inclusion of Research Studies

In May of 1981, the National Committee, Arts for the Handicapped (NCAH) requested the author to review the published research literature on arts and the handicapped. Because a similar project (Kalenić, 1978) had covered the research on arts and the handicapped up to 1975, the NCAH literature review originally was intended to cover the period from 1975 to the summer of 1981. As the author undertook the initial computer-assisted library searches, however, it became apparent that a more complete and representative literature review would result from a systematic search of the published research literature over the past decade. Therefore, the NCAH literature review was expanded to include the 10-year period from 1971–1981.

Careful criteria were established for the inclusion of research studies in the literature review. These were based on the criteria established by Kalenić (1978), which required that studies be “structured inquiries that utilized acceptable scientific problem-solving methodology and created new knowledge that could be generally applicable.” The NCAH project, therefore, was limited to empirical research (Eisner, 1972) utilizing methods of investigation that were grounded in psychological and educational research methods and that yielded “hard data.” Articles that dealt with philosophical, theoretical, or more “subjective” investigations were not included in the review.

These parameters were drawn because it had become apparent to NCAH that lay persons, researchers, and funding agents outside the arts were demanding systematic research. What was critically needed was evidence that could convince professionals and funding agencies outside of the arts of the value of the arts as treatment modalities and as means of reinforcing learning, modifying behaviors, and improving the lives of handicapped individuals. The external agencies and professionals who are not art therapists generally do not accept the case study as a valid research method upon which decisions and generalizations can be based. What is acceptable is empirical research based on scientific methodology that includes objective measurement, hypothesis testing, and replication. Therefore, only those research articles that used case studies employing time series strategies (Rush & Krathochwill, 1981) or an ABAB reversing experimental treatment research design (Walker, 1980) were included. As Dr. Ernest L. Boyer, Chair of the NCAH Board of Directors, stated in his introduction to the NCAH literature review:

Some of the reasons for attention to applied research in the arts and the handicapped are practical. Today, when widespread and rapid changes are being made in governmental support, demands for strict budget...
and programming accountability become imperative. Knowing more about what does and does not work can increase the relevance of our work.

Once the criteria for inclusion of research studies were established, the author, assisted by Linda Ash, then Director of the Special Education Instructional Materials Library at Illinois State University and James Gambach, a graduate student in special education at Illinois State University, made computer-assisted and manual searches of over 33,000 books, technical reports, and monographs, as well as over 50,000 educational documents that covered the 10-year span of the research.

The following art forms were included in the literature search: visual arts, drama, music, and dance/movement, as well as the following handicapping conditions: hearing, speech, and visual impairments; mental retardation; behavioral or emotional disorders; orthopedic handicaps; and learning disabilities.

Sources of Data

Two major data bases were covered in the computer searches: Educational Resources Information Center (ERIC) and Psychological Abstracts Information Service (Psychinfo). ERIC was initiated in 1966 and has two main files: Research in Education (RIE) and Current Index of Journals in Education (CIJE). Educational documents such as conference presentations, final grant reports, and educational research projects are covered in the 52,729 entries of the RIE. About 780 publications and journals in education and related fields are covered in CIJE. Psychinfo, started in 1967 by the American Psychological Association, includes 334,021 citations with monthly updates. It covers the world's literature in psychology and related disciplines in a data base that includes 1,500 books, technical reports, and monographs, as well as 940 periodicals.

In conducting the computerized searches the project staff identified all possible key descriptors and words for the handicapped and the arts from the Psychinfo and ERIC thesauruses. Over 90 different descriptors pertaining to the handicapped, research, and the arts were used in the automated searches. Next, manual searches were made of the Education Index, which includes 334 journals, and of The Music Therapy Index and the Art Index, which together cover 202 journals. Finally, bibliographies from identified articles also were checked for further possible research studies. The final part of the search process was personal contact with experts in the field of arts for the handicapped in an attempt to locate as many research studies as possible and to ensure that no important article was overlooked.

Despite these efforts, some studies were undoubtedly omitted. Also, because the project was conducted over only 2½ months (June 1 to August 15, 1981), other data bases, such as Art Therapy in Mental Health (U.S. Department of Health and Human Services, 1981), could not be tapped. One of the aims of the NCAH literature review was to stimulate further research and to identify other pertinent research. Since the publication of the NCAH project results, other studies have been (and are being) identified that meet the inclusion criteria, and it is hoped that it will be possible to update the literature review periodically.

Time constraints also did not permit the reading of dissertations on the arts and the handicapped. A list of 30 dissertations was compiled, however, using the Comprehensive Dissertation Data Base, which includes every dissertation completed at an American institution of higher education since 1861. The compiled list covers 10 studies in music, 9 in visual arts, 5 in dance movement, 5 in drama, and 1 study in creative thinking. Two universities (Illinois State University, Normal, Illinois, and Texas Women's University, Denton, Texas) are making efforts to purchase all dissertations that pertain to research in arts and the handicapped.

Results Produced by the Literature Search

The literature search produced 30 studies on music and the handicapped, 19 studies on the visual arts and the handicapped, 3 studies on dance/movement and the handicapped, and 1 on drama and the handicapped. One of the ongoing problems with research on handicapped individuals is the variation in descriptions of handicapping conditions. These descriptions change over time as various labels are revised and refined. Unfortunately, because many of the authors of the 52 identified research studies did not provide an operational definition of the handicapping condition under investigation, there is no uniformity in definition or description. This created problems in comparing research studies and in drawing conclusions about the effects of arts on the behavior of handicapped individuals. The project staff had to rely on each author's own description of the particular handicapping conditions. Thus, the NCAH literature search included the following studies:

- Deaf
  1-visual arts
  1-music
  1-dance/movement
- Hearing Impaired
  2-visual arts
- Speech Impaired
  1-music
- Mentally Retarded
  16-music
  4-visual arts
  1-dance/movement

What was critically needed was evidence that could convince professionals and funding agencies... of the value of the arts as treatment modalities...
• Orthopedically Handicapped
  1-visual arts
  1-music
• Emotionally Maladjusted
  7-music
  1-visual arts
  1-dance/movement
  1-drama
• Learning Disabled
  8-visual arts
  5-music
• Two or More Handicaps
  1-visual arts (Mentally Retarded, Emotionally Maladjusted, Learning Disabled)
  1-visual arts (Mentally Retarded, Multiply Handicapped)

The original literature review was to have two phases. The first phase consisted of identifying and abstracting the published research that met project criteria. Abstracts one to three pages long were written that included the following categories of information whenever possible: topic or hypotheses of the study, selection of subjects and description of handicaps, presence or absence of control groups, research design and methods used, assessment instruments used, including sources and dates, all experimental treatments and intervention methods, and results and conclusions (including statistical results). The second phase, which was to be a critical analysis of the 52 identified research studies, was never undertaken because of budget restrictions at NCAH. The results of the first phase (abstracts of the 52 identified studies and the list of 30 dissertations) was published by NCAH in the spring of 1982.

Despite this budget reduction, the author was able to obtain partial support to undertake a portion of the originally planned critical analysis. This critical analysis involved three parts. First, all studies in the NCAH literature review were reread by the author. Next, the authors were grouped according to topic areas. Once these areas were identified, it seemed helpful to "chart" each research study so that comparisons could be more easily drawn. This charting (see Table 1) included the following categories: author and date of study, handicapping condition, topic or research question under investigation, assessment instruments (tests) used in the research with the citations (i.e., sources and publication dates of tests if the original study included them), types of experimental treatments, research design, and results. (The table is at best a condensation of the research, therefore, the reader is urged to read the original published work for other relevant details.)

The published research studies on art from the NCAH literature review can be utilized in several ways. By examining the charts, the reader can quickly identify all studies concerning a particular handicapping condition. The reader can also look at all studies using a particular research design, or the same standardized assessment instruments. Themes and issues addressed in each study can be compared. Finally, it is possible to group the studies around themes, such as the use of the art product to identify personality traits and problems, as well as the use of art as a means of reinforcing other behaviors or academic concepts.

Analysis of Visual Arts Studies Included in the Review

In the NCAH literature review, 19 studies on the handicapped and the visual arts were identified. Of these, eight concern the learning disabled, four the mentally retarded, and three the hearing impaired. Two dealt with several handicapping conditions (one with mentally retarded, learning disabled, and emotionally maladjusted persons; one with mentally retarded and multiply handicapped; one with emotionally maladjusted; and one with poliomyelitis patients.

Studies of Figure Drawing Assessment as a Diagnostic Tool

One group of research studies investigated the art products of various types of handicapped individuals to determine in what ways various handicapping conditions influence the ways human figures were drawn. This group of studies further attempted to determine if a type of problem, such as emotional maladjustment, including low self-esteem or other personality traits, could be predicted from an assessment of the figure drawings themselves.

Johnson and Greenberg (1978) found no significant difference between the figure drawings of polio patients and non-impaired subjects who were matched on geographic locality, age, sex, educational level, and marital status. Raskin and Bloom (1979) examined the Kinetic Family Drawings of two groups of learning disabled children. The 33 males and 17 females in the study, all of whom had significant academic delays were divided into two groups according to chronological age. When their drawings were evaluated for indicators of emotional problems, no statistically significant differences between the two age groups were found.

Calhoun and Whiteley (1978) did find, however, a statistically significant relationship between a measure of self-esteem (Coopersmith Self-Esteem Inventory, 1967) and the self-drawings of eight secondary school age students who were considered educable mentally retarded. Iretion, Quast, and Gantcher (1971) also found that the Draw-A-Man Test (DAM) was an effective means of indicating a need for further, more sensitive testing for behavior and learning problems. These three researchers screened all children 4 to 6 years old who entered a pediatric clinic over a 9-month period. All subjects who scored below 85 on the DAM Test (Harris, 1963) were identified and screened for other possible learning problems, speech problems, visual and motor problems, and retardation. Of the 38

### Table 1 (continued)

<p>| Walker, 1980 | Learning disabled | Can painting and/or gross motor activities program decrease the hyperkinetic activity of learning disabled children? | Four elementary school age learning disabled children randomly selected from a group of 12 children who had been matched for attention to task behavior | Four subjects | Observation by judges to establish baseline behavior for attention to task (Frostig, no date) | Two treatments: one consisting of 30 minutes of painting a day, the other of 30 minutes of running, skipping rope, and tossing balls for 5 days | ABAB reversal design (time series strategy) | For three of the four subjects, art activities were most effective in increasing attention to task behavior. For one subject, it was the gross motor activity that significantly increased attention to task behavior. For three of the four, the attention to task behavior increased by at least 20% |
| Wood, 1977 | Learning disabled | Can directed art activities increase visual perception in learning disabled subjects? | Eight subjects having a mean chronological age of 9.3 years, 7 of whom scored 90 or below on the Frostig Developmental Test of Visual Perception. No report of sex or socio-economic status; no reported random selection | Eight subjects | Frostig Developmental Test of Visual Perception; Wide Range Achievement Test (Wright, 1976); and Peabody Picture Vocabulary Test (Dunn, 1985) | Draw-A-Person Test (Urban, 1965). Eight weeks of directed art activities (no details specified as to type) | Quasi-experimental (pretest, treatment, posttest; no control group or randomization indicated) | All subjects increased 11.62 on the Frostig Developmental Test of Visual Perception, which was statistically significant. Visual motor functioning improved for all subjects when pre- and posttest &quot;learning quotients&quot; for subjects were compared |
| Buchara, Zahn, &amp; Raskins, 1975 | Learning disabled | Do figure drawings of learning disabled children differ on emotional indicators from the drawings of non-impaired children? | Two groups: an experimental group of 35 children matched in age (5 to 13 years) and sex (40 males and 30 females) with a control group of 35 children | 70 subjects | Human Figure Drawings scored according to Koppitz for 30 emotional indicators | Subjects asked to draw a human figure | Ex post facto | The drawings of the experimental group showed omissions of hands and feet, excessive attention to eyes. The experimental group demonstrated a statistically significant occurrence of two of the Koppitz emotional indicators, feelings of inadequacy and sense of insecurity and helplessness |
| Netley, 1973 | Learning disabled | How do subjects with drawing disorders differ from non-impaired subjects on other tests? | 15 males, each of whom was referred to the hospital because of academic achievement problems. This group was matched for age and IQ (Wechsler Intelligence Scale of Children) with a control group of 15 males. The experimental group scored one standard deviation above the norm on the Bender Gestalt Test | 30 males | Guessing Games Test, Motor Skills Test, and Prismatic Distortion Tests (Netley, 1973) | All tests were individually administered | Ex post facto | The experimental group made statistically significantly more guesses on the Guessing Game Test, and had more difficulty in analyzing sequentially a visual array and solving problems with visual-motor integration than did the control group |</p>

</table>

37 October 1983, ART THERAPY 33
children thus screened, 36 did indeed have a higher occurrence of mental retardation or cognitive and behavioral problems.

Bachara, Zaba, and Raskin (1975) also discovered a significant difference in the emotional indicators (feelings of inadequacy and a general sense of insecurity and helplessness indicated by over-attention to the eyes and omission of hand and feet in the drawings) of the figure drawings of two groups of children, ages 5 to 13 years who were matched for sex, age, and intellectual functioning, but differed in terms of learning problems. One group had learning problems including eye/hand coordination problems, difficulty with tracking, and difficulty with visualization. The control group had no visual or academic difficulties. The figure drawings of the learning-disabled group displayed two of Koppitz's indicators of emotional problems.

Arkell (1976) found that it was possible to predict emotional maladjustment from the figure drawings of children. This researcher took the drawings of 20 children, half of whom had been diagnosed as emotionally maladjusted by means of clinical evaluations. These drawings were shown to five groups of judges: one group each of teachers, students, clinicians, administrators, and secretaries. All judges were able to predict those children who had emotional disturbances from their drawings, 79% to 83% of the time.

Davis and Hoopes (1975), however, found that judges could not predict emotional disturbances from the House-Tree-Person drawings of hearing impaired and hearing children. Judgments of these drawings did not match teacher evaluations of the children. Although there were some differences in the ways the hearing impaired children drew trees and mouths, those children who had been identified as emotionally disturbed produced drawings that judges did not identify as the work of emotionally disturbed persons.

Taking a somewhat different approach, Netley (1973) investigated how children who had demonstrated drawing problems differed on other types of tests from children who were matched with a control group of 15 males. The experimental group had error scores that were one standard deviation above the norm on the Bender Gestalt Test (Koppitz, 1964). The experimental group had more difficulty in sequentially analyzing a visual array, more difficulty with visual-motor integration, and made more guesses on the Guessing Game Test (a test developed by Netley for the study).

Although the evidence is not conclusive, these studies suggest that it may be possible to identify students with potential emotional problems by assessing their figure drawings. The contradictory results in this area of study suggest the need for a larger, more comprehensive study of the House-Tree-Person and Kinetic Family Drawings of matched groups of the six major handicapping conditions (learning disabled, mentally retarded, emotionally maladjusted, hearing impaired, visually impaired, and orthopedically handicapped) matched with non-impaired groups of children, so that a set of norms can be established against which future research studies in the area might be compared. In addition, these same groups of matched subjects could be given the other standardized assessment instruments that have been used in the research studies mentioned above. Specifically, these six studies utilized the following assessment instruments: Coopersmith Self-Esteem Inventory (1967); Behavior Rating of Pupils Scale (Lambert & Bower, 1961); and Guessing Game, Motor Skills Test, and Prismatic Distortion Test (Netley, 1973).

Norms, once established, might be helpful in predicting emotional and visual-motor problems. Without such norms, prediction of any type of problem based on only one or two drawings from one subject can be tenuous at best. Moreover, such a research project might help to clarify the issue Rubin (1982) addressed—that standardized measures of personality traits and self-concepts are not sensitive enough to assess the deficits or progress of a specific handicapped individual.

Studies of the Learning Disabled

If the research studies are grouped by type of handicapping conditions, the largest single group of studies included in the NCAH literature review concerned the learning disabled. In addition to the five studies of the art products of the learning disabled already discussed (two of which were studies of learning disabilities and other handicaps), five other studies focusing on art and the learning disabled student were identified (Gair, 1975; Miller, Sabatino, & Miller, 1977; Silver & Lavin, 1977; Walker, 1980; Wood, 1977). This research suggests that use of traditional remediation techniques does not inhibit the artistic expression of the learning disabled student (Miller, Sabatino, & Miller, 1977) and that art activities can be effective remediation tools (Gair, 1975; Silver & Lavin, 1977; Walker, 1980; Wood, 1977).

Some of the traditional types of visual-perceptual mediation have been identified as potentially inhibitory to other artistic work. Miller, Sabatino, and Miller (1977) investigated how much remediation could affect the art work of learning disabled students. Tested were 35 female and 78 male students ages 6 to 10. Of these, 56 had no visual perceptual dysfunction and the rest had visual-perceptual problems, were underachievers, and had word recognition problems. All children tested were randomly assigned to three experimental groups and one control group. Each of the three experimental groups was given one standard type of visual-perceptual remediation (Merrill Linguistic Reader, the Frostig Program for the Development of Visual Perception, and the Early Childhood: Form Constancy Program). The control group received standard remediation work without any special visual-perceptual remediation. All children were asked to make pre- and posttest drawings illustrating a story they had been told. These drawings were rated by art education graduate students on seven independent variables. The results of these evaluations indicated that children who received spe-
specific visual-perceptual remediation techniques did not experience a disruption in their drawing abilities.

Silver and Lavin (1977) studied the potential of art for remediation with learning disabled students. They used three types of tasks (forming groups, spatial relationships, and ordering and conserving) incorporating art materials to remediate 11 children who had visual-spatial handicaps. All children made 22 pre-treatment drawings and were then involved in 10 Saturday art sessions, each an hour long, organized so that each child received individual instruction. Instruction was provided on a one-to-one basis by 11 art therapy graduate students. Post-treatment drawings of all children were evaluated and compared with the pre-treatment drawings and indicated a statistically significant improvement in the three task areas. The authors concluded that art can be an effective remediation tool for learners with visual-spatial handicaps.

Wood (1977) also found that art activities improved visual-perceptual functioning for eight children with a mean age of 9.3 years, seven of whom scored 90 or below on the Perceptual Quotient of the Frostig Developmental Test of Visual Perception (FDTVP). After 8 weeks of art activities, all children increased 11.62 points on the FDTVP, which was a statistically significant gain.

Gair (1975) also studied the potential of art in remediation of visual problems of students. She tested 20 children ranging in age from 7 to 12 years and having average IQ scores of 102. All children were given the five visual subtests of the Illinois Test of Psycholinguistic Abilities (ITPA) and all were asked to draw a design and a self-portrait prior to any experimental treatment. The treatment consisted of a slide/tape design curriculum that required 29 art tasks, and ran 1 hour a day, 5 days a week, for 7 weeks. After the treatment program, the children were again given the ITPA subtests and asked to draw a design and self-portrait. Pre- and posttest treatment drawings were rated on an author-developed scale and indicated a statistically significant increase in ratings. There were also statistically significant increases in ITPA scores in visual reception, visual association, visual closure, visual memory, manual expression, and receptive-expressive tasks. Gair concluded that art-based learning can help children learn other tasks and can improve visual skills as measured by the ITPA.

The effectiveness of art as compared to movement as a remediation and training vehicle was investigated by Walker (1980). She found that art was more effective than movement for remediation and training in working with hyperkinetic subjects. Using a time series ABAB reversal research design, she investigated the effects of painting and physical exercise on the level of hyperkinesis of four elementary school, learning disabled students. The students had been randomly selected from a group of 12 who were matched for attention to task behavior. Treatment A consisted of painting half an hour a day for 5 days. Treatment B included running, skipping rope, and tossing beanbags half an hour for 5 days. For three of the four children the art activities were the most effective in increasing attention to task behavior. The three increased their attention spans by at least 20%. For the fourth child, it was the gross motor activity that significantly increased the attention to task behavior.

Mention should also be made of those studies already cited that deal with art products of learning disabled subjects. Raskin and Bloom (1979) found no statistical difference between two age groups of learning disabled students and their indicators of emotional problems as illustrated in Kinetic Family Drawings. Bachara, Zaba, and Raskin (1975b) did find a statistically significant occurrence of two of the Koppitz emotional indicators in a group of 36 learning disabled students. Ireton, Quast, and Gantcher (1971) discovered that the Draw-A-Man Test could be used as a means of screening 4- to 6-year-old children and identifying those who have learning problems and need to be tested further. Finally, Netley (1973) found that children with learning disabilities that were manifested as drawing disorders also scored differently on three other tests, had more difficulty in analyzing sequentially a visual array, and had problems with visual-motor integration. These research results suggest that drawings can be used as a means of identifying learning problems.

Studies of the Mentally Retarded

The next largest group of studies identified were four investigations of visual arts programs for the mentally retarded. Two of these four studies were with the mentally retarded and the multiply handicapped, and one with mentally retarded, behaviorally disturbed, and learning disabled children. Like Walker (1980), Carter, Richmond, and Bundschuk (1973) found that visual arts activities were more effective than gross motor activities in achieving a particular result. In the latter study, the result being measured was an increase in the creative thinking of the mentally retarded subjects.

As noted above, two studies dealt with the art products of mentally retarded persons. Calhoun and Whitley (1978) found that the self-drawings of mentally retarded, secondary school students correlated with a measure of low self-esteem. Ireton, Quast, and Gantcher (1971) found that the Draw-A-Man Test could be used to identify retardation as well as learning problems and could serve as an indicator of the need to further test children ages 4 to 6 in a pediatric clinic.
Both Bryant and Schwan (1971) and Arem and Zimmerman (1976) investigated different instructional methods that might be appropriate for use with the mentally retarded child. Bryant and Schwan found that a structured approach using drill and repetition was helpful in teaching art information and design terms to 13 students with chronological ages ranging from 8 years 6 months to 12 years 9 months, and IQ scores that ranged from 59 to 108. Arem and Zimmerman (1976) found that a group of 54 educable mentally retarded children learned best when a modeling treatment was used. The control group of 68 nonretarded children were not helped in learning a task when the same strategy was used. It is interesting to note that

21 hearing impaired children of normal intelligence, ages 5 years 6 months to 7 years 9 months. The 21 children were taken from the population of two classrooms of two state schools for the deaf. These subjects were randomly assigned to four groups and all groups were given both the control and experimental treatments. As a pretest, Form A of the Boehm Test of Basic Concepts was administered. Two groups were taught the unmastered concepts from the BTBC using an art curriculum and the other two groups were taught the same language concepts using a traditional (non-art) curriculum. After 5 weeks, Form B of the BTBC was administered to all children and then the treatments for each group were reversed. Then, after 5 additional weeks, Form A of the BTBC was readministered to all the children. Every child made statistically significant improvement in concept development when the art curriculum was the treatment method.

...if art activities can enhance the acquisition of language concepts, can they also enhance the acquisition of ... other concepts from the school curriculum?

when the researchers checked for instances of copying in conjunction with the modeling treatment, there was less than a 5% incidence of copying from the model presented in the educable mentally retarded group. This result is thought-provoking because "copying" is often one of the main criticisms that professionals make when a modeling methodology is used with children. The results of this study suggest that that criticism is not a valid one.

The final study of art with the mentally retarded was a report of the results of a special creative arts program to increase both the mentally retarded and multiply handicapped subjects' visual-perceptual skills beyond expected levels for this population (Musick, 1977). The program, which ran twice a week for 20 weeks,

Studies of the Hearing Impaired

In addition to the study of the drawings of hearing impaired children discussed above (Davis & Hoopes, 1975), there were two studies of hearing impaired children and the effects of art activities on the development of their cognitive skills and language development. Silver (1975) studied the effects of an experimental art curriculum on the cognitive skills of 36 children from a school for the deaf. Half the children were randomly placed in an experimental group and half in a control group. The experimental group was exposed to a variety of art tasks over 11 periods. All subjects were evaluated on 14 cognitive skills before and after the experimental treatment. The experimental group made statistically significant gains on the 14 cognitive skills.

One of the few studies that investigated the effects of an integrated art and language curriculum on the language development of hearing impaired students was one by Greene and Hasselbring (1981). Using an ABAB research design, they tested...
experience, and handicapping condition. Without matched subjects, one cannot make any conclusive statement as to whether a particular treatment was the cause of subjects' behavior changes (Kerlinger, 1973).

In addition to these inadequacies in experimental design, there were failures in defining the handicapping conditions being examined or the population being tested. For example, one study might state that mentally retarded, primary school children were tested, without providing any information as to what was meant by the term retarded and without specifying the subjects' ages. It would be more helpful to indicate that subjects ranged in chronological age from 10 years 5 months to 12 years 4 months and scored 45 to 55 on the same standardized test (such as the Stanford Binet Intelligence Test) and had no handicapping condition other than mental retardation.

Another problem that arose was the failure of many researchers to describe adequately the instruments they used to assess abilities or personality traits. At times a researcher would refer to the Draw-A-Man Test or to the Draw-A-Person Test or the Human Figure Drawing Test without specifying the originator of this instrument. Without this information about the assessment tools used, no researcher would be able to replicate the study. Moreover, in many studies, researchers discussed their own assessment tools and evaluative instruments or art product rating scales without clear explanations as to how these self-developed tests and scales were originated, refined, validated, and made reliable. Researchers also often failed to describe sufficiently the experimental treatments used.

Exemplary Studies and Recommendations for Meeting Research Needs

Perhaps two of the best studies reported in the NCAH literature review were the Walker (1980) study and the Greene and Hasselbring (1981) study. Both provide enough information about methods of selecting subjects and about pre- and post-treatment assessment tools so that it is possible to replicate these studies. Also, the Walker study explains how a time series strategy can be used in research with a very small number of subjects (in this case only four). The Greene and Hasselbring study (1981) provides a useful explanation of what is meant by an ABAB reversal research design. Because of clear reporting of their method of subject selection and assessment of pre-experimental behaviors and because of thorough attention to systematic research methods and appropriate statistical treatment, these studies are examples of good research in the visual arts with handicapped children. Moreover, their findings are credible and impressive; these two studies do document with hard evidence that carefully planned art activities can have positive effects on the development of language concepts and increased attention spans. Also, these studies are cast in terms that even the most skeptical scholars from disciplines outside of art therapy readily understand and respect.

Not only does a critical analysis of existing research studies in art for the handicapped underscore the need for better, more systematic study, but such an analysis also points out that there are many knowledge gaps in the field. There is a pressing need for more sensitive testing and evaluation in order to pinpoint more precisely the kinds of art tasks most helpful in the remediation of learning problems. For example, is one art medium better than another in remediating visual sequencing? Is a structured sequence of marker drawings more effective than a "free choice" drawing? Motor control is another area in which knowledge is inadequate. The research discussed in this review tells nothing of the effects of art activities on the improvement of motor control for orthopedically handicapped or mentally retarded persons. There is also a need for more systematic study of visually impaired and behaviorally disordered persons. If art is effective in the remediation of learning problems, can it also remediate problems that accompany other such handicapping conditions?

An integrated art and language curriculum can significantly enhance the language development of hearing impaired students (Greene & Hasselbring, 1981). What would be the results of similar studies with other handicapping conditions, especially mental retardation? Moreover, if art activities can enhance the acquisition of language concepts, can they also enhance the acquisition of reading, social studies, mathematics concepts, and other concepts from the school curriculum? In the treatment of emotionally disturbed individuals, what is the unique therapeutic effect that one art activity or a series of art activities can produce?

Finally, as noted above, there is an urgent need to examine existing assessment instruments and determine if they are suitable for subjects with handicapping conditions. If existing tools are suitable, then norms need to be established for these tools with various ages and types of handicapping conditions. If, as Rubin (1982) suggested, the existing tools are not sensitive enough for this purpose, then there is a pressing need to develop more appropriate assessment tools for use in research with individuals with handicapping conditions.

Art therapists believe strongly that art is a major means of treatment. The profession must document this belief in terms that laypersons and scholars from other disciplines can understand and accept. If art therapists lack the research skills and training to do this kind of investi-
peration, then it is important that they acquire this expertise or interest scholars and researchers from other disciplines in collaborating with them to do the needed research (Anderson, 1981).

There is also a gap in systematic research in most studies being undertaken in art therapy. This research is necessary to provide standardized information for building the knowledge base of art therapy and for replication of important studies. With this need in mind it is interesting to note that the most widely used form of research reporting, the case study, has no generally accepted, systematic format for conveying information. Without this standardized format, researchers from outside the art therapy field are not as willing to accept the case study as appropriate research methodology. In fact, case studies are important research strategies; they help in developing hypotheses that, in turn, can form the basic questions for planning and implementing research strategies. What is needed is a generally accepted format and the systematic inclusion of certain kinds of information for all case studies. Moreover, a case study approach can increase its potential for generating data if time series strategies and ABAB reversing treatment research strategies are utilized.

If art has value as a treatment modality, and if this value is supported by evidence obtained from case studies, then the use of art as a treatment and assessment tool will stand the test of other types of research methods. Art therapists must begin to use other research methodologies, in addition to the traditional case study, if they are to expand knowledge and justify the discipline to scholars and policymakers outside the field.

Identifying Gifted Handicapped Children Through Their Drawings

Rawley A. Silver, EdD, ATR

Rawley A. Silver, EdD, ATR has conducted three research projects on art and the handicapped, supported by the U.S. Department of Education, the National Institute of Education, and the New York State Department of Education. Parts of the following article are excerpted with permission from the manual of Silver Drawing Test of Cognitive and Creative Skills, published by Special Child Publications, Seattle, Wash., Copyright © 1983.

This study explores the question whether a drawing test can be useful in identifying children who have intellectual abilities that escape detection on traditional tests of intelligence or achievement. Two such children are considered: Joey, 8, learning disabled; and Alan, 14, an "average" student.

In the test under consideration, drawing takes the place of language as the primary channel for receiving and expressing ideas. Stimulus drawings prompt response drawings that solve problems and represent concepts. There are three tasks, designed to assess levels of ability in conceptual, spatial, and sequential thinking—the three areas of cognition said to be fundamental in mathematics (Piaget, 1970) and in reading (Bannatyne, 1971; Rugel, 1974; Smith, Coleman, Dokecki, & Davis, 1977).

The Drawing from Imagination task assesses ability to associate and form concepts. When appropriate, drawing responses are also scored for projection of feelings and for language skills. The Drawing from Observation task assesses concepts of space, and the Predictive Drawing task assesses ability to sequence.

In previous studies, the test was used to assess the abilities of children and adults who were language-impaired, hearing-impaired, learning disabled, or emotionally disturbed. Norms were developed, and in a pilot study, gifted children showed unusually high scores for their grade levels (Silver, 1973, 1976, 1978, 1982, 1983; Silver et al., 1980; Silver & Lavin, 1977).

Although the drawing test showed significant correlations with 10 traditional tests, a few children with high scores on the drawing test had low scores on the traditional tests. How can this be explained? Did these children have intellectual abilities untapped by the traditional tests? Were their low scores caused by subtle cognitive disabilities? Were they handicapped by emotional problems?

Whitmore (1980) found evidence that gifted underachievers had been confused with learning disabled children when, in fact, their major deficits were feelings of inadequacy. She cited special characteristics that cause the gifted children to be vulnerable: perfectionism (feelings of inadequacy and unrealistic expectations of performance), supersensitivity, deficit social skills, and social isolation.

These characteristics seem to fit one of the children, "Joey."

Joey

In the 2nd grade, Joey was not succeeding in the classroom. He had particular difficulty with reading and was on a behavior modification program. According to his teacher, "Only for that, I'm afraid he would not have progressed at all."

As measured by the Canadian Cognitive Abilities Test (CCAT), Joey's IQ was 91, below average. Only two of the 24 other children in his class had lower scores.

As measured by the Drawing from Imagination subtest, however, Joey had the highest score in his class, higher than the mean score of 103 2nd graders in the test's normative sample, higher than the eight gifted 4th graders in the pilot study, even higher than the adult sample. Joey scored in the 99th percentile.

To determine the relationship of the drawing test to the CCAT, the scores of the 25 children tested were correlated. On the Drawing from Imagination subtest, significant correlations were found at the .01 level (r = .50). On the other two subtests, Drawing from Observation and Predictive Drawing, no significant correlations were found.

Except for Joey, most of the children in his class were approximately as successful in Drawing from Imagination as they were on the CCAT.
The three children with the next highest scores in Drawing from Imagination had IQs ranging between 123 and 150 on the CCAT.

In the Drawing from Observation subtest, however, Joey had the lowest score in his class, well below the 2nd grade norm, placing him in the 14th percentile.

Joey’s remediation teacher had offered to help develop norms for the drawing test by giving it to pupils in her school. Then, because she was interested in acquiring new remediation techniques, it was arranged that she would follow the art program of our research project (Silver et al., 1980). Supervised via correspondence and telephone, she worked with Joey individually once a week for 12 weeks.

While the art program with Joey was in progress, the CCAT was again administered, as it was once a year in his school. Joey’s score increased 8 points, from 91 to 99.

**Joey’s Drawings**

Joey’s pretest Drawing from Imagination, Figure 1, entitled, “The Killer,” (sic) seems to represent a doctor operating on a patient who calls for help even though anaesthetized. Upstairs, someone lies in bed, snoring.

Although Joey did not explain his drawing, it nevertheless provides considerable information about his ability to form concepts. It is recognized that impairment of this ability underlies maladjustment and language disorders. Forming concepts involves making selections, associating them with past experiences, and combining them into a context, such as selecting words and combining them into sentences. Selecting and combining are the two fundamental operations underlying verbal behavior, according to the linguist, Ramon Jakobson (1964). They are also fundamental in drawing—selecting subjects and combining them into images.

In the Drawing from Imagination subtest, the task is to select two subjects, one from each page of the test booklet, combine them into a narrative drawings, and give the drawing a title. Children are encouraged to change the stimulus drawings and to add other images of their own.

Joey’s response drawing does more than simply show what his subjects do, the functional level typical of 8-year olds. It indicates that he selected subjects at the conceptual level, on the basis of an imaginative, well-organized idea that implies more than is visible.

His drawing shows that his ability to combine goes beyond the base line level, also typical of children his age (someone is upstairs). Furthermore, his ability to represent goes beyond imitating or restructuring the stimulus drawings of the test booklet. His drawing is original and expressive, representing feelings of intense distress and suggesting that he identified himself with either the victim, the sleeper, or the “Killer.”

Joey’s pretest Drawing from Observation, Figure 2, provides consid-
erable information about his spatial thinking. In this subtest, the task is to draw an arrangement of three cylinders differing in height and width, and a stone. Joey's response shows only one of the objects in the correct position—the tallest cylinder on the right. He confused all the left-right and above-below relationships, and failed to show any depth in his drawing although two objects in the arrangement were, in fact, in the foreground and two, in the background. Most 8-year olds can perceive and represent accurately these left-right (horizontal) and above-below (vertical) relationships although they often miss front-back (depth) relationships, drawing all objects in a row. Consequently, Joey's score in the 14th percentile, in Drawing from Observation, strongly suggests that something is wrong.

The art program begins with drawing from imagination, selecting stimulus drawings (different from those in the test booklet and now presented in groups according to category).

Joey selected an elephant and a tree—an old gnarled tree with a small young tree at its side, then drew "The Elephant's Journey," Figure 3. Although the elephant is under a cloud, it smiles. Birds are nesting or on the wing, and the feeling projected suggests hope for pleasant things to come, perhaps a metaphor for the new art class.

With time for another drawing in his first art session, Joey selected a whale and an alligator, then drew, "The Fight is Going to Begin," Figure 4. The whale and alligator confront one another, the alligator (and another old tree) on land, the whale (smiling) at sea, with birds and a 747 in the air. This drawing suggests that Joey was having second thoughts about the art program.

The following week, Joey drew "The Bear Chased them Away" (sic), Figure 5. An unsmiling bear stands between two trees, one behind him, the other in front. The trees seem to hold back the sun as they hold back the bear. Facing the bear on the other side of the tree is a red car with a yellow flag, black wheels, and blue roof lamp, suggesting a military or police car, and above the car is a dark blue cloud. Only the car, cloud and sun (yellow) have colors, and they are colored in heavily with many strokes of a fine point, indicating that they were of much concern. Joey's title suggests a wish, contradicted by a drawing that projects feelings of isolation and frustration.

The next session of the art program called for painting (mixing tints
and secondary colors, then painting from imagination). Painting was followed by drawing from observation (an orange and a roll of construction paper at first, an apple was added, then a toy landscape). The following sessions included clay modeling, family portraits, and self-portraits (Joey drew himself smiling.) Joey's remediation teacher, Miss A., reported that even though he was "still struggling with objects in space," his classroom teacher had said, "You have Joe all turned on these days, 'so he is thoroughly enjoying his experiences.'" She felt that he had "improved almost 100%." Previously she had described him as "lashing out at his peers, sometimes justified but often uncalled for." As seen from an adult's point of view:

Deep within, I believe Joe is hostile because he cannot express his very average abilities in our educational system. As I recall, his performance on the WISC-R was one in which the Performance IQ was superior to the verbal, thus Joey's dilemma, to exist in a school system which depends highly on the verbal component of the WISC-R.

Before a week had passed, however, a series of unhappy events began to unfold. Miss A., reporting on his ninth art session, wrote that she was not pleased with the results, "perhaps the answer lies in the fact that his regular teacher threatened him with missing the art lessons because of some misbehavior on his part." Joey's teacher carried out her threat, cancelling two lessons. Then Miss A. became ill, postponing their 10th meeting for 5 weeks. With only 2 weeks before the end of the school year, she provided a final session in drawing from imagination, then administered the posttest.

After the summer recess, two letters addressed to Miss A. went unanswered. Then, on learning that her telephone number had been assigned to someone else, I wrote to the school's principal who replied that Miss A. had died.

Since then, inquiries about Joey's progress in school have produced meager results: when the CCAT was administered the following year, Joey's score dropped to 90 from 99 the previous year (during the art pro-

Figure 5.—"The Bear Chased Them Away," (sic) by Joey.

Figure 6.—Posttest Drawing from Observation, by Joey.

Figure 7.—"The Dog Chasing the Cat," by Joey, Posttest Drawing from Imagination.
being chased, it does not seem very unhappy compared with the man on the operating table in Figure 1. Thus one change is in Joey's Projection score, no longer the expression of intense feelings of distress.

Another change is in the form of the posttest drawing: a house is in the background, a wall in front of the house, a tree in front of the wall, and the chase carried on in front of the tree—spatial concepts that are unusual in drawings by 8-year olds. Thus Joey's score in Ability to Combine improved.

A third change reduced his score in Ability to Select. In this drawing, Joey seems to have selected the dog and cat on the functional rather than conceptual level, simply showing what they do. Furthermore they seem static compared to his dynamic pretest drawing. Thus Joey's gains in spatial concepts were offset by losses in content and creativity. He scored in the 91st percentile in his posttest Drawing from Imagination, down from the 99th percentile in his pretest Drawing from Imagination.

Was a decrease in spontaneity and expressiveness the price that was paid for gains in spatial skills? The only further evidence available is in Joey's last drawing from imagination, produced the week before the posttest was administered.

"Seeing an Elephant in the Woods!" Figure 8, was produced in the 10th and final session of his art program. Joey had selected the stimulus drawing of a young mountain climber wearing a backpack. In his drawing, however, the climber is elderly. He climbs a tree looking for the elephant in the wrong direction and wearing dark glasses. This drawing resembles Figure 5: the bear is now an elephant and the cloud extends across the sky. Once again, Joey's title contradicts his drawing: the man could not see the elephant, and as though to reinforce the contradiction, the elephant would be hidden from the airplane as well. The trees would hide it from view even if the plane had windows.

Scored in the 99th percentile, this drawing received the same score as his pretest Drawing from Imagination, suggesting that Joey's spontaneity and expressiveness were still intact, and that he was still burdened with feelings of frustration, isolation, and inadequacy. Even Miss A had low expectations, referring to Joey's "very average abilities." These expectations may have blinded her to his true potential and blocked her kind intentions as the trees in his drawings blocked the sun and hid him from view.

Alan

Alan, 14, took the drawing test when it was administered to his class in order to develop 8th grade norms. The 21 children in his class were the total number of 8th graders in his school, a small public school in an urban, low to middle socioeconomic neighborhood. Scores on the test were then compared with scores on the two achievement tests used by this school, the Iowa Test of Basic Skills (reading and math) and the California Achievement Test (CAT) (reading only). These tests had been administered by school personnel at the beginning of the school year. On the Iowa, Alan scored at the 8th grade 7th month level (8.7); on the CAT, at the 10th grade level (10.0).

Compared to the scores of his classmates, Alan's scores were just below the mean for his class on the Iowa, and somewhat above those on the CAT. Thus he seemed about average in intelligence for an 8th grader.

On the drawing test, however, Alan had the highest possible score, and so far he is the only person tested to have the highest possible score.

The drawing entitled "Possessed," Figure 9, is Alan's response to the Drawing from Imagination subtest. He selected a man and a knife, then made a sequence of drawings. In the first, a devil speaks to someone lying in bed, saying, "Come." Then, the person in bed becomes possessed by the devil, saying, "Get out!" as he faces a man who calls him "son," repeating "get out" as he wields the knife. Next, he looms over the man who lies stabbed, and finally vanishes as the words, "Be gone!" issue from a cross.

This drawing, highly imaginative in both form and content, also represents violence, injury, and danger, which are scored for Projection, like Joey's pretest Drawing from Imagination. A single such drawing may represent only a passing mood. Repetition, however, suggests a need for clinical follow-up and verification by other methods. Alan did produce another such drawing, but consider, first, drawings by the two students with the highest scores on the CAT and Iowa tests, Max and Sarah.
Max

Max scored at the 11th and 12th grade levels on the Iowa (11.0) and the CAT (12.9). He also had a high score in Drawing from Imagination. Selecting a bride and a mouse as his subjects, he produced, "Panic in a Church" (Figure 10). Like Alan's, his drawing is imaginative and represents intense feelings of unhappiness but there is a crucial difference: Max does not seem to identify himself with the suffering bride (groom?). He seems to be enjoying her embarrassment. Alan, on the other hand, seems to identify himself with the person possessed.

Sarah

Sara scored at the 11th grade level on the Iowa (11.0) and on the CAT (11.7). In Drawing from Imagination, however, she did not have a high score, and her total score on the three subtests was slightly below the mean score for the class.

Sarah's drawing from imagination, entitled, "Going to the Malt Shop," Figure 11, is descriptive rather than imaginative. She seems to have selected her subjects (a girl and an icecream soda) at the functional level—what they do or what one does with them—and represented an event that lacks the creativity and expressiveness of the drawings by Max and Alan. In projection, her associations were with a happy situation. She seems to identify with the girl to whom good things happen.

Why was Sarah's score low in the drawing test and high on the Iowa and CAT? Why did Max have high scores on all three tests? Why did Alan have high scores on the drawing test but moderate scores on the other two tests?

One possible explanation is that Max is strong in both visual and verbal thinking, the so-called left and right hemisphere skills; Sarah is strong in verbal thinking (high scores on the CAT and Iowa tests), weak in visual thinking (in the 44th percentile in the Drawing from Imagination subtest); Alan, is strong enough in verbal thinking to score at and above grade level on the CAT and Iowa tests, but his unusual skills in visual thinking are overlooked by these traditional, language-oriented measures.

Another possible explanation is that Alan is handicapped by emotional conflicts while Max and Sarah are well-adjusted. Reports in Alan's school file indicate that his mother had remarried when he was in the 4th grade, and that Alan had difficulty adjusting to his new family situation. His mother felt that this was the reason for his poor progress in the 4th grade, and in the years since, his progress remained poor. One teacher reported that he worked in spurs. Another reported conferences with his parents to discuss his work habits.

A week or so after taking the drawing test, Alan was asked to make another drawing from imagination,
using the stimulus drawings rather than the test booklet. Again he drew a series of events, entitled, "Murder," Figure 12. It starts with a bank hold-up, two people are shot, a robber escapes, is wanted for murder, is caught, handcuffed, and electrocuted. Alan's repeated fantasies about murder and punishment suggest preoccupation with emotional problems, which could explain, in part, why Alan may be a gifted underachiever. There was no opportunity for follow-up.

Conclusion

In order to function well in school, a child must be free from debilitating emotional problems. It is difficult for teachers, administrators, and parents to recognize that a youth like Alan may be gifted but handicapped by maladjustment, or that a child like Joey may be gifted as well as learning disabled. There may be many like Alan, masquerading as an average student, or Joey whose disability masks his true potential, their gifts hidden even from themselves, but manifest in their drawings. Identifying such children could be a useful first step in art therapy.

Making Verbal the Nonverbal: A Commentary

Mildred Lachman-Chapin, MEd, ATR

Mildred Lachman-Chapin, MEd, ATR, interim associate editor of Art Therapy, is acting director of the Graduate Art Therapy Program at Vermont College of Norwich University, Montpelier, Vermont. She taught art therapy courses in Washington, DC, and in Chicago where she had been the director of the Adjunctive Therapies Department at the Barclay Hospital for the past 4½ years.

Let us take a look at words. Here we are, putting together a journal, a collection of writings about our profession. In our work, we pride ourselves on being able to make verbal the nonverbal, to help our clients make, through their art, a visual expression of the truth about their lives. As we encourage and foster this process, watch it unfold, and respond to the client-in-process as well as to the final product, we are in touch with the client’s truth, we say, in a way that would not be possible if he or she were trying verbally to tell it to us. For most clients we also try at some point to translate something of what we see into words so that they can begin to be conscious about it, to find words for it. This is our specialty. We are trained to be directly in touch with what Spence (Narrative Truth and Historical Truth, 1982) refers to as the “historical.” This, as he describes it, is the vivid experience as lived, as opposed to the telling of the experience. In the telling, he says we weave a tale, we try to “make sense,” we distort by putting into “discursive” thought what is essentially “presentational” thought [as Langer (1957) calls it].

Malcolm (1983), reviewing Spence’s book describes succinctly what Spence terms the “conflict between what is true and what is describable.” Malcolm says, “The true memory or dream or thought is often so unformed and murky and inchoate that it cannot be expressed except by resort to narrative description, which somehow falsifies it. For it is the very nature of speech to form, rather than to express thought.”

Like Malcolm, I was intrigued by Spence’s book. Spence is a psychoanalyst who criticizes most severely what he considers the essential experience of psychoanalysis: the patient free associates in words as the analyst listens and responds in words with interpretive meanings. In this exchange, Spence writes, there are many avenues for distortion and error. Malcolm puts it this way:

Like the patient, the analyst, caught in the conflict between what is true and what can be described, opts for the describable. Inevitably, Spence writes, “in making a formal interpretation we exchange one kind of truth—historical truth—for the truth of being coherent and sayable—narrative truth.” In other words, if you can say it you are not being truthful, since the truth is unsayable, like the word of God.

Malcolm, coming to the defense of psychoanalysis, refutes Spence’s argument. She claims that he has missed the point by focusing on the “truth” of words, both as they are uttered by the patient and as they are interpreted and responded to by the psychoanalyst. The “truth,” she writes, is in the acting out of the transference between the two. She argues that the present, the here-and-now of the analytic encounter, not the past, is the true focus of psychoanalysis.

In a way, Malcolm’s argument brings us back to the nonverbal. In her view it is not what the patient is telling, but how the patient is behaving (which includes how he or she uses his telling, and how this use reenacts past expectations and demands), that holds the kernel of “truth” that is available for examination and change. Malcolm adds that in the end, if the analysis is successful, the patient is enabled to live with the “story” that he or she believed to be the story of his or her life. The patient has a new understanding, achieved after many hours of using words, but not directly attributable to the verbal exchange. The patient may not even be able to put into words what this new understanding is. Rather it is by the new feeling of self, the new way of relating to the world, that he or she “tells” people of the change.

As I was pondering our own professional dilemma, shared with verbal therapists and their clients, of how to use words to tell the “truth” of what we, as art therapists, encounter nonverbally, I came across a book on neurolinguistic programming. It is called Frogs into Princes and is written by Richard Bandler and John Grinder (1979), who don’t beat around the bush.

According to them, we use words to trigger unconscious and sensory responses. For it is at those levels, the authors claim, that we respond “truly” and where real change can occur. We react to the world, they say, through our three primary sensory systems: auditory, visual, and
kinaesthetic. Each of us has a preferred response mode. Some individuals are predominantly auditory (responding to what they hear or are told); others are visual (responding to what they can see or can visualize); and others are kinaesthetic (responding to what they can feel in their bodies). If you address a visual person with visual words (“Do you see what I mean?”), an auditory person with auditory words (“I hear what you are saying”), and a kinaesthetic person with feeling words (“What is your gut feeling about this?”) you, as therapist, will be more directly in touch with the client who is consequently more ready to work for change.

Then, through words, you lead the client to approach directly his or her own sensory responses, which become messengers of unconscious “parts”—those conflicting elements of his or her inner life that cannot be controlled through cognitive awareness. As a therapist you first use words to trigger the sensory gatekeepers of the unconscious into action. You then address the unconscious directly, as the gatekeepers allow it, coaxing, bargaining, wheeling, and dealing. Change comes, then, through successful bargaining with the unconscious. The conscious, the awareness that the client can express verbally, is bypassed. The therapist’s words are used to bypass the client’s cognition as a controlling element of change. The authors were led to work out this theory by observing and studying the work of Virginia Satir (1964, 1972) and Milton Erikson (Haley, 1967; 1973); they attempted to understand and duplicate the ways these therapists were able to effect quick and dramatic patient change through certain indirect verbal approaches to the patient’s unconscious.

Do what art therapists do with words? Do we use them to heighten awareness, to bring cognitive control, to further insight? Do we use them to bypass the conscious system in our own way—perhaps poetically? Do we use them to further transference, or do the psychoanalysts? Do we do all of these, none of these, or something else? I continue to examine these questions.

What I can answer at this moment is that even if we are not sure how we use words with clients, we do need to use them as we relate to and learn from each other and our professional colleagues. This brings me back to our difficulty in writing, talking, and thinking about what we do. Those of us charged with training students to reach their client’s “truth” through nonverbal images, find the process full of traps. One trap is the too-easy translation of images into words—“this means this; that means that”—which so often not only distorts, but also inhibits the unfolding of the living “historical” truth.

In the encounter with our client who makes pictures or art objects in order to convey some truth about himself or herself, we wonder how to complete the dialogue. Like verbal therapists, we wonder what words to use that will not distort the “truth” of the client’s tale without words. If we try to translate it into words, we do an injustice to all that is unwor ded in their visual images. Instead, we can construct a response in kind, a poetic response reflecting, reverberating, rephrasing, what we know of the client through the images made explicit in art work. Verbal metaphors can do this, if words are what we must use. A special kind of language is needed as we watch and register our client’s images. (What is the visual counterpart of “listen,” a word about receiving? “See,” “watch,” “look” are too active.) Once this contact is made, we, like other therapists, must choose the guiding theoretical framework we will use to effect change for our client—psychanalytical psychotherapy, neurolinguistic, or any other. Or maybe sometimes giving the right response to the unsayable becomes in itself a step out of life’s dilemmas for the patient, something like being understood and supported at the right time. In any case, we have learned that we must use words in a special way in referring to visual meaning. I think our special way with words should be similar to that of the poet or novelist who makes an image tale or paints a word-picture.

Once we are reasonably well versed in this new way of using words, we are faced with having to use them in still another way, to describe for other professionals what we have done. In our collaborative work in institutions, should we use the lingo of the milieu in which we work—medical, educational, social work, and so on? Or should we try to offer, through words, something of what “really” was being experienced by the client in the making of art? Pragmatism and the pay check may point the way more than a little here. In writing about our work in professional journals such as this, we must also be able to use language as scientists do, with precision and clarity. For here we are trying to write in a way that will enable others to understand and duplicate our work. Logical analysis, organized thinking, clear sequences of thought are our ways of making certain the reader can do again what we have done, or think what we have thought. That means that we must dig as hard, articulate as clearly, question as profoundly, and analyze as logically as possible.

Those who have already done this in art therapy have created a theoretical foundation for us. They have helped us know what we are doing and how to share this with each other. In particular, I refer to Elinor Ulman, who founded the American Journal of Art Therapy 20 years ago, before the American Art Therapy Association began. Through her writings she clarified some of our basic concepts. She has been a relentlessly demanding editor of that journal, insisting on the highest standards of clarity in thinking and writing. Not only did she require that you have something meaningful and relevant to say, but she also insisted
that you say it well, which, I think, comes down to combining the word-language of the scientist on the one hand with the poet’s reconstruction of reality on the other.

The American Art Therapy Association, Inc. (AATA)

GENERAL MEMBERSHIP INFORMATION:
All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, The AATA Journal, discounts on publications, discount on admission to the annual convention, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (A.T.R.). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA office.

MEMBERSHIP CATEGORIES:
Initial application for membership in the Association shall be accepted in one of the following classes: ASSOCIATE, STUDENT, or CONTRIBUTION. Applications for PROFESSIONAL membership shall be reviewed following one year of association membership in good standing.

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the Annual Meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee.

Annual Dues: $25.00

Applications for student membership must be accompanied by a copy of current ID.

Associate Membership shall be open to individuals interested in the therapeutic use of art, and who wish to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the Annual Meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $40.00

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $80.00

Professional Membership is subject to approval by the Membership Committee, individuals who have been associate or student members of the Association for at least one year and who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art are eligible. Professional membership shall provide for their participation in all activities of the Association and receipt of all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA office for an application.

Annual Dues: $65.00

Credentialed Professional Membership shall be open to individuals who have met the qualifications and been approved for Professional membership and have been granted Registration (A.T.R.) by the American Art Therapy Association, as set forth in Documents and Procedures Relevant to Professional Registration.

Annual Dues: $70.00

October 1983, ART THERAPY
VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. The following selections are related in their emphasis on art.

The Art in Art Therapy

Harriet Wadeson, PhD, ATR
Chicago, Illinois

As one who has been clothed in the garments of "art psychotherapy," it is unusual for me to be recognized in my "importance of art" garb. Perhaps these are my undergarments, which I presume others know I wear even if they do not show. It is about that respect of our work that I wish to address, as well as the extension of creativity into the therapeutic relationship. Is art, therapy? Is therapy, art? That both are possible is obvious, because as art therapists we know that this combination is the power and purpose of our work. And yet subtle pressures often lead us astray from the very heart of our unique philosophy: art as therapy and therapy as art.

A particularly strong pressure is one that I call "institutional." As a director of an art therapy graduate program, I have witnessed the experience of students and graduates as they enter the field. Often, they work in isolation from other art therapists, being the sole art therapy member of a treatment team. The hierarchical ladders they begin to ascend, usually from the bottom rungs, are seldom art-oriented. More often these hierarchies are developed along a medical, social service, or educational model. I refer to these institutions as hierarchies (rather than as hospitals, agencies, or schools) because it is their hierarchical structure that has an impact on the art therapist in terms of power. Entering this sort of structure not only at the bottom, but also as an anomaly, beginning art therapists often feel pressured to conform to the modus operandi of the facility. I have seen art therapists trying to assess patients in the manner of the facility, to chart the same sort of material, to transmit information to other staff in the way in which they communicate with one another, and finally to relate to patients and clients in the manner of other therapists. They become junior psychologists, social workers, or psychiatrists in looking for the way up the ladder. Often they have few other models. The art becomes a mere activity or excuse for contact.

What gets lost is art's powerful potential for catharsis, immersion in feeling, synthesis, and integration. Lost is a fuller communication through imagery, spatial relationships, color, and texture. Lost is art's great ladle for dipping into the unconscious soup. When art therapists forget the mysterious therapeutic possibilities of art-making, they lose their unique source of power.

But that is not all. If there are any therapists whom one would expect to bring creativity to the therapeutic relationship, it would be therapists whose métier is art. It has long been recognized that creativity requires some degree of spontaneity. And yet there are art therapists who plan activities in advance and do not deviate from them, who eagerly seek out "techniques" that others have used. Art therapy in this sense becomes a resort to gimmicks. Therapy cannot be a lesson plan or a series of exercises. What gets lost is the art therapist's sensitivity and responsiveness to the client's ongoing process, and often to the relationship as well. And the art expression also may be diminished because it comes from the therapist's agenda rather than the client's expressive potential. This sort of overs-structure is often a response to the art therapist's own anxiety at the expense of creative spontaneity in relating to clients.

I believe we must look for solutions to the all-too-understandable pressures that cause a beginning art therapist to feel anxious, isolated, and powerless. I believe we must provide art therapy models in addition to those provided by other professionals in the beginning. art therapist's development of professional identity. Art therapists may need to be encouraged to recognize what we already know. We need to remind ourselves and our colleagues that our area of expertise is different from that of other professionals. If we remember the power of art for self-expression, communication, understanding, and integration, and approach the therapeutic relationship with creativity, we will recognize that ours is a unique way in which to work with others. If we perceive ourselves as providing treatment through art, as experts in an area in which co-workers are less famil-
iar, rather than as experiencing ourselves as junior members of a treatment team, then we will relate to patients, other staff, and the institution out of a sense of confidence in the power of our work. Particularly in relating to other staff we will find ourselves communicating out of the richness of our special source of data. And of course, our clients will benefit from our creative relationship to the therapeutic process. In our hands, art can truly be therapy and therapy can be art.

The Art Therapy Intensive

Shaun McNiff, PhD, ATR
Cambridge, Massachusetts

For the past 5 years I have been conducting training programs in the United States, Europe, and Israel. Because of time constraints the groups are structured as “intensives,” meeting for 8 to 12 hours a day for 3 to 5 days. The intensive takes on the qualities of a spiritual retreat, a prolonged shamanic healing ceremony, or a seasonal celebration in a tribal community. The immediate goal of the training group is to provide an opportunity for participants to experience the ways in which art heals; the long term goal is to become a master of that healing process.

I am discovering that the therapeutic and creative value of the intensive is usually determined by the extent to which it allows for the creation of a studio of expression for all group members. My job seems to be one of always initiating the sanctification of the group place, inspiring expression and encouraging the creation of helping relationships between group members. Time, even more than the quality of the physical space, is the basic element needed to create the studio environment. We will often work individually for 3 to 4 hours on art works before coming together as a group for “sharing.”

Within the time structure of the intensive we are given the opportunity to work thematically through multiple creations, allowing personal process to emerge with depth and variety. We might need as much as 2 hours of preparatory work to truly relax and open feelings and find the form of our expression. The extended time that we spend together creating and sharing our work allows for the full expression of conflict and frustration. Many people resist the freedom of the process, desiring more “structure” and guidance. The groups deal with and embrace conflict, using it as fuel for ongoing transformation. I tell the training groups that conflict is our subject matter, the material we work with as therapists, the energy that we must master and help others transform into art. Through conflict, groups grow closer and become a community. The group enactment of inner dissatisfaction releases blocked energy and acknowledges the dark side of our personal and collective souls. Art’s healing power lies in its ability to provide exaltation through the expression of pain and conflict. Within the intensive, time spent in personal creation can be viewed as a pilgrimage into the self, demanding sustained concentration. Sharing with the group as a whole complements the individual process and results in the creation of a collective energy that supports continuous personal creation.

Art and healing are the same energy. They transform one form of life into another, giving healthy expression to pain and illness. My personal interests are in the depth psychology of art, the primal spiritual elements from where all creation and healing emerge. In my experience it is art that reveals the depths. Art can be an ambitious and sophisticated therapy. Within the intensive, therapy takes the form of ART, rather than art trying to squeeze itself into and justify itself within the structures of conventional psychotherapy. Therapy becomes united with the creative transformation and sensitivity of art.

I am returning more each year to work in the art studio of therapy. It is a place where there are no dichotomies between art and therapy; where a psychology of personal depths can emerge in the form of art expressing profound personal feeling. An environment of this kind might beckon artists reluctant to accept “art therapy” because of their fears that serious art values are being violated through subordination to, or over-identification with, conventional therapeutic systems of thought and action. Within the studio environment of the intensive, art is the primary therapeutic process. The artist be-
comes part of a community committed to the revelation of self and group through shared creativity. In the intensive, I personally experience the “lost unity” of art, spirituality, community, and individual mystery. These primary elements will emerge if simply given the proper Time, Space, and Support.

The art therapy intensive becomes a microcosm of nature's ecological interdependence where creations and people are linked to one another. Everything emerges and takes shape in its own time.

The poem below is a response to the title of this section as well as reflection on the similarities between portraiture and therapy.

**VIEWPOINT**

Only I can stand here;
Only my eye can view you;
Only my I can take you in from here.

When I touch you with my eyes
You touch me with your presence.

Eye invites you to my soul

I wander over your face.
I feel you in my fingers.
Pen in hand, I know your
framed bones
wrapped softly
up and over here
there down and back
shadowed deeply here
there caught in light

In my onliness you give to me for taking.

A Review of

Michelangelo: A Psychoanalytic Study of His Life and Images

Ellen Handler Spitz, PhD, is with the Center for Psychoanalytic Training and Research, Columbia University.

Since the publication of Freud's now classic and much discussed, disputed, and imitated monograph on Leonardo da Vinci (1910), numerous psychoanalysts have entered the domain of the arts in an attempt to illuminate issues such as the relation between an artist's life and work, the nature of artistic creativity, and the origins of specific and recurrent symbols. This year, Robert S. Liebert, MD, wrote Michelangelo: A Psychoanalytic Study of His Life and Images, which both partakes of this Freudian tradition and, in refreshing ways, departs from it. His study has relevance not only for scholars in Renaissance art history and psychoanalysts with a penchant for art, but also for all who share his passion for probing the complexities of created visual images—images that have the power to arrest, to evoke, and to endure.

In the 70-odd years since Freud wrote his Leonardo, significant changes have occurred both in the cultural milieu where such writing on art takes place and within psychoanalytic theory itself. Such change is reflected in Liebert's book in terms of both methodology and goals. Although, like Freud, he is principally concerned with relating the internal and external events of Michelangelo's life to his works, especially to the major sculptures, Liebert shifted his focus from the presumed pathology of the artist to the works themselves. He regards these works taken together not as evidence to support a tentative diagnosis of Michelangelo qua patient, but rather as the major datum for whose interpretation all other facts (e.g., historical records) and hypotheses (e.g., psychoanalytic reconstructions) must be mustered. In other words, Liebert gives primary weight and emphasis to the visual imagery itself. Hence, his is genuinely a book about art. It discusses the shift that has taken place in this century from the Romantic, expressive, artist-centered mode of interpretation still in vogue in Freud's time to the critical approach of this era in which the primacy and autonomy of works of art are stressed and in which the artist's manifest and latent intentions become important only insofar as they illuminate particular aspects of given works.

As even Freud's staunchest apologists now agree, his data on Leonardo were often selected arbitrarily, misinterpreted, and distorted. By contrast, Liebert's book reflects meticulous scholarship, grounding its psychoanalytic hypotheses on a foundation of data amassed from a rich variety of sources. These sources include contemporary biographies, Michelangelo's letters, poems, personal documents, and drawings, a thorough acquaintance with the artist's oeuvre and that of contemporary Florentine masters, as well as aspects of the relevant iconographic tradition (both mythological and religious). Thus, Liebert utilizes what I have called elsewhere a "documentary" approach within the psychoanalytic tradition, an approach that leads him to his most remarkable contribution.

That contribution is the tracing through Michelangelo's works of themes and motifs borrowed from the works of earlier artists. Of course, such tracing of figure-types, poses, and other stylistic idiosyncrasies to their sources in antiquity has, since Panofsky, been the staple of research in art history. But Liebert's uniqueness lies in the questioning of such artistic choices from a psychodynamic perspective. Thus, in subjecting these sorts of decisions to psychoanalytic inquiry, Liebert, using Michelangelo as a special case of a more general principle, demonstrates that an artist's particular problems and visual solutions (both in terms of form and content) make sense not only culturally and intellectually but also in terms of his own persistent intrapsychic themes. Liebert points out that Michelangelo, operating in the Renaissance tradition, which sponsored the adaptation and re-working of classical visual material for religious purposes, was able to put this tradition
to work for himself psychically by appropriating, for the expression of forbidden unconscious wishes, a series of acceptable symbolic forms. In so doing, Liebert offers us a richer understanding of the imagery than previously was possible.

In the course of his chronological and well-illustrated book, Liebert presents the series of Michelangelo’s madonnas, his sculptures for the tomb of Julius II, the pietä$s, and so on, tracing with the author as many interrelationships as possible among formal, thematic, affective, and iconographic elements. These form the broad-based substructure of evidence on which Liebert has built and from which he has elicited his psychoanalytic hypotheses.

Rather than offer a condensed example of his approach which, as is the case with all psychoanalytic interpretations, derives plausibility from the repetition of its general trends over a series of examples, this reviewer suggests that the major value of this book lies in its paradigmatic quality. Its power to enhance experience with works of art and to offer insights into the psychic life of that conflicted and enigmatic titan known as Michelangelo, emanates from Liebert’s unique admixture of psychoanalytic narrative with ingredients drawn from relevant nonpsychoanalytic systems of interpretation. This rich merging of disciplines enables him to hold out the promise of telling a story that is not only internally consistent but that also tallies with the facts as they are known. Such an ambitious promise, with all the as yet unresolved methodological and philosophical difficulties it entails, lies at the heart of this book and sets it apart from others of its genre.

This book’s implications for clinical practice warrant discussion as well. In reading it and experiencing the intellectual excitement and aesthetic value of integrating knowledge from multiple contexts, readers will become increasingly aware of the poverty of any approach to art that would omit either a cultural-historical or a psychoanalytic dimension. In clinical work, where therapist and patient share the same time and place, cultural contexts are perhaps too often taken for granted and full therapeutic reliance is placed on transference phenomena, the ad hoc application of general theory, or both. Liebert’s book, with its profuse documentation and respect for the contextual aspects of human data of all kinds, with its commitment to a species of truth that can withstand the rigors of scrutiny under the lights of various disciplines, may well serve to inspire practicing clinicians with a renewed sensitivity to the irreducibility of art.

Liebert states in his conclusion that “We cannot account for Michelangelo’s extraordinary endowments as a sculptor, architect, painter and poet” (p. 416). In applying a mind trained in psychoanalytic theory, an eye trained in art history, and the disciplined will of the patient scholar to works of genius, Liebert has provided a paradigm, however incomplete, for further exploration in the arts. Michelangelo is no more “accounted for” or “explained” in these pages than is any work of art by any critic, or the mind of any patient by any therapist. Rather (and perhaps this is all that can and should be hoped for at the present), this book enriches the context for experiencing specific imagery and, in equal measure, expands interpretative horizons in general.

A Review of
Art and Disabilities

Carole Kunkle-Miller ATR, is an art therapist at the Western Pennsylvania School for the Deaf and Coordinator of the Art Therapy Preparation Program, Carlow College, Pittsburgh, Pennsylvania. She chairs the AATA Special Committee on Art Therapy with the Disabled.

In 1973, Florence Ludins-Katz, an artist and educator, and Elias Katz, a clinical psychologist, began a project based on a unique and exciting concept. Their dream was to establish a creative arts center that would be a stimulating and noncompetitive environment designed to assist disabled artists and non-
artists to reach their highest level of artistic ability. They believed that the disabled should be active members of the community and that this goal could best be accomplished through such a center.

Their program, Creative Growth, is now well established, offering art studio facilities to handicapped persons, ranging from those with severe physical limitations to severe mental impairments, including individuals with varying levels of artistic skill and experience. Creative Growth is a place where people come to create art; the authors emphatically state that creating art is not therapy, nor is it recreation or provocational training. The creative experience is valued in and of itself, as a worthwhile personal endeavor; it represents "work" to many of the individuals. The basic premise is that, given the right opportunities, the disabled can be creative.

The Creative Art Center sees each person, no matter how disabled, mentally, physically or emotionally, as a potential artist and seeks to develop his ability to create and grow through rich and varying art experiences within a supportive environment (p. 11).

Based upon their extensive experience in establishing and directing programs and centers for the disabled, Ludins-Katz and Katz have compiled a limited edition, photocopied publication that focuses upon the philosophy, conceptualization, and implementation involved in establishing a creative art center for people with disabilities. Their work reflects considerable brainstorming about the components of a successful program. This publication, a compilation of pre-tested ideas, is directed toward professionals interested in replicating such a program.

The uniqueness of the program is its focus on a topic that has only recently received national attention. Considering that Public Law 94-142 (Education for All Handicapped) was implemented in 1978, the concept of art for the disabled child is still fairly new. The notion of providing studio art experiences to disabled adults, with the primary goal being to stimulate their development as artists, is both novel and noteworthy. The authors' steadfast belief in the potential for creative growth in the disabled adult serves as an additional model to other professionals.

_Art and Disabilities_ begins with a brief discussion on creativity in general, as well as an exposition on the creativity of people with disabilities. This is an essential starting point. In designing an art program for the disabled, one needs to examine the nature of creativity and its application to the disabled. Misconceptions about the disabled's impaired creative ability are frequently the stumbling block preventing many art educators and art therapists from considering work with this population.

The specific intent of the book is to provide information about initiating a creative art center. In many respects, the book is similar to a "how-to" manual, describing the details of program implementation. The authors freely share the wealth of their experience, giving their thoughts on stimulating community involvement and support, choosing and acquiring a site, rehabilitating a building (including floor plans), drafting a budget for the first year of operation, obtaining a license, establishing a non-profit tax exempt corporation, writing job descriptions for the staff, and obtaining continuing financial support. The authors' energy and commitment to their dream is nothing short of amazing. Every aspect of the essentials has been covered in detail; consequently, the development of other art centers will be much more feasible.

One specific section deserves special mention for the application of creative and effective programming ideas. The authors devote one entire chapter to public relations, including numerous useful strategies. They discuss the purpose and organization of exhibits, broadcasts, publications, workshops and conferences, open houses, and exchange visits with other programs. One particularly intriguing idea is the organization of "Disabled Artists Month," where a specific month is set aside to publicize the accomplishments of these special artists. During this month, stores and museums are encouraged to display work; radio and television broadcasts featuring the art and artists are presented. At the Creative Growth Gallery, disabled artists exhibit their work alone, in groups, and sometimes with nondisabled artists. The purpose of these events is to involve broader segments of the community and enhance their understanding of the disabled and their art. The more people from the community who are involved and the more personal interest they develop, the greater the chance that an arts center will become a permanent part of the community. This effort to integrate the disabled with the nondisabled is recognized as an essential component of normalization.

A materials section describes art materials, including characteristics of expressive media and useful techniques. Seasoned art therapists or art educators will not find much that is new, but the book will be informative to those in special education or rehabilitation currently working in art programs for the disabled. This section is brief, yet practical and useful. Detailed descriptions and illustrations suggest methods of adapting materials and tools. Illustrations of designs for adaptive mechanisms, such as head-gear, foot aides, or mouth pieces are precisely drawn with specified dimensions, and can be created from easily obtainable materials.

One particularly significant aspect of this publication is the definition of terms and roles related to the practice of art with the disabled. Ludins-Katz and Katz point out the similarities and differences among the creative art center concept, art therapy, art recreation, and art education. Several goals of the creative art center are therapeutic, yet they are not perceived as therapy. This is an important clar-
ification, because art with the handicapped is frequently perceived as art therapy. Although all art professions employ art materials, art language, and personnel trained in art, each one has goals, methods, and expectations that distinguish it from the others.

The authors' philosophy of art teaching is clearly stated throughout the text. They view the art teacher's role as providing creative stimulation for the students; the teachers are to be available, but not to direct student work or become the dominant force in the creative process.

This philosophy seems akin to Lowenfeld's. Unfortunately, no theoretical perspective is provided as a background from which the reader may better understand the development of the art center concept. This book defines a new and important direction in art that deserves recognition, but it does not address the past or present status of the field of art and the disabled. The authors state that they are currently conducting research on art with the disabled, yet they list topics that are under investigation, with no report of results. For the field of art with the disabled to progress and thrive, it needs more attention to theoretical background and development of research, in addition to the detailed program development described by the authors.

Art and Disabilities is a comprehensive and creative instruction manual that describes the essential information required to initiate a successful art program. Clearly, the authors' intent is to demonstrate a need and to stimulate seeds of interest; this, the book fully accomplishes. Ludins-Katz and Katz are to be commended for their progress in an uncharted field, their commitment to an important concept and their willingness to share the benefits of their immeasurable knowledge about program implementation. In essence, this is a book about establishing art programs for the disabled, rather than a descriptive publication on art and disabilities. It is highly recommended as a resource book for anyone who wishes to establish an art program for the disabled.

A Review of
Clinical Work with Children

Eleanor C. Irwin, PhD, is a drama therapist who works with children at the Western Psychiatric Institute and Clinic in Pittsburgh, Pennsylvania. She is Assistant Professor of Child Psychiatry at the University of Pittsburgh and a research candidate at the Pittsburgh Psychoanalytic Institute.

As though to correct a famine, a number of books on child therapy have been published lately, whetting the appetite of clinicians who work with children. In the main, these offerings reflect a variety of current eclectic approaches to theory and practice, serving to stimulate interest in individual as well as group work. For hungry practitioners who are working to make sense of the "play" of children, such publications are welcome fare. Child therapy, it seems, is one of those fields where good teachers are rare, and good books, rarer still.

Not surprisingly, there is a ready market for practice and technique books, reflecting, perhaps, the ubiquitous eternal wish to find the answer that will tell all, the approach that will cure all. On the other hand, theory books generally stimulate less interest, possibly because they are harder to digest. Such has seemed the case with books on psychoanalytic theory.

Despite the fact that psychoanalysis has dominated the field in child work, making enormous contributions to theory and practice, many clinicians remain unaware of core concepts, or have a strong emotional bias against it. The more's the pity, because psychoanalysis continues to provide a clinical heritage that can enrich our understanding of troubled children and their families. One of the difficulties has been the dearth of good material that can translate theory in understandable terms into practice. A good text could help remedy the situation, serving to illuminate past contributions and providing a framework for current clinical work.

Such a text may be at hand in Judith Mishne's new book. Trained in the Child Therapy Program at the Chicago Institute of Psychoanalysis, Mishne holds a doctorate in social work from Hunter. Her experience as a psychotherapist, teacher, and supervisor
is evident as is her ease, tact, and empathy for children and their caregivers as well as for clinicians and the systems they serve. In a straightforward style, with little mysterious jargon, she presents current, albeit complex, ego psychology. She then demonstrates, through detailed case histories, just how theory shapes and guides practice. The goals of her book, stated in Chapter I, are:

- to lessen ... therapeutic nihilism and bias, to kindle or rekindle enthusiasm for work with children, and to provide a comprehensive view of diagnosis and treatment planning for children and their parents; to convey the spirit of the diagnostic process, and to focus on the problems and issues specific to child therapy and general childcare services. The hope is to avoid a cookbook of recipes and instead to present a survey of the literature that deliberately omits some of the highly abstract and controversial aspects of the theory (p. 4).

The book is, indeed, a “clear and comprehensive presentation of the fundamentals of child psychotherapy” (p. 3). In addition to a presentation of the facts and perhaps ultimately more important, however, is the attitude the author conveys. She teaches, supports, inspires. Without apology, she makes clear the complexity of the work and demonstrates the imperative need for a firm theoretical base on which to anchor one’s practice. Along the way, the reader senses a growing identification with the author’s attitude, an awareness of the long-term commitment needed, and increased tolerance for the inevitable anxiety that is aroused in work with troubled children and their families. The naive reader may have some difficulty with the theory, but there is much to be learned from a thorough reading of the case studies alone. Because of content as well as style, however, this book surely will be used as a text in clinical work in a variety of settings by professionals from many backgrounds.

From the overall presentation of the material to the finely culled reference list, there are many admirable aspects to the book. Lucid sections on theory are woven throughout the book, their implications echoed and articulated in case presentations. Also throughout, the psychoanalytic developmental approach leads the way. Thus, for example, Anna Freud’s diagnostic profile is used in a general way to provide a comprehensive understanding of assessment; Mahler’s stages of separation-individuation and the achievement of self and object constancy are used to delineate psychotic from neurotic functioning, as well as that of the “borderline” in between.

Beginning with a brief overview of psychoanalytic theory, the author outlines the multiple ways in which the ego acquires an organizing function in the process of development. Perceiving, evaluating, coordinating, and integrating, the ego mediates between the agencies of the id and superego, Mishne states. Following this overview, the spectrum of child psychopathology is covered, with case examples of autism and psychosis, mental retardation, pre-Oedipal disorders, and psychoneurosis. This is followed by sections on translating the assessment material into a treatment plan, the treatment process itself. Throughout, there is an emphasis on the child and parents’ psychological structure—or lack thereof—and the implications of this for clinical work.

One of the most valuable contributions is the discussion of pre-Oedipal disorders: the borderline, narcissistic, and character disorders. Individuals with such disorders present a bewildering array of difficulties—developmental arrests and fixations, a poorly defined sense of self and object, severe defects in ego functioning, and little capacity to invest in treatment. Mishne’s intelligible presentation of controversies, along with discussions of etiology and treatment interventions will be welcomed by most clinicians. She stresses that for the borderline individual as well as the psychotic, supportive—not insight-oriented—work is needed. Goals for these individuals include achieving some measure of separation-individuation and moving toward fusing the split-off good and bad aspects of self and object, along with developing a more tolerant and flexible superego. The treatment approach should be “slow, indirect, lengthy, supportive and empathic, with the emphasis on building identification and introjection, and more mature defensive and adaptive mechanisms” (p. 180). As with adults, interpretation should be directed toward the reflection of feelings, affects, and defenses, rather than interpretation of the id material. She agrees with Ekstein who suggests that clinicians adjust to the “special modes of relating and communicating, e.g., their play with metaphor and simile, their indirect way of talking, and their different stage of language and play development” (p. 180). Always linking theory to practice, she comments that it is erroneous to seek a unitary concept of the borderline child. . . . In general, the less inner structure the child possesses, the more outer structure he or she will need” (p. 107).

An emphasis is placed on need for a family perspective in considering child treatment. The author stresses the child’s dependence on home and family, and includes a sensitive discussion on the multiple (and maddening) issues inherent in placement of children. Parents and caregivers are presented in a humane way, their strengths as well as weaknesses highlighted. A diagnostic picture is drawn of the parents as well as the child, with an examination of environmental and constitutional factors. Clinicians are admonished to be aware of unconscious racism and stereotyping. She quotes Cooper in detailing the “errors made by clinicians who not infrequently impose their own highly emotional attitudes on clients” (p. 158).

Mishne both quotes and follows Josselyn’s advice to not rely on any one mode of intervention to the
neglect of others. Accordingly, many kinds of treatment are discussed, from child analysis to child psychotherapy, from family to group work. Material on the latter, although brief, is helpful, covering group composition, types of therapy, setting, and goals. Current issues in family therapy also are presented, including an overview of the family systems approach vis-a-vis the psychodynamic one. Here, as elsewhere, she gives practical advice. To wit, “The general rule is that the therapist must guard against criticizing the parents or endorsing the child’s indignation over something the parents have done.” But understanding human nature (not to mention countertransference), she adds tactfully, “One can say that the child’s indignation is understandable—adding that perhaps the parents did not fully understand the situation, or maybe that their action was their way of showing love and concern” (p. 205), a suggestion she attributes to Kessler.

The chapters on resistance, defense, regression, and working through are useful. The case study of Arleen is presented, a child who “unquestionably” was the most difficult the author ever treated. Recounting the tribulations in treatment, she adds, “This case underscores the need for the therapist’s absolute respect of the child without becoming retaliatory in the face of unpleasant forms of resistance” (p. 304).

It is this attitude of awareness and control of countertransference, coupled with empathy and intelligent use of theory that informs and inspires the reader.

Arts therapists looking for special mention of their fields will be disappointed. Drawings are mentioned in passing as serving as projective tools; paper and crayons are stock materials in the play room. Children are depicted as drawing, dramatizing, role-playing. The arts are mentioned specifically, however, in a sensitive section on the needs of those with severe narcissistic pathology. Treatment interventions with this population should include greater opportunities for sublimation, for “transformations of narcissism” (Kohut) via creative outlets. She quotes Green and Clark as saying it is “imperative that ‘leisure activities’ be taken seriously” with such populations (p. 217). Similarly, the chapter on play therapy presents little that is new to experienced art therapists. These, however, are minor disappointments, given the general richness of the material.

Overall, what is new is a comprehensive text in which theory forms and informs practice, coupled with an attitude of patience, respect, and empathy for disturbed children. In a fine chapter on countertransference and countertransference, Mishne quotes Marcus as saying that it is “untenable” to view interest in the patient and pleasure in the therapeutic work as unconscious over-identification. “Such an all-inclusive concept denies appropriate human and professional feelings toward patients and the therapeutic work. Warmth, affection, and respect for patients are not overemotional responses and therefore are not countertransference” (p. 217). This intelligently written book, based on theory, filled with such sentiments, garnished with practical advice, and flavored with contributions from the current literature should go a long way toward satiating clinicians, including art therapists who work with children.

A Review of

_They Could Not Talk and So They Drew: Children’s Styles of Coping and Thinking_

**Nancy E. Curry, PhD,** a research candidate at the Pittsburgh Psychoanalytic Institute, heads the Child Development Program at the University of Pittsburgh.

The author of this book has undertaken an ambitious project, which, in her words “…represents the culmination of my educational and professional experience as a clinician art therapist and educator in the field of creative arts in therapy” (p. xv). This explains why there is an enormously complicated body of material in this book. Its purpose is to present a developmental perspective on the mechanisms of
defense as explicated by Anna Freud and to propose
that art therapists can elucidate these mechanisms
of defense in art productions, specifically drawings.
The author uses both psychoanalytic theory and cog-
nitive-developmental theory to undergird her theo-
retical perspectives as well as her considerable
experiences as an art therapist.

In perusing the chapter titles one is impressed
with the intended scope of the book: from an over-
view of the field of art therapy to an explication
of the mechanisms of defense, to an integration of psy-
chosexual and cognitive development as related to
children's drawings. The second half of the book
presents clinical data to illustrate the author's viewpoint
that the mechanisms of defense are hierarchical,
show a developmental progression in the normally
developing child, and serve as a diagnostic tool to
pinpoint developmental regressions, fixations, and
progressions in the art products of disturbed children
and adults. Finally, the author presents her raw data
for examination and to demonstrate the care she took
in establishing the data validity and reliability.

With this awesome body of work that could hold
much promise for clinicians, the author has indeed
shared her theoretical background and her clinical
experience. Undaunted, she has undertaken at least
three major areas—each of which could be a book in
and of itself (the value of art as a therapeutic and
diagnostic tool; the use of drawings to illustrate the
developmental hierarchy of defenses; the integration
and synthesis of psychosexual and cognitive-devel-
opmental theories).

Unfortunately, her attempts to deal with all of
these areas in some depth leaves the reader gasping,
especially in the theoretical section (Section I). Here
readers will find less of the author herself; most of
the material is derivative and readily available and
readable in the sources she cites, many of which
already are secondary. For example, in attempting
to integrate psychoanalytic and cognitive theories,
she depends heavily on Greenspan. Rothgeb is her
secondary source for Sigmund Freud, who needs no
intermediary, given his skill and clarity of writing.
Even the explanation of the chronological develop-
ment of defenses relies heavily on Greenspan and
Kestenberg. Because these secondary sources are
available to the reader interested in these areas,
they add little to this work, which becomes labored
and very difficult to read. In contrast, the summary
tables pull together many concepts with a clarity
that is missing in the text.

Section I may tempt the reader to neglect Section
II, which is enlivened by clinical examples in which
the author shares her clinical expertise. Here, too,
however, the lack of clarity persists both in the the-
oretical use of the mechanisms of defense and in the
photographs, which unfortunately, are in black and
white and occasionally difficult to see, especially those
with small details. The tables in Section II are val-
uable in charting out the author's definitions of
mechanism of defense and the criteria she uses to
label them in drawings. Some of her definitions and
criteria are open to question. For example, in the
table the author defines isolation as "A process in
which ideas are split off from feelings which were
originally associated. Used to avoid guilt, carry
through a logical train of thought without contam-
nination and distraction." Following this somewhat
confused definition are her criteria: "Manifested in
the representation of objects drawn singly on a page;
unconnected inappropriately to other forms on a page;
ungrounded; separate in or from environment" (p. 130).
Although I am not an art therapist, I am wary
of diagnosis based on such a criterion as "objects
drawn singly on a page," yet the author clearly used
this criterion to diagnose isolation on a number of
her subjects' drawings. There is danger in labeling
too precisely what an art symbol may represent, for
it could lead to a quick and easy method of diagnosis
on the part of less sophisticated therapists. Some
readers might be tempted to use the author's inter-
pretation as recipes that very well could be incorrect.

In the field of art therapy as is true of most ther-
apieties utilizing projective techniques, therapists need
to be cautious about interpreting from limited data
or about projecting their own ideas and feelings into
a patient's production. Those of us in the fields of
psychotherapy and education often have been ac-
cused of being unscientific. We have learned to teach
ourselves and our students the importance of de-
veloping hypotheses, finding the data either to sup-
port or reject these hypotheses, and only then making
generalizations with sufficient evidence to support
them. Although the author supplies us with ample
amounts of raw data from which she drew her con-
cclusions, both the validity and reliability checks are
questionable. She honestly acknowledges that this
is a first attempt to propose "criteria for identifying
adaptive and maladaptive defense mechanisms in
drawings" (p. 182), but she should have supplied some
caveats to her readers early on. Careful defense anal-
ysis takes time, a strong working alliance between pa-
tient and therapist, and enough evidence from both
patient and therapist to provide the sense of convic-
tion when a correct interpretation is made. Although
the heart of this book does not deal with therapy,
but with diagnosis, and although the author warns of
the pitfalls in labeling and interpreting from too
little data, this book lends itself to that pitfall by the
author's own tendency to interpret from data that
seem to be limited.

In general, then, I would recommend this book
only for advanced graduate students or practitioners
who already have a very solid understanding of psy-
choanalytic and cognitive-developmental theory.
Without such a background, readers could flounder
in Section I, which paradoxically, is too complex in contrast to Section II, which errs on the side of being too simplistic.

Although the title utilizes the author’s poetic license, it must be recognized that those who draw also can communicate in other ways, verbally and nonverbally, to other people. Art productions indeed make a vital contribution, but cannot be the only data base from which those in the field diagnose, plan treatment programs, and evaluate the effectiveness of treatment plans. Only from this wider data base can and should an individual’s defensive structure be determined with some degree of accuracy and conviction. The author acknowledges that this is a pilot study; her continued efforts to supply validity and reliability to her measures for identifying defenses in drawings will strengthen this promising project.

Dr. Levick’s Reply

Myra F. Levick, PhD, HLM, ATR
Philadelphia, Pennsylvania

I want to thank Dr. Curry for her comprehensive and sensitive review of my book and the editors of this journal for the opportunity to respond.

Dr. Curry credits me with attempting to do more than I in fact did. The value of art as a therapeutic and diagnostic tool has been demonstrated by many art therapists in the field dating back to the 1940s; their books and articles are listed in an extensive bibliography at the end of my book. The integration and synthesis of psychosexual and cognitive-developmental theories also has been addressed by many investigators in the last 4 decades, but a literature search revealed that only Greenspan (1979) had produced a comprehensive work on this topic. To redo what he had done so well, and so recently, seemed presumptuous and so the reader is referred, frequently to Greenspan’s work for further elaboration, hence, the secondary source in this instance.

Part of the motivation for this work was based on the fact that there is little in the literature that points to a hierarchical development of defenses. Anna Freud only began to suggest a hierarchical development in 1967 and this work is cited extensively in Chapter Two. Dr. Curry refers to Rothgeb as a “secondary” source for Sigmund Freud, but it should be noted that Rothgeb is the editor for Abstracts of the Standard Edition of Freud (1971–1972), which contains original passages of Sigmund Freud’s work. It is a particularly useful source for anyone wishing to review Freud’s conclusions from his original writings as they evolved.

I appreciate Dr. Curry’s concern that the theoretical sections are “labored and difficult to read.” I struggled a long time on how much of this material to include. It should be remembered, however, that many art therapists, developmental psychologists, and other practitioners have very limited training in psychoanalytic theory.

I certainly recognize that black and white reproductions of the drawings leave much to be desired, but with over 140 illustrations it was impossible to reproduce any in color, because of the prohibitive costs.

I would reiterate here (and did so repeatedly in the book) that “one needs to be cautious about interpreting from limited data.” Dr. Curry’s concerns about this are mine as well. And because, as Dr. Curry points out “Those of us in the fields of psychotherapy and education have often been accused of being unscientific,” the book contains a first and limited effort to demonstrate reliability and validity. Dr. Curry, of course, could not know this, but since the manuscript was completed 2 years ago, several of my own advanced students have utilized these criteria for their thesis research projects and have further supported the reliability and validity of these data.

The definition of isolation that Dr. Curry finds “somewhat confused” is a direct quote from A Glossary of Psychoanalytic Terms and Concepts published by the American Psychoanalytic Association (Moore & Fine, 1968). This reference is cited at the top of Table 2 (p. 129). My criteria for identifying defenses in drawings, as we both agree, needs further validation.

I would be as distressed as Dr. Curry if some readers looked to this work as “recipes.” The book was written as a text for “advanced graduate students and practitioners,” but not necessarily for those with an extensive background in psychoanalytic and cognitive-developmental theory. I hope that art therapy educators who choose to use this book will pay as close
attention to the caveats (Dr. Curry's and mine) as well as the interpretations I have made and keep in mind that they reflect 20 years of experience as an art therapist and educator. I also hope that students and practitioners not trained extensively in these theories would be stimulated to pursue further study. I believe the theories are critical for understanding human development.

Dr. Curry suggests I used poetic license for the title and in some measure she is correct. The idea for the title came from a poem written as a gift for me by a psychiatric nurse whose first exposure to art therapy was at our mutual place of employment 18 years ago. The first four lines read as follows:

I could not talk
and so I drew
on the floor, with chalk,
when I was small....

The poem is reprinted in its entirety on page 133.

It is not, however, and never has been my intent to imply that people who draw cannot communicate in other ways. In fact, it has been my position (in contrast to that of some of my colleagues) that verbal comments are necessary before interpretations can be reached by patient and therapist. I further maintain that even the best trained art therapist can only make "inferences" and "educated guesses"—"especially in the absence of direct observation, associations from the artist and/or historical data" (pp. 64–65).

Finally, I concur completely with Dr. Curry that art productions "cannot be the only data base from which we make diagnosis, plan treatment programs, and evaluate the effectiveness of our treatments."

I support this further with the belief that "members of education and mental health disciplines, other than art therapists, can use graphic productions to discern whether a child or an adult has age-appropriate capabilities. In the absence of some or all of those criteria [which identify these capabilities], a mental flag should be raised to call for further evaluation by qualified art and other psychodiagnosticians" (p. 165).

Professional Treat

The 27th Annual Meeting of the American Association of Psychoanalysis was held from April 28 to May 1, 1983, in New York City. The topic: Psychoanalysis and the Arts.

The link between art and psychoanalysis was made through a broad series of stimulating presentations. There were the expected papers devoted to psychoanalytic understanding of artists and writers: Could Hyronimus Bosch's ego make distinctions between id, ego, and super-ego? Why did Edvard Munch create? What are some of the psychological themes of Henry Moore's work? In a lively discussion, participants and listeners were warned of trivializing the art with clinical interpretations. This was indicative of the healthy intellectual climate evident throughout the conference.

A number of challenging presentations grappled with the nature of creativity and its relationship to the psychoanalytic process: Are creative endeavors enhanced or impaired by psychoanalytic exploration? How much can psychoanalytic treatment be considered a science? Or is it basically an art that requires the practitioner's creativity as much as his or her scientific training and discipline? One presenter shared her own paintings in looking at chaos and control within the creative process. Such concerns, familiar to art therapists, led to a rich inquiry when addressed by the psychoanalytic community. Art therapists have a great deal to offer to this realm and were represented by participants Myra Levick, PhD, ATR, and Lynne Flexner Berger, ATR.

Included in the program were presentations dealing with psychoanalytic treatment of the artist-patient, as well as the use of art with non-artist patients. The creative aspect of the psychoanalytic treatment process itself was addressed in a number of ways. One such presentation saw transference as drama, and therapy as the play, with the therapist and analyst directing and producing. The keystone of this fascinating paper was how play, illusion, and transitional phenomena take place in the drama of therapy.

The 4-day program, with its focus on creativity and its relationship to the human psyche, was richly rewarding. The complete program is listed below.

PROGRAM OF 27TH ANNUAL MEETING OF THE AMERICAN ASSOCIATION OF PSYCHOANALYSIS

“Arthur Miller's Insights on Aggression,” H. Krystal, MD
“Marcel Proust and His Mother,” D. Lipshutz, MD
“Graham Greene—His Fiction and Autobiography: Reflections on the Writer as Private Person.” R. Spiegel, MD; J. Lefer, MD

“Control and Chaos in the Creative Process,” D. Safon-Gerard, PhD; “The Art in Analysis,” D. Forrest, MD; I. Bieber, MD
Journals of Interest to Art Therapists

*Visual Arts Research* is a journal concerned with discussing key issues that shape our understanding of the visual arts and for critical analysis of research now being conducted in the field. It is published twice a year by the University of Illinois Press. Individual subscriptions are $10 per year. Mail to: Visual Arts Research, University of Illinois Press, 54 E. Gregory Drive, Champaign, IL 61820.

*Journal of Multi-Cultural and Cross-Cultural Research in Art Education* is a new journal that will appear once a year, beginning in November, 1983. It is published by USSEA (United States Society for Education through Art). It seeks to confirm cultural and social commitment to a greater understanding of diverse cultures and the role of art in multi-cultural education. Send manuscripts to the editor, Dr. Larry A. Kantner, A202 Fine Arts Bldg., University of Missouri, Columbia, MO 65211. Send subscription orders ($8 per year) to Dr. Maryl Fletcher DeJong, USSEA Treasurer, 5052 Collinwood Place, Cincinnati, OH 45227.

*Empirical Studies of the Arts* is also a new journal appearing this year. For information regarding its editorial policy and subscription rates, contact: Frederick R. Gardner, Promotion Dept., Baywood Publishing Co., 120 Marine St., Farmingdale, NY 11735.

New Testing Material Available

The *Silver Drawing Test of Cognitive and Creative Skills* is now available. It is the work of Rawley A. Silver, EdD, ATR. Write to: Special Child Publications, J. B. Preston, Editor and Publisher. P.O. Box 33548, Seattle, WA 98133.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal
is to advance the understanding of how art functions in the education, enrichment, development, and
treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy
and strives to present a broad spectrum of ideas in theory, practice, and research. An emphasis will
be placed on the visual arts but articles in related disciplines that have relevance to art therapists will
also be published.

American Art Therapy Association, Inc. 5999 Stevenson Avenue, Alexandria, VA 22304, (703) 370-3223
With this issue of Art Therapy our profession has reached an important milestone. Following an impressive inaugural issue, with members of the American Art Therapy Association serving on the planning and editorial committees (plaudits to Linda Gant, ATR, the interim editor and her committees for the first issue!) we now have a bona fide journal, an editor and an editorial board. The 1981-83 and the (current) 1983-85 AATA Executive Boards have supported this publishing venture, and Scott Stoner, ATR, past Executive Director of AATA was also instrumental in helping to bring this publication into existence. We are all indebted to these persons for their interest, support, and encouragement.

It seems fitting that, as our profession grows, we take this significant step into a new phase of professional publication. Our sister journal, The American Journal of Art Therapy (formerly the Bulletin of Art Therapy) has been an important voice for nearly 23 years, and has done much to bring art therapy to the forefront. In more recent years, another sister publication, The Arts in Psychotherapy, was established for professionals in the fields of mental health, education, and creative arts therapies and, also, is an invaluable contribution to the professional literature. As editor of Art Therapy, it is my wish to join with these two important predecessors in building additional strength, integrity, vitality, service, and awareness to current and potential readership.

The American Art Therapy Association is 15 years old — perhaps the “crisis of adolescence” is an appropriate term in describing our developmental stage. From the early 1980s and the work of Margaret Naumburg, art therapy was taking its first steps toward becoming a major field of study and practice. Pioneering efforts of Naumburg and others began to give credence to this voice in the wilderness, and the voice soon grew loud and clear. Over the next few decades the field rapidly gained prominence, and a new awareness of art therapy developed.

We do have an impressive, albeit relatively short, history as our written documentation attests; however, we have by no means been exhaustive in our historical search of our “roots” with focus on implications for mental health training and service through the visual modality of art therapy.

In addition to our rich history, throughout the most recent years we have had to quickly reassess our professional strategies relative to the job market, legislation regarding funding and support of programs, related human service modalities, foundation and outcome research, economics, and the budget “crunch.” The results of our appraisals have often been discouraging; however, in a larger perspective, by focusing on the potential of art therapy, and our sound educational training and professional practices, we seem to be alive and well.

For the future we should give strong consideration to the building of an even greater body of knowledge through our research efforts in art therapy. We must continue to have dialogue with professionals in related therapies and plan strategies to share efforts in human service delivery. We should educate others about the excitement of, and the need for, the visual arts as an expressive and therapeutic modality. We need to identify and understand legislative issues and move forward with concerted efforts to give even greater credence and strength to art therapy. Let us come to know our profession, and ourselves, with greater depth and understanding. Perhaps the theme of the 1983 AATA Conference can give us an obvious direction for future action: “Working Together: Sharing Efforts.”

Art Therapy, as a professional journal, should be representative of all of us. It can “speak to” many professional areas through clinical and theoretical articles, reported outcome research, letters to the editor, and personal viewpoints. I encourage your participation, suggestions and views; diversity of thought within articles, open letters, general opinions, and about content, format and theme is encouraged. Your contributions will help to make the journal grow and develop into a major voice in art therapy. I look forward with great anticipation to our combined efforts in this vital and exciting venture.

Gary C. Barlow, EdD, ATR
Editor
Letter to the Editor

To the Editor:

In the October, 1983 issue, there is an error in the article, “A Critical Analysis of A Review of the Published Research Literature in Arts for the Handicapped, 1971-1981.” Referring to my 1975 publication, the review states:

Quasi-experimental design (pretest, treatment, posttest); no control group or randomization indicated. (p. 39)

The fact is that both randomization and a control group were described in the 1975 publication, as follows:

There were 18 children in Burt’s experimental group. Eighteen other children, who did not attend the art classes, served as controls. They were a randomly selected 50% sample of all pupils in three classes in a school for children with language and hearing impairments. On the posttest, the difference between groups in favor of the experimental group was found to be highly significant, at the p < .001 level, as measured by the 14 key items. (ERIC ED # 116 401, p 15/17)

At the end of this quotation, the footnote referred to the original study, a 110-page 1973 project report having an ERIC Ed number (084 745) and an EC number (060 575).

The project results were also described in a 1978 book (ERIC ED # 157 252) and in a 1981 document (ED # 207 674) which is also a chapter in Vol. 4 of Current Topics in Early Childhood Education, published by the ERIC Clearinghouse at the University of Illinois at Urbana-Champaign. None of these publications are mentioned in the review which relied on computer searches of the ERIC data system.

I am under the impression that many ERIC documents fall between the cracks, and therefore do not blame the researchers who contributed to the review.

Rawley A. Silver, EdD, HLM, ATR

CORRECTION

In the first issue of Art Therapy (Vol. 1, No. 1, 1983) the following error occurred in the Summary Charts accompanying “A Critical Analysis of A Review of the Published Research Literature in Arts for the Handicapped: 1971-1981, with Special Attention to the Visual Arts” by Frances E. Anderson (pp. 26-39): the Silver, 1975 research study that is identified on page 33 was listed as a quasi-experimental study. The correct designation is “Experimental (two randomly assigned groups: one experimental and one control, with pre- and post-treatment testing).”

NOTICE

AATA has adopted a policy for the purchase of advertising space in Art Therapy. Universities, institutes, clinical programs, companies, publishers, and commercial exhibitors are encouraged to consider the opportunity to purchase advertising space in the journal. Additionally, programs or persons wishing to place ads in Art Therapy relative to workshops, institutes, and other clinical or educational offerings should write to the AATA Office for information on format and costs.

Art Work of Cystic Fibrosis Patients

Marilyn D. Leonhart, BFA
Richard M. Rothberg, MD
Don Seiden, ATR

Marilyn D. Leonhart, BFA, an art therapist at the University of Chicago, Departments of Pediatrics and Psychiatry, initiated an ongoing comparative study of medical patient art work there in 1980. She earned a Graduate Certificate in Art Therapy from The School of the Art Institute of Chicago in 1981. Richard M. Rothberg, MD, is a professor of pediatrics, head of the Section of Allergy, Immunology and Pulmonology and director of the Cystic Fibrosis Center, University of Chicago. Don Seiden, ATR, is an associate professor, chairman of the Department of Art Education and Art Therapy, The School of the Art Institute of Chicago and senior art therapist at Rush-Presbyterian St. Luke’s Hospital, Chicago. A practicing artist and lecturer, he was the founding president of the Illinois Art Therapy Association.

Spontaneous drawings by 30 patients with cystic fibrosis (CF) and 24 controls with pulmonary disease were obtained at health maintenance clinic visits between December, 1981 and April, 1983. The initial correlations were made in a prospective blind manner. The drawings were analyzed for art content, psychosocial content, and possible pathophysiologic implication. After 12 months, the pathophysiologic speculations were evaluated by direct comparison of drawings with the medical information routinely collected for health maintenance care. This retrospective analysis demonstrated some consistent relationships between drawing content and physiologic symptomatology. In addition, many interesting psychosocial correlations with the patients’ life cycle events and disease severity became evident. The CF drawings exhibited a high degree of sublimation. The latter possibly was an indication of the development of survival attitudes associated with inherited, potentially fatal illness.

The regularity with which somatic metaphors (pictorial imagery symbolic of body parts affected by illness) showed up in art work of patients led to formal studies of the significance of such somatic metaphors and physiologic manifestations in drawings by patients with specific pathophysiologic problems. Since psychological (Kramer, 1971; Naumberg, 1966) and developmental (Kellogg, 1970; Lowenfeld & Brittain, 1964) correlations with art work have been established, it was speculated that the expression of physiologic correlations should be found in the drawings of patients with a chronic life threatening disease. Cystic fibrosis (CF) was chosen as a condition to study because it is a progressive chronic disease of young patients and it has multiple system involvement. At present, this disorder is the most common, potentially lethal genetic disorder in the white population of the United States (1 in 2,000 live births). The main pathophysiologic abnormality is the production of thick, viscid mucus that blocks the mucus epithelial-lined ducts to the outside of the body. This blockage has two major effects. The first is to block secretions of exocrine glands, such as the pancreas, resulting in glandular destruction. The major manifestation of destruction of glands of the gastrointestinal tract, such as the pancreas, is malabsorption of food secondary to the loss of the digestive enzymes. This results in malnutrition, diarrhea, and
d psychophysiologic correlations while enhancing physician evaluation of individual CF patient status as to self-image, compliance, disease-related emotions, and family dynamics. In these studies a report is given on the emergence of patterns of color usage, composition, affect, linear configuration, and use of materials in specific pathophysiologic conditions.

This study was supported in part by the Cystic Fibrosis Foundation and The School of the Art Institute of Chicago. The authors gratefully acknowledge the contributions of C.P. Kimball, MD, L.A. Lester, MD, Zenaida Corpus, RN, Margaret Moenelkamp, Glenn Leonhart, Nancy Muller, and Anne Grigg.

1 Somatic metaphors were noted by the author during field work in Spring, 1980 at West Suburban Hospital, Oak Park, Illinois.
Materials and Methods

Population

Thirty CF patients, ages 3 to 22, and 24 control patients with other pulmonary diseases (PUL), ages 3 to 15 were studied. Because CF also involves the gastrointestinal tract and this illness can be fatal, concurrent studies of drawings by hospitalized adult gastrointestinal (GI) and oncology patients provided additional controls for substantiating correlations.

Settings

Of the 215 CF- and PUL-patient drawings, 203 were done in outpatient clinic examining rooms. The remaining 12 drawings were done by hospitalized patients. Both of these settings provided heightened patient awareness of illness and attitudes toward it.

As the patient enters the examining room, a whole change in orientation may be occurring, but the nature of this change varies, depending on age. The main concern of the younger patient is how the visit will affect their day-to-day living. For the adolescent or adult, it is time to focus on the disease process. Thoughts and feelings are concentrated not only on illness and its manifestations, but on a very personal sense of self and a desire for well-being.

This awareness on the part of the patient and the concentration of the health-care team on the patient possibly had a strong effect on the emotional and physiologic components manifested in the drawings.

Procedures

The purpose of the study was explained briefly to the patient and parents. The patient was offered 9 x 12 construction paper and drawing media consisting of pastels, oil pastels, watercolor markers, and pencils. Paper and media were in full representative color range. Brief descriptions of media qualities, such as softness and blendability of pastels, were given in order to encourage spontaneous emergence of patient inner structure, rather than imposing preconceived structure through specific directions on what to draw. The approach was non-intrusive—questions concerning feelings were not asked.

During the drawing process, pertinent data were noted, such as media and color choices, placement of paper, progression of drawing, gender, and age. To avoid initial therapist bias, diagnosis and general degree of illness were not noted until analysis of the first drawing of each patient began, along with other follow-up drawings, after the completion of clinic for the day. Clinical findings based on history and physical examinations on the particular day of any drawing were not considered in these analyses during the first year. In drawing analyses done during the same period (at The School of the Art Institute of Chicago), however, pathophysiologic speculations were made. These results were then compared with data from the patient charts at the end of the first 12 months of the study.

Figure 1—Disturbed affect, smeared pastels, filled-in shape at top. (Female, age 5, CF)

Figure 2—Patient A, several weeks before agitated lines appeared, as shown in Figures 3 and 4. Complete figures returned to drawings following acute episodes. (Female, age 4, CF)

Figure 3—Patient A. Disturbed affect, disintegrating figure, smeared pastels, implied triangles. (Pink eyes, body and feet are not evident in black and white photo.) (Female, age 4, CF)

Results

In viewing the collection of drawings by CF patients as a whole, the most significant observation was that of sublimation. Sublimation is defined in this context as the ability to transform deficits of chronic illness into a focus for corrective and adaptive ego responses. It translates into aesthetic refinement of the art product (Kramer, 1971). This transformation is exemplified in the drawings by serene affect (affect is defined here as emotional content or mood of the drawing as perceived by the viewer), combined with compositional balance and full-page orientation. Prior to comparisons of individual patient drawings (with information from medical charts) at the end of the first 12 months, drawings that showed disturbed affect, compositional imbalance and/or incomplete use of space, were clipped. They were usually found to be indicative of acute phases of disease. Disturbed affect was associated with anxiety over bodily conditions (see Figure 1, Figure 2, Figure 3, Figure 4), and was manifested as agitated line quality and excessive overlaying of media. Compositional imbalance and incomplete use of space (areas left empty) suggested avoidance of (see Figure 5, Figure 6, Figure 7, and Figure 8), or exaggerated awareness of an affected part of the body (see Figure 1 and Figure 9).

Other drawings, while maintaining the serenity of composition (see Figure 10), showed linear configurations, such as triangles, and metaphors, such as filled-in clouds representing upper respiratory congestion, similar to those found in acute drawings. These were reflective of underlying pathophysiological symptomatology. Physiologic involvement in drawings by both CF and PUL patients appeared in mirror image, according to affected body parts. For example: A PUL-patient with a left lung lesion drew a “mouse hole” on the left side of the page (Figure 9).

An example of linear configurations (regardless of pictorial content) correlating with symptomatology would be triangles, or implied triangles (Figure 5), which were identified with GI pain, and occasionally with pulmonary pain. This was substantiated in drawings by adult GI patients. In addition, CF patients with GI involvement, and adult GI patients frequently drew compartmentalized shapes (see Figure 11 and Figure 12), which may be associated with constriction. Triangles and compartments also appeared in drawings by pediatric GI patients in earlier studies.²

The triangles, which showed up during acute phases of GI involvement and as underlying symptomatology in some CF patients, were universally present in the drawings by hospitalized adult GI patients in acute care units. Compartmentalized shapes commonly accompanied the triangles. In both CF- and adult GI-patient drawings, the triangles and compartments

² Completed in fall, 1989, at Westlake Community Hospital, Melrose Park, Illinois, and Wyler Children’s Hospital, the University of Chicago.
were generally incorporated in the drawings as integral parts of the composition. They become apparent when drawing is viewed in a linear flat pattern. Examples of incorporated triangles are: pine trees, sails, and high-pitched roofs. Examples of incorporated compartments are: paned windows, picket fences, and clothing decorations. Rarely (and only in adult patient drawings) were these configurations attributed verbally to pain and constriction by the patient.

Untidy use of materials—smeared pastels and excessive overdrawing of watercolor markers inconsistent with recognized developmental drawing stages—was sometimes present when mucus plugging in CF patients significantly increased (Figures 1 and 3). Filled-in shapes, often clouds (Figures 1, 5, 6, and 10), were associated with respiratory congestion in drawings by both CF and PUL patients, as well as

in drawings done by pediatric respiratory patients from earlier studies. Filled-in shapes, again usually clouds, at the very top of the page appeared in drawings made by patients suffering from rhinitis, an inflammation of the mucus membrane of the nose (Figure 7).

Large horizon suns, showing partially above horizon lines, occurred only in drawings done by CF patients, and were often associated with increasing lung hyperexpansion (Figures 5, 6, and 13).

A phenomenon peculiar to drawings done by patients with respiratory involvement was designated initial monochromatic color scheme (IMCS). The first drawing color used matches the paper color chosen—blue on blue, yellow on yellow, white on white, and so on (Figure 9). IMCS was found in some drawings by patients with lung disease (with or without CF), once among the drawing of adult GI patients but not in oncology patient drawings, nor in drawings done by other pediatric patients without lung disease.

Although not a consistent finding, a few seriously ill CF patients drew prominent horizon lines combined with the theme of hidden treasures symbolizing things to come. An example of this would be a Halloween farm scene (Figure 14) of a closed barn next to an empty, fenced-in field with an open gate. The CF patient-artist explained that inside the barn (unseen) was "a horse of the most beautiful color you have ever seen." She said that there would be a path leading to the field, (it was not in the picture), and that the gate was open, waiting for the horse.

Discussion

Cystic fibrosis is a potentially fatal inherited autosomal recessive disease. Thus, both parents are heterozygotes (carriers) with no phenotypic expression of the disorder, and the severe illness in the child is often unexpected. The parents often are greatly disturbed and this feeling influences the

---

3 Completed in Fall, 1980, at Westlake Community Hospital, Melrose Park, Illinois, and Wyler Children's Hospital, the University of Chicago.
child’s outlook and the ability of the family to comply with the preventive medical program. Although the degree of compliance cannot be directly correlated with the patient’s present health, there is an overall correlation between compliance and long-term survival.

Considering the existing knowledge about CF and the care available to those who have it, evaluation of the drawings must take into account concerns of these patients and their families. The extensive health maintenance emphasis given the families is directed at the pulmonary and gastrointestinal manifestations, the two processes most seriously affected by CF. This results in a greater conscious awareness and monitoring of these functions by the patient and physician than is usually the case.

Maintaining physical functions and thus survival is not the only motivational goal. A desire to preserve a sense of well-being and a semblance of normality in spite of difficulties, is also prevalent. Given that a cure is not available, it becomes a matter of living life as well as possible in light of the circumstances. The sublimation found in the drawings could be interpreted as confirmation of this. The patients develop this strength as they learn to cope with the disease. Without the aid of health care professionals and family in developing this attitude, these coping strengths falter. The drawings help illuminate patient response to illness, providing assessment of stability, concerns, and attitudes.

A balanced composition with full-page orientation may indicate a harmonious global approach by the patient. (In this study, the paper was identified with patient perception of environment, and the use of drawing media was identified with the patient’s way of dealing with the perceived environment.) This would be compatible with sublimation—in this case incorporating health care regimens as a regular part of activities of daily living while monitoring and adjusting to the whole of one’s world, and upgrading the quality of living.

The necessity of drawings was obtained during health maintenance visits; therefore, the predominance of serene affect, balance, and full-page use can be attributed to the general approach to CF by the patients. Deviance from these three given qualities usually occurred during acute activation of the disease process. When this happened it was difficult, in the interpretations, to separate physical distress from emotional distress as exemplified in art form. They seemed to be closely intertwined.

The association of sharp-angled triangles with sharp pain was not difficult to make. Further speculations can be made based on the drawing processes of a 4-year-old CF patient with severe GI disease. In one drawing session (Figure 4) she used extra pressure in executing the approach line of each angle. She eased up at the end, then very deliberately changed the direction of the line to form the apex. This could represent the cyclic wave-like pattern of the gastrointestinal pain. The therapist, who had seen similar strong reactions during adult GI therapy sessions, also had the impression of a sudden turning away, of relief from the inevitable. This specific maneuver may warrant more intensive study.

Compartmentalized shapes, often drawn in a ritualistic, attention-to-detail way (occasionally in a compulsive manner) provide many ideas for discussion. Only once during the studies did a GI patient, an adult with Crohn’s Disease, specifically identify compartmentalizing with constriction. She explained while drawing part of her intestinal tract (Figure 12) that she knew the constriction (which her lines represented) would always be there, but that she was ready to deal with it. When the usually self-regulating and orderly mechanics of digestion become abnormal, the drawings suggest a psychological attempt to impose regulation. For example, when diarrhea secondary to malabsorption occurs,
The drawings help illuminate patient response to illness, providing assessment of stability, concerns, attitudes. . . . The association of sharp-angled triangles with sharp pain was not difficult to make.

The drawings suggest an instinctive desire to regulate them, to compartmentalize the process as with the locks of a canal.

Other suggestions of a correlation between drawings and patient problems were: untidy use of materials, which was reflective of mucus plugging; and the filling-in of shapes, especially clouds, representing respiratory congestion.

The horizon lines come closer to pictorial metaphors than those previously discussed, with the exception of compartmentalized shapes. They appear in concrete structural forms, symbolic of the bodily structures they represent.

The use of IMCS, beginning a drawing with a media color to match the paper chosen is the most unusual finding to date. It was first noticed in 1980 and has been described during speculative analyses by therapists and attending physicians as “fading into the wallpaper,” “brittleness” (not wanting to change; staying the same), “soaking in,” and “tentative beginning.” Occasional conscious awareness of this phenomenon on the part of patient or family does occur: “You can’t use that, Joey. It won’t show up” and “I’d better use green. Red won’t show up.” A hospitalized 4-year-old turned the process around by picking the marker color first, then the same paper color. After three such drawings, his mother handed him a contrasting color marker. He turned it down, saying, “But this matches!”

The process of breathing, unlike eating, sleeping, or exercising, cannot be suspended for hours, or even minutes at a time. It establishes a direct dependency on environmental air. The same air that is part of our world metabolically becomes a part of us. The IMCS might be symbolic of the establishment of this sameness, and once the relationship is functioning (air is being exchanged) then the other processes can be attended to.

Finally, the hidden treasures symbolize things to come and imply hope for the future, a spiritual strength that is consistent with the composed balance noted in so many CF patient drawings.

The American Art Therapy Association, Inc. (AATA)

GENERAL MEMBERSHIP INFORMATION:
All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, The AATA Journal, discounts on publications, discount on admission to the annual Conference as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (A.T.R.). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA office.

MEMBERSHIP CATEGORIES:
Initial application for membership in the Association shall be accepted in one of the following classes: ASSOCIATE, STUDENT, or CONTRIBUTING. Contact the AATA Office for applications for Professional and Credentialed Professional Membership.

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the Annual Meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee.

Annual Dues: $25.00

Applications for student membership must be accompanied by a copy of current ID.

Associate Membership shall be open to individuals interested in the therapeutic use of art, and who wish to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the Annual Meeting, but shall not have the right to vote or hold office.

Annual Dues: $40.00

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $80.00

Professional Membership is subject to approval by the Membership Committee. Individuals who have completed professional training in art therapy and who are or have engaged in the therapeutic use of art are eligible. Professional membership shall provide for their participation in all activities of the Association and receipt of all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA office for an application.

Annual Dues: $65.00

Credentialed Professional Membership shall be open to individuals who have met the qualifications and been approved for Professional membership and have been granted Registration (A.T.R.) by the American Art Therapy Association, as set forth in Documents and Procedures Relevant to Professional Registration.

Annual Dues: $70.00

The American Art Therapy Association serves as a clearinghouse for information about the field of art therapy. The following Proceedings are available from the AATA Office. Contact the AATA Office for a Resource Order Form.

R E S T C O P Y A V A I L A B L E  8 1  May 1984, ART THERAPY 75
New Horizons of Holistic Healing through Creative Expression

Josef E. Garai, PhD, ATR

Josef E. Garai, PhD, ATR, is professor emeritus at Pratt Institute, New York. Dr. Garai is a creative expressive therapist in private practice, and is the founder and former chairperson of the Graduate Art, Dance and Movement Therapy Department at Pratt Institute. A consultant to many community mental health associations, Dr. Garai has authored many articles in psychology, art therapy, and social issues. He received the Adolf Meyer Award, from the Association for Improvement of Mental Health for leadership in community mental health organization and education.

Feelings of fragmentation and alienation are characteristic of the spirit of our times. In recent years holistic health movements have sprung up all over the world. They tend to counteract splitting and fragmenting tendencies by placing the emphasis on the harmonious integration of body, mind, and spirit and creating a mutually satisfying interaction between the individual and his natural ecological environment.

Ferguson (1980) described the transformations that our society is experiencing as creating a climate in which each individual considers his or her own personal transformation as the basis for the transformation of society as a whole. The Aquarian Conspiracy: Personal and Social Transformations in the 1980s consists of an informal network of people from all walks of life who have joined in this endeavor to achieve a change in the surrounding society based on personal experiences of change. Roszak (1979) in Person/Planet: The Creative Disintegration of Industrial Society introduces us to the “Age of the Person,” which, for the first time in human history, makes the personal self-fulfillment of each individual person the avowed goal of society.

Garai (1979) outlined the seven specific steps that must be taken to educate each individual toward the conscious assertion of these five principles. This article defines each of these seven steps, and presents specific exercises in art therapy and other expressive modalities that the author has developed during the past 10 years to assist students to gain holistic personality integration. The purpose of the detailed descriptions of these methodologies is to provide the holistically oriented student of expressive therapies with a basic holistic healing training manual that can be used both for personal holistic personality integration and for holistic healing with clients.

On the threshold of the third millennium, the future of mankind offers unprecedented opportunities for transformation and change, while it simultaneously sees itself confronted by unfathomable risks of global self-destruction. No wonder that feelings of fragmentation, loss of identity, disintegration of personhood, a sense of being cut off from nature and rootedness altogether, feelings of helplessness, despondency, and lack of control over one’s own life reflect the zeitgeist or the characteristic spirit or ethos of our times. Mankind seems to have become fragmented in its own inherent structure. Instead of cooperating and reinforcing mutual functions, body, mind, and spirit are deeply at odds with one another. This internal process of fragmentation has increasingly led to an alienation of one from the natural environment. In efforts to fragment the natural habitat, humankind has further compounded the effects of one’s internal splitting. In Person/Planet: The Creative Disintegration of Industrial Society, Roszak eloquently analyzes the repercussions of this process of disintegration and their revolutionary implications.

We are fortunate to witness the emergence of powerful trends that recently have begun to move away from this process of schizophrenic fragmentation. They seek to make the person whole again both within oneself and within one’s bond to the planetary environment. Holistic health movements are spontaneously springing up all over the world. The time is ripe for innovative approaches to achieve basic changes and transformations that are intended to counteract splitting, alienation, hopelessness, despair, and cynical aloofness.

The Aquarian Conspiracy

In her groundbreaking book, The Aquarian Conspiracy: Personal and Social Transformation in the 1980s, Ferguson (1980) described this new movement as an informal network of people from all walks of life, all income levels, and all status categories, from the humblest to the highest. Ferguson pointed out the specific characteristics of the Aquarian Conspiracy:

A leaderless but powerful and working to bring about a radical change in the United States. . . .

This network is the Aquarian Conspiracy. It is a conspiracy without a political doctrine. . . .
Broader than reform, deeper than revolution, this benign conspiracy for a new human agenda has triggered the most rapid cultural realignment in history. . . . It is a new mind—the ascendance of a startling world view that gathers into its framework breakthrough science and insights from earliest recorded thought. . . .

You can break through old limits, past inertia and fear, to levels of fulfillment that once seemed impossible . . . to richness of choice, freedom, human closeness. You can be more productive, confident, comfortable with insecurity. Problems can be experienced as challenges, a chance for renewal rather than stress. Habitual defensiveness and worry can fall away. It can all be otherwise. . . .

[People] found themselves rethinking everything, examining old assumptions, looking anew, at their work and relationships, health, political power and "experts," goals, and values . . . .

The poets and philosophers were right in their intimations of an open, creative universe. Transformation, innovation, evolution—these are the natural responses to crisis.

The crises of our time, it becomes increasingly clear, are the necessary impetus for the revolution now under way. And once we understand nature's transformative powers, we see that it is our powerful ally, not a force to be feared or subdued. Our pathology is our opportunity. (pp. 23-25).

The Aquarian conspirators have profited from the lessons of the past. All the mass movements that have ever tried to evolve the "new" person by changing society first have proved ineffective in the long run. Neither socialism nor democracy has produced the new ideal "socialist" or "democratic" person. In order to be lasting, transformation and change must first be experienced by individual persons as profound redefinitions of their own lives to provide the basis for a total transformation of society and its harmonious compassionate reintegration.

Roszak (1979) pointed out that we are entering the Age of the Person. This means that for the first time in the history of humankind the association of each individual's right to the fullest development of his or her unique personhood and identity becomes the sacred trust and shared goal of society. This new principle is bound to change profoundly the role of all of our institutions and agencies, whether they relate to government, education, the professions, trade unions, science, physical and mental health, industry, or business. All these organizational frameworks will henceforth be evaluated in accordance with their ability to respond effectively to and provide opportunities for the personal growth, self-fulfillment, and life enrichment of their individual members. They can no longer claim that their members must pay allegiance to their norms, values, and organizational structure rather than seek self-actualization, growth, and new challenges.

A second Aquarian principle implies that this search for the assertion of a unique identity, personhood, and self-fulfillment remains no longer restricted to a privileged minority or elite; it is now claimed by all individuals. Adherents demand full respect for their dignity, integrity, individuality, and choice of belief or lifestyle. We are today witnessing the emergence of support groups and self-help networks that provide a communal basis for individuals who share problems, disabilities, and handicaps that are frequently ridiculed, disregarded or even violently rejected and attacked by other people.

There are groups of childless couples, homosexual artists, abused wives, former mental patients, senior citizens, mistresses anonymous, and many others whose main purpose consists in strengthening the pride of their members in their common experiences and sharing a unique identity and personhood. They want to confront a discompassionate competitive society with living examples of compassionate support and sympathetic cooperation. "No matter how different I may be from you and many others, I have the same right to assert my own dignity, self-respect, uniqueness, identity, and inviolability as you do," say the members of these support networks. Society must be flexible enough to accommodate diversity and even nonconformity.

Basic Principles of the Holistic Approach

From the confluence of ideas expressed by Fergusson (1980), Garai (1979), and Roszak (1979), one can formulate the following five principles: (a) Each individual has the inalienable right to the fullest development of unique personhood, identity, and lifestyle; (b) each individual has the right to expect respect for unique personhood, identity, and integrity or wholeness from all other people; (c) each individual is encouraged to associate oneself with other individuals on the basis of sharing common goals, ideas, interests, handicaps, or lifestyles; (d) each individual has the right to challenge any authority or institution to respond positively to one's own need for recognition of unique identity and personhood; and (e) each individual is encouraged to seek internal wholeness, that is, a harmonious balance between body, mind, and spirit, as well as external wholeness, that is, a wholesome connectedness with other people and the ecological environment on this planet.

These five principles must be adhered to in order to ensure the transformation needed to initiate the Age of the Person as defined by Roszak (1979). The specific steps that must be taken to educate each individual toward the conscious assertion of these five principles of unique personhood, are outlined by Garai (1979) as follows: (I) The Holistic Approach; (II) Achievement of Genuine Individuation; (III) Movement from Autonomy to Intimacy; (IV) For-
mulation of Meaningful Life Goals; (V) The Holistic Perspective of the Life Cycle; (VI) Fluidity and Stability of Individual Identity; and (VII) Empathy and Intuition in Symbolic Communication.

Each of these seven steps suggests practical exercises to provide therapeutic tools for the promotion of holistic personality integration in education and mental health.

The Holistic Approach

The holistic approach is based on a field theory of intrasystemic and inter-systemic interactions of body, mind and spiritual functions with special emphasis on their integration through harmonious combinations of the effects of both brain hemispheres. All the disciplines and professions must cooperate in the process of achieving holistic integration.” (Garai, 1979, p. 178)

Exercises

The first exercise is designed to achieve holistic personality integration. Each subject is given two pieces of plasticine modeling clay with which to model figures (preferably the nontoxic nonhardenning Swiss Caran d’Ache clay), two sheets of sketching paper (preferably 17 x 14 inches) and assortments of multicolored crayons. Instructions are: “Take a piece of clay, close your eyes, and model the clay with your eyes closed. Imagine how you are fragmenting and splitting yourself, how you engage in activities or thoughts that cut off your body from your mind, your mind from your spirit, and yourself from your natural environment. Try to impart these splitting tendencies to the piece of clay in your hand.” Then wait 10 or 12 minutes before adding the following instructions: “Now soon I will count from one to three. When you hear the number three, open your eyes, place the clay figure of your self-segmentation next to the first sheet of paper, mark this sheet with number one in the left hand upper corner, and proceed to draw with crayons the experience of your self-splitting in any way you desire.” After waiting for 3 more minutes, the count to three is made.

The second exercise is initiated with the following instructions: “Now take another piece of clay, close your eyes, and model it with your eyes closed. Let images flow depicting how you attempt to integrate your body, mind, and spirit harmoniously so as to satisfy your basic needs and feel whole within yourself.” Then after a delay of 10 or 12 minutes the following instructions are added: “Soon I will count from one to three. When you hear the number three called out, open your eyes, place the clay figure of your self-integration next to the second sheet of paper, mark this sheet with the number two in the left hand upper corner and proceed to draw with crayons the experience of your self-integration in any way you desire.” After an additional delay of 3 more minutes, the count to three is made.

A comparison of the clay models and the crayon drawings is then made, first in dyads, then in groups of four, and finally by the whole group with the assistance of the facilitator in order to clarify movements from fragmentation to integration as revealed by interpretations of the symbolic meanings of the clay models and the crayon drawings. It is a simple yet powerful method of demonstrating holistic personality integration.

Achievement of Genuine Individuation

This process can best be described as attainment of authenticity, autonomy, and actualization of self (the three A’s) through creative expression. The most important step leading to individuation consists in the accomplishment of the developmental task of learning to be a separate person able to take full charge of one’s own life. It requires completion of the process of separation from significant other persons, especially from the mother and the father. This separation leads to genuine individuation providing the basis for true autonomy. The autonomous person is able to control his life effectively. He can enjoy the state of aloneness without experiencing feelings of loneliness and despair. He has the courage to stand alone without feeling lost or abandoned. (Garai, 1979, p. 178)

The autonomous person is therefore able to appreciate the state of being alone as an opportunity to enjoy the utmost freedom of choice with regard to goals, ideas, interests, and activities that can be pursued without fear of disapproval, ridicule, objection, or intrusion. The dependent non-autonomous person seems to experience all aloneness as “loneliness,” that is, a state of deficiency, the absence of an important companion or lover, and consequently, exposure to frightening feelings of abandonment and rejection. One can focus on this state of deprivation to such an extent that he or she feels paralyzed, immobilized, and unable to envisage any activity that would replace the absent partner.

Exercises

The first exercise is designed to assist participants to move from the type of loneliness that is perceived as a lack, a state of deficiency, or an incapacitating experience to enjoyable aloneness providing optimal freedom of choice and relaxation encouraging creative expression. Subjects are provided with two pieces of plasticine modeling clay, two sheets of sketching paper, and assortments of multicolored crayons. The first instructions are: “Take a piece of modeling clay in your hand, close your eyes, and model it with your eyes closed. Imagine yourself feeling lonely because you are missing the companionship of the person closest to you. You cannot concentrate on anything you would like to do alone because of the painful absence of your partner. You feel as if you were nonexistent and are unable to engage in any meaningful activities.”

After 10 or 12 minutes the following instructions are added: “I will soon count from one to three. When you hear the number three, open your eyes, place the clay model next to the first sheet of paper, mark this sheet with number one in the upper left hand corner, and proceed to draw the experience of your painful loneliness with crayons.” After 3 more minutes the count is made from one to three.

This first exercise is followed by a second exercise for which the initial instructions are: “Take a piece of modeling clay, close your eyes, and model the clay. Imagine yourself alone and eagerly looking forward to the opportunity to be able to do whatever
comes to your mind and whatever you enjoy doing most without having to bother about the needs, likes, preferences, or objections of any other person in the world. You experience a tremendous surge of vital energy and a feeling of complete freedom of choice. Impart these feelings upon the piece of clay in your hand."

Then after 10 or 12 minutes the final instructions are given: "I will soon count from one to three. When you hear the number three, open your eyes, place the clay model of your enjoyable aloneness next to the second sheet of paper, mark this sheet with number two in the upper lefthand corner, and proceed to draw the experience of your positive aloneness with crayons." After 3 more minutes the count to three is made.

Participants get together first in dyads, then in groups of four to compare drawings and clay models of both exercises to draw conclusions about movement from dependency to genuine individuation reflected in the symbolic meanings of the artwork. This is followed by analyses of the artwork and interpretation of symbolic meanings by the group facilitator with individual group members to deepen the understanding of symbolic interpretations of dependency versus autonomy and individuation.

Movement from Autonomy to Intimacy

Once a person has achieved genuine individuation and autonomy, he is ready to seek out other similarly individuated and autonomous persons for the purpose of satisfying relationships. One must first be a person in one's own right to get ready for the encounter with another person. This is most eloquently expressed in the treatise 'I and Thou' by Martin Buber. The expressive therapist realizes the importance of balancing the needs for intimacy and privacy in close dyadic relationships. (Garai, 1979, p. 178)

Exercises

To explore the movement from autonomy to intimacy, the following exercise is suggested. First have each participant depict with clay and crayons the following: "I feel whole in body, mind, and spirit, and at ease with the world around me." Then each participant depicts the scenario: "My friend feels whole in body, mind, and spirit and at ease with the world around him or her." The third exercise deals with the theme: "I feel whole within myself and at ease with the world, my friend feels whole within himself or herself and at ease with the world, and we both feel whole within our relationship." In each of these exercises similar instructions to those used in the previous exercises on achievement of individuation with similar time sequences can be used with relevant adoption of the scenarios. The clay models and crayon drawings from the three scenarios are then interpreted by the group, first in dyads, then in groups of four, and finally by the whole group with the facilitator using his experience in the interpretation of the symbolic meanings of the artwork as a valuable asset for further clarification of movement from autonomy to intimacy.

Formulation of Meaningful Life Goals

Man cannot live by bread alone. He must find some meaning in his existence. . . . Life thus becomes a series of metamorphoses . . . life goals must involve self-actualization through engagement in some meaningful and personally satisfying occupation. But it must also go beyond mere self-fulfillment to reach other people in the search for self-transcendence. One's personal life must move toward transcendence of the mere personal interest and strive toward transpersonal experiences. A meaningful life goal must open up avenues that hold out the promise of some kind of transformation characterized by growth and change in other people's lives. A profound concern for social justice and change, alleviation of social and economic discrimination, elimination of racial, ethnic, national, religious, and sexual prejudices, and the improvement of the microcosm of the family and the immediate neighborhood as well as of the macrocosm of the nation and the world community as a whole reflects the value system of self-transcendence. It appears to create a firm basis for a genuinely meaningful existence. (Garai, 1979, p. 178-179)

Exercises

The following exercises have been developed to explore meaningful life goals. Using plastinc clay, sketching paper, and multicolored crayons, each subject first models and draws the theme: "I am doing something I really like; and follows it with an exercise depicting the theme: "I am doing something I dislike very much." Drawings and clay models are then compared first in dyads, then in groups of four, and finally by the group as a whole with the facilitator deepening the analytic interpretations of the symbolic meanings reflected in the clay models and crayon drawings.

In the "real" world we must learn to walk with a variety of people whose identities and life styles are often quite different from ours.

Another relevant exercise requires participants to focus on their most meaningful life goals, making clay models, crayon drawings or collages depicting these goals, and following this exercise with artwork depicting: "Obstacles in the way to achievement of this goal created by myself and others and ways of overcoming these obstacles."

The Holistic Perspective of the Life Cycle

The individual person must develop the perception of the life cycle as an integrated process rather than a se-
... the holistic perspective of the life cycle emphasizes the continuity and fluidity of life as a cyclic phenomenon characterized by birth, death, and rebirth of cosmic matter. Living and dying are intricately intertwined processes.

Exercises

During the past few years I have developed a new method that has proved to be most effective in assisting participants to gain an integrated view of the total life cycle. I have described this method as rebirthing through creative expression in art or rebirthing through art. Participants are induced to go through the four stages of being in the womb, being born, facing death, and smiled rebirth with the help of imagery. Autogenic induction of guided imagery precedes each stage as follows: (a) "Imagine yourself being in your mother's womb and floating in the amniotic fluid"; (b) "Imagine yourself going through the birth canal and emerging in the outside world"; (c) "Imagine yourself facing the last hour of your life"; and (d) "Imagine yourself going through the birth canal again, but this time you are able to determine the outcome of your birth, choosing whoever and whatever you will be in this reborn existence."

During the exercises, each participant models the experience (with eyes closed) with a piece of plasticine clay, and following this experience draws it with multicolored crayons. This advanced and difficult exercise should be presented only by highly qualified registered art therapists who have undergone advanced training. Experience has shown that this method leads to an unusual unfolding of creative energies in the rebirth state in which colorful mandalas, flowers with scintillating petals, mountains, rainbows, landscapes, scenes from the bottom of the sea, birds and stars appear as symbolic representations of rebirth.

After developing this method of rebirthing through art, I attempted several times to administer it, while omitting the death stage. I discovered that the rebirth experience (immediately following the original birth experience) brought forth drawings and clay figures that were stiff, poor in detail, and unexciting. This was in contrast to the artwork following the death state, which was striking, colorful, expansive, and imaginative, and reflected surges of vital energy. Once a person faced the fear of death, he or she seemed to release a strong reservoir of vital energy that was waiting for creative expression. This result furnishes convincing evidence for the holistic integration of the life cycle.

Fluidity and Stability of Individual Identity

This was stated in Buhler's eighth principle of the humanistic approach as follows: 'Identity is fluid and yet stable throughout a person's life requiring continued attempts to reintegrate and reconcile polar tendencies and different needs.' Erikson's brilliant analysis of 'The Eight Ages of Man' in Childhood and Society focuses in depth on the first five stages of life until adulthood which is described as the stage of 'Intimacy versus Isolation.' But his later stages fail to reflect the significant transitional stages of growth, change, redefinitions of identity, and challenges which people in modern societies go through in early childhood, midlife,
midlife, early old age, and old age. Erikson allocates the lifespan from age thirty-five until seventy, the expected average age of death in modern industrial societies . . . only the two stages of 'Generativity versus Stagnation and Ego Integrity versus Despair.' There is no doubt that we need a greater awareness and comprehension of the numerous transitional stages, the challenges, crises, changes, redefinitions of identity and life goals, and the creative resources needed to negotiate the adult and later stages of life.

The humanistic expressive therapist considers the total life-span as a continuous series of challenges and crises which require the constant learning of new adaptive strategies in order to cope with them. Each individual must acquire a sense of trust and confidence in his ability to survive and derive satisfaction from life. We must learn to cope with transitions from one stage to another, with change, choices, and the creation of our specific lifestyles. The humanistic expressive therapist assists his clients in the mobilization of latent creative resources to meet these challenges with authenticity, autonomy and actualization of their creative potential.

The benefits accruing from working with older clients stem from the frequent discovery of potent creative energies which a youth-centered society does not want to acknowledge or discover. (Garai, 1979, p. 180-181)

It is clear from this description that the process of identity formation is not finally completed by the end of adolescence. Transitional periods, turning points, and new life experiences provoke identity crises in early childhood, middle childhood around age 8, early adolescence, adolescence, midlife around age 40, early old age around age 60, and old age between the ages of 70 and 80. Change is inherent in the experience of life in the modern era. The person who has a firm and stable core identity is most likely to successfully adapt one to the required changes, and modify identity without losing basic anchoring points. Expressive therapies can be most effectively used to assist clients in the resolution of subsequent identity crises.

**Exercises**

A danger that may frustrate efforts to resolve an identity crisis consists in confusing the role one plays with one's basic identity. An exercise intended to explore and clarify this confusion of role-playing with identity might suggest to participants (using crayons, clay, or collages, or through movement improvisation or poetry therapy) various roles each of them may be required to play such as teacher, husband, wife, accountant, psychologist, or policeman. Then each participant depicts (a) how one is able to maintain identity while enacting this specific role, and (b) what might happen, if the role took over to such an extent as to replace one's identity. Finally, each participant depicts how he or she plans to maintain this unique identity, no matter how overriding any specific roles might become. A comparison of the artwork, movement improvisations, or poetic passages produced under these three different conditions can be used to explore ways of resolution of identity conflicts devised by the participants.

Another exercise would require participants first to depict "the stable me" and then "the fluid me" and follow up with a third exercise centering around the theme: "I am integrating the 'stable me' with the 'fluid me' harmoniously."

**Empathy and Intuition in Symbolic Communication**

The special skill of the expressive therapist consists in his training in methods of symbolic communication. His preference for this modality stems from the realization that symbolic communication can become a more direct, genuine, honest, and sincere way of expression of feelings than verbal communication. Words can conceal, hide, and lie as well as reveal, expose, and tell the truth. Using empathy and intuition in his interpretation of symbolic communication and the meanings of symbolic messages, the sensitive art therapist is able to get in touch with his client's feelings more directly. The art therapist prefers means of graphic, sculpted, pictorial, and collage expression, the music therapist, musical instruments and the singing voice, the dance and movement therapist, various forms of individual and group dance, movement improvisation, and breathing techniques. We ought to include also poetry therapy among the expressive therapies, because it is characterized by the use of verbal communication on a deeper symbolic level.

Symbolic communication requires an empathetic and intuitive grasp of what Jung has defined as the collective unconscious and its relationship to the personal unconscious of the client. The explorations of myths, fairy tales, religious stories, dreams, great tribal, national, and supernatural epics, traditions of good and evil spirits, God and the Devil, folklore, etc., involve an understanding of the archetypes, images, and symbolic messages which frequently assume a strong powerful role in the unconscious of the individual. They affect our conscious behavior as well. (Garai, 1979, p. 181)

**Dreams focus on unfulfilled wishes or unresolved problems.**

Imagery and fantasy are acknowledged as powerful healing forces. Many of the innovative techniques in imagery and fantasy have been described by Singer and Pope (1978). Asking individuals to depict with crayons, plasticine clay, collages, or movement improvisation a recent or recurrent dream can provide insights into the imagery and fantasy of participants. Dreams focus on unfulfilled wishes or unresolved problems. They may even resolve deep-seated personal crises or point out solutions to everyday problems as Jung has demonstrated. Simonton (1980) and his coworkers have used imagery to assist cancer patients in their recovery from cancer. Using chemotherapy, he instructs his patients to visualize the laser beam as directly attacking the cancerous cells with invading armies of immunogenic or "health-bringing" cells, while imagining that his own
body mobilizes auxiliary armies of immunogenic cells which help the invading health-bringing cells to defeat the “enemies,” that is, the diseased cancer cells.

A healthy mind in a healthy body in a healthy spirit in a healthy world.

Exercises

Garai developed a method that can be used to replace drug therapy based on the use of tranquilizers. Whenever a client claims that he or she cannot survive without the use of tranquilizers, Garai suggests: “Imagine the pain as vividly as possible. Try to focus on the specific part of the body it attacks, picture how it squeezes, tears, cuts, hurts, nags, etc., how heavy it feels, and try to draw with crayons and model with plasticine clay the pain and all its effects.” After discussion of the symbolic meanings of the drawings and the clay models, the following instructions are presented: “Now imagine how the pain is receding and leaving your body. Try to picture how your muscles are relaxing, how your body feels more at ease, and how you can breathe more freely and easily. You feel your energy slowly coming back and the pain no longer interfering with your activities. You can breathe freely.” After interpreting the artwork of the pain leaving the client’s body, the surprising effect of freedom from it is frequently more relaxing and longer lasting than that which might be derived from a tranquilizing pill.

Summary

To summarize the basic position of holistic expressive therapy, it may be stated that it follows the principle: Mens sana in corpore sano in spiritu sano in mundo sano. It reflects the holistic approach whose ideal is: A healthy mind in a healthy body in a healthy spirit in a healthy world. Its purpose consists in assisting the individual in the development of his or her holistic and integrative rather than a fragmented and alienated life style. The person who genuinely experiences wholeness respects the Integrity, Indentity, Individuality, and Idealism (the four I’s) of both oneself and every other human being. This holistic philosophy leads the way of life of Care, Compassion, and Concern (the three C’s) which flows organically from the integration of Authenticity, Autonomy, and Actualization of Self (the three A’s).

The truly educated healer is a healed or whole individual and in healing others, one heals oneself, in healing oneself, the individual is healing others.

AN INTERNATIONAL JOURNAL

GIVE YOURSELF A HEAD START! SUBSCRIBE NOW AND SAVE!
Subscribers to Art Therapy and Members of American Art Therapy Association
ENJOY REDUCED RATE!

A quarterly, international, multi-disciplinary journal for professionals and students in all areas of the arts in psychotherapy, mental health and education. THE ARTS IN PSYCHOTHERAPY publishes original articles (including illustrations) by art, dance/movement, music, poetry, and drama psychotherapists and by psychiatrists and psychologists which reflect advances in theory, research and practice with no restrictions on philosophical orientation or application.

AN IMPORTANT SOURCE for news and summaries of national and international conferences and current educational information relevant to the creative arts in therapy, THE ARTS IN PSYCHOTHERAPY contains book reviews, welcomes letters to the editors, dialogue among contributors; has International Editorial and Advisory Boards of highly respected specialists who represent a wide spectrum of experience. It appeals to scholars and practitioners of the arts in psychotherapy and to psychiatrists and psychologists.

THE EDITORS WELCOME ORIGINAL MANUSCRIPTS.

american journal of ART THERAPY
Art in Education, Rehabilitation, and Psychotherapy

This independent quarterly, published since 1961, deals with the visual arts as they contribute to human understanding and mental health. Its contents include new theoretical formulations, bibliographical information, a job information exchange, and news of opportunities for training and of international developments in the field.

Topics treated in recent articles include:

- transference and countertransference in art therapy
- art therapy and cultural difference
- art as therapy in a public school
- art therapy with the severely physically disabled
- self-expression of a disturbed adolescent
- art in strategic family therapy
- the combination of art and play therapy
- the place of art in art therapy
- research into hospitalized children's self-images

Ten Year Follow-Up Survey on the Status of Art Therapy in the Greater Los Angeles Area

Helen B. Landgarten, MA, HLM, ATR

Helen B. Landgarten, MA, HLM, ATR, is director of the Graduate Department of Clinical Art Therapy of Loyola Marymount University in Los Angeles. She is also coordinator of the Art Psychotherapy Program of the Family and Child Department of Psychiatry of the Thalians Community Mental Health Center at Cedars-Sinai Medical Center, Los Angeles. An Honorary Lifetime Member of the American Art Therapy Association, she has lectured and conducted workshops on clinical art therapy throughout the U.S. and in the U.S.S.R., Germany, South Africa, Sweden, Israel, Brazil, France, Yugoslavia, and England. She is the author of Clinical Art Therapy, A Comprehensive Guide, and is a member of the Executive Board of A.A.T.A.

This article presents a format for, and information from a regional questionnaire about art therapy in the mental health field, and could serve as a model for other surveys. Collection of regional data at different time periods would be useful in yielding information from both regional and national perspectives. The survey, therefore, provides both a model for a survey format that could be used by art therapists in different geographical areas, and presents data that can be cross-referenced to build a greater body of knowledge regarding the status of art therapy.

In 1982, a survey was conducted to ascertain the status and future for art therapy in the mental health field in the Greater Los Angeles area. This survey was a follow-up to similar surveys taken in 1972 (Anderson & Landgarten, 1973, 1974, Landgarten, 1972, 1974a, 1974b). In addition, three later surveys, utilizing similar questionnaires, were conducted by Immaculate Heart graduate students (Hoseman, 1976; Siegel, 1979). Each of these latter surveys conveyed and recorded the mental health institutional attitudes and perceptions of the field of art therapy in the Greater Los Angeles area. The information from the survey discussed here provides both comparative data regarding the growth of art therapy in the Greater Los Angeles area and information that can be compared with that from other regional or national surveys.

The questionnaire provided important information about the current employment and status of art therapists, the training background and credentials of both art therapists and supervisors, and a listing of agencies that expressed an interest in an art therapy presentation or being available for use as a practicum site for training.

A cover letter and questionnaire (Figure 1) were sent to 245 mental health institutions in the Greater Los Angeles area. The mailing was based on information from The Directory of Health, Welfare, Vocational, and Recreational Services in Los Angeles County and the Loyola Marymount University's Field Placement lists. Of the 245 questionnaires that were mailed, 137 were returned, for a response rate of 56%.

A total of 96 questionnaires (39%) were not returned, and 12 questionnaires (5%) were returned by the Post Office as undeliverable. Sixteen (12%) of the returned questionnaires were not applicable to the study. The survey analysis is based on 121 responses, (49% of the total number of questionnaires mailed), and 88% of the total number of responses returned.

For the purpose of making numbers and percentages clear, the following procedure is used in this article: when segments of the sampling are discussed, percentages are given in terms of the number in the segment, which is represented by the small letter "n." Findings are reported in terms of numbers and percentages of the completed answers. Table data are referred to in the discussion where both the number and percentages of responses bear an importance to the questions.

Responses were compiled from the following types of institutions: community mental health/family counseling; out-patient and in-patient units; schools; developmentally disabled centers; residential treatment (child, adolescent, adult); rehabilitation; day care (adult, geriatric); day treatment (child, adolescent, adult); out-patient (drug use, alcohol); geriatric; residential treatment (child, adolescent). The facilities were listed according to various service categories to determine what type of institution showed the greatest amount of interest in the art therapy field. The response rates are listed in Table 1.

It would have been wise to combine community mental health with outpatient facilities because they serve the same function. In situations where in-patient units are within a community mental health center, they were cited under the "in-patient" heading. Table 1 may be utilized to study comparisons between the 1982 survey and the past surveys of 1972, 1974, 1976, and 1979.

QUESTIONNAIRE

Name and type of facility __________________________________________________________

Director ___________________________________________ Phone ____________________

Address ___________________________________________ City/State __________ Zip ________

1. Do you currently employ Art Therapists? No ______ Yes _______ How Many? ________

2. The art therapist is employed in which of the following departments?

   a) □ Art Therapy Dept.
   b) □ Activity Therapy Dept.
   c) □ Adjunctive Therapy Dept.
   d) □ Occupational Therapy Dept.
   e) □ Recreational Therapy Dept.
   f) □ Psychiatry Dept.
   g) □ Vocational/Manual Arts Dept.
   h) □ Education Dept.

3. State how many FULL TIME Art Therapists are employed __________________________

4. State how many PART TIME Art Therapists are employed per week __________________

   How many hours per week does each art therapist work?

   #1 __________ #2 __________ #3 __________ #4 __________ #5 __________

5. What professional training do these art therapists have? (By each option indicate NUMBER of Art
   Therapists who have that kind of training).

   a) Non-degreed, but experienced; how many? ____________________________
   b) Degreed in art or related field; how many? ____________________________
   c) Masters degree in Art Therapy; how many? ____________________________

6. Number of Art Therapists registered by the American Art Therapy Association ____________

7. Are you considering hiring an Art Therapist within 2 years? Yes ______ No ______

8. If answer to question 7 is YES, what type of training would you prefer? PLEASE INDICATE
   PREFERENCE BY CIRCLING NUMBER AFTER EACH OPTION.
   
   One (1) means your first choice; three (3) means your last choice.

   Do not use the same number twice. First Choice Last Choice

   a) Masters degree in Art Therapy 1 2 3
   b) Bachelors degree in Art or Psychology 1 2 3
   c) One or two year program with Certificate 1 2 3

9. Would your facility be available for use as a practicum for training persons in this profession?
   (Check one only.) Yes __________ No __________

10. If answer to #9 is YES, would weekly clinical supervision be available to our students?
    No _________ Yes __________ By whom? __________________________

11. For educational purposes, would your staff be interested in a lecture/slide presentation on Art
    Therapy? Yes _______ No _______

If there are any comments, please use the back of the page.

Please use self-addressed envelope for your return. Thank you for your prompt reply.

Figure 1.—Art therapy questionnaire sent to 245 mental health institutions in Greater Los Angeles.

Questions 1, 3, and 4 (See Figure 1) were directed toward discovering the number of facilities who hire full-time and part-time art therapists. This survey represents a total of 81 art therapists. Twenty-eight (45%) facilities hire art therapists on a full-time basis, and 35 (55%) facilities hire on a part-time basis.

The 45% rate of full-time employed Art therapists is extremely high in Los Angeles, for a profession which graduated its first seven master’s degree students in 1975.

The questionnaire provided information on institutional hiring practices. The number of art therapists that are employed ranges from one to five in a single institution. Of the total number of institutions, 24 (46%) facilities hire one art therapist on a full-time basis. This full-time statistic is low because a number of art therapists prefer not to have one full-time job.

The number of art therapists that are employed part-time ranges from one to five in a single institution. Of the 63 total number of institutions, 29 (46%) facilities hire one art therapist on a part-time basis. Written comments on the questionnaire and discussion with personnel
indicated that many art therapists chose to hold several part-time institutional positions. This preference has been cited as: a deterrent to burnout, extra time needed for private practice, a desire to combine their work as an art therapy instructor or supervisor. In addition, some art therapists have part-time group work as a means to higher earnings.

Because the role of the art therapist may be revealed through the department in which he or she functions, question 2 (see Figure 1) referred to an identification of specific departments within which the art therapist worked. Departments were listed as: art therapy; activity therapy; adjunctive therapy; occupational therapy; recreational therapy; psychiatry; vocational/manual arts; and education. It is gratifying to find that 27% of the art therapists are located in art therapy departments (see Table 2).

Psychiatry (25%) is almost equal in number to art therapy, with psychology and social work receiving the third and fourth highest number. Because clinicians in these disciplines are frequently the primary and/or only workers to offer treatment to the client, it is assumed that art therapy is also viewed as a primary or parallel therapeutic intervention.

In the original 1972 survey, Art Therapy as a department was nonexistent. The departments with the lowest number of art therapists are equally important. The survey shows departments of education, activity, adjunctive, occupational, and recreational therapies with low scores of 8 to 1 percent (see Table 2).

The survey provided data on the educational background of employed art therapists. A master's degree in art therapy received a high response of 76 (94%) (see Table 3).

This indicates that the master's degree in art therapy is highly recommended for the professional art therapist in order to be integrated into the paid mental health system in Greater Los Angeles. Institutions are viewing art therapists as equal to social workers in view of educational background, duties, and salaries.

Fifty (62%) of the employed art therapists hold an ATR (Registered

Art Therapist, awarded by the American Art Therapy Association. A number of respondents filled in information stating that their employees' registrations were in progress (see Table 3).

Art therapy registration (ATR) currently fulfills a dual purpose: it is a symbol of professional qualifications and is also a necessary requirement for agencies who desire a Loyola Marymount University Clinical Art Therapy Intern. In addition, it seems that the increased number of professional art therapists is certainly a boon to the public relations aspects of art therapy as the therapeutic agent.

The 121 questionnaires showed that 42 (35%) respondents planned on employing art therapists within the next 2 years: 33 (27%) answered with a "yes," while 9 (7%) wrote in a "possible" response (see Table 4).

In Table 4, institutions are listed according to their services in order to gain a clearer picture of the type of facility where job offers will be available. The responding institutions that offer the largest number of hiring considerations are: Community Mental Health and Family Counseling with nine (21%); Inpatient units with eight (19%); and Outpatient/Drug/Alcohol with five (12%).

The 35 percent of prospective employment returns is considered to be especially high and surprising during these depressed times. With federal, state, and county mental health funding cutbacks, and the author wondered about the optimistic responses regarding the future hiring practices within agencies. In discussions with institutional directors and art therapists who have been recently employed, it was discovered that art therapists are filling jobs that were formerly held by social workers or psychologists with a master's degree, or by other degree counselors. Mental health facilities have commented on the impressive gains that the Loyola Marymount University interns have been able to accomplish through their competent use of the clinical art therapy modality.

Institutions that stated they will, or might, hire an art therapist were requested to answer the question referring to the preferred educational
background. Eleven additional respondents also chose to answer this question. This may be due to the institutions' desire to obtain a Loyola Marymount University intern. Some facilities that listed choices for the training of art therapists did not answer second or third choices. The large number of first choices for preferred educational background indicated 38 (90%) of the institutions wanted a master's degree in art therapy (see Table 5).

This indicates the acceptance of art therapy as a viable mental health modality equal to the master's degree in both social work and school psychology.

The question concerning the institution's availability for practicum training purposes yielded a high score of 91 (75%) "yes" answers. (This score includes three respondents who wrote "possibly.") From the 30 (25%) respondents who marked "no" replies, six declared that supervision was a problem.

The high number of "yes" answers may have been affected by institutional motivation to answer the questionnaire with a desire to receive an intern from Loyola Marymount University.

Institutional clinical supervision with the highest percentages were as follows: 21 (17%) by psychologists; 16 (13%) by art therapists; 14 (12%) by clinical social workers; 14 (12%) by marriage family child counselors; 12 (10%) by psychiatrists; and nine (7%) were to be supplied by directors whose degree was unknown (see Table 6).

Clinical supervision revealed the institution's perception of art therapy. This question is not as important as it was in the original survey due to the large number of current master's degreed art therapists. It reveals a trend, however, toward clinical supervisors who have an equal or higher degree than the one the student is completing.

Related to Number 11 on the Questionnaire, seventy-nine (65%) of the responses indicated an interest in receiving art therapy education through a slide/lecture presentation. Forty-two (35%) answered with a "no." Some of the "no" responses stated art therapists were already employed with no need for further education.

A number of institutions who employed art therapists also expressed a desire to receive a slide presentation. The desire for presentations in the original 1972 survey stemmed directly from the institution's curiosity and willingness to learn about an innovative and pioneering mental health modality. In this survey, however, the majority of respondents were well aware of the field of art therapy, and their current motivation tended toward staff meetings where various therapeutic approaches formulated a base for discussion. This fact is validated by the institutions that have taken advantage of Immaculate Heart College and Loyola Marymount University's graduate presentations in the past.

Conclusions

In comparison to previous surveys, clinical art therapy has made tremendous gains in the field of mental health. Agencies have been educated to the value of the dynamically oriented art therapy approach. A master's degree in art therapy has become a requirement for persons seeking employment. The mental health community recognizes the value of hiring an art therapist who is certified by the American Art Therapy Association, or who offers documentation of working toward that goal. In spite of funding cutbacks for institutions, future hiring plans are positive.

This survey indicates the art therapy profession has forged its way to an acceptable position in the field of mental health in Greater Los Angeles.

Ed. Note: A copy of the complete research paper may be obtained from the author at: c/o Loyola Marymount University, Loyola Blvd. at 80th Street, Los Angeles, CA 90045.

GUIDELINES FOR AUTHORS: Please submit four (4) copies of manuscript to: AATA Journal, 5999 Stevenson Ave., Alexandria, VA 22304. Only original articles that are not under review by another periodical are acceptable. FORM: Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least ½ inch margins. STYLE: Prepared to conform to the Publication Manual of the American Psychological Association (Third Edition), available from APA Headquarters, 1200 17th Street, NW, Washington, DC 20036.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white, glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

Some Views About the New Art Therapist

Ursula Goebels, MA
Westmont, Illinois

I was pleased to find an article in the first issue of Art Therapy touching upon a subject matter that has been of interest to me for quite some time. As a neophyte in the profession, still vividly remembering the anxieties, doubts, and frustrations experienced during the first couple of months on the job, I would like to share some thoughts and concerns about my search for a solution to the “all too understandable pressures that cause a beginning art therapist to feel anxious, isolated, and powerless” (Wadeson, 1983).

I am not so sure that we need to remind graduate students entering the field that our area of expertise is different; after all, that’s why most of us chose this field. Providing additional models may not be extremely helpful since students entering the field seldom have the luxury of working in an established setting with an experienced art therapist to model. Instead, it seems to me it is important to recognize that everyday realities of clinical practice often do not mesh with the projected ideal needs (which is the first step in the never-ending search for an art therapist’s unique and flexible concept in art therapy).

Much needs to be learned through experience, but I think most of us acknowledge that students entering our profession face an especially difficult task. Often students are on their own in creating new jobs which means fighting lonely battles for facilities, materials, recognition, self-assurance, and professional identity all at once. Indeed, they might have to fit into well-established systems and have to adjust to treatment approaches that are quite different from the new with which they are familiar, and it is hard — maybe even impossible — to determine the effectiveness and usefulness of different techniques without trying them.

Little wonder, then, that under all of this pressure beginning art therapists struggle and stumble in an attempt to learn from other distinguished colleagues by selecting the right amount of tools needed to enhance art therapy without succumbing to the modus operandi of the facility, the therapeutic team. Yes, many might go overboard in an attempt to survive or “fit in” or both. Nevertheless, it is from the experience that eventually causes the pendulum to swing into the right position; namely, the position in which the individual’s personality, his or her expectations, and aspirations as humanist and artist determines the first primitive framework utilized to effect change in the clientele.

It takes maturity, tolerance, and sensitivity to accept different ideologies and treatment approaches working in conjunction with each other, and time to develop solid cornerstones on which clearly enunciated principles and tenets can be built. The young professional must be helped and guided (by teachers, supervisors, and other clinicians) in his or her relentless effort to establish the first workable relationships among the desires of an art therapist, the demands of an institution, and the needs of the population served.

An ideological framework in which the best of all theoretical approaches is combined with “art’s powerful potential for catharsis, immersion in feeling, synthesis and integration” (Wadeson, 1983) will emerge as the result of experience in clinical practice. I think that all art therapists (both new and the experienced) must be patient and gentle with themselves and with each other.

Art Therapy: An Educator’s Response

Virginia Niswander, MEd, ATR
Dayton, Ohio

The issue of the status of lone art therapists working in institutions, addressed by Harriet Wadeson (1983) in Art Therapy, is a very real one to art therapy educators whose concern for their graduated students extends to students’ continuing growth and future registration. The lack of understanding of the role of art therapy that may greet the new art therapist stems from the relative-
A Review of

The Lowenfeld Lectures: 
Viktor Lowenfeld on Art Education and Therapy

(420 pages, $24.50)

Reviewer Rauley Silver, EdD, HLM, ATR, is an art therapist who has done teaching, research, and consultation with special emphasis on art with the deaf.

If you are in your twenties or thirties, it may come as a surprise that Viktor Lowenfeld’s famous book, Creative and Mental Growth, once included a chapter titled, “Therapeutic Aspects of Art Education.” This 74-page chapter appeared until the fifth printing of the third edition. After his death in 1960, his book was revised and his chapter on art therapy disappeared without a trace.

In the early 1960s, art education was uncomfortable with art therapy. Art teachers were under the thumb of abstract expressionism, figurative art was taboo, and the time-honored occupation of working your way through college by posing for the life-drawing classes had disappeared. Many art schools had discontinued representation in any art form.

It is not surprising, therefore, that the chapter on the therapeutic aspects of art education was eliminated from Lowenfeld’s book in subsequent editions, or that students in art education and art therapy never knew what they were missing.

Now they can know, thanks to two of Lowenfeld’s former students. One had taped his lectures and the other has edited the tapes into the book that is the subject of this review. The first student, Ellen Abell, inspired by his lectures, had obtained his permission to tape them at Pennsylvania State University in 1958, just 2 years before his death.

She wanted to publish the tapes but after years of inactivity and in failing health, she turned to a fellow-student, John H. Michael, now professor of art education at Miami University. He edited the lectures with the help of others who transcribed the tapes in longhand, and then typed them. The 51 lectures have now been published by The Pennsylvania State University Press.

Section III of this work, titled, “Art Education Therapy,” includes four lectures on the therapeutic aspects of art education. These are, “Psychotic-Neurotic Considerations”; “A Case Study of Virginia, a Neurotic Child”; “A Case Study of Aggie, a Mongoloid Individual”; and “A Case Study of Camilla, a Deaf-Blind Child.”

From my point of view, this book should be required reading not only for art therapy students but also for art education students so that they can judge for themselves the work of a pioneer in both fields.

Viktor Lowenfeld is another of the refugees from Nazism who have made valuable and lasting contributions not only to us but also to the world at large. His books have been translated into Arabic, Chinese, Danish, German, Hebrew, Italian, Japanese, Norwegian, Spanish, and Swedish. One can only wonder whether his chapter on art therapy is missing from the foreign editions. If so, it is hoped that these Lectures will follow them, even if they can never catch up.
A Review of

_invented Worlds: The Psychology of the Arts_

Review: Nancy A. Cusack, ATR, is assistant professor, Department of Art Education, at the Massachusetts College of Art in Boston. She is also an independent consultant to clinical and educational programs.

That there has not been a current reference/resource to serve as an introduction to the psychology of the arts has made the task of teaching in this area all the more challenging. Ellen Winner’s response to that challenge was to formulate such a work, _Invented Worlds: The Psychology of the Arts_.

We are early advised that the “book has both a theoretical and a methodological basis” (p.12). We know that we will be considering the cognitive psychology of the arts. Goodman (1983), one of the mentors Winner credits with influencing her theoretical orientation, recently commented that the cognitive movement “is often decried by behaviorally oriented theorists as nonempirical and unscientific, and widely thought by writers on art to be bent on analyzing the arts to death” (p. 34). Such overdoses may find considerable fuel in this work. In Goodman’s view, however, cognition is relative in contrast to perceptual, emotive, and nonlinguistic modes but is incorporative in the sense of “gaining insight” and understating by all available means.” This distinction seems essential here because the book is designed to be approached from this later perspective.

The format in which all of this material is considered is impressive. Within a framework of investigating the “why” and “how” of aesthetic response, Winner is arbiter. She selects views considered significant to this investigation and presents them against her theoretical/methodological base. A careful selection of three art areas (painting, music, and literature) further the manageability of the author’s task. The rationale for this selection is the different manner of symbolizing, which characterizes each as well as the wealth of resources available.

The most characteristic strength of this work might be seen as its tight organization and clarity of intent. The latter may largely derive from the author’s style throughout as “agent provocateur.” Winner presents a view, states it plainly and briefly. The reader, free from lengthy presentation of arguments and limitations of the view, is thus urged to allow, argue, or further pursue. To illustrate: “The average five-year-old can paint a picture that is strikingly similar to works by contemporary painters” (p. 306). No discussion of contrary ideas concerning qualitative characteristics of adult/child/ work is offered. Readers who question this notion will want to read varying views elsewhere.

Where this book will be a handbook is not in the expected traditional sense of compendium but largely in the provocative style and presentation of key and often controversial views through which the author opens the door to further investigation.

The final section of the text is entitled “Art and Abnormality” and might immediately attract readers of _Art Therapy_. It opens with an enticing discussion of “The Damaged Brain.” Following this is a chapter devoted to mental illness, which may be considered the weakest portion of this commendable work. Here, the focus has been narrowed to the degree that two themes dominate. One is the author’s interest in the anomaly of the artist—a theme that appears early and emerges throughout the text. The other is that mental illness is considered almost entirely through pieces of information about schizophrenia. Emphasis is given to the artist’s link with madness, schizophrenia in particular. Winner’s rationale is that artists exhibit behavior symptomatic of schizophrenia but to a lesser degree. She cites the similarity of artists’ “unusual insights” to schizophrenic hallucinations and schizophrenic loss of contact with reality to artists as “often deviant, isolated members of society” (p. 355).

In suggesting a relation between art and schizophrenia, Winner accepts as a parallel the idea that “schizophrenics fail to screen out ‘irrelevant’ details from their perceptual field, just as artists notice important details that ordinary people ignore as trivial” (p. 355). Here she confuses schizophrenic diffusion and lack of differentiation with a refined, highly differentiated process.

It is in this section also that the therapeutic application of art is addressed. Winner discusses art as a reflection of mental state emphasizing the value as a diagnostic tool more than as a measurable therapeutic process.

Readers may find this final section, “Art and Abnormality,” generally lacking in balance. The paucity of the chapter on mental illness lies in its lack of reference to a breadth of ideas that might have brought it to a more useful end.

As a whole, however, the book is useful and welcome. Alone in its effort, it is extremely polished and highly courageous. It will be used and, no doubt, quoted for many years.

Film Review

The Color Bunch

Reviewers Kate Hartman, ATR and Georgiana Jungels, ATR are in Art Therapy Studies, Art Education Department, State University College at Buffalo.

The use of film animation for therapeutic purposes was first documented in the mid-sixties at the Lausanne University Psychiatric Clinic. Bader (1972) of the Center for the Study of Psychopathology of Expression, described the film production work of the inpatients as a new form of group therapy." Since then, three of the films made by the patients at Lausanne have been widely distributed ("The Poet and the Unicorn," "Good Morning My Eye," and "Seven Nights in Siberia").

"The Color Bunch," made by art therapist Judith Rothschild, MS, presents film animation as a therapeutic tool. (The film was partially funded by the Illinois Arts Council, an Illinois state agency.) The film demonstrates the use of several different film animation techniques within a group therapy setting. "The Color Bunch" is the name the clients gave themselves as participants in this creative group process.

The viewer is introduced to the film's focus by a series of well-organized interviews with mental health professionals: "I thought it was exciting because often when clients first come in here they are very much into themselves and kinda in their own world and the fact that they would be willing to come together collaboratively is exciting."

Film animation lends itself to a narrative life review process, and one client says, "I always said that I wished the time would come so that I could retire; I wished I didn't have to get up in the morning; I was feeling very tired every morning ... they told me I would get nervous ... it came out true." The animation process involved the clients—individually and as a group—in active self-exploration and self-expression.

Clinical issues such as self-identity and self-esteem are addressed by the clients and presented in case vignettes. The selected case material provides the film viewer with an understanding of the clients' concerns and use of filmmaking as a therapeutic tool and "how animation aided therapy goals." For example, one client who was identified as learning disabled found that he could "do" film animation and then began to "tackle some other activities that he was always afraid to do."

Treatment goals of goal setting, problem solving, decision-making, socialization, and peer interaction are accomplished through the use of film animation as an artistic and therapeutic process. The film illustrates some of the parallels between some film animation techniques and art therapy techniques (eg., the use of the story board and the sequential pictorial narrative) and there are obvious similarities between the combination of sequential verbal and visual information in a film animation and a client's images and comments in art therapy. In "The Color Bunch" a client tells a "story" through film animation. This process is similar to the use of theatrical performance in drama therapy (eg., Emunah and Johnson, 1983).

The "The Color Bunch" gives a good introductory overview of the technique of film animation. Although there is enough information to interest the viewer in using film animation as a therapeutic technique, the art therapist who has no previous film training would need to learn more about "how" to do film animation prior to beginning to use film animation as a therapeutic technique. (There are currently many excellent publications on the technique of film animation.) In addition to reading supplementary material on film and film animation, the viewer should analyze the safety considerations of the tools used to apply and/or scratch the painted film and the photochemicals used to develop the film. (An excellent reference on the safe use of a variety of art materials is Safe Practices in the Arts and Crafts: A Studio Guide published by the College Art Association.

The film contains a considerable amount of information about the potential of film animation as a therapeutic technique and is edited to share the filmmaker's enthusiasm about the process. The therapist who is considering the use of film animation as a therapeutic technique would need to consider the appropriateness of this technique to individual and group needs.

Some questions might be: What functioning level is necessary before a client is able to successfully participate in film animation? (The clients in "The Color Bunch" are described as "chronic" and "isolated" and seem to be relatively articulate, high functioning, and able to use a variety of art materials and to learn to animate pictures and combine these narrative images with personal statements.) Is the technique of film animation applicable to a wide variety of client populations? Are adaptations necessary for some special needs? How does film animation fit into an ongoing art therapy program? (Some of the case material in "The Color Bunch" is developed enough for the viewer to understand both the client's treatment issues and the use of film animation as a therapeutic intervention. Other vignettes present only basic information—sex, age, diagnosis—and leave the viewer to wonder how the film animation group provided a therapeutic experience.) Is film animation a specialization within an art therapy program or group therapy of a special activity program?
Is this technique appropriate for individual therapy and/or group therapy? What are the roles of the group leaders? Is the therapist skilled in both film animation and art therapy or are a therapist and a filmmaker/artist acting as co-leaders?

Film animation has many therapeutic possibilities and “The Color Bunch” is a good introduction to several techniques in film animation. This film offers the viewer a visually exciting introduction to the use of film animation as a group therapy technique. Although the film has some technical limitations, it has been edited to include relevant information as efficiently as possible on a low-budget with respect for the decision-making of the group members. One of the strongest testimonials to the therapeutically beneficial aspect of film animation was made by one of the client’s participating in “The Color Bunch,” who said: “I think I got something done... seeing my film makes me feel like a star.”

“The Color Bunch” (16mm, color/sound, 17 minutes, 1982) is a film by Judith Rothschild, MS, and is distributed by Judith Rothschild, JKR Productions, 650 Midfield Lane, Northbrook, Illinois, 60062 for rental or purchase.

References

Continued from page 89.

ly recent advent of art therapy into areas of therapy and rehabilitation already served by professionals from long established human service fields.

It is no wonder that newly employed art therapists may feel isolated practicing their “art” within this structure. Much like the artist or art teacher, the graduating art therapist is removed from the nurturing environment of an educational program where faculty and students share a philosophy based upon confidence in their individual experiences of the power of art. They quite likely will be thrust among those to whom art may be a frill, a mystique, a hobby — certainly not a serious contender as a mode of treatment. Until communication, understanding, and respect can be established, the new art therapists are in a vulnerable position, and are required to practice and defend their skills to maintain the identity of art therapy.

Although each one must prove competent as an art therapist, he or she must also be prepared to serve as an advocate for art therapy, demonstrating its unique value and its credibility. Unfortunately, the right-brain attributes of artists frequently are countered by a lack of verbal skills so necessary to communicate with colleagues whose dedication is evidenced by their left-brained verbal interactions and written rep. As it is imperative that each student, at the very least, develops a basic description of art therapy and delivers it with conviction in preparation for job-seeking. Clinical sites of internships or practica may be urged to give the student the opportunity to give art therapy presentations to the staff, and it is a wise student who seeks appropriate ways to promote art therapy and develop his or her advocacy skills even before employment. The contribution of art therapy to the multidisciplinary team can become apparent during the sharing of information and participation in treatment planning. Slide presentations are very effective in illustrating the process, products, and progress of art therapy sessions to the clinical or administrative staffs. As always, most effective learning results from actual experience. Providing the staff with direct art therapy experiences will bring them greater personal understanding of the potentials of art therapy.

Exhibits of clients’ or patients’ art work not only enhance an area visually, but also attest to the presence and vitality of the art therapy program. As these bridges of professional acceptance develop, ripples of information flow to other institutions, clients, families, and friends creating interest and demand. It is from such slow, but substantial experiential efforts of art therapists that our field has grown, and will continue to grow.

Although there is increased awareness of the role of art therapists in geographic areas where their service has been available, numbers have been few in relation to those already long entrenched in the delivery of human services. There is a tremendous “information gap” about art therapy not only among the general public, but also among the populations and service-givers of those we strive to serve. As a developing profession it has been — and continues to be — important to share our experiences, techniques, and research among ourselves in our meetings and conferences, and in our books and journals. Now, we need a broader base of public awareness of the benefits of art therapy. There is a need for media coverage of factual accounts of what art therapy is, what it does and whom it serves. This would not only extend the opportunities for employment, but also would ease the entry of graduates into a therapeutic milieu that already is beginning to understand and value what art therapy has to offer.
STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in theory, practice and research. An emphasis will be placed on the visual arts, but articles in related disciplines that have relevance to art therapists will also be published.

ART THERAPY is published quarterly by the American Art Therapy Association. Members of AATA receive the journal as a membership benefit. Non-members may subscribe at the following annual rates:
- Individuals: $18 (US); $22 (Foreign)
- Institutions: $30 (US); $34 (Foreign)
A discount of 10% is available for 10 copy minimum orders. Single copies of the premiere issue are available at $9 (Individual), $15 (Institutions). Printed in the U.S.

Subscribers to THE ARTS IN PSYCHOTHERAPY enjoy reduced rate! Individual: $15.

To subscribe, fill in coupon below and mail now. Enclose proof of subscription to THE ARTS IN PSYCHOTHERAPY.

American Art Therapy Association, Inc.
5999 Stevenson Avenue, Alexandria, VA 22304

Please enter my subscription for 1984. Enclosed is my check, payable to AATA, for $15. (Regular rate for individuals is $18)

ART THERAPIST — Western Psychiatric Institute & Clinic, a division of the University of Pittsburgh, is currently seeking an Art Therapist. Responsibilities include diagnostics and therapeutic use of art with individuals, families, and groups. Evening and weekend hours included on a regular basis. Significant experience with acutely disturbed and psychotic individuals in a psychiatric hospital required. Experience in neuropsychological testing a plus. Masters degree preferred. Salary range $15K - $16K including a competitive benefits package. Please submit resume by May 30, 1984 including salary requirements to:

Allied Health Recruiter,
WESTERN PSYCHIATRIC INSTITUTE & CLINIC,
3811 O’Hara Street
Pittsburgh, PA 15213

An Equal Opportunity Employer M/F.
Hahnemann Symposium Set

The Creative Arts in Therapy Program at Hahnemann University will host a symposium “The Creative Arts in Therapies As An Integral Part of Treatment for the 90’s: Looking Ahead — Planning Together,” June 22-24, 1984. Distinguished professionals from the fields of psychiatry, psychology, medicine, and the creative arts therapies will participate in presentations, discussions, and panels. Panel moderators will include Israel Zwerling, PhD, MD, Bertram S. Brown, MD, and Paul J. Fink, MD. For information write: Hahnemann University, Mail Stop 424, Creative Arts in Therapy Department, Philadelphia, PA 19102.

Kaleidoscope Publishes International Edition

The second International Edition of Kaleidoscope magazine has been published. The unique publication provides a forum for the works of published and unpublished writers and artists who manifest various physical, mental, and emotional handicaps. The eighth issue, also the second international edition, features many contributors including a profile and art of photorealist Charles Wildbank, who is deaf; photography and an interview with Flo Fox, a legally blind photographer who will have her life story made into a television movie; poetry and fiction winners from the United Kingdom's Spastic Society Contest; selections from Vassar Miller's anthology Whispered in the Chambers: Shout it from the Housetops; a posthumous tribute to Susan Dunn, featuring excerpts from her play The Drummer I Must March To; and Kaleidoscope's 1983 International poetry, fiction, and art award winners.

What people are saying about Kaleidoscope:

... honest and powerful portrayal by disabled artists and writers of the experience of disability, devoid of the common triteness and pat answer quality of so much that is produced on disability. Disability Rag. December, 1983.

Highly recommended for any type or size of library because it reaches not only the disabled, but others who can learn much from the fine material in each issue. Library Journal, March 1, 1983.

Kaleidoscope is bringing the disparate parts of a unique creative perspective together in a beautiful way ... and succeeding in giving artist and reader alike a new vision. Art Space. The Ohio Arts Council, January/February, 1984.

For information on Kaleidoscope, write to: United Cerebral Palsy and Services for the Handicapped (UCP/SHI), Kaleidoscope, 326 Locust Street, Akron, Ohio 44302.
"Lori" Film Available

Helen Landgarten, HLM, ATR has generously donated three copies of the film, "Lori, Art Therapy and Self Discovery," to AATA. The 32-minute film focuses on a emotionally disturbed 14-year old girl who struggles to break out of her inner world with the help of art therapy. "Lori" is a 16 mm, color/sound film and is available for rental to AATA members for $30.

Address Correction

Please note in your Membership Directory that the address of the President-Elect, Sandra L. Graves, ATR, is incorrect. Her correct address is: Sandra L. Graves, ATR, Department of Expressive Therapies, Robbins Hall, University of Louisville, Louisville, KY 40292, 502/588-5265.

Report on Standards Ballot

The Professional membership voted into place Adopted Revised Standards and Procedures for Registration, December, 1983. Contact the AATA office for copies of the newly revised Standards. Anyone involved in a program or in accumulating hours to apply for AATA registration under previous Standards should send a Readiness Checklist and letter of intent to Ron Hays, Standards Chair. The standard due date for filing these requests is 6 month: from the date (February 10, 1984) when information on the newly revised Standards was distributed.

Fee Structure for Training Program Evaluation Adopted

The Executive Board of AATA has adopted a fee structure for the processing of new program applications and yearly review of approved programs. The fees are in effect as of February 1, 1984.

Programs applying for initial approval must submit a fee of $300 to begin the program evaluation process. Programs that are approved must submit a renewal fee of $150. Programs already approved and applying for continuation of approval of programs will indicate that original standards are being maintained.

This fee structure falls within a format consistent with other associations and professions. Once the evaluation process is underway, the fees are not refundable.

For further information, contact the national AATA Office, or Dr. Gary Barlow, Chairperson, Education Committee, AATA.

Pratt Summer Institute Offered

The Pratt Creative Arts Therapy annual summer Institute will be held in Jefferson, New Hampshire, from June 25 to July 31, 1984. Graduate workshops and courses will be offered from object relations, Gestalt, and Jungian perspectives. Opportunities will be offered through the Institute to complete a master's degree.

For further information please contact: Art Therapy Department, Pratt Institute, Brooklyn, NY 11205, or call (212) 636-3428.

Government Affairs Conference Sponsored

A Creative Arts Therapy Governmental Affairs Working Conference will be sponsored by the Legislative Alliance of Creative Arts Therapies in Washington, D.C., July 21 and 22, 1984. The Conference will provide a forum for creative arts therapists to explore licensure and reimbursement strategies with policy makers, insurance representatives, and related health professionals. For registration information write: C.A.T. Governmental Affairs Conference, 1438 Duke Street, Alexandria, VA 22314.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in theory, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

BEST COPY AVAILABLE

American Art Therapy Association, Inc., 11600 Sunrise Valley Drive, Suite 808, Reston, VA 22091 (703) 476-5437
This issue of *Art Therapy* offers a potpourri of articles with important content relative to awareness, practice, training and research. The topic of supervision, that has been prevalent in the past two AATA conference programs, is given emphasis at the initial, middle and termination stages by Laurie Wilson, Shirley Riley and Harriet Wadeson. Myra Levick’s article on imagery offers information on creativity, image and language formation, approaches and research. A three-part article on the Stimulus Drawings and their use with psychiatric and stroke patients and with adolescents in therapy, is presented by Louise Sandburg, Rawley Silver and Kristen Vilstrup. An extensive case study illustrates Arthur Robbins’ work with a 29 year old male in long-term therapy, and gives information on the “mirroring” aspect of therapy. Shaun McNiff’s article on cross-cultural art psychotherapy emphasizes an area in which there has been little art therapy research; he reiterates the need for the art therapist to be aware of the increasing interest in cross-cultural modalities. In addition to the regular features contained in the issue, I believe that the art therapist, and other readers, will find much to ponder and discover.

The readership is encouraged to submit articles to *Art Therapy* for publication consideration. Procedures for submission of articles are found elsewhere in this issue. A brief abstract must be included that will serve as the “lead-in” for each article. In addition to main articles, submissions for “Viewpoints,” “Reviews” and “Brief Communications” are also welcome. If photographs accompany articles, they must be of good quality, crisp and clear and documented on the back. For readers who want to submit individual photographs of art work that might be included in an issue, or used in various issues, the same high quality standards apply. Color photographs may also be submitted for possible use on the cover.

With the recent, and hopefully temporary, cutback on allocations at various levels within the American Art Therapy Association, the Executive Board has approved a change in the publishing schedule of *Art Therapy*. The journal will be published on a biannual rather than a quarterly basis. For the present time, therefore, *Art Therapy* will be published as a pre-conference issue, with the remaining issue scheduled for March or April.

You are encouraged to correspond with the editor, and to offer comments on the content, format and special features. Suggestions for future content, for special issues and for noteworthy material, are welcome. It is your journal and your input is important. It is my hope that, by our working together, *Art Therapy* will not only be an important voice in our own professional field, but in the other human services professions as well.

Finally, it doesn’t seem as if a year has gone by since our last AATA conference, and that we are ready for our next annual meeting. Sandra Graves, 1984 conference chairperson, Richelle Grapsy, AATA Executive Director, Pat Allen, program chairperson, Bonnie Smith, local arrangements chairperson, and the many committees have worked long and hard to organize the numerous details that are necessary for a successful conference. I hope that the conference will be well-attended, and I know that each person will come away from it with information, insight and inspiration. I look forward to seeing you in Washington!

*Gary C. Barlow, EdD, ATR*

Letters to the Editor

To the Editor:

Just got the second issue of *Art Therapy*. It looks good. Congratulations! In your editorial you give "plaudits to Linda Gantt, ATR, the interim editor and her committees for the first issue!" As you know I was the interim associate editor and was very much responsible for helping Linda with this first issue. So, since clearly I was not on one of Linda's committees, you have left me out in your plaudits.

Mildred Lachman-Chapin, M.Ed., ATR
Montpelier, VT

Ed: There was no intention to overlook anyone who played a role in planning and bringing to fruition the first issue of *Art Therapy*. Certainly Millie Lachman-Chapin, who served as the interim associate editor, deserves much of the credit for the first issue and I, therefore, also send plaudits her way.

***

To the Editor:

"Congratulations on the latest edition of the new journal! Just the right combination of professionalism and panache. It is a pleasure to be associated with the effort. Best wishes..."

Dana N. Christensen
Louisville, KY

To the Editor:

"...my congratulations to you on this effort! (*Art Therapy*, Vol. 1, No. 2, May, 1984) The articles are interesting and the layout is a good mix between visuals and verbal word content. I also like the use of the bulletin headlines which helps to set off the straight copy. I think it is a real excellent job."

J. Theodore Anderson
Assistant Executive Director
The National Art Education Association
Reston, VA

***

Ed: My thanks to everyone who sent comments on the second issue of *Art Therapy*. Letters on future issues are welcome and encouraged.

---

Guidelines for Authors

Please submit four (4) copies of manuscripts to: AATA Journal, 11800 Sunrise Valley Drive, Suite 808, Reston, VA 22091. Only original articles that are not under review by another periodical are acceptable.

**FORM:** Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

**COVER PAGE:** A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

**ABSTRACT:** An abstract of 100-125 words outlining the main ideas of the paper is required.

**SECTION HEADINGS:** The organization of the paper should be clearly indicated by headings and subheadings, if appropriate.

**FIGURES:** For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

**REFERENCES:** References must be typed, double-spaced, in alphabetical order, on a separate sheet.
Art Therapy Supervision

Part I: The Beginning Phase of Supervision in Art Therapy
Laurie Wilson, PhD, ATR

Part II: The Middle Phase of Therapy and Supervision
Shirley Riley, MA, ATR

Part III: The Termination Phase of Supervision
Harriet Wadeson, PhD, ATR

Laurie Wilson, PhD, ATR, is Director of the Graduate Art Therapy Department at New York University, New York, New York. Shirley Riley, MA, ATR, is Field Placement Coordinator Graduate Art Therapy Department, Loyola Marymount University, Los Angeles, California. Harriet Wadeson, PhD, ATR, is Director of the Graduate Art Therapy Department, University of Illinois, Chicago, Illinois.

This three-part article addresses specific phases of art therapy supervision: beginning, middle and termination. The authors (Wilson, Riley and Wadeson) identify special skills needed to successfully supervise graduate art therapy interns. They emphasize the integration of theory and art expression, the effective use of the art therapy or psychotherapy modalities and the supervisory relationship. The authors suggest that the articles be read as three brief chapters in a manual focused on art therapy supervision.

Each of the authors is an art psychotherapist or an art therapist/educator, who guides master's level art therapy students in practicum experiences. An art therapy internship is arranged by each university and clinical supervisors meet a level of professionalism that is set by the graduate program.

In addition, each author has administrative duties, teaching obligations and extensive clinical experience. This combination of skills provides the practical and theoretical knowledge necessary for the successful selection, continuing support and education of good supervisors.

To supervise graduate master's level students, the American Art Therapy Association recommends that the art therapist/supervisor be Registered. The authors agree that in addition to registration, the supervisor should have additional training in the special skills of supervision.

The initial motivation for exploring these issues of supervision was stimulated by the interest expressed by educators, supervisors, and supervisees at recent conferences of the American Art Therapy Association (Riley, 1982, 1983 and 1984). Panel discussions were offered and participants became aware that very little material was available to guide the art therapy supervisor. This three-part article is the result of the authors' collaborations and continuing interest in providing some guidelines to answer this need.

In these writings, supervision is referred to in the context of a relationship between an experienced art therapy supervisor and a graduate art therapy student/Intern who is training as a therapist in an approved practice setting. This supervision process requires at least one hour per week, over a prescribed time; it is usually an individual session, but it also can be supplemented by small group supervision.

Additional information is available in the guidelines for master's level programs published by the American Art Therapy Association.

Part I: The Beginning Phase of Supervision in Art Therapy

The beginning of any formal relationship such as that of supervision or clinical work is marked by the expectations of the individuals entering the relationship. It is important to specify with clarity the nature of these expectations. In order for this to occur, the introduction to both relationships needs to include two ingredients: an introduction of the individuals involved, including a direct or indirect statement of their roles in the relationship, and some sort of contract setting out the "rules of the game."

In introducing oneself as a supervisor to students it is helpful to briefly describe one's professional experience as an art therapist (i.e., populations with whom one has worked), and the type of institutions in which one has worked or trained. It is also important to indicate the nature of one's approach to art therapy if that is not already known to the students. This will later help them to place the comments and advice in context. There should be a minimum of "how to" advice from "on high" and an understanding that the supervisor will help the students learn how to identify and solve their clinical dilemmas. The supervisor serves as a model of the reflective, thoughtful art therapist who continually examines and questions his/her work and its results. The supervisor's role is one of teaching students how to ask questions. "Why did the patient paint that way?" "Why did I say what I said?" and so on. This essential self-examination on the part of the student in supervision needs to be clearly separate from the self-examination of
personal therapy. It is the supervisor's role to identify personal difficulties which interfere with a student's clinical work, but I believe it is not appropriate to work therapeutically with those difficulties in the educational setting of supervision. Instead, the students should come to realize that the supervisor is there to help them with the specifics of their clinical work and not with their personal problems no matter how much these two areas may become intertwined.

The student's or supervisee's role is more difficult and fraught with anxiety that of the supervisor. Normally as a student one is judged upon one's grasp of the material taught in a course, as evidenced by an exam or paper. In clinical supervision, however, one is judged by the reporting of one's own and the client's behavior in exquisite detail. To be useful to a student the supervisor must know a great deal about the student's work; the student reveals both successes and "mistakes" in as frank a way as possible, and it is probably true that more can be learned from mistakes and problems than from successes. A supervisor, particularly with new students, needs to create an atmosphere in which revelation of ignorance and error is gently received, carefully supported and non-judgmentally welcomed. I frequently thank students for helping the class by their willingness to reveal problems which usually turn out to be common for all in the group. It often occurs, subsequently, that another student in the group has found a solution to the problem presented and can pass on his/her expertise. Through the supervision process students should come to feel accepted at their own level and know that their capacity to grow and learn from mistakes is a factor being assessed by supervisors.

The supervisor should explicitly state, in the first meeting, expectations both for himself/herself and for the students. General expectations would likely include the idea that the students are there to learn how to do art therapy and, in addition, to learn how to report clinical work both orally and in written form.

The ways in which students will be assessed should be made clear to the students from the beginning. Likewise, the ways used to help students should be outlined early. There may be considerable variety on supervisory styles as some supervisors will write copious notes on individual student's process notes, and others will lecture to the group on specific issues they find in the course of reading the process notes, and so on.

Students need to learn that just as they have made an informal contract with the supervisor they must also make some kind of contract with their patients. Fruitful classes early in supervision will cover details of how such a contract is best established addressing management issues, such as length of stay in art therapy, meeting times and use of materials, as well as more subtle questions. The student needs to be aware that unspoken but important questions may be lurking in the minds of patients. "How will this therapist compare to the last one I had?" "How is the evaluation different from art therapy per se?" "What will this person expect from me?" "How will I be judged?" Central to these questions is the issue of anxiety. Both the new student and the patient are almost certain to feel anxious at the beginning of their work together. A discussion of this anxiety in supervision sessions can help allay some of the worst pangs, and students can be helped to sensitively tune in to the fears of patients while not acting upon their own jitters. A discussion of the initial intense desire to do something to help patients can lead to the awareness of the value of passivity in the therapist. This discussion might include mention of the students' probable feelings of incompetence and worthlessness and how frequently these feelings impel new students to activity that may be intrusive and obstructive. I have found that the first and most difficult problem for new students is learning how to tactfully and productively "do nothing" and feel comfortable about it. This topic always touches on issues of timing, clinical tact, and the inherent value of a receptive non-judgmental apparently passive stance. By placing a focus on observation, students may come to be actively and constructively involved without moving a muscle or opening their mouths.

A parallel issue is the new student's desire to know the meaning of the patient's art work immediately. This is manifested in several ways. Some students barely allow the patient the opportunity to finish the work on his/her picture or sculpture before asking questions about the work or asking the patient to "tell me something about your picture." The patient soon gets the idea that the meaning behind the work is much more important than the work itself, and I believe this reduces the therapeutic value of the process. Furthermore, the interruption of art making at a moment when the patient is hesitant, unsure of how or whether to proceed may abort the unfolding of expression via art and short-circuit a process which has its natural pauses and rhythms.

The other facet of the urgent wish to decipher meaning in a patient's work is seen in the quick leap to interpretation from one or two pieces of data: big ears mean paranoia, black means depression, etc. Satisfying as these fast answers may be, they also short-circuit a more profound and probably more accurate assessment of meaning.

New students need to be encouraged to look at the patient's behavior as well as the work, and to contemplate all the features before them: both formal and narrative, size, color, pressure of drawing tool, part of the page used, relation of the parts to the whole, and so on.

The fine art of asking questions leading from the most neutral "Oh!" to the more specific "What's going to happen to that boy?" must be taught
and students need to carefully reflect on the effect of their own interventions. In short, students need to learn to tolerate their own ignorance with equanimity and humility. They need to hear from supervisors that they will in time understand more of what is happening before their eyes and know more quickly what to do. For the moment, they must learn to suspend judgment and pause before acting.

A final perspective has to do with the larger goals of supervision, and what I believe are effective ways of reaching them. I once heard a psychiatrist describe two alternative ways of supervising. The first involved the supervisor functioning as the therapist, by directing the case with the student functioning as a vessel or vassal. The second approach emphasized the student developing his or her own initiative with the supervisor serving to draw out the student’s ideas and observation.

I expect you feel as I do that the latter is the preferred mode, and I would go even a bit further. I believe if the student has a good grasp of the theoretical issues lying behind the clinical work he/she will be able to find his or her own solutions to any clinical dilemma. I believe in fostering this approach by encouraging the group to find alternative solutions to the clinical problems that arise. Students, especially new ones, need to be convinced and coaxed into the realization that there is no one right way to “do” art therapy. Rather, students need to learn how to observe what actually happens in sessions and how to develop sufficient distance so that they can analyze why it happened. Finally, they need to have the flexibility to seek alternative solutions.

Bibliography

Part II: The Middle Phase of Therapy and Supervision

An introduction to the concept of middle phase of therapy might perhaps begin by asking the question: “Is there a clearly defined middle phase in the therapeutic process?”

If the answer is “Yes, there does seem to be a recognizable shift in both the content and process of the supervisory relationship and the client/therapist relationship,” we can then ask a second question: “How do the participants (supervisor/supervisee/client) recognize that the treatment has arrived at this phase?” The third aspect of this concept is a concern about how, or if, the supervisory sessions and relationship should be modified at this point in treatment. The answers to these questions are, as expected, more conditional than most of us would prefer; however, we can consider some of the following points to help us better understand some of these issues.

When the middle phase of therapy is achieved, it can be looked at in various ways depending upon the theoretical approach and the demands of the agency where the therapy is being offered. Some examples of the modifying factors are: therapists who work on a brief therapy model, six to ten sessions, and would move as quickly as possible into the process of defining the problems; other models would use the beginning relationship to more slowly unbalance the family system sufficiently that the intense working phase might be relatively short; long term therapy would expect this period to emerge at a slower pace. There are many variations on this theme, but there is always the need to be flexible and responsive to the case dynamics.

In addition, since the supervisor must guide the students in the theoretical model preferred by the agency in which they train, they must teach them specific techniques which will enhance the art therapy treatment within this framework. The art psychotherapist can work within a variety of theoretical models. The appropriate use of art will enrich any systemic or psychodynamic approach. During this central portion of the therapeutic alliance with the client, reflected in the supervisory relationship with the trainee, it should become apparent that theory and art expression have fused.

The type of work done in the middle phase of therapy, as in the middle phase of the supervisory relationship, is built on other strengths that have been established during the earlier joining period. The task is to be sure that all involved recognize that they have entered into a new phase of a relationship which will call for unique techniques, techniques which are reflective and responsive to this change.

In treatment, one can expect that at this time, after the more superficial matters have been cleared away, the basic problem may be revealed. This core may be multi-faceted and the possibility of finding resolution offers challenge to therapist, client and supervisor.

One can look at some examples of how casework and supervision display parallel growth and change. The trainee may feel anxious about attempting more adventurous interventions with the client and may also lack confidence to utilize these interventions in the therapeutic process. If a student-therapist decides to take these chances he or she may fear that a result might be the loss of a comfortable dependent position on the supervisor. The persons in treatment may also reflect this timidity by remaining dependent and anxious about change. The student-therapist may demonstrate an unwillingness to
move the usual pace of therapy into a new gear that will match the readiness of the client(s) to deal with issues. This hesitation may affect the clients and inhibit them from making a move toward problem resolution. The timing and force of the student's interventions often reflect their perception of how their supervisor has affirmed the students' competence and thus timed reinforcement of their progress. Often the therapeutic relationship and the supervisory relationship progress, stand still, or regress in a remarkably parallel pace.

Client resistance differs at this middle period. It is often a more covert, powerful defense used to protect against dealing with the deeper, more painful issue in the therapy. Corrective interventions usually demand a greater sophistication on the part of the therapist and these moves cannot be learned unless there is a minimum amount of resistance in the education/supervisory relationship. Freedom to examine, counter-transference feeling and to accept criticism, and not feel it as blame, are all signs that supervisor and supervisee can handle the resistance that may occur at this point in the process.

An experienced supervisor sometimes has to lead the trainee into an awareness that some major systemic changes have occurred in the treatment. The new therapist often will sense the shift in attitudes and resistances, but not having been exposed to this level of dynamic interactions before, be unable to identify the signs that a modified method of punctuation and reframing is appropriate. The support given at this time from the supervisor usually will be directly reflected through the intern into the therapeutic session—support which gives encouragement to the family or individual to try new solutions and tolerate unaccustomed stress or relief.

A major training opportunity can be offered the intern if the supervisor is able to share a sense of excitement when he/she observes that there is a positive shift in the therapeutic relationship. This heightened awareness indicates that all involved have entered into a more intense working period. This is evidenced by the greater sense of trust felt from the client and it gives permission for the therapist to encourage change in a more vigorous manner. A vigor is needed that does not translate as mere interpretations by the clinician, but rather recognizing that the client is conscious of the process and more in control; thus the therapist can be either passive or aggressive as is appropriate. This does not diminish the work done earlier in the relationship, and in fact, cannot occur unless sufficient trust has been established.

The art component becomes expressive in a new way. This is demonstrated by the clients' awareness of how much their graphic work adds to the verbal process and by a more acute ability to self-interpret the art product and initiate goals. Often the client feels greater comfort with the art modality.

A change may also be exhibited in the supervisory relationship. The student may venture more risky questions, try more creative interventions and challenge the supervisor's interpretations. The supervisor can be receptive to the way the case material is offered and take more chances in creative criticism. These modifications indicate confidence built on the strength of the past sessions and underlines trust in the trainee's ability. The student shows greater insight into the covert messages revealed in the art—and builds future expressive/therapeutic opportunities on the material gained through the art.

The middle phase of therapy and the middle phase of a supervisory relationship is a time when the supervisor can also gain the most for his/her own learning enrichment. The synergistic process between supervisor/trainee/client aids in the possibility that a unique solution for the treatment being considered may be created. It is my conviction that the parallel process is highly apparent in this middle-central part of the student's relationship with a client or family and with his/her supervisor.

It cannot be taken for granted that this middle phase of the therapeutic experience is an ordinary occurrence for the student and supervisor. In many instances the relationship does not achieve this satisfactory and challenging level. Often circumstances inhibit the success implied in the above descriptions. Some of the roadblocks encountered are: limitations on the length of time needed to implement and carry through a treatment plan; the system in which the trainee works may ask for unreasonable goals; the necessary skill may be lacking to establish the groundwork of a working relationship; and in particular, a lack of willingness to risk and test the creativity which must be tapped in the forming of both a treatment plan and fostering unique expression through the art products.

Resistance to these more creatively adventurous and yet theoretically profound interventions will cheat the therapist, supervisor and client of the satisfaction that can be derived from achieving goals that profit each person involved in this multi-leveled relationship.

The gift of supervision is the permission for the trainee to hypothesize, experiment, and fantasize creative moves both with the therapeutic plan and the art expression. At the same time, the protection of the supervisor exists to inhibit the use of these techniques if they seem inappropriate. The dialogue in supervision about theory and practice, the implementation of the client's use of art expression and verbal interpretations is the core of this middle phase of supervision and leads toward anticipation and recognition of the time for termination.
Separation is one of life's central experiences. Seldom is it possible to move to a plateau of greater growth without leaving a previous one. Termination is the ultimate separation and perhaps life's most difficult experience, leading as it does to the realization for each of us of our own death. That most of us do not handle separations well is reflected in the dearth of writing on termination in the psychiatric literature.

Because of the universality of strong feeling associated with separation, nowhere in supervision is the parallel process of student and patient etched in as sharp relief as in the experience of termination. Therefore, it is essential that the supervisor be particularly sensitive to the student's actions, reactions and feelings at this time. But even more difficult, the supervisor must be aware of his/her own process that parallels that student's: the difficulty in separating from the student may be similar to the student's painful issues in separating from patients.

There are other difficulties as well that require particular attention to termination issues. Successful therapy can reverse itself in the struggles to terminate, and what might have become a positive outcome may eventuate in a therapeutic miscarriage if termination is handled poorly: "The manner in which the therapeutic relationship is brought to a close is crucial to the outcome of treatment; it has a major influence on the degree to which the gains that occurred are maintained... Failure to adequately explore and work out these feelings during the ending period may result in a weakening or undoing of the completed therapeutic work." (Levinson, 1977, p. 491)

To make matters even more problematic, it is characteristic that patients who have progressed well will begin to regress as the ending approaches, and many of the symptoms that characterized the patient's presenting picture will re-emerge (Levinson, 1977, p. 485; Dewald, 1971, p. 280). Therefore, in addition to facing the difficulty of separation from the patient, the student must deal with the disappointment in seeing what had appeared to be fruitful therapeutic work seem to go up in smoke.

The parallel, of course, is that the student may exhibit a similar regression. I have seen a resurgence of students' anger at supervisors and other students around issues that had surfaced earlier in training and had seemingly been resolved.

Specific points of focus must be considered. First, it is important that the student recognize different conditions of termination, each imposing its various implications for the termination process. For example, the termination of short-term therapy where there has been less engagement is likely to be considerably less consequential than termination from long-term therapy for both patient and student-therapist (Levinson, 1977, p. 481). Termination may occur because the patient has completed therapy, is being transferred to another facility, or because the student is leaving after having completed the practicum assignment. Each of these situations differs from the other with regard to the feelings evoked.

Termination from group therapy has further ramifications. The group may continue after the student's departure, and the student may need to help the group adjust to the transition as well as come to terms with his/her own feelings about not being indispensable to its life. The group, as a whole, may be ending and may have to deal with its dissolution. One member may be terminating, and the student-therapist will not only have to help that member come to closure, but also help the other members to deal with the loss of that participant (McGee, Schuman, Racusen, 1972). In the parallel process, students may be coming to the end of their own supervision group's life.

Because of the complexities and difficulties of termination, supervisors should encourage their trainees to prepare for it well in advance. Similarly, the student should prepare the patient. This is done by bringing up the issue, focusing on its importance, and interpreting behaviors and feelings in the light of the pending ending (Dewald, 1971, p. 280). How far in advance this process begins depends upon the conditions of the treatment. In some instances, such as brief, time-limited therapy, it may be appropriate to point toward termination in the first session.

A further consideration in termination is the transference to an institution. It is both place and people. For students and patients alike it is often a home and a way of life. Termination requires leave-taking of that structure for support. A patient leaves the hospital; a student leaves school. Both usually will be entering a world where they are expected to take on more responsibility, in a sense to become more adult. Although there may have been anger at the infantilization that both patient and student status often encourage, there may be fear in having to become more responsible. (I have heard students, who did excellent work with patients, express fears...
that they would be unable to function in a professional capacity.) Therefore, both termination from therapy and graduation from training often necessitate attention to the institution's importance and what its loss means.

The understanding that termination regressions are expectable and not necessarily indications of major set-backs is another aspect of the process in which the supervisor supports the trainee and the therapist-in-training supports the clients. Much discouragement can be avoided in this way.

Just as elderly persons are encouraged to review their lives as it is approaching its end, so should the therapeutic endeavor be reviewed as it enters the home stretch. This review would include all those who are involved: patient, student-therapist, supervisor. The student helps the patient to see what has been accomplished, what needs to be done, and points the way toward the future. If the nature of the therapeutic relationship has been mainly supportive, then the focus may be on how much the patient and student-therapist have meant to each other. There must be acknowledgement of feelings of loss in any case, but also an emphasis that what has been gained has been a capacity to relate or engage, and that is not lost but can be utilized further.

Naturally in some cases there is bound to be disappointment and frustration at what has not been accomplished, which ending makes no longer possible. These feelings must be acknowledged to efficiently produce a successful termination. If the termination process is painless, then probably little engagement has occurred.

For the student-therapist the feelings of loss may be especially strong. The zeal to practice what one has invested so much effort to learn makes one's initial patients particularly important, meaningful and memorable. Students, unaccustomed to the comings and goings of client and patients often find their initial leave-taking especially poignant.

It is obvious that the same forces operate in the supervisory relationship. If it has been especially fruitful there may be feelings of loss on both sides. Both may believe that more work needs to be done and could be done, but an arbitrary ending intervenes. If the supervisor is new to supervision, the student may have special significance, and parting may be difficult. Just as in therapy, it is necessary for the supervisor to encourage a review of the process and a transition to the next step, whether it be a new placement or professional status.

Even with adequate preparation, the unknown is usually frightening, and the wish to remain in the present, known situation is often preferable to a future uncertainty. Thus, patients are afraid to leave the support of the therapist and the student may be reluctant to leave the guidance of the supervisor. As stated previously, the more helpful the therapy or the supervision, the more painful the leave-taking may be. The supervisor may need to aid the student in both the awareness of the feelings and the courage to take the next step. Patients' regression toward termination time often conveys the message that they can't get along without the therapy. Similarly, at this time students often express fears that they won't be able to do therapy on their own, that the transition from student to the professional is more than they can manage. In this regard, the fantasy-tapping process of art therapy can be useful in supervision as well. Students can be encouraged to make pictures of their images of being a professional and in this way confront some of their fears.

Because of its inherent painfulness, separation is often avoided, so there may be collusion at all levels (supervisor, student and patient) to avoid the processing. In this respect, denial often takes a strong hold. For example, in the parallel process one student denied imminent separation from her supervisor by citing that they would continue to see one another at professional meetings. The supervisor had to insist that the student recognize the ending of their supervisory relationship and their regular weekly meetings. As is evident, diligence is necessary at all levels, beginning with the supervisor who must stay on track and encourage the student's awareness of termination issues. This then becomes translated to the therapeutic relationship.

Finally, it seems to me that just as a life process is seldom rounded out with a sense of completion—there is more left to be done—so it is with termination. There is always more to be done in therapy, more that can be learned in supervision. But there comes a time to end and to acknowledge ending.

Bibliography

IN MEMORIUM

Bernard I. Levy, PhD, ATR, HLM
April 3, 1924 - August 18, 1984

The world of art therapy has experienced a great loss in the sudden death of Bernie Levy, who suffered a heart attack caused by an embolism following orthopedic surgery.

Dr. Levy was a major force in the development of art therapy as a profession, and in the growth of AATA. He served the organization in many capacities: including eight years on the Executive Board as Chairman of Public Relations (1971-1973), Research (1973-1977), and Bylaws (1981-1983). He was instrumental in founding the first journal in the field (Bulletin of Art Therapy), and one of the first graduate training programs (at George Washington University) of which he was the Director.

Born and raised in New York, his study of art at Pratt (1941-43) was interrupted for military service in W.W. II (1943-45). While in service he was awarded the Purple Heart. He then turned to psychology, earning a BA at New York University (1948), an MA at Princeton (1950), and a PhD at the University of Rochester. He became a member of the Psychology Department at George Washington University, a licensed psychologist, and a Fellow of the American Psychological Association.

He remained an artist as well, turning from early work in pottery and sculpture, to teaching and creating watercolor, and creating paintings, for which he won local and national awards. His “vision” was not limited to art; Bernie was also able to provide leadership to AATA in the development of professional standards for both practitioners and educators. He was a passionate man, with deeply held convictions and profound affection for the people he loved. He was a demanding, inspiring and popular teacher, a gifted and lyrical painter, and a possessor of a witty way with words. He will be missed not only by his wife Claire and his children, Amy and Adam; he will also be sorely missed by all of us.

By Judy Rubin, with the gracious assistance of Claire Levy, Elinor Ulman, and Millie Chapin.
The Struggle for Self-Cohesion: An Analytically Oriented Art Therapy Case Study

Arthur Robbins, PhD, ATR

Arthur Robbins, PhD, ATR, is Chairman of the Graduate Creative Arts Therapy Department of Pratt Institute, New York, and Director of the Institute of Expressive Analysis.

This article describes a long-term therapy of Bob, a 29 year old male who was imprisoned by a restrictive ego ideal preoccupied with conforming and achieving. In the therapy sessions there was a focus on helping the patient to find self-cohesion through the discovery of a “unique self,” and the concept of mirroring was utilized. In the context of a real relationship, a mirror transference evolves; the therapeutic work encourages the patient’s sense of self that has not been nurtured during critical periods of development.

Six principles are identified that summarize the mirroring process. These principles were instrumental in the work with Bob over four years of art psychotherapy. The patient moved from harbored pain and low affect to an active participant in a group, with evidence of self-cohesion, successful human contact and successful integration.

Introduction

Much has been written in recent years concerning the “false self” personality and the difficulties in treating such a patient. This article explores the subtle interplay between art and psychoanalytic psychology in the long-term therapy of one patient’s grappling for self-cohesion. Critical in this process is the development of a mirror transference which, in this particular case, did not emerge until art media were introduced. Several factors were obvious with this patient in therapy. On the one hand was the patient’s attempt to reconcile the drab reality of everyday existence with the rich libidinal life forming the core of his deep inner self (the struggle of the slow tempering of his rigidly strict ego ideal by an emerging idealized image). On the other, was the therapist’s use of psychoanalytic and psychological theory and methodology along with aesthetic perceptions and sensitivities to promote a dialogue on a non-verbal level as well as on a more conventional verbal one.

In the study of the self, artists and psychologists have written on its origins and evolution, and on its relationships to mother, father, family, society and the cosmos. Each of these perspectives illuminates a different dimension and deepens one’s understanding. One such facet is represented by self psychologist Heinz Kohut who defines the self as the basis of our sense of being and the independent center of initiative and perception. The self is integrated with our most central ambitions and ideals as well as with our sense that our body and mind form a unit in space and a continuum in time. This psychic configuration exists in connection with an individual set of talents and skills responsive to both the demands placed upon it and the ideals living within the nuclear self (1). As Kohut is quick to point out, the self falls into the realm of psychical reality phenomena which are unknowable in their essences. We may each have an intuitive grasp of what “self” means in its broad sense as the center of the individual psychological universe, but it would be difficult to be more specific in a way that was acceptable to everyone.

Paradoxically, the artist’s preoccupation with the self is essentially with this elusive essence. In one’s work, the artist attempts to organize dimensions of form, color, space, depth and shading. Since the gestalt principle that the whole is more meaningful than its independent components is inherent in all visual organization, a work of art can capture the dimensions of the self and transcend the limitation of words. Therapeutically, this is important, in that patient and therapist alike can view the complex and unique self as it is mirrored in the patient’s art.

Mirroring means more, in art psychotherapy as I practice it, than merely the creation of a visual frame in which to externalize and explore internal images. This alone, does not accomplish the therapeutic task of repairing an unattended or neglected self. In my work, mirroring connotes a mirroring transference. This embodies many of the characteristics associated with an early mother-infant relationship, that special multi-sensory experience that exists on kinesthetic, auditory, tactile, visual levels. The importance of the real relationship, which modifies the traditional therapeutic approach of neutrality, cannot be overstated.

In the context of this real relationship, a mirror transference evolves that has as its cornerstone empathy from therapist to patient. Within this frame of reference, there are far fewer direct interpretations and a greater degree of reflection of the process. Essentially, the therapeutic work is directed toward the encouragement and development of the patient’s sense of self that has not been adequately nurtured during critical
periods of development. Consequently, the curative power of treatment comes via transmuting internalizations rather than from insight or the release of unconscious material alone.

The following principles summarize the mirroring process:

1. The patient’s artwork is a part of the total therapeutic matrix, both stimulating and reflecting the patient/therapist interaction.

2. Within this matrix, two minds touch and play as they create a transitional space. Transitional space becomes a therapeutic space of empathy and connection. When I speak of this “space,” noted by Winnicott as being neither inside nor outside but somewhere in between (2), I am describing the mutual process of non-verbal communication between patient and therapist in which they are wholly connected while paradoxically maintaining their own separateness.

3. The artistic mirroring used in building this mirroring transitional space reflects the multi-sensory mirroring of early childhood development. In the artwork, this is seen in such dimensions as space, rhythm, rate and energy.

4. Similarly, associated mental structure phenomena such as ego ideal, idealized image, internalizations and libidinal manifestations all have parallels in the artwork. Necessarily, these are very personal in expression.

5. The mirror transference does not preclude the development of competition, rivalry, jealousy or other traditional issues within the therapeutic matrix.

6. The job of the therapist is to facilitate the patient’s quest to integrate the various components of the self through exploration, questioning, enthusiasm, interest and response. Mirroring, then, becomes a joint process in which the affects, perceptions and attitudes of the therapist are of major importance in giving validation to the development of the patient’s self.

**Background and Initial Therapy**

The following case material on Bob, a 29-year-old engineer, represents a self, imprisoned by a restrictive ego ideal preoccupied with conforming, being “good” and achieving. Like so many of the cases Alice Miller writes about in *Prisoners of Childhood* (3), this case is one in which the patient’s love—served as a refuge—pervaded his parents caused him to internalize aspirations and ideals which choked off other significant portions of himself from expression. Each individual must find a balance between childlike primitive urges and the values and aspirations handed down by one’s family. This process, however, which could have served to shape Bob’s life with richness and vitality worked, instead, to debase his responses and leave him consumed by emptiness. Our work together was aimed at bringing his cut-off inner and outer worlds into congruence and putting vitality back into his life.

Four years earlier, Bob walked into my office; he was hunched over and stiff, and his upper torso was locked as though it was in an iron corset. He spoke in a low, flat voice to which I had to strain to hear and attend. Suddenly he blurted out that his past therapist had jumped out of a window and was now hospitalized. It was due to this experience that Bob had been referred to me for verbal therapy.

Bob was agitated; he simply didn’t know what to do. His desperation, loneliness and isolation were encapsulated in his query “If this is what happens to supposedly healthy people, is there any help for me?” He mumbled that he was particularly frightened of homosexuality which was manifested in vague, lingering thoughts of being penetrated from the rear. What was remarkable was that all of this was said with so little affect that I could hardly sense this man’s presence.

In the subsequent weekly therapy sessions, my attention often wandered, and I felt removed and disconnected in spite of my efforts to encourage Bob to address himself to his real thoughts and feelings. At times, I confronted and, at other times, mirrored or reflected, but all of my efforts were met by the patient with a sense of puzzlement. The excitement, the release of affect, the subtle connection with non-verbal cues that mark empathy in the therapeutic process evaded us. Only rarely did Bob break down in pain and tears to voice a deep sense of loneliness and isolation; he had been shrunken and truncated to the point where all one could hear and see was a hollow robot performing his duties. All of the energy and passions of life lay buried in body armor. In his weekly group sessions, Bob was viewed as a nice, quiet, sweet man, although he personally felt absent from the interactions.

Although sessions continued in this dull, plodding vein, Bob’s life improved immeasurably over the next three years. After a number of brief affairs, he met a woman to whom he became engaged and married in the third year of treatment. The relationship was a good one, though Bob often had difficulties in either being sexually involved or excited by his wife. Work relationships also seemingly improved.

**The Third Year in Therapy**

In the third year of treatment it became clear that despite of Bob’s gains, his essence (the self) had re-
mained unchanged. The first session followed a long summer break in which Bob described the miserable summer he had suffered. In a flat, disconnected tone Bob related how he had thought he was going to die from a heart attack as short breathing, cold sweats and nausea washed over him. He went to many doctors and was assured nothing was wrong. He stayed home from work for a number of days and felt as if he were fighting for his life, even though he had been told that there was no physical problem.

As the monotonously delivered recitation continued, I knew that something had to be done to break this unbearable isolation that words only seemed to accentuate. I asked Bob if he would like to draw how he was feeling in the session, in the hope that this would help us to connect on a pre-logical, symbolic and feeling level. He looked at me somewhat curiously, but was pleased with the idea.

He began to draw circles and then made big sharp points on top of the circles. "That's you. You are God, and I am one of your supplicants," he lamented. Then, with a display of affect as he made sharp points up and down in a green magic marker, he continued "I'm angry! We patients have to wait for you therapists and we can do nothing about it until you decide to return." (4) As he started to fill in the rest of the picture, there was a shift in our relationship. I became engaged and intrigued as the face developed (see Figure 1).

As Bob worked on his drawing (while becoming quite pleased with himself) it began to take on qualities that seemed to emerge into a combined clown and king. I could see myself reflected in Bob's image as the God he was entertaining: the clown/king who opened up the surreal world of Bob's unconscious. This stimulated further associations on my part. On one level, I could see Bob's grandiose self searching for a safe harbor in the therapeutic relationship, just as a slightly irreverent subject might look to his king. Underneath this grandiosity, I could see the "good little boy" wearing forks on his crown, striving for the sky. This mask was woven with a richness of color that had a surreal integration. Although it would have been premature to make interpretations on these newfound impressions until further exploration was made and groundwork laid, they did suggest some basic personal content and pointed toward new directions to pursue, new material from which to build a bridge between us. The importance of such images as these which bubble up from the therapist's unconscious in response to something not quite tangible in a patient would not be underestimated as they so often turn out to resonate with emerging issues in the patient.

Here were the true beginnings of the mirroring process in more than just one way. Most tangibly, Bob's pictorial representation became a meeting ground where we made contact: we both looked into the same mirror, so to speak. With the gazing I found myself transfixed by the penetrating look of Bob's clown/king, and therefore, by Bob. So many nuances never seen before appeared in this face: fear, sadness, loneliness, sensuousness, sadism, cosmic consciousness and some depersonalization.

Parallels between mirroring in therapy and in early childhood de-

Figure 1
development became obvious. Threads from such theorists and clinicians as Greenacre, Eigen and Winnicott, are woven together here. Eigen and Greenacre speak of the face as a focal point of contact between mother and child which strongly influences later patterns of behavior (5, 6), while Winnicott describes the significance of mother and infant transfixed in one another’s gaze. The infant sees himself/herself reflected in the mother’s look and thereby comes to formulate a sense of oneself. Furthermore, this ongoing interaction helps the baby to feel good about oneself and consequently one’s world. In Winnicott’s terminology, mother and child (or therapist and patient) create a transitional space via primary creativity (7).

When this mirroring does not occur, it is not uncommon for the psyche to embed itself within stout walls, refusing communication with the soma, and making the expression of emotional richness and vitality impossible. This description paralleled Bob’s behavior when he first walked into my office. The continued lack of direct facial contact up to the time of the clown/king drawing further added evidence to suggest a lack of adequate early mirroring.

Here, with the two of us riveted to Bob’s clown/king with its richness of nuance, I re-experienced Winnicott’s primary creativity, and felt that we were creating that critically important transitional space. I commented to Bob that we had a clown and a king rolled into one, but I did not elaborate further (not wanting to push him inappropriately). As he laughed at the drawing of the clown/king, I interpreted his response as indicative of some vague awareness of this image, but he certainly was by no means ready to explore more deeply.

In the next session, Bob came back to the image he had drawn. He started out this session by telling of a dream in which he was attracted to a woman in his office, but he was afraid that his wife would discover his secret. His associations brought him to the recognition that he was actually sexually attracted to a woman in the therapy group. After a pause he said “You know, I’ve been thinking about that drawing, and in many respects it reminds me of the Statue of Liberty.” The clown/king had metamorphosed into a symbol of freedom, one that has always indicated liberty and opportunity. Bob’s symbol was encased in cold concrete, and I wondered why the symbol of freedom was represented in such a massive, cold form. (Were women in general, or his mother in particular, experienced by Bob as being hard, cold or unyielding?)

Bob could go no further with this dream as he wondered whether he could ever share his interest in the group member with others in the group. This man’s need for encouragement and support was so strong it was almost palpable, but I managed to contain my wish to tell him to get with it and take the risk when I realized that I would be acting out the omnipotent God or clown/king of his symbolic inner world. I said little and listened. Bob’s stance continued to be alternately despairing and resigned in the therapy group.

The Fourth Year in Therapy

It was again the first session following a long summer break. Bob reported that the summer hadn’t been bad. He and his wife had rented a place on Fire Island and were part of a small cooperative living situation. Bob missed the therapy sessions, but there were none of the frightening symptoms of the previous year. As happy as he was to return to individual sessions, Bob was not looking forward to returning to the therapy group. He never had made much of a connection there, and nothing seemed to be happening. In spite of how disconnected he felt from the group, the people were still quite important to him.

When I asked him to draw a picture of the group, he resulting nine empty circles made quite a statement (Figure 2). I was differentiated as the big circle (located at the bottom center) and he was a small yellow circle directly opposite me. The rest of the circle/group members had very little individuality. At this point I decided to take a more
active role. I commented that the group members were more than empty shells. (Could he, I wondered, put some life and substance into them?) Through a more active role, I realized that I could become an extension of Bob's ego and, in turn, he could feel supported enough to venture into the frightening realm of his feelings. Because of the degree of his disconnection, most feelings were frightening to this man, be they positively or negatively charged. I said to Bob "You can do better than that. Let's see the people in the circles."

The resulting second picture of the group (Figure 3) had the same riveting power as had his clown/king drawing. It was like an aerial view of the group, faces absent, but essences captured with a few quick strokes. The hair, in particular, conveyed the sensuality of each individual. Bob placed himself at one end (in the right corner) with short stubby hands reaching out in the attempt to make contact, while the remaining group members collected around me at the far end.

The aerial quality of the drawing commanded my attention: this might reflect Bob's detachment, or it could also represent the distance we both had to negotiate if we were to form a closer and more emotionally empathic relationship. Bob looked as if he had things to say about his drawing so, for the moment, I kept personal observations to myself. Bob verbalized that he was attracted to some members and repelled by others. He commented about one man who reminded him of his father (a "hard working drudge who was full of duties and busyness and very little life"). Bob's comments about his father continued and he mentioned "He's alright and a nice guy, but I would never want to be like him. He just drones on and on, and everything just seems so boring and uninteresting."

Bob detested Diane, the woman sitting next to him. He saw her as loud, boisterous, and unable to hear anybody but herself. Next, he described the two men sitting side by side who were particularly close to him. They were his good friends, and his allies.

Again, a drawing provided access to the inner life Bob could not spontaneously have put into words. The artwork offered a framework within which we could jointly play with the symbols of Bob's inner reality and together observe the feelings, sensations and attitudes which emerged. With this mirroring process, the empty first representation of the group was transformed into a multifaceted vision.

With this drawing another piece of Bob's being suffered for the first time. The man who seemed like a lost, lonely soul due to his lack of manifest and energy, revealed himself to be an intensely libidinal person who kept his "treasures" tucked away in secret corners of himself.

That night in the group session, Bob made a passing reference to his picture. Everyone's interest was piqued, so Bob repeated his observations from the morning session, leaving out some of the more sensuous or angry details. With this sharing, Bob's hidden self found a port of entry into the world. I mused on his earlier drawings and wondered if he could now carry his own torch and find his own liberty. For the moment, though, it was more appropriate to support Bob's newfound mastery in art and his ability to let himself go in order to share and have some fun with his creation than to make interpretations.

Again, Greenacre's statements regarding the importance of the face and genitals in facilitating self-differentiation and identity came to my mind. In the earlier clown/king drawing Bob became more interested in the face. Now, the therapy group had been transformed from a faceless crowd into several unique individuals.

Bob was differentiating others from one another and from himself with greater clarity and richness. A full spectrum of bright colors from browns and reds to oranges and blues were used along with the description of organizing forbidden strivings and permitting partial expression through visual play. The good, conforming, achieving boy with his facade of an empty shell had changed enough to recognize and display affect and sensual nuances.

Soon thereafter, in a following session, Bob discussed a dream. He told of bugs flying around him—bugs that were harmless enough, but annoying. I asked if he wished to draw the dream and he readily agreed. The picture showed the outline of a man whose insides were missing, an empty faceless shell (Figure 4). He then drew one of the bugs in a larger scale (center left), and said that it reminded him of pubic hair and a naked woman. My response was to ask Bob to draw this naked woman. While I questioned my being too seductive or directive, I recognized the importance of this intervention on various levels. Most immediately, Bob needed me to be a real object, to provide tangible support for him to explore his sensuality or sexuality. Empathy and attunement are essences of this [mirroring] process that should occur naturally in infancy. Self psychologists (e.g., Kohut) maintain that the ability to connect feeling states and words emerge from the pre-verbal period when the budding self in an infant is nourished by the verbal and non-verbal ministrations of the mother (8). Bob clearly had lacked adequate mirroring judging from his disconnection from his sensual self and his difficulty in recognizing and naming his own feeling states. My attunement and genuine responses were important therapeutically to him now.

Within the therapeutic relationship, Bob's drawings allowed us to make connection with one another and with Bob's pre-verbal self. The mirroring process went on with his vital energies making contact with his own as well as my source of symbols, which either resonated with, or were reactions to, his representations. The
art work offered a safe framework within which Bob could see his innermost reflections organized and mirrored back in an empathic way.

This interplay reflects Winnicott's definition of therapy as play, or a moving of the patient towards play (2). Play is not aimless. It involves the meeting of psyches on a deep, symbolic, tactile and non-verbal level. It is through this kind of relatedness that the patient is helped to create and define self, other, and their interrelationships.

Bob's first attempt to draw a woman was a pale one, the outline barely perceptible. The genital region could vaguely be seen, but there was no torso or legs. I urged him to elaborate and knew that I was risking asking him to do something for which psychologically he might not be ready. I also knew that the authenticity of his response would provide information as to where he really was.

He took a deep breath and went on to do another drawing. The resulting figure was a primitive earth woman: powerful, genital and with implied feet firmly planted on the ground (Figure 5). When I asked Bob where this woman had come from, he was unable to supply further information. What he did associate with the drawing was the recollection of seeing his mother naked in the bathroom when he was young. He could remember thinking that if only he didn't have a penis, he could stay forever to gaze at her. The verbal association connected the drawing to infantile issues and clearly stirred up Bob's libidinal energy as he proceeded to knock his knees back and forth in a masturbatory fashion. This way his way of ridding himself of his free-floating sexual excitement. The drawing and discussion of the primitive earth mother gave grounding to the energy as Bob found and defined its source.

The theme shifted slightly in our next meeting. Bob drew another dream (Figure 6). In this one, he was in his parents' house. The women were sitting in the kitchen; they consisted of his grandmother, mother, and some local women (located in the upper right). He stood outside the room looking in. He felt excluded and wanted to be part of the group. He drew his brother and placed him alone in one corner (lower right). He then placed his father at the other end of the house (upper left). All figures were faceless as the house was filled with empty circles and boxes. The hallway led to an elevator (Figure 7) which was going up and down while two men inside embraced (center right). He stated that the dots on the left were "bums" that were outside in the street.

Issues of isolation, strictness of ego ideal, and lack of idealized image came to the fore as Bob associated to his dream/drawing. He had always felt excluded from the family inner circle which was comprised of women and headed by grandma, the matriarch. Bob's sense of isolation and lack of warm attachments were reflected in the empty circles and boxes in the house, as well as in the faceless figures.

This wish for warmth, an erotic need for male contact, and a need for a strong man with whom to identify led Bob to draw the men embracing in the elevator. Unaware of his deep rooted needs, Bob associated his wish for closeness to men with homosexuality. He was unaware that his search for the real male/hero was a normal stage in development. Bob needed this transitional adoration in order to help define his sense of male-ness, strength and identity.

Both his father and brother were devalued and distanced from him in the drawing and, in fact, he so rarely mentioned his brother that I sometimes thought of Bob as an only child. As he elaborated on the lack of respect and relatedness he felt toward his father, Bob described an accountant so busy with the figures and numbers of his profession that nothing else seemed to exist for him. The warmth, hero worship and male contact Bob craved was not to be found in his relationship with the father. Bob recalled how his father had repeatedly warned that if he did not work hard and get good grades, he would turn out to be a "bum."

Bob's only ideal of manliness within his childhood home was to be a super-
worker and achiever. Bob was frightened to risk becoming like one of the outcast bums in his drawing, so he adopted the ego ideal he was given. To feel loved, he became a well-behaved, conforming boy who received high grades and achieved. This ego ideal gave him a value system, organization and direction, but at a tremendous cost. Bob not only curtailed his autonomy, but also kept all of his sexual drives in secret masturbatory check while maintaining an anti-libidinal existence for the eyes of the world.

Bob's childhood was devoid of an idealized image, or hero, except in his homosexual fears. Although the more primitive ego ideal allowed Bob to function in the world, he never went through the transitional state of development where the early "should" system was modified through emulation of an idealized hero. He, therefore, never gained a sense of identity based upon the "picking and choosing" among many models.

Bob's figures of the isolated self, brother, and father, of the embracing men in the elevator and bums in the street, poignantly depicted the conflicting desires and fears of Bob as a small boy. The support and real relationship in therapy allowed painful and frightening memories and images to emerge for recognition and feedback. Bob could talk about the drawings and was able to make conscious connections concerning issues regarding family structure. Homosexual fears and wishes became less threatening as they were explored via visual representations and were fitted into a cognitive structure. In two successive sessions, Bob's erotic interest in women and men revealed itself and was verbalized as his emerging self gained further cohesiveness.

In the next session another dream was offered. Bob was sitting in the office with a co-worker. There were many papers around them. As he drew the dream, I was aware of the reappearance of numerous boxes and circles (Figure 8). Bob spoke about the other man with whom he felt somewhat competitive. He first drew himself in gray outline and then wondered why he picked such a drab
color. He proceeded to fill himself in with a red marker. There was a woman drawn between them (middle of the drawing). Smiling at this drawing, he then stopped to complain: "Why do we have to share one woman?" He proceeded to draw a circle of two men and two women (center bottom) and smiled with satisfaction as he said "Now we each have a woman."

Through this image, Bob shared with me his need for communion and closeness: a wish to break out of the rigid structure of his existence, a world of achievement and work. This highly structured world had always been Bob's anchor, supporting ego mastery and giving purpose and direction. It wouldn't be easy to modify this structure, yet this battle for self-cohesion now faced him with the challenge of bringing his needs for intimacy and relatedness into the sphere of his work. Bob discussed how "fed up" he was with overtime work and how much he wanted to enjoy himself with his wife and friends. The specific symbolism of circles and squares was not mentioned, but Bob verbally connected his drawing with his very real wish for closeness and intimacy. The conflict was still evident, however, by the fact that there were no faces in these pictures.

In a subsequent session Bob brought in another dream. He no longer asked if he could draw, but proceeded to do so on his own initiative. The dream centered around moving into a new apartment. The drawing (Figure 9) showed a man from his office whom he described as a "schmegg" (far left) standing outside the apartment. In the dream, he and his wife were investigating all the new space in the apartment. The inner house had a barren look with no furniture moved in, with his wife (lower center) in one room and he (top center) in another. Bob's compartmentalization and isolation were again apparent in the separate, doorless rooms and faceless figures. Bob needed some way to connect with others. He and his wife were in distinct worlds, as were the men and women previously depicted in his family drawing. I reflected that he needed to find a connection between past and present to really touch and be touched by others.

Bob had often complained of his wife's demanding and dependent nature. This session his complaints specifically focused on her "sloppy approach to job hunting." I hoped that the vehemence of his complaints might form the basis of an opening to reach out to one another.

A few more weeks into treatment, and Bob presented another dream. As a small boy Bob was seated under the sink in the kitchen looking at his mother's and grandmother's legs (Figure 10). He was playing with a fish, but the women took it away and cooked it. The fish reminded him of a penis, and Bob remarked that the women in his house were man-eaters. "Men just didn't have a place or a say in anything."

The dream in the next session might well have been a reaction to this protest. The dream took place in his parents' house. His mother and father were having sex, and he heard them
"Each individual must
find a balance between
childlike primitive urges
and the values and
aspirations handed
down by one's family."

from his bedroom next door. As Bob
began to depict the dream (Figure
11), he first drew a large and erect
water cooler, and placed himself next
to it. Then he drew his parents having
sex. Bob was quite impressed with
himself for being able to draw his
parents so graphically (center of pic-
ture). As Bob admired the visual ex-
pression of his dream, he commented
"Oh yes, in the corner of the house is
my baby brother." Bob's face now
took on a twisted and upset look. The
warm sexual feeling he expressed in
the drawing disappered. "My picture
is ruined by the entrance of my baby
brother," he said. I encouraged him to
draw his anger, so in the corner of the
paper he drew himself standing with a
knife (upper right). For the first time,
Bob directly depicted evidence of
aggressive and sexual natures. Pre-
dominant in previous sessions were
impotence and loneliness; he diluted
the sexual and aggressive content of
his group portrait when he described
it to the members. In his family draw-
ing he was searching for male support
while he felt frozen out of the inner
female circle. After his last dream he
produced a symbolic visual expres-
sion of castration with a verbal com-
mentary on impotence. In this latest
drawing of a dream, the flatness of
expression diminished and a furi-
ously angry boy was depicted express-
ing feelings towards a new brother for
intruding into a secret world. After
expressing his castration ("they took
away my fish") Bob was able to take
the next step to recognize a piece of
his aggressive, sexual self within the
framework of a supportive therapeu-
tic environment. The appearance of
a more frontal, direct view of the face
now occurs.

This final picture presented here
elaborates upon some of the issues
regarding Bob's self-cohesion (Fig-
ures 12 and 13). Bob reported that he
had an interesting dream about a
member of the group. In the dream,
Diane was stitching his mouth shut,
and he proceeded to draw a picture of
his mouth stitched (Figure 12, upper
left). In the next part of the dream,
Diane's boyfriend and a friend were
standing on a corner (upper right). In
the following sequence, two gangsters
in a car shot at her boyfriend (lower
right). In the next frame, Bob saw
Diane in miniature and stroked her
behind (lower left). When Bob drew
this part, he drew her larger than she
had appeared in the dream. The pre-
sence of therapeutic support plus felt
markers allowed Bob to give a sharp,
visual focus to the drawing of the body. Finally, in the last section of the dream (Figure 13), a gangster went to Diane’s summer house and gassed her. In the corner, the patient was observing the action.

Bob labeled himself the jester, then proceeded to identify all the parts of the dream. His title “Bob the Jester” was reminiscent of the first clown/king image he drew a year and a half before, but now we had a much better notion of what was behind the clown’s face. Bob connected the clown/king image to the jester, and commented that, in the drawing, he looked as if he were masturbating. The front view did capture a certain physical likeness and essence of his true self standing in a masturbatory-like trance day-dreaming about the “loudmouthed group member, Diane.”

From Bob’s first picture of the group, Diane was the one person he could not tolerate. He was turned off by this woman whom he saw as attention seeking and crude. Diane’s sewing of his mouth in the latest dream gave the clear message to keep his mouth shut and his erotic interest to himself. In the course of the dream, Bob managed to open his mouth, freeing murderous impulses toward Diane’s boyfriend.

When Bob brought the dream drawing to the group, everyone was interested in it, but especially Diane, who was joyous. “You mean you dreamed about me?” she asked as he described himself stroking her behind. He continued to tell Diane that he had seen her living a wild, exciting life. When Diane reported that she did not care in the least that, in the dream, Bob shot her boyfriend, Bob was astonished. “You mean you are not mad at me for shooting up your boyfriend?” “No,” she responded, “who cares about him? You found me wild and exciting and that’s what counts.” Bob couldn’t believe that he received approbation.

The picture of the good little boy searching for an omnipotent ideal while keeping his wild, erotic, playful self under wraps, now had evolved. Drive content had been recognized within the self structure to take its place next to the ego ideal of hard work and achievement. I didn’t verbally share these insights with Bob because, from an empathic mirroring point of view, Bob’s wonderment at being appreciated for expressing murderous fantasies was far more important than making historical connections.

Bob responded to all of this in a dream brought in during the next session. In the dream he was having sex with his wife in his parents’ room. His mother opened the door to intrude. Suddenly the dream switched and his father wanted to meet one of his dull, dreary friends, but oddly enough, this dull friend turned out to be a football hero. Bob had a flashback and commented “You know that picture where I was standing in the corner as the jester with my mouth sewn up by Diane? Well, I always thought that there was something secret going on between me and my mother. We were always intimate and close when my father wasn’t around. It really was like my lips were sealed.” It was suddenly clear why our strictly verbal therapy had originally had so little meaning. His lips also had been sealed in the sessions. I joked to him that it would no longer be necessary to keep his lips sealed since his secret was now out in the open. His response was one of a shy grin and cold sweat.

Next Bob started to talk about his father. He hated his father’s friends because they were so dull and nonsensical. I reminded him of the image of the football hero in his dream. “Well,” he said, “my father did play ball with me and that was fun. One good thing about my father, he was always there to help me with my television repair hobby. My brother and I ran a small service and we could repair everything. My father would help get the supplies.”

As his sexual and aggressive feelings erupted into consciousness we began to see the emergence of an idealized self image. In contrast to the overpowering ego ideal composed of the “shoulds” and “should nots” reflected in his earlier dreams, another dimension of Bob’s self was emerging. Here, the hero so sorely longed for in his youth, surfaced. Bob’s transitional identification could help tame his raw erotic and aggressive drives and would serve as the basis for future mature identifications. His need for warmth and control, freedom and expression were slowly becoming integrated with a more realistic sense of the work ethic. In remembering incidents like playing ball and working on his hobby with his father, Bob was permitting himself to see some of the better aspects of their relationship, but he still was far from coming to terms with his feelings of vengeance toward women for putting him to sleep and making sex a sin.

Summary and Discussion

A crucial aspect of this case related to the use of transitional space. Bob’s symbol of the penis being sealed represented the complete cutting off of libidinal and aggressive energy in verbal communication. Through non-verbal play, we discovered a bridge by which to make symbolic therapeutic contact. Bob could not be explicit regarding this issue, but there was little question in his mind that he now could be more forceful and aggressive with others than he had been able to be before this series of drawings.

The use of art for patients is neither magic nor the answer for everyone in creating the bridge. In each case, we must find the appropriate container that allows the metaphor and image to find its own expression.

Bob had received support from his father for his mechanical endeavors. The family also supported Bob in such artistic and musical pursuits as piano lessons. Both areas lent themselves to freer expression so that art, in therapy, became an additional means to connect image and libidinal
expression where words, at first, were hollow representations of the self.

Before Bob and I started using art in the therapy sessions we had made superficial contact on the level of his ego ideal. In many respects he seemed to have made progress. This progress, however, is not uncommon in "false self" personalities. This kind of patient will often try hard to make progress in order to please the therapist. It is simply one more means to conform and be successful (2). Unfortunately, this success may come at the cost of total integration of the self, as it did for Bob.

Bob had kept his "guts and soul" in hiding cloaked by a false self, but with the introduction of a non-verbal medium, it no longer was possible for patient and therapist to delude themselves into thinking that there had been as much progress as originally assumed. Bob's original ego ideal was based on fear and pressure. There was little joy in, nor room for, the release or flow of energies. Within this very restricted self, oedipal material was a dark secret beneath layers of masturbatory fantasies and, in turn, encased within rigid body armor. The gap between libidinal body self and work-oriented ego was enormous as seen in the polarity between boxes and circles, each representing un-integrated parts of the self. This choice of symbols had always seemed apt to me. Although the connected issues were verbalized, the specific symbolism was not.

Bob worked hard in his quest for self-cohesion. His need for more human contact and community relatedness was consistently represented by the symbol of the circle, as he openly discussed his wish for intimacy and closeness. His striving for achievement and success was first viewed in the sharp points of the clown/king reaching for the sky and was later more clearly verbalized and responded to with empathy. In treatment, the lifting of repression permitted the release of an idealized image and allowed Bob's libidinal life to become better integrated in his identity. Bob's joy, good humor, and sharing ultimately became part of his group participation.

Crucial in the facilitation of Bob's inner life finding expression in his outside behavior was the development of the mirror transference through art. Where words alone seemed to encourage repetition of Bob's sterile early childhood experience, the non-verbal medium of art permitted a profound connection necessary to transform stagnant sessions into exciting and magical worlds where the discovery of new paths was possible. The patient and therapist rediscovered the lost parts of the self through a mutual psychic adventure. A mirroring transference must have the dimensionality and vision of a good work of art so that this rediscovery can take place.

Author's Note:
I am indebted to Trudie Loubet for her editorial help and guidance.

Imagery as a Style of Thinking

Myra F. Levick, PhD, ATR, HLM

Myra F. Levick, PhD, ATR, HLM is professor and director, Master of Creative Arts in Therapy Program, Hahnemann University, Philadelphia, Pennsylvania.
She is the author of They Could Not Talk and So They Drew, and is Editor-in-Chief of The Arts in Psychotherapy.

This article reflects the author's efforts to synthesize image formation and its relationship to development and role in learning. References include material on the creative process with a specific focus on "image formation as a style of thinking and learning."

Read (1960) and Horowitz (1970) are discussed at length—the former for his interest in art and education and the latter for his interest in the process of image formation in the treatment of psychotic patients. Horowitz's work also includes a historical review of the literature pertaining to thought and perception and the role of environment in producing a style of thinking.

Some attention is given to recent right brain/left brain research and the author offers some of her own clinical case material to illustrate these phenomena. A major developmental issue regarding the sequential emergence of words versus image is discussed and significant investigators including Segal (1971), Paivio (1971), Haber (1971) and Chall and Mirsky (1978) are cited.

In the summary and conclusion the author suggests some ways in which specialists from different disciplines may pool their resources, utilize what scientific knowledge is available, current and timely, in the area of child development and begin to apply it to prevent emotional problems and intervene early for emotional problems and/or learning disabilities. In addition to some examples from the author, the recent work in this direction by Silver (1978) is discussed.

Introduction

As a child and adolescent, I drew everything that appealed to me, and many things that did not. Image formation, in one form or another, has been a way of doing and learning for me as far back as I can remember. Therefore, after graduation from art school (trained as a painter) it seemed perfectly logical to me to respond to an advertisement for an artist to work with mentally disabled patients. I had never heard of art therapy, did have a knowledge of psychology on an undergraduate college level, but knew very little about psychiatry. The sensitive, intuitive psychiatrists and psychoanalysts who trained me knew the power of non-verbal communication with disturbed populations. As they struggled to articulate this, I struggled with such questions as: If it works so well for severely neurotic and psychotic patients as a means of communication, how can it be employed for children with language problems? What were the implications when children with borderline or below average I.Q.'s drew in a manner that indicated they were clearly using higher level mental functions such as reality oriented perceptions, organization, sequencing and appropriate spatial relations in their images?

A number of learned, articulate psychiatrists have written extensively on the creative process and its role in mental illness in an effort to synthesize for themselves, and for the field, this complex relationship. A review of this literature and examples from professional experience reflects my efforts to synthesize image formation and its relationship to development in the area of learning.

The Creative Process

The last four decades have produced a voluminous amount of literature on the creative process in the fields of psychology, psychiatry and education. Its role in education is often undefined and inconclusive. Because the scope of this paper is limited, I will review only a number of publications that address the focus of "image formation as a style of thinking and learning."

Read (1960) cites Fiedler (1949) who describes the artistic process as "a holding on to perceptual experiences in spite of both sensation and abstraction" (p 61). Read compares this statement to the words of Cezanne (in Rewald, 1941, p 235) who said that "an artistic production which represents and at the same time expresses a feeling is a form of cognition which is separate from scientific and philosophical cognition and for the arts suffices as a principle of reality." According to Fiedler (in Read, 1960) art does not start from abstract thought in order to arrive at forms; rather, it moves up from the formless
to the formed, and in the process is found its entire mental meaning.

Read (1960) sees education exclusively as a system for developing a capacity for forming concepts with little attention paid to developing a capacity for concrete perceiving. The earliest cave drawings date back to 40,000 B.C. and demonstrate that early man used images to comprehend his word and record those images on the walls of his dwellings. Throughout history man has continued to find need for comprehension and expression through the visual arts. Great works of visual art are honored side by side with philosophical teachings and Read purports that we do not give recognition to the results of perceptual experience, or ability to conceptualize forms, in ordinary people when we assess capabilities in our educational and social systems (Read, 1960).

Image Formation

Sir Herbert Read felt compelled to address educational reforms in England, and ten years later Dr. Mardi Horowitz, a psychoanalyst using art as a means of communication with psychotic patients, saw image formation connected to the issues of thinking, emotion and perception. He was confronted with the questions of the usefulness of images in cognition and differentiation of internal images from perceptions. Working with a number of patients who hallucinat ed, he wondered how to control image formation (Horowitz, 1970).

Historically, image formation was a major topic for research in academic, psychological and psychoanalytical study around 1900. After World War II, this was replaced by experimental cognitive research and interest in the functions of the ego with emphasis on the "defensive aspects of thought processes, perception and regulation of emotion" (Horowitz, 1970). Along with the increased interest in cognitive research there was a need to know more about nonlexical thought and its relationship to other aspects of cognition. Horowitz, as a psychiatrist, needed to communicate with withdrawn, psychotic patients and was impressed with spontaneous images emerging during a patient's free associations. He defined these images as representations of thought with a sensory quality, and the underlying process of image formation as being unconscious. He further defined images as "memory fragments, reconstructions, reinterpretations and symbols" (Horowitz, 1970). Within this definition, an image can represent objects, feelings or ideas.

In order to pursue the study of image formation, Horowitz suggests a phenomenological categorization which would serve as a basis of his theory that images are stimulated by a specific experience. His categories are: 1) Hallucinations—images associated with a psychotic state in which internal thoughts and images seem real; 2) Hypnagogic—images appearing in the twilight state between wakefulness and sleep which move from logic to fantasy; 3) Hypnopompic—similar to hypnagogic but occurring in the process of awakening, when thoughts move from fantasy to logic; 4) Dream—images which are usually visual; 5) Nightmares—unpleasant images usually accompanied by a physical sensation; 6) Psychedelic—images like a hallucination, but drug induced; 7) Dream Scintillations—a rapid succession of images intruding upon awareness and not easily remembered, and are often induced by physical stress; 8) Illusion—a transformation of external stimulus into a different object (common in everyday life); 9) Perceptual distortions—changes in line direction, shape, size, color; 10) Synesthesias—blends of images which are produced by an auditory stimuli and imagined both auditorily and visually (Example: I was so inspired by a concert performance that I "heard in yellow" and then, subsequently, I painted in yellow); 11) Images in a collection of forgotten details; 12) Imaginary images—when past images and perceptions are combined to form new concepts and fantasies; 13) Entopic images—intrapsyhic images that relate to perception (Example: After a blow to the head, one might "see stars"); 14) Body image—experiences which have a constant, transactional relationship and contain current perceptions, memory and emotions, along with drives, thoughts and actions. (Some body image experiences may be on a preconscious level and can be raised volitionally, while others are unconscious and cannot be raised easily. Common examples include reported cases of people who experience their body as it was before a physical injury. A specific example is of a student when asked to make a clay mask of her own face with her eyes closed, made her nose as it was prior to plastic surgery;): 15) Para-Normal Hallucinations or visions—these are usually mystical and/or religious visions; 16) Imaginary companions—frequently described by children who usually know the 'companion' is not real; and 17) Number and Diagram Forms—used by some people for arithmetic problems. (This last kind of vision certainly suggests some form of right and left brain synthesized organization.)

Horowitz (1970) cites Aristotle who saw image formation as a basic element of thought, connected by relevant associations and a motivating force for the expression of emotion and effort. Lock (1690, in Horowitz, 1970) described complex ideas as the result of the recombination of simple images which are recalled as part of thought. Hume (1759) saw images as separate from and copies of perceptions; however, he maintained that perceptions are more vivid, have more force and liveliness than images (in Horowitz, 1970). Hartley (1854) defined two systems for representing thought: words without sensory quality; and various sensory type words (in Horowitz, 1970). In the early 19th century, psychologists categorized words by their image quality. These
were visual (quality of being articulated). Images were assembled according to various laws of association, and one image led to another: "Thought proceeded by selecting the image highest in a hierarchy of activation" (Horowitz, 1970, p 57). In the early 1900's, members of the Wurzburg School concluded that thought was imageless. This was disputed by Wundt and Titchener, and the questioning continued when, in 1905, Arch attempted to unite both ideas by suggesting that conscious sensations or memory image is an image representation in consciousness of imageless knowledge. In 1927, Selz concluded that thought can be understood, but investigation of introspective reports of conscious awareness was necessary to understand thought processes beyond information (Horowitz, 1970).

The Gestalt School concluded that thought (as well as perception) was assembled holistically from less clear to more distinct versions, and conceived two image types: people who formed concepts pictorially, and others who had no picture in their mind's eye and conceived thought as a series of words (Horowitz, 1970). Angeli, in 1910, (in Horowitz, 1970) reviewed methods used to study determination of mental imagery and made recommendations that Horowitz suggests would still be worth following. Angeli thought investigators should examine all forms of images any individual could command such as forms used in daily life and, therefore, define the functions of the image.

Language and Image Formation

Horowitz (1970) concludes that environment must play a role in producing a style of thinking. He sees the environment as a kind of perceptual stimulation particularly to the extent that the infant uses internal images as a substitute for perceptions. He suggests that the ability to acquire symbolism and language substitutes for image formation. He also believes that infantile experiences play an important role in image formation and a significant influence on eventual cognitive style may be the separation-individuation phase of development.

In the last two decades there have been a number of other theorists who have suggested different ideas about the relationship of language and image formation. In addition to those cited by Horowitz (1970), others are briefly discussed. Piaget. 1950 (in Horowitz, 1970) said the pre-verbal child uses an image to transform or to gratify a desire. Werner (1957) and Lukianwica (1960) contend that children, primitive men and psychotic persons fuse inner images with perceptions of external reality through the use of magical constructions (in Horowitz, 1970). Children progress naturally from images to words, and for adults thinking has lexical significance. Horowitz cites Humphrey (1951) who believed that thinking is not the same as word usage, and that images either serve as distractions or enrichment of thinking. Vernon (1967, in Horowitz, 1970) studied 800 subjects and concluded there was no relationship between concept formation and level of verbal language development. Bruner, 1964 (in Horowitz, 1970) sees thought representation as the end product of information processing. Bruner identifies three forms of processing as enactive, iconic, symbolic, and the process moves from concrete to abstract. Horowitz agrees with Bruner's concept of information processing, but he believes the three forms are enactive, image and lexical. Horowitz' focus is on the subjective quality and he concludes that thought is represented by images and words. In ordinary thought, modes interact; modes are less integrated in organic pathology and psychic trauma.

Horowitz sees perception as an active process and maintains that there is an interaction between internal and external processing. This results in a schemata that the cognitive process needs to organize in order to identify and label (1970). From his clinical experience, Horowitz has concluded that image formation (in hallucinations) is elaborated from elementary sensations. He further raised the questions of psychological motives versus physiological structures. He identified permanent or transient changes in structure or function of the brain. Briefly, he points out that nondominant hemisphere pathology impairs visual and spatial tasks that require image formation, while dominant hemisphere pathology will more likely impair lexical thinking.

A number of years ago a twenty-two year old man was referred to me for art therapy after an attempted suicide. I was told he had suffered a cerebral hemorrhage, had been a science major in college and as a result of the trauma could no longer focus on that curriculum. He found himself painting to fill the time during his recovery, but became more frustrated and consequently very depressed. Little was known at that time about right brain/left brain studies, other than one side of the brain could take over some functions of a damaged part. His course of therapy, with art being used as a rehabilitative modality was dramatic. Within two years he was enrolled in an art school and finding a new way to be a productive human being. The results of this case, while exciting, left many questions unanswered for me and the neurologist and psychiatrist who supervised this patient's progress. Our conclusions at that time were certainly consistent with Horowitz's conclusion that there is a connection between art therapy and learning, and that the creative process can serve as a new form of communication for the mute, withdrawn or blocked patient. The implications of this in the field of learning disabilities are enormous, particularly in light of recent brain research.

Imagery and Cognitive Approaches

Segal (1971) invited several psychologists to contribute to his book on
imagery and the relationship to cognitive approaches. Paivio (in Segal, 1971) sees the aspect of meaning in an image related to verbalization and an aid in developing comprehension and retention. Language competence and language performance are initially dependent on the substrate of images. It follows that an image approach would enhance language acquisition. Infants develop a storehouse of images upon which language is built. Infants can indicate by behavior that they recognize objects before they respond to names of those objects. This suggests that some kind of representation is stored which matches perceptual information which later produces a word/image relationship (Paivio, in Segal, 1971).

Infants are exposed to objects in relation to other objects. This produces events which repeat themselves and from observed events a syntax is evolved. This becomes incorporated into representational images. Syntax is elaborated and enriched by the action component derived from the child's own actions. Names are learned for events, relations and objects, with a developing association forming between or among them. The child begins to acquire function words, develops an intraverbal network which expands through usage. Eventually abstract verbal skills are learned, verbal behavior and verbal understanding are possible at a relatively autonomous level. Paivio (in Segal, 1971) maintains these verbal skills—to some extent—are free from a situational context and image. Haber (in Segal, 1971) states that "the perceiver may see the world before he knows it—at the early state of processing he does not know what he sees. Thus in the beginning there is the image before the word" (p 47).

Brain Research

Right brain and left brain research will be reviewed briefly in relation to the creative process and its implications for education. Environmental stimulation and experience appear to be the most important influence on the growth of the brain (Chall and Mirsky, 1978). These are specifically important in overcoming inherited deficiencies or acquired injuries. The concept of plasticity of the brain is most important in understanding how damaged brain function may recover over time in the child. Mastery of sequences/stages can be accomplished by going back to simple known forms to build upon, recognize and to elaborate (Rudel, in Chall and Mirsky, 1978). The importance of timing in learning is discussed by MacLean and Epstein. For example, the emotion of empathy must start early because the region of the brain that is responsible for this emotion develops early. Also, if proper timing is observed more effective cognitive development can be achieved (in Chall and Mirsky, 1978).

Wittrock suggests that in the future educators should match instructional methods to right brain and left brain functions (see examples in the conclusion). Wittrock points out the importance of cerebral lateralization in the development of human cognition. The implications direct educators to plan curriculum based on different cognitive strengths and weaknesses in individuals, by sex, social class and cultural background. He sees a weakness in the left brain as genetic and would therefore give such children success experiences in music and construction for right brain performance (Chall and Mirsky, 1978).

Chall and Mirsky report their fantasy for the future: collaboration between educators and neuroscientists in the 21st century. This will produce a new specialist—an educational neurophysiologist—who will have knowledge of effective methods of teaching and neuropsychology and neuropsychology (1978).

"The concept of plasticity of the brain is most important in understanding how damaged brain function may recover over time in the child."

Edwards (1979) was searching for new methods to teach art and during a lecture discovered that she could not talk and draw at the same time. She embarked on a study of split-brain research and concluded that drawing requires a shift from verbal analytic processing (left brain function) to spatial global processing (right brain function). Subsequently, Edwards developed a "new way of seeing" to teach art. Her technique focuses the students on the space around the form, instead of on the form directly. She demonstrated considerable success with this method, working with college students and other normal populations. Her work may help us find
new ways to guide the non-verbal child to clarify images first in the process of learning self expression.

Silver (1978) is an art therapist who teaches handicapped children. She hypothesized that brain damaged children could acquire concepts of space, order and class by means of art procedures. She set up an experimental design, with art classes as the independent variable. There were thirty-four children in each group. Significant results supporting her hypotheses were obtained. In addition her study indicated that drawing procedures can serve as an instrument for assessing and developing cognitive growth abilities of children or adults who cannot communicate well verbally. These abilities are to associate and represent concepts, order sequentially, and perceive and represent spatial relationships. These abilities are relatively independent of language (Silver, 1978).

**Summary and Conclusion**

Art is an integral part of everyday living. It was-and is-a part of mine, stimulated and supported first by my parents, and throughout my growth and development by other people and situations in my environment. Compelled to “follow my nose” and use my art to work with the mentally disabled, I have now come full circle. How can the creative process be used to prevent emotional problems, serve as early intervention in emotional and/or learning disabilities?

Chall and Mirsky’s (1978) fantasy is the ideal solution. However, the educational system is resistant to change and creative innovations, and we cannot afford to wait to train a new specialist. We must pool our resources, utilize whatever knowledge we have about development, and begin to apply it.

There are numerous authors who have described the development of children’s art. Kellogg (1970) has done the most comprehensive and descriptive analysis demonstrating that all children, regardless of ethnic background or geographic location move through the same sequences pictorially. This process experienced by all children is the same and is not noticeably influenced by culture or socioeconomic factors or sex until around the ages of five to seven years. Graphic image formation is inherent and moves from the formless to the formed in the child who has no genetic abnormalities. Children often master their environment, their fears and their anxieties through drawing and, in this process, learn. At this early level of development it appears to be much more a function of the right brain. As images are connected, and as organizations and reorganizations take place, one can see the beginning of left brain function.

This is consistent with the literature reported above. Unfortunately, it is also true that our educational system inhibits creative expression and the child who cannot master language and reading is too often identified as learning disabled. Horowitz, (1970) suggests that the ability to acquire language and symbolism is a learned substitute for image formation. But, what is “wrong”? Or is it possible that some children may have a different style for thinking and learning? Silver’s study (1978) proved the value of using art to develop certain cognitive skills with handicapped, non-verbal children, and there are many case studies supporting her hypothesis.

Intelligence tests have played havoc with our perceptions and conclusions regarding individuals' cognitive performance; in many instances these tests have been used indiscriminately to label a child or adult as below average intelligence. Over the years, acting as a consultant to schools where art therapy students have been interns, I found I could not reconcile reported I.Q. scores of some children with their drawings that clearly indicated their ability to conceptualize, organize and sequence. In other situations I could not reconcile diagnosis of minimal brain damage for some children whose drawings showed they had the ability to identify boundaries, and with structured direction make appropriate spatial relationships (not unlike Edwards’ teaching program). Paradoxically, my experience and training enabled me to recognize that some children diagnosed as having behavioral problems did, in fact, have minimal brain damage that had not been detected by standardized testing. In some cases the conclusion was based solely on observable behavior.

Edwards (1979) describes an incident about a child of a friend of hers. The child came home from school excited about a new word he had learned in school and wrote on his little blackboard. The word was “house,” and when asked what it meant he had no idea. He had simply visualized it, and the teacher satisfied that he could write it assumed that the child knew what it meant.

During my graduate work I had the opportunity to test a sixteen year old girl. After one mistake in the verbal subtest she immediately became discouraged and would not continue. Her performance scores, Bender Gestalt and Beery results were almost perfect and her figure drawing was age appropriate for developmental indicators. In addition, her strategies were highly sophisticated. What was not apparent on the test scores was her depression and poor self-concept.

One of my students recently completed her thesis for the master’s degree using cartoon drawing to develop comprehension (Hado, 1980). She told the children in her study (all diagnosed as learning disabled with no organic signs) a story and had them recall it in three conditions: recall it verbally; recall it in the cartoon format; and recall it verbally following the drawing of the cartoon. Recall in the second and third conditions was far more successful than in the first.

The vignettes above reflect a small sample of problems we face in meeting the individual needs of children to help them learn. The first child “saw” the word, but did not know what it meant; the sixteen year old girl...
"knows" many things on a superior level, but cannot communicate it verbally and has experienced so many failures that she sees herself as worthless; my student effectively demonstrated a technique for improving comprehension, but the children in her study are still expected to learn to read by traditional methods.

Cultural and social influences were also mentioned earlier (Horowitz, 1970). When I first entered the field of art therapy in 1962, I learned that most children begin to draw stick figures around the age of seven. The reasons for this seemed to be attributed to the fact that children at that age are preoccupied with school, peers or their own sex and "learned" this stick-figure image in school. Figures with sexual indicators did not appear until around nine or ten years, which is pre-adolescent and was considered an age appropriate addition. Over the years, the stick figure has disappeared and the pre-adolescent form appears much earlier. In discussing this with my colleagues we have concluded that exposure to television has had a tremendous influence on making children much more aware of sexual differences at an earlier age and I now view this as "normal" in today's world. Another example is the marked difference in the drawings of lower socioeconomic black children of the same age and class. The black children's drawings show a slower maturation and appear to be one-to-three years behind. In my experience, and the experiences of my colleagues, the gap closed in adolescence. To my knowledge, there is no statistical evidence to support this—only case studies and anecdotal reports.

Kubie (1958) believed neurotic and creative energy emerged from the same psychic force. In the practice of art therapy it is the creative process that leads the patient back through the psychoneurotic process and eventually to conscious awareness of self and the tools to reorganize and restructure behavior. This therapeutic exploration of the creative process is a learning experience for patient and therapist. With what we already know, and are learning everyday, it seems critical that we continue to explore the creative process to better understand the relationship between image formation and learning, and identify styles of thinking to develop minds that are curious and unrestricted.

I believe that we already have specialists in the fields that Chall and Mirsky would "blend" together to produce a "super" educator. Our specialists need to learn to communicate first with each other verbally and nonverbally and with the creative arts therapists to help individuals utilize whatever learning capacities they have.

Cross-Cultural Psychotherapy and Art

Shaun McNiff, PhD, ATR

Shaun McNiff, PhD, ATR, is Professor of Expressive Therapy, and Dean, Institute for the Arts and Human Development Lesley College Graduate School, Cambridge, Massachusetts.

This article presents an introduction to cross-cultural psychotherapy, with reference to historical theories of art, symbols and myth, and to the therapist working with the client—both individual and groups. Cross-cultural dimensions of art therapy are delineated with a support for further research and cooperation between cultures, with attention given to outcomes relative to art therapy practice and training. An art therapy perspective is presented by the author from his work over a ten-year span with cultural groups from numerous countries. A review of literature is presented which focuses on cross-cultural psychology, defining issues applicable to art therapy. The literature discussed includes psychotherapy practice and training, cultural differences in therapeutic methods, research on cross-cultural mental health, as well as universal and personal symbols. A section on cross-cultural art therapy training brings together the author's observations of training in various countries, art therapy principles, and symbolic focus and transformation.

Introduction

Cross-cultural psychotherapy is a vehicle for the study of the therapeutic process in relation to the many variables of human behavior and universal phenomena. Clarification of transcultural therapeutic elements does not contradict the need for sensitivity to, and knowledge of, the specific qualities of different cultural and clinical situations. Throughout history theories of art, symbols and myth have conceptualized universal structural forms to human expression. In the twentieth century C. G. Jung has been the most influential theorist articulating the presence of universal symbolic forms and the existence of motivational forces of a "collective" character. Rank (1959, 1968) and Campbell (1949, 1959, 1972) have documented universal myth structures in varied cultural groups. James George Frazier's The Golden Bough (1951), in describing how fundamental principles of similarity and contagion underlie healing rituals in indigenous cultures throughout the world, has been one of the formative influences on twentieth century thought on the subject of universal forms of healing. In his studies of world religions and his research on Shamanism, Mircea Eliade (1964) documented the presence of universal religious forms. Artists responsible for major movements in twentieth century culture (Picasso, Dubuffet, Gauguin, Van Gogh and others) received inspiration from artistic traditions and forms of Africa, the Far East and the South Pacific. D. H. Lawrence and numerous writers have immersed themselves in the mythology of native cultures and ancient civilizations, making applications to contemporary life. Darwin's theories were formulated through world travel and comparative observations of nature. His concepts of evolution influenced Freud who saw both the individual and the human race as developing according to universal principles. Freud's position was that basic psychic processes are universally present in all human experience and there is a fundamental "psychic unity" to behavior in the present and past.

Freud's work helps to guide the process of cross-cultural psychotherapeutic research since his theories of universal psychological dynamics have been criticized for overlooking the particulars of regional cultures and gender. Totem and Taboo (Freud, 1955), although making contributions to understanding cross-cultural manifestations of taboo, projection and other phenomena investigated by Freud, also reveals the problems that are created by interpreting all human behavior in terms of personally created theory. The value and brilliance of Freud's research can be better appreciated if viewed from a phenomenological and creative perspective, whereby the researcher engages the universal by investigating private experience. When evaluating the ongoing controversy that his theories have generated together with their lasting power and influence, Freud can be regarded as one of the greatest phenomenologists of the twentieth century.

In cross-cultural research a fundamental taboo is the projection of a personal theory of behavior and values onto other cultural groups. This principle can also be applied to interpersonal relations within a culture. Historically, cultural stereotyping, prejudice and misunderstanding have resulted from these practices. It, therefore, seems important to understand universal elements of the therapeutic process together with variables of culture, personality and individual style with specific reference to cross-cultural art therapy practice and training. A review of literature is necessary to raise issues relevant to art therapy. Cross-cultural dimensions of art therapy
need to be delineated to encourage further research and cooperation between cultures. Future outcomes may include both increased attention given to cross-cultural art therapy practice, training and research and the involvement of the arts in cross-cultural studies.

An Art Therapy Perspective

My work as an art therapist has in the past ten years engaged me in world travel and practice with many cultural groups. I have worked with students and faculty from over thirty countries and have taught regularly in Israel, West Germany, Scandinavia, The Netherlands, Switzerland and various regions of the United States. My students and clients have included people from European countries, South and Central America, Africa, the South Pacific and the Far East. As a result of these varied cultural experiences I find that people commonly ask how my work with them compares with groups in other countries. Experience has revealed that cross-cultural commonalities are much more apparent than differences. These characteristics have been apparent not only in my training groups, but also in the clinical practice of art therapy. Common qualities consistently present themselves in imagery and in the process of making art. Cultural groups tend to similarly correspond in approaches to sharing feeling and discussing their group process. It would appear that art therapy as it is being developed in the United States, exhibits definite characteristics of cross-cultural interchangeability. There is a distinct universality to the art therapy process which also applies to other art modalities of dance, drama, music and poetry.

Research and treatment methods developed in the United States tend to be easily adapted to other countries so long as they respect cultural differences. The same applies to application within the United States of art therapy approaches developed outside the country. This is not necessarily true of more language based treatment practices which express the particular values of a culture. Of all expressive modes, language most clearly presents cultural differences whereas the visual arts, music and dance are more interchangeable and universal.

The principles of cross-cultural practice can be perceived as applying not only to different countries and cultural groups within a nation or community, but also to different psychological systems of thought and therapy that may be operating within a single clinic. If culture is defined as a systematic mode for interpreting life, the principles of cross-cultural psychology can serve as a guide to relations between individuals. This is particularly true in a pluralistic society. One-sided emphasis on differences makes cooperation difficult. Contemporary cross-cultural psychology, perhaps in response to earlier tendencies to perceive all cultures in terms of "psychic unity," seems to deal extensively with differences. Recent editions of Psychological Abstracts list numerous references comparing differences between cultural groups—Anglo versus Chicano, Dane versus Swede, Israeli versus Arab and American Indian versus White. The image of one group versus another is the dominant theme of many of the studies listed. This trend in research is essentially positive in that it satisfies the need to differentiate cultural attributes while creating a complementary need for the study of commonalities. The articulation of differences helps to form individual, community and national identity. Psychologically, it can be said that identity is a necessary individual and collective creation. Heelas and Lock (1981) describe how "No one indigenous psychology is the same as another..." and that these native psychological systems are "necessary." In addition to defining identity, indigenous and personal psychologies serve as sources of empowerment and organization.

In my personal experience in cross-cultural art therapy and practice, there has been an interdependence between universal and particular forms of communication. Creativity is the drive toward the particular, providing a specific definition of the self which allows access to universal forces of transformation.

Dr. Kuang Chung Ho, a noted authority on acupuncture, Chinese herbal medicine, Tai Chi and I Ching, told me that methods of healing can be viewed hierarchically in terms of the extent to which they stimulate natural healing functions. In his perception surgery is the lowest form of healing together with the use of synthetic medications. Herbs are higher on his scale because they introduce natural elements to the body. Acupuncture, massage and other related therapies activate natural chemical reactions which promote healing. The highest form of healing—according to Dr. Ho—is the self directed creative process in which a person, without external manipulations by others or the introduction of materials into the body, activates healing energies through action and contemplation. The continuities of Chinese medicine demonstrate how the mind can direct healing transformations within the body.

The energies of art and healing are closely related and often identical. Art therapy has historically taken its philosophical foundations from the "cultures" of western psychiatry and psychology. Art therapy, as a profession, can benefit from theoretical expansion and interdisciplinary studies with fields such as anthropology, religion, the philosophy of art and the practice of art. Respect can be given to the necessary interdependence with the dominant medical and psychological cultures of the mental health field while also engaging art as a primary source of identity. Art therapy and the other creative arts therapies have a unique potential to construct a

“Experience has revealed that cross-cultural commonalities are much more apparent than differences.”

cross-cultural theory of psychotherapy based on universal properties of the creative process. If this opportunity is to be grasped, it will be necessary to view the art experience as a primary, rather than as an adjunctive mode of therapy.

Review of Literature

The literature on cross-cultural psychology helps to define many issues applicable to art therapy. Leonard Doob, in evaluating recent trends in cross-cultural psychology, notes how the extensive documentation of cultural differences has produced positive outcomes in human understanding but that further investigations of how people differ will be of little value. What is needed according to Doob is validation of the fundamental similarities between people in all parts of the world (Doob, 1980). In the Netherlands, Ype Poortinga also encourages the investigation of cultural similarities (Poortinga, 1982). Art therapy research can be particularly useful in providing visual data.

A. O. Odejide from Nigeria, in a review of literature on cross-cultural psychiatric disorders, maintains that there are few differences between Western and non-Western cultures (Odejide, 1979). Murphy and Leighton through their studies of Melanesian and Eskimo concepts of illness, found that western psychiatric observers experience little difficulty in determining “genuine pathology.” Acknowledging clear differences between western psychiatry and the native conceptions studied, Murphy and Leighton found “underlying parallels which strongly suggest that cross-cultural comparisons can be reasonably made.” (Murphy and Leighton, 1965).

Although there are universal elements of both sickness and healing, the literature on cross-cultural mental health consistently recognizes the need for sensitivity, respect and understanding of local beliefs. Culture and values often make therapeutic systems and attitudes irrelevant to particular groups of people within the same nation or community (Ahn Toupin, 1980; Sue, 1981; Lager and Zwerling, 1980). It might be helpful for therapists to constantly evaluate their work in terms of its cultural orientation and the extent to which their viewpoints and operational systems are adaptable to the needs of clients and students.

Psychotherapy practice and training have been criticized for imposing stereotypic psychological values onto clients from different cultural groups. Treatment approaches are more likely to succeed if they avoid “ethnic chauvinism” (Patterson, 1977) and have meaning to the client groups by engaging culture in a positive way (Casas, 1976; Kareem, 1978). It has been suggested that therapists working with groups where folk medicine is practiced should familiarize themselves with these methods (Ness and Wintrob, 1981).

Cross-cultural and historical studies of psychotherapy at first glance will present significant differences and varieties ranging from the spiritual and magical enactment of the shaman to the more analytic and scientifically based methods of clinicians today. It is generally believed that the formal principles of therapy are culturally determined and some would suggest that positive outcomes are not likely if there are major cultural differences between therapist and client (Neki, 1977).

Laosebikan (1980) documents how American mental health workers tend to be more permissive and open-minded than their more authoritarian and restrictive Nigerian counterparts. According to Nüssner (1980) the Japanese have maintained far more traditional and culturally specific forms of therapy within technological society than the Germans. In a cross-cultural study of creativity Mar'i (1976) reveals how social and economic factors influence creative thinking and expression. Social status as well as sex role stereotypes can affect opportunities for the development of creativity (Raina, 1969). Mar'i's research documents how specific forms of creativity are evaluated in accordance with social values and thus culture can have a dominant influence on creative outcomes of individual behavior. Obvious examples of cultural influences on creativity include the differences in artistic forms produced in societies that value collective participation versus those which emphasize individual autonomy (Rank, 1968).

“It might be helpful for therapists to constantly evaluate their work in terms of its cultural orientation...”

While giving full respect to cultural differences in both the formation of personality and therapeutic methods, the continuation of studies which focus only on differences will result in a diffusion and separation of human energy. The challenge to an increasingly global society is the integration of universality and regionalism. With the possible exception of Jungian analysis, the major western psychotherapeutic methods of the twentieth century have not been conceived within a universalist theoretical context. However, the international appeal of certain therapeutic methods, such as the theatre inspired techniques of psychodrama and gestalt therapy can be attributed to their engagement of universal forms of expression. Perhaps the clearest contemporary example of universality in psychotherapeutic practice is the recognition of the value of meditation and relaxation techniques inspired by eastern spiritual disciplines. These practices have not only been widely integrated into psychotherapy but also into western approaches to the
treatment of cancer, heart disease and other ailments. Meditation practices have similarly affected western religious disciplines. New opportunities for the expansion of art therapy have been suggested by these transformations of health care principles due to the prominent role of "visual imagery" in focusing healing energy.

Research on cross-cultural mental health has been primarily concerned with manifestations of psychopathology and relative standards of deviance in both universal and culturally specific forms (Murphy and Leighton, 1965). There has been less emphasis on cross-cultural methods of treatment. In related fields of religion and anthropology the methods of healers and the structures of symbols across cultures have been studied. Jerome Frank (1974) and E. F. Torrey (1972) have attempted to reveal universal elements of the therapeutic process which characterize all forms of treatment, regardless of theoretical orientation, culture and methodology. Frank stresses that the core element of all therapeutic practices is the belief in the process, while Torrey emphasizes the universal therapeutic abilities to name and explain (diagnose); to fulfill client needs for acceptance (also described by Rogers in terms of empathy and a totally positive feeling for the client on the part of the therapist); and to generate respect from clients. R. H. Prince (1976) believes that all forms of psychotherapy utilize endogenous resources.

Draguns presents the view that "culture pervades the conduct and experience of psychotherapy, and change in one's behavior and well being takes place in relation to cultural referents." (Draguns, 1981, p. 6). He maintains that therapeutic techniques must be "adapted" if they are to be applied beyond the culture of their origin. Although Draguns recognizes universal elements of therapy, he believes that culture "...contributes more than just the external and visible trappings..." and "...is embedded in the subjective experience of therapy..." (Ibid., p. 23). This experience of cultural orientation characterizes every therapeutic relationship.

"Artistic energy in all cultures engages and transforms pain, conflict and disorder."

In a pluralistic contemporary society cultural differences are present within age groups, genders, races, people of different sexual preferences, and political and religious values. If therapy is approached with sensitivity to differences, then all relationships between therapists and clients can be viewed as meetings between cultures. If every therapeutic relationship does involve dimensions of cross-cultural communication, then there is reason to seriously consider the underlying theory of psychotherapy in relation to this fact. I believe that in practice therapists are typically sensitive and adaptive to client needs. However, the more general presentation of psychotherapeutic theory, with the exception of people like Frank and Torrey, has tended to be far more concerned with the projection of the values of therapists.

Because the individual personality can be perceived as a culture and world view unto itself, especially in relation to the intricacies of emotional structures investigated in psychotherapy, it is perhaps unrealistic to make ethnic or cultural matching between therapist and client a priority when conceptualizing optimum conditions for the therapeutic process. However, race, culture, language, values and other factors that I have described are important variables to be carefully considered in evaluating the therapeutic relationship. Cultural similarity will have positive effects in some cases and negative implications in others.

In my personal work I have consistently found that cultural differences have had beneficial effects on the therapeutic process. In all of its forms I find psychotherapy to be a process of sharing subjective perceptions of experience. Quentin Lauer described phenomenological philosophy in terms of "intersubjectivity." In reviewing the history of nationalism in the west since ancient times Lauer maintains that particular "forms" of thought have consistently been considered invalid by those that succeed them, while what Husserl described as the "essences," or "invariants," of experience maintain continuity (Lauer, 1967). The particular therapeutic experience and on a larger scale, all systems of psychotherapeutic thought comprise a vast ecological structure of intersubjectivity. All parts make contributions to the advancement, decline and general validity of the whole.

The process of intersubjectivity characterizes all human relations. Cross-cultural communications simply make the perception of differences more explicit. Within cross-cultural therapeutic relationships and art therapy training groups differences tend to increase curiosity and interest. Barring serious depression and thought disorder, people generally want to learn about others and themselves. The increase of cultural variables tends to stimulate rather than impede the process. This fundamental human motivation to learn about different forms of experience, together with the realities of contemporary accessibility, guarantee increasing developments in the field of cross-cultural psychotherapy.

Cross-Cultural Art Therapy Training

In training sessions I tell participants that the strongest groups and interpersonal relationships encourage and support the revelation of differences. This theory of small group process has been useful in clarifying my more general cross-cultural experience. Whether working with training groups in Israel and Finland, or Cambridge, Massachusetts, I have consistently found that only through respect for differences can we establish strong and trusting relationships. The issues generated by cross-cultural situations serve to highlight this principle which provides an example of how a "universal essence" (respect for
differences) works together with variables (the existence of differences) in psychotherapy. There is an interdependence between the universal and the particular.

In practicing cross-cultural psychotherapy and art I have observed universal elements which manifest themselves in every training experience. My historical and anthropological investigations have suggested that there is an "eternal recurrence" (Nietzsche) of these core elements which include the principle of correspondence, creative transformation, symbolic and ceremonial focus, rhythm, catharsis, purposeful action, contagious energy, the emergence of personal form, group validation, opening to others and giving. In the practice of art therapy principles of correspondence, symbolic focus and transformation have particular significance. Symbolic correspondence involves a relationship between inner and outer experience, between the self and the image. The art work not only serves as an expression of inner feelings but its external structure also stimulates internal transformations. These qualities of art are universal and cross-cultural. In The Golden Bough Frazer (1951) describes how native healing practices throughout the world are based on correspondence and the principle that "like produces like." In the sixteenth century Paracelsus said that "the outer reveals the inner" and "the similar is cured by the similar." Correspondence serves as the underlying psychodynamic principle of therapeutic practices which establish reciprocal relationships with nature and of symbols which act as focal points for transformative energy. The symbol stimulates and channels healing energy, acting as an external form for inner feelings. The process of symbolic transformation indicates how the psychology of art suggests a universal psychology of healing in that both creativity and therapeutic change involve changes in physical and psychic structure. Artistic energy in all cultures engages and transforms pain, conflict and disorder. What is most bothersome can potentially fuel the creative will. No matter what the content of their theories may be, virtually all systems of psychotherapy involve a fundamental transformation process.

"The value and brilliance of Freud's research can be better appreciated if viewed from a phenomenological and creative perspective..."

Symbols may change across cultures but the underlying dynamics that I have summarized are consistent. I have often observed that although a specific symbolic form, like the mandala or the cross, may appear in different cultures, varied interpretations may be attached to the image as a result of experience and history. Yet, Gestalt psychologists like Rudolf Arnheim (1954) present the view that on a structural and perceptual level there is a continuity across cultures in terms of how formal configurations affect consciousness. In music and dance, rhythm serves as an example of this process. There are thus universal patterns to the relationship between form, thought and feelings. These sensory qualities of vision, sound, touch and movement are rarely influenced by culture. They are, rather, examples of the universal physiological and psychological qualities of human experience.

In her cross-cultural research on children's drawings Rhoda Kellogg (1969) documents universal formal elements. Art historians have observed similar continuities across cultures. There are undisputed universalities of line, color, form, shape, texture, material, composition, movement, touch, etc., which produce these similarities. Because of this shared and universal language, art therapy has potential for indepth exploration on a cross-cultural basis that is not possible within more language limited therapies. The art object becomes a bridge between cultures and languages and a common focal point that provides access to universal qualities of feeling. I have found that—even when working exclusively with translators—art objects, materials from nature, rhythmic music and dance, gesture and dramatic enactment have enabled shared communication to take place on a level of mutuality that parallels comparable experiences in situations where a common language exists. The absence of verbal language can actually have positive results, focusing even more energy on the significance of the art object. Body movement, facial expression and the tone of voice are similarly influenced when there is not a shared verbal language. Other forms of communication by necessity begin to compensate for the loss. Art therapists are potentially capable of working successfully with these challenges because in their clinical practice, clients have been referred because of inability to communicate verbally. By clinical definition art therapy thus lends itself to cross-cultural practice, providing the beginnings of a universal language and an alternative to verbal communication.

In cross-cultural training sessions I have observed major differences in groups as a result of external conditions within the society such as war versus peacetime; poverty versus affluence; climate; and regional ritual traditions. These culturally specific experiences manifest themselves in both art and group process. It is also interesting how training groups in European countries involve many more men than groups in the United States and Israel. Psychiatrists, psychologists and professional artists in European countries have been more eager to involve themselves in art therapy work than their American and Israeli counterparts.

Cross-cultural differences are often most pronounced between individual group members within the same country. In art therapy intensive training sessions which meet communally for periods of three-to-five days, I have observed how the universality of the artistic process and attitudes of
respect for differences have enabled
groups of people from distinctly
different personal, political, religious
and cultural backgrounds, to coopera-
te in the most intimate ways. Artistic
expression and group responsibility
can become vehicles for sharing.

Cross-cultural work is not only a
constant source of new stimulation for
me but also an ongoing opportunity
for learning. Because English is rarely
the first language of most of the
people with whom I work, I have
learned to speak slowly, simply and
with increased clarity. My psycho-
therapeutic vocabulary has also been
enriched by terms and concepts from
other languages. I have developed an
increased sensitivity and respect for
the process of translation as it applies
to all levels of experience. A graduate

student from Switzerland, involved in
translating my writings into German,
worked with me in exploring the
fundamental psychodynamics of the
translation process. The good trans-
lation not only brings about a trans-
formation of a statement from one
language to another, but penetrates to
the “universal idea” which relates to
the source of the original statement.
The translation process can also be
applied to therapy where the ther-
apist and client working in the same
language translate the emotional ex-
pressions of one another and give
them back transformed and with
additional meaning (Ursprung,
1984). All of psychotherapy and hu-
man relations can be perceived as the
exchange of personal creations moti-
vated by universal sources.

Summary

Both art therapy and cross-cultural
psychotherapy are relatively new
areas of study and have much to
contribute to one another. Cross-
cultural research and the history of
the arts as ways of healing provide a
conceptual framework for investigat-
ing how contemporary therapeutic
processes relate to ancient and world-
wide continuities in human experi-
ence. Because they share universal
languages, creative arts therapists will
find many opportunities for inter-
national and cross-cultural com-
unication. The specific art object is a
tangible meeting point. “Art” can take
many forms and may include psycho-
therapy itself, which has much to gain
by expanding its conceptual and cre-
ative boundaries.

The Stimulus Drawing Technique with Adult Psychiatric Patients, Stroke Patients, and in Adolescent Art Therapy

Part I: The Use of Stimulus Drawings with Adult Psychiatric Patients in a Day-Care Setting
Louise Sandburg, MSc, ATR

Part II: The Use of Stimulus Drawings with Stroke Patients in a Rehabilitation Center
Rawley Silver, EdD, ATR, HLM

Part III: The Stimulus Drawing Technique as Metaphor in Adolescent Art Therapy
Kristen K. Vilstrup, MA

Louise Sandburg, MSc, ATR, is Art Therapist at St. Vincent's Hospital, Harrison, New York. Rawley Silver, EdD, ATR, HLM, is author of Developing Cognitive and Creative Skills Through Art, and has additionally authored more than 30 research reports and articles. Other of her works include a drawing test and two exhibitions on art and disabled children and adults (circulated by the Smithsonian Institution). Kristen K. Vilstrup, MA, is Clinical Art Therapist at Shadow Mountain Institute, Tulsa, Oklahoma.

The stimulus drawings used in these studies consist of a set of 50 line drawings of people, animals, places and things (Silver, 1982). The drawings are designed to be ambiguous or suggestive in order to facilitate their use in diagnostic or treatment, or both. The technique consists of presenting the stimulus drawings (individually or to groups), asking the patients to choose some drawings, imagine something happening to the subjects chosen, then show what is happening in drawings of their own. When response drawings are finished, they are discussed. The authors (Sandburg, Silver and Vilstrup) adapted this basic technique to the needs of the patients with whom each worked. Stimulus drawings with adult psychiatric patients in a day-care setting, with adult stroke patients in a rehabilitation center, and the technique as metaphor in adolescent art therapy comprise this three-part article.

Part I: The Use of Stimulus Drawings with Adult Psychiatric Patients in a Day-Care Setting

Overview

This section presents the use of stimulus drawings over a one year period, with chronic schizophrenic patients at the Preventive Treatment Unit of St. Vincent's Hospital in Harrison, New York. An "Artworks Group" was designed to meet the needs of the lower-functioning patients in the program. The stimulus drawings provided a structured format which offered safe choices while, at the same time, provided enrichment and encouraged socialization.

The stimulus drawings were presented to the patients as a working tool, and the meaning of stimulus was discussed with them. The drawings were displayed and discussed before each of the sessions with the patients; the instructions directed the patients to choose two or three of the stimulus drawings and to think of a story that could include these images. These simple images provided models and also served as a starting point. The instructions remained identical from week to week for the purpose of establishing consistency. Following the instructions, the patients drew a picture from the story that was created (using the stimulus drawing as a motivation). The patients were encouraged to create their own imagery, although they were allowed to copy a stimulus drawing if they felt it was necessary. Copying was most often an issue when a patient first joined the group, and also if a patient was in periods of regression under stress; however, the stimulus drawings helped to overcome fear and resistance, and they helped to decrease comments such as "I can't draw."

The art work was done in a closed room, at a large table that seated eight. 12" x 18" white paper was used, with craypas as the drawing medium. This size of paper, as well as the vivid
colors, were chosen to stimulate the patients and to counteract any rigidity that might be present. After completion of the drawing, the art work was displayed on the wall, and in some cases the patients chose to display the cue stimulus drawings with their drawings.

The chairs were moved into a semi-circle in order to arrange the patients comfortably in preparation for viewing the completed and collected art work. The therapist encouraged interaction with questions such as “Is there anything you would like to know about one of these pictures?” Each patient was given ample time and encouragement to verbally present his or her own art work.

The structuring of the sessions around the stimulus drawings helped to focus on specific ideas, and it helped to stem the flow of loose associations; it was previously noticed that at time the loose associations overwhelmed the patient and made working in art a threatening process. This group served as an introduction to the creative process for patients who had never before explored art. The art experience was presented as a problem-solving task, thereby making the process more accessible and enticing to those with poor self-concepts. Group cohesiveness was built by encouraging even the most minimal participation. When a patient was feeling particularly stressed and too agitated to draw, he or she would often choose a stimulus drawing and participate in the verbal processing, rejoining the group the following week as a full participant.

The direct involvement in developing one’s own art work from the drawings and processing it within the group often brought up therapeutic issues. The processing often moved from the art work itself into aspects of the patient’s own life experiences. At times, patients shared these past experiences, discovered peer identification and received peer support. Uncharacteristic affect flexibility and spontaneous humor were periodically observed.

The art work was often cathartic, it served as a source of pride and pleasure, and it provided accomplishments for patients who seldom experienced these positive feelings in their daily lives. The group served as a model for interpersonal interactions and the stimulus drawings, in turn, often served as the focal point. The drawings also promoted common shared experiences; patients often remembered who had used a particular drawing and they reminded each other of previously chosen stories.

After one year of work with the standardized stimulus drawings, the patients decided to construct their own set of story cards using the collage technique to construct these cards. They took this initiative after having gained much self-confidence in this long-term process, and they used the stimulus drawings as their working models to move (although somewhat tentatively) in more personal directions.
The style of Ms. A’s first image of a “Queen” (Figure 1) revealed her hesitancy in the new group setting. She was quite involved in the drawing process, physically isolating herself from the group which she later rejoined to proudly discuss her artwork. The elaborate hat corresponded to a tumor on her head. Her next picture (Figure 2) was a “Curious Chicken in the Forest” and at this point she used the group to explore her self-experiences. Ms. A’s third image (Figure 3) portrayed fall trees, and included a horizon line and multicolors. The chicken, looking smug, reappears in the last drawing (Figure 4) and this image is more complete than in previous work. As she moved through this series of drawings, Ms. A received positive feedback on her progress from her peers as well as support from the therapist. These drawings were done over a one year period where progress in the group helped to promote progress that was noted in other aspects of her treatment.

Conclusion

Richard Lamb states that:

...many long term severely disabled psychiatric patients find only emptiness. A positive sense of meaning in life is usually associated with membership in groups...as these persons with limited capabilities become older, they have experienced repeated failures in dealing with life’s demands and in achieving their earlier goals. (Lamb, 1982)

A need for success within a group counters the “common sense of defeat” that Arthur Robbins sees as a trait of schizophrenia (Robbins, 1976). A highly structured group, built around the stimulus drawings, correlates with Sylvia Honig and Kathleen Haynes’ findings that identify the need for consistency within the treatment regime when working with chronic patients in long-term settings (Honig, et al, 1982). Helen Landgarten writes about “cooperative task orientation,” wherein the sheltered group setting serves as a trial area for interactions that develop socialization skills to be used and further developed elsewhere (Landgarten, 1981). The “stilted styles,” also mentioned by Landgarten, are often seen in the art work of patients in day treatment settings. Many of these
In this study, the stimulus drawings were used for diagnostic and therapeutic purposes with patients who had language impairments as a result of cerebral accidents.

To illustrate, Mr. O, age 56, had a cerebral hemorrhage. Although he spoke fluently, his vocal responses did not always make sense. He could not read aloud and tended to confuse grammar and verb tenses. He also had difficulty following a series of commands, such as “Put the book on the table, and put the pencil in your pocket.” His greatest difficulty, according to the medical report, lay in expressing concepts. Although he was discharged from the hospital, Mr. O returned once a week for speech therapy.

As an art therapist, my goals were: 1) to determine whether Mr. O’s impairments were cognitive as well as linguistic; and 2) to help Mr. O overcome his difficulties in expressing concepts.

Diagnostic Information

The stimulus drawings (SDs) were used in conjunction with the Silver Drawing Test (1983) which was administered as a pre-post instrument in the first and last sessions. The objective was to obtain information about his ability to perceive, form and represent concepts nonverbally as well as verbally.

In the pretest Mr. O had no difficulty with two of the three subtests, scoring the maximum 15 points in Drawing from Observation (spatial concepts) and Predictive Drawing (the ability to deal with hypothetical situations). In the third subtest, however, Drawing from Imagination (the ability to select, combine and represent), Mr. O’s graphic response was somewhat garbled. This corresponded to, and resembled, his expressive language. This response included two drawings (see Figure 5). The first, titled “A Life Time of Growth,” shows stick figures of men, women and children. Although the figures are related by arrows, their meaning is unclear. His second drawing (also in Figure 5) is more meaningful: titled “Cat and Dog Confrontation in a Strange Home,” it may reflect his feelings about his hospital experience, or perhaps his feelings about taking the test. His first drawing was scored 5 points; his second, 8 points (from a maximum possible 15 points). Comparing these scores with our norms for children in the second grade, Mr. O’s scores were in the 7th and 40th percentiles respectively. In other words, he seemed to be performing at a level that was low for 8 year old children.

---

**Figure 5**

---

"The structuring of the sessions around the stimulus drawings helped to focus on specific ideas, and it helped to stem the flow of loose associations..."
Did this low score reflect cognitive impairment or language impairment, or both? To obtain further information, the stimulus drawings were used.

Therapy

The therapeutic objectives were to encourage Mr. O to express concepts through drawings followed by talk, as well as to provide him with opportunities to ventilate feelings which he could not verbalize. We met in four weekly hour-long sessions.

In the first session the stimulus drawings (SDs) were spread out on the table between us, clustered into two groups: people and animals in one group, places and things in the other. Mr. O chose a mountain climber, then drew Figure 6, which he titled “Gathering Magic Herbs.” In Mr. O’s drawing the mountain climber was changed from a child into an apparently masculine, faceless adult. Mr. O added the climbing equipment and mountain scenery, showing the climber higher than an airplane and the tree line just below the herbs on the peak. On a neighboring peak, a mountain goat has reached the top and is savoring the rewards. The theme of this drawing seems to be striving to overcome obstacles, with the likelihood of success. Climbing mountains is an appropriate metaphor for trying to regain one’s health. This drawing shows no difficulty with forming and expressing concepts, and its upbeat character presumably reflects a need or wish to overcome the dangers and difficulties of his illness. The drawing, scored as though it had been a response to the test, received the highest possible score of 15 points.

Returning to the stimulus drawings, Mr. O selected a whale and a seascape, then drew Figure 7 titled “Call Home Quick. There is a Whale in Sight.” In trying to explain his drawing, Mr. O pointed to the person on the dock and said “sing walk walk.” I asked if he meant telephoning. He replied “yes,” adding that his words “do not come out right.” Mr. O then talked about the onset of his stroke.
He had been having lunch with a friend when suddenly he found that he was unable to talk or write. Even so, he said that he was fully aware of what was happening at the time as well as later, when he was in the hospital. His choice of a whale with water spraying from its spout is an interesting metaphor for a cerebral hemorrhage.

The following week Mr. O chose the stimulus drawing of a city street, then he made two drawings: people with crutches and canes (titled “Handicapped People That Can be Trained to New Aspects of Machine Maintenance”), and a drawing of someone walking along dotted lines across city streets (titled “Paths to Learning Machine Maintenance”). Mr. O then talked about his work as an executive in a large company, and he noted that he was planning to return to work soon. Although the subjects of his drawings were handicapped in walking rather than talking, and their work involved maintaining machines rather than communications, they seemed to represent Mr. O in disguise. Like the mountain climber in Figure 6, the figure symbols are overcoming obstacles; they can be trained, they can find the paths through a maze of city streets, and perhaps they can also help him to conquer fears and fulfill wishes indirectly by projecting them onto his surrogates.

At the last therapy meeting the Test was administered again. This time Mr. O’s score on the Drawing from Imagination subtest yielded the maximum possible score. This subtest resembles the SD technique in that the examinee is asked to look over a different group of 15 SDs, choose two, think of something happening to the subjects selected, draw what is happening, and add a title. (Directions: “Don’t just copy these pictures. You can change them and draw other things, too”). Mr. O chose the snake and the cat, then drew Figure 8, titled “Hedges May Hide Surprises.” His snake (in the hedge) faces away from the cat, apparently in retreat. The cat, facing toward the snake, partly resembles the “test booklet cat” in that its back is arched and its tail is raised. Unlike the test drawing, however, Mr. O’s cat smiles and its eyes are open. Like the mountain climber and the handicapped people in previous drawings, his cat seems about to achieve success—in this case, mastering an unpleasant surprise.

It may be that Mr. O was preoccupied with his return to work the next day and that the cat represented himself (Mr. O), courageously facing up to and dominating a threatening situation. On the other hand, it may be that Mr. O identified the snake with himself. There was no way to know, and Mr. O offered no explanation; he spent the remaining time saying goodbye.

It seems evident from Mr. O’s response drawings and explanations that his impairments were not cognitive, but linguistic. His drawings also suggest that art experiences provided him with opportunities to express some of the fears, needs and wishes that he was unable to put into words.

Part III: The Stimulus Drawing Technique as Metaphor in Adolescent Art Therapy

The stimulus drawings by Rawley Silver (hereafter referred to as stimulus drawings), provide a valuable resource for art psychotherapy with children and adolescents. Although these drawings were originally developed for assessment purposes, this section will focus on the stimulus drawings as a projective technique with adolescents in an inpatient psychiatric setting. The drawings stimulate symbol formation and provide insight into strengths, conflicts, and maladaptive defenses of even highly resistive clients. The metaphoric level of material is less emotionally charged, and can often serve as a bridge to the child’s life situation. Furthermore, the therapist has a better chance of effectively being understood while speaking within the child’s own symbolic language (Ekstein and Wallerstein, 1957).
Directives and Technique

The child is provided with paper and pencils or other suitable media. The four stimulus card groupings of People, Animals, Places and Things are placed in front of them and the following directions are given:

Choose 2 or 3 cards which can be combined together to illustrate a story. You may choose cards from any category, but do not take more than one card from a single category.

After the cards are chosen, continue with the following:

- Draw a picture using the ideas from the cards you have chosen. Try not to copy the cards directly, but use them as a starting point for your picture.

Upon completion of the drawing, the child is asked to explain it by telling a story which contains a beginning, a middle and an end. Finally, the therapist asks the child to provide a moral or title for the story.

The child's personal symbols and metaphors are presented through the selection of stimulus cards and the storytelling process. A varied choice of mood and setting are available within the combinations of the 50 possible stimulus card selections. Drawings may range from creative fantasy to tragedy, depending upon the life experience and current affect of each individual.

As in any art work, no single stimulus drawing should be interpreted to represent overall functioning of that individual. These projective responses, as reflections of internal states, will vary from day to day. Common characters and themes surfacing over time, however, offer the therapist a more genuine understanding of the child's inner process (Silver, 1983).

Schematic deviation from the original stimulus cards is a creative variable, and by no means should be perceived as being abnormal. In the author's experience, however, major alterations in form or subject often punctuate a critical theme for that individual. Figure 9 illustrates the stimulus cards selected by a 14 year old boy with a history of repeated abuse and abandonment. During the drawing process the whale, often selected by adolescents to symbolize venting or "blowing off steam," was transformed to a shark moving toward a frightened man (as seen in Figure 10). When asked if this change was significant, the young man discussed the fear he felt when his mother used to "take her anger out" on him.

When the child presents a story which contains a great deal of unresolved conflict, it is important for the therapist to assist that child in sealing over raw affect and achieving closure. The stimulus drawings often enhance the primary process orientation of the art media, evoking powerful affect-laden material relating to family, home and interpersonal relationships. Keeping interpretation within the metaphor at these times may prove less threatening to a frightened child. The metaphor can be used to manipulate toxic primary-process material without prematurely lifting its meaning into the language of the secondary process (Caruth and Eckstein, 1966).

One method very helpful in facilitating this process is the Mutual Storytelling Technique" developed by Dr. Richard Gardner. This technique provides the therapist with the opportunity to create a second story containing the same characters and theme, but presents the child with...
healthier adaptations and coping choices. Gardner (1982) explain his technique as follows:

After asking myself, "What would be a healthier resolution... than the one used by the child?", I create a story of my own. My story involves the same characters, setting, and initial situation as the child's story, but it has a more appropriate or salutary resolution of the most important conflicts. In creating my story, I attempt to provide the child with more alternatives... Therapy must open new avenues not considered in the child's scheme of things. (page 69)

Readers interested in this technique are referred directly to the source for a more comprehensive explanation of story analysis (Gardner, 1971).

A corrective drawing has similar potential, and can be used separately or in conjunction with the storytelling technique. This process allows the child and/or therapist to make changes on the original drawing which helps to alleviate a threatening situation. For example, a dragon in pursuit of a helpless victim can be "contained" with an added fence to help that child set healthy limits.

Case Example

Frequently, the situation arises in which clients recognize their personal metaphors and choose to process them directly. This was the case with Michael, a withdrawn 16 year old with a history of withholding anger until he blew up in violent acting-out episodes. The last of these incidents culminated with Michael kicking down a door because he felt his father "wasn't listening" to him. Michael's natural parents divorced seven years ago. Feelings of rejection developed as he was traded back and forth between parents. He felt especially rejected by women, a position which was continually reinforced by the covert actions of his step-mother. Due to non-verbal tendencies and past therapeutic failures, art psychotherapy was determined to be the treatment of choice for this young man. Despite psychological tests indicating little capacity for insight, Michael worked actively through metaphor. Choosing the stimulus drawings of a king and a castle (Figure 11) Michael illustrated his feelings of isolation (Figure 12). His story went as follows:

Michael: "One day the king forgot his keys and had to climb the wall. So he went to climb the wall and just as he got to the top he fell."
Therapist: "What happened next?"
Michael: "He went to the hospital. and found out he had a spare set of keys to get back in, but he also realized that this door (pointing to the small door below the king) was open all along."
Therapist: "Does any of this story fit for you? Did you ever feel a time when you felt locked out and tried to climb in, but kept falling?"
Michael: "In a way I feel like that with my family. I feel like they're on the inside and they lock me out."
Therapist: "But you have a spare set of keys. Do you have any ideas what those keys may be that you already possess?"
Michael: "I don't know, I'm so confused. I just can't talk to my stepmother. She's the one that really locks me out."
Therapist: "I think we need to work on what keys are there for you, and for you to remember that somewhere in that fortress is an unlocked door. Can you think of who or what the door might be?"
Michael: "The door might be my father, but its a small door. It has to be a lot bigger before I could fit through."

Michael's story not only demonstrated that he had capacity for in-
"As in any art work, no single stimulus drawing should be interpreted to represent overall functioning of the individual."

sight, but it also provided a valuable therapeutic focus underscoring the need for a stronger alliance between father and son. Weekly family therapy sessions were temporarily revised to meet this goal. Father and son were seen in a dyad for several weeks to increase communication and strengthen assertive skills. With his father's support, Michael was able to overcome the fear of expressing himself to his step-mother, and was able to relinquish his role as the "identified patient" in the family.

Conclusions

In summary, the Rawley Silver Stimulus Drawings are a valuable projective tool for clinicians working with adolescents and children. These drawings provide a wonderful opportunity to enter into a child's own symbolic language. The storytelling process offers further insight into the child's strengths and weaknesses, and allows the therapist a vehicle to facilitate conflict resolution.

VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. The following selections are related in their emphasis on art.

Editor's Preface

Yolande Porter, from Toronto, Canada, shared a series of slides, written documentation (including poetry) and narration of personal tragedy (i.e., the burning of her home, the death of her husband, and economic trouble within a relatively short time) and subsequent healing and rebirth experiences through art therapy. The photographs of her paintings were categorized into three series headings: Series I, “Journey Through Hell”; Series II, “Uncertain Journey”; and Series III, “The Sun Series.” Through this personal testament and reaffirmation of the power of art therapy, Mrs. Porter shares with readers a few personal statements, together with selected photographs from each of the series. The complete collection of paintings will be exhibited at the Robarts Library, University of Toronto in 1985.

Artist's Statement

[In the “Journey Through Hell” series, the pieces of debris, charred fragments, toys and broken machines]-
“...bears no likeness to anything I previously painted...I did not realize what I was actually creating. The story itself is literal. The material used to create the pieces are authentic and survived by mere chance...After its completion. I spent months reviewing my own work realizing, to my amazement, that everything had stemmed from my subconscious and that it encompassed my entire life. It took months for me to allow anyone to see what is in reality a private part of me.”

“The healing series “Uncertain Journey” started in a strange way...This was how I saw myself—an empty shell, black inside...over a black, bottomless ocean...The lowest ebb in my life, and what more could I hope for than a green valley...” For ten months I was like a possessed person, and if my life depended on it I could not have stopped the outflow. I now realize that it was as though something has festered and burst—all the poison drained away.” [As the “Uncertain Journey” series evolved, the primary focus was on healing, implemented by the therapeutic process of painting.]

[Finally, the “Sun Series” was created to celebrate the reentering life with special focus on the sun, birds, blossoms, the spirit and the dance.] “After a decade...when I left the darkness and broke the last bonds that confined me, there was the Sun—at last...Morning and evening I watched the sun bird and gazed upon spectrums appearing in many hues...it was time to return to earth...These complete the cycle and are intrinsic to it. Though the wound is now healed, the scar remains.”

"Charred Machine" from Series I: “Journey Through Hell"
“Egg Over Black Bottomless Ocean” from Series II: “Uncertain Journey”

“Sun Bird 1” from Series III: “The Sun Series”
Book Reviews

Psychotherapy Through Imagery

(476 pages) $19.95

Reviewer Evelyn Virshup, PhD, ATR is an author, an art therapist in private practice, and an active member of the American Association for the Study of Mental Imagery.

It is interesting to remember that less than 10 years ago imagery was just beginning to emerge as a respectable clinical tool and experimental science. One of a handful of pioneers, Joseph Shorr wrote two of the landmark books in this field, Psycho-Imagination Therapy and Psychotherapy Through Imagery, in 1972 and 1974. Now, in a more receptive environment, these two classics have been expanded, brought up to date, and combined in one book, Psychotherapy Through Imagery.

This is a biased review. I have been a fan and admirer of Joseph Shorr since I attended one of his seminars ten years ago, and was first exposed to his ingenious and powerful methods for evoking personal imagery. I have been using many of his techniques successfully since. I am in good company in my enthusiasm. Eric Klinger (University of Minnesota) says in the Introduction to the book, that Joseph Shorr is among the most fertile contemporary creators of psychotherapeutic techniques. Jerome Singer of Yale writes, "Few people I know are as ingenious and imaginative as Dr. Shorr in generating situations that can evoke from patients powerful and meaningful imagery."

Psychotherapy Through Imagery is an encyclopedia of various directed imagery methods that Shorr has developed in the course of direct patient care. They have been validated through his extensive clinical experience, and are organized and categorized to make them useful and available for every conceivable clinical situation. The book is bursting with suggestions which, as we know, have to be experienced to be fully understood. Individually, his imaginative questions are invaluable. When combined, they act synergistically, helping the client bring to awareness his conflicts, the traumas behind them, and his feelings about those experiences.

Dr. Shorr is a clinical psychologist, not an art therapist; his book is directed to talking psychologists, and does not mention art or art therapy. But not to worry: as an art therapist, I have tested his theories and used his techniques. Not only do they translate to our language, but art gives them a dimension of which even Shorr may not be aware. Drawing provides his images with a range and variety of information hardly possible with linear verbal discourse.

What is Dr. Shorr's conceptual framework? Go directly to the chapter called "Imagination and Psychotherapy." After a fascinating historical overview of imagery in psychology, you will find that he has been influenced by Freud, Sullivan, Horney, Laing, Jung, May, Desoille, Leuner, Rogers, symbolic interactionism, various existential therapists, and the empirical tradition of general psychology. Shorr brings all of these elements into relationship with one another within his orientation to imagery and his well-developed techniques.

Shorr quotes R.D. Laing frequently . . . "One is in the first instance the person that other people say one is. As one grows older one either endorses or tries to discard ways in which others have defined one." Shorr uses imagery to help strip away false identities. The psycho-imagery approach used in this framework is specifically geared to help people become strong enough to define themselves accurately. He believes that one of the principle functions of imagination is the resolution of conflicts between outer reality and inner fantasy. Imagination is the "modus operandi" which harmonizes these opposing components. The active and conscious use of imagination helps to distinguish the difference between one's world and that of others.

He defines the therapeutic relationship as one of basic equality between two people whose roles are different. He found that as patients became "accustomed to this kind of therapy, it was less and less necessary to make any interpretations for them . . . It would be possible to help focus the patients to greater awareness, where they would be forced to face the truth for themselves." Shorr advises that we interpret sparingly; that instead, by using imagery appropriately, we lead the patients to understand their phenomenological ways of seeing the world for themselves. He abhors formulas and recommends that these specific approaches not be used in any set order, but flexibly and responsively to reflect the individual client's needs. He encourages the therapist to adapt and to improvise. The following examples will help.
give the flavor of his approach.

In "The Imaginary Situation," to assess how a person feels about his situation, he says to the client, "Imagine you are on top of a mountain and on a ledge below, you are also there. Now the top you lowers a line to the bottom you. What will happen?" The response allows him to get a picture of the client's attitudes about help, self-help, and resistance to therapy. He also describes variations, such as "Imagine one you in a boat and the other you in the ocean. The you in the boat throws the you in the ocean a line." He suggests using variations in later sessions to assess change.

In "Self-and-Other" questions, clients will disclose how they view themselves, and how they feel others have defined them. One such question is "How would you like someone crazy?" You will probably hear the dark side of the patient's memory of his/her childhood. Or, "Look into a mirror and see another person. Whom do you see? What would you say?" People are generally quite surprised by their responses to this powerful question. Used as the last of a series of completion sentences, the "Finish-the-Sentence" item "Never refer to me as..." quickly evokes the patient's despised image.

One of my favorites elicits information about specific internal conflicts: "Imagine two fantasy animals. Describe them. Imagine them walking down a road together. How would they behave? What would they say to each other?" When I ask patients to draw these two animals, I have them write three adjectives for each animal, and then their conversation. For evoking an image of the trauma behind a conflict, he asks, "What was the day of shame in your life? What was the guiltiest feeling in your life?" For sexual imagery, Shorr has varying degrees of evocative instructions, depending upon the tolerance of the client. "Look into a hole in the floor. What do you see?" There are more explicit imaginary situations, as the client becomes willing to deal with such conflicts. And, for the exploration of self-esteem: "Imagine yourself sitting on a throne." Or, for exploring relationships with a parent: "Imagine you are holding your father's face in your hands. What do you see? Say something to him. What does he say to you?"

Two of the chapters are transcripts of audio-taped interviews, and are helpful for those who would learn by following Dr. Shorr's thinking as he interacts verbally with his patients. Shorr suggests that clients listen to their audio-tapes after a period of time for a "picture" of where they have been, where they are now, and where they want to go. This is undoubtedly useful. Personally, I find that reviewing a patient's actual drawings is even more effective and, of course, more succinct.

Where the manuscripts of the two original books join together, the book becomes a little repetitious. Some skillful editing might have made the transition more graceful. However, repetition does help ideas stick. These are minor caviats. Taken as a whole, the book is a classic; it is a landmark in our understanding of the uses of imagery and psychotherapy. I highly recommend Psychotherapy Through Imagery, not only as a source book for stimulating imagery, but for its conceptual framework. If you take the time to digest and experience these "Psycho-Imagination" techniques for yourself and adapt them to your own art therapy practice, I predict that you and your clients will be richly rewarded.

A Review of

Spontaneous Painting and Modelling:
A Practical Approach in Therapy

(Out of Print)

Reviewer Edith Wallace, MD, PhD, is a Jungian Analyst who trained with C.G. Jung and has taught at the Jung Foundation and Institute in New York. She is also a prize-winning painter who conducts art workshops on "Opening Channels to the Creative."

"You love the earth and the earth loves you. And therefore the earth brings forth."
C.G. Jung. Two Essays in Analytical Psychology
(quoted by Lyddiatt, it could well be the motto for her book)

There are all too few books that describe a Jungian approach to art therapy. Jolande Jacobi’s Vom Bildereich der Seele (Imagery from the Depth of the Soul) has been translated but not published; the richness of the illustrations presumably make the publishing too expensive. Irene Champignowne’s excellent articles have not been collected in a book, although they could and should be. Seonaid Robertson’s Rosegarden and Labyrinth is once again available, a fine example of how a process for training and therapy can be started, carried out, researched, and applied—often via mythology. Margaret Frings-Keyes’ Inward Journey is also
valuable, but only touches on the Jungian approach and is more outward than inward. This is not a very big collection, so I was delighted when my attention was drawn to a book that was not familiar to me: E.M. Lyddia's *Spontaneous Painting and Modelling: A Practical Approach to Therapy*. However, the book is out of print, available in libraries only.

E.M. Lyddia is an English art therapist who, according to her testimony, worked in mental hospitals, mainly with inpatients. She carefully stays within the realm of allowing art to be the therapeutic medium, with as little interpretation or “interference” on her part as possible. She also works with the doctors, apparently in harmony, though there is at times little tolerance or understanding on their part. As one patient expressed it: “No, you and the doctor have different points of view; he clips my wings, you make me feel there is magic in the air, that anything might happen,” to which Lyddia's comment was: “The roles might have been reversed; the aim is to make sure the different points of view blend.”

I find that there can be not only magic in the air, but also poetry. Lyddia is aware of it and gives it space. She says, “Often what is desirable for an art department is reminiscent of the quiet pondering of adults who in solitude play in streams and wander on the seashore.” (p. 14) When L. describes her intent, she states: “We need an immediate practical method of helping those who are ill, or whose lives are unsatisfying, to get in touch with their own unconscious background, and painting can do this.” (p. 10) We know how important it is to live one’s creative potential; and this is not mere self-expression, nor is it sublimation. Lyddia makes clear and succinct statements on this subject, never losing her enthusiasm and astonishment about results achieved via the use of art media—she gives many examples from her own practice.

I read recently in the diary of a woman-writer and psychologist some words with which I believe Lyddia would agree: “I think people can't be reduced to psychological formulae, that only the artist can render human beings down to their last irrational elements.” The writer also says: “And then there is that ridiculous unease that I still can’t quite place, but that one day, I should think, might help me to write, if only I learn how to channel it properly.” This description of what goes on inside the artist-writer confirms the art therapist’s endeavour to use malaise or even deeper disturbances as a starting point in this form of therapy. As the author says, “This is how the inner life of ordinary people can show itself.” (p. 45)

I once studied with a Chinese woman painter who said to her students: “Don’t go to the canvas when you are happy—go when you are troubled, even desperate; but don’t go when you are tired, either.” In the patients’ terminology “spontaneous painting” as Lyddia calls it, is: “practical imagination” or “immediate thinking.”

“Even if it is an over-simplification it may sometimes be a useful plan to describe spontaneous painting in three stages: firstly, imaginative material is given form; secondly, it ‘works back’ on the maker and is experienced; and thirdly, one feels more alive. Often these stages blend.” (p. 6)

In another place she describes the creative process:

“People put on paint; paintings make themselves and these in their turn work back on their makers—if the paintings are given the chance. It is a perpetual surprise to see how quickly scribbles grow and change when valued by the painter as well as by the therapist. . . . This ‘thing’ moves and changes us, provided we feel and value it and cease to demand reasons. It is a spark of something greater than ourselves that can lead us on so long as we do not seek to cage it.” (p. 15)

This non-interpretative approach appeals greatly to me: I use art myself in this manner. We learned it from Jung and from his method which he called “Active Imagination.” Lyddia tried it out on herself and speaks of it as “something one can live by, and it can be developed until it can be trusted as something to depend upon.” (p. 139) Lyddia describes; she does not interpret. I found it fascinating how 12 inmates, who made a collective mural, produced something chaotic and not always intelligible to the “sane” mind that was, however, profoundly moving and meaningful to the patients. While, when Lyddia herself added something to the painting to tie things together, it was rejected. How little we know about this world of the so-called “insane.” Another observation of Lyddia’s concerning an Exhibition also reflects her humility:

“Work I had deliberately included to demonstrate ‘this is not art’ was pointed out as excellent art. One painting was particularly chosen to show how extremely ill and shattered the person was at the time of painting it; but artists particularly hailed this as an excellent and desirable picture. It seemed that the unconscious material set the onlookers talking. More than one critic said, ‘Are all these people artists or are all modern artists crazy?’ . . . Curiously enough, one of the first visitors said, ‘It is as if you have taken up the paving stones and shown what lies in the raw ground underneath.’ ” (p. 130)

One is reminded of the compensatory function of the unconscious, compensatory that is to conscious knowledge, attitude, and behavior with these mental patients, compensatory even to their so-called insanity. This in turn gave a validation to the irrational in the eyes of the patients which Lyddia sometimes could not see (she was maybe too close to it), while the visitors to the exhibit, without foreknowledge, saw it with unconditioned eyes.

Lyddia describes several aspects of the process of art therapy, for instance, working in and with a group in various ways: 1) individually—just everyone being together in the art room; 2) doing a collective mural; 3) having an exhibit and the working on putting it...
together, done by the patients under supervision. I am very much in sympathy with what the author describes. Trust in the constructive, creative aspect of the unconscious is the basis of her work, so that her intention can be to allow that which is below appearances to surface. According to her repeated joyful statements, the art medium brings it out without its being threatening. It is a gentle opener as well.

Lyddiatt leaves interpretation to the doctors, but she also takes a strong stand against all interpretation. If interpretation means analyzing and labelling, I am with her. However, she leaves out one step here: all articulation is consciousness. If this articulation means putting preconceived general notions on the image, then it is not only wrong but destructive. This would not be working in the spirit of Jung's approach to the unconscious. However, what has been produced needs to be looked at thoughtfully, and that means putting into words what we see, not only an emotional reaction. Both levels can meet here. It is true some paintings or other works of art say so much that they say enough. But as we live with them, and as more and more recognition occurs, we need to put such recognitions—which are revelations about ourselves and sometimes beyond ourselves—into words. If it is subtle enough, it may even come out in poetry. I do not forget that most of the time she works with mentally ill people where verbal articulation may not always be available, while articulation through images may be of the highest value. In such instances one cannot look for more. An illustration from my own hospital experience comes to mind: a young hebephrenic girl who would hardly ever talk drew a tree for me (I used the House—Tree—Person test at the time) from which she could not part, it meant so much to her, even though the tree was a dead tree and—interestingly enough—when I tried to make a copy for my records, my tree always came out alive!

I can also corroborate another observation of Lyddiatt's with an experience of my own. Lyddiatt says:

"In the acute stage of a psychotic illness, sometimes—not always—patients produce in their paintings a remarkable clarity and conviction. These pictures have a definite wholeness about them and from an artistic point of view they are not broken up. Whichever way the illness goes the ability to produce in this manner fades. When they have recovered, some patients value these pictures and others destroy them." (p. 131)

Once a young girl was admitted to a mental hospital (in which I worked) in a severely disturbed state. She had done lifeless paintings of a photographic nature which her parents proudly showed; they had no artistic value. During her stay in the hospital, in her disturbed condition she produced fine, somewhat abstract paintings full of life and beauty. There seems to be a place in the depth of the unconscious which is the source of creativity or total chaos. Lombroso knew about it: note the title of his major work—"Genius and Madness"—note many an artist's life story. Jung spoke of this place as one of greatest reward and greatest danger.

Since the book I am reviewing here is out of print, I have allowed more quotes than I would ordinarily use. I want to end with a longer quote, in order to present the flavor of Lyddiatt's spirit, her writing, and her basic philosophy.

"Art can work in the same way as active imagination, that is, the unconscious and the conscious come together in the creation of a symbol, and this is health giving and restoring. This is easy to say but a mystery when it occurs."

Often it is external facts and problems that people discuss with regard to spontaneous painting; but its essence concerns the inner, unknown domain of life. This is difficult to talk about in whatever strain and from whatever point of view. The feelings, the wonderings, the gleams of hope that get expressed when we start to paint or write, the moods of hopelessness, the unknown stuff of ourselves. These are expressions of the elements of our nature that have forever been cared for by ritual and religion. To allow them life and form, however simple, seems to be vitalizing. This is a fact I know when I do it and I do not know when I do not do it. How foolish we are to neglect our own source of well being." (p. 138)

"We all see things in different way and I was astonished to hear a psychiatrist tell the hospital staff that spontaneous painting was a modern form of prayer."

This activity is deep and mystificious because one is contacting something unknown and realizing something new that is both constant and changing. It is of immediate practical value and seems to be never-ending." (p. 139)
A Review of

To Be Remembered:
Art and the Older Adult
in Therapeutic Settings

Reviewer Ann Strosser, RN, MA, is Art Therapist, Geriatric Module, Creative and Expressive Arts Therapy Program, Western Psychiatric Institute and Clinic, University of Pittsburgh School of Medicine. She is also a consultant with an emphasis on work with women and the elderly.

I have a scene in my memory that I mentally view when I need to remember a touch of beauty... On a warm summer day I walk through a wooded area, and see a large, flat rock covered with hundreds of pale blue butterflies. After the initial moment of surprise and delight, I begin to wonder about them. Why are they gathered here? Where did they come from?

I had a similar feeling after reading To Be Remembered by Georgiana Jungels. I was delighted with it, and then began to wonder about the population represented. It is a small book which makes sensitive statements about the author-therapist, by telling about her interactions with some elderly people.

Examples are given of various materials, how they may be used, and specific responses that are elicited in the therapy process. Approximately half of the text is devoted to a description of the experiences of one patient.

These glimpses that are offered make me wonder why the book is written for those working with older persons, without defining approaches more specifically in terms of different segments of that population. Some of the advice about using adult language and techniques, for example, seems to make the assumption that all elderly people associate art with kindergarten, or that they need specific directions to enable them to use materials. With geriatrics, like any other identified population, there is a wide range of ages and abilities. There is perhaps a wider range in this group than in younger populations.

In spite of this small irritation, it is a small book to be remembered, especially if you are interested in working in art therapy with the elderly.
Film/Video Review

SUICIDE: THE ULTIMATE REJECTION

Videotape (¼", color, 58:52, 1982) Gregory Bernhardt, PhD and Susan Praeger, PhD, produced by Wright State University, Dayton, OH.

THE MAZE

Film (16mm, color/sound, 1970, 30 minutes), produced by Houghton Mifflin, Boston, MA.

Reviewer Georgiana Jungels, ATR, is in Art Therapy Studies, Art Education Department, State University College at Buffalo, New York.

There are approximately 22,000 to 27,000 suicides reported in the United States each year and suicidologists suggest that the actual number may be twice as high (Patterson, 1983 and Johnson, et al, 1980). The videotape SUICIDE: THE ULTIMATE REJECTION documents a group therapy session for the “survivors” of a suicide—the victim’s parents, children, or friends. As a silent member of this group session for 58 minutes, the viewer learns about the feelings of guilt, anger, grieving, confusion, isolation, and rejection commonly felt by the people close to someone who commits suicide. The message of a common pain is explained by each person: a “life defined by loss”... “a blow to ego... person preferred death over you.” As the members of the group talk about their own experiences, the viewer simultaneously learns about the members of the group and learns more about suicide prevention, the stages of grieving and support services for survivors. The viewer is also able to observe the clinical expertise of Drs. Bernhardt and Praeger as role model facilitators.

As we watch the members of the suicide survivors group discussing their experiences and feelings with each other, we begin to wonder about the person who committed suicide: what did they look like? how would they describe their feelings? what led to their decision to commit suicide? We begin to share the question that all of the survivors have asked over and over: Why?

In the classic film THE MAZE, we learn from the well-known Canadian artist William Kurelek more about one person’s imagery of depression and suicidal ideation as we see the graphic pictures of “himself as a lizard pinned to the ground with black crows waiting to make him their prey” and “cutting self right down to the bone.” In his autobiography (Kurelek, 1980) describes how he became discouraged by his lack of progress in treatment and “began for the first time to consider suicide.” In the film Kurelek recalls that he “just let things take their course” and decided “logically that suicide was the right thing to do” and that he had “this feeling of utter abandonment... complete and utter abandonment.”

The film THE MAZE tells the story of William Kurelek’s years of depression and depersonalization through the images he included in a large painting entitled “The Maze” that he made while he was hospitalized in England in the 50’s. In one of the film scenes, Kurelek says that the painting “The Maze” is “a story of my life in the sense that people tell stories to entertain their guests and trying to make them accept you... in this case I wanted to be accepted.” In his autobiography, Someone With Me (1980), Kurelek says:

The Maze was conceived as a kind of pictorial package of all my emotional problems in a single painting. This I contrived to do by fitting the various problems as little vignettes into the compartments of a maze inside my skull, which was cloven in half and lying open on the ground. The group is a wheat field in Manitoba. It was my firm belief that my problems stemmed from the main from my father’s farm failures, his habit of taking his frustrations out on me because I was so useless at farming. My helpless dependence on the doctors was represented symbolically by a white rat knotted up in the middle of the maze. I had picked up that idea from the two-unit course in psychology I took at the University of Manitoba... The anatomy of the middle of the skull I found in a detailed medical book in a Charing Cross Road book store during one of my leaves from the hospital. I had to use my imagination and memory for the rest of the pictures. An example is the dung heap seen through the nose of the skull. The implication of this Swiftian image is that the world is a dung heap and the human race a cloud of flies crawling over it to suck out a living.”

Dr. Morris Carstairs, who treated Kurelek during his hospitalization, wrote that in “The Maze”, the artist drew “his skull open to reveal a maze, enclosed with no escape” and revealing his preoccupied feelings with “his own tortured ruminations, his own nightmarish fantasies and his sense of being trapped and helpless.” (Kurelek, 1980)

Painting was an important part of Kurelek’s communication during treatment and in the early years of hospitalization he designed a self-help experiment to establish the image of what “the public often imagines a temperamental artist to be.” However, “no matter how intensely I painted out my accumulated store of fears, hates and disillusionments, they still remained with me as an immense psychological burden. (Kur-
When he was transferred to the Netherne Psychiatric Hospital, Kurelek painted a picture entitled “Help Me Please Help Me Please Help—Help.” This picture “showed me symbolically as a bird flying across the Atlantic with a bag around my head, the bag representing my depersonalization. Instead of untying it, a figure in a clinically white smock, resembling Dr. Carstairs, clips my wings, puts me in a cage and hanged it: by a hook on the White Cliffs of Dover.” (Kurelek, 1980) A later painting, “I Spit on Life” was given to one of his psychiatrists as a going-away gift before a suicide attempt. The artist/therapist, Edward Adamson reports:

“When I first saw William he was extremely withdrawn. His body was huddled up and he was nursing a small doll which he had made. He could hardly speak and it soon became obvious that he would not be able to mix with the others in the studio. He did try, but it was quite impossible. What he needed was to be entirely alone with his paints. Finally, I managed to find a small room for him which had previously been used as a linen store. I provided him with paint and materials and he began to work entirely on his own. I came and sat with him each day. He would not speak; he just pushed his latest painting in front of me. One of the first works he completed was entitled, ‘Where am I? Who am I? Why am I?’ It told me with an eloquence greater than words exactly how he felt: blind and lost on a windswept barren plain. The only vital aspects of the picture are the hands. They helped him paint his way to recovery... I am convinced that it was through painting that William found his own way back to health.” (Adamson, 1984)

The imagery in Kurelek’s paintings focuses on his personal symbols and the painting “The Maze” contains many of his memories of his childhood and early family life. The film “THE MAZE” intercuts scenes from Kurelek’s painting of “The Maze” with real life interviews and family discussions. The footage is edited to illustrate the complexity of what Whitaker (1982) calls the family system.

Kurelek’s sister Winnie remembers how “Mother and Dad were terribly worried about him” and his father remembers finding the drawings and paintings that were on the walls of his son’s room:

“I saw so many pictures on the walls...all kind of snakes and devils and priests and nurses and everything and so I was afraid to go there; so I saw, ‘Who draw all that? Who paint all that?’ William started looking down because he was afraid. William says ‘I do that’ and I say ‘don’t do that anymore because you’re wasting time and you wouldn’t be able to study.’ After that it was worse because he was still doing that and he had to hide from me.”

His mother recalls that “he was quiet... that what I think of him... that I should have looked at him more closely but I guess I didn’t understand much. I think when a child is quiet you have to be with him more and talk to him more; well I didn’t have the time; I had to work; oh, I don’t know what to say... I just feel bad about it all... when I look back I feel bad that I didn’t have the money then to take better care of him... and now our children... they would just listen to what the child said and I didn’t do that... I felt that that work had to be done... so for those things I feel sorry.” His father asks, “was that a good thing or a bad thing?” and his mother replies “I think they’re overdoing it and we were underdoing it.”

Over and over we see recorded in the sections of THE MAZE Kurelek’s memories of his childhood fears and adult terrors. We can observe the efforts of his whole family to understand his pain and illness. We can further understand his father’s own struggle as he “left the Old Country with hard feelings against his parents...” and his mother’s attempts to elicit sympathy for her husband by saying to her children “You mustn’t be annoyed with him. He’s trying so hard and things aren’t working out.” (Kurelek, 1980)

Things did eventually work out for William Kurelek and he wanted the film THE MAZE to be made so that his story could be told and he could “bear witness to the fact that people do recover from mental depression.” (Kurelek, 1973) When he rewrote his autobiography SOMEONE WITH ME in 1980, he said:

“I believe those who suffer mentally, both in hospital and out, will take hope from the fact that someone like themselves—a real person with a real name—did eventually recover. Not only is it possible for them to recover, it is possible to take advantage of and put to work the suffering they are going through.” (Kurelek, 1980)

The videotape SUICIDE: THE ULTIMATE REJECTION and the film THE MAZE are excellent references for increasing our understanding of the knowledge about suicide. This information is essential to Art Therapists because “frequently graphic representation of suicidal feelings led to greater insight than did words alone, particularly among depressed patients with difficulty in verbalizing feelings. On occasion, the first indication of a death-wish appeared in a picture.” (Wadason, 1975). Additional information about the pictorial clues to suicidal ideation/intent may be found in the writings of Wadason (1975, 1980), Landgarden (1981), Ogdon (1982) and Hammer (1978). Information about procedures for assessing suicidal ideation or intent may be found in the guidelines for the suicide assessment form (Johnson, et al. 1980), the SAD PERSONS Scale (Patterson, 1983), and the suicidal death prediction scales (Beck, Resnik, Lettieri. 1974).

The videotape, SUICIDE: THE ULTIMATE REJECTION, presents the work of Drs. Bernhardt and Praeger. It was produced and directed by James Craig and Annette Scarizzo in cooperation with the Wright State University College of Education and
Human Services, the School of Nursing, and the Suicide Prevention Center in Dayton, Ohio. This videotape of a suicide survivors group illustrates one community’s services and can serve as both an educational program and a model for programs in other communities because “The surviving experience can be an emotionally and physically difficult one. This is natural, but survivors have the right to feel and to have their feeling respected. Groups such as this one can be found in many suicide prevention centers... remember you don’t have to go it alone.”

The film THE MAZE is a classic film that was made in 1970 by Dr. James B. Maas, Robert Young and David Grubens and won the Red Ribbon Award for outstanding educational documentary in the 1972 American Film Festival. In an introduction to the 1973 edition of Kurelek’s autobiography, Dr. Maas says that he “wished to document the life story of a person my students could easily relate to; and, to make a film wherein the student is forced to think, being confronted with the realities of modern day psychiatry.”

The videotape SUICIDE: THE ULTIMATE REJECTION and the film THE MAZE make us think by presenting both the view of an individual who has been suicidal and the surviving family and friends of a suicide victim. One pain is more focused on depression and hopelessness; the other pain is dominated by hurt and rejection. The members of the suicide survivors group and the Kurelek family have shared their feelings of fear and guilt and confusion, and support through the media of a film and a videotape so that we can all understand more about depression and suicide and illness and the power of therapeutic communication in images and words.

Bibliography

Notes

1) The imagery in William Kurelek’s painting “The Maze” and his other paintings made during his periods of depression and suicidal states include many of the pictorial indicators identified by Art Therapists as possible early clues of suicidal ideation—the spiral, the loop, the slash, the blackbirds, the dead tree, the path going nowhere. His paintings also contain many other pictorial elements and are pictures made by a skilled artist. Further study is needed in the area of suicidal pictorial indicators.

2) Slides of William Kurelek’s imagery in “The Maze” can be obtained from McGraw Hill; several of the paintings he made during his hospitalization in England are included in the Adamson Collection/England; his paintings are handled by the Isaacs Gallery Ltd. in Toronto.

3) The film THE MAZE can be rented from film libraries; the videotape, SUICIDE: THE ULTIMATE REJECTION is available from Wright State University, Dayton, Ohio.

4) I am grateful to Patricia Brown for her assistance in researching material on William Kurelek and to Jill Fondiller for her assistance in researching material on suicide.
“Highly recommended.”

By Judith A. Rubin
Child Art Therapy
Second Edition

Expert therapist Judith Rubin shows you how to help your students use art to achieve important goals—self-expression, increased awareness, and emotional control. She offers sound advice on how to interpret children’s needs from their art, when to intervene in the creative process, how to get your students to respond more easily, and more.

BRIEF COMMUNICATIONS

This column provides a forum for information exchange among clinicians and educators. Items relevant to research and to programmatic, historical, or clinical developments may be submitted. Contributions should be sent to Brief Communications, ART THERAPY, AATA, 11800 Sunrise Valley Drive, Suite 808, Reston, VA 22091.

AATA’S New Executive Director

As of May 1984, the American Art Therapy Association, Inc. transferred management of association business from the National Office in Alexandria, Virginia to The Cate Corporation, an association management firm in Reston, Virginia. With the change in management, AATA underwent both a staff change and an office move.

Richelle Grapsy is an employee of The Cate Corporation and serves as AATA’s newly appointed Executive Director. She graduated from The Catholic University of America with a degree in Music Therapy and Piano. While working in the creative arts therapy field, she worked with geriatric patients and handicapped children.

Before joining The Cate Corporation, Ms. Grapsy was awarded an Arts Management Fellowship with the National Endowment for the Arts where she conducted a study of the effectiveness of education programs administered by symphony orchestras throughout the United States. At the close of the Fellowship, Ms. Grapsy continued with the NEA Music Program performing special assignments which included service as Interim Chorus Program Specialist and coordination of a joint Special Constituencies/Orchestra review panel. This panel awarded grants to orchestras conducting model education and outreach programs aimed at special constituencies.

Ms. Grapsy has also held positions in public relations and meeting planning with the Maryland Summer Institute for the Creative and Performing Arts and the American Symphony Orchestra League. She is currently an MBA candidate at George Mason University, and is specializing in non-profit organizations.

You can contact Ms. Grapsy at AATA’s new National Office:

The current issue of *Art Therapy* brings to the reader diverse facets of art therapy: articles, a position paper, a conference overview and a major artist’s work (reproduction), as well as regular features—book and film reviews, Viewpoints and Brief Communications. Our pertinent and timely articles are on “Object Relations Theory and the Language of Art,” including case overviews, and “The Book About Daddy Dying” that illustrates a preventive art therapy technique appropriate for working with families in trauma following the loss of a family member.

The Governmental Affairs Committee of A.A.T.A. has a subcommittee whose purpose is to focus on art therapy in schools. This subcommittee, for the past number of years, has dealt with issues emphasizing art therapy and education, and during the past two years has brought to fruition a position statement. This statement was presented to the Executive Board of A.A.T.A. for its consideration, and it was subsequently adopted by the Board in October, 1984. The position paper, “Art Therapy in the Schools,” is presented in this issue for your consideration and comments. Many thanks must be given to the committee members for their long and arduous work in preparing this position statement.

The recent A.A.T.A. Conference was an exciting and productive one. Praise is given to the many personnel and committees responsible for organizing the Conference, and for the continued work that was completed during the full run of the Conference. Because the proceedings from A.A.T.A. Conferences are currently not being published, the Editorial Board of *Art Therapy*, together with consultants to the Journal, suggested that the Conference overview might be of interest to the readers, and to persons who did not attend the Conference as well as those who did. Therefore, in this issue you will find an overview of the pre- and post-Conference courses, papers, panels, workshops, open forums, general sessions, exhibits, special meetings and events, the film festival (including the grand prize and merit awards), and other highlights. The descriptions appear as each was printed in the Conference program; no attempt was made to edit or change any of the written information submitted by the presenters. However, addresses are included so that readers may contact the presenter(s) for additional information regarding the particular content, method or format. It should be noted that *Art Therapy* will continue to publish a Conference overview in each yearly post-Conference issue.

One of the highlights of the recent Conference in Washington, D.C., was a museum tour to the Corcoran Gallery of Art where members were treated to a sensitive and powerful retrospective exhibit of the work of Robert Motherwell, a dominant figure in American art. With consent of the Corcoran Gallery, we are pleased to present in this issue a reproduction of a Robert Motherwell work.

At the Executive Board meeting of the American Art Therapy Association, October, 1984, approval was given to publish *Art Therapy* three times (instead of two) for the coming year. As of now, we are moving ahead with this plan, and a timeline is being formulated that will permit a changeover to March, June and October issues.

A suggestion was made recently by an A.A.T.A. member that the membership should be encouraged to submit statements about our profession for the purpose of collecting thoughts, sharing the information by making definitive statements for deliberation and discussion. Questions to consider are: What is art therapy now as compared to ten or twenty years ago? Where do we want to be ten or twenty years from now? Where do we see drastic changes currently occurring? What changes might be projected in the near and distant future? We invite you to communicate with us on these issues. Your statements might be submitted in an article format, or perhaps be specifically planned for the “Viewpoints” section. I encourage each of you to share your thoughts and ideas on these and other issues that have importance for our profession.

An Innovative Overview of the Essential Components in the Delivery of Services through Art Therapy
- in any setting
- with all ages
- in any modality

In THE ART OF ART THERAPY, Dr. Judith Rubin shows "how to think about doing" art therapy, rather than "how to do" art therapy. She presents the general "understandings" necessary for effective art therapy with any age level, in any setting, and in any modality, as well as the specific knowledge essential for work with particular populations in different contexts. It will be useful not only to art therapists but also to any mental health professional incorporating art into clinical work. "I expect this book to be an excellent addition to public libraries and private collections as a resource to practitioners of art therapy."

—IRENE JAKAB, M.D., PH.D., Professor of Psychiatry, U. of Pittsburgh, School of Medicine

March, 1985, ART THERAPY 3
"The Book About Daddy Dying":
A Preventive Art Therapy Technique to Help Families Deal with the Death of a Family Member

Maxine Junge, MSW, LCSW, ATR

Maxine Junge, MSW, LCSW, ATR is Assistant Professor and Associate Director, Graduate Department of Clinical Art Therapy, Loyola Marymount University, Loyola Blvd. at 80th Street, Los Angeles, CA 90045. Parts of this paper in a different form were presented at the 1983 Conference of the American Art Therapy Association.

This paper presents a clinical art therapy technique to help a family cope with the death of one of its members. It describes the making of a book in which all the family participates. A theoretical rationale about bereavement is proposed and two case examples described. The approach of the "Book About Dying" is presented as a technique and model for dealing with the attendant feelings of a death in the family, with perhaps its most important benefit to the family being its preventive mental health function. Also, the book's potential as a vehicle for family ritual to aid in the transition from one life stage to another is discussed.

Introduction and Theoretical Rationale

In the last ten years or so, we have experienced a virtual cultural revolution in our attitudes toward death and its vicissitudes with a resulting proliferation of thought and literature on death and dying. Out of the pioneering work of Kubler-Ross (1969) and others we have gained important new insights in many of these areas including that of the impact of death on those left behind.

The importance of the expression of a mourning process and its role in the successful adaptation in later life to separations and losses, has been emphasized in the psychological literature starting with Freud's seminal work, "Mourning and Melancholia," (1917). Further, it is well-known that failure to mourn or inadequate mourning by a parent may result in various, possible pathological problems in parent-child relationships. Clearly, problems may not arise in all cases of death in a family nor may there be resultant pathology or symptomatology, as a reaction to any crisis is strongly influenced by past and present life experiences, ego strengths and coping mechanisms.

However, over the years, the consistent and increasing presence in my clinical practice of families who need help in dealing with and communicating about the death of a family member leads me to the notion that a reconsideration of the issues involved, as well as the development of new effective interventions and strategies to deal with loss, are in order.

Studies on the level of stress' effect on the development of illness have found that the "death of a spouse is the life event associated with the greatest degree of stress" (Holmes and Masuda, 1973). The parent whose spouse had died suddenly needs to cope with changed financial, emotional and domestic roles and responsibilities and an uncertain future at a time when she or he is most unable. Questions from children may not be welcome nor answered as to the facts of the death, cremation or burial, etc.

Sometimes the circumstances of death, such as a violent one or a suicide, may be cause for shame and may make the subject of the death taboo. Or a surviving parent may want to spare the children the pain of loss and may not share their own feelings with them. A parent overwhelmed with his or her own feelings of sadness, abandonment and confusion, finds it difficult at best to help the children effectively grieve. In any case, the surviving parent's silence conveys to the children that the death is secret and frightening and cannot be openly discussed. After the intense reaction of the first few days or weeks, the loss may be covered over and becomes for the family a taboo subject, a hidden and uncommunicated reservoir of pain and secrecy which can lead to the development of grave family dysfunction and psychopathology.

The reaction of the child, or children, to a death in the family depends on many factors including age, emotional and cognitive development and the emotional closeness to the dead family member. The death may result in loss of residence or change in schools. The child may not only have to cope with the primary loss, but also with his or her feelings of distance from and abandonment by the surviving parent who, because of the situations noted above, or others, cannot be emotionally available and withdraws from the child. Thus the child experiences a second, perhaps even more devastating, loss and has no avenue of communication with which to question or understand. Family therapist Murray Bowen (1976) and others have found that "the most influential factor in the child's reaction to the loss of the parent appears to be the ability of the remaining parent to not allow his or her emotions to create distance from the child."

Herz in Carter and McGoldrick (1980) cites four factors which she feels affect a family's reactions and adjustments to a
death. These are: (1) the timing of the death in the life cycle of the family; (2) the nature of the death (is it expected or unexpected? Was there a long term of caring for the dying family member or was it a sudden death?); (3) the family position of the dying or dead family member and the emotional significance to the family; and (4) the openness of the family system.

Herz feels that difficulties arise from a lack of openness in the family system and goes on to define openness as the "ability of each family member to stay nonreactive to the emotional intensity in the system and to be able to communicate thoughts and feelings to others without expecting others to act on them."

The book described in this paper is seen as a technique to permit family expression and communication and to prevent the premature closing down of the family system.

Case Examples

The following two case examples show the process of making a book with two families. The first example describes the development of the book idea because of the clinical needs of a particular family. It describes an intact family with two young children undergoing the death of the father by suicide. The second case example concerns a divorced family, in which the 32-year-old father died of a melanoma and is intended to underscore the flexibility of the book technique in its adaptability to use with various family constellations.

Case 1: The F. Family

Ms. F. came to the mental health clinic with her two young sons, Jimmy, age four and Mark, age seven, two months after the suicide of her husband, Mr. F., a 37-year-old engineer, who had a history of depression. One month before his death he had been a patient in a psychiatric hospital where he was thought to be improved and no longer suicidal. Ms. F. had disagreed with her husband's psychiatrist's assessment and asked that he be kept for a longer time at the hospital. This was refused. Three days after his release, Mr. F. ingested an overdose of medication and died.

As presenting problems at the clinic, Ms. F. cited intense and ongoing depression in herself. She felt overcome with guilt that she had been unable to convince her husband's doctors of the seriousness of the situation, as well as intense anger at the mental health system. Both sons had been noted by their teachers as being pervasively sad and unable to concentrate on their school work.

The F. family was assigned for therapy to a staff psychologist who saw them for four sessions, which she felt were of little help. Mother could do little other than cry through the sessions, and said she also cried at home whenever she thought of her husband. She was preoccupied with the loss of her husband and seemed unable to disconnect from her constant ruminations in order to focus on her two sons and their grief. In the sessions, the psychologist observed that the boys made occasional attempts to gain their mother's attention, but seemed to grow increasingly detached and withdrawn at her lack of response. The psychologist contacted me in her hope that a family art therapy task might serve to focus the family in a more productive way.

As I thought about the F. family system, it seemed to me that something more than the usual art therapy techniques were needed to symbolically contain all the overwhelming thoughts and feelings evoked by the father's suicide. Although there was clearly an overriding need for catharsis to allow for acceptance and support. Ms. F.'s inability to control her feelings in any way had caused her to withdraw from her sons and they from her. Using a structural theoretical framework, it seemed necessary to help Ms. F., if possible, to re-connect with her sons, so that she could begin to help them with their loss, as well as perhaps gain some sustenance from them. Appropriate defenses would be supported and confrontation of fragile ones would be avoided. As I look back, however, the book idea may have emerged because I knew education was highly valued in this family and Mr. F. had read nightly to his sons.

The psychologist and I met with the family, to suggest that they make a book together about Mr. F. This would include their memories of him, both good and bad, and events together as a family before his death, their questions (and answers) about the death and, of course, all their feelings. I asked the family to bring in photographs of Mr. F. to include.

We met weekly for six weeks and worked together in the sessions on the book. During our work together Ms. F. became increasingly capable of concentrating and helping her sons to do so. Thus her nurturance of them resumed. The distancing device of making the book and the focus on its pages seemed to cause a damming up of the previous spilling-over of feelings in mother, giving her more control and more comfort, thus allowing more room for her sons' feelings. Sometimes the family worked individually and sometimes together on one piece of paper around a central theme. The separate pages remained in a folder with the therapists each week and we told the F. family that when we finished the book, we would get it bound for them to take home.

In the sessions, family communication was emphasized and questions were asked and answered and re-asked and answered again. This was my first experience in working with a very young child undergoing the experience of the death of a parent, and although many developmentists tend to emphasize the young child's lack of conceptual ability and thus the inability to understand, I found that Jimmy was trying to understand. His repeated questions, as well as his ongoing involvement in the work of the book, convinced me of this. With Jimmy I came to believe that the young child must find some way to make sense out of his dramatically changed world in order to be able to go on.

At the end of the six weeks, family and therapists agreed that the book seemed finished. (The six weeks were not preplanned, and we would have continued with the many chapters as long as this seemed useful.) The therapists
agreed to "get the book put together" and we arranged a last meeting. We mounted the newsprint pages on sturdier paper and put four notebook rings through the pages to keep them firmly together. At the last meeting, the family talked about its feelings of doing the book and both family and therapists expressed that they had shared a difficult but special experience together. We recommended that the book be kept in a safe place at home where any family member could read it at will, but that the book be read together by all three at least once a week.

One year later, Ms. F. called at the insistence of Jimmy who had told her "the book is falling apart and needs to go back to the clinic." We asked Ms. F. to bring the boys and the book in for a re-evaluation (what I like to call "a 2,000 mile check-up").

Indeed, the book was falling apart literally. We wondered was the family also? The family told us that they had read the book together almost every night for the year. Ms. F. stated that the book had given the family an avenue for communicating about Mr. F. and a vehicle whereby they could continue the expression of feelings of all kinds. Each family member had individually read the book as needed in her or his own way and it was the only thing in the house consistently returned to its "safe place" on the shelf.

In our re-evaluation sessions, we created some new pages for the book as to what had been happening to the family in the year since Mr. F.'s death. Ms. F. was now attending a widows' group. She had started graduate school with a goal of a career as a mathematics teacher. She had very recently had a few dates and in the month before the call to the clinic, had spent a weekend away skiing with friends. The boys had remained with a baby sitter for the weekend. Jimmy and Mark had settled down in school and were doing well except for occasional spells of "moodiness." Mark still tended to be overaggressive at times and Jimmy had occasional nights when he wet his bed. But generally all family members seemed to be progressing appropriately in their mourning process. Jimmy's urging that the F.'s come to the clinic was seen as an anniversary reaction to Mr. F.'s death, probably exacerbated by Ms. F.'s trip away.

"Sometimes the circumstances of death, such as a violent one or a suicide, may be cause for shame and may make the subject of the death taboo."

We took the book and reinforced the binding with notebook "reinforcers" and sent the book and family home with the recommendation that they call us as needed.

At the two-year point, we received no phone call, so we decided to follow up ourselves. Ms. F. reported that all was well. She was still having trouble adjusting to her role change as a single mother and felt overwhelmed and harried at times. She had finished her graduate work, acquired a teaching position which was very rewarding to her, was still attending the widows' group, and had recently begun a relationship that she said, "might become very important." Both boys were doing well at school and with friends. Mark, the older, had begun to successfully stay overnight at the houses of his friends. Jimmy, though invited, was not ready for this yet, but his incidences of bed wetting were down to practically nothing. Both boys had big brothers through the Big Brother's organization.

Ms. F. said that in the second year, they had continued to read the book together though not as often, and that she would sometimes find one or the other of the boys, usually Mark, engrossed in it. She said that they sometimes still cried when they read the book, but that the pain had diminished. The book stayed in its safe place on the shelf for whichever family member who might need it. Ms. F. expressed her gratitude for the book and later wrote the Director of the Clinic a letter expressing her thanks.

Case 2: The H. Family

The family was being seen in treatment for problems of stress and family disruption at the time of the divorced 32-year-old father's death from a malignant melanoma after a three-year illness. The family consisted of Ms. H., a single mother, with two daughters, Ruthie age five, and Sharon age seven. Also attending meetings periodically was Sam, Ms. H.'s live-in boyfriend. Because of the divorce (which had occurred four years previously), this book was viewed as "belonging to the two children." However, mother was included with Ruthie and Sharon in almost every session as a "therapeutic ally" in an attempt to help her help her children with their feelings of loss, and in an effort to increase family cohesiveness.

Ms. H., as a self-supporting single mother with two young children, typically experienced role overload and the family style tended toward chaos. However, Mr. and Ms. H., after the divorce, when their daughters were very young, had managed to remain on good terms and the girls had regular contact with their father. Ms. H. had contributed financially to help her ex-husband with medical bills and Mr. H. had been included in several therapy sessions with his daughter. Mr. H.'s death was unexpected in spite of his long illness and there had been little anticipatory grieving.

We met in the therapy room to begin the book soon after the family's brief memorial service, and the making of it continued for slightly more than three months. Ruthie and Sharon were invited to bring in photographs to include and simple materials such as markers, crayons, and collage pictures were offered. At times the therapist suggested specific directives. At other times free drawing was encouraged, as themes emerged indirectly. Verbal exploration, discussion and writing on the artwork were encouraged to extend communication. At times, Ruthie and Sharon directed me or their mother what to put on the picture and we wrote it for them.

The weekly therapy sessions were often attended by Ms. H.; occasionally the two girls met alone with the therapist to allow freedom for information and feelings that might be difficult for the children to say in front of their mother. Communication was enhanced when the girls shared these pages with their mother.

The artwork centered around typical issues of grieving, separation and loss.
The following are chronological, though not consecutive, examples of artwork from beginning, middle and ending phases of the book.

Figure 1 shows the front cover of the book finished and bound by the therapist upon completion. Then the book began with a page of Sharon’s (age 7) writing:

Daddy died Sunday. He was lying sick in bed when all of a sudden the door sprung open and two little girls came in. The nurse had to wake him up because right before they came, daddy had just had a shot. And right after they left he died.

Figures 2 and 3 by Sharon, show the visit to the funeral home and the cremation. Pages in the first section of the book, along with feelings of grief, were often informational in tone. In the middle phase of the book more ambivalent expressions prevailed. Figure 4 shows pleasant memories of past times, together with loss. Also in this section appropriate underlying anger surfaced.

In Figure 5 “Daddy Lying Sick in Bed,” a spontaneous drawing, Ruthie showed her vivid and mixed feelings. She told me about the picture and I wrote the words on another sheet of paper for her:

Daddy’s in pain. He feels sad and all Daddy said when we went to visit him was “Hi L,” cause I’m my Grandpa and he is very tall. I wished he would say “Hi” to me. I felt mad that he didn’t say “Hi” to me because I wasn’t tall enough. I held his hand. My grandmother kissed him. I wanted to kiss him but right after she kissed him it was time to go because he fell back to sleep. I felt mad that I didn’t get to kiss him. But there was another reason I didn’t get to kiss him. I was scared cause he looked scary. He had his mouth open and he was breathing hard and he was moaning.

Sharon’s drawing of the aggressive “Packman (sic) Eating Daddy’s Dreams” (Figure 6) depicted her normal rage metaphorically. In the last month of making the book, Ruthie expressed a reunion fantasy and a wish to have a tangible part of her father (an ash) in Figure 7. Figure 8, done by Sharon in a last session, “Daddy is as nice as a butterfly” shows Daddy floating away, smaller than the butterflies and in the distant top corner.

In her drawing from the end of the book, Sharon pictures one of her Father’s
drawings. During his illness, Mr. H. had been involved in a holistic cancer program which utilized techniques of guided imagery and drawing. After his death, the girls had asked to have his drawings and were given them. Both children often mentioned his drawings during the course of our therapy time, as if their father’s imagery on paper, now in their possession, had provided some tangible evidence of his presence in their lives. They often drew "his pictures" in their book.

For the last page of "The Book About Daddy Dying," Ruthie and Sharon each chose to render one of their father’s drawings. Sharon illustrated three arches (Figure 9) with a hand-written "I love you Daddy" covered by a paper flap (perhaps representing their lost father, the shape resembled a tombstone). Over the arches is a vibrant red sun setting into dark blue clouds. The sun has a few spikey points on the bottom reminiscent of the spikes of hair, typical of the girls’ portrayals of their father’s head, bald from chemotherapy. It is my speculation that the three arches represent the remaining family group with Mr. H. as the setting sun in the distance.

In the last session, we took the calendar and counted up how long it had been since the day of Mr. H.’s death. The girls wrote: "Daddy died May 3, 1982, on Sunday, 14 weeks and two days, three months and a week, 100 days ago today," and the book was finished.

Approximately a year later, I met Sharon and Ruthie in the waiting room where they were waiting for their mother, who was now participating in a group with a colleague in the office. Sharon’s first words to me were "We still have the book."

Conclusion

Each life transition in the developmental phases of a family requires more or less drastic changes by all family members and death demands a uniquely difficult adjustment. The art therapy technique described, based on a family systems approach, has as its goal the openness and flexibility of the system at a time of great family crisis and change. The book is seen as preventive as well as ameliorating in that grief is incompletely
resolved by the premature closure of the system, family dysfunction and the development of psychopathology can result. This therapist believes that a book such as this can be an instrument of important family ritual to aid in a successful transition.

Grief rituals such as traditional funerals require the expression of different emotional reactions within a context and thereby can help stimulation of both the mourning process and the restoration of normal life. In making the book, family members are given permission to express, communicate and work on the many feelings of grief within the safety of the therapeutic milieu.

Rituals consist of symbolic acts and often objects with symbolic value may be used. Being able to work with the symbolic act or object implies both a focus and a certain amount of distance and can free up the investment of psychic energy for real life activities. A book such as that described is a permanent, stable container of memories, feelings and of a history. Like a life it has a beginning and an end and thus can provide a symbolic way of working on the sense of loss caused by a death. This may be particularly important in helping young children gain some level of understanding and comfort.

“Each life transition in the developmental phases of a family requires more or less drastic changes by all family members and death demands a uniquely difficult adjustment.”

We began and ended our sessions. We began to make and finished making the book’s pages. We began and ended reading the book and we began and ended the first year and continued on to the next. And throughout, the book remains in a “safe place” on the shelf to remind us of our beginnings and our endings and our constancy in the face of

MANDALA ASSESSMENT SEMINAR SCHEDULED JUNE 1985

The CLINIC FOR HUMAN DEVELOPMENT, Clearwater, Florida, will sponsor a 30-hour course in MANDALA ASSESSMENT. The instructor will be Joan Kellogg, MA, ATR. A Certificate of Completion will be awarded by MARI, Mandala Assessment and Research Institute, to participants. Part #1 and Part #2 will be held on two consecutive weekends in June; attendees may elect to take one or both parts. Dates: June 21, 22, 23 and June 28, 29, 30. Course will be repeated in September, 1985. For information write to Clinic for Human Development, 925 Lakeview Rd., Clearwater, FL 33516, Attention Ms. Sally Meadows. Phone numbers: (813) 447-7606 or (813) 581-0786. Certificate course fee: $300. For information on on-going evening courses write MARI, P.O. Box 14009, Clearwater, FL 34279-4009, or call (813) 796-1341.

A Landmark Publication for Every Therapist
The Psychosocial Therapies: Part II of The Psychiatric Therapies
The American Psychiatric Association Commission on Psychiatric Therapies
Chaired by Toksoz Byram Karasu, M.D.
Five years in the making, this landmark reference objectively examines the major psychosocial therapies and places them in perspective. Under the careful guidance and scrutiny of the Commission, the presentation of each therapy includes historical background, basic theoretical issues, strategies and techniques, indications and limitations, and developmental age-related issues. This book will be a guide and classical textbook for all clinicians for years to come.

Contents of The Psychosocial Therapies:
- Psychoanalysis and Individual Psychotherapy • Disorder Specific-Manual Based Psychotherapies • Group Therapy
- Family Therapy • Behavior Therapy • Experiential, Inspirational, Cognitive/Emotive, and Other Therapies
- Biofeedback • Multidimensional Therapy • Nursery Schools, Children and Adolescents • Therapies for Psychosocial Dysfunction • Hypnosis
- Narcosisynthesis • Creative Therapies • Psychodrama
- Occupational Therapy • Self-Help Groups • Psychotherapy Outcome Research.

The Psychiatric Therapies:
The Somatic Therapies:
Part I of The Psychiatric Therapies
The Psychosocial Therapies:
Part II of The Psychiatric Therapies

them. It is a book made by those still living and is representative of the acknowledgement and permanancy of important feelings and memories and that those we love live on in our memories and feelings. This acknowledgement can be crucial in the process of saying goodbye, for it is the beginning of letting go and of going on.

Bibliography

Object Relations Theory and the Language of Art

Tools for Treatment of the Borderline Patient

Ruth Obernbreit, MPS, ATR

Ruth Obernbreit, MPS, ATR is Assistant Professor, Adjunct Faculty, Graduate Art Department, College of New Rochelle, New Rochelle, New York, and Art Therapist, Long Island Jewish/Hillside Medical Center, New Hyde Park, New York.

With the advent of Object Relations Theory, art therapists have a new framework relevant to their work. This approach is particularly useful in understanding the patient whose unresolved issues involving separation and individuation result in borderline pathology. Borderline patients are often drawn to creative endeavors, and in clinical situations are referred to art therapy so that this strength can be tapped and used to expedite treatment. The art process as experienced by the borderline individuals parallels their internal dilemmas. D.W. Winnicott's concept of the transitional object phenomena is of importance for understanding this type of patient. The borderline's inclinations toward the creative process can be correlated with developmental arrest, pointing to the stage when transitional experiences did not lead to separation. The art provides a vehicle to remaster this deficit. The language of art, and the many methods through which art is taught can address these intrapsychic phenomena. The art therapist can transpose (object relations oriented) clinical understanding into elements crucial to the making of art and prescribe them as borderline patients experience their disabling condition in art therapy treatment. These elements are claimed to be restorative to the patients fragmented ego. The paper supports specific art therapy techniques correlated with theory from the school of object relations.

Introduction

"...It's an excellent shoulder," remarked the instructor to the art student, "but it's not what is out there." The artist's interpretation of the form had lacked contact with the model being drawn. The instructor witnessed this falseness and confronted the student in terms of the art. "Look at the shoulder," he suggested, "and find a line that is true."

I was a student in a life drawing class when I overheard these words. At that time, as an art therapist I worked with hospitalized patients who were diagnosed as borderline. They were a group that mystified me. Bright, engaging, verbal, and displaying no psychotic features, these patients were initially responsive to art therapy. These individuals seemed to like art and more often than not expressed themselves with great intensity and insight. (Figures 1 & 2) These attributes alone would not prove to be the basis of a working therapeutic relationship. I was perplexed by this group that was drawn to the arts but seemed unable to use the art experience as a restorative tool.

To enhance my clinical understanding, I read works by leading object relations theorists. I found the works of Winnicott,

Figure 1—"Rebirth"
"It became clear that artistic perception and the ability to carry it out had much to do with one's internalized relations to objects."

process. Being able to understand art vis-à-vis an object relations framework led to therapeutic techniques particularly applicable to the borderline patient.

The Borderline Dilemma

Borderline patients represent a unique clinical picture because they exhibit characteristics similar to both neurotics and psychotics. Unlike psychotics, they maintain reality testing, but have not achieved the neurotic's integrated self identity [Kernberg, 1975]. The adult borderline is psychologically arrested in the developmental realm of toddlerhood. One can say that they have one foot in the world and one foot in the womb, thus explaining their capacity to function on disparate levels. In an attempt to maintain the balance between symbiosis and separation, the borderline's relationships are marked by ambivalence. On becoming close to someone they fear

What this meant in terms of my patients was that I found a way to transform the problems patients were having with their work into concepts germane to object relations, and conversely could easily see how problems with the self were manifested in terms of the creative

Figure 2—"About Trying to Touch"

Guntrip, Kernberg and Horner to be diverse and interesting, but techniques regarding the application of the theory within a framework of art therapy still eluded me.

The drawing instructor spoke to us using speech that was a type of shorthand. Things "worked" or they "didn't work." There was a great deal of discussion about form and space. Talking to the woman beside me, the instructor spoke about how her narcissism was causing her to distort her perceptions, and as a result, her picture was out of control. He did not use these words, of course; he spoke to her in the language of art but being influenced by recent studies I found myself translating his comments in a therapeutic context. In being able to translate problems into another "language," one could understand that what was addressed was crucial to both the artist and the clinician. For example, elements of projection, internalization, narcissism: how much of the model can one let in, and how much of one really "reaches out" to grasp the essence of something outside oneself? (Figures 3 & 4) It became clear that artistic perception and the ability to carry it out had much to do with one's internalized relations to objects. I began to eavesdrop on discussions that were basically concerned with the self and reality and the intricate process whereby they meet on paper.

Figure 3—"How much of one really reaches out to grasp the essence of something outside oneself?"

This portrait done by a patient of another member of the art therapy group resembles the creator far more than the subject. The portrait was made with construction paper cutouts.

Figure 4—In this portrait the creator was able to capture something of the subject.
merging, but when there is too much distance, they will experience a sense of abandonment. Because their object consistency and self identity are not developed, the self oscillates back and forth and their ambivalence about separation becomes part of a life pattern. This life position is confronted when borderline individuals become involved in making art.

The borderline individual is seemingly receptive to art media but often approaches the task with a grandiosity which only feebly covers their extreme vulnerability. A better appreciation of the nuances of this psychic state might be had by reviewing the basic tenets of Object Relations Theory.

Object Relations Theory

- The term “object” in object relations theory is borrowed from philosophy and when used philosophically refers to the “other,” that which is not the self.
- Object relations theorists uphold the principle that human beings are epigenetically programmed to respond to other human beings. The psyche internally organizes because of this emotional contact. This theory differs from the classical Freudian position which postulates character development as deriving from the regulation of instinctual drives.
- Object relations theorists see human development occurring as a result of internalized early mother-child relationships. At birth, the infant is in a state of normal autism; he/she is unrelated (Mahler, 1968). In infancy, he/she forms an attachment to the mother, thereby contributing to a mutually satisfying symbiosis. The infant is dependent on the mother to organize his/her environment and takes in sufficient emotional supplies in order to reduce frustration and achieve a sense of security. The mother cannot always be physically and emotionally available to meet the infant’s needs, and thus emerges the inevitability of object loss.
- In response to the lost object the baby invents a substitute force to fill its needs and creates an affectual and abstract replacement. With a need to replace the mothering figure, the child turns to actual objects. A blanket, a stuffed teddy bear or a piece of mother’s clothing is imbued with emotional significance. The object does not have to be of particular substance. It can be a crack in the ceiling or a familiar corner in the room where the eyes can comfortably rest (Grolnick et al. 1978). An emotional exchange ensues and the baby receives the comfort from a relationship that he/she initiates. This activity is an example of projection.
- These new cognitive experiences and the attachment to an object are said to be “transitional” because they serve as mediators between the inner psyche and the outside world. The infant negotiates these two realities by adapting to loss through creation (Winnicott, 1953).
- The infant, in being able to play in this way, now has some flexible control between fact and fantasy, being alone and not being alone. Because of this new cognitive capacity, the baby can safely practice separating from mother. In doing so, the development of an emotionally independent self is initiated.
- The emergent self is elaborated in terms of the concepts of the true self and the false self (Winnicott, 1960). The true self is the basic core of our being. It forms the nucleus for an organized self-identity. The false self is the part of the personality that develops when the core being is not accepted by the environment, i.e. the mother may respond to the baby in accordance with her own needs and not those expressed by the infant. Consequently, the false self organizes to conform to mother’s desire and if successful, hides the true self.

"... At the earliest stage the True Self is the theoretical position from which come the spontaneous gesture and the personal idea. The spontaneous gesture is the True Self in action. Only the True Self can be creative and only the True Self can feel real..." (Winnicott, 1965 p. 148)

The Borderline and the Art Therapy Milieu

In the formative early years, emotional independence for the borderline was not fostered; a “true” self was not supported. Instead, symbiotic yearnings were rewarded sufficiently to thwart the completion of the transitional phase of development normally leading to a separate self-identity. The borderline thus has a chronic need to create a transitional object, a substitute for attachment. Due to a vague and shifting constellation of a self, borderlines experience difficulty obtaining the relief and creative satisfaction that transitional phenomena have to offer, yet this sphere holds attraction for such a population. Unlike the artist who, as it will be later explained, makes use of the transitional arena to refurbish, the borderline has never left this transitional arena. The borderline thus has easy access to creative realms, but enters them largely as a result of psychological necessity. These individuals find themselves acutely sensitive to transitional experiences but lack the ego strengths necessary to do anything with these very perceptions.

Issues pertaining to the true and false selves come into play when the borderline embarks on a creative task. The frustration oftentimes expressed is the result of the person creating from an inauthentic (false) position. The “true” representation, when not hidden, flounders without an organizing ego to support it. This explains, in part, why so many attempts at art work by the borderline patients wind up crinkled in a ball or torn to shreds.

Skills needed by the artist are unavailable to this individual: the ability to tolerate frustration; the ability to withstand the anxiety of something unfinished or undeveloped; the capacity to maintain a sense of control over the self while experiencing closeness to the work; the capacity to retain distance and objectivity; the ability to perceive positive and negative attributes in the same work; the capacity to take a point of view; and the capacity to experience pleasure and love what one is doing. These attributes, all functions of the ego, are not always available to the borderline.

When involved in creative efforts, the borderlines’ relationship with their artistic productions mirror their inner
“There is a wish that the creative tools will magically produce the image intended. When this does not occur the borderline experiences inordinate frustration.”

object relations. They will treat their work in a way similar to how they relate to themselves and others. For example, their expectations that the “other” should symbiotically gratify needs get projected onto the art materials. There is a wish that the creative tools will magically produce the image intended. When this does not occur the borderline experiences inordinate frustration. The medium is perceived as an obstacle rather than a challenge. This position taken by the borderline is in contrast to that of the artist, who might find the process of making art an exciting struggle.

Due to the borderline’s fragmented sense of self he or she will be terrified by the chaos that is inherent in the artistic process, and frustrated by the lack of immediate resolution. This individual will experience the work in parts, each part perceived as either very good or very bad. This splitting makes it impossible to experience the work as part of a whole. Because the borderline exists psychologically in two places, a consistent point of view with regard to the work is also unobtainable. Without a stable core self within, external and internal stimuli are confused. Associations, projections, and distortions easily overwhelm the psyche.

The frustration experienced is typified by one of my first borderline patients, a young woman named Leah:

Leah G. a 23 year old woman diagnosed as borderline, was referred to the art therapy studio in a long term psychiatric facility. She came in totally delighted to have the opportunity to do some art work. Leah told the therapist at length about her past endeavors in art, which included working for a commercial art studio. She had an idea for a painting based on a dream she recently had, and proceeded to describe it in full, including an interpretation. She was asked if she would like to do a sketch of the image. “No,” Leah replied. “I would like to paint it because it is very important.” Insisting that she could handle the oil paints available because of all her experience, she walked towards a large stretched canvas and said, “I’ve got to get started.” She spent the first session getting set up and then became annoyed when told it was time to clean up.

The subsequent session found Leah frustrated in her attempts to “get it right.” She started over a number of times, always obliterating with turpen- tine all that she had painted. Leah did not attend the third session. During the fourth session, she tried a new approach. Rather than paint with a loose medium she employed a palette knife and used thick globs of paint. Exasperated, she said, “Ugh, I hate it!” and taking the palette knife attacked the painting as if to rip it open. Frustrated and angry, tears came to her eyes.

The Artist’s Experience

The intrinsic nature of making art requires the artist to be able to move freely through various developmental stages and to experience a sense of object relatedness with the work itself. For example, the artist goes back to the transitional arena in order to create, and can also move out of this state with freedom. The artist may, in fact, re-experience the continuum from unrelatedness to attachment to separation and individuation in the creative act itself (Rose, 1980). The capacity to substitute, invent, and re-create, rooted in early development, lays the foundation for future creative endeavors (Rosen, 1964).

The artist, cognitively comfortable in transitional realms, depends on transitional phenomena to help him/her perceive a more multidimensional view of things. He sees things as both fact and illusion. This capacity for multiple perception relates to early experiences with transitional phenomena; for example, the baby’s perception of the teddy bear. The teddy bear as transitional object is teddy bear is fact. It is a piece of objective reality; it is brown; it is fuzzy; it has two plastic eyes. But it is also teddy bear as illusion. It simultaneously represents a subjective inner reality; it has soul, a personality that is projected from the introject of good mother.

The artist masters this paradox of
return to the place where one might be at an impasse. He/she must be able to get very close to the primary source of inspiration within, so one can “feed” the work as well as move away from it so as to objectively critique it.

The way in which the artist speaks about his/her work offers clues as to how these issues can be addressed in treatment. It is the art therapists’ own experiences with these aspects of the artistic process that perhaps make us uniquely empathic toward the borderline individual who has been unsuccessful in developing skills necessary for artistic differentiation.

Treatment: The Language of Art

Language belonging to the art world speaks of elements crucial for persons struggling with self identity and object relations. Common art phraseology is replete with notions about form or lack of it, structure, or lack of it, and being true to the mind’s eye. In talking and writing about art, the language used by artists borrows heavily from emotionally laden words describing relationships and the manner of relating to the work. Elements of the work can be spoken about in this dynamic way:

“The shapes are aggressive.”

“These are lines that scream NO!”

“The picture cannot decide what it is about.”

Words from the art critic’s page reflect this way of speaking about art:

“...painting is a synonym for truth where all mistakes are visible.”

“The forms are locked in their struggle for dominance.”

“The painting gives an impression of color so totally enveloping the viewer that other factors are initially obscured. Color was restricted in what appeared to be a conscious effort to deal with structure.”

The art-critic author is implying that affect takes over so that organization is obscured, and then affect is limited, so structure emerges. Language belonging to the art world makes it possible to label unconscious dynamics in a nonjudgmental way. Use of non-pejorative phraseology from the art milieu is restorative to the punitive part object within one that harshly judges this individual.

This way of speaking about oneself and one’s work could be internalized through learning a new “language.” The terms become metaphor and shorthand for the patient to assess aspects of the self. He/she can discuss what intrinsically feels true, and can perceive those parts of the self as reflected in the art process: parts that are genuine, contrived, impulsive, rigid, spontaneous, whimsical, etc. By immersing treatment into the realm of art, yet understanding what is being experienced in terms of the patient’s object relations, the art therapist has the opportunity to communicate to the individual an understanding of what he is feeling in a non-toxic way.

The clinician addresses the issues by translating them into the language of art. “What parts of the piece work? What parts don’t work?” Speaking about the art as working or not working allows for the exploration of inner dynamics with a minimum of anxiety. “What does the picture need?” The work can be spoken about in terms of needs that can be met. In approaching the art as an object that had needs that can be met, the patient is forced to separate from the picture and respond to it as a different other with its own requirements. He/she can find creative ways to highlight aspects that are ego-dystonic and true to the self.

The art therapy milieu affords such an individual the opportunity to remaster problems concerning the self. Recall that it is the baby’s capacity to invent his own imagery which is the first step towards establishing a self and moving away from the symbiotic orbit. In a therapeutic situation, the individual has a chance to recreate something that will help him/her to respond to the object world in a healthier way. The art is a suitable vehicle in which something pathological (i.e. arrest in the transitional sphere), can be maximized and transformed into something positive—art that is connected to the true self. In redirecting the creative process, stimuli are untangled and new concepts about the relation of self and others can be internalized. “Self and work create and transform each other.”

The borderline presents special treatment concerns with regard to the internalization of such new experiences. It is profoundly difficult for this type of person to internalize what the art has to offer because the necessary curative processes inherent in the making of art are experienced as ego-dystonic. For example, the borderline may devalue praise because “hating” the work is more comfortable. The work often remains unfinished, similarly because that state resonates with the psyche. Their introjects are negative.

Figures 5 & 6—These self portraits were done as part of a series executed in front of a mirror by an adult borderline patient. She depicts herself as very young. As treatment progressed, the self image drawn began to take on greater maturity. The portraits were ego syntonic with her then psychic states.
In responding to this, the art therapist is aided not only by a clinical understanding but by the language of art and the lessons learned from artistic training. It is the language and milieu of art which provide the necessary boundaries which enable the borderlines to digest new experiences at their own pace. It is the art therapist's familiarity with the artist's creative process which needs to be further examined and related to difficulties in the borderline's object world.

The art therapist calls upon a wide repertoire of art exercises and prescribes selected ones as the dynamics call for them. For example, in the art therapy studio, it may become apparent that the borderline has great difficulty in organizing time in accordance with a given task. In a life drawing class, the typical short post exercise is very useful to the artist. It helps him/her to warm up to the process and reminds one that the first stroke is not the final one. It also helps the artist to "see" differently as dictated somewhat by time. The "two minute," "five minute," or "ten minute" pose exercise could be very helpful to the borderline who has difficulty in working within the realm of time constraints.

This type of directive not only helps the individual to be more spontaneous, but the boundaries imposed break down the drawing process into manageable segments. (Figures 7 & 8) Such an assignment helps to structure the process of a developing work, a conflictual sphere for the borderline. A live model may be not feasible in a clinical situation, but any object of interest would accomplish the same task. The plant on the windowsill can be depicted taking only two minutes, taking five minutes, and taking ten minutes. This helps the patient adapt to time restraints and also generates a more spontaneous and hopefully "real" response to the subject.

Another example of therapeutically structuring the art process would be to have particular patients work with watercolors, doing studies that would gradually increase in intensity from very watery to opaque. The art materials serve as "the other" with whom this individual needs to learn how to negotiate.

The patient is helped to approach his/her deficits in a controlled and safe way, with a therapist available to intervene as problems with the task are expressed. The therapist, with an understanding of how the individual's object relations will be reflected in this arena, can communicate with the patient about these issues as they are represented in the art. Problems with the self will emerge as drawing problems, painting problems, perceptual difficulties, etc. The picture or piece will scream for help vis-a-vis aesthetic problems. The individual will need help in trying new options. This flexibility is not often possible for the borderline whose rigidity hinders seeing the work through. Assessing the aesthetics of the art is conflictual for the borderline individual who splits the experience into good and bad and cannot handle processes.

Art exercises provide a rich resource for interventions with a theoretical base. The creative experience must be modulated in a manageable way and the patient acquainted with gradual change. Different directives parallel different aspects of internal object relatedness. The focus of intervention with borderlines lies not in responding to the content of their work, but in addressing its structure (i.e. what "it needs") and

"Speaking about the art as working or not working allows for exploration of inner dynamics with a minimum of anxiety."

Figure 7 — Directive: "Draw the plant in two minutes"

Figure 8: Directive: "Draw the leaf without looking at the page" (contour drawing)
the subtlety of their relationship with it.

Another use of the plant as a model could be used to help foster a sense of the creative paradox. "Draw the plant as if it's tired (slowly) or using only dots or..." Such directives have their psychodynamic correlates and moderate the multidimensional ways in which the environment can be perceived. (Figures 9 & 10)

![Figure 9—Directive: “Draw the plant as a mass”](image)

Interventions suggesting ‘doing a study’ could help the individual foster a balance between fact and illusion. Art always requires a negotiation between fact and illusion. If the borderline is too steeped in illusion, no art can be made. This can be seen in the case of Penny, who was referred to the art therapy studio while undergoing long-term hospitalization:

Penny M., a borderline woman of 33 was working on a pastel portrait of another patient who was sitting across the room. She was having great difficulty with the picture, letting out deep sighs every few seconds. "It's no good," she said. The therapist saw a very anxious person with a very overworked picture. The colors had turned muddy and the form was indistinguishable from the background. Seemingly overrun with associations, the therapist suggested to the patient that she make three “studies” to help the picture. The first was to be about how she herself was feeling. Penny picked several colors and smeared them all together. The second was to be a study of the main characteristic of her subject. She drew a determined looking face. Third was a picture about what she thought her subject was feeling. She drew a face and wrote "embarrassment" over it. Her present picture was having difficulties because she was flooded with her own associations, projections and distortions and was not able to "see." When it was pointed out by the therapist that she was drawing her own discomfort and not the external object, Penny started again and this time was much more able to work on her art.

A problem for the artist, and one in greater extreme for the borderline, is upholding a point of view with regard to the art. Without having one, without having an essential focus from which to work, determining what the art work needs is impossible. The borderline often sets out with a very diffused idea, one without a “point of view,” and may struggle to conform to a pre-set notion of how the picture should be. This problem relates to the true self versus false self dilemma. The false self that conformed to mother’s desires is reflected in the patient’s difficulty in developing parts of the work that come from an organized center within.

The emergence of the dormant true self can be supported by specific exercises that encourage one’s own point of view. At the time that the work or patient is in trouble due to this deficit, the art therapist could suggest a series of studies. These could be brief sketches of things that the patient finds truly appealing such as a color, a shape, or parts of an object. (Figures 11 & 12) The studies are in an incomplete state and the patient is encouraged to capture the essence of something that strikes a chord within and not be concerned with details. This exercise mirrors the task of separating from the introject of mother and being true to one’s own point of view.

When awareness is visually identified, the patients have a graphic clue as to how to have some control over their projections. Distance is provided, so the artistic process can be reversed, slowed down and unmangled, separating out internal versus external stimulations. The art therapist calls upon training in art and a style of communication to convey to the borderline patient important and curative concepts. The therapist helps the individual to integrate continuity of experience and the search for authentic representation.

“When awareness is visually identified, the patients have a graphic clue as to how to have some control over their projections.”

![Figure 10—Directive: “Draw the model only using dots”](image)
Summary

The “language” of art, and the many methods whereby art is taught, can address intrapsychic phenomenon. The art therapist can work effectively with the borderline patient by being able to conceptually translate back and forth from an Object Relations framework to the “language” of art. An understanding of how object relations are manifested through the art problems that emerge in the work guides the art therapist. While engaged in the creative process, the borderline’s difficulty regarding impulse control, reality testing, and authenticity are exposed. In response to specific interventions which utilize lessons from the art milieu, the patient can begin to resolve various developmental crises. The symbiosis with the work slowly breaks down, and the borderline can learn to individuate around the creative work. Art therapists are encouraged to go back to their experiences as artists to recall mechanisms from the art process that draw upon intrapsychic strengths. In doing so, clinical theory of how to treat the borderline in art therapy is enhanced.

“Art Therapy in the Schools”
A Position Paper of the American Art Therapy Association

This position paper was prepared as a project of the “Art Therapy in Schools” subcommittee of the Governmental Affairs Committee of the American Art Therapy Association. The paper was written by Barbara Shostak, ATR, subcommittee chair, with help of the contributors: Audrey DiMaria, ATR and Edna Salant, ATR who initiated the project; Nancy Schoebel, ATR, Chair, AATA Governmental Affairs Committee, who served as a project consultant; and a review panel of art therapists working in schools. This review panel included: Janet Bush, ATR; Virginia Minar, ATR; and Leslee Pollakoff, ATR. The “Art Therapy in Schools” subcommittee is now working on an accompanying resource packet that will include sample job descriptions, goals and objectives, referral forms, and other useful guidelines for art therapists working in schools.

Art therapy is a psychoeducational therapeutic intervention that focuses upon art media as primary expressive and communicative channels. The art therapy process allows one to explore personal problems and potentials through nonverbal and verbal expression and to develop physical, emotional and/or learning skills through therapeutic art experiences. In art therapy the child can directly manipulate materials and the environment, symbolically exploring, organizing and assimilating meaning from a complex world of ideas and experiences. This process may facilitate order, reduce confusion and uncertainty and promote the integration of experiences. This integrative process is important for children as they experience, communicate and negotiate through developmental levels.

For children with special needs, art therapy in a school setting can offer opportunities to work through obstacles that impede educational success. Art therapy can facilitate appropriate social behavior and promote healthy affective development so that children can become more receptive to learning, realizing their social and academic potential. Therefore, art therapy in a school—whether public or private—can be relevant to a child’s education and social-emotional maturation.

In recent years there has been a growing awareness of the value art therapy may have in a child’s educational program. There has been slow but steady progress in distinguishing art therapy services from art education, thereby giving opportunity for the inclusion of art therapy services in the schools. Art therapy positions have been created where none have previously existed.

Administrators, parents and professional colleagues need to know the effectiveness of the diagnostic assessment and treatment of children that is possible in art therapy. This knowledge will help to facilitate the continuing development of more art therapy programs in schools.

Target Population

Art therapy can be a treatment of choice for children who have emotional, social, cognitive or physical adjustment difficulties that require specialized remediation within a school setting. Such children are usually identified as having special needs under Public Law 94-142, The Education For All Handicapped Children Act (1975). The term “handicapped” refers to those individuals who are learning disabled, emotionally disturbed (including autistic), hearing impaired, speech impaired, visually handicapped, mentally retarded, orthopedically impaired, or those who have other health impairments (PL 94-142, Section 121a.5). The pressing needs of these youngsters call for unique educational and related services applications.

“For children with special needs, art therapy in a school setting can offer opportunities to work through obstacles that impede educational success.”

Additionally, there are children who are not identified as handicapped, but who may experience difficulty in school as a result of social or emotional problems. Art therapy assists them in achieving an appropriate level of social and academic performance. Difficulties associated with the nonschool environment may be related to a crisis in the home, such as the death of a significant person, parental separation or divorce, physical or mental ailment, physical or psychological abuse, and other disruptive circumstances. The supportive service and direct involvement of an art therapist in the school can help to address, assess and remediate those specific issues.

Behavior problems not visible at home but exhibited at school may be caused by academic-related difficulties, transferring to a new school, peer pressure, problems in socialization and difficulties with authority figures. The resolution of conflicts during a child’s educational career may result in more successful school adjustment and more productive adult experiences.

Art therapy is applicable to, and appropriate for, students at all age levels, from pre-school through senior high school and it offers a therapeutic diagnostic and prescriptive approach. Continued efforts should be made to strengthen the program for those students identified as handicapped, and also to develop programs for students who, although not identified as handicapped, would profit from the art therapy treatment.
“Art therapy is applicable for students at all age levels, from preschool through senior high school and it offers a therapeutic diagnostic and prescriptive approach.”

Rationale

Individuals recognized as handicapped qualify for special education and related services. The Senate Report on the Code of Regulations for Public Law 94-142 clearly defines art therapy as a related service that can assist a handicapped child to benefit from education (PL 94-142, Section 121a.305). Art therapy helps the child to resolve the conflicts that can often impede learning.

The distinction between art education and art therapy was clarified by a joint statement developed by the National Art Education Association and the American Art Therapy Association (in a conference sponsored by the National Committee, Arts for the Handicapped). These organizations recognize that art education could contain specially designed instruction to meet the unique needs of a handicapped child. They recognize art therapy as a supportive service designed to assist a child in benefitting from education.

While art therapy and art education are by no means mutually exclusive, their primary goals are quite different. It is possible for a child to need both specialized art instruction and art therapy as part of the requirements for one’s education program.

One aspect of interpreting Public Law 94-142 is determining a child’s eligibility for art therapy. Some children are more accessible by nonverbal, graphic means of communication. For example, a language impaired child who has difficulty with verbal expression may profit more from art therapy than from a therapy focusing on verbal intervention. It is important that these children become eligible for art therapy services.

Documentation

1) The Rockefeller Task Panel (1977) was composed of twenty-five members who focused on the significance of the arts for American education. In the book Coming to Our Senses, that resulted from the panel’s study, referral was given to “convincing statistics” that demonstrated how meaningful artistic activities promoted clear gains in performance; for example, the influence of art programming on discipline and motivation was included.

2) The Senate and House Report (No. 96-712, May 15, 1980) on the Mental Health Systems Act of 1980 paid special attention to the creative arts therapies in the treatment of persons who require mental health services but do not respond to traditional therapeutic modalities. This report also acknowledged that these persons are quite often “unserved or underserved,” because obstacles exist in the establishment and broader utilization of the arts therapies within mental health settings.

3) Through the Governmental Liaison representative, the American Art Therapy Association submitted testimony (September, 1982) to the U.S. Department of Education regarding PL 94-142; this testimony cited exemplary programs in both public and private schools.

Funding

Within the school there may be obstacles to providing art therapy services for many children who need these services. Obstacles may relate to a lack of awareness of art therapy and its benefits, to an unclear plan for the utilization of art therapy services within the school, and to a lack of a mechanism for hiring art therapists in schools. Funds can be designated for art therapy through Public Law 94-142, as long as eligible candidates for treatment are identified and there is a qualified staff art therapist to provide the art therapy services.

Federal funds are not available for children not identified as handicapped. It therefore remains under the jurisdiction of local county school systems or private school organizations to budget funds for art therapy. A number of programs have succeeded in securing and maintaining the funds necessary to provide art therapy services.1

Credentials

The American Art Therapy Association, Inc. (A.A.T.A.) establishes professional standards for the awarding of credentials to qualified art therapists through its registration process. Criteria for art therapy registration (ATR) include a graduate degree (master’s) from an accredited academic institution, or graduate level clinical training in art therapy, or graduate level institute training in art therapy. Also included are extensive hours of supervised clinical work and experience as an art therapist. In addition, the A.A.T.A. has established “Guidelines for Academic, Clinical and Institute Art Therapy Training” that delineate standards for training in the field.2 Included in these standards are requirements for supervised graduate level clinical experiences. The A.A.T.A. recommends that state teacher certification boards and school administrators use these guidelines as a model when developing position descriptions and recruiting for art therapists.

Some states additionally require that art therapists secure teaching credentials or teacher education credits in order to work in schools. Administrators should consider employing qualified art therapists as related service providers who may not possess teaching credentials, since the art therapist’s role is one of assessment and treatment, requiring specialized clinical experiences rather than teaching credential.

1For five years, the Dade County public school system in Miami, Florida has recognized the need for art therapists, and has integrated them into the exceptional student education programs. The Niles Township (Illinois) has also included art therapy in its Federally funded, public therapeutic day school program for the past five years.

2For particular details, copies of the “Adopted Revised Standards and Procedures for Registration” and “Guidelines for Academic, Clinical and Institute Art Therapy Training” may be obtained from the national office of the American Art Therapy Association.
“The art therapist works primarily outside of the traditional classroom setting with individuals or small groups, engaging in long or short term treatment, and using basic art materials.”

than teaching experience. The A.A.T.A. encourages each state to establish criteria for art therapists in the schools that align with current A.A.T.A. standards.³

Role of Art Therapists in Schools

The art therapist works primarily outside of the traditional classroom setting with individuals or small groups, engaging in long or short term treatment, and using basic art materials. Services include the diagnostic evaluation and assessment of the child’s needs, and implementation of a treatment program designed to address those needs. The art therapist has close consultation with the child’s classroom teacher, staff psychologist, and other service providers as well as with the child’s parents or guardian. Parental consent should be required for a child to receive therapeutic services, such as art therapy, within an educational milieu.

Working in a school, an art therapist would design and implement an individualized treatment plan for each student with whom the art therapist works; this should include working with appropriate personnel in the development of an IEP (individualized educational plan), rather than following a traditional instructional teaching curriculum. Periodic progress reports⁴ are prepared. Such reports are considered confidential, as are all evaluations and documented records pertaining to each child.

An art therapist also acts as a liaison or consultant to other supportive programs within the school; for example, the art therapist supplements the verbal efforts of guidance counselors or school psychologists, and is considered a member of the human services team. With younger children the use of art media as an aid in counseling is one of the few and most appropriate means of intervention. The art therapist acts as a resource person and consultant to designated school staff regarding the assessment and treatment of individual students.

The Necessity of Research

Art therapy is gaining recognition in the public and private sector of psychoeducational care. This recognition has favorably influenced art therapy service delivery in educational settings. The clinical use of art therapy enjoys growing recognition and respect. The field of art therapy encourages continued controlled research regarding its application to, and outcome in, educational settings. Publication of accounts of the effectiveness of using art therapy in educational settings, and of the development of innovative strategies for the most beneficial utilization and dissemination, are also encouraged.

Summary

Art therapy fosters and facilitates cognitive and emotional development by providing experiences conducive to psychoeducational growth. For children with special needs, this process will undoubtedly play a vital role in their education. The role of art therapy in the schools is important for consideration by both teachers and therapists, as well as for administrators, parents and human services personnel.

AATA Conference Overview

The 15th annual Conference of the American Art Therapy Association was held in Washington, D.C. from Wednesday, October 31 through Sunday, November 4, 1984. Based on numbers of attendees and on enthusiasm and interest, the Conference was a success. The Conference and committee chairpersons and the presenters and participants are to be congratulated for their involvement and support in helping to make the Washington Conference a good one.

Beginning here and on the following pages is a listing of the presenters with a brief overview of the presentations, workshops, papers, pre- and post-conference courses and other highlights of the Conference. Following the presenters' names are addresses. When more than one presenter is listed, the complete address of only the first presenter is given. In lieu of the AATA Proceedings, this information is offered so that readers can communicate directly with the presenter(s) for any additional information desired. It should be noted that the information and descriptions have not been edited and are printed as they appeared in the Conference program.

*Open Studio:* Alma Tolins
*Publicity:* Gwen McPhaul
*Registration:* Marie Therese Endrés
*Special Events:* Sondra Geller, ATR
*Students:* Adrienne Kwopen
*Theme:* Barry Cohen, ATR
*Volunteers:* Francesco Creo
PRE- AND POST-CONFERENCE COURSES

The Association is again pleased to offer special courses of study prior to and following the Conference. The courses include didactic/experiential instruction at the graduate level, and are taught by art therapy educators.

PRE-CONFERENCE COURSES

I. The Rainbow Phenomenon: Toward a Psychology of Color
   Roberta Shoemaker, MFA, ATR, Assistant Professor, Art Therapy, Emporia State College, Emporia, KS 66041.
   The main problem with studying color has been the contradictory information. This course will attempt to bring together divergent opinions into a cohesive overview of color theory. As reflected in the rainbow symbol, certain colors reflect physical stress; these will be presented with experiential work and with case studies from recent research.

II. The Full Rainbow: Symbol of Individuation
   Lillian Rhinehart, MA, MFCC, ATR, Director, Eagle Rock Trail Art Therapy Institute, P.O. 2885, Santa Rosa, CA 95405.
   Paula Engelhorn, MA, ATR, Coordinator, Eagle Rock Trail Art Therapy Institute.
   The workshop will focus on color as a natural source of individuation by exploring three principles: 1) color as an objective reality; 2) the symbol of the circle as the greatest representation of wholeness; and 3) the theory of opposites as expressed in Jung's psychological system. Because we have found these principles expressed in the Native American path of life, we have based much of our work on color as an individuation process in this heritage.

III. Art as Therapy with the Handicapped Child
   Frances E. Anderson, EdD, ATR, Professor of Art, Illinois State University, Normal, IL 61761
   This session includes lecture, discussion and hands-on arts activities focusing on children with a range of disabilities. The course content will include implications of the IEP (Individualized Education Plan) process and "mainstreaming" of special needs students. A major focus will be on adaptations of the arts activities to fit children with specific handicapping conditions on task analysis. (The course is planned as an introduction to the topic and is for beginning professionals.)

IV. Use of Art Therapy in a Phase-Specific Approach to Treatment of Borderline Patients
   Molly Hardy, MA, Art Therapist, The Brown Schools, San Marcos Treatment Center, San Marcos, TX 78666
   L.G. Hornsby, MD, Medical Director, San Marcos Treatment Center
   An art therapist and a child psychiatrist will present Mahlerian phases of development shown in artwork of their borderline patients and discuss utilization of these therapeutic tools in team treatment of borderlines (DSM-III 301.83 and 313.82). Participants are requested to bring borderline's artwork for consultation/discussion period. Extensive illustrations, handouts, bibliography are included.

V. Art Therapy with Children in Trauma
   Cathy A. Malchiotti, MA, ATR, Instructor of Art Therapy, University of Utah, Salt Lake City, Utah 84112; Art Therapist/Program Coordinator, Women in Jeopardy Program
   Valerie E. Appleton, MA, MFCC, ATR, Art and Play Therapist, St. Francis Memorial Hospital
   This course focuses on the use of art therapy with children in crisis because of physical/emotional abuse, incest, physical illness and hospitalization. Specific art therapy interventions to facilitate transition from trauma to resolution will be demonstrated through case material and experiential work. Symbols and recurring themes in the art productions of young burn patients, abused children and incest victims as well as indicators of psychic return to "pre-crisis" life will be presented through slides.

VI. Theory and Practice of Transpersonal Art Therapy
   Josef E. Garai, PhD, ATR, Professor Emeritus, Pratt Institute, 155 West 68th St., New York, NY 10023
   This one-day pre-conference course introduces participants into theories of transpersonal psychology and their potential for application in art therapy work with clients of different population samples. Transpersonal art therapy requires profound self-knowledge, holistic integration of body, mind, and spirit, and transcendence of self. These attitudes lead the individual toward profound self-transformation and the ability to merge with the cosmos transcending the limited boundaries of the self to get ready for community enrichment and the solution of global problems.

VII. Life Review of the Stages of Development Through Art Therapy: Gardening in the Great Forest
   Doris Arrington, MAT, ATR, Director, Assistant Professor, Master of Art Therapy Program, College of Notre Dame, Belmont, CA 94002
   This course focuses on adult development in a cyclical mode rather than a linear mechanical one, with emphasis on reminiscence and life review. The life cycle of death, threshold, and renewal will be presented metaphorically through slides and creative expression. Drawing on contemporary research, evidence will be presented from traditional societies that consciously and unconsciously investigate tasks of midlife individuation. Visual concepts used as instruments to assess aspects of development and their clinical application will be shared. Life prints will be explored.

VIII. Theory and Techniques of Adolescent Art Therapy
   Shirley S. Riley, MA, ATR, MFCC, Instructor, Clincial Art Therapy, Loyola Marymount University, Los Angeles, CA 90045
   This one-day course on the effective use of clinical art therapy with an adolescent population will include a focus on the major developmental tasks of adolescence and the differentiation of goals concerning the pre-adolescent, early adolescent, mid-adolescent, and late adolescent. Emphasis will be on the particular techniques that a therapist must be aware of in establishing and continuing a therapeutic relationship with this age group. There will be a discussion of the problems parents face when their child becomes an adolescent and the stress factors that most commonly arise in families with adolescents will be explored. A brief discussion of the more disturbed adolescent as well as role-play will be included.

POST-CONFERENCE COURSES

IX. Fundamentals of Depth-Oriented Psychodynamic Group Art Therapy
   Ralph Levinson, PhD, ATR, Clinical Psychologist, Doyle Center of Loyola University, 2306 Ridge Avenue, Evanston, IL 60201
   This course will concentrate on the fundamental aspects of depth-oriented group art psychotherapy. Through lecture, discussion, and experiential activities, participants will explore underlying group process issues, group development, the role of the group leader, transference and countertransference phenomena and contrasting intervention techniques. Special attention will focus on how the participants' artwork symbolically represents personal, often unconscious communications about the group, its individual members and the group therapist.
X. The Practice of Jungian Art Therapy: Introduction to Jung's Principles of the Therapeutic Relationship
Ethne J. Gray, MA, ATR, Clinical Social Worker, Jungian Art Therapist, 112 Chestnut Street, West Newton, MA 02165
The course will explore Jung's theories about the interactional resources in therapy as practiced by analytical psychologists ("Jungians"), from empathy and interpretation to amplification and active imagination. It will examine Jung's theories of transference and countertransference reactions, and will compare and contrast Freudian theories for working with such reactions with those of Jung. In particular, an attempt will be made to show that the Jungian model for the therapeutic interaction between art therapist and patient offers particularly rich possibilities for healing and integration in view of Jung's unique and effective manner of working with patients' symbolic language.

SPECIAL MEETINGS AND EVENTS

Opening Reception
Come and join your fellow colleagues for refreshments and a special "Welcome!" to the 15th Annual AATA Conference. The exhibits in the Capitol Ballroom will be open for preview.

Washington Highlights Tour
Tour Washington by moonlight when its major monuments and buildings are beautifully illuminated and provide a spectacular view of the Capitol City. A three-hour tour by motor coach, with a professional guide from the National Fine Arts Associates, Inc., is offered.

Dancers of the Third Age
A well-known senior citizen dance group will perform (audience participation invited). The concert will be held at the "Pavilion" in the Old Post Office Building, the location of many shops and restaurants and home of the National Endowment for the Arts and Humanities. The "Pavilion" is less than a five-minute walk from the J.W. Marriott Hotel. Stop at the Ticket Sales Desk for directions. Plan to arrive early to get a table. This event is sponsored by AATA and is open to the public.

"Kaleidoscope"
Annual Masquerade Ball
Come create a kaleidoscope...Don your favorite colors. Be a painting, a flower, a rainbow. Whatever! Color is the theme. Do with it what you will. A cash bar and light snacks will be provided.

Annual Business Meeting
Bring your lunch!

Art Therapy Educators Meeting

Student Meeting
Come and share your lunch hour with your fellow students! Bring your lunch, if you wish.

"Fireside Chat" with Executive board
Bring your lunch!

Regional Lunchees
"Networking: Art Therapy in the Marketplace"
Join your regional colleagues for a luncheon treat!
Eastern Region
Robin F. Goodman, MA, ATR, speaker
Midwestern Region
Donald J. Cutcher, MA, ATR, speaker
Western Region
Cay Drachnik, ATR, speaker

EXHIBITS

OPEN STUDIO
For those who wish to indulge their creative needs during the Conference, an Open Studio is again available to delegates throughout the day on Friday and Saturday, 10:30 a.m.-5:00 p.m., in the Exhibit area of the Capitol Ballroom. It will be well-stocked with basic art supplies/materials and facilitated by art therapists. Don't forget, this is a good opportunity to create your special mask for the Masquerade Ball!

EXHIBITS
As part of efforts to expand educational opportunities available to delegates during AATA's Annual Conference, coordinators have designed an Exhibit Area that includes the latest in professional resources and supplies. The Exhibit Area is located in the Capitol Ballroom. Please take advantage of this excellent opportunity to learn more about the tools, processes and products of your profession!

15th Annual AATA Conference Exhibitors
American Journal of Art Therapy
Brunner/Mazel, Inc.
Chaselle, Inc.
Chroma-Vision
College of St. Theresa
Color Research/George Washington University
Davis Publications, Inc./School Arts
Goucher College—Graduate Art Therapy Program
Missouri Art Therapy Association
Nasco
Sax Arts & Crafts
S & S Arts & Crafts
Stemmer House Publishers, Inc.

Vermont College of Norwich University
J. Weston Walch, Publisher
Wright State University

"ART AND DESIGN IN ACTION"
Through a cooperative effort between AATA and the National Art Materials Trade Association, you are invited to "Art and Design in Action," the largest art materials exposition ever held on the East Coast. Visit over 1,400 booths displaying, demonstrating and offering hands-on experiences with artists' materials. The exposition will be held November 1-3, 1984 at the Washington Convention Center.

"ART BY ART THERAPISTS"
An exhibit of artwork by art therapists at the Firebird Gallery in Olde Town Alexandria is planned. The Firebird specializes in artwork done by the disabled or by therapists, so Dennis Roach, the gallery director, is anxious to meet all of you. Take advantage of this opportunity to view
the work of your peers. The Gallery is located at 814 N.
Saint Asaph Street in Alexandria, Va. and is within walking
distance from the King Street Metro Station (but wear
your walking shoes!)

Firebird
Gallery
“Therapeutic Masks for Play and Display”
Sirkku Hiltunen, EdD
This art exhibit of masks by Sky can be
viewed at the Firebird Gallery in Old Town
Alexandria

Arts Club of
Washington
“Paintings, Collages, and Drawings by Edith
Kramer”

Corcoran
Gallery
Of Art
Museum Tour
The Corcoran Gallery of Art, featuring a
Robert Motherwell retrospective, will be open
for all who wish to tour. The Corcoran
is within walking distance from the J.W.
Marriott Hotel, but buses are available for
those who prefer to ride.

Tapestry
Room
Reception
After the Gallery tour, you may wish to relax
at a special wine and cheese reception in the
Tapestry Room.

The Green Creature Within
Judith A. Rubin, PhD, ATR, HLM and
Eleanor C. Irwin, PhD, RDT, producers

Lonny: A Case Study in Clinical Art Therapy
Jane Schulman, producer

The Monument of Chief Rolling Mountain Thunder
Allie Light and Irving Saraf, producers

Stevie’s Light Bulb: Graphic Art in Child Psychiatry
Ralph D. Rabinovitch, MD, producer

A Study of Lights and Sound (Parts 1 and 2)
Charles Anderson, ATR, producer

A Very Special Arts Festival
Robert Hart, director and Norman Bassett, editor

We’ll Show You What We’re Gonna Do!
Judith A. Rubin, PhD, ATR, HLM, producer

With Eyes Wide Open
Laurence A. Becker, PhD, producer

Working Together
Eric Marano, Bruce Birnbaum and Ray Levine, producers

FILM FESTIVAL

AATA proudly presents its First Annual Film Festival
this year with eighteen films and videos for viewing. All
entries will be judged by Eddie Cockrell, a Washington
film critic who regularly reviews films for WGMS-FM
radio and The Washington Post. The winning entrant
will be presented with a trophy which has been designed
and executed by New England Sculptor James Wright.
Certificates of merit will also be presented to media of
exceptional quality. Please see the program for Festival
viewing times. The films and videos entered in the Festival
are:

The Angel That Stands By Me
Allie Light and Irving Saraf, producers

Art and Therapy
Hugues Lavergne, producer

Art Therapy: What Is It?
Mary Lou Weber, producer

Children and the Arts
Judith A. Rubin, PhD, ATR, HLM, producer

Creative Art Therapy with Children
Kim Pawley, MA and Terry Conheady, producers

Draw From Within: An Introduction to Art Therapy
Don L. Jones, ATR, producer

Expressive Art With the TMR
Kay Hometachko, producer

Lonny: A Case Study in Clinical Art Therapy
OPEN FORUMS

Computer Literacy and Application in Art Therapy
Virginia Niswander, MEd, ATR, Assistant Professor, Art Therapy, Wright State University, Dayton, Ohio 45435
This is a continuation of last year's presentation of computer literacy which was requested by members wanting to initiate an interest group discussion. Those who listed their names last are urged to attend and anyone else with an interest in the subject is invited to the discussion.

How to Do a Presentation Proposal
Pat B. Allen, MA, ATR, Program Chair Program Committee, Art Therapy Program, University of Illinois, P.O. Box 4348, Chicago, IL 60680

Jung's Active Imagination in Art Therapy
Ethele J. Gray, MA, ATR, Jungian Art Therapist, Clinical Social Worker, 112 Chestnut Street, West Newton, MA 02165 Painting, modeling, dancing and music, as a means to releasing unconscious fantasies in an awakened state of consciousness may be seen as salutary forms of what Jung described as "passive imagination." Active imagination, which is done alone, is not so well understood, although Jung saw it as the most powerful tool for achieving wholeness. A case study illustrating its use with art therapy, is presented in this open forum.

The Significance of Color in Art Therapy
Sandy Geller, ATR, Coordinator of Art Therapy Services, George Washington University, 5 Primrose St., Chevy Chase, MD 20015

Selling Skills for Art Therapists
Judith Gerberg, MA, ATR, 35 West 82nd Street, #8B, New York, NY 10024
Selling skills are necessary to confidently pursue your career. Learn techniques to market your unique skills and talents. Recognize and overcome the common barriers that prevent you from achieving the job, the promotion and the income you deserve. Discover methods to create opportunities for new jobs and clients. Leave with an action plan for Monday.

The Pregnant Art Therapist. Images of Pregnancy: Role Integration, Identity and Transference Issues in Art Therapy
Julia Byers, MA, ATR, Assistant Professor, Art Therapy, Concordia University, 4382 Melrose Avenue, Montreal Quebec, H4A 2S6 Canada
The symbolic and metaphoric "pregnancy" is a unique time limited event with profound implications for the therapeutic relationship. This forum intends to discuss the relevance of an art therapist's actual pregnancy to the therapeutic interaction in art therapy.

Student Forums

Governmental Affairs

GENERAL SESSIONS

GENERAL SESSION: Keynote Speaker
Archetypal Images and Art
Dean L. Frantz, Analyst in the Psychology of C. G. Jung, 3831 Evergreen Lane, Fort Wayne, IN 46815
Jung said "Whenever the archetypal clothes itself with adequate symbols, it takes hold of the individual in a startling way, creating a condition of 'being deeply moved', the consequences of which may be immeasurable." The creative power of archetypes to move us at the deepest levels of our being is manifested in dreams, fairy tales, great music, literature, and art. The paintings of Peter Birkhauser are the medium through which archetypal powers have found expression in a most unique way. These paintings have been characterized as "medicine for the soul."

Frantz will examine the relationship between archetypes and art, and remarkable life of Birkhauser himself, and experience some of the same forces which moved Birkhauser to paint. Slides of Birkhauser paintings will be shown.

With Eyes Wide Open
Laurence A. Becker, PhD, producer, 507 Park Blvd., Austin, TX 78751
This general session offers a viewing and discussion of With Eyes Wide Open, a documentary film about the Scottish artist Richard Wawro. Don't miss this inspiring film about a handicapped artist whose art has earned him four international awards in 1984 alone!
This film is reviewed on page 46.

Lisa Montag Brotman and Sarah Tuft: Slide Presentation and Discussion of Their Work
7910 Springer Road, Bethesda, MD 20817
Lisa Montag Brotman and Sarah Tuft, artists and mothers, will present a visual history of the evolution of their work. Their art is figurative and rich in psychological content. Sarah, a painter, photographer and filmmaker, uses images of mothers and daughters as symbols for all relationships. Lisa, a painter, deals with all relationships though images of women. In her work, the viewer is incorporated as part of the relationship. Both artists will discuss the creative process utilized in their work. Slides will be shown.

PAPERS

Art Therapy With Spinal Cord Injury, Stroke, and Head Injury Patients in a Rehabilitation Setting
Margaret Ann Cotton, MA, ATR, Art Therapist, Rehabilitation Institute of Chicago, 1625 Sheridan Rd. 204, Chicago, IL 60611
This paper concentrates on the correlation and progression of art work in three major diagnostic groups: spinal cord injury, stroke, and head injury. Background information of each disability group will be summarized, and the therapist's approach to each group will be discussed. Slides, the major portion of this presentation, will verify information given.

Art Therapy Used to Enhance Patients' Ability to Utilize a Vocational Rehabilitation Program
Jane Schroeder DeSouza, MPS, ATR, Therapeutic Activities and Vocational Rehabilitation Service Coordinator, St. Vincent's Hospital, 7 Sterling Forest Lane, Suffern, NY 10901
This paper discusses the development of an art therapy group designed to complement a time-limited vocational rehabilitation program. It has provided therapeutic intervention that is recognized by both patients and the multi-disciplinary team as both beneficial and integral in promoting involvement, participation, and commitment to treatment.

Women Healing Women: Group Treatment of Childhood Sexual Abuse
Terri L. Sweig, MA, ATR, Art Therapist/Art Psychotherapist, Department of Psychology, Highland Park Hospital, 364 Roger Williams Avenue, Highland Park, IL 60035
Unhealed emotional scars of traumatic childhood sexual abuse resurface and painfully disrupt adult women's lives. A therapeutic partnership between art therapy and psychiatric nursing established a structured group therapy model for treating unresolved feelings of rage, shame, guilt, isolation, betrayal, mistrust and focused on ending victimization and healing the wounded-child-self.
A Day in the Life: The Story of Q, An Autistic Man
Nancy Hall, MA, ATR, Recreation Therapist (Art), Buffalo Psychiatric Center, P.O. Box 203, Bidwill Station, Buffalo, NY 14222

This paper is a case study documenting the work of Q, a young man who appears to perceive, synthesize, and communicate information and experience through images rather than words.

Loss and Mourning: Art Therapy with a Child Cancer Patient and his Family
Mari M. Fleming, MA, ATR, Art Therapist, ADJ Assistant Professor, George Washington University, 1711 McGee Ave., Berkeley, CA 94703
Discussant: Pat Davis, ACSW, Director of Social Work, Child and Adolescent Services, Department of Psychiatry, Walter Reed Army Medical Center

An 11 year old boy with inoperable cancer and his family were seen in time-limited art therapy. Expression of feelings of loss and depression through art and the metaphors of danger and the hero were utilized to rebuild the love and support previously known. The issues of working with the medically ill child and his family are discussed and illustrated.

Coping with Loss and the Art of Pediatric Oncology Patients
Robin F. Goodman, MA, ATR, Art Therapist, Mount Sinai Hospital, 77 East 12th St. #3B, New York, NY 10003

Presentation of the concerns of pediatric cancer patients. Focus is on three major types of loss: loss of identity, control, and relationships. Art work is used to illustrate how these themes are depicted, how the patients cope, and what can be done in treatment.

Art Therapy and the Homeless
Patricia Prugh, MA, Art Therapist, Sarah House, 1305 Rhode Island Avenue, NW, Washington, DC 20005

This presentation provides an overview of the problems surrounding homeless women in the United States. The results of an art therapy group comprised largely of “bag ladies” is equally explored. In addition, the role of art therapy with this neglected population is explored.

Animals in Dreams and Spontaneous Drawings
Elizabeth Caspari, Art Therapist, 30 Lincoln Plaza, 30 N, New York, NY 10023

The role of animals in fantasies, dreams and spontaneous pictures has often been discussed as “instinct.” Through actual dreams, slides and audience participation, I intend to show that the significance of the animal, with its own distinctive biological and natural qualities, can give us valuable clues and greater insight into the unconscious.

Co-Treatment by an Art-Psychotherapist and a Clinical Psychologist of a Suicidal, Sexually Abused Adolescent
Elizabeth Goll, MA, ATR, Art Therapist, CharterBarclay Hospital, 6101 No. Sheridan Rd. 8H, Chicago, IL 60660

David Kenis, PhD, Director, Sexual Abuse Program, CharterBarclay Hospital, 6101 No. Sheridan Rd. 811, Chicago, IL 60660

Noted will be the sexual abuse component of this case intertwined with the girl’s suicidal ideation and the different treatment methods used to teach a common goal. Special attention will be given to parallel evolution of the patient’s process and the collaborative relationship, transference and countertransference issues, and the advantage of opposite sex co-therapists.

Treatment Metaphors from Adolescent and Adult Psychiatric Patients: Watermelon Saviors and Pilgrims
Bruce L. Moon, MA, ATR, Art Psychotherapist, Supervisor of Adolescent Adjunctive Therapy Program, Harding Hospital, 1997 Bunty Station Road, Delaware, OH 43015

This presentation explores the recurring and dominant metaphors expressed by hospitalized adult and adolescent patients engaged in intensive long-term inpatient psychiatric treatment. Attention is also given to the metaphor responses of the art psychotherapist and adjunctive therapist member of the treatment team.

Fear of Fat: The Use of Art Therapy in an Interdisciplinary Approach to the Treatment of Anorexia Nervosa
Tally Tripp, ATR, Art Therapist, Psychiatric Institute of Washington, 4121 W St., NW #303, Washington, DC 20007
Peter Coe, ACSW, Social Worker, Washington, DC
This presentation describes the collaboration in treatment efforts between an art therapist and a social worker with an adolescent anorexic girl and her family. Slides of her art work produced in art therapy and guided imagery groups will be discussed in relation to psychological issues and family dynamics.

Art Therapy with Only-Child Early Adolescent Boys of Divorce
Gregory L. Wolfe, MA, Clinical Art Therapist, Kendall & Associates, 8920 Ashcroft Avenue, Los Angeles, CA 90048

This clinical paper and slide presentation presents three case studies in which art therapy was used as a primary treatment modality with only-child early adolescent boys of divorce in an outpatient clinic. The case studies demonstrate how art therapy facilitated the exploration of divorce-related issues and brought about change and growth in the lives of these boys and their families.

Portrait of an Adolescent Obsessive Personality: A Case Study
Barbara Sprayregen, MEd, ATR, Art Therapist, McLean Hospital, Old Sudbury Rd., Lincoln, MA 01773

This paper will describe the case of a seventeen-year-old youth participating in an adolescent art therapy group, who experienced more than usual developmental difficulties. His major presenting issues were very vividly and dramatically depicted in his artwork and will be shown in a series of slides. The patient has been considered to show a profile of an alienated obsessive personality similar to the type given notoriety by the John Hinckley, Jr., case.

Using Art Therapy with Chemically Dependent Adolescents
Erica L. Thompson, MA, Substance Abuse Prevention Counselor, Council on Prevention and Education: Substances, 3525 Ramona Ave., Louisville, KY 40220

Pat Crajkowski, Student

This presentation focuses on art therapy techniques in an adolescent treatment program. Slides are used to increase awareness of the effectiveness of art therapy and chemically dependent adolescents. Theory, media and techniques are emphasized in this presentation.

Group Art Therapy With the Abused Adolescent
Josie Abbenante, MA, ATR, Counselor, Art Therapist, UNM/BCMHRC Drug Counseling, 917 Amherst SE #5, Albuquerque, NM 87106

This paper will explore an approach to treatment of the abused adolescent utilizing group art therapy. Techniques and client response will be demonstrated with slides. The group is of mixed sex and the clients are in residential treatment. Art therapy is the vehicle by which the evocative imagery is allowed expression and through which the healing occurs.

Assertiveness Training through Art Therapy with Handicapped Adolescents
Denise Gatti, MCA, ATR, Art Therapist, Children’s Heart Hospital, 3955 Consoluhucken Ave., Philadelphia, PA 19131

Handicapped individuals often have limited opportunities for social interactions and therefore often interact in a passive manner. This presentation will focus on a unique use of art therapy to develop assertive social skills. Slides of artwork and discussion of weekly group art therapy sessions with adolescents with spina bifida will be used to illustrate this process which would be applicable to many other populations.
Assessment, the Learning Disabled Child and Art Therapy
Patricia A. St. Jo-\n, EdD, Assistant Profes\nor of Art, University of Massachusetts, Art Dept. FAC 365, Amherst, MA 01003
Careful assessment is the basis of effective treatment. Treating the LD child through art therapy demands a thorough appreciation of the relationships among perceptual processing, learning, and psychological characteristics. These relationships are explored through general and specific tests which tap graphic-constructional abilities. Two cases illustrate the diverse abilities, psychological factors and treatment strategies used with learning disabled children.

The Process of Art Therapy: A Case of a Pre-adolescent Boy
Pamela Madden, MS, Art Therapist, Western Psychiatric Institute and Clinic, 6633 Wilkins Avenue, Pittsburgh, PA 15217
This project is an empirical study exploring how art therapy works as a technique of psychotherapy. A systematic analysis of a pre-adolescent boy's course in treatment is formulated. Discussed will be techniques of analysis and implications the findings suggest for theory and practice of art therapy.

Intervention Following a Sniper's Attack Which Traumatized an Elementary School
Suzanne Silverstein, MCAT, ATR, Art Psychotherapist, Center for the Study of Psychological Trauma, 2336½ So. Beverly Glen, Los Angeles, CA 90065
This presentation describes an intensive elementary school intervention following a sniper attack in which one child was killed and eleven other children and two adults were wounded. The following issues will be explored: the intrusion of violence and death, the threat to personal safety, and the consequences of the sniper attack on the school students, teachers, administrative staff and parents.

From Psychotherapy to Recreation to Breakdancing: Art and Dance with Children and Adolescents
Kate Hartman, MA, ATR, Art Therapist, Art Therapy Educator, State University College at Buffalo, 763 Bird Avenue, Buffalo, NY 14209
Ulrike Chamberlain, ATR, Field Supervisor, Art Therapy Studies; Georgiana Jungels, ATR, Program Director, Art Therapy Studies; Tracy Gevirtzman, MA, Art Therapy Intern, Graduate Assistant; Sandy Tien, MA, Art Therapy Intern, Graduate Assistant
Art and Dance therapy with emotionally disturbed and delinquent children and adolescents in a residential treatment setting is the subject of this presentation.

Words and Pictures: Developmental Relationships in Preschool Children
Judith A. Rubin, PhD, ATR, HLM, Assistant Professor, Child Psychiatry, Western Psychiatric Institute & Clinic, 3811 O'Hara Street, Pittsburgh, PA 15213; Herbert Rubin, PhD, Professor, Department of Communications.
Twelve normal preschool children were presented individually with five drawing and five oral verbal tasks to explore relationships between the two parallel modes of expression. Following semantic, morphological and syntactic analyses of both kinds of data, each matched pair of tasks was examined phenomenologically. Results suggest that the same mechanism(s) may underlie both skills.

Primary and Secondary Intervention in Infancy and Toddlerhood Through Art Therapy: A Theoretical Rational
Donna J. Baszkin, MPS, ATR, Faculty, Creative Arts Therapy Department, Pratt Institute, 7 Great Jones Street, New York, NY 10012
Art therapists have an opportunity to devise optimal therapeutic intervention in infancy and toddlerhood through the use of art. This paper will provide a theoretical rationale for "why do we use art for prevention" and "how do art experiences in the earliest years facilitate the construction of self and other."

Art Therapy Through a Museum-Based Program for Children and Adults of Special Need
Lucy Andrus, MS, ATR, Art Therapist, Coordinator, Matter at Hand Program, Albright-Knox Art Gallery, 799 Potomac Ave., Buffalo, NY 14209
This presentation will focus on an innovative art therapy program called "The Matter At Hand", sponsored by the Albright-Knox Art Gallery, Buffalo, N.Y. MAH serves children and adults of three distinct art therapy approaches. This presentation will demonstrate how the use of original works of art can enhance art therapy treatment by serving as a stimulus for client participation, motivation, and heightened creative self-expression.

Is the Parakeet Dead? And Other Vignettes from Lives of Children from Alcoholic Homes
Debra DeBrular, BFA, Art Therapist, Harding Hospital, 445 E. Dublin-Granville Rd., Worthington, OH 43085
The purpose of this paper is to illustrate the uses of art therapy in an educational and therapeutic treatment program for children from alcoholic homes. Objectives include: 1) to develop understanding of problems these children experience; 2) to delineate a treatment paradigm; and 3) to suggest techniques and processes for the art therapist.

The Art of the Sexually Abused Child
Cynthia A. Wolf, MS, ATR, Director, Art Therapy Master's Program, Eastern Virginia Medical School, CMHC, P.O. Box 1980, Norfolk, VA 23501
This presentation will touch upon some of the history of the use of art with the sexually abused child and give an overview of the psychological problems most commonly experienced by these children. It will, through the use of victim artwork, illuminate the ways these problems are revealed in the work of these children and how the art therapist functions as an integral part of the sexual trauma team.

incest Markers of Children's Art *work
Felice W. Cohen, ATR, Chief, Art Psychotherapy, Texas Research Institute of Mental Sciences, 1300 Moursund Avenue, Houston, TX 77030
Co-researchers: Randy Phelps, PhD, Research Consultant, Child and Family Clinic, Texas Research Institute of Mental Services; Sara Simon, MSW, Child Sexual Abuse Team, Harris County Child Welfare Program
Consultant: Lauren Bender, MD, Child Psychiatrist
Discussants: Gary C. Barlow, EdD, ATR, Myra Levick, PhD, ATR, Lewis K. Shupe, PhD, ATR
A comprehensive study of the analysis of eighty children's drawings, with experimental and control groups, to determine markers of incest will be presented. Drawing protocol includes: free drawing, a House-Tree-Person and the family in some activity. Blind ratings were obtained from naive and sophisticated judges. Results of this study are reported with projections for further collaborative research and implications are presented for training helping relationships professionals in detection and referral procedures.

Multiple Family Group Art Therapy
Debra B. Greenspoon, MA, ATR, Clinical Art Therapist, Vista Del Mar Child Care Services, 664 Kelton Avenue, Los Angeles, CA 90024
Discussant: Helen Landgarten, MA, HLM, ATR, Director, Clinical Art Therapy, Loyola Marymount University, 664 Kelton Avenue, Los Angeles, CA 90024
This paper will explore multiple family group art therapy through the development of a theoretical framework and the
exploration of case material. Pertinent literature will be examined briefly in order to establish a treatment model and rationale. The remainder of the paper will discuss examples of artwork in an ongoing multiple family art therapy group, focusing on the utilization of this process for both assessment and intervention.

The Family Art Evaluation as an Intake Tool at a Community Mental Health Center
Audrey DiMaria, MA, ATR, Art Therapist, North Community Mental Health Center, 1711 Mass. Ave., NW #301, Washington, DC 20036
Mary D. Durrum, MA, Clinical Psychologist; Trudy Summers, MSW, Social Worker
Although the family art evaluation procedure was developed by Kwiatkowska in the 1960's, few facilities make consistent, ongoing use of it. This presentation demonstrates the important role of the family art evaluation as a major component of the intake process in an adolescent outpatient program and a children's day treatment program.

Draw Me a Paradox
Shirley Riley, MA, ATR, MFCC, Art Psychotherapist, Loyola Marymount University and Didi Hirsch Community Health Center, 960 Roscomare Rd., Los Angeles, CA 90077
This paper will first review the basic systemic and Milan techniques of conducting family therapy, touching upon the premises of joining, reframing, and positive connotation, etc., and their function in producing change. Discussion will then move toward the feasibility of incorporating art therapy expression with the systemic theories. The argument presented will focus on what appears to be a reluctance of some art therapists to consider a creative accommodation of their abilities and special skills with the more current and also creative approaches to family therapy. In conclusion, the paper will attempt to weigh the gains or losses that might occur if these two techniques were unified in family sessions.

The Symbolic Meaning of Early Childhood Imagery in the Art Work of a Brain Injured Man
Susan R. Dwight, MA, Art Therapist, Trevilla of Robbinsdale, 4815 Queen Avenue So., Minneapolis, MN 55410
This paper presents a case study of a 29-year-old brain injured man with whom the author worked as an art therapist over a two-year period at a nursing home for physically disabled young adults. Early childhood imagery is used to symbolize aspects of his personality and his feelings about his present condition.

Utilization of Art Therapy in the Diagnosis of Organic Mental Disorder
Toby Michaels, MA, ATR, Art Therapist, Department of Psychiatry, Norwalk Hospital, 248 North Avenue, Westport, CT 06880
This paper summarizes the case of a 71-year-old woman and describes how the use of art material assisted the medical team to further evaluate and test for organic mental disorder in an otherwise organized personality.

Healing Images: The Use of Art Therapy in Traumatic Head Injury
Phyllis Cohen, MA, ATR, Clinical Art Therapist, Center for Creative Art Therapies, 1778 Commonwealth Ave., Brighton, MA 02135
Severe head trauma can leave its victim with a variety of psychological and physical difficulties. This presentation will explore the treatment needs of the head injured and how art therapy helped one woman deal with these impairments. The paper will also describe broader implications for the use of art therapy with other neurologically impaired clients.

Art Therapy and the Dually Diagnosed Client: The Mentally Retarded and Emotionally Disturbed Adult
Ellen Sontag, MSW, MA, Art Therapist, 1021 Ridge Court, Evanston, IL 60202
Gilda Moreno, MA, Art Therapist
This presentation will focus on the concerns that have been expressed in the work of the dually diagnosed, developmentally disabled and emotionally disturbed adult. This presentation will help others to more accurately identify the particular needs of this population.

A Comprehensive Treatment Approach to Geriatrics: A Creative Arts Partial Hospitalization Program
Marianne Thomas, MCAT, Art Therapist, Bristol-Bensalem Human Services Center, 4424 Wingate St., Apt. C-22, Philadelphia, PA 19136
The innovative program design of the Creative Arts Partial Hospitalization Program for geriatric, chronically mentally ill individuals is introduced. The myths and stereotypes accompanying the elderly are addressed and stripped away enabling the clinician to maximize the potential of each individual. Art therapy tasks are presented through a slide presentation to address problem areas of attention, memory, visuo-spatial ability and cognitive flexibility.

The Importance and Integration of a Sequential Art Therapy Program for the Developmentally Disabled Adult in a Day Treatment Setting
Elizabeth Spear Rogers, MS, Art Therapist, Self-Direction Coordinator, Niagara County Association for Retarded Children, 1256 Colvin Blvd., Kenmore, NY 14223
Beth Farr, MS, Art Therapist; Glenn Gleason, MA, Training Coordinator
One of the most challenging problems facing the field of art therapy today is that of providing effective programs for the developmentally disabled adult. The Niagara County Association for Retarded Children's Adult Day Treatment Program, based on a principle of normalization, offers individualized, integrated programs in a multitude of environments and opportunities for client growth. Sequential art therapy has been incorporated into the program using multi-sensory, highly structured, success-oriented experiences, within the framework of the developmental mode. This paper will show now, with the continued coordination of art therapists and other specialists, the development of cohesive programs will lessen the distance between the developmentally disabled adult and the rest of society.

Uncovering Buried Treasure: A Look at a Successful Art Program for Elders in Long Term Care
Mary Lou Coles, MA, Art Therapist/Activity Director, Hillhaven Convalescent Hospital, 477 30th Ave., San Francisco, CA 94121
The "Art for Elders Program! at Hillhaven Convalescent Hospital (Oakland, CA) has successfully created an environment where its elderly residents can use "art as a vehicle for basic human expression" (Merks-Benton, 1983). This paper examines the success of using art with the frail elderly as a means of self expression and discovery; a means of connecting with others, with environment and with the community.

A Study of Human Figure Drawings of Rheumatoid Arthritis Patients
Vija B. Lusebrink, PhD, ATR, Associate Professor, University of Louisville, 255 Labor Vallee Rd., Louisville, KY 40223
Bruce Scott, Louisville, KY; Josephine Rhodes, New Albany, IN
Human figure drawing scale (HFD) and visual pain chart (VPC) were developed to evaluate the changes in the body image and pain experience for patients with a physical illness. Both HFD and VPC were used to evaluate the body concept of rheumatoid arthritis patients as compared to a control group, and the changes present in drawings of the rheumatoid arthritis patients after twenty weeks of peer group counseling.

March, 1985, ART THERAPY 29
Group Art Therapy with the Institutionalized Aged: A Restorative, Reparative and Reengagement Agent
Vicky Youngman-Yazdi, Activities Worker, Florence Nightingale Nursing Home, 420 Clinton Ave., Apt. 6D, Brooklyn, NY 11238
"Total institutionalization" inflicts heavy damage upon the ego. Aspects in which nursing homes constitute total institutions and the incurred adverse effects upon the aged's cognitive, social and psychological abilities will be explored. Group art therapy combats the "institutionalization syndrome" and attempts to restore capacities for relatedness, self-determination and self-respect. A slide review of art work, which illustrates the group's growth process, is included.

An Art Assessment Study of Schizophrenic Subjects Cn and Off Haloperidol
Elaine S. Kramer, MA, ATR, Chief, Art Therapy Section, St. Elizabeth's Hospital, United States Department of Health and Human Services, 6621 Wakefield Dr., #213A, Alexandria, VA 22307
Andrei-Claudian lager, MD, Clinical Research Associate, National Institutes of Mental Health

Ambivalence: Art Therapy With a Chronic Paranoid Schizophrenic Patient in a Psychiatric Setting
Rachel Garber, MA, Art Therapist, Douglas Hospital, Mental Hygiene Institute, 3839 Clark Street, Montreal Quebec, H2W 1W4 Canada
A case study spanning eight months of art therapy, this paper focuses on the problems of splitting and ambivalence in the context of contradictory and inconsistent interventions on the part of the treatment team. The relation of staff conflicts to the art therapeutic approach and the patient's conflicts will be explored with the aid of slides.

Graphic Images of Going Crazy and Being Sane
Janie Rhine, PhD, ATR, HLM, Gestalt Counselor/Art Therapist, 1301 E. College, Iowa City, IA 52240
Drawings representing real and fantasized images of psychosis and sanity have been collected along with descriptions of these mind-states as verbalized by their creators. Drawings by clients in therapy with the presenter will be shown to demonstrate how constructs of "craziness" are reflected in therapeutic process and benefits.

Drawing Toward Wellness: Art Therapy with the Hospitalized Medically Ill
Barry M. Cohen, MA, ATR, Director of Expressive Therapies, Mount Vernon Hospital, 855 Richmond Hwy. #302, Alexandria, VA 22309
The theoretical basis for art therapy's unique role in treating the hospitalized medically ill patient is presented. A model which delineates the concepts of illness and disease is discussed. The psychological impact of medical hospitalization on the patient is clarified.

Separateness and Relatedness: The Structured Use of the Mural with a Psychiatric Population
Laura V. Loumeau, MPS, Activities Therapist, Mount Sinai Medical Center, 79-04 149th Street, #3-1, Flushing, NY 11367
This modality is discussed in terms of its implications for a schizophrenic population where issues of merging can make the use of a common space an anxiety-provoking experience. Various structured uses of the mural were developed specifically to address the issue of individual identity within a common space, to act as an organizer for chaotic stimuli, and to develop symbolic thinking will be presented.

Pictures in a Methadone Clinic Lobby
Evelyn Vrshup, PhD, ATR, Art Therapy Consultant, Suicide Prevention Center, 4900 Dunman Avenue, Woodland Hills, CA 91364
This paper presents a methadone clinic client's graphic experience over a year's time, using the process of art in an informal group in the waiting room of the clinic. Drug abusers have considerable difficulty articulating their feelings. The "public" art process proved effective in helping the clients become more aware and able to relate to each other and their counselors, and find common bonds with both groups.

The Peter Pan Dilemma: Treatment of Psychiatric Patients with Emancipation Problems
Catherine Moon, BFA, ATR, Art and Activity Therapist, Harding Psychiatric Hospital, 1697 Bunty Station Rd., Delaware, OH 43015
This presentation employs the use of allegory, imagery and didactic modalities to explore the treatment of psychiatric patients who are in the process of emancipating from their families. A clinical description of the three phases of treatment will be given, as well as a delineation of the role of the art therapist.

The Role of Creative-Expressive Arts Therapies in the Third Millennium
Josef E. Garai, PhD, ATR, Professor Emeritus, Pratt Institute, 155 West 68th St., New York, NY 10023
This paper visualizes the role of creative-expressive arts therapies in the "Age of the Person" which we enter in the third millennium. Artists as therapists will use imagination, intuition, and empathy.

The Full Rainbow: Symbol of Individuation
Lillian Rhinehart, MA, MFCC, ATR, Director, Eagle Rock Trail Art Therapy Institute, P.O. Box 2885, Santa Rosa, CA 95405
Paula Engelhorn, MA, ATR, Coordinator
The paper will investigate color as a natural source of individuation by exploring three principles: 1) color as an objective reality; 2) the symbol of the circle as the greatest representation of wholeness; and 3) the theory of opposites as expressed in Jung's psychological system. Because we have found these three principles expressed in the Native American Path of Life, we have based much of our work concerning the Full Rainbow on this heritage.

The Psycho-Cybernetic Model of Art Therapy
Aina O. Nuchu, PhD, ATR, ACSW, Associate Professor, University of Maryland at Baltimore, 2124 Cedar Circle Drive, Baltimore, MD 21228
The concept of cybernetics (derived from the Greek word for "heirningman" or "navigator") is utilized to develop a model of art therapy process consisting of three phases. The specific tasks of the therapist in each phase are described and illustrated with brief excerpts from video taped art therapy sessions with several clients.

Milton Erikson's Theories and Techniques of Hypnotic Induction as they Refer to Art Therapy
Mildred Lachman-Chapin, MS, ATR, Assistant Professor of Art Therapy, Graduate Art Therapy Program, Vermont College of Norwich University, 25 Foster Street, Montpelier, VT 05602
Discussant: Linda Gant, ATR
Dr. Erikson's hypnotic techniques achieve a direct accessing of the client's unconscious material, finding language cues and metaphors to tap the private language of the client. This process, and the trance induction it occasions, is compared to the process of art therapy.

Non-Structured Art Therapy for Diagnostic Purpose
Ikuko Acoastia, MA, Art Therapist, Essex County Hospital Center, 122 No. Mountain Avenue, Montclair, NJ 07042
Discussant: Harriet Power, MA, ATR, Art Therapist
This presentation focuses on the values and advantages of non-structured art therapy format for diagnostic purpose. A wide variety of drawings (slides) are shown in order to illustrate how they could be utilized for depicting various mental disorders in a categorical manner.
The Diagnostic Drawing Series: A Systematic Approach to Art Therapy Evaluation and Research
Barry M. Cohen, MA, ATR, Director of Expressive Therapies, Mount Vernon Hospital, 8559 Richmond Hwy, #302, Alexandria, VA 22309
Anna Reyner, MA, ATR, Art Therapist; Shira Singer, MA, ATR, Art Therapist
The Diagnostic Drawing Series is presented and discussed. Designed by art therapists for use by art therapists in the clinical setting, this tool is being systematically studied in psychiatric settings nationwide. The series was the winner of the 1984 AATA Research Assistance Grant.

To Interpret or Not to Interpret? That Is Often the Question
Robert Shoemaker, MFA, ATR, Assistant Professor, Art Therapy, Emporia State College, Emporia, KS 66041
Bonnie Smith, MA, ATR, Psychiatry Unit, Prince George's County General Hospital
An approach to verbal interpretation of the visual content of art work done in art therapy sessions will be discussed. Since there are differences of opinions about the value, timing and need for verbal interpretation, the presenters will give a conceptual theory and the pros and cons of interpretation.

Advanced Clinical Seminar: An Approach to Training and Education
Christine W. Wang, MA, ATR, Assistant Professor and Director, Graduate Art Therapy Program, Goucher College; Assistant Clinical Professor, University of Maryland; Clinical Supervisor and Instructor, Sheppard and Enoch Pratt Hospital, Preceptor in Psychiatry, Sinai Hospital
This paper considers the use of students' drawings as part of a formal course on transference and counter-transference. We will present material on issues of empathy, intuition, projection, and transference. The resultant benefits are: for the student, clarification of the therapeutic relationship, integration of theoretical and clinical learning, growth and change; for the instructors, clarification of process group, identification of weaknesses in supervision.

The Clinical Application of Art Therapy: Its Contribution to a Short Term Psychiatric Setting
Mary Anne Blank, MA, Art Psychotherapist/Activities Therapist, Mental Health Management, Inc., 211 Jackson Avenue, Ridgeway, PA 15853
The major objective of the session is to identify the various treatment, cathartic, and diagnostic uses of art psychotherapy in a short-term psychiatric setting. The eleven therapeutic (curative) factors will be identified and expounded upon as well as those countertherapeutic elements involved in an acute inpatient setting. The multi-disciplinary team approach and the specific role the art psychotherapist plays in this overall domain will be discussed. Finally, various techniques that are most beneficial to this clientele will be discussed and explained.

How Patients Evoke Therapists' Shadows: Subtle Dangers of Unacknowledged Counter-Transference
Don L. Jones, ATR, Director, Adjunctive Therapy, Harding Hospital, 490 Mid Drive, Worthington, OH 43085
The patient who fails to improve, who is resistant or who disagrees with one's treatment approaches, perhaps threatening that subtle sense of omnipotence, is always in danger of being confronted with primitive behavior barely disguised as therapeutic.

Art Therapy Evaluation: A Standardized System Based on the Use of Computer Scoring and Video
Georgiana Jungels, MA, ATR, Program Director, Art Therapy Studies, State University College at Buffalo, 745 West Delavan Avenue, Buffalo, NY 14222
Kate Hartman, ATR, Art Therapy Studies Faculty, Art Therapy Graduate Research Assistant
Discussant: Lewis K. Shupe, PhD, ATR, Professor, Art Therapy/Speech Pathology, Wright State University
Report on a recently developed system and standardized procedure for collecting, recording, and analyzing visual and verbal information in drawings through the use of a computer-scorable evaluation form and video.

The Concept of Space: The Circle and the Square. An Art Therapy Protocol to Address Cognitive Disturbance
Marilyn La Monica, MPS, Art Therapist, Clinical Supervisor, Pratt Institute, 454 14th St., Brooklyn, NY 11245
Maria Belfiore, MPS, Art Therapist
This presentation describes an art therapy protocol designed to address the cognitive disturbance of the concept of space. The underlying psychological, aesthetic and clinical assumptions of such a protocol will be developed through (a) a clinical description of cognitive disturbance in schizophrenia, with particular emphasis on distortions of the concept of space (b) developmental considerations using various theories to describe the cognitive, psychological and affective stages in the achievement of organized space and ego boundaries (c) an overview of geometrical shapes and their intrinsic meaning, with particular emphasis on the characteristics of the square as it represents, organizes and defines space and (d) a protocol of a structured art therapy group which suggests the clinical application of the previous work.

Progress Through Art Therapy With a Thirty-Nine Year Old Inmate of a County Prison
Irene McLaughlin, BA
A slide presentation depicting progress made through two art therapy students, working consecutively over a seven month period with a low functioning male inmate. The progress includes: 1) going from extreme low self-esteem to presently exhibiting self-confidence; 2) from a determination of pre-school level to now learning to read and write; 3) from having no goals to originating future goals upon release from prison.

Exploratory Literature Study of Self-Mutilators' Characteristics and Their Reflection in Art Work
Nancy Knapp, MA, ATR, Assistant Behavioral Science Consultant, Director of Art Therapy Program, Harbor-UCLA Medical Center, 16081 St. Croix Cir., Huntington Beach, CA 92649
Isoldi Martin, Art Therapy Intern
This presentation consists of the findings of a literature search of self-mutilating behavior which was tabulated with the presenting behaviors, case histories and art from twenty psychiatric patients. The results of the exploratory study and slides of the art will be shown.

continued

See page 38 for the preliminary announcement of AATA's 16th Annual Conference.

BEST COPY AVAILABLE
The Use of Art Therapy in a Multi-Disciplinary Approach to English as a Second Language
Virginia Minar, MS, ATR, Art-Exceptional Education Teacher/Therapist for the School District of West Allis-West Milwaukee; Art Therapy Instructor, Alverno College, 308 East Dean Road, Milwaukee, WI 53217
An overview of team procedures used in developing a program for teaching English to an eight-year-old from Thailand will be presented. Art therapy sessions will be detailed showing that the creative experience allowed for non-threatening visual communication which then served as the catalyst for verbal communication.

PANELS

Healing and Psychotherapeutic Process in Art Therapeutic Practice
Arthur Robbins, EdD, ATR, Chairperson, Art Therapy Department, Pratt Institute, 325 West End Avenue, New York, NY 10027
Elaine Rapp, ATR, Faculty
Edith Wallace, MD, Jungian Analyst, Faculty, Institute for Expressive Analysis
Shaun A. McNiff, PhD, ATR, Chairperson, Creative Arts Therapy Department, Lesley College
Through open-ended questions and discussion, this panel will discuss specific issues pertinent to this area: 1) What do we mean by healing energy? 2) The interpersonal relationship of the healing agent of art and the therapist. 3) Are there different levels of healing and can it be misused or abused? How so? 4) What kind of patients are ready for a healing? 5) Where and how can healing orientation be counterproductive to treatment? 6) Can all therapists utilize a healing approach to art therapy? 7) Specific case examples may be discussed regarding the interface of a psychotherapeutic and healing approach.

Dialogue with Editors of Publications in Art Therapy
Gary C. Barlow, EdD, ATR, Editor, Art Therapy and Professor of Art Therapy, Wright State University, 228 Creative Arts Center, Wright State University, Dayton, OH 45435
Myra Levick, PhD, ATR, Editor-in-Chief, Arts in Psychotherapy
Barbara Sobel, MA, ATR, American Journal of Art Therapy
A presentation by editorial personnel of the primary publications in our field and related fields is planned. Emphasis will be given to editorial policies and procedures, suggestions for prospective authors, ideas on manuscript preparation, and other suggestions for publication. Following the panel, the session will be open to the audience for questions.

The Quiet Trauma: Symbolic Language of the Sexually Abused Gives Predictive Clues
Dae Spring, MA, ATR, Consultant/Therapist, Consulting Services in Victimology, 361 Arapaho St., Ventura, CA 93001
Josie Abbenante, MA, ATR, Beth Silvercloud, MEd, CSW, Dianne L. Meixner, MA, ATR, and Nana Zizzin, OT

Private Practice: Ethical, Personal, Professional and State Considerations
Bobbi Stoll, MA, MFCC, ATR, Marriage, Family, Child Therapist, 8020 Briar Summit Drive, Los Angeles, CA 90046
Robert Wolf, MSc, ATR
Nancy Schoebel, MA, ATR, Director, Expressive Therapies, Psychiatric Institute of Washington
Irene E. Corbit, MA, ATR, Art Psychotherapist, Center for Creative Resources
Basic guidelines for private practice in art therapy including educational, ethical, financial and entrepreneurial demands, variations in state's laws and licensing regulations with special focus on NY, CA, TX and overview of the status of private
practitioners in other popular states. Attention will be given to art therapists' efforts to effect state legislation granting private practice privileges.

What is the Impact of PhD Studies on the Career of an Art Therapist?
Ellen A. Roth, PhD, ATR, Art Therapist/Research Consultant, Western Psychiatric Institute and Clinic, 114 Yorkshire Drive, Pittsburgh, PA 15208
Sandra L. Graves, PhD, ATR, Chair, Expressive Therapies Department, University of Louisville
Myra Levick, PhD, ATR, Director, Creative Arts Therapy Program, Hahnemann Medical College
Janie Rhyne, PhD, ATR, Psychotherapist in Private Practice
Laurie Wilson, PhD, ATR, Director, Art Therapy Program, New York University

There is a growing trend among registered art therapists to seek advanced education and training leading to a PhD degree in a related field. This panel brings together a distinguished group of art therapists to share their experiences and impressions related to PhD study. The presentation will be of interest to students planning their future academic goals as well as to seasoned practitioners who may be contemplating PhD study.

Art Education vs. Art Therapy with the Disabled: Where Do You Draw the Line?
Carole Kunkle-Miller, MEd, ATR, Art Therapist, Western Pennsylvania School for Deaf, Carlow College, 3117 Dobson Street, Pittsburgh, PA 15219
Gary C. Barlow, EdD, ATR, Professor of Art Therapy, Wright State University
Judith Rubin, PhD, ATR, HLM, Western Psychiatric Institute and Clinic

This session will feature a discussion of the divergent points of view regarding the roles and responsibilities of art therapists and art educators working with the disabled. Implications for training and practical applications will also be emphasized.

The Status of Men in Art Therapy: Yesterday, Today and Tomorrow
Herbert Rosenberg, MFA, ATR, Director, Art Therapy Studies, Jersey City State College, 408 Ogden Avenue, Jersey City, NJ 07007
Robert Ault, ATR, Menninger Foundation
Gary C. Barlow, EdD, ATR, Professor of Art Therapy, Wright State University
Ronald E. Hays, MS, ATR, Hahnemann University
CJ Joseph, ATR, Elizabeth General Hospital
Arthur Robbins, EdD, ATR, Chairperson, Art Therapy Department, Pratt Institute

Is art therapy a female profession? We don't think so but a look at the history of our field challenges a good look at the underlying issues that have kept men in disproportionate numbers. Leading men in the field discuss the issues.

The Interface of Object Relations Theory and Art Therapeutic Practice
Arthur Robbins, EdD, ATR, Chairperson, Art Therapy Department, Pratt Institute, 325 West End Avenue, New York, NY 10027
Judith A. Rubin, PhD, ATR, HLM, Western Psychiatric Institute and Clinic, 3811 O'Hara St., Pittsburgh, PA 15213
Marilyn LaMonica, MPS, Art Therapist, Clinical Supervisor, Pratt Institute
Donna Bassin, MPS, ATR, Faculty, Creative Arts Therapy Department, Pratt Institute

This is object relations theory and how does it apply to art therapeutic practice? Specific issues will be raised regarding the therapeutic management of anxiety, etc. Principles of aesthetic form will be discussed in terms of transitional process.

WORKSHOPS

How the Arts Affect Learning: Research and Use of Arts Interventions in the Public Schools
Dottie H. Oatman, MA, Art Therapist, 959/4 Arapahoe, Boulder, CO 80302
Eric Goodwin, RMT, Music Therapist
Steve Harvey, PhD, Educational Psychologist/Dance Therapist, 959/4 Arapahoe, Boulder, CO 80302

Classroom interventions using activities designed from the art, music and dance therapies were used in a research project to increase students' self-esteem and positively affect their achievement in reading. Drawing on our most successful experience, in this workshop we will draw, dance and sing in order to explore creative arts programming in the public schools.

The Memory Suitcase: A Paper and Workshop on a Technique for Facilitating the Termination Phase of Hospitalization
Diane L. Tumblin, MS, ATR, Assistant Director, Art Therapy Master's Program, Eastern Virginia Medical School, 150 Broad Street, Portsmouth, VA 23707

This is a paper and workshop presentation of a technique used with latency-aged children. The technique, "The Memory Suitcase," is designed to aid in the termination phase of the child's hospitalization. It is designed to help the child express symbolically his ideas and concerns about leaving the hospital. The Memory Suitcase can function as a transitional object for this purpose; it is only used with the child around the time of discharge. The technique will be presented in full during the presentation.

The Stimulus Drawing Technique in Therapy, Development and Assessment
Rawley A. Silver, EdD, ATR, HLM, Art Therapist/Consultant, 1600 Harrison Avenue, Mamaroneck, NY 10543

This workshop will provide experiences in using the stimulus drawings, interpreting and scoring response drawings, and in self-exploration. This technique has served as an educational tool in identifying and developing cognitive and creative skills, as well as in the diagnosis and treatment of emotionally disturbed patients.

Art Therapy in Hospice Settings
Grace Cocuzza Zambelli, ATR, Art Therapist, Consultant, 41 Coolidge Rd., Maplewood, NJ 07040
Gail Shambert Davidson, MEd, Psychotherapist, Delaware Valley Psychological Clinics
Discusant: Susan Lennon, ATR, Mt. Sinai Hospital

Many children have found art to be a useful tool when working through feelings about impending or recent loss. This paper will outline some guidelines for implementing art therapy programs in Hospice settings. Experimental training will be provided and actual case examples will be discussed.

Intrastructural Drama With Masks
Irene E. Corbit, MA, ATR, Art Psychotherapist Center for Creative Resources, 7722 Braesview Lane, Houston, TX 77071
Jerry Fryrear, PhD, Psychologist, University of Houston at Clear Lake

Fryrear and Corbit have developed a technique in which players create their own masks, then interact with aspects of themselves personified in the masks. Based upon Jungian theory of the persona, these interactions provide players the opportunity for expanded awareness and integration of the shadow side of the personality.

"Step into our Environment...": Exploring the Senses through Art with Developmentally Disabled Adults
Elizabeth Spear Rogers, MS, Art Therapist, Self-Direction Coordinator, Niagara County Association for Retarded Children, 29 Minnesota Avenue, Buffalo, NY 14222
Sensory Tactility: Use of Media with Moderately, Severely and Profoundly Disabled Individuals
Jacquelyn Martin, ATR, Art Consultant, County of Summit Board of MR/DD, 214 No. Portage Path, Akron, OH
This workshop will focus on the utilization of sensory-tactile media for clients who are moderate, severe or profoundly disabled individuals. Areas of discussion and demonstration will include increasing attention span and visual attention to task, improving fine motor skills and decreasing tactile defensiveness.

That Magnificent Metaphor: Art Therapy’s Unique Tool
Don L. Jones, ATR, Director of Adjunctive Therapy, Harding Hospital, 490 Mid Drive, Worthington, OH 43085
Karen Rush Jones, ATR, Art Therapist/Lecturer, Capital University
A combination paper, case dramatication and workshop to explore metaphor and its unique role in evoking feeling and revealing insight into unconscious conflicts. Presentation illustrates the use of metaphorical dialogue, an “interpretation within the metaphor” rather than a direct verbal intervention or analysis.

Combined Art and Movement Therapy Group: Paper and Workshop
Barry M. Cohen, MA, ATR, Director of Expressive Therapies, Mount Vernon Hospital, 859 Richmond Hwy, #302, Alexandria, VA 22309
Beth Kaplan, DTR, Movement Therapist
An art and movement therapy group is discussed in this paper and demonstrated with audience volunteers in a workshop format. Designed for use with psychiatric inpatients, this structure may be employed in many populations. Aspects of the Expressive Therapies continuum will be correlated with constructs from Effort Shape Analysis. Slides will be shown.

Exploring Dimensions of Stimulation and Structure as a Means of Facilitating a Holding Environment
Leslie Abrams, MPS, ATR, Assistant to the Chairperson, Pratt Institute, 1 Bank Street, #5N, New York, NY 10014
Participants will explore some of the problems inherent in the breakdown of stimulus barriers that are connected with ego disintegration and how the expressive group art therapist facilitates reintegration and synthesis.

Grants: Creating Job Connections
Doris Arrington, MAT, ATR, Director, Assistant Professor, Master in Art Therapy Program, College of Notre Dame, 30 Knollcrest, Hillsborough, CA 94010
Valerie E. Appleton, MA, MFCC, ATR, Art and Play Therapist, St. Francis Memorial Hospital
Cathy A. Malchiodi, MA, ATR, Instructor of Art Therapy, University of Utah
David Anderson, San Francisco, CA
Pat Keeffe, ATR, Hillsborough, CA
Art Therapy graduates, educators and professionals will share experiences in the creation and realization of grants as job sources. The “how to’s” and the consideration of the broad creative options available to professional art therapists in this hi-tech age will be shared.

How to Create an Effective Experiential Inservice
Barbara Fish, MA, Art Therapist, Allendale School, 1635 W. Touhy Ave., #1N, Chicago, IL 60626
An experiential art therapy inservice can be helpful in the development of a productive working relationship between the art therapist and the staff at any facility. This workshop will demonstrate an experiential art therapy inservice. Following the example media exercise, practical considerations of setting up an inservice will be discussed.

Picture Making for Peer Group Supervision
Harriet Wadeson, PhD, ATR, Director, Art Therapy, Graduate Program, University of Illinois at Chicago, 1020 W. Oakdale, Chicago, IL 60657
The power of the image can be utilized for reflection and communication in supervision. This workshop will present a model for art therapy peer group supervision using picture making for feedback. The process can also be adapted for group supervision from a supervisor.

Discovering the Creative Self in Later Life: Being Creative at Any Age
Helen Weil, MA, ATR, Art Therapist, Educator, Artist, Marble Hill Senior Citizens Center, 40 West 86th St., New York, NY 10024
The session will be experiential and didactic for those working with the elderly and interested in creativity as relating, to longevity and the quality of life. Methods of stimulating the client/patient will be demonstrated by participants through role-playing, involving art materials and several other creative expressive modalities.

Burnout: What Is It and How to Get Rid of It
T. Thorne Wiggers, EdD, Coordinator of Outreach and Consultation, George Washington University, 718 21st St., NW, Washington, DC 20052
Sandy Geller, ATR, Coordinator of Art Therapy Services, George Washington University
This workshop will define burnout and provide information about its causes and symptoms. Using cognitive-behavioral and art therapy experiences participants will identify aspects of themselves and their jobs that contribute to burnout and will learn how to gain more control as a way of inoculating themselves.
A New Hawthorn Center Teaching Film

Stevie's Light Bulb:
Graphic Art in Child Psychiatry

Awarded Blue Ribbon as Best-in-Category
American Film Festival, New York, 1984

Awarded Grand Prize
American Art Therapy Association Film Festival, 1984

Written by Ralph D. Rabinovitch, M.D. and Sara Dubo, M.D.

Produced by Ralph D. Rabinovitch, M.D. and Francis C. Pasley, M.D.

"STEVIE'S LIGHT BULB is a stunningly effective example of both thematic organization and an innate understanding of film's relentlessly honest power. Without sacrificing the responsibility of contributing to the field, STEVIE'S LIGHT BULB has a clinical effectiveness that won't soon be forgotten by anyone who watches it."

From a review in Art Therapy
by Eddie Cockrell
American Film Institute Theater
The Kennedy Center, Washington, D.C.
Writer of "Films Talk" in
The Washington Post

STEVIE'S LIGHT BULB illustrates the uses of graphic art in child psychiatry through applications in diagnosis and treatment. The film covers 35 years of involvement by the authors. Numerous case studies demonstrate the elements of graphic art that are crucial in work with disturbed children. Eight young artists appear; the work of sixty others is shown. The film is directed to the interests of workers in mental health, art therapy, education and related fields, as well as to an interested general public.

76 minutes in two parts: PART I—41 minutes; Part II—35 minutes
Available in FILM 16 mm, color and VIDEO CASSETTE VHS, Beta and 3/4"

PURCHASE PRICE: Film—$695 Video—$225
RENTAL FEE: Film—$50 for three days Video—$40 for three days

A Question of Creativity: Paradigms—Facilitators or Inhibitors?

Harriet Wadeson, PhD, ATR

C. G. Jung wrote: "I can only hope and wish that no one becomes 'Jungian'. . . . I proclaim no cut-and-dried doctrine and I abhor 'blind adherents.' I leave everyone free to deal with the facts in his own way, since I also claim this freedom for myself." The special genius of Jung or Freud enabled each to transform his own unique experience into a new way of viewing human life. In his own conceptual structuring, Jung did not remain a "blind adherent" to another's ideology, but in fact parted company from Freud.

Although those of us engaged in developing and refining the profession of art therapy may never reach the stature or the impact of a Jung or a Freud, nevertheless we work in a field fertile with opportunity for creative exploration. Furthermore, the very nature of our work is the encouragement of the creative. It seems ironic to me, therefore, that often we become the "blind adherents" Jung abhorred. We become "Jungians" or "Freudians" or whatever.

I am not suggesting that we discard the teachings of Jung, Freud and the many others who have informed our work. But I would like to see art therapists gain greater respect for and confidence in our creativity. Just as we have much to learn, we also have much to teach. Who is better prepared than art therapists to encourage and to understand the use of image-making for personal human development?

As a young field, we have struggled for our place in the sun among the older sturdier professions of psychiatry, psychology, social work, education and others. Often working in a setting as the lone art therapist among other more established professionals, lacking the presence of art therapy role models, some of us may be isolated; some of us may model ourselves on seemingly more successful professionals from other disciplines. Needing a theory or an approach to support our efforts, we may look to a Jung or a Freud for guidance.

In so doing, we may neglect the very heart of our work: creativity. We encourage it in our clients, but sometimes forget its place in our own work. We recognize that in conducting art therapy, the practitioner must be creative in working with clients rather than depending on prescribed formulas. But do we consider that in a larger sense art therapists have the creative potential to become who we are—art therapists, rather than Jungians or Freudians using art? Most of us would agree that art therapy is more than a technique. But it seems to me that sometimes we operate otherwise. Such was my impression from attending the last A.A.T.A. Conference. For some of us, art is merely a method used in the context of a larger theoretical framework.

A narrow adherence to another's doctrine limits our vision. To use Jung as an example, his concepts provide a useful paradigm for many art therapists. As a creative thinker, he is an exemplary model. It is in this light that I believe he is an illuminating guide. His vision encourages us to take from him what we can use and to create our own vision. It is time for our young profession to grow beyond our parents, to go forth from the houses of our fathers and mothers (such as Jung and Freud), and to articulate the centrality of art and imagery in self development and in the therapeutic relationship.

Book Reviews

Phototherapy in Mental Health

Reviewer: Shaun McNiff, PhD, ATR is Professor of Expressive Therapy and Dean of the Institute for the Arts and Human Development, Lesley College Graduate School, Cambridge, MA. He is also the author of The Arts and Psychotherapy (Springfield, IL: Charles C. Thomas, 1981).

Phototherapy in Mental Health follows the previous books co-authored and co-edited by Jerry Fryrear (Videotherapy in Mental Health and The Arts in Therapy) in defining the field addressed in a manner which respects varied points of view and advances the interests of the whole. The Introduction, written with co-editor David Krauss, discusses eleven dimensions of phototherapy: "The evocation of emotional states: the elicitation of verbal behavior; modeling; mastery of a skill; facilitation of socialization; creativity/expression; diagnostic adjunct to verbal therapies; a form of nonverbal communication between client and therapist; documentation of change; prolongation of certain experiences; and self-confrontation."

The book includes twelve chapters on various phototherapy themes written by the editors and contributing authors. Fryrear's chapter, "photographic Self-Confrontation as Therapy" presents a practical overview of the literature and process of self-confrontation, which can be considered an essential element of both photo and video therapy. Fryrear's well-documented presentation offers an effective integration between clinical work and theory.

Alan Entin's chapter, "The Family Photo Album as Icon: Photographs in Family Psychotherapy" presents many provocative ideas for the creative use of photographic imagery in psychotherapy. The author explores possibilities for the "visual" analysis of family systems through family albums which offer information about earlier generations; relationships between family members; the identification of "favorite" and "hated" photographs; the photographing of one family member more than others; etc. The author describes how, during periods of stress or conflict, photographic patterns often change with a certain family member being absent. The author tries to connect his interesting personal ideas and experiences with family photographs in therapy to Bowen's family systems theory, which unfortunately tends to weaken rather than strengthen this creative and original chapter.

Judy Weiser's "Using Photographs in Therapy With People Who Are Different" offers an excellent and detailed case study of the role of photographs in a long-term relationship with a Native American girl who began working with the author at the age of nine. This case study helps to personalize the book, adding emotional and artistic depth through the story and the author's photographs of the child. Other chapters include Robert Wolf's presentation of the medium of instant photography combined with children's drawings. The Wolf chapter is thorough and comprehensive in its treatment of the visual medium and its place within the psychodynamics of the more general therapeutic relationship. Illustrative case materials are also presented.

Joel Walker's discussion of "The Photograph as a Catalyst in Psychotherapy" offers a series of stimulating and attractive photographic images which "though basically abstract, are representational enough to imply either singular thoughts or actions, or relationships between individuals." Walker's chapter suggests possibilities for artistic, personalized and more therapeutically oriented transformations of the standardized and more rigid TAT and Rorschach tests. The photos are described as "ambiguous images of suffused color and shadowy form that attempt to leave everything to the imagination."

There is a humanistic tone to Walker's chapter. The photographs used in the therapeutic work were taken by the author himself, and they seemed to serve the purpose of engaging him in a process of shared creativity with clients. He is engaged as both an artist and a therapist, utilizing projective qualities of the visual image adapted by both art therapy and psychology. This chapter demonstrates how the personal interests of therapists and clients can shape methodology, and how ultimately it is the person who is the therapeutic vehicle. Walker stresses how "the visual impact overshadows the verbal defensive repertoire," and how "the photograph as a catalyst in psychotherapy should not be viewed as a strategy in and of itself, but rather should be utilized as an integral part of the psychotherapeutic process."

"The Psychological Niche: The Auto-Photographic Study of Self-Environment Interaction" by Ziller, Rorer, Combs and Lewis, presents an overview of the principles of self-concept and self-presentation within a more general cognitive orientation theory. As a result of being cited by a number of authors, the work of Dr. Hugh Diamond of
England in the 1850's in photographing the "insane" is marked in the memory of the reader. This historical information and other nineteenth century precedents cited in the book give a sense of continuity to the therapeutic use of photos. Historical information could have been furthered through the inclusion of historical photographs. David Krauss ("Reality, Photographs and Psychotherapy" and "The Visual Metaphor: Some Underlying Assumptions of Psychotherapy") contributes reflections on the "underlying" themes of symbol and metaphor, the psychodynamics of perception, reality, culture, visual imagery, etc. From a practical perspective the message comes through that photography supplies "a vast amount of information" to the therapeutic relationship, both in terms of communication and client projections, often presenting material that people avoid or of which they are unaware.

Krauss, like all of the contributing authors, approaches photography as one of many modes of communication available to therapists and clients, and as a means through which "visual" imagery can be introduced. Krauss' discussion of image and metaphor reflects the book's more general lack of attention to photography as an artistic process, and the many parallels between photography and art therapy. A chapter dealing with these issues would have increased the depth and scope of the book.

Art, however, has a way of always manifesting itself in works of quality, and in this book it is in the form of Krauss' personal photographs, included between the chapters and introductory pages. The sensitivity, technical quality and visual appeal of these images increased my desire for a discussion of "imagery," and a serious analysis of how psychotherapy relates to other "visual" art therapies.

Although certain art therapists may declare that phototherapists are members of a distinct discipline, and vice versa, it is an undisputed fact that both are united in the primary attention focused on the visual image. It is also generally accepted that photography, together with painting, drawing, sculpture and other media, is a visual art. Additional attention and inquiry directed toward the imaginative and informal qualities of photographs could benefit both phototherapy and art therapy. The image as a reality unto itself deserves additional attention.

The scholarly and professional tone of *Phototherapy in Mental health* will give a big boost to the practice of phototherapy. The attractive layout and high quality materials used by Charles C. Thomas to produce the book will similarly contribute to the "image" of the work, and result in yet another contribution to the literature of the creative arts in therapy.

Psychoanalytic Perspectives on Art . . . A Review of Three Books

Portraits of the Artist:
Psychoanalysis of Creativity and its Vicissitudes
(303 pages, $20.00)

Picasso: Art as Autobiography
(304 pages, $10.95 paperback)

Psychoanalytic Theory of Art:
A Philosophy of Art on Developmental Principles
(169 pages, $11.50 paperback).

Reviewer Judith A. Rubin, PhD, ATR is Assistant Professor, Department of Psychiatry, University of Pittsburgh School of Medicine; and Co-Director, Creative and Expressive Arts Therapy Program, Western Psychiatric Institute & Clinic, Pittsburgh, Pennsylvania. She is also a graduate and member of the Faculty-by-Invitation of the Pittsburgh Psychoanalytic Institute.

Three exciting new books—one by a psychiatrist, one by an art historian, and one by a philosopher—offer distinct and stimulating psychoanalytic perspectives on art and the artist. As an undergraduate art history major, this reviewer was quite intrigued by the light shed on that discipline by all three volumes. As an art therapist and psychoanalyst, the most exciting aspect of all three books was their ability to illuminate aspects of the creative process and the art product heretofore either shadowy or not visible.

One reason for the quality of all three books is the genuine interdisciplinary understanding of their authors. It is not uncommon for books on art by analysts or on analytic approaches by aestheticians, to be flawed by the writer's incomplete comprehension and presentation of concepts foreign to his/her primary field of expertise. This is equally true of much writing on art therapy by non-artists or non-clinicians. It is also regrettably valid for some publications by art therapists, which attempt to deal with ideas from related—but incompletely digested—
disciplines. Each of these books, however, provides a welcome model of how two or more perspectives can be fruitfully integrated by a serious investigator.

Dr. Kuhns, in a most original synthesis of early and recent psychoanalytic thought, develops and describes his own "enactment" theory of art, applying it both to the creative product and to the cultural tradition of which it is a part. His reliance on classical literature, particularly some relevant works by Freud, does not inhibit him from selectively integrating those later ideas and concepts which allow him to expand and explicate his ideas. He draws creatively on the work of Hartman, Kris, Winnicott, and Kernberg in a way which indicates his deep understanding of each man's contribution.

While this reviewer is tempted to share with the reader some of the specific notions espoused by Kuhns, it seems unfair to deprive anyone of the immense pleasure of following the author, step by step, in his careful exposition of his clever and provocative thesis. I can recommend the journey to anyone with even a slightly philosophical bent. An especially appealing aspect of this guide is his ability to put complex ideas into clear and simple language, rendering the book accessible to even the less-sophisticated reader.

John and Mary Gedo are not only authors of two related books; they are also husband and wife. He is a psychiatrist and psychoanalyst, with an impressive list of publications to his credit, including Advances in Clinical Psychoanalysis (1981), Beyond Interpretation (1979), and Models of the Mind (1973, co-authored with Arnold Goldberg). She is an art historian who has shared and developed her ideas not only within that community, but also in the lively milieu provided by Institute for Psychoanalysis in Chicago.

Mary Gedo's book on Picasso is subtitled "Art as Autobiography," which is an apt description not only of her hypothesis, but also of her research method. In essence, she studied the artist's life by studying his creations, paying close "attention to how, when, where, and why he created each of them." As she describes in her Introduction, she "carefully noted alterations in his medium or mode of production and correlated such changes with events in his life." Assuring the reader that she approached this study without preconceptions about Picasso's personality conflicts, Dr. Gedo states that "the evidence shaped her conclusions." This is a simple but profound statement of diagnostic integrity. I think the author's subsequent words bear repeating, since they apply equally well to work in assessment by art therapists: "...the hypotheses I developed fit the visual evidence, providing internally consistent reconstructions of the relationship between the artist's character and his creativity."

Dr. Gedo's most intriguing conclusion is that "Picasso's art, like his life, depended on partnerships." Her detailed rendition of his history of partners, from mother and father through mistresses, wives, and colleagues, is a fascinating and well-documented tale. Picasso's inner life, like his art, never fails to intrigue the reader with its complexity and many levels of meaning. This reader was also stimulated to reflect on the "partnership" of therapist and patient in art therapy. The natural liaisons described by Mary Gedo are similar to that between Freud and Flies, who served as transferees-object for the former's pioneering self-analysis. Since then, the analyst or therapist has served in a variety of ways as "partner" to the patient undergoing the exciting but frightening process of change. In art therapy, there is the additional component of the creative process of art-making, within a matrix provided and protected by another person. It seems to me that the art therapist plays a kind of "partnership" role in the creative work on both art and self of the patient in treatment. Mary Gedo's analysis of the function of his "partners" in Picasso's creative work helps us to think more deeply about our own roles as "partners" in art therapy.

While many ideas were stimulated by Mary Gedo's "artobiography" of Pablo Picasso; even more were evoked by John Gedo's wide-ranging book, Portraits of the Artist. Most exciting was Dr. Gedo's integration of insights derived from seeing creative patients in analysis, with ideas drawn from the psychoanalytic study of famous artists and theorists. His subtitle, Psychoanalysis of Creativity and its Vicissitudes, "while appropriate to the content, does not begin to describe the richness of this book. While it may sometimes be necessary, to make a choice between a "depth" and a "breadth" mode of inquiry or presentation; Dr. Gedo has impressively accomplished both depth and breadth throughout this stimulating volume.

The first two chapters, in a section entitled: "Psychosanalytic Studies of Creativity: A Retrospect," offer the finest review and discussion of that literature this reviewer has read. The four chapters of clinical studies which follow are written in a novelistic narrative form, and are fascinating to read on a human level. On a conceptual level, Dr. Gedo leads the reader through the "material" via his own psychoanalytic perspective, to a number of prescient hypotheses about the nature of creativity.

One chapter which is sure to interest the predominantly female members of the field of art therapy is entitled "Barefoot and Pregnant: The Dilemma of the Woman Artist." The third section includes psychoanalytic considerations of creative individuals in the arts; offering new perspectives on even the much-studied painters Van Gogh, Gauguin, and Picasso, along with provocative analyses of Caravaggio and Nietzsche.

A series of chapters are devoted to the creative work of the two great psychoanalysts, Sigmund Freud and Carl Jung, including the role played by each in the life of the other. A final chapter discusses the dilemma of our time: "The Artist and the Age of Mass Culture: Prophet in the Wilderness" into what has too often been a jungle of heated, tangled conjecture, Dr. Gedo brings a welcome breath of clear, fresh air.

The book is an aesthetic as well as a scholarly delight to read, and is highly recommended.
The Mind's Best Work

Reviewer Dr. Jack Matthews is Professor of Speech and Theatre Arts, and also has an appointment in the School of Dental Medicine, University of Pittsburgh, Pittsburgh, Pennsylvania. He was awarded his PhD from the Ohio State University. He has a lifelong interest and experience in the crafts, and has devoted much professional work toward studies of creativity.

This is more than just another attempt to describe or explain the creative process. It does present explanations others have given but it goes far beyond. This is a book which brings together many explanations of creativity that have been advanced over several centuries. The explanations are examined both from the standpoint of their logical consistency as well as the empirical data available to support or to question the explanations. Perkins allows us to observe him as he goes through the process of stating some preliminary propositions about the creative process and of revising those propositions as he carries out experiments and thinks about his findings.

In a sense he "walks us through" the laboratory of his own mind. It's a pleasant journey because his is an alert and creative mind and because it's the mind of a scientist-artist who is interested in both poetry and science. In addition he writes good prose. He has produced a book which students of creativity—artists and scientists—should read to gain additional insights into the creative process.

Writers on creativity have described how in one night as Mozart was hardly able to keep awake he composed the overture to Don Giovanni; we have been led to believe that in Beethoven we had a composer who improvised with great ease but labored over every note in the process of composition.

Coleridge would have us believe that he conceived Kublic Khan in a dream brought on by opium. The actual writing supposedly was accomplished in a single sitting.

Poe, on the other hand claimed that the "Raven" was worked out with the precision and rigid consequence of a mathematical problem.

Perkins has examined numerous examples of the creative process as carried out by both artists and scientists—Picasso, Darwin, Marie Curie as well as numerous published poets. He provides us with their descriptions of what happens as they create. The descriptions are derived in part from what the artists and scientists wrote about the creative process. These explanations are supplemented by a series of more controlled observations in which the creative individual is asked to talk about the creative process immediately following the creative act. Perkins argues that such controlled observations do not unduly impede the creative process and result in more accurate information about what goes on in the process of creating.

Perkins' goal is to get a better picture of what the mind is doing during the process of creating—a time when the mind "is working at its very best."

Perkins examines a number of propositions which have been used or which might be used to explain the process of creating. He musters evidence to support and to question each of the propositions and moves on to reject or revise propositions. In this process he offers propositions about mental leaps, introspection, insight, directed memory, etc.

In the end we are led to believe that we should not oversimplify creativity nor treat it as some mysterious entity. He argues instead that creativity should be viewed as the extension and orchestration of perception; understanding and memory—all ordinary everyday abilities about which we have much information and which can be investigated by widely accepted methodologies developed by psychologists working in many areas of the discipline.

If I were forced to give shelf space to only one book on creativity I believe that today the book would be D. N. Perkins The Mind's Best Work.

Guidelines for Authors

Please submit four (4) copies of manuscripts to: AATA Journal, 1980 Isaac Newton Square South, Reston, VA 22090. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8 1/2 x 11 inch bond paper, with at least 1 1/2 margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.
Silver Drawing Test of Cognitive and Creative Skills

Rawley A. Silver, EdD, ATR, Seattle: Special Child Publications, 1983
(96 pages with black and white illustrations)

Reviewer: Ellen G. Horovitz, MA, ATR, is an art therapist at Hillside Children's Center, teaches art therapy at Nazareth College in Rochester, NY, and is in private practice. She is also on the national advisory board of Substance Abuse Intervention Services for the Deaf (SAISD), and is on the membership committee of AATA.

Finally someone has introduced a non-verbal test that can be used for screening cognitive abilities and measuring developmental gains over time through pretest-posttest administration. That person is Dr. Rawley Silver.

The objectives in designing the Silver Test for children and adults were: a) to create a tool capable of identifying skills which often elude detection on language-oriented intelligence/achievement tests; and b) to provide a pretest-posttest measure proposed to test the efficacy of educational/therapeutic programs.

Dr. Silver's premise is that "art can be a language of cognition paralleling the spoken word." (p. 5) Her aim is to bypass language and graphically assess conceptual problems basic to the "fundamentals in mathematics and possibly reading." (p. 11)

The body of the manual is 33 pages long and consists of an introductory chapter and sections on research and administration of the test. The remaining chapters offer extensive scoring samples (with illustrations and short case histories), tables of statistics and a reference section.

The battery is divided into three subtests: 1) Predictive Drawing—which evaluates the subject's understanding of sequential concepts and principles of conservation; 2) Drawing from Observation—which measures the subject's ability to perceive and represent spatial relationships; and 3) Drawing from Imagination—which determines the subject's capacity to form concepts, particularly that of class inclusion.

Performance in each area is rated on a scale of 0-5, (5 being highest), with a maximum of 15 points per subtest and a total score of 45 points. The test is succinct and can be administered to individuals or groups by teachers, therapists or psychologists.

Nevertheless, its concise quality has both positive and negative aspects. On the negative side, it offers the administrait less data for purposes of correlation and test reliability. When comparing the correlations of the Silver Test to intelligence/achievement tests, such as the WISC-Performance, WAIS-Performance, Metropolitan Achievement Test (MAT), Otis Lennon, and the Canadian Cognitive Abilities Test (CCAT), the Silver Test falls short of the mark. Yet it is difficult to fault the Silver Test for this shortcoming given the opinion of noted authorities such as MacCay Vernon, who states "neither the methods of diagnosis nor the appropriate therapies are completely known" when dealing with non-verbal populations. (p. 220) Dr. Vernon looked at several verbal instruments including the WISC-Performance and WAIS-Performance. Although he found the WISC-Performance and WAIS-Performance adequate, he repeatedly stated their limitations when working with a non-verbal population. (p. 208-211) One wonders how he would have viewed the Silver Test.

The Silver Test indicates great promise. Its brevity is useful for subjects with histories of limited attention span. In addition, the subtest, Drawing from Observation, measures areas untapped in many of the language-oriented instruments. As a pretest-posttest, the Silver Test is an excellent gauge for charting educational/therapeutic programs. The Silver Test's ability to measure art therapy (treatment) over time, fills a previous void and creates the potential for impacting related clinicians and commanding greater respect for the field. It could very well become an invaluable assessment tool offering the art therapist an avenue to monitor theoretical findings. For the theorist seriously interested in validating art therapy (treatment) through pretest-posttest administration, the Silver Test is a must.

The Honesty of the Image.

Stevie’s Light Bulb: Graphic Art in Child Psychiatry
Best-of-Festival Award, American Art Therapy Association
1984 Film Festival

Film (16m, color, 76 minute in two parts: 41 minutes and 35 minutes; also available on VHS, Beta or 3/4" videocassette). Produced by Ralph D. Rabinovitch, M.D. and Francis C. Pasley, M.D.

Reviewer Eddie Cockrell is a film consultant and teacher based in Washington, D.C. Currently, his "Film Talk" column appears in the Washington Post. He is also programming The American Film Institute Theater at The Kennedy Center.

The non-fiction film is a difficult genre in which to work. Effectiveness and responsibility are rarely in evidence simultaneously; filming real life in real time rarely yields significant drama. To hold the interest of an audience (be they professionals or laypersons), it is often necessary to jazz up the flow of events through editing or other film techniques, thereby violating the purity of the documentary form. If observation alters the event observed, as many film theoreticians feel, then how on earth, especially in this media-conscious age, is it possible to use the documentary film as a teaching tool—particularly in such an arbitrary, mysterious world as child psychiatry?

Ralph D. Rabinovitch, M.D., Director of Clinical Research for Michigan's Hawthorn Center, has assembled a clinical film team that has, to date, produced six teaching films in child psychiatry. Their most recent effort, Stevie's Light Bulb: Graphic Art in Child Psychiatry, is a stunningly effective example of both thematic organization and an innate understanding of film's relentlessly honest power. Through clarity, organization, and a simplicity born of care, the team has made a movie that reveals a methodology of discovering the fantasy life of disturbed children with a words and pictures that are of interest to all. Without sacrificing the responsibility of contributing to the field, Stevie's Light Bulb has a clinical and emotional effectiveness that won't be forgotten by anyone who watches it.

"While this is a teaching film," says "Dr. R." (as he is familiarly known to his patients) near the beginning of the film, "it is hopefully not too didactic. To identify with children's creativity, one really should relax, kind of lose oneself, and just enjoy the experience. For the next hour, we are the guests of Stevie and his fellow artists." A little later on, he opines "Free expression often can and should be fun, enjoyed by child, teacher, and therapist. A too didactic or interpretive approach may well take the joy out of art, and may also lead to unwarranted conclusions. Is Stevie's light bulb really only a light bulb? Only Stevie knows, and he won't tell. If we plague him with our conjectures, he may well come to exclude us from his fantasies. He loves to create, and that's good enough. Most important, through his creating and sharing in therapy, he is beginning to find language for communication."

Accepted clinical doctrine aside, here is a man who knows how to communicate. While it is far beyond this reviewer's scope of experience to critique the methodology employed, as a full-time film critic with a special interest in the documentary format, rest assured that films like Stevie's Light Bulb don't come along very often. The majority of films in this genre tend to be dry, serious pieces that do very little more than attach pictures to a thesis. In this film, Dr. Rabinovitch and his team have had the good sense to do what any filmmakers should do when confronted with such a visual subject: point the camera at it and wait.

Mostly a series of static interviews intercut with examples of artwork, Stevie's Light Bulb succeeds primarily because it doesn't rush or manipulate its subjects. If you've ever been near a film set, you know that the bizarre-looking equipment and hot lights can be terribly intrusive in a real-life situation. Film consultant and editor Christa Kindt and cinematographer Lawrence W. Trinkaus have somehow managed to create an on-screen environment that doesn't appear to intrude on the therapeutic process—without sacrificing technical quality. Similarly, the original music of Dana Newhouse avoids the irritating cliches so often used in films of this sort (plaintive pianos, busy reeds), choosing instead to complement the mood of the art without making a direct comment on it.

Working in tandem with fellow psychiatrists Dr. Francis Pasley and Dr. Sara Dubo (Mrs. "Dr. R."), Rabinovitch has filtered 35 years of work into the film's existing format, which features eight young artists on-screen and representative works by 60 others. Using the title patient, and his board construction of a light bulb, and drawing of an alphabet as the central metaphor of the film, the doctors have arranged the content into an exploration of elements of drawing and painting. This is followed by a variety of clinical applications. Subdividing the elements of drawing and painting into form, affect, content, defenses, and symbols, the art is examined economically, yet completely.

As important as the individual team contributions
are to the success of the film, it is Rabinovitch's vision and presence that makes the movie move. Sort of the Marlin Perkins of child psychiatry, Rabinovitch has a folksy, sing-song tenor that relates the voluminous narration with unfailing enthusiasm. While most of his on-camera involvement is secondary to the main action (and rightly so), he appears to be a natural—relaxed and photogenic. This kind of figure acts as a conduit to the viewer, making even the most clinical passages of the film understandable.

The five other films in the team's series cover reading disabilities, early infantile autism, and inpatient psychiatric treatment for deaf children. If these works are as cogently organized and technically polished as Stevie's Light Bulb, they deserve to be in any film library that needs information on these subjects.

Incidentally, Stevie's Light Bulb also was awarded the Blue Ribbon at the highly-regarded American Film Festival in New York City last year as the best film in its category. The film or videocassette is available for rental or purchase through Hawthorne Center Films, Hawthorne Center, Northville, MI, 48167. Orders may be phoned in at (313) 349-3000.

---

**With Eyes Wide Open**

Documentary film (16mm, color/sound, 1983, 58 minutes) by Laurence Becker and Ron Zimmerman

*Reviewer Georgiana Jungels, ATR, is in Art Therapy Studies, Art Education Department, State University College at Buffalo, New York.*

The film *With Eyes Wide Open* documents the life of Richard Wawro and includes over 200 of the 3,000 pictures he has made in his lifetime. The film focuses on his life and art from his early years and first drawings to his current pictures, daily activities, travels, and exhibits. Who is Richard Wawro? He is an artist and his preferred medium is oil-crayon. His drawings have been shown in London, Paris, Krakow, and the United States and his "pictures are filled with trains, boats, cars, buses, space ships, and airplanes."

Through interviews and comments we learn that Richard was born in Scotland in 1952 with cataracts in both eyes, was diagnosed as deaf, displayed autistic behaviors and appeared "hopelessly retarded." Although Richard began drawing before he was 4, "he didn't speak out-loud until he was eleven." At home he was "constantly moving and slept only infrequently." When Richard was 12, a Polish art professor, Marian Bohusz-Szyzko, said he was "thunderstruck" by Richard's drawings and urged his parents "to do everything they could possibly do to develop Richard's talent."

In the film we see Richard's pictures are "everywhere" in his parents' home; "in the bedrooms, in the living room, in the dining room. There are stacks of newly completed pictures waiting to be matted, catalogued and exhibited. Even the stairway leading to the attic is lined with early pictures, each one displaying a consistent, developing style." Throughout the film Richard's drawings are constantly present. It is obvious that "drawing takes up most of Richard's time" whether he is at home, or at the adult occupation center he attends every day, or visiting his brother in Glasgow, or traveling through Europe with his father, or in the United States with Laurence Becker (the film producer). He is "almost totally aware of everything around him" and "with his binoculars, Richard seems to be constantly searching for new images. He's like a blotter soaking up every detail, visual elements that might show up even years later in one of his paintings."

The footage in the film *With Eyes Wide Open* is almost equally balanced between the PEOPLE who are significant in Richard's life (his mother, father, brother, teachers, neighbors, the filmmaker/producer) and the PICTURES that Richard has made throughout his life. The film documents Richard Wawro's past and present through real-time contemporary scenes from his daily life, through a review of his collected pictures, and through interviews and commentaries with the people who know Richard.

The most significant footage in this film is the retrospective review of Richard's pictures and the scenes of Richard working on his pictures. "He works close to the surface with his eyes just inches away...and drawings may have half a dozen layers of color...the colors blend and then reflect light together." The film narrator observes that Richard "has a phenomenal memory for places, dates and pictures. He can remember when and where he finished most of his drawings and can calculate the years since that time." Although his pictures reflect his daily life, his travels, or the images he sees in magazines or on television, "he never looks directly at anything while he is drawing" and his pictures "are not simply literal images of what he's seen. He adds and subtracts, rearranges and organizes." His brother Michael has noticed that "the content of his pictures is determined by the size paper given him." These observations are well-illustrated in the making of the picture *Mountains of New Zealand at 30,000 Feet.*

*With Eyes Wide Open* presents an excellent collection of Richard Wawro's pictures and provides the viewer with an "inside" view of both the art work and the artist. The film includes some very special events in Richard's
life and there are the “important” moments that every documentary filmmaker hopes for (e.g., the first time that Richard signs a picture). The viewer is frequently reminded that there is a contrast between Richard’s artistic abilities and his physical disabilities. “Richard is an artist with a special vision responding through his pictures with strong feelings to world events. He continues to express himself most articulately through the medium he knows best: the color crayon . . . when Richard talks about his own pictures, he’s active and articulate.”

The film With Eyes Wide Open has been edited to present the “successful” development of Richard Wawro from a profoundly handicapped child to an internationally exhibited artist. The strength of the film is in the documentation of Richard Wawro’s pictures and their relationship to his life. It is very clear that Richard Wawro’s life and art work have been nurtured by many dedicated people: his parents who refused to follow one doctor’s advice to “put Richard in a home and forget him”; the neighbor in whose kitchen Richard “first discovered a piece of chalk”; the teacher who provided him with paper and crayons and reflected that “it is difficult to describe the emergence of his first picture: so unexpected it was . . . what I saw was magic”; his brother Michael who “has continued to encourage Richard to take new and even bolder steps toward selfhood”; and the film producer who has spent years on this film to prepare a “personal view of a disturbed and disabled little boy who, through his art, is becoming a young man with joy and confidence in his work, in his world, and in himself.”

The film With Eyes Wide Open is well-photographed and includes many memorable scenes from Richard Wawro’s adult life and hundreds of examples of his first drawings to his current pictures. However, the overall impact of the film would have been stronger if the film had been edited to focus more on the documentary footage of Richard Wawro and his family and less on the people who were involved in the making of the film. The beginning and ending film sequences could have been eliminated and some of the factual information (e.g., the fact that Richard eyes had been misdiagnosed for more than 25 years) incorporated into the voice-over comments.

The strength of the film is not in the interpretive comments about Richard Wawro’s art work and life but rather in the fact that the film provides the artist with a broader forum and makes a significant statement about the potential of art.

I would recommend that the viewer approach this film in the spirit suggested at the beginning of the film and “try not to have too many preconceptions about Richard. Keep your mind open; watch Richard yourself.”

For further information about the film, contact the producer, Dr. Laurence Becker (Creative Learning Environments, 507 Park Boulevard, Austin, Texas 78751) or the filmmaker, Ron Zimmerman (Zimmerman & Associates, 411 Bonham, San Antonio, Texas 78215).

Kutztown University presents
ART EDUCATION STUDY INSTITUTE
Art in Action for Exceptional Learners
JUNE 23-28, 1985

The institute will offer an opportunity for teachers and other professionals who work with atypical persons to interact with nationally known experts in the field. A concentrated program will provide instruction and inspiration for professional development.

INSTRUCTIONAL STAFF
• Dr. Gary C. Barlow, Wright State University, Dayton, OH
• Dr. Shaun McNiff, Leslie College, Cambridge, MA
• Dr. Sondra Gair, Educational Management Services, Washington, DC
• Ms. Ellen Granett, Academy School, West Brattleboro, VT
• Mr. Theodore Salazar, Gallaudet College, Washington, DC
• Ms. Susan Aach, school for Blind Children, Pittsburgh, PA

For further information write to: Dr. John R. Sawyer, School of the Visual and Performing Arts, Kutztown University, Kutztown, PA 19530.
The Canadian Art Therapy Association Journal has recently begun publication (Fall & Winter, 1984-85, Volume I, Number 1). As stated in the information for contributors, "The Journal is dedicated to publish scientific papers dealing with all aspects of Art Therapy." For information, contact: Editor, Canadian Art Therapy Association, 216 St. Clair Ave. W., Toronto, Canada M4V 1R2. The Editor and Editorial Board of Art Therapy, the Journal of the American Art Therapy Association, offer our congratulations for the establishment of this new Journal in our professional field.

* * *

The British artist and art therapist, Edward Adamson, and psychologist, John Timlin, will give a lecture on “Art as Healing” at the State University College at Buffalo on April 19, 1985 at 4:00 p.m. in the Communication Center. This public lecture will be the first lecture in the United States for these well-known pioneers in the field of Art Therapy in Britain.

Edward Adamson is an artist, art therapist who developed the Art Therapy program at Netherne Hospital in England and founded the British Association of Art Therapists. During the past 37 years, he has supported and guided many people who were going through critical periods of stress in their lives and he has collected over 60,000 images that illustrate how art can help to communicate feelings about illness and healing. Selections from the world famous Edward Adamson Collection have been exhibited throughout the world and Edward Adamson is a Council Member of the Societe Internationale de Psychopathologie de l'Expression.

John Timlin is a member of the British Psychological Society and taught emotionally disturbed children in London’s East End before becoming Principal Lecturer in Remedial Education at a London University teacher’s college. He was a founder member of the British Association of Art Therapists and is the Honorary Chairman of the “Adamson Collection” charity.

For further information, contact Georgiana Jungels, ATR, Art Therapy Studies, Art Education Department, State University College at Buffalo, 1300 Elmwood Avenue, Buffalo, NY 14222, (716) 878-5721 or (716) 878-4106.

**This Summer, Art Therapists Can Go Jump in the Lake...**

at the Summer Art Therapy Institute
Lake Geneva, Wisconsin

The University of Illinois at Chicago Art Therapy Program and the Office of Continuing Education announce a two week institute for practicing art therapists and those studying art therapy.

Four courses are offered during the two week period, allowing students to earn up to 13 hours of graduate credit if all courses are taken. Instructors for the courses are: Harriet Wadeson, Ph.D., ATR, Robert Ullt, MFA, ATR, Pat Buoye Allen, M.A., ATR, and Eveade McNeil, Ph.D., ATR.

The setting for these courses is George Williams College, located on the shores of beautiful Lake Geneva. It provides a relaxing and creative ambiance for study, sports, and socialising in our summer art therapy community.

For more information or to obtain a registration form, contact:

The University of Illinois at Chicago
Office of Continuing Education
Box 4348, Mail Code 165
Chicago, IL 60680
(312) 996-4650

The University of Illinois at Chicago also announces Intensive Art Therapy Workshops on April 28 and 27 featuring Edith Wallace on Active Imagination. For more information call (312) 996-5728.

Calendar

12-13 April, 1985. Art and Medicine 1985: Diagnosing the Canvas. Sponsored by the University of Connecticut, Office of Continuing Education. Fifteen speakers from the worlds of art and science will discuss topics such as medical illustration, children's art, the art of the mentally ill, and Navajo art and curing. Contact Cecile Volpi, Continuing Education Coordinator, University of Connecticut Health Center, Farmington, CT 06032.

22-24 March, 1985. 8th Annual Invitational Convocation of Art Therapy Educators. Sponsored by the St. Louis Institute of Art Psychotherapy. The conference, open to all art therapy educators, will be held at the Chase Park Plaza Hotel, St. Louis, Missouri. Contact: Mary St. Clair, 8407 Glen Echo Dr., Belle Nor, MO 63121. (314) 381-5447.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is
to advance the understanding of how art functions in the education, enrichment, development, and treatment
of people. The journal provides a scholarly forum for divergent points of view on art therapy and
strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be
placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be
published.

Bits and Pieces

The American Art Therapy Association Conference is not too far away (October 24-27, 1985) and each of us should begin now to make our plans for attending. It promises to be an exciting and productive one (Theme: "Messages in Art") not only in content, but also in the traditional yearly meeting of old friends, the sharing of ideas, the motivating of one another to "get back to the easel or the clay," and the partaking of those extra benefits of belonging to an active professional association. New Orleans is an "energetic" city, and for everyone who attends, the Southern hospitality and unique food should be especially attractive. Another conference that will be of interest to you is the NCATA (National Coalition of Arts Therapy Associations) meeting, to be held in New York City on November 23-27, 1985. The theme is "Creative Arts Therapies: Interaction/Interplay."

* * *

This issue of Art Therapy offers a stimulating mixture of articles, reviews, photographs, viewpoints and other features. Edward Adamson, artist/therapist and a pioneer in art therapy, is featured in an article, with photographs and an interview. We are pleased to include, on all four covers of this issue, full color pages that show some of the patients' work collected by Edward Adamson. His collection of over 60,000 pieces of graphic imagery relating to art as healing has been collected from patients since 1946. Many of these are from his patients in Netherne Psychiatric Hospital in England. This collection—or parts of it—has been exhibited in England, the United States, France, Spain, Sweden, Finland and Egypt.

An article on "Creative Art Expression from a Leukemic Child" offers support for the power of art therapy as an important modality when working with a dying child. "The Potential of Rehabilitative Computer Art Therapy for the Quadriplegic, Cerebral Vascular Accident and Brain Trauma Patient" presents the importance of looking beyond the paper and pencil to other forms of media and adaptive devices appropriate for handicapped and disabled clients in art therapy.

The Viewpoints section offers two [seemingly] disparate areas of content: the search for excellence, with references to corporate management, and multiple intelligences, as identified by Howard Gardner. The two authors (Barlow and Rhyne) present views, then offer responses to the other's content. A final comment is shared by Harriet Wadeson, Viewpoints editor.

A thought: In re-reading Creativity, The Magic Synthesis by Silvano Arieti (1976), this section emerged once again:

The person who appreciates a great work of art has the feeling that the work grows in him as he becomes involved in a prolonged capturing of emerging marginal meanings. He feels that he, too, is creative, that he himself is adding to his experience and understanding. Moreover, he wants to confront the work of art many times. He is not easily tired of it, as he would be had he read a purely logical statement. He realizes that the work of art does not merely transmit information; it produces pleasure. He also experiences each element of it as essential and unique: nothing is redundant. By reading the poem again, the reader adds further to his aesthetic understanding and again experiences pleasure. Indeed, many people enjoy and even prefer going back to well-known poems and music many times, rather than experiencing new works. (Arieti, 1976, p 141).

As art therapists, we should continue to "go back to the work." We should reexperience those paintings and sculptures not merely as information givers, but also as pleasure givers. At a recent university exhibition of collected works from individuals and corporations, paintings and sculptures were shown. Many past and present artists were represented such as Stuart, Corot, Millet, Gainsborough, Reynolds, Arp, Dalí, Christo, Hofmann, Kline, Motherwell, Oldenberg, Pollock, Poons, Rothko, Warhol and others. My art therapy graduate students spent much time experiencing and enjoying, and came away being revitalized. They revisited, reexplored and added further to their aesthetic understandings. As art therapists, we need to continue to visit galleries, attend concerts and poetry readings, attend plays and opera and dance performances. We need to be creative, feel creative, and gain from the pleasure and the understandings that work offers. This can be revitalizing for each of us.

* * *

There have been some questions regarding the proper way to submit articles for publication in Art Therapy. Each issue of the journal includes "Guidelines for Authors." You will find them in this issue as well. However, it might be pertinent to identify here some specific points that may answer questions that authors have posed.

Articles submitted to Art Therapy must include four copies of the manuscript, and must be typed (double-spaced). If original photographs are included, photocopies of them should be included with the remaining three copies of the manuscripts. A detachable cover page should include information...
about the author (name, title, place of work, address, and telephone number). Three of these copies are sent by the Editor to reviewers for "blind" evaluation. The article may be accepted, accepted pending major or minor revisions, or rejected. The Editor then communicates with the author regarding acceptance, revisions or rejection. The Editor will work closely with any author in the revisions, or in the case of an article that is rejected, will offer suggestions for revamping the article for possible future submission.

An abstract must accompany the manuscript. This condensed, comprehensive version of the entire article provides the reader with a quick survey of the material. It is also used by abstracting and information services to index the article, and to formulate a retrieval system for it. An abstract generally consists of approximately 100-125 words, although it may be slightly more or less, depending upon the nature of the article.

For particular questions on style or format, refer to the Publication Manual of the American Psychological Association (1983). Often called the "APA Manual," this book offers rules for the preparation of manuscripts and is an invaluable reference for content and organization, writing style, referencing and much more.

Many authors have asked about the proper way to reference, and to formulate a bibliography that has consistency. Some specific questions are as follows:

Q. How does one reference an unpublished paper?

A. To reference an unpublished paper presented at a meeting, the correct style would be:

Q. How should one reference proceedings of meetings and symposia?

A. To give specific references to proceedings, the correct style would be:

Q. How should an unpublished master's thesis be referenced?

A. An unpublished master's thesis would appear as follows:

For additional guidelines on manuscript preparation, or for the sharing of ideas on writing in art therapy, you may wish to attend the session on "Writing for Publication" that is to be offered at the AATA Conference in New Orleans.

Happy writing!

MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

Creative Art Expression from a Leukemic Child

Margaret A. Cotton, MA, ATR

Margaret A. Cotton, MA, ATR is Art Therapist at the Rehabilitation Institute of Chicago.

A primary purpose in studying the creative art expression of a leukemic child was to observe the progress of the disease as it might appear in a child’s art work. In this case study the author was interested in discovering whether the healing process through art could alleviate the mental and physical traumas of leukemia in its more acute and advanced stages. By working with the child, an atmosphere of mutual trust was encouraged whereby some of these feelings could emerge through pictorial expression. Further study with children who have leukemia must be done in order to expand our knowledge through research; however, some of the present evaluations might provide insight into the problem of leukemia—both diagnostically and therapeutically.

Following an introduction and examples from literature, a section is included on leukemia. Then a description illustrates the author’s work with Sabrina for approximately six months. The author ends the descriptive case study with a section on personal experience, conclusion, and a list of references.

Introduction

In this study I was interested in discovering whether or not the healing process through art could alleviate the mental and physical traumas of leukemia in its more acute and advanced stages. Through the child’s art, possible implications of death awareness might be seen. (My own observations would be strengthened by research in the general concept of the process of dying, all of this hopefully evolving into a fuller realization of the power of art to reveal the progression of death awareness through art.)

In my work with Sabrina, a six year old girl with whom I worked, some of the practical problems occurred; these problems could be expected, and were: the physical limitations of the critically ill child; the emotional stress of the patient, family and therapist; and the constant coming-and-going of a hospital routine. Nevertheless, the art therapy continued over a period of time. A variety of materials were chosen for the therapy; this was done to maximize the art expression through the art experience. Because of the nature of the illness and the obvious limitations of the child, my plans would have to be flexible and perhaps spontaneous whenever possible.

Literature References

Little research material was available on the specific study of art and the leukemic child. In the concept of dying, literature was more comprehensive and this helped me to assess, observe and evaluate my work with Sabrina. Focus was given to art as a dynamic medium to further therapeutic communication (Naumburg, 1966) and to art as a means of sublimation, a process through which the ego comes to master unconscious drives and impulses (Kramer, 1971).

Information relating to the dying child was important. Regarding the overall stress that occurs in the process of dying, Kübler-Ross explained five stages that usually emerge. The first is denial, “no not me,” followed by anger, “why me.” Succeeding in order are bargaining with the Superior Power as the patient and family hope for more time, depression as the actuality of the prognosis is realized, and acceptance of dying either positively or negatively. As the patient and family hold onto the expectation of a cure or the like, hope may be experienced (Kübler-Ross, 1975). The way that a child is told about the prognosis depends upon his/her age and maturity, and the parents, in most cases, make the final decision on how much a child is actually told about the disease and its outcome.

The family of a child who is terminally ill is of a major importance in the process of dying. They often have to make decisions about time to be spent with the child in the hospital, interim home visits during the child’s remission, and communication with the siblings. The duration of the disease may be from diagnosis to five years. Emotions may be displayed in dealing with all of these facets. Sometimes anger, irritation, and worry about financial investments and assessments evolve. The anger can be directed at physicians, research programs, and treatment teams (Sherman, 1976). In the final analysis the parents work with the medical team. Important for both staff and parents is not to mourn the child too early and too completely. “He has been mourned and put to rest before he is dead.” (Essen, 1970, p 79). This is important as the child needs active support day to day.

A review of literature specifically relating to the art expression of leukemic children would be significant and relevant. Carol Perkins (1977), in “The Art of Life-Threatened Children, A Preliminary Study” wrote on the anxiety of life-threatened children as it appeared in the art expression. In her study the drawings of life-threatening children contained large quantities of black. The children’s response was a negative one—faceless nightmare creatures, shadows and
"...an integral part of an art therapist’s working with a person with leukemia is an understanding of the disease and the treatment protocol."

dark houses. Although red was consistently used by many children, exceptionally large quantities of red were found in the drawings of life-threatened children. Their verbal correlation was usually in the concept of blood. Perkins also indicated that at least one other author had signified this red as “burning” or “tumor” red.

With regard to space positioning and specific correlations in her group, Perkins placed the division of a picture into four quadrants: the lower left, the darkest downhill trend; the upper right, a positive sign, the here and now; the upper left, following the setting sun, or if a path, then a going out of life; the fourth, located in the lower right, a potential future or recent past (Perkins, 1977). Most of the life-threatened children, according to Perkins, drew the sun in the upper left part of the page.

The leukemic children in Perkins’ study seldom drew pictures of persons, perhaps because of a sense of isolation from the outside world. Their houses often projected a diseased state, and small, often round windows were drawn under the eaves of their houses. Other symbols noted by Perkins were snakes, threatening representations to the children, cave-like structures, rainbows, and fruit trees, possible maternal or nurturing symbols. One leukemic child in Perkins’ study said she wanted to draw a happy face, but instead drew a small black ball. She then started to work on a larger face, but the face was still not a happy one. She added black spots over the face and called them chicken pox. The picture was overall “burning” red, purple and black.

Her last picture, painted two weeks before her death, had a blotch of red in the center, with red coming from the lower left quadrant. She also painted a white, almost closed, circle—possibly symbolizing an uncontrolled production of white blood cells. Another leukemic child in Perkins’ study painted a picture of a sailboat sailing on a calm and peaceful sea. After a fourth central nervous system relapse when the white cell count had increased, the sailboat was on a “storm tossed sea.”

Leukemia

Because of the nature of the disease, medical treatment may be required at any time—occasionally, some treatment may be administered during an art therapy session. Therefore, an integral part of an art therapist’s working with a person with leukemia is an understanding of the disease and the treatment protocol.

Leukemia is defined as cancer of the blood, a condition in which there is an uncontrolled proliferation of white cells (leukocytes). In acute leukemia immature white cells are discharged into the blood. In one type of acute leukemia the blood produces oversized white cells that crowd out and destroy essential cells. In chronic lymphocytic, also called lymphoblastic, leukemia there is a tremendous increase in lymphocytes, which are produced in the nodes and responsible for antibody production. Thus, the body’s disease fighting mechanism is completely destroyed (Fishbein, 1979).

Anemia, hemorrhage, fever, sweating, enlarged liver and spleen, swollen glands, and aches and pains in the joints are some of the different indications of the disease. Bleeding disturbances correlate to the number of blood clotting platelets. In almost all instances the bleeding correlates with a platelet count of 70,000 cu. mm. or less, and serious life-threatening hemorrhage has occurred in levels below 20,000 cu. mm. (Lascari, 1973). Whereas normal blood contains from 5,000 to 10,000 cu. mm. white cells, the leukemic child may have as many as 500,000 white cells (Fishbein, 1979).

Platelets are defined as tiny or circular discs in the blood, concerned with the physiological process of coagulation and contraction of the clot. Petechiae, small red dots, and bruises are some of the symptoms of leukemia, and these develop from a low platelet count. The presence of leukemia may be suspected from any of these symptoms, but the final diagnosis is made from the white cell count and platelet count, blood tests, and bone marrow examinations (Fishbein, 1979).

The goal of chemotherapy is to achieve a decrease or eradication of leukemic cells. A remission occurs when symptoms are gone. Blood and platelet transfusions correct anemia and restore clotting functions. Hydrocortisone is part of long-term therapy for combating the overproduction of white cells, and anti-metabolites help to restore normal blood cell manufacture. One development in treatment is the transplanting of healthy bone marrow (Fishbein, 1979). Drugs can be administered as pills, intravenously, or as intra-muscular injections. All of these are capable of producing side effects. Prednisone causes mood changes and weight gain, whereas vincristine causes hair loss and affects the nervous system. Drugs may cause bone marrow depression and gastrointestinal disturbances. Despite serious side effects, drugs can be tolerated for months or indefinitely (Sherman, 1976).

The use of these therapies has resulted in 50% remissions in young children for as long as five years, and in adults for as long as fifteen years. If the child survives for five years, his/her chances for remission and survival increase (Sherman, 1976). The cure for all types of cancer is a goal for which the medical society constantly strives. Hope for a complete eradication of leukemia continues.

Case Study: Associations with the Child

This particular study was specifically designed for a six week period;

“Sabrina was encouraged to draw whatever she wished, and I drew with her to make her feel comfortable.”
however, work with the child continued for approximately six months. The first six weeks were documented in more detail and the remaining months in less detail as times together were dependent upon the availability of the child and therapist. During the first six weeks, the child and I met three times a week for approximately one-to-two hours although schedules varied according to her illness. The child was in isolation most of the time (isolation referring to room isolation to keep the child free from cold viruses and other infections the body in its weakened state could not tolerate). The child was quiet although she often spoke to her mother, sometimes in Italian, as the family was of Italian origin. The immediate family consisted of her mother, father, younger brother, and older sister.

Description of the Mother

Sabrina’s mother was young and pretty with dark hair and dark eyes. She stayed in the hospital room around the clock, and was often with Sabrina during our sessions. Much time and attention was devoted to her child, and the mother and child became as one. She was especially friendly toward people who were helping and working with her daughter, and “thank you” was often said. At times, the mother appeared depressed, sometimes she was angry at the medical staff, and at God; however, these times were few and her mood was generally uplifted and she was very considerate and kind to others. The mother and father chose not to tell their child that she might die. Leukemia was discussed with Sabrina, but the possible outcome of the disease was never mentioned to her. The mother noted that everyone had ideas as to why and how Sabrina should be told about the disease but to this she would like to reply “Wait until this situation happens to you—then let’s see about your advice.” Sabrina did not directly ask her mother and father if she would die although, once, she asked her mother if children die. Her mother answered “yes” and continued to tell her a story about a beautiful heaven where children go after they die. Sabrina did not ask again.

Patient History

Sabrina’s condition was first diagnosed as acute lymphoblastic leukemia in 1975. Before diagnosis she had complained of acute pain in one leg and her symptoms were similar to those of influenza. She began chemotherapy treatments after the diagnosis. She was admitted to the hospital in early 1978 because of a low platelet count and overall swelling, and it was during her admittance that I started working with her.

First Session

(I will relay in some detail a general atmosphere of our times together, and provide an overall description of Sabrina and her art work when she was feeling well.) Although the picture described in this session is unavailable (as are the pictures done in the next few weeks), it is important to compare this drawing with the others later seen. For this first session I chose chalk as an expressive medium. Sabrina was encouraged to draw whatever she wished, and I drew with her to make her feel comfortable.

When I entered the room, I saw a little girl sitting on the edge of the bed, her back toward the door. Her mother was standing near the bed. The room was filled with stuffed animals, pictures and crafts. Her art work suggested the schematic stage (7-9 years) of development and gang age (9-11) of development (Lowenfeld, 1979). Sabrina turned around as I entered the room, and upon a closer look, I noticed a red ring around the iris of her right eye—this was possibly due to a hemorrhage as a result of the disease. Her mother left the room, and we started to work.

On a large sheet of newsprint Sabrina drew a farm. In order, she colored green grass along the bottom
edge of the paper, a farmer with a hat and pipe, a horse, a dog, a kitten, two chickens, two ducks in a pond of water, two cows, and in the upper right corner, a large yellow sun outlined in red with a happy face outlined in red. Last, she drew a blue sky at the top of the page.

After her picture was completed, it was displayed on the wall. I asked her a few questions about the drawing to which she replied “I don’t know.” Sabrina had previously been in isolation and was not in isolation on this day. I could see that she wanted to leave the room so I said goodbye and she went down the hall in a very determined fashion.

In this particular session Sabrina was feeling well, and I believe, her picture was indicative of her feelings. The page was filled with many colors, all appropriate to the content. She included animals in the first drawing and animals became a part of many pictures during the progression of the disease. During the first sessions, appropriate colors, animals and typical scenes drawn by children her age appeared. In this first picture, the red ring around the sun could correlate with the red ring around her iris.

Continued Art Work and Analysis

The sun was prevalent in many of Sabrina’s pictures, and continued to illustrate the progression of her disease. Many times she would draw a sun to ease her pain. According to the Jungian theory, the sun as a circle represents total life and a source of all energy. Machover (1978), Hammer (1958) and Jolles (1971) represent the sun as an authority figure of high positive or negative regard. The sun, in Sabrina’s second drawing, was also outlined in red; however, this time the sun wore glasses outlined in red. When the red ring disappeared from the iris of her right eye, the glasses were more often outlined in black (Figure 1) or filled in with black (Figure 2). I asked Sabrina many questions about the sun’s glasses to which she replied “I don’t know.” When I asked who the sun might be if it were a person, she said “The sun does not want to be a person.” Typically, small children draw suns; however, I believed that the sun represented a special kind of warmth light and energy to Sabrina. She did not wear glasses nor did any member of her family. Because Sabrina’s eyes were especially sensitive to light—often painful—and occasionally red and bruised, possibly glasses or sun glasses represented an awareness of these symptoms.

Sabrina drew a mural in red and black (Figure 3) during the weekend in mid-March. Four self-portraits (she identified these as being herself) were drawn left to right at the bottom of the page; the last one had her name above it. The portrait next to the last looked very much like her mother. Sabrina drew herself with a downturned mouth, matted hair and glasses. The eyes were mere dots in the last portrait; this was in contrast to the more elaborate eyes previously seen. This picture was the first in red and black and the first with a downturned mouth. A few days later Sabrina was not feeling well, the area around her right eye was bruised, and intermittently she cried out in pain. At this time, she made a turtle out of a paper plate (Figure 4) with a downturned mouth and thick red glasses—this, again, suggesting her discomfort and pain.

On a weekend late in March, Sabrina made three people (father, mother and herself) out of yarn and placed them in a basket (Figure 5). The child again displayed dots for the eyes, matted hair and glasses. Red dots were on the child’s cheeks, and would be seen in later pictures. These dots could correlate with petechiae, tiny pin point sized hemorrhages underneath the skin. (Perkins, 1977, described a child who drew black dots on a face and called them chicken pox). In late March the doctor tested Sabrina’s vision, and although no conclusive results warranted serious visual problems, he indicated that her eyes would continue to be sensitive as a result of the disease. Sabrina rarely drew glasses after this time, and her room was often kept dark.

Black swing sets and playground sets were drawn in many pictures at this time (Figures 6 and 7), possibly indicating a wish to play and a focus on the disease which thwarted her play. Also seen in pictures were paths leading to the upper left quadrant of the page (Figures 6 and 7). In Figure
7, a path leading to a house (possible self-symbol) could suggest a bleeding through the mouth or nose area, as the child was susceptible to nose bleeds and vomiting of blood. (A path leading to the upper left quadrant might mean a going out of life). In her pictures Sabrina drew many fruit trees, commonly drawn by children, and specifically drawn by leukemic children (as noted in Perkins’ group, 1977). When she was not feeling well, Sabrina focused on drawing clouds in her pictures.

Leukemia has it ups-and-downs as the disease takes its course. Therefore, Sabrina’s art work did not consistently take a downward trend. Happy pictures were drawn when she was feeling well and many of these pictures were drawn at home while on interim home visits (Figures 8, 9 and 10). In these drawings smiles were big, checks were large and red—although the red might correlate with blood, as noted earlier. In Figure 9, a happy child is depicted, with dots on the face as a possible remainder of the disease. Sabrina was discharged from the hospital in mid-April, as she seemed to be feeling better. At this time, she made a happy girl (Figure 10).

One week after leaving the hospital she was re-admitted. Her platelet count was low, and an infection had developed in the spinal area. The day following this admittance, Sabrina’s condition was crucial and life-threatening. Sabrina did not die at this time; however, her condition was considerably weakened. During the following week, Sabrina worked in art. Her pictures contained excessive quantities of red and black—particularly black—colors that Perkins (1977) had observed as appearing often. Other colors had been available to Sabrina at the time.

One picture in red and black (Figure 11) illustrated a row of houses, a walkway and two cars facing toward the upper left quadrant. Again, a path slanted toward the upper left section of the page. Black windows and doors could suggest a black within, a probable projection of the child. Another picture in red and black (Figure 12) illustrated a boat on
"storm tossed" water, a striking correlation to a picture drawn by a leukemic child in Perkins' study group. The sun appeared to be drawn quickly with dots for the eyes and a slash for the mouth. Suns at this time appeared more often in the upper left corner of the page. Black completely surrounded a little girl (Figure 13). Many pictures followed this pattern at the time. Mandalas were drawn in red and black (Figure 14), and in one picture black covered the entire page. In Figures 15 and 16, Sabrina drew what appeared to be a family: man, woman, boy and girl. One picture was outlined in red and the other in black. This particular picture could represent Sabrina's family, Sabrina not visible.

One week following her critical period she began to feel better. She drew a girl (Figure 17) with legs that appeared limp, possibly suggesting her inability to walk at the time. She drew a house (Figure 18) and a person to the left of the house. The body was completed blurred in white "as if the white cells had taken charge" (Perkins, 1977). The front of the house was face-like with blue in the windows for eyes and red in the doorway for the mouth. Sabrina was again discharged in early May as she was feeling better. I met with her once at her home. She made snakes (Figures 19 and 20), representations described as threatening by leukemic children in Perkins' group. Sabrina's art work at this time was more often only outlined, and appeared to be done more quickly. Single items on the page replaced more complicated and filled-in pictures. Sad faces, glasses, dots on the faces, roof top windows in black... all continued to be apparent in her work (Figures 21, 22, 23 and 24).

Sabrina was re-admitted to the hospital in mid-May (her home stays were usually about one week in duration). As a last resort, Sabrina was put on experimental medication—this medication followed a pattern of remission and relapses after three months. After receiving this medication, Sabrina appeared more stable although nose bleeds and infections continued. At this time, hand control became more difficult as the disease took its course (Figure 25). Sabrina was in remission until August. Although I did not work with her at this time, I saw pictures completed by her during the remission period. She drew butterflies (Figures 26, 27 and 28)—possibly symbolizing a kind of rebirth. Black centers of the butterflies might be a reminder/symbol of the disease (as a correlation, I have recently worked with a cancer patient in remission who drew butterflies with black centers). While she was in remission Sabrina drew a night scene (Figure 29).

Sabrina was re-admitted in mid-August, and I brought to her room canvas paper and acrylic paints. Because her hands were so weakened from the deterioration of the disease and the continuous intravenous injections in her hands, Sabrina could...
not use a brush. Instead, she applied paint to the paper with a small plastic knife placed in the palm of her hand; her fingers were unable to wrap around the handle. She painted a picture (Figure 30) that would be special, a picture that would be well-remembered by those who knew her. On the right side of the page, she painted a large three quarters view of a house with a large black opening in the attic area. A fence separated the house and tree filled with red fruit. Three flowers grew along one side of the house. The sky was filled with blue, turquoise and white paint. Black stars were scattered across the sky, and a half moon shone in the upper left quadrant of the page.

Figure 29

Figure 30

Sabrina drew another night scene. The house, a possible self-symbol, was cut off on the right side of the page (the future side, according to Machover and Hammer). A large black opening was under the eaves of the house, a remarkable correlation to a "soul" window drawn by leukemia children in Perkins' group. A fence separated the house (self-symbol) and fruit tree (maternal, nurturing symbol). This was Sabrina's last picture. She died in August.

Personal Experience

Sabrina, her mother and I spent many hours together and we became friends, relying on each other for support. Thus the therapist is part of this picture—my past experiences and emotions play a part in the ongoing experience. I recall one earlier experience with Sabrina which might illustrate the emotional impact of working with a dying child.

When I opened Sabrina’s door that morning with art supplies under one arm, I noticed her mother crying. I saw Sabrina with the back of her head, hair wet, against the pillow, and her face gray. Her breathing was short and raspy. Sabrina’s mother mentioned for me to come inside the room, and I laid the materials on the floor outside the door, donned a gown and mask, and entered the room. I sat on a chair on the opposite side of the bed. I felt my heart pounding. I felt that Sabrina would die soon. My thoughts flashed back to my own father lying in a hospital bed, looking pale, and breathing in much the same manner as Sabrina. The doctors said that my father had two hours to live. I thought that Sabrina had no longer to live than he.

Her mother and I said little. If we talked, we talked about her anger toward God, and her questions as to why this was happening to her child. Although I could not answer "why," I was there to listen, and to support. Intermittently, Sabrina would open her eyes, roll them to one side, and look at me, then slowly close them again. I wondered what she was thinking about when she looked at me. I stayed all morning, not wanting to leave. At noon, I left and until late afternoon I worked with my scheduled patients. I thought about Sabrina the entire time. I returned to Sabrina’s room at 4:00. Her skin appeared extremely gray, and she was vomiting blood. I stayed with her mother until 6:00. I thought that Sabrina would die during the night. I heard doctors ordering blood and platelet transfusions "stat" (immediately) as I was leaving the room. On the way home I cried. The emotional experience for me was staggering one.

Conclusion

Throughout many of Sabrina’s experiences, when we worked together and when she worked alone, some definite patterns emerged in the progression of her art work. These patterns became more apparent when she was not feeling well as she possibly tried to communicate her pain and discomfort (examples: in clouds, tightened figures and downturned mouths). In comparing her work with other leukemic children, some death awareness could be assumed. These correlations could be observed in the use of color and page placement. Some of her pictures seemingly did not relate to her illness and were “typical” pictures of a happy child drawn especially when she was feeling well.

Her experiences in doing the work provided her with an interest, a mutual continuing relationship with me, and an incentive to reveal her feelings. Her art experiences were perceived to be valuable in alleviating the trauma of her disease and in the meaningfulness of expressing feelings through art. Although Sabrina was often verbally unresponsive, especially toward the end of our sessions, we did communicate through her art experience.

I observed correlations between Sabrina’s drawings and those described by Perkins (1977). Red and black were evident in many pictures, especially after her life-threatening experience. Paths leading toward the upper left quadrant could mean a
"When she was not feeling well, Sabrina focused on drawing clouds in her pictures."

“going out of life,” and suns more often moving toward the upper left corner could suggest similar meanings. Other correlations were fruit trees as nurturing symbols, and dots on the faces as representatives of petechiae, commonly seen in the disease.

After her life-threatening experience, specific implications of Sabrina’s pictures correlated with those of Perkins’ study. Excessive quantities of red and black, boats on “storm tossed seas,” black windows under the eaves of houses, bodies blurred in white as if the “white cells had taken charge,” and snakes as threatening representations...all were seen in Sabrina’s pictures and those described by Perkins.

Happy pictures were drawn when Sabrina was feeling well; clouds were prevalent when she was not. The glasses appearing on the suns, animals and little girls (self-portraits) were rarely seen after the doctor tested Sabrina’s eyes and clarified the sensitivity of her eyes. The elaborate faces on the suns turned to mere dots for the eyes and a slash for the mouth. Black playground sets possibly expressed her wish to play as well as an expression of the disease which was a denial of this wish. Butterflies possibly symbolized a rebirth while Sabrina was on experimental medication and in remission.

Sabrina was left-handed, although during the progression of the disease she became proficient in the use of both hands. Toward the end of our sessions, her hand/motor functioning decreased as a result of the disease and excessive intravenous injections. She could not control a brush in her last picture and she used a white plastic knife to apply the paint. Her eagerness to “do art” was apparent as she released her feelings and communicated her thoughts onto the paper. Sabrina was special, she had much to say, and she said it through her art. The value for me was through the learning experiences, both in the field of art therapy and in my interpersonal relationship with her. The intrinsic value of my own experiences with Sabrina will always be remembered.

June 1985, ART THERAPY 65
The Potential of Rehabilitative Computer Art Therapy for the Quadriplegic, Cerebral Vascular Accident and Brain Trauma Patient

Diane J. Weinberg, MA

Diane J. Weinberg, MA is Art Therapist at Chicago City-Wide Colleges, and a Board Member of the Illinois Art Therapy Association and the Westwood Center for the Arts of California. Ms. Weinberg is also an artist. Parts of this paper were presented at the 1983 meeting of the American Art Therapy Association.

Certain frustrations physically and mentally disabled patients and the art therapist encounter during art therapy sessions, prompted an investigation of computer art therapy as a potential support to conventional rehabilitative art therapy.

Artistry, which is an inherent quality in computer art, increases the possibility for successful art experiences. Patients' autonomy and control are challenged when their minds, in substitution for their hands, make the decisions that direct the metamorphosis of a computer design.

Both rehabilitative computer art therapy and conventional art therapy, in attempting to foster the ability to adapt and cope, provide the suddenly disabled patient with a non-threatening method to express anger and frustration. Both therapies test patients' cognitive abilities, reflect their affect and encourage their psychosocial skills. For patients who need specialized adaptations, rehabilitative computer art therapy offers an unusually novel and rapid approach to successful art experiences, and it has the unique power and advantage to elicit disabled patients' curiosity and motivation to build upon their residual strengths.

The credibility of rehabilitative computer art therapy rests in its potential to offer the disabled accessibility and advantages beyond what has previously been confirmed by conventional rehabilitative art therapy.

Following an introduction to the potential of rehabilitative computer art therapy, conventional art therapy is discussed with specific reference to quadriplegic and stroke patients (patients who experienced cerebral vascular accidents), and brain trauma patients. Examples of computer art are shared followed by a summary.

Introduction

There is a pervasive demand for rehabilitation and the necessity to understand and to utilize the scientific implements of any and every discipline to achieve its objectives. This article explores the premise that the computer provides a powerful instrument for rehabilitative art therapy for physically and mentally disabled patients.

The primary goal of rehabilitation is to return the diseased and injured, as much as possible, to their former healthy state of activity. Patients suffering a sudden physical disability also experience a psychological loss with regard to their personal wholeness and identity. Depression and difficulties, associated with the basic pathologic process, are apt to increase impairment unless an attempt is made to improve the disabled patient's independent functioning.

It is crucial for the art therapist to attempt to understand the thoughts of those who are suddenly disabled to discern their varying degrees of risk for physical and psychological deterioration. Many severely handicapped individuals are sensory deprived and lack exploration experiences due to low levels of expectation and self-confidence. Expectations that others will reject them are unfortunately too often realized. Problems such as incontinence promote fear of embarrassment and often prevent patients from attending therapy and other activity or therapy functions. As a result, the physically impaired individual may experience the paradox of greatly needing acceptance while withdrawing from most social situations to avoid rejection. It would appear that the ability to psychologically adapt is a critical element in influencing successful rehabilitation. Prolonged depression, low self-esteem and fear of rejection must be dealt with promptly.

Conventional rehabilitative art therapy was conducted with three populations: quadriplegia, cerebral vascular accident (cva or stroke) and brain trauma. Recurring problems of resistance, lack of self-control, short attention span, distortion of reality, emotional liability, depression, distractibility, irregular attendance and my difficulties in making the art experience possible prompted an investigation of rehabilitative computer art therapy as a potential support to conventional rehabilitative art therapy.

Conventional Rehabilitative Art Therapy

In a rehabilitative setting, often only the patient's mental functioning is intact. The desire to make the art experience possible for the disabled...
“The primary goal of rehabilitation is to return the diseased and injured, as much as possible, to their former healthy state of activity.”

may stretch an art therapist’s creativity, imagination and patience further than for any other population. The rehabilitative art therapist has the responsibility to monitor progress in range of motion and cognition. Therefore, the therapist must be aware of the physical as well as the mental state of the patient. Some knowledge of adaptive devices and their application is mandatory. The art therapist, by improvising with the adaptive devices and art materials, discovers how these devices and materials can best serve to support and compensate for a disability. Such innovations help to promote a positive environment that will stimulate and challenge a patient’s self-expression, creative growth, and exploration.

Unconscious information revealed by the art work of quadriplegic and stroke patients, in particular, often shows recurring concerns regarding body image; disabled body parts are often exaggerated or omitted. Such drawing phenomena appear to be manifestations of natural anxiety rather than illness, because most patients were productive and well-adjusted individuals prior to their physical impairment. In my experience, deep psychological illness in the suddenly physically disabled patients was so rare that dependence upon psychotherapy or patients’ explanations of the intention of their art work did not appear to offer maximum benefit. Psychoeducational art therapy or art as therapy were more appropriate because they focus upon patients’ current problems of coping, adapting and building self-esteem through accomplishment.

The Quadriplegic, Cerebral Vascular Accident and Brain Trauma Patient

Quadriplegia is caused by an injury or disease to a particular area of the spinal cord; the location of the spinal cord damage determines the degree of consequential paralysis. Paraplegia involves a paralysis that affects the body only from below the waist. Quadriplegia, however, manifests in a paralysis that begins at the shoulder line and affects the whole body.

Minimal gross and fine motor activity necessitates the use of adaptive devices. The flexi-splint, pneumatic pulf-sip control, mouth-stick, braces and other orthopedic appliances provide some support to the muscles of disabled limbs. The adaptive device, by ensuring some measure of activity, prevents disfigurement and psychological alienation of the impaired limb from the patient’s body image. Practice with adaptive devices may promote gradual improvement in hand/motor functioning.

Automobile, motorcycle and swimming accidents account for the large number of quadriplegic patients who are young males barely into their teens. A preoccupation with their healthy past often produces a type of depression that has intense anger at its core. Considering the circumstances of a suddenly disabled person, depression is experienced so often that its absence might suggest a denial of reality.

It is important for the art therapist, in attempting to determine quadriplegics’ reactions to their disability, to ask the following questions: (1) How are patients perceiving their body image? (2) How are they adapting to and coping with their situation? (3) Do they have a locus of control? (4) Are they grieving? (5) Do they need to be coaxed to resocialize?

Patients who were accomplished artists prior to their quadriplegia are most difficult to engage in art therapy. The scratch marks they produce are unacceptable to them. The inability to maintain their artistic standard creates anger and frustration which often manifests in some antisocial behavior and, perhaps, withdrawal. They often refuse to return to art therapy sessions despite their realization that practice with adaptive devices could gradually improve their hand/motor functioning enough to possibly regain the ability to produce satisfying art work.

A male quadriplegic’s manhood may be extremely vulnerable, and he may refuse to use adaptive devices because he believes that art activities are unmasculine, or even an assault to his masculinity. It is not uncommon for male patients to use manipulative behavior or outright refusal to avoid art therapy sessions. Male paraplegics will attend art therapy sessions more readily, but they often request photographs of powerful or ferocious animals to copy. Their art work often depicts monsters and sharp teeth which appear to be symbols of anger.

Cerebral vascular accident (cva or stroke), is an injury to the brain and may be caused by a blood clot, a rupture to a blood vessel, a tumor, an infection or a trauma to the head. Patients often experience varying degrees of weakness or paralysis (hemiplegia), which usually affects the one side of the body that is opposite to the affected side of the brain. A left hemiplegic suffers stroke damage on the right side of the brain but the paralysis manifests on the left side of the body. The reverse is true for the right hemiplegic.

Aphasia usually appears in right hemiplegics and refers to varying degrees of loss of speech, language comprehension, reading and calculating abilities. Frequently the mental functioning of aphasic patients is intact; however, I worked with Betty, aged 75, whose aphasia was quite severe. She was given the task of drawing a picture of a tree and she responded by producing symbols, numbers and random writing that

“It is crucial for the art therapist to attempt to understand the thoughts of those who are suddenly disabled to discern their varying degrees of risk for physical and psychological deterioration.”

June 1985, ART THERAPY 67

236
she was unable to decipher (Figure 1).

Often stroke patients are conscious of their environment and sadly frustrated by their deficits, which include confusion due to memory and perceptual problems. Although psychological distress is expressed in anger, shock, anxiety, depression and in denial of the permanence of the stroke condition, feelings and the overt expression of emotion are not always connected. Stroke patients’ emotional lability often has little relationship to what they are experiencing in their environment. Unlike true emotional response, emotional lability can be easily interrupted by diverting the patient’s attention.

Stroke patients can frequently be motivated to work from their imaginations if given concrete instructions. The art therapist watches the stroke patient for improvement in cognition, range of motion and hand/eye coordination. Due to residual eye problems, one-sided neglect of the drawing paper is a common occurrence. Although patients think that they are drawing on the whole sheet of paper, only one side—depending upon whether they are right or left hemiplegics—will be used. William, aged 72, was continually reminded of the neglected side and prompted to keep his unimpaired side toward the action (Figure 2). In some cases patients can be taught to compensate by turning their heads to the neglected side. Over a period of time, as the conditions of stroke patients improve, their drawings gradually begin to move across the paper to the neglected area and eventually may fill the entire sheet of paper. A collection of consecutive drawings provides the art therapist with a remarkable documentation of the stroke recovery process.

It is important for the art therapist to attempt to make use of patients’ paralyzed upper extremities. A paralyzed arm can be situated to hold the drawing paper in place; however, as part of the medical treatment the disabled arm is sometimes elevated and placed in a splint. In the latter case, the paper is taped down to the table surface and the patient has to adjust to the awkwardness of using the non-dominant hand.

Depending upon the severity of the impairment, brain trauma (caused by an outside injury to the head) produces difficulties that are very similar to those of stroke patients. Deficits and frustrations that both populations share are often revealed in their art work: drawings are placed high on the paper, essential parts and color mass are omitted, the line is disconnected, one side of the paper is often neglected, perseveration is experienced. David’s drawing (Figure 3) illustrates several of these examples that are indicative of per-
ceptual deficits, misperceptions of spatial relationships or spatial neglect, body image disorders, disorganization of thought, or visual-motor disorders.

Due to their memory deficits, brain trauma patients are often indifferent to their surroundings and are therefore unmotivated. It is necessary for the art therapist to continually structure and direct them throughout the art therapy session. A brain trauma patient’s attention span can be as short as only a few seconds. Often they exhibit poor judgment and are capable of behaving and talking impulsively. The art therapist should be prepared to deal with this impulsivity, sexual comments, gestures and overtures.

Brain trauma patients’ levels of regression are evident in their art work. Depending upon the severity of the trauma, the patient’s developmental level may be reduced to the scribble representation. A felt tip pen scribble, by 35 year old Tim, is placed high on the paper (Figure 4). Progress is noted (Figure 5) with the scribble moving closer to the center of the paper, increasing in size and having more than one color. Tim titled his drawing “Toys with Wheels” which indicated that he was finally making mental [image] connections to his art work. The art work of brain trauma patients will gradually progress to each developmental stage and become more age appropriate as the patient begins to recover.

Occasionally brain trauma and stroke patients will perseverate during the art process as shown in a drawing by Dan, aged 24 (Figure 6). A gentle attempt should be made to interrupt the perseveration and alert the patient to his/her repetitious movements. Claude, aged 26, traced a large stencil (Figure 7) which appeared to bring some control to his perseveration and was due, perhaps, to the stencil serving as a concrete guide.

Rehabilitative Computer Art Therapy for the Quadriplegic, Cerebral Vascular Accident and Brain Trauma Patient

One of the greatest powers of the computer is its ability to easily change a simple design into one of striking complexity. A different orientation or visual effect may become instantly visible to the artist by rotating the angle of the design. The artist theoretically has the opportunity to infinitely vary and alter the size and position of programmed images, lines and colors. Therefore, the computer art process has the potential to provide an education in symmetry, aesthetics and creativity.

Previous computer experience is no longer necessary because today’s computer programs provide simple step-by-step instructions. I experimented with the Atari 800™ graphic art program titled Video Easel, and produced free line, abstract and representational drawings (for an example, see Figure 8). Drawings were made by manipulating the keyboard and joystick, a handle that can be moved in any position to give the computer directional information. Symmetrical designs were made by slowing down the speed of the computer and activating four lines to converge simultaneously (Figure 9). The painting segment of the programmer consists of six preprogrammed designs in transition that continually change in shape while moving across the computer’s TV monitor. Termination of this metamorphic activity provides a finished design. This design was used as an overlay for my computer line drawings, and a wide selection of background colors allowed me to easily change the “mood” of the art work.

The light pen is a photosensitive pen-like device. It is used to trace objects or images that are placed on the graphics tablet. The graphics tablet is a prescribed surface on which each point, located under the tip of the light pen, may be accurately sensed by the computer. As I used the light pen to trace the shape of a frog, the frog’s image began to appear on the TV monitor. The plotter, an instrument that prints felt tip pen drawings of what is featured on the TV monitor, produced a printout of the frog that I had traced (Figure 10). The computer was then programmed to sense all the movements and pauses I experienced while tracing the frog. The plotter duplicated my movements and pauses while it simultaneously repeated the image, diminished its size and rotated its angle (Figures 11 and 12).

Physically and mentally disabled patients’ autonomy and control are
challenged when their minds, in substitution for their hands, make the decisions about composition, color and size that will control the metamorphosis of a computer design. Rehabilitative computer art therapy has the potential capability to monitor stroke patients' cognitive abilities, spontaneity, creativity, perception and expression in carrying out and elaborating upon personal ideas for problem solving.

Artistry is an inherent quality in computer art. The increased possibility for successful computer art experiences could mitigate patients' frustration, anger, tension and depression. Frustrated artistic quadriplegics may find a creative outlet by using the preprogrammed continual motion designs to produce satisfying work. Their decisions in directing the computer might provide the experience of feeling some control in their lives and increase their motivation to explore and create.

For those with little or no upper extremity fine or gross motor activity, the light pen—which does not have to make direct contact with the graphics tablet—eliminates the need for hand pressure and cumbersome adaptive equipment. The voice command, which uses the sound of the voice to activate the computer program, offers another alternative.

Physical lack of control and manipulative limitations result in fatigue and frustration and cause those with quadriplegia to work at a slower rate. The speed of the computer may be slowed down to meet the needs of a patient and offers a less taxing method of creating art. The spontaneous and rapid action of shapes and colors might stimulate those who are sensory deprived by sharpening their perceptions, and the bright colors and rapid activity of the shapes might help to hold and increase the patient's attention span. Swift computer activity has the potential to shorten the length of therapy sessions which might encourage the attendance of those suffering from incontinence. Computer capability to store work in progress until activity is resumed could provide a consistent reminder and basis for reality orienta-
tion for brain trauma and stroke patients with memory deficits.

The computer's ability to accept a wide range of inputs vastly increases its potential to accommodate to various physical disabilities. Technologists, however, are continually developing new strategies to modify computers and their adaptive devices to enable the physically handicapped to perform increasing numbers of tasks otherwise denied to them.

Summary

Fear and frustration are just two of the emotions that may undermine a disabled patient's self-worth. Productivity and energy needed to maintain mental and physical activity become depleted by long-term hospitalization. The patient's personality changes from passive to unmotivated and withdrawn. Bodily disability shifts to the main focus of attention for the withdrawn patient who no longer feels hope for the future.

The use of computers for the handicapped is significant because computers do not demand manual skill for the creation of art. What the computer does require is that the artist [patient] make aesthetic judgments. The computer's unusually novel method of creating art stimulates observation, reflection, discrimination and recall. Computer art opens the way to communication by arousing curiosity which encourages patients' psychosocial skills. Sharing art work is a natural method of gaining the esteem and acceptance of others, and overcoming feelings of isolation and fear of rejection.

The spontaneity of the computer lends itself to the process of art therapy. Computer art therapy provides opportunities for the manipulation and processing of spatial information and can serve as an instrument for assessing and developing the cognitive abilities of patients who cannot communicate well verbally, or comprehend and illustrate spatial relationships, organize sequentially, or associate and depict concepts. Graphic information can be stored, regenerated to another form, or viewed purely for its aesthetic value. These multiple computer art experi-
"One of the greatest powers of the computer is its ability to easily change a simple design into one of striking complexity."

The Art of Healing: The Work of Edward Adamson

Georgiana Jungels, ATR

Georgiana Jungels, ATR is an Associate Professor in Art Therapy Studies, State University College at Buffalo, New York, and Art Therapist, Private Practice, Counseling Services, University Center for Human Services, Amherst, New York.

Introduction to Edward Adamson

Art has been an essential part of human existence for as long as civilizations have been recorded (Brookes, 1983) and people have expressed their understanding of the mysteries of life and death through art expression (Jones, 1978).

The search for some sense of well being through art is very old (Levy, 1976) and art has been part of therapy throughout all of recorded history (Lommel, 1967). Over and over people have created configurations that are equivalent to life processes (Kramer, 1958) and art is basic to psychotherapeutic treatment (Naumburg, 1966). Both the artist and the analyst search to recognize the inner and outer reality of life and the universal in people (Hammer, 1975).

In the 19th century, psychiatrists studied the spontaneous art of psychotic and neurotic patients in Europe (Naumburg, 1950) and in the 20th century, Margaret Naumburg defined Art Therapy as a profession in America (Levick, 1973). All of the individual artists, therapists, and art therapists who pioneered art therapy in the United States (Ulman, 1977, APA, 1984) and Europe (Gantt and Schmal, 1974) synthesized the histories of artistic expression and therapeutic intervention into a recognized interdisciplinary profession in contemporary times.

In recent years the field of Art Therapy has grown rapidly in the United States and the work of art therapists who have contributed to the growth of the field has been documented by publications, films, exhibits, and the American Art Therapy Association (AATA 1976-82). Much less, however, is known in the United States about the art therapists who are the pioneers in other countries. In England, one of these pioneers is Edward Adamson.

Edward Adamson has worked as an artist, therapist, and art therapist for over 40 years in England. He developed the Art Therapy program at Netherne Hospital, founded the British Association of Art Therapists, and is a member of the Societe Internationale de Psychopathologie de l'Expression. He is an artist, therapist, cotherapist, facilitator, lecturer, and author.

In the recent book, Art as Healing (Adamson, 1984), Edward Adamson and John Timlin document how Adamson has used art to facilitate healing and health. The National Association for Mental Health (MIND) in England selected the book, Art as Healing, for the 1984 MIND Book of the Year Award. When the Chairman of the judges, Professor Derek Russell Davis, announced the award, he said:

Edward Adamson's approach has been educative. He has put the emphasis on self-healing, the release of creative resources latent within every patient, and reintegration...he has given people, with great respect for them as individuals, the courage and the space to express themselves.

This space to express has been described by Anthony Stevens as an "enabling space":

Edward Adamson possessed not only vision, but the talent and charisma needed to bring his vision to birth in reality. Intuitively he knew there to be a connection between creativity and healing, and he understood the importance of providing a sanctuary—a space, a temenos—in which this connection could be made. His genius lies in his ability to create the enabling space.

When Adamson chronicles his involvement in art as a form of treatment, he prefers to rely "on the pictures to speak for themselves, and to provide a more eloquent testimony to the extraordinary efficacy of Art as healing" (Adamson, 1984).

In order to understand more about Adamson's work and his approach, I have reviewed hundreds of images from the Adamson Collection and recorded Adamson’s comments and observations about his work. I think that the best way to begin to understand the art of healing illustrated in Adamson's work is to study the images that have been made by the people with whom he has worked. To further our understanding of how these images were related to the healing process, I have included an accompanying text based on recorded comments and observations by Edward Adamson. These visual and verbal statements will be followed by a review of the past and present work of Edward Adamson, a discussion of the Adamson Collection, and some of the relationships between Adamson's Art Therapy work and current Art Therapy services in the United States.

The Images With Observations Based on Comments By Edward Adamson

Pictures #22, #37, #25, and #29 were made by a young man who is an artist and whose mother was dying of cancer. He was in great distress and unable to express his feelings in words. When he first came, he just couldn't use any other color but black. All of his paintings were black and this distressed him even more. He felt completely depersonalized, depressed, and empty. Through his
painting he pulled himself out of his depression, began to use color, and faced up to the fact that he was going to lose his mother. He did get better after about a year and he did it himself...through his painting.

These pictures illustrate the pain and suffering of illness; but they are only part of a process...the healing process. When it is no longer necessary to make any more images of illness, the healthier person can emerge. This young man was helped by Edward Adamson because he was allowed to express all of his painful feelings graphically. However the pictures were not the end product. As John Timlin (1985) has observed:

"The end product was that he no longer needed to express his grief...it was something that he got over...it is an example of someone who came when they felt an imminent breakdown...expressed everything in the most eloquent way possible and then...got over the trauma in the shorter and best possible way."

Pictures #92 and #93 were made by a young man—about 25—who was under the impression that he killed somebody. He said he knocked a child over in his car and knocked both his eyes out. This became an obsession with him and he had to go to report it every day to the police. They were very tolerant and tried to help him in every possible way. They used to take him back to the scene of the accident—or supposed accident—just to point out to him that there was nothing wrong. However, this went on for about 18 months and they got rather tired of this every day appearance and suggested that he should have psychiatric treatment. When he didn't progress very favorably with his psychiatrist, she suggested that he should come to the studio and try to paint out his troubles.

When he first came to the studio, he didn't want to produce at all and all he would do is doodle. (Although artists are usually sustained by their creativity, when they are overcome by illness their sensitivity may make the experience very painful; and it may take some time before art can begin to assist in the healing process.) Later he portrayed himself as a tree that was fenced in or a tree that was cut down and completely infertile. Over and over he recalled and painted the recurring nightmare about the child he thought he killed. This dream had originally occurred when his mother died and he used his graphic skills to go over the evidence again and again.

When he painted the picture of the carriage going toward the gate in front of a large house (#92), he said that he was longing to get into other people's houses but was barred from everybody's home because of the crime that he committed. He painted the gate at the end of the avenue completely shut and he said he would never be allowed in.

He wished that he could knock some sense into himself and felt that there was no love for him because he had a broken heart and had to be fed on tranquilizers. (#93) After about two years he was discharged from the hospital. He relapsed and had to come back to the hospital.

At this stage, Edward Adamson suggested that he should buy a new car...which he did...and...he "took me for a ride in it...I was terrified." (Adamson, 1985)

He was discharged again and went back to his job as a graphic designer which he has held on to the present day and is doing quite well again. In his own creative way—through his painting—he managed to face up to his difficulty.

* In Art as Healing (1984), Adamson recommends that:

"Where problems of the mind are concerned, the solution must be found where they originated, that is, from WITHIN. It is only here that we have the source of real change."

...have precipitated the problem, so that the symptoms of illness we observe are merely the acting out of an unresolved, inward struggle...Art places the central responsibility for change upon the individual, rather than making him rely exclusively upon imposed treatment from outside."

Pictures #82, #83, #85, #86 are four examples from the thousands of paintings that M.S. made during her hospitalization for over 30 years. Her pictures describe some of her intensely painful feelings of fear, rejection, isolation, depression, anger, persecution, and despair (#82) and "her existence was only made bearable by the fact that she could come and paint whenever she liked." (Adamson, 1985)

She thought the hospital was like a prison. If anyone said anything that she didn't like, she would stop and scream. One time she was demonstrated to the medical students when they came to the hospital. She disliked it intensely and made the medical students look stupid in her painting about this experience and then she would not paint again for almost six months.

She traveled all over the world in her paintings...bowing down to the elements. (#83) She would become trapped, tied up, part of the elements, the witches would catch her, and she would be left alone crying in the desert. She identified with the crucifixion and would die in her paintings and then have to be reborn. Occasionally she would paint a slightly happier picture, but disaster was always lurking.

She identified with suffering in most of her images and would discuss these feelings with her doctor. In the picture of the face with the snake around her neck (#85), she is controlled by a being in her body which she calls George which sometimes comes out like a snake-like creature and strangles her.

Over and over she requested help, and she frequently said "If you can't help me, I'll kill myself". Picture #86 is a powerful example of her pleading. Picture after picture was titled "Help me." Sometimes she painted the same picture every day for two weeks. "You may see the same imag-
very coming out day after day but this must be accepted” and “you must be there to help...all the time.” (Adamson, 1985)

She was recently discharged and is living in a hostel and managing for herself; but she is still desperately lonely and now there is nowhere for her to paint.

The images collected by Edward Adamson range in size, media, symbols, themes, subject matter, skill, and style. Some are very simple statements that mean a great deal only to the person who makes the image. Other pictures dramatically illustrate very clear graphic statements about feelings of anxiety, depression, loneliness, fear, anger, abandonment, or grief. Some pictures include personal or universal symbols (#9). Other pictures are self-portraits that reveal a distorted self image or great distress (#17, #18, #21). Other pictures are conventional landscapes or illustrate a view of the hospital grounds (#73, #74).

Who is Edward Adamson and How Does He Work?

After seeing the images made by the people with whom Edward Adamson has worked, the viewer may have many questions about the artists: Who made the pictures? How? When? Why? Where? What about the therapist, Edward Adamson? How does he work with people? What does he say? What does he do? Where does he work? When? How did he begin?

Edward Adamson was trained as an artist and worked with the artist Adrian Hill in a T.B. sanitarium the early 40s. As artists, their role was to assist people “who needed an occupation and a diversion during their long months of recuperation...we
practiced a form of occupational therapy through Art...the main concern was to acquire a good technique.” (Adamson, 1984)

When Edward Adamson began to work at Netherne Hospital in Hertfordshire in 1946, he found that psychiatric patients exhibited a wider range of personalities than the people with whom he had worked in the sanitoria. He remembers that “we were all working very much in the dark in those early days.” (Adamson, 1984). He began by creating a stimulating environment, painting the ceilings and walls in sunshine yellow and shocking pink. He worked with patients that nobody else would take. When people were incontinent, he worked with them on their paintings in the hospital showers. He frequently observed the spontaneous need to draw...on scraps of paper, on toilet paper and on library books. He offered people paints, brushes, paper, and a place. Every day about 40 people came to his makeshift studio.

Later he made a studio on the hospital grounds—away from the hospital buildings—so the patients could make the effort to get there...and leave the hospital atmosphere behind. In the studio, Adamson provided the materials for drawing, painting, sculpting, and pottery and created an atmosphere of quiet encouragement. Everyone had their own space—a “little island”—where each person could feel that privacy was respected. The studio became an oasis...people appreciated the natural silence and quiet concentration and looked forward to their time in the studio...and artistic expression became a form of treatment. In this studio, Adamson saw his role as a facilitator and cotherapist:

In the studio, I considered it my role to facilitate, rather than direct. I never suggested what anyone ought to paint, because it seemed essential that the idea should be entirely theirs. If someone wished to discuss a possible topic for a painting, I would merely try to explore what he wanted to do. Invariably, when we had finished talking, he would go away and paint something entirely different. I never criticised, and I never praised the paintings. I just welcomed them. I certainly never tried to interpret them. I did pass them
on to the individual’s doctor, whom I hoped would use them to get a little closer to his patient.

Sometimes people came to the studio on their own; sometimes at the request of their doctor. John Timlin (1984) reports that “art became the medium through which they could collaborate with their doctors and assume some personal responsibility for their return to mental health. The people who came to the studio were allowed to rediscover a rich vein of creativity which made their predicament relative and coherent to themselves and to others.”

Adamson (1984) noticed that even though the majority of people had little or no art training, “many of the paintings possessed an extraordinary degree of intensity... the reason that the paintings are so positive in their statement is that they express the powerful creative energy that we all possess but may not have released.”

Sometimes people confused Adamson's role with that of an occupational therapist or an art teacher. He was neither. He was an artist and a therapist, a facilitator, a catalyst who “allowed the healing art to emerge.” He “never imposed the use of a particular medium, but might suggest one to facilitate the expression of someone’s idea.” In the studio, people would “be reborn,” “ventilate,” “dream,” “fantasize,” “recollect,” “reintegrate,” and discover how art could rescue and heal. He worked with individuals and groups and offered people who could not talk about their pain and hopes the vocabulary of imagery. He found that the “act of painting is a magical moment” that creates a “subtle dialogue...between the painter and the slowly unfolding symbolic drama of the inner mind.” Sometimes he was the object of “deeply felt hatred”; other times he was the symbolic groom or “buried in the bed of the sea and taunted by a lobster.” He knew that there “are many parallels between the dynamics of spontaneous painting, and the therapeutic process.” (Adamson, 1984)

How does Edward Adamson work with people? In the forward to Art as Healing (Adamson, 1984), the British psychiatrist Anthony Stevens suggests that “the key to Adamson’s success is the absolute respect—one might say reverence—he has for the individual” and reminds the reader that “success in art therapy, like success in analysis, depends as much on the relationship between patient and therapist as on the symbol-forming potential of the unconscious psyche.”

John Timlin (1984) has observed that Edward Adamson goes about “his extraordinary work with a Zen-like simplicity” and Edward Adamson emphasizes the relationship between time and healing in his work:

There seems to be a natural, 'fullness of time' which occurs in both Art and healing. Just as a painting cannot be forced, healing must proceed at its own pace. One is obliged to co-operate with this rhythm to avoid any precipitous insult which could abort the process. Because of this, when a person comes to the studio, I never suggest what he should draw; it is essential that the idea should be entirely his own. This particular approach demands a considerable amount of patience. Sometimes it is often weeks, months, or even years that we are both obliged to wait for the birth of someone's creativity. All I can do is to try and create a permissive atmosphere and have the necessary paint and paper on hand. If the person is prepared to come and spend his time with me, then I must be prepared to join in the vigil. (Adamson, 1984)

Gordon (1973) suggests that the creative process depends upon a capacity to be active as well as passive and to give as well as receive.

In a recent interview (Jungels, 1985), Edward Adamson talked about working “quietly active in a passive way” and stressed the importance of silence and time in his method; and John Timlin described Adamson’s ability to wait—to be simultaneously active and passive:

Edward Adamson:

“The silence is very important. Inactivity on the part of the therapist, being passive as possible and withdrawing the whole time and encouraging the individual to produce things in his own way. You know in stillness there is great activity. That is the thing they sense. As long as I’m there—they know I’m there—and they appeal to me for that reason. When I’m with them, I never sit down because once I relax, they will relax too and it will not be necessary for them to paint. So it is quietly active in a passive way, if that is possible. You must tune in to the individual you are going to work with. And that takes a little while. You try to get behind their eyes to see what they are trying to envision, paint, and I encourage it from their angle the whole time—if they’re prepared to share it with you...then you must be prepared to wait for it.”

John Timlin:

“Edward waits and he does not know for what he waits but when it comes he knows it has arrived. Because then people are willing to do something. The person is nervous at first. They go through a whole lot of stages; they know, then they think—‘well, perhaps I better please...but no, we haven’t even got to do that...perhaps I better do something small’—they’re going through this process of development. They can externalize how they are feeling and can face up to it because on the paper there is something concrete and they can talk about that thing on the paper rather than talk about themselves. If one waits, then one is waiting for the patient—the person themselves—to make a statement. One just has to wait and wait. I’ve seen Edward wait and wait for many years in some cases. In Edward’s method, anything that the person produces is right; they don’t have to please Edward. The studio in the hospital was one of the happiest places in the hospital...it was one place where people could be themselves and act—but not act really do something for themselves...in the studio they were trying to heal themselves.”

During his many years of therapeutic work, Edward Adamson
guided many people through critical periods of stress and collected over 60,000 images that illustrate how art can help to communicate feelings about illness and facilitate healing. Currently he is continuing his work in private practice in his studio in Chelsea and working on the development of a stress center “where people can come and paint when they feel under stress.” (Adamson, 1985)

When Adamson retired from his position as Art Director at Netherne Hospital, the gallery that he had built with great care was turned into a physiotherapy department and some of the art work was destroyed. The hospital was ambivalent about the pictures and a charitable trust—the Adamson Collection—was set up to preserve and augment the collection. John Timlin, (Adamson Foundation, 1984) Honorary Chairman of the Adamson Collection, reports:

“The Adamson Collection is not static but continues to evolve, encompassing the work of prisoners and children for whom art therapy is used as a preventative tool.”

The purpose of the collection is multiple: to witness the efficacy of Adamson’s work; to stimulate members of the medical and helping professions to gain deeper insights into the situation of the mentally ill; to educate the general public; to study the graphic representations of psychopathology; to show how people can communicate their difficulties through art, prevent long hospitalizations, and be responsible for their own cure. (Timlin, 1985)

The Adamson Foundation for Creative Therapy in Canada was formed in 1982 to further study and research into the application of creative therapy in the diagnosis, treatment, and prevention of mental illness. In a recent presentation, the foundation summarized the purposes of the Adamson Collection:

- to illustrate the process of art therapy;
- to provide the patient’s own illustrations of his psychiatric, social, and environmental experience;
- to illustrate the great creative potential of some patients work;
- to furnish visual aids for specialized groups of visitors who study aspects of psychiatric work, such as doctors; nurses, health visitors, social workers, counsellors, psychologists, psychiatrists, teachers, and clergymen;
- to provide visual material for art exhibitions, the mass media, and specialized text books.

Currently, selections from the permanent collection of the Adamson Collection are exhibited in the public gallery on Ashton estate (near Cambridge) of one of the Adamson Foundation trustees, Dr. Miriam Rothschild. In 1984 selections from the Adamson Collection were exhibited in Canada (Art Gallery of Ontario) and the United States (Albright-Knox Art Gallery, Buffalo NY). In the exhibit catalog, David Burnett, Curator of Contemporary Canadian Art at the Art Gallery of Ontario observed that these art works have “a rare, literalness in the relationship between visual signs and the verbal language those signs elicit.” (Burnett, 1984)

David Sax, a contributing reviewer for the BUFFALO NEWS observed that the work from Adamson’s collection conveys a sense of “therapy at work while also conveying a feeling for the creative process that underlies an artist’s work” and offers “insights into both the human condition and the artistic process.” (Sax, 1984)

When work is selected from the Adamson Collection for public exhibits, people frequently select certain pictures because they are graphically dramatic and illustrate something that is frequently much more difficult to describe in words. Adamson (1984) points out that “these pictures may be superficially regarded as the stereotype of mental illness” and it is important to recognize that they simply illustrate feelings that we have all experienced to one degree or another.

In any exhibit, it is important to include the images of hope and healing to balance the images of pleading and pain. Timlin (1984) has found that some visitors may be shocked at the uninhibited display of feeling, and question the intrusion into the confidential relationship between therapist and patient. Adamson always requests permission to publish or exhibit art work made by the people with whom he has worked and has found that many people who have experienced mental disturbance are very willing to contribute their work to educate the public about mental illness and share their experience in using art as healing.

Visitors to exhibits of the art work from the Adamson Collection comment that the work is “remarkable,” “powerful,” “beautiful,” “frightening,” “reveling,” “fantastic,” “touching,” and “moving.” Some people find the images “almost depressing but impressive”; or “an eye opener”; or “very human, very real”; others wonder why this art “seems more true to the events that shape us all.”

Edward Adamson is one of the pioneers in Art Therapy. Through the thousands of images made by people with whom Edward Adamson worked, we are able to understand more about the many different kinds of visual statements that can be made about feelings of anger, depression, pain, confusion, hurt, or other feelings associated with stress, crises or illness.

These images of illness are complemented by each person’s journey toward health. The pioneering work of Edward Adamson in England, Margaret Naumburg in the United States, and many other art therapists throughout the world established the foundations for the growth and development of the profession. Currently art therapists work in different countries with children and adults in a variety of health and educational settings.

In the United States, art therapy is a recognized professional field providing assessment, treatment, evaluation and discharge planning services in rehabilitation, counseling, psychi-
atic, habilitation, substance abuse, and other health related or educational programs. In 1985 art therapists are credentialed specialists in counseling, psychotherapy, and rehabilitation (Goldenson, 1984) and provide services ranging from physical rehabilitation to psychosocial therapy. (APA, 1984) Art Therapists monitor, evaluate, and record patients' progress toward treatment goals, functional or behavioral objectives, and criteria for discharge; and participate in multidisciplinary or interdisciplinary case reviews and rehabilitation team meetings.

From the pioneering work of many people throughout the world, art therapy services have expanded to include:

1. assessment of physical, cognitive, psychological, and social functioning;
2. treatment and discharge planning based on initial and ongoing assessments of strengths, limitations, and needs;
3. evaluation of self-care, daily living, and coping skills, mental status, stress level, adjustment to disability, family support, interpersonal skills, functioning level, and other physical, social, or psychosocial areas;
4. rehabilitation plan of care using art experiences to develop skills, restore functioning, prevent or reduce disability complications, assist communication, increase coping and adaptive living skills, facilitate optimal level of functioning, increase ability to express feelings about illness or disability and identify realistic goals, and/or provide counseling for individuals, families, or groups to attain or maintain health.

In these different roles and responsibilities, each therapist's day-to-day experiences may vary considerably. Whether we wait for a few minutes or years and emphasize the artistic or the therapeutic process, we all work to reduce the pain of illness and facilitate health. The images and words may vary but quality of care is a common goal. We can all identify with what Edward Adamson calls "Art as Healing."

I am grateful to several groups and individuals for their assistance in preparing the material for this article: to Edward Adamson for granting permission to photograph the original art work; to the trustees of the Adamson Foundation; to John Timlin for his observations about the work of Adamson; to Dianne Shelton for her assistance in making the arrangements for the exhibit and lecture; to Kate Hartman, Lucy Andrus, and Ulrike Chamberlain for their observations and suggestions; to Rena Reisman for references on the collaborative work of artists and therapists; to Sandy Tichen, Dianne Seger, and Jody Benton for their assistance in photographing the Adamson Collection; to Applied Media Associates, Campos Photography, the University Center for Human Services, and the SUNY State University College at Buffalo for technical advice and assistance; and to the Faculty Student Association and the Creative Arts Therapy Association at the State University College at Buffalo for funding Edward Adamson’s visit and lecture at Buffalo.
VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. It also encourages the submission of photographs of art by art therapists with an accompanying statement describing the work’s meaningfulness to its creator. Submit a black and white glossy photograph and four copies of the written material to: Viewpoints, ART THERAPY, 1980 Isaac Newton Square, Reston, VA 22090.

Editor’s Note: On October 5-6, 1984, Janie Rhyme, ATR and Gary Barlow, ATR, were participants in the Michigan Art Therapy Association Conference at Michigan State University, East Lansing, Michigan. Dr. Barlow presented the keynote address “Art Therapy: Assuming a Professional Role,” and Dr. Rhyme gave a major presentation on a theory of multiple intelligences. Each spoke to a general theme of "excellence." Both Rhyme and Barlow collaborated to present this information, in condensed form, for VIEWPOINTS.

Our Search for Excellence

Gary C. Barlow, EdD, ATR

All of us are, and should be, concerned with excellence in our profession—as art therapists, in the delivery of services, and at our places of work. In pursuing readings on excellence, with the emphasis aimed specifically toward art therapy and expressive arts therapy, I discovered a "best seller" on excellence in corporate research titled In Search of Excellence, Lessons from America’s Best-Run Companies by Thomas J. Peters and Robert H. Waterman, Jr. (1982). The authors posed many questions that, although related to large American companies, seemed pertinent for consideration for those of us in art therapy and the expressive arts therapies.

The corporate styles and content were not necessarily easy to translate into art therapy terminology or method, or even style, but many of the strategies posed interesting questions for us. The art of American management was the focus of this book—the authors, for a number of years had been studying corporate excellence—and these large commercial companies were those familiar to all of us: McDonald's, Texas Instruments, International Business Machines, Hewlett-Packard, Xerox, Procter & Gamble, and numerous others. In the study of these corporations the authors focused on what conditions encourage success and what approaches and methods seemed to be key factors in innovation, productivity and goodwill among workers, as well as many other factors.

Data were collected and the standards of excellence were condensed into eight basic principles. Each of these may seem a platitude, but when actually put into practice all together they make for excellence in performance. These basic guiding principles are: 1) A bias for action (a preference for doing something—anything—rather than sending a question through cycles and cycles of analyses and committee reports; 2) [Staying] Close to the customer (learning his/her preferences and catering to them); 3) Autonomy and entrepreneurship (breaking the corporation into small companies and encouraging them to think independently and competitively); 4) Productivity through people (creating in all employees the awareness that their best efforts are essential and that they will share in the rewards of the company's success); 5) Hands-on, value driven [modes] (insisting that executives keep in touch with the firm's essential business); 6) Stick to the knitting (remaining with the business the company knows best); 7) Simple form, lean staff (few administrative layers, few people at the upper levels); and 8) Simultaneous loose-tight properties (fostering a climate where there is dedication to the central values of the company combined with tolerance for all employees who accept those values) (1982, pages 119 ff).

The study of excellent corporations shows that these companies were "brilliant on the basics." As examples, tools didn’t substitute for thinking, intellect didn’t overpower wisdom, and analysis didn’t impede action. Rather, these companies worked to keep things simple in a complex world. They insisted on top quality, and listened to their customers. (1982, page 13)

The basic principles of excellence in business and corporate management might seem simplistic and obvious. In our technological age, we sometimes need reminding that platitudes exist for so long because they sometimes state pragmatic truisms. Nevertheless, as professionals in art therapy and in the expressive therapies, what might we learn from this thought-provoking research on corporate activity and management? "To understand why the excellent companies are so effective in engendering both commitment and regular innovation...we have to take into account the way they deal with...constrictions that are built into human nature." (1982, page 55)

As art therapists we may not often have the luxury of revamping, for example, aspects of facilities where we work, nor do we always have the means to operate in smaller units as is identified in the overall structure
of some excellent companies. We might, however, have possibilities presented to us for change in the future. For example, buildings—or parts of buildings—may be restructured in a way that would affect the spatial units within which the art therapy sessions would function. With some reference to space use, and to those effective measures adopted by successful corporations, might the art therapist be able to make some pertinent decisions regarding newer innovative ways that build and enhance excellence, both in process and product?

We should not adopt step-by-step strategies from corporations, because the dissimilarity is too great. However, in our “search for excellence” in all of the intricate aspects of service delivery, art expression, healing potential, communication and the physical structures within which we work, the art therapist must play a role in helping to foster a climate for excellence—a climate of productive, creative experiencing and communicating, of learning and sharing.

Multiple Intelligences

Janie Rhynes, PhD, HLM, ATR

My presentation was planned around ideas from Frames of Mind: The Theory of Multiple Intelligences (1983), and I am excited by how relevant Howard Gardner’s observations and studies seem to be to the practice of art therapy. The relevance has to do with what we all know when we work directly with our clients, but which we seem to forget when we get all involved in esoteric dialogues that take away from our more prosaic job of helping people find out what they can do best. We are, I think, in the business of promoting excellence in our clients’ functioning. In doing so we must deal with the role of intelligence as a factor in successful performance. Art therapists tend to shy away from open admission that levels of intelligence are of any concern to us. A good reason for our denial is that we recognize that conventional intelligence scoring is, at best, inadequate and, at worst, discriminatory. Along with many others in human services, we know that testing for verbal, mathematical, and analytical abilities does not tap into other kinds of capacities which people use in making sense of experience. A not-so-good reason for art therapists’ denial of any interest in intelligence levels is a sort of reverse elitism which discriminates against the kind of thinking that people with high scores in verbal, mathematical and analytical skills are likely to use in their own therapy.

Gardner’s ideas of multiple intelligences provide us with a nondiscriminatory way of recognizing and respecting a wide range of intelligences. When we do that, we can bring together in our own an acceptance of the kinds of capacities that are not available to our clients, while we delve into their resources—and our own—for those faculties that can be developed and honed into maximum functioning. For that way of searching for excellence, we are being honest and realistic in admitting that we all live in a competitive world and that our clients want to succeed in it as surely as do those who engage in organizational management.

Gardner’s data are gathered from observation and studies of children’s play, prodigies, brain-damaged patients, and professional experts in action. He suggests that the multiple forms of intelligence can be mobilized by society to achieve a greater diversity of ends and to fulfill a wider range of social goals. In addition to the linguistic and mathematical intelligences, scored and esteemed as indicants of academic excellence, Gardner proposes five other intelligences: musical, spatial, bodily, and two personal intelli-

The American Art Therapy Association announces its Second Annual Film Festival under the chair of Cathy Malchiodi, ATR. The AATA Film Festival provides exposure for commercial, amateur and student filmmakers. The goal is to identify and honor quality films and video tapes which explore the field of art therapy through educational, entertaining and creative media presentations. The competition is open to AATA members and nonmembers, and students are particularly encouraged to enter.

Films and videos of exceptional merit will be awarded AATA Certificates; the best overall entry will be awarded a trophy. For more information on the Second Annual AATA Film Festival please contact: Cathy Malchiodi, ATR, AATA Film Festival Chairperson, 45 Kilgore Avenue, Medford, MA 02155 (617) 483-5058.

Call for Manuscripts

Dr. Shawn McNiff, ATR, and Dr. Gary Barlow, ATR, Editor, are planning an issue of Art Therapy focusing on multi-cultural issues and the sharing of international concerns in art therapy. People working in the cross-cultural modalities are invited to send manuscripts, or to submit special features or photographs. For more information, write to the Editor, or to Dr. McNiff, Dean of the Arts Institute, Lesley College, Cambridge, MA 02138.

***

The Art Therapy Educators Conference, scheduled for March 22-24, 1985, was postponed. However, it is being planned for 1986. Watch for details.

---

Guidelines for Authors

Please submit four (4) copies of manuscripts to: AATA Journal, 1980 Isaac Newton Square South, Reston, VA 22090. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½”x11” bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5”x7” black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet; In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.
"The authors have performed a most valuable service in showing how the drawings reflect the damage to the child's developing personality and in indicating measures to heal and restore, and to break the cycle that tends to perpetuate destructive, barbaric behavior."
—Joseph H. Di Leo, M.D.

SILENT SCREAMS AND HIDDEN CRIES:
An Interpretation of Artwork by Children from Violent Homes

By Agnes Wohl, C.S.W., A.C.S.W., & Bobbie Kaufman, M.P.S., A.T.R.
(under the auspices of the Coalition for Abused Women, Inc.)

This poignant volume is the first study of drawings of elementary school children who have witnessed domestic violence or have been themselves victims of violence. The 50 drawings project the children's emotional disturbances and alert the therapist to their feelings of helplessness, fragmentation, depression, anger, and anxiety. As a result, the helping professional is better able to define the therapeutic task and to "heal and restore."

Book Reviews

Art and Mainstreaming (Art Instruction for Exceptional Children in Regular School Classes)

(171 pages with over 70 black and white photographs and illustrations) $17.50.

Reviewer Virginia Minar, ATR is an art exceptional education teacher/therapist with the School District of West Allis-West Milwaukee, West Allis, Wisconsin, and an art therapy instructor at Alverno College, Milwaukee, Wisconsin. She is also a member of the Education Committee of the American Art Therapy Association.

Early in 1975, a National Art Education Association Mini-Conference on “Art Education and Special Education” was held in Chicago. The reports of that conference were published in a special issue of Art Education (1975, 28(8)). Although most of the presenters and participants were providing art experiences to handicapped children, there was at that time very little published material on the subject. Since then, numerous articles and books have appeared in print.

Because so many school districts use the art class for mainstreaming, the subject needed to be addressed. I therefore looked forward to reviewing Art and Mainstreaming by Claire B. Clements, Associate Professor of Education of Exceptional Children, Georgia Retardation Center, a University Affiliated Program, University of Georgia; and Robert D. Clements, Professor of Art Education, Department of Art, University of Georgia.

The issue of mainstreaming in art should deal with: 1) the exceptionalities of those students being mainstreamed; 2) the other students in the art class; 3) the art educator receiving those students, and 4) the purpose of the mainstreaming. In regard to the first item, the authors present individual chapters on all of the handicapping conditions defined in P.L. 94-142 except “speech impaired,” with an additional chapter on art for gifted children. These chapters serve as an introduction to the various kinds of handicapping conditions that an art teacher might need to be familiar with. It should be understood that each child is unique and that all descriptors do not necessarily fit. Art teachers interested in learning more about specific exceptionalities would need to read other in-depth coverage.

The first chapter, “Art for the Behavior-Disordered,” is the most extensive coverage of a handicapping condition. The authors describe a behavior management program, using art terms and art-related contingencies. The material presented is well-written and would be useful to the art educator serving this population. It would be advisable, however, to discuss any system one wishes to use with the classroom teacher, to see if it is consistent with the one he/she is using. Also, in the years I have been serving emotionally disturbed children, I have used some of the techniques the authors describe, but not always with the same results. One needs to remember that what works for one student, may not work for another; and that what works well one time may “bomb” the next. The readers need to take the Clements’ detailed and knowledgeable suggestions, and then adapt them to their own situations.

The second issue that needs to be addressed pertains to the attitudes and feelings of the other students in the class. The authors do not discuss preparation of the regular students prior to mainstreaming. Mary E. Scott, in her article, “The Real Issue of Mainstreaming: The Education of the Non-handicapped” (1982) touches on some of the problems and gives a number of suggested activities. These authors, however, do not deal with questions like: 1) How does a regular student become a “buddy?”; 2) Does he volunteer? Does the teacher interview people or does he/she just assign those he/she thinks would do a good job?; 3) If the students are helping others, when do they do their own work?; 4) Do they resent the disproportionate time the teacher spends with the exceptional students?; and 5) How do you handle negativism?

The authors have covered the various disabilities well enough to give art teachers some understanding of the handicapped student’s special needs and how to meet them. They do not, however, adequately address the third issue: the needs of the art educator receiving the mainstreamed students. How does the art educator—who may be teaching 5 to 6 classes per day, 25 to 30 classes per week—find the time to institute these services, which include preparing lesson plans for the mainstreamed students as well as for the regular students?

The authors repeatedly advise different projects for and different handling of the exceptional children. They do not suggest, however, how many children could comfortably be mainstreamed into one class. If mainstreaming does occur, shouldn’t some kind of
"weighting" be followed to make it workable? For example, in a class of 25, one might suggest that no more than two or three students, depending upon the disability, should be mainstreamed. The authors also do not address the extra time needed for staffing, or for the art teacher's written contributions to each handicapped child's Individualized Education Program as required under P.L. 94-142.

The fourth issue is the purpose of the mainstreaming. If it is mainly socialization, then mainstreaming in art might accomplish that purpose, if the regular students are properly prepared. When a handicapped student is academically at grade level, then mainstreaming should certainly occur, except where behavior is so disruptive that the entire class is adversely affected. If the exceptional education student would learn better in a self-contained art class, however, then mainstreaming should not occur. In the school district where I am employed, students are mainstreamed into regular art class only after staffings, and/or on the recommendation of one of the two art/exceptional education teacher/therapists. P.L. 94-142 mandates that education take place in the "least restrictive environment." A key word is "education." If mainstreaming does not enable the exceptional education student to show academic, motoric, or emotional growth, then "education" is not occurring.

After reading the book, it is apparent that the authors are concerned with providing meaningful art experiences for all handicapped children. In combining their knowledge and experience, they have sensitively produced a usable beginning work. Readers should be aware that the material they have developed was used successfully at the Georgia Retardation Center, and by student teachers under their supervision working in mainstreamed art classes.

There are two instances, however, where the authors give suggestions for eliciting verbal responses from the students about their art work, which seem to me to be closer to art therapy than to art education. The first one is in the chapter dealing with the emotionally-disturbed student:

The teacher can encourage the withdrawn student to express his thoughts and feelings through art, by saying to him, "I'm interested in how you feel about this picture." By talking about what he sees in art reproductions and his feelings toward those subjects depicted, the student learns that his feelings are okay. Sometimes it is easier for him to draw his ideas than to talk about them; the teacher might say, "Some things happen that are so important that it's hard to talk about them. Can you show me kind of what it's like in a picture?" In developing this student's ability to talk about his art to his classmates, it is most important that first the teacher, then the more verbal students, demonstrate the kind of verbal response considered acceptable. (p. 23)

There are several problems with using this approach in a regular classroom. The first is that the material seen or depicted in a picture may be very personal, and perhaps inappropriate for a classroom setting. The second is that the material may trigger emotional responses in that child or others that the art teacher, who is not trained in therapeutic techniques, might not be able to handle.

The second instance occurs in the chapter dealing with trainable mentally retarded students:

Children for whom night toilet training is a problem could, with a little water poured on their clay creation, act out the sorrow and parental scoldings of bed-wetting and the praise of getting up in the night to go to the bathroom. Thus, for the TMR child, art can provide a way to work through some of the problems connected with daily living. (p. 55)

One concern about using this approach with mainstreamed TMRs is that the other children might make fun of the activity or the discussion. It is, however, a rather clever technique which could be used by an art therapist easily in a one-to-one relationship, and possibly with a group, if all members are experiencing the same problem.

A joint conference of the National Art Education Association and the American Art Therapy Association, through the support of the National Committee Arts for the Handicapped, took place in August of 1980. At that conference some of these same issues and many others were considered by the participants. Recommendations were made for future directions and further dialogue. Through continued effort by all parties, art for the disabled should finally be recognized as an important element of their lives. Not only art for all the children, but art for all the people, is beginning to become a reality. There has been considerable progress since the NAEA Mini-Conference of 1975.

Although I have raised a number of points for consideration, I do feel Art and Mainstreaming would be a worthwhile addition to any library on art in exceptional education. The Clements' work reflects expertise in their areas of specialization. The procedures they detail are certainly workable in self-contained groups, and are worth trying with exceptional children who are mainstreamed in the regular art class. It is one thing to develop methods and techniques that work in a controlled setting like the Georgia Retardation Center, or in supervising student teachers who utilize the procedures during their short-term practicums; but quite another to carry them out day-after-day, year-after-year, in mainstreamed art classes in public schools. The authors are to be commended for their dedication and their work on exceptional children, and for writing a usable methods book on art in exceptional education.

Obtaining Funds for Therapeutic Recreation and the Creative Arts Therapies

Reviewer Harriet Wadeson, PhD, ATR is Director of the Graduate Art Therapy Department, University of Illinois, Chicago, Illinois, and is VIEWPOINTS Editor for Art Therapy.

The cover of this handbook states that it is "a manual for therapeutic recreation personnel, and music, art, psychodrama and dance therapies." As an art therapist myself I am all too aware that my skills and interests, and those of many of my colleagues, reside in clinical realms, and that few of us would consider ourselves "business people." And yet in these days of shrinking (or already shrunk) budgets, we find ourselves needing to attract and administer funding from external sources.

This “workbook” describes itself as “designed for individuals involved in planning and directing programs of recreation or creative arts for special populations” and “faculty...involved in research or...professional preparation curricula or in service and continuous education in...recreation for special populations or the creative arts therapies.” It promises to “help you learn...about writing a proposal for funding,...evaluating your potential for getting grants and contracts, open your eyes to...types of grant assistance available,...types of agencies in the ‘funding business,’ and hone your skills in the ‘positive politics’ of grantmanship.” As I am getting ready to look into grant support for art therapy training, service and research, I figured the book was written for me. It was with eager anticipation, therefore, that I opened its cover.

The Introduction presented me with a confusion of definitions about types of federal assistance, differences between grants and contracts and types of proposals. This section seems misplaced. A more appropriate beginning would be the first steps in seeking funding. Hard on the heels of this section are sample forms and instructions that are difficult to read because of the poor quality of their reproductions. The clearer ones, however, do give a sense of the amount of effort required to write a grant proposal.

If the reader is able to get past these initial obstacles, there is useful information sprinkled throughout the rest of the book. This includes references to funding sources, tips about proposal writing, a checklist of information to obtain about the funding agency to which one is applying, a timetable for proposal development, milestone charts, budget estimating pointers, criteria employed by grant reviewing boards, and sample forms they use for evaluation of proposals.

These are the areas where the book is most helpful. For example, under “Tips on How to Write Grant Proposals,” there are concrete suggestions, such as “Keep your paragraphs short, and only present one thought per paragraph.” “If you have trouble getting started, begin with the budget. Money has a strange way of defining our methods and objectives.” An example of the 15 items on the checklist of information to obtain about the funding agency before writing the proposal is: “What is the length of time over which a project may run? Is it fiscal year to fiscal year?”

On the other hand, the book is less useful in its presentation of the obvious, for example, the several places where it emphasizes following the funding agency’s directions in writing the proposal. Also, its myriad reproductions of forms, regulations, and directions are redundant.

Upon completion of the book I found myself puzzled as to why it is directed toward recreation and arts therapists. Except for some initial examples of relevant grants awarded, some sample application forms and regulations for grants in this general area, and an appendix of foundations that support the handicapped, the book focused on “grantmanship” in general. On the other hand, the authors limited themselves primarily to public monies with a disclaimer that grant-writing is the same regardless of the funding source. In my limited experience, I have learned of private sources that request little more than a budget and a descriptive letter, compared to the elaborate documentation required by NIH, for example.

It seems to me that Obtaining Funds is most useful as a reference, rather than as an instrument for learning “grantmanship” as it purports to be. A grantseeker might refer to it initially for references to directories of funding sources and utilize its pointers and checklists for evaluating a project’s “fundability,” for obtaining information to help gear a proposal toward an agency’s manner of funding, for estimating a budget, and for tips on proposal writing and criteria on which proposals are reviewed. Though hardly the solution to the recreation and art therapist’s funding needs, Obtaining Funds provides some helpful hints.

The Artist in Each of Us

Florence Cane, Craftsbury Common, VT: Art Therapy Publications, 1983
(370 pages)

Reviewer Helen B. Landgarten, MA, HLM, ATR is Professor and Director of the Clinical Art Therapy Master's Degree program at Loyola Marymount University in Los Angeles. She is also the Coordinator of Art Psychotherapy at the Cedars-Sinai Medical Center, in the Thalians Mental Health Out-Patient Division. Landgarten authored the book, Clinical Art Therapy: A Comprehensive Guide (Brunner/Mazel, 1981).

The readers of this review will fall into two categories: those who are reacquainting themselves with The Artist in Each of Us, and persons new to art therapy, who will be experiencing this book for the first time.

To fully appreciate Florence Cane's book one must view it in a historical perspective. In 1951, the author's contribution to art education was, and still is, innovative, sensitive and therapeutic. Many art therapists who work within the art-as-therapy framework claim Florence Cane as the founding mother of their approach. The last segment of this book is devoted to describing "The Healing Quality of Art."

The Artist in Each of Us was a pioneering and fascinating publication for art educators and therapists in the fifties and sixties. Now, some thirty years after the book first appeared, the approach is no longer innovative; but more importantly, it does present itself as a tried and true current piece of literature, a reflection of the lasting value of Florence Cane's work. She was certainly an influential person who helped to lay the foundations of our profession.

The newly revised paperback edition of The Artist in Each of Us is beautifully presented, with 23 color plates and 166 illustrations in black and white. The book is divided into four parts: Theory, Method, Practice, and the Healing Quality of Art. The theoretical segment addresses the creative process, the conditions which stimulate creativity, and the integration of the person through the art experience. This particular section of the book may prove to hold the least amount of interest for art therapist, whereas the later chapters may prove to be progressively more interesting and involving.

Part II is devoted to Cane's METHOD. In it she tells about what she called the "Release of Creative Faculty Through Basic Experience of the Body." She describes techniques for developing the kinesthetic sense, and offers specific movements to liberate expression. The author expresses her belief that large movements in drawings release images from the mind, and thereby stimulate the creative process. In addition, she offers the reader step-by-step exercises which include the purpose for each activity. A segment on the "scribble" is especially worthwhile. Although many art therapists have integrated this particular technique into their own repertoires, they may be unaware that Florence Cane was its originator.

Methods also include "Release of the Creative Faculty Through Basic Experiences of Feeling" as well as what she calls the "Psychological Approach." The vignettes included illustrate the ways in which Cane solved specific problems with a variety of individual students. Here one begins to get a sense of the beauty in Florence Cane, as well as the inventive and energetic aspects of her personality.

"Awakening of the Imagination" is additionally related to Cane's methodology. A parallel to the Jungian approach to "active imagination" is seen. The history of a depressed girl whose unconscious drawings dealt with her inner struggles and conflicts is described. The art enabled the student to gain insight, which furthered her developmental growth. In contrast, the chapter on "The Training of Observation, Recollection, and Perception," depicts a process which is automatically created by any artist. However, Cane is to be commended for putting it into a cognitive perspective.

This reviewer found the chapter on "The Growth of Form and Design" to be of greatest interest. It presented the normal progression of a child's pictorial development through form and design. Cane also delineates ways in which the teacher can bring out the child's intuitive potential.

Part Three, which refers to PRACTICE, is divided into two segments, the Child and the Adult. Five case histories are delineated; they were gathered while the author acted as a consultant to the Counseling Centre for Gifted Children at New York University. One value of these cases lies in the extensive longitudinal data presented. One child's pictures are recorded from the ages of four through twelve; another example includes work created from age six through sixteen; and a third person's work is from the twelfth through the twentieth year. In the last account, where the girl goes through her adolescence, the issues of this stage of development are addressed and pictorial interpretations are made. The author strives to bridge the gap of feeling and expression, in order to help the adolescent through the insecurities indigenous to the particular phase of her life.

These chapters are lightly sprinkled with additional techniques for helping her students achieve a freer and more productive approach to art. Cane also introduces a spiritual element, reading the Old Testament to her students to stimulate creative ideas. The Jungian approach, which evidently influenced Florence Cane, also integrates the spiritual side of the individual.

In spite of the brevity of the "adult" section of the book, this segment deals with four students whose ages range from late adolescence to early adulthood. One case involves overcoming a creative block. An-
other portrays Cane's success in helping an older woman bring art into her life. Yet another individual demonstrates the integration of art as a symbol for beginning a new life style. In addition, there is an illustration of a male student, who was directed into utilizing his creativity for professional purposes.

The last sixty pages of the book deal with "The Healing Quality of Art." This fourth part of the book is dedicated to "A Modern Psychotherapy." It contains a vignette on the way in which art, creativity, and increased self-esteem helps a shy child to interact with peers. Cane offers the reader fresh and updated interpretations of the drawings throughout the child's development. Her inventiveness brings a new dimension to the therapeutic aspects of art.

Patients were sent to Florence Cane for the purpose of drawing from the unconscious, for the presumed healing effects of this approach. Referrals came from physicians and analysts. This was a collaborative effort, with Cane the creative teacher who perceived the meaning of her pupil's work, yet left the analysis to the psychiatrist. She claimed the only difference between the referred individuals and other students was "that the emphasis is placed on their expression of fantasy with a minimum of time spent on technical proficiency." The book has several examples which are described lesson by lesson. One reads about the persons, who delved into their past. The author writes about the working process and the outcome which held a brighter future.

Cane's last chapter is entitled: "Mario—Renewal through New Use of Breath and Sound." She claimed "it offers the most dramatic illustration of the value and influence of art in the development of the child." It describes a very talented boy who creates art for a period of nine years. The reader sees the initial sketches which were drawn at the age of nine, accompanied by a series of pictures created in different years. The last sketch shows the student's physical and artistic maturity. In this final case, the point the author makes is that Mario did not use his art to escape from life. Rather, he created art in which he "found new health in body, soul, and mind." I found statements such as this one rather grandiose. Nevertheless, many readers may find them consonant with their own therapeutic beliefs.

The Artist in Each of Us holds historical value. This book, that was out of print for many years, deserves to be read. Art educators and art therapists who seek an understanding of the key contributors to their professions will be pleased to acquaint themselves with Florence Cane and her innovative work.

Inpatient Group Therapy
(350 pages, $16.95)

Reviewer Kathleen Mileski Hanes, ATR is Clinical Instructor in Art Therapy at Trenton State College, Art Therapist at St. Francis Medical Center, Dept. of Psychiatry, and the author of Art Therapy and Group Work: An Annotated Bibliography, Greenwood Press, Westport, CT, 1982.

Irvin Yalom, psychiatrist and author of the landmark text on long-term groups (The Theory and Practice of Group Psychotherapy, 1976), now offers a much-needed book about short-term, inpatient group therapy. His audience is "the front line clinician—the harried mental health professional who leads groups amidst the tumult often found on the acute psychiatric ward" (p. x). One senses that Yalom knows the unit only too well, with its frantic pace, problems with turnover, conflicts among disciplines, and misunderstandings about the value and goals of group work. Yalom, in fact, visited 25 training units, each with 15 to 35 beds, interviewing the staff and observing group therapy sessions. He draws from these visits, as well as from his personal clinical experience and vast knowledge of the research literature. The creative arts therapist may take issue with the lack of attention Yalom gives to expressive groups, or to page 311 where he refers to "activities that call for indirect expression [italics mine] such as art, writing, or movement." Yalom, however, delimits his task in the Preface: "I focus exclusively... upon the central, indivisible ingredient of the inpatient group therapy program: the daily 'talking' group" (p. xiii). He does not discuss groups for patients with special programs or diagnosis. Rather, he describes the generic verbal therapy group, and carefully delineates how to operate such a group in order to implement goals he believes to be germane to this special setting.

Yalom is careful to point out that his goals for group practice are not identical to those for inpatient hospitalization. He believes it is important (1) to engage the patient in the therapy process and obtain a commitment to outpatient follow-up; (2) to encourage patients in the belief that "talking helps," and that life experience and feelings are often shared by others; (3) to assist patients in identifying their personal problems in relating to others; and (4) to alleviate anxieties about hospitalization. In discussing this last goal, the psycho-ecology of the milieu itself is addressed, with stresses on the staff understood as potential sources of disruption to the patient group (and vice-versa). Art therapists will probably recall the writings on moral groups by Harris & Joseph (1973) or Brown (1976) that document such interactions.

Strategies for assigning patients to groups are described, with advantages and disadvantages of various approaches carefully spelled out. Yalom favors
the "levels" approach, with the "focus" group designed for patients who are the most disorganized. Such groups have mandatory attendance and meet for about 45 minutes. Leaders are responsible for the judicious selection of themes and methods, and are urged to offer "support, support, support." Among the techniques mentioned are several graphic tasks; many others are readily adaptable to graphic or plastic media. The "curative factors" of catharsis, universality, altruism, and cohesiveness (Yalom, 1976) are said to be especially salient in a focus group. In higher level groups, meeting for up to 75 minutes, interpersonal learning and self-understanding are more relevant. For all groups, Yalom stresses the importance of boundaries and of operating sessions with a firm sense of beginning, middle, and end.

Strategies and techniques of leadership are covered in chapters three and four, describing how the group leader can deal with common issues such as the expression of anger, leader transparency, giving and encouraging feedback, focusing on the here-and-now, etc. The final two chapters outline specific procedures for both the higher and lower level groups. Clinical vignettes are employed to exemplify and amplify premises and techniques, and deserve careful reading. Yalom focuses on the single session and does so in detail, devoting less attention to the flow of affect and of "basic assumptions" throughout the week or month. These, too, need attention when describing group work on an inpatient unit.

It is important to step back from the text long enough to ponder the theoretical base from which this particular helping model emanates. Yalom identifies himself with the "existential" school of psychology (Corsini, 1984). Hence, he would operate from a "compensatory model," according to the four generic helping/coping paradigms defined by Brickman et al. (1983). In this model, patients are felt to suffer from conditions imposed by their environments (they are "thrown into the world" so to speak), and must assert themselves in order to create their own futures. In subscribing to the compensatory model a helper says, in effect, "I am your temporary servant. How may I help you?"

In the "medical model," in contrast, a helper says in effect, "Do what I suggest." Patients are not felt to be responsible for their condition or their cure. In the other two models, patients are seen as responsible for their presenting condition, but the locus of responsibility for cure differs in each instance. In the "Moral model" (associated with Albert Ellis' RET and est groups), the patient is held accountable for future actions or "cure." In the "enlightenment model" (associated with therapeutic communities and Alcoholics Anonymous), the helping group or individual practitioner is the locus of responsibility.

One would like to hear more from Yalom himself on the theoretical framework he offers, its inherent values and its ramifications. For example, what are some of the problems in using the compensatory model he seems to describe? Is it differentially effective with various social classes, ethnic groups or diagnostic categories? What are the possibilities of potential staff burnout using the Yalom model? If patients are seen as responsible for their futures, would staff be willing to view the continually readmitted patient as somehow not responsible for his/her condition? What is Yalom's understanding of how his model contrasts with other models? While the text is primarily a manual of practice, this does not eliminate responsibility for framing the work within theory and value system.

Finally, how might the art therapist benefit from this highly recommended book? First, the therapist might present the text to his/her staff for consideration. Secondly, the generic principles of leadership delineated in the text translate readily to the expressive therapies. Problems discussed range from basic gatekeeping functions to the timing and "dosage" of interventions. Certainly, these are problems faced by every art therapist (cf. Shoemaker & Smith, 1984). Yalom offers a clear "agenda"—even a "prescription"—for operating verbal groups. While the gestalt or phenomenological art therapist might be at home with some of these practices, the analytic or non-directive art therapist would probably be less comfortable with Yalom's active here-and-now style. Also, the therapist committed to art-as-therapy or the evolution of personal symbol systems may have difficulty working within Yalom's frame, or even adapting to the contemporary short-term treatment setting. These matters bear further discussion within the field of art therapy.

Carol Beighley Paraskevas (1979) is one of the few art therapists who has published on combining art with verbal therapy on a short-term unit. In addition, Linda Gantt (1979) has designed special projects for short-term remediation of ego diffusions, and Pat Allen (1983) has described the evolution of her treatment approaches in short-term hospital settings. Cohn and Tudor (1978) reported on a specially designed group problem-solving approach at an early AATA conference, and Francis F. Kaplan (1984) spoke recently on the benefits of combined verbal and art therapy. Mary Ann Blank (1984) spoke at the last AATA conference on utilizing Yalom's approach, but did not deal with how the art group related to other groups on the unit. This is essential if Yalom's latest work is to be utilized within the field of art therapy.

It will be the task of all art therapists to develop short-term strategies and goals, as well as to define viable complementary services. Short-term hospitalization is here to stay, and Yalom offers a humane method for coping with this situation. His is a voice of experience and authority, and one hopes that his approach will be adopted by many enlightened units. Finding ways to "go with the flow" on such units will be essential.
Self-Growth in Families, Kinetic Drawings (K-F-D): Research and Application

Robert C. Burns, New York: Bruner/Mazel, 1982

Reviewer Mari Fleming, ATR, MFCC, is an art therapist currently working in the eating disorders unit at Marshall Hale Hospital in San Francisco, and teaching at both the College of Notre Dame and Sacramento State University, in California.

"Aside from studies by Reznikoff (1956) and Shearn and Russell (1969) no other reports of the D-A-F (Draw-a-Family test) could be found in the literature. Hammer (1958), Koppitz (1968), and Di Leo (1974) discuss the use of D-A-F." (1982, p. 63)

So writes Burns, an author who, with Kaufman, is referred to by many art therapists and used by them as a valuable resource. Yet he seems not to have heard of art therapy as a field, nor to be aware of those who have worked with families using art. True, art therapists do not write of the "Draw-a-Family test," but it is regrettable that a researcher who uses family drawings is unfamiliar with the work of Kwiatkowska (1962, 1967, 1978), Rubin (1974, 1978), and Wadeson (1973). When Burns and Kaufman first published their work on Kinetic Family Drawings (K-F-D) in 1970 and 1972, such an omission was understandable.

The current volume, however, published in an era of computer access and library search, has less of an excuse. In fact, what seems extraordinary is the inclusion of a reference to Betty Edwards, art educator/author of Drawing on the Right Side of the Brain. Although Dr. Edwards' work does not deal with children, families, family drawings, or assessment, she and/or her publisher are apparently possessed of enviable merchandising skills!

Putting my frustration and parochialism aside, however, I recommend this as a useful and thought-provoking book for art therapists. In their first text (1970) Burns and Kaufman described their Kinetic Family Drawing Test (K-F-D), presenting the thesis that "in drawing every member of his family doing something, the subject reveals a great deal more about himself than in the simpler and more conventional task of drawing a family." (1982, p. 7). The second volume (1972) provided the authors' interpretations at a symbolic level for commonly-depicted objects, different styles, and common themes in K-F-Ds.

The current volume summarizes the use of the K-F-D, and seeks to demonstrate its use as a scientific tool, including a research manual, scoring criteria and instructions for judging, with a projection of computer quantification and handling of data. This section offers stimulating ideas about how to accomplish the very difficult task of objectively evaluating drawings. The suggestion of a superimposed grid, for example, is a direction researchers in art therapy might well consider. I also found myself thinking of the ways in which children compose color, line, and form on computers, as they learn to manipulate this new technology. Could the process be tabulated and quantified as well as the final form?

Yet this is the kind of question only the art therapist seems to ask. The protocol for the K-F-D requires the examiner to state the instructions, and then to leave the room and check back periodically. "The situation is terminated when the subject indicates verbally or by gesture that he/she is finished." (1982,
p. 68) If the child is not observed drawing, is the process inferred from the work itself? The criteria for scoring include actions, figure characteristics, position, distance, barriers, styles, etc. “Style” is related to “compartmentalization, edging, encapsulation, folding, underlining, and bird’s eye view.” (p. 72) In none of these are line quality, degree of pressure, order of drawing, or the child’s affect considered. Color is mentioned only briefly, in one case history, with no discussion of the possible meanings of color usage in drawings.

This way of looking at art contrasts sharply with that of Rubin, who suggests that “the process is as revealing as the decision-making that preceded it.” (1978, p.65) It is also different from that of Kwiatkowska (1978), who emphasizes the value of observing the process, and of having the drawing take place within the family group. As an art therapist who has used both the Kwiatkowska and Rubin family evaluations, and taught and supervised their use, I believe my evaluation and treatment would suffer by omission of the data on art process and family interaction. My training in making art and using art in therapy, as well as my training as a family therapist in viewing the family as a system, insist that I observe context as well as content.

Burns states the K-F-D is significant for its reflection of the self within the family context. He conjectures that the K-F-D is the nuclear self, “the self shaped in the early years of family life.” (p. 17) He contrasts this with D-A-P (Draw-A-Person), “an expression of the self in the environment” (p. 17), i.e. the environmental self, which he states is similar to the person obtained by the House-Tree-Person technique. The material contrasting a child’s D-A-P self and the self in the K-F-D is among the most interesting in the book. In the troubled families shown, the K-F-D-S (Kinetic Family Drawing Self) is markedly less mature or more disturbed, fragmented or incomplete than the D-A-P self or the D-A-F self. Burns provides a useful way of looking at this contrast: seeing the drawings as reflecting the child as he is inside the family, vs. his reflection in the context of the outside world.

This is a fertile area for further inquiry, and Burns presents material demonstrating how such contrasting data can be used to help determine custody and foster placement. Others have also sought contrasting methods of picturing the family as a way to obtain fuller information. Kwiatkowska, for example, contrasts the picture of the family with an abstract family portrait. Rubin describes having the family draw the main problem in the family.

Burns also focuses on the process of identification, the internalization of the feelings and values of parental figures, and the role of pictured identification in evaluating the child. This material can provide validation of changes in the K-F-D self following treatment or more appropriate placement. Art therapists have observed similar changes in drawings, and can learn from this sustained and systematic procedure another means of evaluating the efficacy of treatment.

The book also includes an Appendix, which brings together and summarizes general hypotheses regarding the variables used in human figure drawings. Burns adds an additional “style”—the “bird’s eye view”—and discusses the moon as a symbol. Burns states the moon is almost always masculine (p. 174), and all his examples stress the “high frequency of morbidity moon fascination in children with unrequited love for a parent, usually the father.” (p. 174) His examples are not totally convincing to this reviewer, since two pictures reflect loss of a mother’s nurturing equally well.

In viewing and evaluating pictures and symbols according to Burns, the art therapist needs to keep in mind that this is a research procedure. The novice may be seduced by a dramatic procedure and readily available interpretations, without confusing variables like “How” and “In what order” and “What was said.” Most art therapists are aware of the necessity for viewing symbols within a cultural and personal context, emphasizing the artist as the authority for the meaning of his own work.

In his Introduction, Burns states the theory: “K-FDs have a special language telling us a great deal about family interactions, if we speak the language. Most of us are visually illiterate, however...” (p. 3) He suggests that all those interested in human figure drawing analysis should learn to draw people. That is, in order to truly see, we must have experienced the processes of drawing. The art therapist’s contribution to the use of art in measurement and evaluation can be a major one, insisting that such evaluation consider process as well as product. Perhaps this text and its careful methodology will inspire productive investigation of this additional factor.

Normal and Anomalous Representational Drawing Ability in Children

Reviewer Vivian T. Harway, PhD is a Child Psychologist with many years of experience in consultation, teaching, research and clinical work (both diagnosis and therapy). She is Director of Psychological Consultation Associates, and she is also Clinical Associate Professor of Child Psychiatry at the University of Pittsburgh.

This is a fascinating and important book. The author is unnecessarily modest when she implies on the dust jacket that the studies on which her book is based would be of interest to “educational psychologists, and psychologists from student to professional level...and to those concerned with art education.”

Normal and Anomalous Representational Drawing Ability in Children makes a valuable contribution to the literature on cognitive and conceptual development in children, and on the all important relationships between non-verbal (spatial and imaginal) and verbal (symbolic) intellectual functioning. As such, it should be read by developmental psychologists, clinical child psychologists, and all other professionals interested in normal and impaired cognitive growth.

The author, Dr. Lorna Sefte, a teacher and educational psychologist, from Hereford, United Kingdom, published in 1977 Nadia—A Case of Extraordinary Drawing Ability in an Autistic Child. This is a case study of a severely autistic and language-impaired child who, between three-and-a-half and adolescence (she is now 17), produced a series of drawings which showed, from the first, a remarkable understanding of proportion and perspective. Dr. Sefte used her continuing work with this unusual child as a springboard for the study of the special nature of anomalous drawing skills in autistic children with severe expressive and receptive language retardation. She also conducted an intensive study of the development of realistic representation in normal children between the ages of five and ten.

The author reviews the international literature on theoretical approaches to understanding children’s drawings developmentally, and the assumptions made by proponents of different approaches about the course of conceptual and cognitive growth. In terms of the relationship of drawing to intelligence, the prevailing view seems to be that of Goodenough (1926). The child is seen as attempting to approximate photographic reality in the representative of the human form. His or her relative success is considered to be a reflection of the intellectual maturity of the child.

This conceptualization is rather narrow, ignoring the fact—emphasized especially by the Gestalt psychologists (cf. Arneheim, 1974) that children see more than they draw, and that the representation of objects is usually not as well differentiated as the perception of objects. Thus, drawing may represent not only what an object looks like, but also how the child has experienced the object.

Dr. Sefte’s theoretical approach to understanding children’s drawing derives from the interactionist model proposed by Gibson (1979). Children’s drawings represent the perceptual experience of the child; they need not be photographic, since the child’s perceptions may include experiences of color, speed, motion, etc. The child learns to use certain invariant representational structures, such as the human head as a graphic circular structure. The child draws those aspects of the environment which are salient or relevant for him/her, and may neglect other features. The young child will not usually draw in perspective, because he/she is not interested in those aspects of the optic array which determine perspective (such as edges, contours, occlusions, etc.). The child will represent those features which are significant to him/her at the time. Only later will the child begin to manifest an interest in fixed-position perspective. Thus, to Gibson, “visual realism” may not be the primary aim of the drawings of normal young children. Rather, the drawings represent a symbolic representation of meanings to the individual child.

It is of particular interest that in the language-impaired and autistic children in Dr. Sefte’s population, the anomalous drawing ability is seen in a facility for expressing perspective from a single fixed
viewpoint. It is as if the drawings of the autistic children are meant less to communicate, or to symbolize, or to express meaning; but rather manifest excessive concentration on non-symbolic aspects of the visual field.

The author also reviews the literature on the development of the representation of depth and linear perspective in children's drawings. Mastery of this problem comes with the child's gradual realization, generally at adolescence, that with distance comes change in the perception of proportion, dimensionality, and diminishing size.

This comprehensive theoretical overview, clearly and economically written, comprises the first quarter of this book. The author then describes her systematic studies of the development of skills in representation of photographic realism in normal children's drawings between the ages of 5 and 10. She also provides an in-depth analysis of the drawings and the histories of six children with exceptional graphic competence (including Nadia). These children also manifested severe learning difficulties and "retarded language development.

The author investigated separate elements of representation of photographic realism in children's drawings. These included the ability to portray realistic proportions in the human figures; the ability to depict three dimensions in single objects; the ability to represent depth by drawing diminishing size; and the ability to represent two objects, one partially occluded by the other. The author devised several unique and ingenious tasks to assess the child's skill in each of these areas. A scale for the natural progression of the representation of photographic realism was then devised, based on the results of these studies.

In all of these areas there was an age-related trend toward more accurate depiction of realism through representation of accurate proportions, dimensions, diminishing size with distance, and occlusion. However, even by ten years of age, most normal children have not accurately solved the problem.

In contrast, drawings of the anomalous groups (ages six to eight), when compared to the drawings of the normal children (using the 12 point scale of photographic realism) show that the autistic children were able, at a very early age, to achieve realistic proportions in a single figure; to depict three-dimensionality; to depict realistic proportions between objects with distance; and to depict overlap or occlusion in drawings with relative ease.

The author speculates that normal children, even when presented with specific experimental tasks, tend to represent features of the optic array that have significance or meaning to them at different age levels. Also, with increasing socialization there is gradually increasing similarity in the process of attending to and organizing features of the visual field. The drawing of the normal child represents the interaction of the dynamic visual experience of the child with properties of the object he/she is trying to represent.

The autistic children, on the other hand, attend to such features as the lines, edges, contours, and angles of the optic array. The focus on non-symbolic, and non-linguistic aspects of their visual field. The space between and around objects is given equal consideration with the object. For the normal child, the depiction of the object itself is paramount. For the normal child, the development of photographic realism is a "late blooming" accomplishment. For the anomalous children with language deficits and idiosyncratic symbolic abilities, the early development of photographic realism is symptomatic of their disturbance. The author states that this trait is symptomatic of the depth of these children's cognitive deficits. However, it also could be viewed as symptomatic of their extreme inability to communicate with the world in terms of language and verbal symbolism. With their anomalous skills they "mirror" visual experience, without incorporating any intermediary symbolism or personalization, as the normal child does.

The author considers the literature on the art of talented children and mentally retarded children, and demonstrates that her "anomalous" group is indeed unique. All six of these subjects had IQs in the lowest 2% of the population on whom the tests were standardized. All showed a wide range of variability in skill levels. They had "peaks" in perceptual matching, spatial imagery and visual memory for abstract symbols; and "troughs" in performance on verbal reasoning tasks, speed of information processing, retrieval and application of knowledge. All of the children began spontaneously producing accurate representations of animals, buildings, architectural details, and human figures, usually in three-dimensional settings, at very early ages. The 40 pages of this book which are devoted to reproductions of these drawings are worth intensive study.

In her conclusions, Dr. Selfe presents a fascinating discourse on the relationship of art and language, and how the ability to depict space in drawings may vary from child to child as a function of the degree to which the child uses verbal mediation in the approach to the task. The autistic children's drawings represent the comprehension of spatial relationships at a very early age, in the absence of a commensurate level of language expression and comprehension. Artistic expression is enriched as the artist acquires skills in integrating imaginal information with the ability to express insights into human nature. The drawings of normal children have charm as they reveal the child's attempts to organize and express his experience, under the domination of his symbolic and conceptual thinking. Dr. Selfe concludes that "realism" in artistic development is a less advanced stage than that seen in the drawings of normal young children who are struggling to create a symbolic representation of their experience.

Why, however, is this anomalous drawing ability limited to only a few of the autistic, language-impaired children? Severe infantile autism is a very
rare disorder (approximately two to four cases per 10,000). Although performance is generally worse for this group on tasks demanding symbolic thought and sequential logic, and many show better performance levels on manipulative or visual-spatial skills (DSM III, p. 14); only a small percentage of autistic youngsters show the type of anomalous skill that Dr. Selle’s group manifested. Might it be that her group, and children like them, represent the extreme end of a continuum that extends at the other extreme to the excessively symbolic and highly internalized representations of the drawings produced by severely disturbed and acutely schizophrenic individuals? Dr. Selle does not make this point, but it is a logical extension of her reasoning. There is a rich literature in the area of the art of severely disturbed individuals, and this comparison begs to be made.

This excellent and very important book should be widely read, and should stimulate much further research on children’s art, children’s cognitive development, the artistic expression of a typical and disturbed individuals, and on the nature of art itself.

Film/Video Review

**Art and Therapy**

**Lila**

Film (16 mm, color/sound, 28:30, 1980) Ideas and Images, Inc., P.O. Box 5354, Atlanta, GA 30307, Tel: (404) 523-8023.

Reviewer Lewis K. Shupe, PhD, ATR is Professor of Art Therapy and Communication, Wright State University, Dayton, Ohio.

The videotape of *Art and Therapy* and the 16mm color film of *Lila* are two productions that are recommended for the experienced clinician, the neophyte therapist, and all personnel working in the human services to view as honest sharings of the clinical process in action. These are not presentations that are staged strictly for the purpose of demonstrating process, but are a sharing of the rationales, experiences, and insights of two practicing clinicians who are able to demonstrate the translation of theory into practice.

In the videotape *Art and Therapy*, art therapist Vera Zilzer effectively demonstrates a range of techniques in working with both individuals, and individuals within a group setting, in the South Bronx Community Mental Health Center. The tape also serves as a testimony for the value of art therapy in working with clients who are being seen for treatment in a mental health agency.

The beginning of the tape introduces the therapist and her direct work with individual clients in the Community Mental Health Center. Ms. Zilzer is clear in presenting her rationale for working as an art therapist. This presentation of rationale is evident by observing the rapport she has established with her clients, and also may be one of the factors in the results that are reported, and evidenced in the sharing of the art of the members of her therapy group. The tape demonstrates a confidence of the therapist in the work being done, and within the videotape it is evident that art therapy is a viable discipline.

Individual clients are interviewed and verbalize the values of their experiences in the therapeutic process as they share their art work with the viewer. Motivated to complete drawings of “every tree in the Bronx,” a client experienced the rebirth process and responded that it was like “bringing new life to me.” He added that working in art “helps me to relearn how to express my own feelings.” These specific responses from the clients are not insertions into the videotape as solicited testimonies but are genuine extensions of their involvement in the process. Ms. Zilzer demonstrates a range of responses by the thera-
pist: a verbal therapist, to the comfort of being there as a support to the clients and allowing them to work in the art without intrusion. "She meets him in his silence" is an important message to all therapists that the client needs time to work without verbal interruptions. The meeting in silence is presented as a level of comfort for both the client and the therapist.

In addition to the traditional procedures for working in art therapy, Ms. Zilzer shares two of her techniques that may not be in the repertoire of the majority of art therapists. In one scene of Art and Therapy she sketches directly onto the work of a client in helping this client to recreate an earlier experience. Another technique refers to the therapist drawing a series of portraits of the client in therapy as a procedure to enhance self-esteem. This is also used to set the mood in the art therapy room where the clients then sketch themselves and other members of the group. The therapist interprets, for the client, the changes in affect that have occurred; the client appears comfortable with this procedure. These two approaches may stimulate some questions as appropriate procedures; however, Ms. Zilzer demonstrates the procedures through experience and as a therapist who can articulate the rationale for use. They also demonstrate the uniqueness in the diversity of art therapy as not being a recipe-type intervention process.

The last part of the videotape demonstrates the individual members working in a group setting, and focuses primarily on two members interacting on an interpersonal level through their art. The interaction between the two members is illustrated as a specific description of how the art work served as the introduction to the establishment of communication. The symbols in the art work depict how weapons and missiles were used as barriers and probes in the interactive process, and the two clients are able to share their emerging insights as they progress to a higher level of comfortable dialogue. The interaction of these two clients, with the appropriate interpretations by Ms. Zilzer, reflects group process for both content style and work style as presented in the Hill Interaction Matrix (Dinkmeyer and Muro, 1971). The other members of the therapy group do not interact within the dialogue of the two members. The viewer can infer that they are comfortable members of the group as they continue to work on their art and listen to the assertive, speculative, and confrontive interactions of their two group members. In the midst of an "argument" they appear to be comfortable "in their silence."

The therapist states that in the group process the members are being gently "pushed and pulled through small changes." Ms. Zilzer explains that "art therapy is not group therapy although it takes elements of group therapy. We go as fast as possible into group cohesiveness, which is the third stage of group therapy. Working gives them a sense of calmness that is like relaxation." This sense of calmness is apparent among members of the group.

The medium selected for the work is drawing, and the product appears to be emphasized as an important element of the process. The art work and the process of creating the drawings are well photographed for the videotape, and are presented as a well crafted, completed video production. This is complemented by an excellent musical background and an audio narration that is clear and articulate.

The average length of day-treatment therapy for the clients shown in the videotape is six months. It is difficult to encapsulate a six month time period into a twenty minute presentation; however, with the viewer being able to infer early motivations with the clients and interim therapy, there is a feeling of completeness. The ending of the videotape is abrupt, but does not diminish the effectiveness of this excellent presentation of an art therapist who is willing to share the clinical process in a comfortable and positive manner.

The videotape is sponsored by the Bronx Mental Health Council, Inc., and consultant for the project was Laurie Wilson, PhD, ATR.

* * *

Lila is a sensitive, beautifully reminiscent film introducing us to Lila Bonner-Miller, M.D. Dr. Bonner-Miller is an active, practicing psychiatrist who, at eighty years of age, informs us that "I'm not going to talk about senility because I'm not going to fool with it." This declaration establishes the primary impact of the film that "life can be exciting but we need to put forth the effort." Specifically, the film is recommended for those persons working with geriatric and/or gerontological populations, but it is also a film that should be seen by all persons who believe in the human condition—in sensitivity, awareness and the joy of living.

In 1920 Dr. Bonner-Miller was enrolled into the first medical school class (at the University of Virginia) to accept females as students. She became a successful practicing physician while at the same time maintaining a marriage and raising a family. An interesting transition occurred in her medical career (in 1949) when she returned to medical school to study psychiatry because it was apparent to her that in working with her patients there were questions that could not be explained by their physical symptoms. This motivation for learning is characteristic throughout the entire film where we come to know Dr. Bonner-Miller as a life-long student.

The film does not emphasize the creative process as the primary influence in Dr. Bonner-Miller's philosophy, but it is apparent that creativity permeates all that she attempts and accomplishes. As an artist, she shares with the viewer that art has been an important part of her life and it helped her gain insights into her own self. She continues to practice her art and also
encourages those with whom she works to "do something creative." The specific media incorporated throughout the film are painting, drawing, and clay, and they are used integrally as motivations for the group members to "do something" and to work toward independence.

In addition to the dictum of "doing something creative," we are also told that we "need to be with people." Dr. Bonner-Miller is a strong advocate of the group process; and she is shown in diverse interactions from working with after-care patients following release from a mental hospital, to a group of persons who are coping with being alone as a result of divorce, separation or death of a spouse or family member. The discussion of group process is not presented in an academic sense because we see Dr. Bonner-Miller with friends and family members and the same respect for others is evident in these interactions also. As a keen observer of others, the establishment of the groups presented in the film emerged from her recognition of lonely people needing to have experiences in learning to relate to each other. An interesting commentary from Dr. Bonner-Miller is that she learned a lot about group therapy and group interaction from working with the Girl Scouts at a time when she assumed the leadership role when no one else could be found to be their leader.

The film is presented in a comfortable manner where the viewer can identify as being a member of the group and is drawn into the "community fellowship" that Dr. Bonner-Miller believes to be so important. The film is able to create the atmosphere of being a participant in the clinical process and life experiences, and the camera does not intrude into the clinical environment. (This is in contrast to some films or videotapes where group process interaction appears to have been staged or simulated.) The producers, Fran Burst-Terranella and Cheryl Gosa, have constructed a nostalgic, retrospective narrative with Dr. Bonner-Miller reflecting back to previous experiences, interacting at the present time, and sharing early black and white photographs in an effective manner. There are times when the camera work becomes imprecise, and there is some narrative that may be difficult to hear—suggesting similarities to a home movie. This in no way detracts from the overall effect of this excellent film, but enhances the personal quality of it. Dr. Bonner-Miller is an inspiring individual who serves as a role model for all clinical persons. She is able to demonstrate in a simplistic manner one of the intrinsic values of group therapy, that of treating the patient with dignity and respect (Yalom, 1983). This film is recommended because it presents Dr. Bonner-Miller, but one gets to know Lila.

MANDALA ASSESSMENT SEMINAR SCHEDULED SEPTEMBER 1985

The CLINIC FOR HUMAN DEVELOPMENT, Clearwater, Florida, will sponsor a 30-hour course in MANDALA ASSESSMENT. The instructor will be Joan Kellogg, MA, ATR. A Certificate awarded by MARI, Mandala Assessment and Research Institute, to participants after completion of the 30 hour course. Part #1 and Part #2 will be held on two consecutive weekends in September; attendees may elect to take one or both parts. Dates: September 13, 14, 15, September 20, 21, 22.

For information write to Clinic for Human Development, 925 Lakeview Rd., Clearwater, FL 33756, Attention Ms. Sally Meadows. Phone numbers: (813) 447-7606 or (813) 581-0786.

Certificate course fee: $300

For information on on-going evening courses write MARI, P.O. Box 14039, Clearwater, FL 34279-4009, or call (813) 796-1341.

Continued from page 84

gences (one turns inward for access to one’s sense of self, and the other turns outward in understanding others as individuals). There is evidence that all intelligences are, in part, biologically based since they show up in infancy and early childhood. Gardner makes no claims for this—or any other listing—as demonstrably a “truth” about the nature of intelligence. I take his thesis as a proposition: if we assume such entities as these multiple intelligences, then how can we educate and apply them?

In my own thinking, I make many applications of these ideas in my way of working with clients. I question my thinking, too, and wonder how other art therapists, with viewpoints differing from mine, might feel and think about this focus on “frames of mind” and its importance in their therapeutic approach. It seems to me we already know through personal contact with clients that each person is individually endowed: does it help or hinder to consider these endowments as latent intelligences?

Reference

Barlow’s Response

As Gardner states, what is missing from an analysis through “anthropological lenses” are ways that individuals within a culture can still differ significantly from one another—in intellectual strengths, in ability to learn, in ultimate use of their faculties, in originality and creativity (1983, pp 325-6).

The multiple intelligences framework may help us to understand better educational methods and strategies, as well as defining a more comprehensive clinical focus, for our future work with clients. Gardner’s proposal for five other senses (musical, spatial, bodily and the inward/outward personal intelligences) offers us limitless possibilities for methods, assessment, and a more definitive understanding of the persons with whom we work. His mention of the possibility that multiple forms of intelligence may serve to expand and broaden social participation and goal setting is important for our consideration.

Janie’s plea that we consider the “help or hinder” aspects seems appropriate, and should serve as a starting point for our discussion and thinking relative to clinical concerns—and to the topics of excellence and intelligence posed in these Viewpoints articles.

* * *

VIEWPOINTS Editor’s Note: Gary Barlow’s discussion on In Search of Excellence, Lessons from America’s Best-Run Companies, and Janie Rhyne’s discussion on Frames of Mind: The Theory of Multiple Intelligences pose interesting questions for art therapists. In viewing the organizations with which we are connected, including our places of employment as well as our professional societies, are we in positions to influence their positive functioning along the lines suggested by Barlow? As art people we are particularly sensitive to other than analytic, linear, scientific intelligences. How might we apply the understandings suggested by Rhyne to clinical work?...to training art therapists?

Perhaps you see possibilities for greater excellence in the aspects of our profession in which you are involved. “Viewpoints” invites your responses.

THREE EXCITING GUIDES TO BETTER TEACHING AND THERAPY

1

SILENT SCREAMS AND HIDDEN CRIES: An Interpretation of Artwork by Children from Violent Homes

By Agnes Wohl, C.S.W., A.C.S.W., and Bobbie Kaufman, M.P.S., A.T.R.
(under the auspices of the Coalition for Abused Women, Inc.)

"The authors have performed a most valuable service in showing how the drawings reflect the damage to the child’s developing personality and in indicating measures to heal and restore, and to break the cycle that tends to perpetuate destructive, barbaric behavior."
—Joseph H. DiLeo, M.D.

Here is the first study of drawings by elementary schoolchildren who have actually witnessed domestic violence or have been victims of violence themselves. Fifty drawings of human figures, families, trees, and houses were produced by 18 children over a two-year period during their stay at The Safe Home for Abused Families (a service of the Coalition for Abused Women, Inc., Nassau County, N.Y.). The drawings which project the children’s emotional disturbances and feelings and the authors’ interpretations prepare the helping professional to define the therapeutic task and “heal and restore.”

192 pp. 50 Illus. LCN 85-6652 Cloth $20.00 SPECIAL ONLY $18.00

2

THE ART OF ART THERAPY

By Judith Aron Rubin, A.T.R.

“A penetrating exposition of those elements that produce professional excellence, a welcome addition to the literature.”
—Glady Agell, A.T.R., Associate Professor, Director, Graduate Art Therapy Program, Vermont College of Norwich University

THE ART OF ART THERAPY is a "how to think about doing," rather than "how to do" art therapy book. Ms. Rubin provides the specific know-how essential for working with populations of any particular age level, setting, and modality. The problems encountered by both patient and therapist as artists are closely examined to enhance the art therapist’s clinical skills and increase the effectiveness of treatment for every patient.

224 pp. LCN 84-9344 Cloth $25.00 SPECIAL ONLY $22.50

3

CLINICAL ART THERAPY: A Comprehensive Guide

By Helen B. Landgarten, M.P.A., A.R.R.

“A remarkable and practical book. It is written creatively and its many detailed descriptions of the art therapy process are nicely organized. It is enormously useful to psychotherapists and mental health workers.”
—American Journal of Orthopsychiatry

This integrated guide to the entire spectrum of clinical art therapy covers every age range in various settings—from school and outpatient clinics to psychiatric hospitals and private treatment. Included are detailed instructions for use of numerous clinical procedures for assessment and treatment, and extensive case studies.

410 pp. 148 Illus. LCN 80-22564 Cloth $27.50 SPECIAL ONLY $24.75

ATJ1065
In his article "Image Induction in the Countertransference: A Revision of the Totalistic View," Robert Wolf, MPS, ATR, presents an integration of psychoanalytic and creative art therapy concepts as related to the totalistic view of countertransference. The author states that the writing is "an attempt to expand the parameters of what psychoanalytists call 'totalistic' countertransference." Also, in his alluding to the possibility (or probably fact, by inference) that psychoanalysis and creative art have certain commonalities and "complement each other," the author supports the belief that art materials should be available to both the patient and the analyst during the session. This article gives the reader much insight, offers many points for personal consideration, and I urge you to devote time to this highly important content.

Similarly, Shirley Riley, MA, ATR, MFCC, presents an article titled "Draw Me A Paradox...Family Art Psychotherapy Utilizing a Systemic Approach to Change." Riley offers to the reader procedures for integrating art therapy into the systemic theoretical approach to family therapy. She believes that the use of creativity produces positive interaction within the family unit. Theoretical principles are included in the article, such as metaphoric utilization, ritual, and paradoxical interventions. A major insight for all art therapists to be aware of is the "therapeutic double bind," which the author illustrates prior to leading into "Case III."

Contained within this issue is the newly revised Education and Training List of the American Art Therapy Association. Categories include: 1) Approved programs; 2) U.S. and Canadian institutions, graduate degree programs; 3) Graduate level certificate/diploma programs; 4) Clinical training programs; 5) Institute programs; 6) Undergraduate degree programs offering art therapy prerequisites; and 7) Institutions offering courses in art therapy or closely related subjects. This is an important listing for our profession, and it is as comprehensive and accurate as could be done with the information sent in to the Education Committee. It is necessary, however, for the designated contact person (or his/her representative) of each of the listed entries to continue to update this information whenever the occasion demands. We must keep the listings as current and as accurate as possible.

* * *

The color plates for the outside and inside covers in the last issue of Art Therapy (Volume 2, Number 2, June 1985) were made possible through private donations to the journal. Many thanks to the contributors.

* * *

We are most fortunate to have Chris Sizemore for our keynote speaker at the October AATA Conference. Through the publication of The Three Faces of Eve (1957) as well as the movie of the same title, worldwide audiences were spellbound when observing the personal experiences of a person with multiple personalities. A professor of clinical psychology, W. Scott Gehman, Jr., Ph.D., in I'm Eve (1977) states:

I remember...my vicarious meeting with Eve White and Eve Black. What a fascinating account of her neurosis—dissociative reaction, multiple personality type. Then came the professional film "A Case of Multiple Personality," which allowed one to be present at a few moments of therapy with the real Eve...one could see the dissociative state in action...Dissociative hysterical amnesia, the blotting out of important, sometimes traumatic experiences is a precondition to both fugue states and multiple personalities. This is beautifully illustrated in Chris's early life, when she denied doing things (repressed them) and as a result received punishment for acts she could no longer remember doing. (pp vii-viii).

In the Author's Note, Chris Costner Sizemore (1977) writes:

This book was born because of my conviction that the true facts of my life were not known, and that I had a story to tell; because the world had the impression that I had recovered from my dissociative problem, multiple personality. I have known twenty-two personalities and have lived to tell of their demise. I have attempted to present my story openly, freely, and with dignity and feeling...It is my life as I have lived it. These are my memories and impressions; and my emotions. (p x)
Chris Sizemore further elaborates on her reasons for writing *I'm Eve*—as personal therapy and documentation, and to open a door through which the reader may journey, as well as to help the general public better understand and accept the mentally disturbed.

It is a book of hope, and it is a pleasure to be able to hear from a most courageous and sensitive woman.

ART THERAPY EDUCATION 1985-86

The following entries compose the "Art Therapy Education List, 1985-86" for the American Art Therapy Association, Inc. Categories of the entries include: 1) Approved Programs; 2) U.S. and Canadian Institutions, Graduate Degree Programs; 3) Graduate Level Certificate/Diploma Programs; 4) Clinical Training Programs; 5) Institute Programs; 6) Undergraduate Degree Programs Offering Art Therapy Prerequisites; and 7) Institutions Offering Courses in Art Therapy or Closely Related Subjects.

This collection and editing of the listing is a project of the Education Committee, AATA. Members of this Committee are: Gary C. Barlow, ATR (Chair); Myra Levick, ATR; Virginia Minar, ATR; Bruce Moon, ATR; Arthur Robbins, ATR; and Mary St. Clair, ATR.

### Approved Programs

The following constitutes a list of those degree granting graduate training programs that have received the approval of the Association. Approved programs, in meeting the standards set forth in Guidelines for Art Therapy Training, have assured their graduates of the award of credit toward Registration (ATR).

**COLLEGE OF NEW ROCHELLE**, New Rochelle, NY 10801 (Contact: Caryl Horwitz, MA, ATR, Director, Graduate Art Programs) Master of Science (MS) in Art Therapy.

**EASTERN VIRGINIA MEDICAL SCHOOL**, PO Box 1980, Norfolk, VA 23501 (Contact: Cynthia A. Wolf, MA, MS, ATR) Master of Science (MS) in Art Therapy.

**HAHNEMANN UNIVERSITY OF HEALTH SCIENCES**, Broad and Vine Streets, M.S. 424, Philadelphia, PA 19102 (Contact: Ronald E. Hays, MS, ATR, Director, Masters of Creative Arts in Therapy Program, or Myra Levick, PhD, ATR, HLM, Professor and Consultant to Art Therapy Education) Master of Creative Arts in Therapy (MCAT)—Art Therapy.

**HOFSTRA UNIVERSITY**, Department of Counseling, Psychology and Research in Education, Hempstead, NY 11550 (Contact: Lillian C. Resnick, ATR, Coordinator) Master of Arts (MA) in Creative Arts Therapy.

**LESLEY COLLEGE**, Institute for the Arts and Human Development, 29 Everett Street, Cambridge, MA 02238 (Contact: Shaun McNiff, PhD, ATR, Professor and Dean of the Arts Institute) Master of Arts (MA)—Art Therapy and other Creative Arts Therapies, and Certificate of Advanced Graduate Study (CAGS) in Creative Arts Therapies.

**LOYOLA MARYMOUNT UNIVERSITY**, Loyola Boulevard at West 80th Street, Los Angeles, CA 90045 (Contact: Helen Landgarten, ATR, HLM, Director, Graduate Department of Clinical Art Therapy) Master of Arts (MA) in Clinical Art Therapy.

**NEW YORK UNIVERSITY**, 735 East Building, 239 Greene Street, New York, NY 10003 (Contact: Laurie Wilson, PhD, ATR, Director, Art Therapy Program) Master of Arts (MA)—Art Therapy.

**PRATT INSTITUTE**, Creative Arts Therapy Department, East Building, Third Floor, Brooklyn, NY 11205 (Contact: Leslie Abrams, MPS, ATR, Acting Chairperson) Master of Professional Studies (MPS) in Art Therapy.

**STATE UNIVERSITY COLLEGE AT BUFFALO**, 1300 Elmwood Avenue, Buffalo, NY 14222 (Contact: John R. Rogers, MA) Master of Arts (MA) or Master of Science (MS)—Multidisciplinary Studies.

**THE GEORGE WASHINGTON UNIVERSITY**, Department of Art Therapy, 2129 G Street, NW, Washington, DC 20052 (Contact: Katherine J. Williams, MA, ATR, Acting Director, Graduate Program in Art Therapy) Master of Arts (MA) in Art Therapy.

**UNIVERSITY OF ILLINOIS AT CHICAGO**, Art Therapy Department, School of Art and Design, Box 4348, Chicago, IL 60608 (Contact: Harriet Wadeson, PhD, ATR, Director) MA in Art Therapy.

**UNIVERSITY OF LOUISVILLE**, Department of Expressive Therapies, Belknap Campus, Louisville, KY 40292 (Contact: Dana N. Christensen, PhD, Director) Master of Arts (MA)—Art Therapy.

**VERMONT COLLEGE OF NORWICH UNIVERSITY**, Montpelier, VT 05602 (Contact: Gladys Agell, ATR, Director) Master of Arts (MA) in Art Therapy.

**WRIGHT STATE UNIVERSITY**, 228 Creative Arts Center, Dayton, OH 45435 (Contact: Gary C. Barlow, EdD, ATR, Coordinator of Art Therapy) Master of Art Therapy (MAT).
Other Educational Opportunities

The following programs submitted information to AATA indicating their coursework offerings in art therapy. Although the Association cannot endorse other than the preceding Approved Programs, the entries below are listed for informational purposes. It is recommended that interested persons contact program personnel directly for further information and, in addition, review AATA's Guidelines for Academic, Clinical and Institute Art Therapy Training.

U.S. and Canadian Institutions, Graduate Degree Programs

ANTIOCH UNIVERSITY SEATTLE, 1165 Eastlake Ave. E., Seattle, WA 98109 (Contact: Lea Camero, MFA, ATR or Dean Elias, Regional Director) MA Psychology/Area of Concentration: Art Therapy or other creative arts modalities.

CALIFORNIA STATE UNIVERSITY AT LOS ANGELES, 5151 State University Drive, Los Angeles, CA 90032 (Contact: Ed Forde, Chair, Art Department) MA in Art Specialization—Art Therapy.

CALIFORNIA STATE UNIVERSITY AT SACRAMENTO, 6000 J Street, Sacramento, CA 95819 (Contact: Dr. Lita Whitesel) MA in Art with Emphasis in Art Education.

COLLEGE OF NOTRE DAME, Belmont, CA 94002 (Contact: Doris Arrington, MA, ATR, Director) Master of Art Therapy.

CONCORDIA UNIVERSITY, 1455 de Maisonneuve Bldg. West, Montréal, Quebec, CANADA H3G 1M8 (Contact: Graduate Programs Coordinator, VA-201) MA in Art Education (Option: Art in Therapy); and Diploma (in Art Therapy).

EMPORIA STATE UNIVERSITY, 1200 Commercial Street, Emporia, KS 66801 (Contact: Robert E. Ault, ATR) MS in Art Therapy.

GOUCHER COLLEGE, Dulaney Valley Road, Towson, MD 21204 (Contact: Christine W. Wang, MA, ATR, Director) MA in Art Therapy.

ILLINOIS STATE UNIVERSITY. Normal, IL 61761 (Contact: Dr. Marilyn Newby, Art Department) MS in Art Education, MRA and MA in Art, EdD in Art.

INDIANA UNIVERSITY OF PENNSYLVANIA, Indiana, PA 15705 (Contact: Dr. Robert J. Vislosky, EdD, ATR) MA in Art Therapy.

INTERNATIONAL COLLEGE, Los Angeles, CA (Contact: M.A. Fischer, MD, D. Psych., Executive Director, Toronto Art Therapy Institute, 216 St. Clair Avenue West, Toronto, Ontario, CANADA M4V 1R2).

LINDENWOOD COLLEGE FOR INDIVIDUALIZED EDUCATION, St. Charles, MO 63301 (Contact: Dr. Rebecca Glenn, Program Coordinator) MA in Counseling Psychology—Art Therapy Emphasis.

MARYLHURST COLLEGE, PO Box 261, Marylhurst, OR 97036 (Contact: Kay Slusarenko, BA, Chairperson, Art Department) MA in Art Therapy.

MARYWOOD COLLEGE, Scranton, PA 18509 (Contact: Sister Dorothy McLaughlin, RSM, EdD, ATR) MA in Art Therapy.

NEW YORK UNIVERSITY, 735 East Building, 239 Greene Street, New York, NY 10003 (Contact: Laurie Wilson, PhD, ATR) DA—Art Therapy; PhD—Art and Art Education.

NORTHERN ILLINOIS UNIVERSITY, Department of Art, DeKalb, IL 60115 (Contact: Terri Sweig, MA, ATR, Department of Art) MS in Education, Major in Art with Specialization in Art Therapy.

SCHOOL OF THE ART INSTITUTE OF CHICAGO, Jackson and Columbus Drive, Chicago, IL 60603 (Contact: Don Seiden, ATR) MA in Art Therapy.

SOUTHERN ILLINOIS UNIVERSITY AT EDWARDSVILLE, School of Fine Arts and Communications, Dept. of Art and Design, PO Box 64, Edwardsville, IL 62026 (Contact: Dr. Joseph A. Weber, Head, Art Education) MFA—Art Therapy Specialization.

STATE UNIVERSITY COLLEGE AT BUFFALO, 1300 Elmwood Avenue, Buffalo, NY 14222 (Contact: John Rogers, MA) MS—Art Education.

UNIVERSITY OF BRIDGEPORT, University Avenue, Bridgeport, CT 06602 (Contact: Robert Brennan, Chairman, Art Department or Carol Paraskevas, ATR, Coordinator, Art Therapy Program), MS in Counseling, Art Therapy Specialty.

UNIVERSITY OF NEW MEXICO, Department of Art Education, College of Education, Albuquerque, NM 87131 (Contact: Dr. Howard McConkey, Professor) MA in Art Education with Emphasis in Art Therapy.
Clinical Training Programs

ART STUDIO, INCORPORATED, Cleveland Metropolitan General/Highland View Hospital, 3395 Scran-
ton Road, Cleveland, OH 44109 (Contact: M.K. Mc-
graw, ATR) Academic credit. Clinical experience
through accredited colleges.

BETHESDA HOSPITAL, Art Psychotherapy Depart-
ment, 2951 Maple Avenue, Zanesville, OH 43701
(Contact: Bernard Stone, MFA, ATR) Clinical Inter-
ims: 8-20 weeks; Graduate students or post-grads
only. Certificate.

CARRIER FOUNDATION, Adjunctive Therapies De-
partment, Belle Meade, NJ 08502 (Contact: Frances F.
Kaplan, MPS, ATR, Supervisor, Creative Arts Thera-
pies) sixteen-week full-time or thirty-two week part-
time internship. Certificate of completion.

HARDING HOSPITAL, 445 East Granville Road,
Worthington, OH 43085 (Contact: Don L. Jones,
ATR, LM, Director of Adjunctive Therapy) Graduate Level
one year full-time Clinical Internship. Individually
ATR Supervised, 2000 hours. Certificate in Art Psy-
chotherapy. Collaboration with Master's programs
possible.

MILWAUKEE PSYCHIATRIC HOSPITAL, 1220 De-
wey Avenue, Wauwatosa, WI 53213 (Contact: Rose
Washington, Supervisor of Activities) Certificate of
Completion—600 hours, six months.

Institute Programs

EAGLE ROCK TRAIL ART THERAPY INSTITUTE,
PO Box 2885, Santa Rosa, CA 94905 (Contact: Lillian
Rhinehart, MA, ATR) Certificate.

INSTITUTE FOR EXPRESSIVE ANALYSIS, 325 West
End Avenue, New York, NY 10023 (Contact: Dr. Ar-

MATRIX ART THERAPY INSTITUTE, 7447 Holmes
Road, Kansas City, MO 64131 (Contact: JoEl Vogt,
MA, ATR) Certificate.

NEW SCHOOL FOR SOCIAL RESEARCH, 66 West
12th Street, New York, NY 10011 (Contact: Erika
Steinberger, ATR) Training Certificate.

PITTSBURG STATE UNIVERSITY, Art Department,
1701 South Broadway, Pittsburg, KS 66762 (Contact:
Harry Krug, Chairperson).
ST. LOUIS INSTITUTE OF ART PSYCHOTHERAPY, 8407 Glen Echo Drive, St. Louis, MO 63121 (Contact: Mary St. Clair, ATR) Certificate.

THOMAS MERTON INSTITUTE, PO Box 11931, Shorewood, WI 53211 (Contact: Deirdre L. Kozlowski, MS, ATR) Certificate. (For information on TMI Minnesota Branch, contact: Virginia Shaver, MA).

Undergraduate Degree Programs Offering Art Therapy Prerequisites

ALBERTUS MAGNUS COLLEGE, New Haven, CT 06511 (Contact: Dr. William M. Sherman, Chairperson, Department of Psychology) BA in Art or Psychology—Art Therapy Concentration.

ALVERNO COLLEGE, 3401 South 39th Street, Milwaukee, WI 53215 (Contact: Sister Julie Knotek, ATR, Art Therapy Director) BA—Concentration in Art Therapy.

ANNA MARIA COLLEGE, Paxton, MA 01612 (Contact: Ralph A. Parente, Jr.) BFA.

BOWLING GREEN STATE UNIVERSITY, School of Art, Bowling Green, OH 43403 (Contact: Registrar) BS—Art Therapy.

CAPITAL UNIVERSITY, 2199 East Main Street, Columbus, OH 43209 (Contact: Richard Phipps) BA—Major in Art Therapy.

CARLOW COLLEGE, 3333 Fifth Avenue, Pittsburgh, PA 15213 (Contact: Carole Kunkle-Miller, MEd, ATR, Coordinator) BA in Art, with a Concentration in Art Therapy Preparation.

COLLEGE OF NEW ROCHELLE, New Rochelle, NY 10801 (Contact: Jo-Ann O’Brien, MA, ATR, Chairperson, School of Arts and Sciences Art Department) BFA and BS, Art Therapy.

COLLEGE OF SAINT TERESA, Winona, MN 55987 (Contact: John DeFrancisco, ATR) BA—Art Therapy.

DRAKE UNIVERSITY, Des Moines, IA 50311 (Contact: Jeanette Wright, ATR, Associate Professor and Director of Art Therapy) BFA or BA, Major in Art Therapy; MS—Concentration in Art Therapy.

EMMANUEL COLLEGE, 400 The Fenway, Boston, MA 02115 (Contact: Sister Susan Thornell, MA, Department of Art) BA in Art with Specialization in Art Therapy.

EMPORIA STATE UNIVERSITY, 1200 Commercial Street, Emporia, KS 66801 (Contact: Roberta Shoemaker, ATR) BS in Art Therapy.

ILLINOIS STATE UNIVERSITY, Normal, IL 61761 (Contact: Dr. Marilyn Newby, Art Department) BS, BA, BFA in Art.

INDIANA CENTRAL UNIVERSITY, 1400 East Hanna Ave., Indianapolis, IN 46227 (Contact: Chairman of Art Department) BS and BA in Art—Minor in Psychology.

JERSEY CITY STATE COLLEGE, 2039 Kennedy Boulevard, Jersey City, NJ 07307 (Contact: Herb Rosenberg, ATR, Chairman, Art Therapy Studies), BA, GFA.

MARIAN COLLEGE, 3200 Cold Springs Road, Indianapolis, IN 46222 (Contact: Sr. Sandra Schweitzer, OSF, Chairperson, Art Department) BA in Art—Concentration in Art Therapy.

MARYVILLE COLLEGE, 13550 Conway Road, St. Louis, MO 63141 (Contact: Muriel Eulich, MEd, ATR) BA—Therapeutic Art.

MARYWOOD COLLEGE, Scranton, PA 18509 (Contact: Sister Dorothy McLaughlin, RSM, EdD, ATR) BA in Art Education; BFA.

MERCYHURST COLLEGE, Glenwood Hills, Erie, PA 16546 (Contact: Joseph Pizzat, Professor of Art) BA—Art Therapy.

MOUNT MARY COLLEGE, 2900 North Menomonee River Parkway, Milwaukee, WI 53222 (Contact: Lori Vance, ATR) BA—Art Therapy.

NORTHERN ILLINOIS UNIVERSITY, Department of Art, DeKalb, IL 60115 (Contact: Dr. Caroline Allrutz, Department of Art) Bachelor of General Studies Program Contract Major—Emphasis in Pre-Art Therapy.

OHIO UNIVERSITY, School of Art, College of Fine Arts, Athens, OH 45701 (Contact: Geraldine H. Williams, ATR) BFA—Art Therapy.

PHILADELPHIA COLLEGE OF ART, Broad and Spruce Streets, Philadelphia, PA 19102 (Contact: Sherry Lyons, ATR, Director, Art Therapy) BFA in Studio Major with Concentration in Art Therapy.

PITTSBURG STATE UNIVERSITY, Art Department 1701 South Broadway, Pittsburg, KS 66762 (Contact: Harry Krug, Chairperson) BS in Education, Art Therapy Major.

SALEM COLLEGE, Salem, WV 26426 (Contact: Harold Reed, Arts Department Chair) BA.

SPRINGFIELD COLLEGE, Dana Fine Arts Center, 263 Alden Street, Springfield, MA 01109 (Contact: William Blizard, Chairman, Art Department) B5, BA.
STATE UNIVERSITY COLLEGE AT BUFFALO, 1300 Elmwood Avenue, Buffalo, NY 14222 (Contact: John Rogers, MA) BS—Professional Studies in Art Therapy.

THE SCHOOL OF VISUAL ARTS, 209 East 23rd Street, New York, NY 10010 (Contact: Estelle Bellomo, ATR, Coordinator, Art Therapy Department) BFA—Concentration in Art Therapy.

TRENTON STATE COLLEGE, Hillwood Lakes, Department of Art, CN 550, Trenton, NJ 08625 (Contact: Marcia F. Taylor, PhD, ATR) BA—Art Therapy.

UNIVERSITY OF MIAMI, School of Education and Allied Professions, PO Box 248025, Coral Gables, FL 33124 (Contact: Dr. Marion F. Jefferson, Coordinator of Art Education) BA, BFA.

UNIVERSITY OF WISCONSIN—SUPERIOR, Superior, WI 54880 (Contact: Dr. Marjorie Whitsett, PhD, ATR, Art Therapy Program Coordinator) BA.

URSULINE COLLEGE, 2550 Lander Road, Cleveland, OH 44124 (Contact: Sr. Kathleen Burke, MA, ATR, Associate Professor and Coordinator, Art Therapy) Certificate—Adjunctive Art Therapy Program.

WRIGHT STATE UNIVERSITY, 228 Creative Arts Center, Dayton, OH 45435 (Contact: Gary C. Barlow, EdD, ATR, Coordinator, Art Therapy) BFA, BA, BS in Art Education—with Coursework in Art Therapy.

Institutions Offering Courses in Art Therapy or Closely Related Subjects

ALFRED ADLER INSTITUTE OF CHICAGO, 159 North Dearborn Street, Chicago, IL 60601 (Contact: Evelyn Wachman, Registrar) MA—Counseling Psychology.

COLUMBUS COLLEGE OF ART AND DESIGN, 47 North Washington Avenue, Columbus, OH 43136 (Contact: Edward Lathys, Dean of General Studies) BFA in Art Therapy/General Studies.

MONTCLAIR STATE COLLEGE, Fine Arts Department, Upper Montclair, NJ 07043 (Contact: Dr. Susan E. Gonick-Barris, ATR).

PARSONS SCHOOL OF DESIGN, Department of Continuing Education, 2 West 13th Street, New York, NY 10011 (Contact: Judith Gerberg, MA, ATR) ASA, BFA.

S.P.O. MIDDELOO, Creative Therapies, 140 Hooglandseweg, 3813 AS Amersfoort (Contact: Dr. Art Stuijt, Director).

The author points out how family art therapy can be integrated into the systemic theoretical approach to family therapy, and supports the thesis that the use of creativity produces positive interactions in family therapy. Key theoretical principles of systemic family work described by the author are: the family as a system; positive connotation through art process; prescribing the symptom; utilizing the metaphor; family ritual; paradoxical interventions; the therapeutic double bind; homeostasis; and the termination of treatment. Three condensed case studies are presented in which techniques are highlighted, such as circular causality versus linear causality, forming a hypothesis, assessment of complacency, and recursive patterned behavior and interventions.

Introduction

This article supports the notion that family art therapy can be successfully integrated into the systemic theoretical approach to family therapy. Moreover, the use of creativity—basic to both theories—produces a positive interaction resulting in a process that enhances family art therapy treatment.

In a paper delivered as a keynote address at the Family Therapy Net-York, discussed "The Links Between Clinical and Artistic Creativity." Papp stated:

The major goal of therapy, as of art, is to change a basic perception so that one 'sees differently.' Through the introduction of the novel or unexpected, a frame of reference is broken and the structure of reality is arranged." (Papp, 1984).

This remark (in my view) seems to be addressed to the family art therapist and leads one to question why family art psychotherapy plays a minor role in the growing field of family therapy.

Other family therapists have referred to the need for the therapist to bring to the work of psychotherapy a creative and innovative view, and this certainly could be one of the family art therapist's contributions. In an article in Family Process (June, 1984, Vol. 23, page 159) Stanton offers a theory of systemic change which includes several hypotheses. From his "Hypothesis 2" Stanton says:

The extent to which a change is total will depend upon the similarity between the intervention and the actual interactive process addressed by the intervention. The more elements or dimensions—visual, auditory, kinaesthetic—attending or composing the intervention, the more effective that intervention will be in bringing about change.

These elements by the use of a variety of visual and kinaesthetic art media that are natural tools of the art therapist. This hypothesis reinforces the importance of the use of concrete imagery which has been an integral part of art psychotherapy from its beginning.

With this thought in mind, I have taken some of the key theoretical principles of systemic family work and have attempted to demonstrate how these techniques have been utilized by this art therapist. These principles are: 1) The family as a system; 2) Positive connotation through art; 3) Prescribing the symptom; 4) Utilizing metaphors; 5) Understanding family ritual; 6) Using paradoxical interventions; 7) Understanding a therapeutic double bind; 8) Maintaining homeostatic properties; and 9) Terminating treatment. This procedure of looking at the principles and demonstrating how certain techniques have been used by the author may help to focus on the "addition of art" and to study whether it enhances the effectiveness of the interventions made by the therapist. We can also gauge whether the art was an aid to the family in achieving relief from symptoms they have connotated as undesirable.

The Family as a System
seeing the family as operating within a system. The family as a system has often been defined as two or more people in a relationship interacting with each other in a recursive manner over a period of time, despite changes in environment. Within a systems approach, causality is seen as a process of circular causality, and it is judged anti-productive to see one member’s behavior as separate or disassociated from the other members of the family system. The circular view of cause and effect in transactions is a radically different stance from the historically accepted linear view of events.

Another aspect of this definition lies in the concept that the family members are usually unaware of the redundant interactional sequences that make up the bulk of their patterned responses. It follows that family behavior can be understood when seen in the context of family rules and to observe how their rules serve to maintain the family stability or guard against its dissolution. Here “seeing” is a key word, since we can “see” in a unique manner many aspects of the system in the art product. The therapist’s task is to discover how the dysfunction has taken a particular form and what patterns maintain what Minuchin calls “the family dance;” therefore the early assessment should speculate on the processes which appear to maintain the problem.

In the assessment phase this basic concept of causality and the other aspects of family systems (not mentioned in this brief definition) present a difficult challenge for the family therapist to understand and then decide which interventions to put into practice. It follows that at the beginning of treatment, an overview of the system and observation of the interactions between the members are the first steps that must be considered.

One of the more common and effective techniques utilized by family art therapists when they start treatment is to have the family do a family drawing/mural. Observation of the results of this task, which is left up to the family members to accomplish in any way they feel is the most natural, is an immediate opportunity for the therapist to form a hypothesis about the family system and to think about interventions that will redirect the family’s interactions.

The task of a family drawing together enables the therapist to introduce these concepts: definition of the problem, pose the dilemma of change, and formulate the treatment in a manner best accepted by this particular family.

Let’s look at some of the technical underpinnings of this family mural task:

a) The therapist has taken control early by persuading the family to use a media (art) which, for most families, is unfamiliar and, sometimes, even adverse to their idea of what therapy should be. The thought of doing art as a therapy seems to many families a “ridiculous way” to solve serious problems since it includes offering pleasurable experiences such as use of media, color, etc. How paradoxical (they feel) to expect pleasure to relieve pain! Based on their acceptance or rejection of the new experience, the therapist can begin to speculate whether the family falls into the compliant or non-compliant mode of family systems. The next move is to decide how it would be appropriate to further test their high/low resistance to change (or new ideas) and then decide on an approach to treatment.

Interventions, interpretations, and homework are tailored to these considerations. A family that is compliant and ready for change may need only suggestions, feedback, and a new way of looking at their problems. At the other end of the scale, a non-compliant family with a system rigidly resistant to change requires a different set of techniques.

In returning to the task of the family mural, we can examine how the therapist’s utilization of the task can facilitate appropriate interpretations.

b) The family members reveal their family system in the mural drawing. All family members are represented; spatial, dominant and sub-dominant positions are noted; verbal and non-verbal messages are sent and received, they are either rejected or acted upon. In short, so much can be observed by the therapist in the mural, and in the way the family created the drawing, that he/she can proceed to use some of the following techniques if they serve the goals.

In Minuchin’s book, Families and Family Therapy, 1976, he refers to the family structure as an “invisible set of rules that govern transactions...Family structure becomes visible in the behavioral transactions between family members.” Family art therapy provides tasks which serve to make the invisible visible and which simultaneously supplies a process to observe the family behavior.

Positive Connotation Through Art

A positive connotation of the family’s motivation and behavior can be introduced in an explicit and concrete manner through the art. If the therapist observes how each member has, for example, demonstrated that they “have worked with the others on the paper and have risked expressing their place in the family,” or, “families who take a chance to draw together are families who demonstrate they are able to risk new experiences,” the therapist may then define other behaviors within a positive frame. This supports the fact that indeed this family has been able to engage in doing a task together that is unfamiliar to them. The implications that can be made from the information drawing can begin to reframe the family behavior in a manner that shifts the emphasis from “a family group who is at the clinic because of an inability to solve problems,” to “a family which has strength that will serve them in solving problems that they no longer wish to have as part of their interactions.”

Positive connotation of behavior or redefining behavior is not a simple positive support of the family or an individual in the family, (i.e. “you are good people.”) The redefinition is based on the therapist’s assessment of the family system and how each piece of behavior can be seen to be a gesture to preserve the family stabil-
"... at the beginning of treatment an overview of the system and observation of the interactions between the members are the first steps that must be considered."

... at the beginning of therapy. Not all redefining is presented in the same way; certainly with violent, illegal, or suicidal acts the therapist avoids positive connotation of the acts themselves and deals with the motivation behind the behavior. This aspect of when to avoid the use of positive connotation must be clearly defined and emphasized for the therapist new to this approach.

Any assumptions and interpretations made by the art therapist must be based on an honest appraisal and an empathetic feeling toward the family. In addition, it is necessary to have an attitude of respect and attentive focus on the family's display of behavior and emotions and do a great deal of theoretical thinking about how the family system works. This is a responsibility that supersedes any choice of approach or manner of working. However, the expressive product that is a result of the family's group or individual effort gives the art therapists additional avenues for appreciating underlying messages and covert alliances within the system. The therapeutic plan or tentative, first hypothesis for treatment is then based on a body of information that is enriched by the material the family has provided through verbal and non-verbal levels of communication.

Case I

A family of seven children, ranging from the age of 7 years to 1½ years, and their mother, came into art psychotherapy five months after the untimely death of the father. Before his death the family had functioned in a "normal" manner; all of the children were well-cared for and wanted by the parents. They had regarded themselves as a "happy family." After Father's death, (which followed a stroke and five months of life support treatment) the family began to fight violently and the children demanded an outrageous and unrealistic amount of material goods as well as emotional support from the mother. At the first session the family promptly revealed that they had not talked with each other about the loss of their father and, in addition, they couldn't understand why the mother, who had always been the disciplinarian and limit setter, had become so withdrawn and lacking in forcefulness. The family spent the first hour drawing a "good by" drawing to Father and, with the therapist's support, sharing their feelings about the loss. They had been afraid to burden each other with additional sorrow and had therefore turned away from each other in their pain. The symptom of "fighting" seemed to be a projection outward of anger around the father's death.

After a coffee break they did a family mural. Each worked with an individual color. They elected to draw their last fishing trip on a boat with Father. Among the multiple issues that were explored during the review of the family mural, one major focus was on the fact that the oldest son, of fourteen, had drawn himself steering the boat, and then drawn his father up in the sky. This was quickly seen by the family as a parallel to his attempt to take over a father role in the family. This effort to be Father had caused a major part of the verbal fighting in the sibling sub-system since he was not only very inept in this role, but in addition, he was preceded in age by three older sisters who also were vying for some part of the parental position.

At the end of the session the art therapist gave the mother this prescription to be read at home to the family every evening. First, the family, and particularly the oldest son, were congratulated on their sensitivity to the family's needs. The boy was further supported for his willingness to sacrifice his youth to perform a role that turned him into a 47-year-old man and forced him to give up the adolescent pleasures enjoyed by most 14-year-old males. The therapist recommended that he continue to act as father, and to further improve his skills to lead and parent the family by isolating himself from his older sisters and his friends and by studying bookkeeping and household management. Second, the sisters were to be respectful, make him his favorite foods and not be rude or sassy to such a dedicated member of the family. Third, the mother as head of the family was to monitor these actions and to point out to the family how their fighting and rudeness to one another had helped her become more perceptive and able to structure some resolution for their problems. She had the power to modify any of the therapist's suggestions and report these changes at the next session, because as head of the household she was the final authority.

This prescription or "prescribing the symptom" seemed to be necessary to push the family interaction pattern off balance and would hopefully result in a new configuration of the field.

Paradoxical prescriptions serve as a means of isolating behaviors, requiring that behaviors occur artificially (Agell, 1982). Ritualized prescriptions must be carried out at specific and regular times. This method forces the clients to think about their situation or act it out in a prescribed fashion. (Weeks and L'Abate, 1982, pg. 92).

Needless to say, the recommendation failed. When this was re-
ported at the next session, the therapist remained "puzzled," the mother took over and delegated family tasks and demanded some improved manners, the son refused to be a responsible adult-figure and wanted time to be "14," and everyone reflected that no one could "father" the family the way their beloved father had when he was alive. They agreed to work on a new way of living together "without father" in future sessions.

This method had raised their awareness and had increased the intensity of the symptomatic behavior. The family then chose to find a "better" solution to their problem. The therapist had successfully "lost" and the family was the real winner.

Prescribing the Symptom

Prescribing the symptom is defined in this manner: "Having been defined positively as serving one another, both the symptom and system are prescribed. The wording of the prescription is extremely important. It should be brief, concise, and unacceptable to the family. If it is acceptable there will be no recoil" (Papp, 1983).

Utilizing Metaphors

To be able to communicate and join with a family, the therapist is best understood if he/she enters into the family's world view by utilizing metaphors particular to the family. It is here that the creative artist in the art therapist can be so successfully utilized. In the family's art products we have a greater opportunity to move into the metaphorical language by observing the product and being attentive to how the family speaks and interprets the artwork. Creatively using their metaphors strengthens the therapeutic relationship since it is a language tailored to "fit" this particular family and no other. After the joining process begins to succeed, we can next evaluate how the family sustains the problematic situation. Through the use of art therapy tasks which provide visual as well as verbal material we may begin the process of change.

"Family art therapy provides tasks which serve to make the invisible visible and which simultaneously supplies a process to observe the family behavior."

Case II

A family of four came for treatment: a mother, father, daughter (15 years) and son (13 years). Their system was sustained by a "blaming" technique that allowed each member to recognize the unhappiness in the family but expect the solution to be achieved when another member changed in some way. This was reinterpreted as "each member loving the other more than they loved themselves and therefore always being attentive to another rather than themselves." Following this reframing the family said, "this was the first time any therapist had really understood how they felt." They agreed that the son was the person that needed to change the most and the son also supported this view. The family was judged to be highly resistant to change but compliant to task performance. (This assessment was based on the beginning sessions.) It included a long past history of unsuccessful individual therapeutic treatment, a marriage that was endured by the couple as a formality; numerous diagnoses of the boy had been made as "learning disordered, oppositional behavior, high I.Q., not using his potential;" and in addition, there was the fact that both children were adopted and had multiple unresolved feelings around this issue.

The family decided they would be willing to build their home together from construction paper, since most of the complaints were focused on the activities and unfulfilled tasks performed in the home. They made every attempt to represent the home in a realistic manner. The process revealed:

Father and Mother aided the construction to a minor degree while constantly correcting and criticizing each other; the daughter refrained from helping except for a mark or two on the walls; the son competently solved most of the building tasks and persisted until the home was completed. Paradoxically, the way the family observed this process was to deny that the son had really contributed much effort, that the daughter had "meant to cooperate" and that Mother and Father alone had provided the basic structural support for the paper house. The art therapist did not modify this perception but just puzzled about "who did what, when?" It became apparent that because of the way the process was experienced by the family they were unable to appreciate how involved and concerned the "bad" son was in building the home, how minimally cooperative the "good" girl was in this same task, and how the parents failed in providing structure for completion of the task.

Understanding Family Ritual

At this junction in art therapy with the family described above, the therapist was faced with a decision as to how to proceed with the treatment. Based on the conviction that the family was highly resistant to change, the therapist decided to prescribe a family ritual. Therefore, the following suggestion was made to the family near the end of the session.

"The family was congratulated for completing such a difficult art task and sharing their home with the therapist by creating it during their session. It was the therapist's recommendation that every evening after dinner they place the little house on the dining table and each person point out what part they had built. They were not to refe: to the house or the process of creating it at any other time until they brought it back into the art therapy session the next week. They were under no circumstances to attempt to generalize
the involvement of the family construction of the house to the emotional and behavioral in-

"My belief is that a positive-synergetic action takes place when family art therapy is based on this epistemology."

volvement of the family members and the actual functioning of the family."

These instructions were written, given to the father and read aloud by him each evening before they talked about the paper construction.

The family came in the following week and made little reference to the house. However, they were concerned that "the daughter had become so uncooperative" and surprised that "the son appeared to be much more attached to the family," even though nothing had changed with the household tasks which were performed in the same manner during the week. No further mention of the "homework" (i.e. ritual) was made except to verify that they had followed through on the directions given for the daily review.

From this session on, the boy was no longer referred to as the "problem-child." The focus shifted to the daughter and, in due time, to the marital relationship.

This non-critical approach aided in modifying a firmly entrenched interaction and recurrent patterned response in this family. It succeeded in achieving the desired results by replacing an old perception of how the family members performed with a more realistic and workable view. When the family was released from the stereotypes they had assigned and accepted to and from each other, they were able to move on from an outmoded stage to a new level of development.

Using Paradoxical Interventions

Webster's International Dictionary defines paradox as "an assertion or sentiment seemingly contradictory or opposed to common sense, but that may be true in fact..."

According to Papp (1983, page 33), "Designing a systemic paradox, the therapist connects the symptom with the function it serves in the system and prescribes each in relation to the other. The consequences of eliminating the symptom are enumerated and the therapist recommends that the family continue to resolve their dilemma through the symptom."

"The therapist must be convinced that the paradoxical messages only appear to be contradictory. It contains a double message to the family—one implies it would be good for them to change, the other implies it would not be so good—and the messages are delivered simultaneously."

This message must be delivered with conviction and sincerity and believed to be a true interpretation of the observed family transaction.

Paradoxical interventions used by the art therapist are no different than if this technique became the treatment of choice by a therapist of another discipline. Usually, the art therapist sees in the art product more of the covert interactions than the clients have been willing to discuss. Since the art therapist is aware (through the messages surfacing in the art) of the second level (covert) stress points, he/she can better tailor the paradoxical intervention to address both available and less available material. These interventions vary from a simple directive, for example, to a resistant adolescent ("Don't draw today, we want you to remain silent as your blank page, while the family talks about your problems") to a more complicated directive which involves the family doing a task in a structured way that reinforces and highlights the problem-maintaining interactional pattern.

Understanding a Therapeutic Double Bind

Therapist resistance to utilizing paradoxical interventions or double bind messages is based on a fear that these techniques could be destructive, over manipulative, and bordering on unethical practice. If the therapist understands the difference between the double bind that produces toxic behavior and the therapeutic double bind, chances are that his/her anxiety will be alleviated.

The original double bind theory described by Bateson is referred to in Lynn Hoffman's book, Foundations of Family Therapy, (1981, page 20). "The basic ingredients that create this kind of impasse are: 1) A primary negative injunction, 'Don't do that,' 2) A secondary negative injunction at another level which conflicts with the first, 'Don't listen to anything I say,' 3) An injunction forbidding comment (usually non-verbal cues reinforcing rules that no longer need to be made explicit), and another forbidding person to leave the field (often delivered by context, as when the person is a child), 4) A situation that seems to be of survival significance, so that it is vitally important for the person to discriminate correctly among the messages, and 5) After a pattern of communication containing these elements has become established, only a small reminder of the original sequence is needed to produce a reaction of rage and panic."

In contrast, the authors of Pragmatics of Human Communication, Watzlawick, Beavin, and Jackson (1967), describe how the therapeutic double bind, works by pointing out that in a pathogenic double bind the patient is "damned if he does and damned if he doesn't." In a therapeutic...

"...the expressive product that is a result of the family's group or individual effort gives the art therapists additional avenues for appreciating underlying messages and covert alliances within the system."
resists the injunction, he/she changes; if one doesn’t change, he/she is “choosing” not to change. Since a symptom is something, which by definition, one “can’t help” he/she is then no longer behaving symptomatically. Thus he/she is “changed if he does and changed if he doesn’t.” It is a bind where a positive reward is provided upon completion rather than a negative impasse.

A mild form of therapeutic bind which we art therapists, even in our student days, were comfortable giving to clients was structured in this manner, “being able to draw your feeling is important, but difficult, so why don’t you make it easier for yourself by choosing either a good feeling or a bad feeling to draw today.” This is an example of an allusion of alternatives.

Considering, in the above example, that no one has ever “seen a feeling” and considering that the options for choice were constructed to gain the desired end result, it follows that when the art therapist recognizes and reinforces the value of the client performing this “impossible” task he/she provides a reward that modifies this bind into a therapeutic experience. At this point perhaps one can see that the use of paradox and art therapy have been bedfellows for a long time!

Case III
An intact family of five, a mother, father, 11 year old son, 13 year old daughter and 11 month old son, requested treatment at the clinic because the teen-age girl had refused to attend school for the last one and a half years. She displayed violent behavior when the parents attempted to force her to return to school, i.e. kicking a hole in the door, screaming and threatening to harm herself. The presenting problem was that they felt they needed therapeutic help to get the girl back to school.

The following observations were made in the initial assessment period. The mother and father were strongly attached to one another and both perceived the other in a positive manner. This was a Latino family and the male/female roles of dominance and sub-dominance were complimentary and functional at this time. The father became rather over-assertive and loud when drinking beer on the weekends but more importantly he provided well for the family and did not distance himself. The mother was pleased with her new baby, liked her marriage, enjoyed the children (until recently) but was now ready to pick up a more active social life since the little boy was no longer an infant. The pre-adolescent son was perceived by the family as a “good” child. He was socially adjusted, a poor student (which was ignored) and often absent from school. He was, in fact, home about half of the school days but this pattern was also overlooked by all. The toddler son seemed to be a happy, healthy baby that was thriving. The daughter described her position in the family as one of being unloved and undervalued. She resented her father’s loud yelling at her mother (even though the mother did not perceive it as “yelling”), she was “afraid” to go to school because of the noise and she “hated” her younger brother and her father.

The pattern of the family was to allow daughter to sleep late every morning. During this time, Mother went to the school and picked up her daughter’s homework, which the girl accomplished during the day and thus kept her grades adequate. When school was over the daughter’s friends came by. They either swam in their pool or picked up Tina (a pseudonym) and went out cruising. They used street drugs and alcohol and returned home very late. Tina denied that she participated in the substance abuse in a heavy manner. This recursive behavior pattern evolved and had been maintained since the mother announced her pregnancy with the last child one and a half years ago.

The group drawings made by the family and the art expression done in individual sessions revealed that each member, with the exception of the pre-adolescent son, was very anxious to make a change. However, every attempt at solving the problem seemed only to maintain the problem. The family was so locked into this system that it needed something to help the family members move to a new and more satisfying set of interactional patterns.

The artwork was essential in making this assessment because each member saw the dilemma and was able to illustrate the components. But even though they were able to verbally and visually lay it all out they were “stuck” in their interrelational system. They projected a feeling of hopelessness.

At the end of one unhappy session this paradoxical prescription was given to the family.

The daughter was acknowledged as the mainstay of the family who was attempting to keep the family “in balance” by sacrificing her normal youthful patterns of school/play. To this end it was advised that Mother should respect her position and wait on her and bring her meals to her room and make every effort to make her life even more agreeable. The father should come home early every day and check that the mother had pleased the daughter, but not talk directly to the girl. The brother was to bring his school progress record home every day and read it to his parents without Sister being present in the room. Daughter was advised that “although she was giving her mother so much support she needed to increase it and therefore no longer go out with her friends at all. She must spend...
more time in her room and increase her efforts to maintain the family. The more she stayed home the more the family would stay in this stable system.”

The family looked startled with this “advice” but promised, in their desperation, to give it a try.

The following week the family came in very angry. Within two days of living by the new rules, the mother and father demanded that the daughter go back to school. The daughter countered by agreeing to go to school if she could go to the therapeutic school the therapist had suggested. The next day she and her mother enrolled her in this new school. The son had “forgotten” to bring his school report home but had attended school every day.

The family was very defiant in mood and aggressively told the therapist that “her plan was not workable and they simply had to take the decision in their own hands.” The therapist then accepted her failure and congratulated them on their success.

This paradoxical prescription seemed to be successful since the family achieved its desired ends of returning the girl to school and did it on the family members’ own terms. The system was clarified when the connection the symptom had with the system emerged. This enabled them to modify the system and move to a new level of functioning even without “insight.”

Maintaining Homeostatic Properties

Each family system varies according to the amount of fluctuation and degree of internal variation it will tolerate. To maintain stability families exhibit homeostatic properties, such as responding adaptively to new circumstances that impact the family from within and without. However, if the homeostatic process is maintained inappropriately and resists acknowledging changing circumstance then this persistence produces maladaptive, symptomatic reactions. An expansion of this notion with the concept of heterostasis or morphogenesis,

“If the therapist understands the difference between the double bind that produces toxic behavior and the therapeutic double bind, chances are that his/her anxiety will be alleviated.”

which is based on processes of positive or negative feedback loops, is a concept that could be pursued in future articles.

Terminating Treatment

The time when the family is ready to terminate treatment can be anticipated when the therapeutic process reaches a point where the patterns, both verbal and visual, that were the target of discomfort have changed and become more adaptive. A successful outcome of therapy is evaluated when behavior and meaning are changed on both first and second levels of reality. Benjamin and Bross (page 92, 1984) describe change: “Evaluation of change should depend neither on the therapist’s subjective judgment nor on the client’s subjective report; rather, it should be a matter of empirical evidence, that is, behavioral sequences and ways of attributing meaning that were observed regularly prior to intervention no longer occur following intervention.”

If we are fortunate, and termination is a result of success, the ending is done with attention to these final goals: 1) Gains are solidified by giving the family full credit for all changes; 2) Success is maintained by speculating on possible failure which will mobilize the family to resist this prediction; and 3) Follow up sessions are offered in the future (six months) to allow for the ongoing process of change to take place and therapeutic reinforcement be available if needed.

Again a technique which has been a bedrock of the termination process in family art psychotherapy, namely, a review of the family’s art products, can be of great use to accomplish the above goals.

How better can the family members “own” their own struggles and resolution with problems, than to see what they accomplished over a period of time? If the therapist has used the strengths of the family and consistently resisted taking credit for change, and has, in fact, been “worried” at the rapid changes and has been “troubled” that the consequences might lead too quickly to problem resolution, then the therapist has helped the family members to become familiar with the idea that they are capable of “doing things that they could not previously do.” Often the family will terminate rather quickly, because the members feel they have been able to solve the problem better than the therapist. The “failure” of the therapist to predict the exact outcome and which results in success for a family is often most clearly seen when the entire course of therapy is reviewed through the art work at the close of therapy. As the family members point out the sessions where they moved from a patterned response to a new combination of more gratifying interactions, in the visual as well as verbal process, both family and therapist can appreciate the successful results achieved by the combination of a systemic theory and a synthesis of these techniques with art psychotherapy.

Conclusion

In this article an attempt has been made to demonstrate how some of the basic theories of systemic-strategic therapy are compatible with the theory and techniques of family art psychotherapy. The art tasks which reflect the attempts of the family to solve its problems also enrich the ability of the family to be expressive. Through the graphic and verbal process displayed in family art therapy the therapist is, in this author’s view, almost forced to view the family as a system.

“The art tasks which reflect the attempts of the family to solve their problems also enrich the ability of the family to be expressive.”
With the conviction of the worth of the systemic approach as a base, some of the techniques of how to work with that system were reviewed: the notions of circular causality vs. linear causality, forming a hypothesis, assessment of complacency, positive connotation, recursive patterned behavior and paradoxical interventions, etc. Although the information offered is limited, the hope is that the family art therapist will be stimulated to pursue learning the theories of this methodology more extensively and to test if it stimulates a more creative approach to family work which will result in more successful outcomes. My belief is that a positive-synergistic action takes place when family art psychotherapy is based on this epistemology.* I also feel that the creative potential which exists in this combination can enhance the position of the clinical art therapist in the field of family therapy.

Guidelines for Authors

Please submit four (4) copies of manuscripts to: AATA Journal, 1980 Isaac Newton Square South, Reston, VA 22090. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½ × 11 inch bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5” × 7” black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.
Seven Artists in One Body

Seven different artists, each with distinctive styles and techniques, along with 15 mother personalities, emerged within Chris Costner Sizemore. She had begun painting as therapy toward recovery from the multiple personality disorder diagnosed in 1952.

Her story of courage, recounted in the film "The Three Faces of Eve," and her autobiography, I'm Eve, has fascinated the world.

The American Art Therapy Association welcomes Chris as its Special guest at the Annual Conference. She will deliver the keynote address on October 27. A reception for her and an exhibit of her art work is scheduled for that evening.

Featured here and on the next three pages are photographs of several of the paintings she will exhibit. (Photographs by Betsy Perdue)

Chris Sizemore at right with four of her paintings. Their titles, clockwise are: "The Attic Child," "Three Faces in One," "Journey into Darkness," and "Taffy—a Portrait of a Daughter." (The latter will not be exhibited at the Conference.)
Image Induction in the Countertransference: A Revision of the Totalistic View

Robert Wolf, MPS, ATR

Robert Wolf, MPS, ATR is a full-time faculty member of the Graduate School of the College of New Rochelle where he teaches art therapy and studio art courses. He is a practicing psychoanalyst, art therapist and sculptor. He is a senior member of the National Psychological Association for Psychoanalysis, a member of the faculty of their Training Institute and the Institute for Expressive Analysis. He is the author of many articles on art therapy and phototherapy, and is a contributing editor to Art Therapy.

This article presents an integration of psychoanalytic and creative art therapy concepts in an attempt to expand the parameters of what psychoanalysts call “totalistic” countertransference. The totalistic view of countertransference, regression and empathy, and projective identification are described and discussed, followed by a brief section on visual reception in which the author supports the belief of the necessity for making creative art materials available to both the patient and the analyst during the session. When art materials are used, identification and understanding the significance of images can take place. A clinical example (Miss A.) is presented; the patient is a 33 year old artist who began psychoanalytic psychotherapy two years previously, and currently is better able to understand some of the aspects of attachments to a boyfriend and to a clinging mother. Intellectual, disconnected experiences were evident from the patient’s past experiences, and the author points out the need—and some procedures—for resolving this disconnection. A brief discussion of the case is presented, followed by a summary statement regarding a technique, with appropriate cautions given.

Introduction

A focus of this article is on an integration of psychoanalytic and creative art therapy concepts in an attempt to expand the parameters of what psychoanalysts call “totalistic” countertransference. Although psychoanalysis and creative art may at first seem quite different from each other, they may indeed have much in common and, in fact, complement each other. Freud himself, in his paper *On The Question of Lay Analysis*, comes to the conclusion that psychoanalysis is, in fact, an “art” rather than a science, and people who are themselves especially creative may be the most particularly well disposed to become psychoanalysts (Freud, 1927). Before I present the major theme of this paper, I would like to define several terms which are often found in psychoanalytic literature, but may be used by various authors in different ways. To ensure that the reader understands my particular usage of these terms, and will, therefore, be better able to follow the reasoning set forth here, I offer the following three definitions.

1. The Totalistic View of Countertransference

When Freud first used the term countertransference (Freud), he spoke of the analyst’s unconscious reaction to his patient, based upon the analyst’s early object internalizations. This was, for many years, considered to be a detriment to the psychoanalytic work and such reactions within the analyst would be understood to indicate a need for the analyst to analyze and work through the personal conflicts which stimulated such reactions, as it was believed they would inevitably interfere with the progress of his patient’s treatment. This specific point of view is today called the “classical” definition of countertransference.

However, during the years since this original conceptualization, other authors have written extensively about other types of countertransference reactions which commonly occur in the analyst as he/she works with various types of patients (Kernberg, Masterson, Racker, Robbins, Roland, Searles, Winnicot). These reactions, because of the inevitability of their presence, have led clinicians to believe that less emphasis should be placed upon viewing this phenomenon as the analyst’s deficiency, but should be seen instead as a new and unique tool with which we can better understand the patient’s transference projections and early object, or self-object experiences.

Some authors point out the necessity for the analyst to be open and receptive to these feeling “inductions,” as they inevitably arise in treatment, in order to keep them conscious and not repressed (Masterson, Winnicott, Racker, Bion). It is precisely the repression of such feelings which most often leads to countertransference acting-out, and ultimately to interference with the progress of the patient. This new emphasis then shifts the analyst’s attention onto these “inductions,” rather than away from them, and encourages the analyst to use them to better understand what is happening within his/her patient and therefore plan more effective treatment strategies.

The term “totalistic countertransference” is utilized to include under...
one term all of the various kinds of affective reactions which are found within the analyst—induced reactions and classical countertransference.

While analysts are advised by these authors to constantly examine their affective responses to patients and utilize these feelings in their clinical work, it is beyond the scope of this article to examine how these authors recommend using these feelings. The reader is, therefore, referred to the bibliography for further exploration of specific techniques. My intent here is to add to the currently accepted range of “totalistic” responses one more kind of response within the analyst. This new additional response is in the form of visual images which spontaneously occur within the analyst in response to his/her patient.

2. Regression and Empathy

Regression in the service of the Ego has been commonly cited as a paradigm for both creative experience and the phenomenon which takes place within the analyst as he/she tries to maintain an affective or empathic connection with a regressed or primordially organized patient (Robbins, Kris).

The analyst needs to maintain this affective tie in order for the patient to feel understood, and for new object relationships to develop which can then modify the earlier, pathogenic internalizations. The analyst needs to become a container for, or receptive to, the split-off and projected aspects of self and object which must be externalized by the patient through the transference. The most critical challenge to the analyst is to receive these projections and not allow himself/herself to be transformed or “changed” by them. For further clarification of this process I offer this last definition, projective identification.

3. Projective Identification

“Projective Identification is the mental mechanism whereby the self experiences the unconscious fantasy of translocation of itself, or parts of itself, onto or into an object for exploratory or defensive purposes.” (Grotstein, p. 123)

To simplify matters, we will focus upon the exploratory or non-defensive aspect of this phenomenon.

“My intent here is to add to the currently accepted range of ‘totalistic’ responses one more kind of response within the analyst.”

Within this context, projective identification is best understood as a communication. It is a device through which a patient may externalize the self or parts of the self onto the analyst, with the hope that these projections will be received and experienced by the analyst (so the patient can identify with the analyst) but that they will not damage, change or otherwise transform the analyst into either a victim or persecutor (Grofstein, p. 126).

The key here is that the analyst must receive this projection and in some way acknowledge this receipt. It must then be demonstrated, through behavior, that he/she has not been pathologically transformed by it. In other words, the analyst must allow himself/herself to feel the affective component of whatever the patient has projected onto him or her but the analyst must discipline himself or herself to feel it without acting it out in any way. This process then becomes a model for the patient to internalize. It clarifies for the patient the difference between feeling and acting-out a feeling. The analyst must use his/her expanded ego capacity to facilitate this process. In essence the analyst is receiving, transforming, and ultimately neutralizing the pathogenic energy which the patient needs to externalize if treatment is to be successful.

This leads the patient to a point where the projection is now somewhat neutralized and more readily available for interpretation and subsequent working through. If any step in this delicate sequence is missed, the patient and analyst may never reach this unconscious material in a way which makes it available for analysis, but instead they would either recreate pathological conflicts through unconscious transference and countertransference acting-out, or find themselves bogged down in a didactic, intellectualized discussion “about” feelings. In either case, this would certainly bring the analytic process to a halt.

Visual Reception

Several authors speak of the necessity for the analyst to assume a position of “passive reception” and become “container” for these projections (Bion, Robbins, meltzer). It is my belief that, if the analyst utilizes his/her own inner creative resources by making creative art materials available to both the patient and the analyst during the analytic session, he/she may significantly widen the range of reception of these projections to include visual images. These images must then be used within the session and explored in an open and often playful way in order for the patient and analyst to more fully identify and understand their significance. These images may be treated in much the same way as we treat dream images. The patient must be encouraged to associate to not only the image but, also, the affective experience stimulated by such a powerful phenomenon.

The following clinical vignette is offered to illustrate this process.

Clinical Example

Miss A. is a 33 year old artist. She is extremely creative and often uses visual images and metaphors in her treatment to describe feelings which, for her, are difficult to put into words. She began once-a-week psychoanalytic psychotherapy two years ago and, as a result of this treatment has been able to better understand how her current attachment to a boyfriend has been, to some degree, a pathological displacement of split-off aspects of her symbiotic, clinging mother. This material has been coming through in the treatment as an intellectual, disconnected experience and as a result, the patient has not been able to effectively work it through in a meaningful way. She has, therefore, remained cautious and guarded and has had difficulty experiencing trust with her (male) analyst.

During the following session the analyst feels this disconnection, but instead of simply confronting it as a
"... the analyst is receiving, transforming and ultimately neutralizing the pathogenic energy which the patient needs to externalize if treatment is to be successful."

defense (a position taken on many past occasions which inevitably led to a stalemate), he decides to explore it by sketching spontaneous images on his note pad, as the patient drones on. His mental state is one of free-floating awareness as he begins to let his mind roam through the procession of affectless words and piece together visual forms. This mental state begins to feel like a form of meditation as the content of the patient's statements is left behind and his aimless sketches begin to take on a form of their own.

Without any cue from the analyst, the patient, who cannot yet see what the analyst is doing, reaches for a piece of clay and also begins to make three-dimensional sketches as she continues her monologue. The analyst is now engrossed in his sketch which has taken on the form of a fish with an open gaping mouth. (See illustration) Once again he becomes aware of the patient who has suddenly stopped talking and is now staring at the clay fish which she has unconsciously created! In startled amazement the analyst flips his pad around to show the patient his sketch. She gasps in surprise.

There follows a special moment of silent astonishment where both the analyst and patient share a deeply moving feeling of empathic connection. There is a feeling of excitement in the air. Something profound has just happened.

Miss A. says: "This is a clear case of being connected." What follows is quite dramatic. As if floodgates had been opened, Miss A. began to pour out highly charged associations.

She says: "Fish, water, unconscious, symbiotically connected...to you! I'm connected to you. That large gaping mouth, dependency...it felt so good when you shared your drawing with me, like we shared the feeling of being connected. I'd get a lot more out of this treatment if I'd trust you more. I need to feel that connection in order to trust you."

The analyst interprets how her mother's need for symbiotic attachment to the patient made it frightening for her as a child to feel comfortable with her own developmentally natural need for closeness and intimacy with her mother. He further points out she had been reliving that experience in the transference, being afraid of her dependent feelings as they evolved in treatment.

To this Miss A. responds: "Yes, mother's sign was Pisces, the fish...the gaping mouth is her need to take me in, in order to feel whole. I can sometimes feel this inside me, too. I'm afraid I would need you too much if I ever let this part of me out. Maybe this is why I've kept my distance from you."

In the weeks that follow, this image and experience is often referred to as having changed her in some way.

Discussion

We see here an example of how an analyst fostered an externalization of pathologically internalized aspects of both self and object, by adopting a passive-receptive position in order to transform the patient's projections in a creative way. Any confrontation of the patient's affective withdrawal as purely defensive would have closed off the possibility of this important material emerging. It is both the analyst's acceptance of this position as the receptor and container (Bion, Robbins, Meltzer), along with his own creative ability to synthesize the projection into a visual image, which leads to this most unusual and productive psychoanalytic experience. Of critical importance here is the analyst's understanding of the projective identification process as being a creative, unconscious communication which is offered by the patient to the analyst, in the service of helping the analyst to better understand her.

It was also important in this situation for the analyst to show the patient his drawing. This demonstrated to the patient that the analyst did indeed receive the projection, and was not pathologically transformed by it. It is interesting to speculate whether ongoing reception of such projections would eventually cause the analyst to
The analyst needs to maintain this affective tie in order for the patient to feel understood, and for new object relationships to develop which can then modify the earlier, pathogenic internalizations.

mobilize some defense mechanism, if he were not able to neutralize the projection through his own process of creative externalization, in this case drawing. We wonder if, without this vehicle of externalization, the analyst might eventually act out this projection or his affective reaction to the projection in some way. This might be in the form of either playing out the clinging, devouring mother or the patient’s unconscious, split-off and projected sense of clinging dependency, the former being the internalized object representation, the latter being the internalized self representation.

It is clear that in this particular case it was important for the analyst to show his drawing to the patient. However, it must also be made clear that acknowledgment of receipt of such projections may sometimes take less direct forms. In fact, the direct sharing of the analyst’s art may be far too threatening for many patients. Patients who have had traumatic experiences with early objects that were intrusive and didn’t promote a healthy sense of personal boundaries may become quite threatened by the analyst’s direct sharing of such material. The experience may become too similar to the feeling that the object is inside of them, and may cause the patient to reinternalize the original traumatic situation.

The challenge here is for the analyst to use these images to put himself/herself on track and become sensitized to subtle shifts in the transference. The analyst may not choose to show the patient how he/she understands; what is most important is the demonstration that he/she understands, and this the analyst may accomplish in many different ways. He/she may design a variety of interventions, from calmly receiving the projection, containing it and using the knowledge to reaffirm in one’s own mind that the overall approach is working, to (on the other end of the spectrum) sharing the image as described above. In fact, for many patients, the analyst’s ability to “not respond” may be the most important therapeutic response of all!

One may ask why, in the case above, the sharing was not experienced as intrusive. It is my belief that this kind of intervention will always be, to some degree, a form of acting out of a symbiotic transference. However, in this type of situation, it led to more cohesion of her sense of self.

Why? The reason is based on a paradox. That is, the patient is best able to relate on a symbiotic level and, therefore, needs to be met on this level. To try to reach the patient in an object related way on a higher level would be, and often was in this case, a hollow intellectualized experience. We needed first to meet in a way in which she could connect and then, through the mirroring of the split-off projection, foster a feeling of cohesion for her fragmented self.

From an Ego Psychological perspective, the use of drawing and clay engages secondary process elaboration and fosters a structure within the ego, which binds instinctual energy, making these images less threatening for both analyst and patient. This “ego mastery” experience takes the primary process energy which until now has had a disintegrating effect on the ego, and transforms it into a structure which can now become internalized, thereby strengthening the ego (Horner).

We must also note the possibility that the analyst’s image may spring forth more from his own unresolved personal conflicts than from the patient’s own psychic material. In this case we may treat it more as a classical countertransference reaction and deal with it as such. However, we must also consider the probability that even in such a situation, there is often some aspect of the patient’s conflict which sets off the reaction in the analyst, and if we can understand it and not act out our personal conflicts, we may still salvage the situation to the patient’s advantage.

A true demonstration of effectiveness of any technique must be judged by the patient’s behavior and growth.

Summary

I present to you this material which demonstrates such growth in the hope of expanding analysts’ awareness of how they can use creative parts of themselves in a new way to help patients grow. It is not my intention to promote this technique as one which should be widely used without careful consideration of its potential dangers. Like any good clinical intervention, it must be woven into a solid treatment structure which reflects both the analyst’s personal and professional skills, along with a healthy regard for and understanding of where the patient is and what he/she can use. It is always essential for us to assess what a person is or isn’t ready to use in the service of personal growth. In the case described above, the image induction experience became the “keys:one” of a phase of treatment. The patient’s progress was fueled by the power of the experience. Her profound sense of being understood led to a deepening ability to trust, which had a dramatic effect on her ability to form healthier object relationships.

The importance of the analyst’s willingness to utilize creative assets to help decipher split-off projections should be reemphasized. Often it is the limitations of the analyst in receiving deciphering, understanding and creatively using these projections that may lead to an inerminable analysis (Robbins). Because of the primitive, nonverbal nature of these projections, an analyst who is most comfortable with his/her own nonverbal, creative processes is perhaps best suited for this kind of intervention.

The patient must be encouraged to associate to not only the image but, also, the affective experience stimulated by such a powerful phenomenon.”
Bibliography

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. **Applications for student membership must be accompanied by a copy of current ID.**

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. **Contact the AATA National Office for an application.**

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. **Contact the AATA National Office for an application.**

Annual Dues: $80

Book Reviews

Expressive Therapy with Elders and the Disabled: Touching the Heart of Life

Reviewer Doris Arrington, MA, ATR is Director of the Masters' degree program in Art Therapy at the College of Notre Dame in Belmont, California.

The rising number of frail and infirm elderly citizens represents a profound shift in our national social and economic structure. Projections indicate that by the year 2020, one in every five Americans will be 65 or older. In this light, Mr. Weiss' book is both timely and provocative.

While creative arts therapies have been a part of programs for the elderly for some time, only in the last ten years has their importance in the overall health of the institution and the individual resident been recognized. Through the practice of creative arts therapy as communication, the book addresses a new model, a new concept, and a new paradigm of the psychology of aging.

The book is a conversational essay, suggesting concrete ways to help the elderly adjust to physical changes, and to the emotional difficulties stemming from changes in life style and/or loss of abilities. Mr. Weiss is insightful regarding both institutional issues and client patterns of regression and dependency. The case studies he presents, as well as the theory he proposes, provide the reader with an opportunity to understand the elderly as persons.

When long-time members of social communities are uprooted and placed in institutions, because of a need for health care or economic support or both, there is still a craving for real human contact. In this new phase of existence there remains a need for the sharing of life experiences. Mr. Weiss sees a caring professional staff as meeting needs of the extended family as well as the client. His understanding of this area indicates that if appropriate and satisfactory changes are not made, and attitude: are not addressed by the family and the institutional staff, then depression and illness will set in, causing further social and economic distress. While his primary focus is on psychological support of the institutionalized individual, the implications are clear. He feels that in order to prevent expensive, ineffective, guilt-ridden warehousing or intensive professional or medical intervention, a caring and involved staff is necessary.

The book's strength is also its weakness: Jules Weiss' personal participation in the lives of his elderly clients, and the emotionality of his writing about these experiences. At times he sounds rather self-indulgent, almost overstating his care and concern, even causing the reader to question his motives. Does he think his "case" needs a "hard sell"? If so, he is speaking to the wrong audience. The audience that reads this book will be interested in his subject. Is he, however, over-identified with his clients?

Mr. Weiss' chapter on "Dying, A Meaningful Experience: Encountering the Process through Art Therapy" could have been explored more thoroughly. A great deal has been written on death and dying; this literature generally relates to the ill and diseased, and not specifically to helping the elderly and their families face the next phase of their lives—accepting aging, infirmity and death. Mr. Weiss piqued my interest in this subject, but too quickly moved on to the next chapter. Perhaps this will be a subject that he will address in the future.

Mr. Weiss' first publication—Creative Arts Therapy with Elders: A Pictorial Essay—was a lovely presentation of elderly and disabled individuals involved in the creative process: "the dynamics of self-encounter—awareness, reflection, re-orientation, and assertion" (p. 15). This second volume, however, is not as well-integrated, leaving the reader somewhat confused. In this format, the pictures and story lose much of their original poignant and power.

Mr. Weiss has a rich background of experiences with the elderly. Although at an early age himself, he is something of an expert in the field of creative arts with the aging. He has much to say and much to tell. He needs, however, to learn to say it succinctly, without either apology or oversell. Any professional who works with the elderly will find in the work of Jules Weiss an illustration of the ethics of commitment—a commitment to joining others in shaping the tasks and the shared meaning of all our time together.
Playing with Form: Children Draw in Six Cultures

220 pages, 100 black and white illustrations. Paperback.

Reviewer Linda Gantt, ATR a graduate of the art therapy program at the George Washington University, is currently working on a doctorate in Interdisciplinary Studies at the University of Pittsburgh in the departments of Anthropology and Communication. She teaches art therapy courses at Vermont College of Norwich University and Carlow College.

A statement which invariably closes written accounts of research projects or doctoral dissertations is "More investigation is needed." Surely, few art therapists will succeed in reading this book and reflecting on its implications without having the same phrase come to mind as it did to me. I hope at least a few will also share my excitement about Alland's work and will be spurred on to become part of those further investigations.

Playing with Form is not Alland's first venture into anthropology and art (see Alland, 1977). The chair of the anthropology department at Columbia University, Alland takes as the focus for his latest book such questions as: What part does culture play in children's art? What rules for art making are followed in particular cultures? Do "formal aesthetic universals" (similar to the universal grammar postulated by the linguist Noam Chomsky) exist? What are the similarities and differences in children's drawings when compared within or between various cultures? To begin answering these questions Alland set up an empirical study under controlled conditions in which he observed and videotaped children drawing in two Western and four non-Western countries.

The subtitle "Children Draw in Six Cultures" recalls the ambitious work on cultural differences in child rearing practices done by the Whittings (Whiting, 1963; Whiting and Whiting, 1975), both part of the multi-volume Six Cultures Series. These carefully designed studies are landmarks in anthropological research; no doubt, Alland wished to invoke the spirit of these earlier works by this subtle reference to the famed Six Cultures Project even though he does not cite these books and articles in his bibliography. Nor is his sample precisely identical to that of the Whittings. However, the cultures he did choose (Bali, Ponape, Taiwan, the United States, France, and Japan) make for a well-balanced and culturally diverse group.

Like the Whittings' work, Alland's book provides an excellent model for empirical research. The standardized procedures are outlined at the beginning of the book along with a list of the terms and definitions Alland has selected to describe the drawing process (fill, build, and kinetic scribble) as well as the finished picture (aggregate, thread, and tadpole figure).

Each child drew one picture of his or her choosing (some were asked for a second one) while the drawing process was filmed. Research assistants translated the child's spontaneous comments and, after the drawing was completed, inquired what the picture and its parts meant. Felt-tip markers (red, blue, yellow, green, brown, and black) and rather small paper (9 by 11 inches) were the only materials offered. With few exceptions (which Alland carefully notes) the children worked alone and did not see the work of those who preceded them.

The bulk of the book presents each of the subsamples in turn, along with a brief ethnographic sketch (including the artistic climate) and a table of the data on each child's sex, age, schooling, and the time spent on the drawing. Almost half of the children and their pictures are discussed in detail. These discussions include the child's comments about the pictures but there is no systematic reporting, tabulating, or analyzing of the verbal material per se.

One hundred of the drawings are reproduced. The publication of this much primary material (Alland wished that all the drawings could have been printed) illustrates the absolute necessity of providing as much of it as possible for only then can the reader get a sense of the scope of the children's responses. Publishing the pictures serves as a check on overly enthusiastic, poorly done, or misguided verbal descriptions. However, the technical problems of reproducing the art work are also apparent. In the black and white versions of the drawings the colors are difficult to identify and the yellow fades into oblivion. Being able to turn to a copy of the actual picture is absolutely crucial when reading the section on "unusual" pictures; as Alland states, one of the criteria for judging a picture to fit this category was that it was "generally aesthetically successful according to [Alland's] own evaluation." Further, he leaves it to the reader "to judge with what success" this had been accomplished (page 190). Such judgment is possible only with recourse to the pictures.

The data presented in this rather modestly appearing book provide a startling challenge to a principle art therapists all but take for granted—that healthy children, regardless of environment, proceed through predictable stages in drawing. After collecting and analyzing 240 drawings Alland concludes that:

"It is quite clear...that cultural influences appear early and have a strong effect on the overall style of
children’s drawing. Leaving aside similarities in the development of human figure drawing (there appear to be real cross-cultural regularities in this domain) generalizations about particular stages of development in children’s drawing appear to be false. My data also strongly suggest that development from scribbling toward representation is not an automatic result of maturation, or even of experience with drawing’’ (page 211, emphasis added).

Thus, Alland scores a dead hit on the generalizations made by Viktor Lowenfeld (among others) and accepted without doubt or further investigation.

Alland’s questioning of the universality of specific stages in children’s drawings must give pause to those art therapists who are called on to evaluate non-English speaking children (particularly recent immigrants). If subsequent studies duplicate Alland’s results one of the basic tools we use in determining age-appropriate drawings may be invalid except under specific conditions (i.e., with children from certain cultural backgrounds, from the United States and Western Europe). As important as this finding is, we cannot accept the conclusions uncritically for, as Alland points out, he could not get a ‘‘completely matched sample by age and sex in each culture’’ (page 21). Nor did he get a truly representative sampling of the drawing process in each culture. He cautions that ‘‘this study is developmental only in the sense that it samples the art work of children in six cultures from a range of ages… but the size of the samples provide little reliable comparable data on how specific types of design are drawn at different ages in the six cultures’’ (page 22).

I found it surprising that Alland did not attempt to collect data on other variables with which he could correlate the drawing skills. Admittedly, IQ tests are difficult to administer and even more difficult to interpret when given to members of different culture. In fact, many anthropologists refuse to use these tests, given the past abuse of the results. However, it seems that a simple task for testing hand-eye coordination, manual dexterity, or color-naming might have been included without great trouble. A test of manual dexterity would have been particularly useful in comparing older scribblers with those children who made small, discrete units or marks. With one exception (a French child whose teacher said she was mentally retarded) all children were presumably ‘‘normal.’’ The need for correlative psychological testing was especially evident to Alland as he was ‘‘struck by the degree of aggression displayed’’ by children in the United States sample who, in the process of doing a kinetic scribble, ‘‘literally attacked the page’’ (page 159). A good study for an art therapist with access to only one cultural group would be the testing of the hypothesis that there is a positive correlation between ‘‘this particularly violent type of scribbling’’ and aggressive feelings.

Alland’s detailed description of the entire data collection process invites, in fact, demands, replication.

No doubt, many art therapists will react initially with disbelief at his conclusions but few will find major faults with his general methods or basic research design. This is not to say, however, that there could not be some modifications in both the methods of obtaining the drawings and of analyzing the results. Of course, such post hoc changes are far easier for a dispassionate observer to suggest than for the researcher to think of de novo.

It may be possible that some of Alland’s results are artifacts of asking for a single drawing. Requesting two or three pictures in one session or collecting several over a specified period might have yielded quite different results. Of course, the ideal cross-cultural study on this subject would follow a large sample of children from infancy to adolescence so that the entire drawing process could be documented. In working with adult psychiatric patients I have observed an example of how asking for only one picture can produce misleading results. Like the shy Ponapean school children who drew stereotyped designs of a school house and a flower my adult patients frequently produced well-practiced formula drawings (of four-pointed stars, profiles of pretty girls, and endless knots). I think that Alland is right in concluding that such pictures reflected the children’s ‘‘general unwillingness to experiment in the face of an unfamiliar situation’’ (page 216); that certainly seemed to be the case with my patients. But, more importantly, the second picture done by these same individuals was stylistically unrelated to the first. If Alland is going to find more generative rules of art-making it will require looking beyond the first drawings.

In trying to describe specific cultural rules, one might ponder which are specific to art and which may apply to larger contexts. For example, it is well-known that various cultures handle time in different ways. The kindergarteners in the American sample had the shortest mean time for drawing (3.6 minutes) (page 156) and, overall, the U.S. children spent less time drawing. Alland postulates that this may have been an artifact of the testing procedures. However, it may be that these children were conforming to a cultural rule which supersedes the art-making rules, that is, a rule regarding spending a minimum of time on one activity before changing to another. (American television with its emphasis on quickly changing plots and scenes and fast-paced commercials certainly exemplifies this rule.)

Alland’s writing is generally clear and straightforward but there were two slips in his thinking that struck me as curious. One was a beginner’s mistake in separating one variable from another. In the Taiwanese sample he reasoned that the use of colors was correlated with schooling, that is, preschool children tended to use only one color while the school children used several colors. Alland states, ‘‘Clearly schooling has an effect on color use’’ (page 102). But the preschool sample was heavily weighted with four-year-
olds while the school sample had a preponderance of six-year-olds. On the basis of this data alone one cannot say that schooling was the determining factor. (Neither, for that matter, could one say that age was.) In this case, the two variables are impossible to separate.

A more serious slip, perhaps, was contained in his proposition that “Art, like language, is specific to humans. It occurs in no other species. This suggests immediately that aesthetic behavior is biological in origin. This in turn raises the possibility that pre-coded principles of aesthetics exist as well” (page 8). One might just as well turn the argument around and conclude that since art does not occur in other species it is not biological. Unfortunately, Alland offers no convincing proofs for his position on this issue. In the main though, Alland’s generalizations are suitably restrained and he does not try to extend his conclusions beyond the limits of his data. When he does insert his own opinions or speculations they are carefully labelled as such.

Alland’s emphasis on teasing out rule-based behavior in art will help to balance what has been for art therapy an almost exclusive emphasis on psychological factors in children’s drawings. Once art therapists and art educators get over the shock of having a challenge mustered to some of their basic assumptions I am certain they will see the importance of this book both as a model for research and for future theory building.

The Art of Art Therapy

(224 pages, 25.00)

Reviewer Don L. Jones, ATR, HLM is Director of Adjunctive Therapy, Harding Hospital, Worthington, Ohio

I bought Dr. Rubin’s new book The Art of Art Therapy “sight unseen,” having appreciated her thoughtful and specialized approach to child art therapy in her first book. The comprehensiveness of the title was intriguing. The content is clearly a systematic and encompassing outline divided into five major sections each with relevant subsections. The major sections include The Art Part, The Therapy Part, The Interface, Indirect Service, and Applications.

The book more than fulfills its purpose if it is aimed at a readership of art educators, undergraduate art therapy students or student advisors. It is also a relatively complete and useful outline to guide art therapy educators. Viewing the book and its contents through the eyes of a practiced clinician, specializing in the field of adolescent and adult psychiatry, will account for the flagging of some specific issues which appear to have been given more critical attention. Among the very few items left out but which deserve mention is the necessity for art therapists to know something about somatic treatments, psychopharmacology and biological factors all of which play a major adjunctive role in treatment planning. The constant referring to the art therapist as “she” and the patient as “he” is an interesting sign of the times, emphasizing that the art therapy field is dominated by women and (implying incorrectly) that the patient population is dominated by men.

The Art of Art Therapy, however, is not a manual of practice. It may be of limited use to practicing clinicians who, from experience, certainly should be “knowing materials,” “knowing processes,” “knowing products” and “knowing therapy.” (These are subsection titles.) The title promises everything you always wanted to know about art therapy and, perhaps, can find out by reading the extensive and useful bibliography. But, in the preface, Dr. Rubin states her own reservations about the title, thinking that it may be presumptuous.

Much of the content seems to speak from and to an art education point of view. The continuous emphasis on “spontaneous expression” and “creativity” suggests the kind of approach that is used in the classroom or in play therapy with children, but which may not necessarily apply in clinical settings or to adult patients. Dr. Rubin is not alone in the art therapy field in overemphasizing the creative and spontaneous approaches. Seldom, however, by classical definition is
the patient able to be creative or spontaneous. Much of what is produced is not free, but is more often than not stereotyped crude communication stifled by neurosis and the influence of disabilities. Dr. Rubin, while emphasizing that “the end is not art but therapy,” must decide if seeking to evoke “authentic art work” in a “least restrictive environment” (a concept that has failed many patients in the mental health system) is applying art therapy in the most therapeutic manner with the efficient interventions necessary in such serious and urgent circumstances.

Although the concept is important, the more technical and extensive discussion of transference and counter-transference may be out of keeping with the more simplified discussion in other areas of the book, but it does reflect Dr. Rubin’s interest in sharing her special background and training. Perhaps a discussion using simpler language describing the “involuntary participation” of the art therapist in the treatment process would set an example for eliminating some of the “jargonese” so often lifted from other disciplines and used by art therapists.

No one can take issue with the philosophical and political notion that every person has “a right to be creative” and “a right to do art.” As Dr. Rubin suggests, to find the “song in the soul” and the “poetry in the person” is an ideal humanistic goal, but a clinician might focus more on symptoms and syndromes, bioplers and borderlines and be concerned with the depth of depression. Certainly the general purposes of art and art therapy include providing growth sublimation and narcissistic gratification. But therapy’s primary focus is to treat specific symptoms, to do therapy. Of course everyone has a right to be creative if only it were possible to interrupt the repetition compulsion quality of behavior that would allow freedom for spontaneity and creativity. More often than not, the art therapy clinician is attempting to understand and correct behavior, to identify character defenses, and to differentiate the ways in which the patient is using the art materials, the process and the personal interaction. The purpose is not usually to explore the level of creativity, but rather the degree of inhibition, the reflections of reaction formation and to assess the potential for impulsive or chaotic acting-out.

On page 95, Dr. Rubin refers critically to some of the structured approaches to art therapy as “clever and probably harmless which may deprive the patient of the essence of a genuine art experience.” She is correct in worrying about the “cookbook” use of techniques, but should not ignore the important role of guided imagery and the designing of isomorphic metaphors which have specific prescriptive functions. I don’t understand how using art therapy in a prescriptive fashion is a perversion of the medical model as Dr. Rubin suggests. Is the purpose of the art therapist to provide a genuine art experience, or to be a clinician who engages the patient in the act of self-healing? If art therapists are not working in a prescriptive fashion, are they then merely working in a surgical cut and search exploration?

I appreciate what Dr. Rubin has provided in this book, for the stimulation to look at the field with a broader perspective. Most of all, I appreciate Dr. Rubin’s challenge to the art therapy field to find its own identity, not as practitioners of other health disciplines who use art. It is a challenge that is given brief emphasis in the book but ultimately may be the most important item in it.

**Using the Creative Arts in Therapy**

Reviewer Vija Lusebrink, PhD, ATR is Associate Professor Expressive Therapies, University of Louisville, Louisville, KY.

This small volume, described in its preface as a "practical introduction to the therapeutic arts" (p. vii), covers the following areas: folklore, movement, visual arts, music, and drama. The contributors all have an English educational background in their respective fields except for Roberta Nadeau, the editor's wife who obtained her undergraduate training in the United States.

The exercises discussed in the book are group-oriented, inasmuch as the first part briefly covers such topics as where and when to meet and the composition of the group. It also suggests that, in order to learn the role of a group leader, it is necessary to work with other leaders. The hints for creative therapy sessions include the suggestion for the leader to enjoy him or herself, but to be careful not to be the only one who does so. The teacher is also advised to turn off the lights and water after the session, which is seen as critical because "janitors and cleaners are possibly the most important professionals we come in contact with" (p. 19). The book also mentions the importance of record-keeping, but does not address the sharing of observations with other mental health professionals. Apparently in the setting where the authors are working (England and Canada), this aspect of professional work is not often necessary for creative arts therapists. Warren states that only a small percentage of those who are employed have been trained in the therapeutic application of the arts.
This raises a question about the purpose of this book, and the validity of addressing the practitioners in this volume as "therapists." Warren states that "it is the act of making a mark—not its effect on an outside professional—that is of value in reintegrating mind, body and soul" (p. 6). The goal of the book is to develop socially acceptable "human creative expression," enabling all people to be themselves, so that "the improvement in the quality of human life will make arts therapy, and books like this redundant" (p. viii). This is a tall order indeed, especially for therapists working in the field of mental health, who are frequently forced to accept in their work the imperfections of human nature.

Maybe the book is addressed to artists, who possess a certain degree of naiveté which allows them to group all individuals with different presenting problems and pathology as "special populations" and "handicapped," as does Nadeau in her chapter on the visual arts. Nadeau does admit, however, that the individuals in a group may keep their distance and their involvement at a minimum—possibly because "at times unknown to us, cruelties have occurred that are too inhuman for us to deal with in creative arts sessions" (p. 81). This statement best defines the line between a therapist and a facilitator for creative expression. Under these terms, the book is useful in providing some exercises in facilitating creative expression, but should not be confused with doing "therapy."

There are some other contradictions, too, in the material presented, especially in regard to using the visual arts. Nadeau, like Warren, admonishes the reader using arts with "special populations" to know his or her art medium well. Her chapter then presents an introduction of the characteristics of basic art media like pencil, charcoal, pastel, paint, etc. Most individuals who have done some work in the visual arts would know these basic media, even if they do not call themselves artists. This leaves this reviewer with some apprehension as to whom this book addresses, and who shall use the material presented therein and in which circumstances. It appears that group leadership skills are not required, nor is any other knowledge about the therapeutic interaction and process. Similarly, even knowledge of the creative experience and the basics of using art materials are not assumed as present.

None of the authors make any direct reference in the text to the existing disciplines of art, music, dance or drama therapy in the United States. This lack of acknowledgment may explain the minimal reference to any work published in the above disciplines. Both Warren and Nadeau refer to Feder and Feder's survey (1981) of the expressive arts therapies, which contains brief summaries of art, music, dance, and movement therapies with some examples of applications. This source is too general and too brief to be, for all practical purposes, a primary reference for the therapeutic use of arts.

On the positive side, individual contributors to the present volume give some examples of their work which appear "track tested," as claimed in the introduction. Professional therapists with knowledge and training in their fields will find some of the exercises in the expressive modalities discussed here useful as a warm-up for further group work.

In his chapter on folklore and ritual, Watling gives a very brief overview on the use of folklore in groups. He also presents several examples of traditional games and narratives, and includes a useful list of references.

Stebbing's approach to the physical roots of movement is based on the use of the weight of a body part and the force of gravity to stretch another part of the body. Stebbing defines his approach as a creative and self-educational body and exercise therapy. He does not give any references in his chapter, but his work appears to be based on Feldenkreis' (1982) awareness through movement exercises and yoga. I am not a movement or physical therapist, but I would be reluctant to try most of the exercises with disabled clients, as suggested by Stebbing.

Yon's chapter on expanding human potential through music is one of the more thorough ones in the present book. He uses sound and rhythm for communicating with others. In his work he also incorporates movement, space, textures, and play. Drawbacks are the many references in the text to notes at the end, and the lack of a bibliography.

Warren covers the areas of dance and drama to develop self-expression and as stepping stones to personal growth. According to Warren, the use of the material discussed under dance requires little formal training in dance or drama therapy. His goals are to gain control over isolated body parts, improve body image, achieve controlled emotional release, and become more socially adept. As a step towards this goal he introduces ten simple games, and a suggestion for a free-form movement to follow wherever the music takes the participants. In the chapter on drama, Warren presents fifteen easy games, including group story-telling and acting out a guided fantasy. Both of Warren's chapters also have the handicap of numerous references to notes at the end; but he does include suggested reading for both chapters.

The present book concludes with a table listing in alphabetical order all the exercises discussed in the book, regardless of the modality or discipline involved. This work is cross-referenced with the possible benefits in ten different areas: body awareness, flexibility, communication, attention span, emotional release, creativity, self-esteem, social skills, motor skills, and perception. This table is an example of one of the basic shortcomings of the book: the emphasis is on specific activities, rather than on the areas of possible change. Thus, despite the use of the term "therapy," this little volume really contains suggestions for a variety of arts activities. In the hands of a trained therapist familiar with a particular creative modality—be it dance, music, art or drama—these activities can become a creative means of facilitating change, and thus being "therapeutic."
Film/Video Reviews

Reviewer: Georgiana Jungels, MA, ATR is an Associate Professor in Art Therapy Studies, State University College at Buffalo, New York, and Art Therapist, Private Practice, Counseling Services, University Center for Human Services, Amherst, New York.

What is an “Art Therapy” film or videotape? One criterion for a film or videotape about art therapy is that the production illustrates what is defined as “Art Therapy.” Although art has been part of therapy throughout all of recorded history (Lommler, 1967), the term “Art Therapy” was first used in the 20th century (APA, 1984). The Longman Dictionary of Psychology and Psychiatry (Goldenson, 1984) defines art therapy as “the use of artistic activities such as painting and clay modeling in psychotherapy and rehabilitation.” Art therapy is also defined as a mental health discipline (Ulman, 1976), a rehabilitation treatment service (ICAIH, 1983), a mental health specialty (APA, 1983) a psychosocial therapy (APA, 1984), a counseling service (AAACD, 1984), an allied health service for handicapped students (P.L. 94-142), and a human service profession (AATA, 1979). The American Art Therapy Association has defined two major approaches in the field of art therapy:

The use of art as therapy implies that the creative process can be means both of reconciling emotional conflicts and of fostering self-awareness and personal growth. When using art as a vehicle for psychotherapy, both the product and the associative references may be used in an effort to help the individual find a more compatible relationship between his or her inner and outer worlds.

Each of these definitions provides a framework for identifying a film or videotape about “Art Therapy.” Because art therapists work with people of all ages, with individuals and groups in clinical, educational, and rehabilitative settings, an art therapy film or videotape may focus on an overview of the field (Art Therapy, 1981) or a specific population (Stevie’s Light Bulb, 1984) or an individual client (LORI, 1978).

Although a single distributor’s catalog may list only one or two “Art Therapy” films/tapes, a review of several major catalogs, the AATA Media List (Jungels, 1977), an Art Therapy bibliography including film and videotapes (Niswander, 1980), and the 1984 AATA Film Festival entries (Malchiodi, 1985) identified over 100 films and videotapes about art therapy. (Note: a number of “media” productions have been made by art therapists to illustrate their work in art therapy and have been presented at conferences or workshops but are not available through commercial distributors or film libraries.)

Each art therapy film/videotape offers different information about the theory, practice, and experience of art therapy. Just as one book or article on art therapy cannot present a comprehensive view of the field, one film or videotape on art therapy cannot make a definitive statement about art therapy. Therefore, for this review, I have selected several films and videotapes on art therapy that present a variety of views about art therapy theory and practice. Some of the productions were made years ago and have become “classics.” The strengths of these films and videotapes is that they have withstood the test of time and have been selected frequently enough that commercial clinical, and/or university libraries continue to distribute these productions. Other films and videotapes are recent and were included in the 1984 AATA Media Festival (Malchiodi, 1985).

The following films and videotapes represent a basic “library” of films and videotapes on art therapy.

Art Therapy (16mm, color/sound, 10 minutes, 1981) Produced by the American Art Therapy Association, Inc. and available from the AATA association office, 1980 Isaac Newton Square South, Reston, VA 22090 (703) 437-6012.

This film is an overview of the field of art therapy and includes hundreds of images selected from the art of children and adults working with art therapists in a variety of human service settings in the United States. The film was produced by the American Art Therapy Association and is appropriate for introducing the field of art therapy to students, educators, clinicians, administrators, legislators, and the general public. This film was selected for the John Muir Medical Film Festival in 1982 and has been shown frequently in colleges/universities, workshops, and conferences and provides the viewer with a basic introduction to the field of art therapy in the United States.

Art Therapy: Beginnings (16mm, color/sound, 45 minutes, 1977) Produced by the American Art Therapy Association and available from the AATA association office, 1980 Isaac Newton Square South Reston, VA 22090 (703) 437-6012.

This film presents four pioneers in art therapy: Margaret Naumburg, Elinor Ulman, Hanna Yaxa Kwiatkowska, and Edith Kramer. The film has four parts and includes a 1976 interview with Margaret Naumburg by Judith Rubin and three clinical sessions (filmed in a studio) led by Elinor Ulman, Hanna Yaxa Kwiatkowska, and Edith Kramer. Ulman, Kwiatkowska, and Kramer demonstrate their individually designed procedures for assessing new clients in a single art therapy session: the “Diagnostic Drawing Series” by Elinor Ulman; the “Family Art Evaluation” by Hanna Yaxa Kwiatkowska; and the “Diagnostic Procedures in Art Therapy with Children” by Edith Kramer.

The three assessment procedures documented in
this film provide the viewer with some "real time" footage and complement the written descriptions about the single session assessment procedures developed by Ulman, Kwiatkowska, and Kramer. Because the three assessment procedures are presented sequentially in the film, the viewer is able to observe the similar and the unique procedures used by these three therapists in their assessment procedures. The value of the filmed sessions is that we can see how a real person in a REAL time situation responds to a request to make a "free picture," a "scribble," or an "abstract family portrait."

In many ways, these filmed sessions offer an example of the strengths and the limits of a film or videotape on art therapy. The strengths are that the viewer can see the development of each visual statement and observe the verbal statements and the hesitancies, the pauses, the glances, and other non-verbal communications. The limits are that the cost of filming a documentary defines very real limitations on the number of people and sessions that can be filmed and the final film may or may not represent the overall approach, technique, therapist style, and/or the most significant clinical issues.

Ideally, a documentary film will be made over a period of time with the subject matter filmed and filmed until the filmmaking is simply part of the experience and the resulting footage represents the variety of experience and responses that occur in more than a single filmed session. This is often very costly and difficult to do. The minimum goal for a documentary is to collect information over a period of time.

Three examples of this documentary style are:

**Stevie's Light Bulb: Graphic Art in Child Psychiatry** (16mm, color/sound; also available on VHS, Beta and 3/4" videocassette, 1984). Produced by Ralph D. Rabinovitch, M.D. and Francis C. Pasley, M.D. and available from Hawthorne Center, Northville, MI 48167 (313) 349-3000.

This film features eight young artists on-screen and the art work of 60 other children who are or have been patients of the child psychiatrists, Dr. Ralph Rabinovitch, Dr. Francis Pasley, and Dr. Sara Dubo. The film presents the use of graphic art in child psychiatry and focuses on the development of communication through the language of art. These case studies illustrate the use of graphic art in diagnosis and treatment. This film won the "Best-of-Festival Award" at the 1984 American Art Therapy Association Film Festival and has been described by the film reviewer Eddie Cockrell as "a movie that reveals a methodology of discovering the fantasy life of disturbed children with words and pictures that are of interest to all." (Art Therapy, Volume 2, Number 1, March 1985).

**Gestalt Art Experience With Janie Rhyne** (16mm, color/sound, 27 minutes, 1976). Produced by Janet Greenwood and available from the University of California Extension Media Center, 2223 Fulton Street, Berkeley, CA 94720 (415) 642-0460.

This film presents a group art experience led by Janie Rhyne, HLM, ATR. She explains the principles and key terminology of gestalt art experience. Working with a diverse group of healthy adults, she presents three therapeutic art experiences: "Finding Your Own Rhythm Vocabulary," "Creating Your World with Clay," and "Building a World Together." This film is a good example of both the broadest definition of art therapy ("fostering self-awareness and personal growth") and the distinction between art therapy and art experiences. The film was awarded a Certificate of Merit (Professional Category) at the 1984 AATA Film Festival.

---

**The Green Creature Within** (3/4" videotape, color/sound, 24 minutes, 1979). Produced by Judith Rubin, Ph.D., ATR, and Eleanor Irwin, PhD, RDT, and available from the Western Psychiatric Institute, 3811 O'Hara Street, Pittsburgh, PA 15213 (412) 624-2378.

This documentary film is a record of a two-year outpatient therapy group for male female adolescents using the expressive modalities of art and drama. The narration summarizes the necessary conditions in the therapeutic environment, two case studies, and some of the specific therapist behaviors that seem to facilitate therapeutic growth. This tape is one of the few productions available on the creative arts with adolescents and documenting the interdisciplinary work of an art therapist and a drama therapist. The strength of the production is that the footage was collected over a period of time and edited to represent a clear and concise statement for educational purposes. This film was awarded a Certificate of Merit (Amateur Category) at the 1984 AATA Film Festival.

---

There are several art therapy case studies available in film or video. The strength of these productions is that they present a detailed accounting of a single person's imagery and clinical issues. The limitations of a case study in film or videotape share the same limitations as a case study in written form; that is, the information is specific to a given person and set of unique situations and cannot be generalized to the population as a whole. The following three films represent very different clinical populations and production styles. Each production uses a retrospective approach; however, one case history is reported by the art therapist (Lori, 1978); one is reported by a physician (The Magic Mirror of Aloyse, 1967); and one is reported by the artist/former patient (The Maze, 1970).
Lori: Art Therapy and Self Discovery (16mm, color/sound, 32 minutes, 1978). Produced by Helen Landgarten, MA, ATR and available from the AATA association office, 1980 Isaac Newton Square South, Reston, VA 22090 (703) 437-6012.

This film is a recreated case study of a 14-year-old girl who was in art psychotherapy for a period of 34 months. The film depicts a sequential history of Lori's progression from a withdrawn, isolated and depressed girl to a maturing person who has learned how to find the good things in herself and "stand up and be myself." The strength of this film is the careful and clear reporting of the therapeutic growth of one person working with one art therapist (Helen Landgarten) over a period of almost three years and the transition from admission to treatment to discharge and subsequent continued health.

The Magic Mirror of Aloys (16mm, color/sound, 27 minutes, 1967). Produced by Alfred Bader, M.D. and the Center for the Study of Plastic Expression, Switzerland and available in the U.S.A. from New York University Film Library, 26 Washington Place, New York, NY 10003 (212) 598-1212.

This film is about the art and life of a woman named Aloys, diagnosed as a chronic schizophrenic and who lived more than half of her life in a Swiss mental hospital. Her pictures document the onset of her illness and romanticized relationships. Although the viewer can see many of the pictures that Aloys has made and a scene of her working (alone, rapidly and silently) on a new picture, the film does not integrate the art content or experiences with any art therapy treatment. It appears that making pictures is simply part of Aloys's daily living activities. The focus of the film is primarily a documentation of the art expression of the art of the mentally ill or the story of an artist who was schizophrenic.

The Maze (16mm, color/sound, 30 minutes, 1970). Produced by Dr. James B. Maas, Cornell University and Houghton Mifflin and available from Audio Visual Services, the Pennsylvania State University, University Park, PA 16802 (814) 865-6314

In this film the well-known Canadian artist, William Kurelek, presents his own case study by reviewing his life and examining his years of depression. He focuses his recall on the images and symbols he included in a large painting entitled "The Maze" that he made while he was hospitalized in England in the 1950s. Although Kurelek worked with the British art therapist Edward Adamson at Netherme Hospital, the film does not include this information and the case study is presented primarily by Kurelek himself. The film footage focuses on his painting "The Maze," his symbols for his emotional problems and suicidal ideation, and his memories of his childhood and early family life. By intercutting scenes from Kurelek's painting of "The Maze" with real life interviews with three generations of the Kurelek family, the film successfully illustrates the complexity of a family system and the life review process from several different perspectives. (Note: A more detailed review of this film is in Art Therapy, Volume 1, Number 3, October 1984.)

* * *

The use of film animation for therapeutic purposes was first documented in the mid-1960s at the Lausanne University Psychiatric Clinic. Bader (1972) of the Center for the Study of Psychopathology of Expression, described the film production work of inpatients as "a new form of group therapy." Since then three of the films made by the patients at Lausanne have been distributed internationally. Although the prints of these films are old and no longer distributed by several previous distributors, it is still possible to rent copies of these films in the U.S.A. from the Embassy of Switzerland in Washington, D.C., Cultural and Information Office, 2900 Cathedral Avenue, N.W. Washington, D.C. (202) 745-7925. The following films are available:

Good Morning, My Eye (16mm, color/sound, 16 minutes, 1965)

This film presents scenes from the daily life in a psychiatric hospital with an imaginative approach. The potato, for instance, which appears frequently in the hospital menu, was used in many symbolic and humorous ways to express the importance of food and the attitude of the patient's confinement, delirium and inability to recognize external reality.

Seven Nights in Siberia (16mm, color/sound, 13 minutes, 1967)

This film presents animated sequences of jokes about psychiatrists and a patient's view of the problems of mental illness.

The Poet and the Unicorn (16mm, color/sound, 17 minutes, 1969)

This film was written, drawn, and animated by the patients of the Psychiatric Clinic of the University of Lausanne. The story focuses on the experiences of admission, treatment and discharge from a psychiatric hospital. Several scenes show the patients working on the film production.

Two contemporary films that present the use of art and film animation as a therapeutic technique are:
The Color Bunch (16mm color/sound, 17 minutes, 1982). Produced by Judith Rothschild and distributed by JKR Productions, 650 Midfield Lane, Northbrook, IL 60062.

This film demonstrates the use of several different film animation techniques within a group therapy setting. "The Color Bunch" is the name the clients gave themselves as participants in this group process. This film offers the viewer a basic introduction to the potential of film animation as a therapeutic technique. Although the film has some technical limitation, it has been edited to include relevant information as efficiently as possible on a low-budget with respect for the decision-making of the group members. (Note: a more detailed review of this film is in Art Therapy, Volume 1, No.2, May 1984)

This film includes both the process of making animated films and several final animated films made by three clients in a community mental health center. The film (and the films within the film) focus on the dreams and realities of three men who present their story through interviews, discussions, and their animated films.

Although there is enough information in the above films to interest the viewer in using film animation as a therapeutic technique, the art therapist who has no previous film training would need to learn more about "how to do" film animation prior to beginning to use film animation as a therapeutic technique. The therapist who is considering the use of film animation as a therapeutic technique would need to consider the appropriateness of this technique to individual and group needs. Some questions might be: How does film animation fit into an ongoing art therapy program and an agency's range of treatment services? What are the benefits of film animation to an individual or group? What functioning level is necessary before a client is able to successfully participate in film animation? What are the roles of the group leaders? Is the therapist skilled in both film animation and art therapy or are a therapist and a filmmaker/artist acting as co-leaders?

* * *

There are several films and/or videotapes that focus on therapeutic art experiences or art therapy with specific populations. Some examples are:

This videotape documents an art therapy program in the South Bronx Community Mental Health Center and the work of the art therapist, Vera Zilzer. The videotape demonstrates a range of techniques in working with both individuals alone and in a group setting. (A more detailed review of this videotape is in Art Therapy, Volume 2, Number 2, June 1985)

Creative Art Therapy with Children (3/4" videotape, 8 minutes, 1984). Produced by Kim Pawley and available from her c/o 80 Berkeley Street, Rochester, NY 14607.

This videotape presents an overview of art therapy with children and is a good example of a brief and succinct introduction to the range of art therapy services in a specific agency. This videotape was awarded a Certificate of Merit (Amateur Category) at the 1984 AATA Film Festival.

Creative Growth (16mm film, color/sound, 25 minutes, 1978). Produced and distributed by James Stanfield Film Associates, Santa Monica, CA 90406 (213) 395-7466.

This film documents a community-based art program for developmentally disabled adults in which many "people can't express themselves in words, but they can do it with their paints." The strength of this film is the documentation of both the studio experiences and art work of participants in the Creative Growth center. This film provides the information for a good discussion about the art in art therapy, the therapy in art therapy, therapeutic art experiences, art therapy, and the making of art.

Lonny: A Case Study in Clinical Art Therapy (3/4" videotape, 30 minutes, 1984). Produced by Jane Schulman and available from her c/o 942 Embury Street, Pacific, Palisades, CA 90272.

This videotape tells the story of Lonny, a six-year old emotionally disturbed boy, and his treatment through art psychotherapy. This case study is recreated by combining slides of the child's art work and a soundtrack of the client-therapist dialogue and therapist's narration. This videotape was awarded a Certificate of Merit (Student Category) at the 1984 AATA Film Festival.

The Shape of a Leaf (16mm film, color/sound, 29 minutes, 1967). Produced by Campbell Films and available from The National Committee*Arts with the Handicapped, John F. Kennedy Center, Education Office, Washington, D.C. 20566 (202) 332-6960.

This film documents an art and educational program for mentally retarded/developmentally delayed children at the Perkins School. The children are encour-
aged by the art teacher (Mary Perkins) to relate their academic work to their art experiences in painting, stitchery, weaving, batiking, ceramics, mask-making, and puppetry. The theme of the "shape of a leaf" is basic to all of the art experiences. Although this film focuses on art and learning experiences in a self-contained special education residential program and was made eight years before Public Law 94-142 was passed, many of the ideas will be useful to current teachers, art educators, and art therapists working in a studio based program in a school setting.

We'll Show You What We're Gonna Do (16mm, black/white, 28 minutes, 1974). Produced by Judith Rubin and available from Western Psychiatric Institute, 3811 O'Hara Street, Pittsburgh, PA 15213. (412) 624-2378.

This film documents an exploratory art program with 18 blind, partially sighted and multiply-handicapped children from ages 4-14. Each child demonstrates his/her individual rhythms, styles, media preferences, and strengths and needs. The narration summarizes some of the basic principles of an initial program for handicapped children and the importance of adult helpers observing behaviors carefully with respect in order to learn what each child is "gonna do." Many of the ideas in this film have been documented in subsequent articles and books and this information will complement and update the overview presented in this film. The soundtrack is especially notable because it was made by the well-known jazz musician Eric Kloss who, as a child, had attended the school for the blind.

* * *

Finally there are films and videotapes that may be seen as "Art Therapy" productions within the broadest definition of art therapy or related to art therapy because they provide models for artists with disabilities. One of the strong messages from the 1977 White House Conference on the Handicapped was that the word therapy should not be applied to everything a person does simply because the person has a handicapping condition. The artist who is handicapped is an artist and art is a vocation, not a therapy. Dally (1984) suggests that art cannot be therapy without a therapist. All of the preceding films and videotapes involved a therapeutic relationship between client and therapist. The following films document the artistic work of people who are artists. Some began their art experiences as part of therapy after a disabling accident. All are now practicing artists.

Could You? (16mm, color/sound, 28 minutes, 1976). Produced and distributed by the International Association of Handicapped Artists, Inc. in the U.S.A. by the Association of Handicapped Artists, Inc. 503 Brisbane Building, Buffalo, NY 14203 (716) 842-1010.

This film features several international artists at work in their home or studio. All of the artists work without the use of their hands or arms and their paintings, drawings, and sculptures are completed by the skillful use of a brush or tool held between the teeth or toes.

This film is about the artist Mark Hicks who is without nerve or muscle function below the neck. He demonstrates his artistic skill and techniques and discusses his images, his life, and others' perceptions of him. This film was an Academy Award winner for Documentary, Short Subjects, in 1977.

With Eyes Wide Open (16mm film, color/sound, 58 minutes, 1983). Produced by Laurence Becker and Ron Zimmerman and available from Creative Learning Environments, 507 Park Boulevard, Austin, TX 78751 (512) 454-4489.

This film documents the life and art of the Scottish artist Richard Wawro, who has made over 3,000 pictures since he first began to draw as a child. Although Richard began drawing before he was four, he didn't speak out loud until he was 11 and was initially diagnosed as deaf, autistic, and retarded. The strength of this film is that it provides this artist with a broader forum. The overall impact of this film would have been stronger if the film had been edited to focus more on the documentary footage of Richard Wawro and his family and less on the people who were involved in the making of the film. (Note: a more detailed review of this film is in Art Therapy, Volume 2, Number 1, March 1985).

* * *

The above films and videotapes represent thousands of hours of filming and editing and present different views of art therapy for educational and informational purposes.

Young Peoples' Portfolio
This issue offers a gallery of work by young people in art therapy.

"Hawaiian Sunset" by a 12 year old hemiplegic girl

Untitled work by a 15 year old girl with mental retardation and psychological problems. Motivation was a drawing of the therapist, leading to a drawing of herself.

Untitled work by a 10 year old boy with Down's Syndrome

Untitled work by a 12 year old boy with a learning disability and behavioral disorder.
"Me" by an 8 year old mentally retarded boy

"Self Portrait" by a 13 year old girl with a hearing impairment

Untitled work by a 10 year old boy, abused, and with an emotional disorder
This column provides a forum for information exchange among clinicians and educators. Items relevant to research and to programmatic, historical, or clinical developments may be submitted. Contributions should be sent to Brief Communications, ART THERAPY AATA, 1980 Isaac Newton Square South, Reston, VA 22090.

Call for Manuscripts
Dr. Shawn McNiff, ATR, and Dr. Gary Barlow, ATR, Editor, are planning an issue of Art Therapy focusing on multi-cultural issues and the sharing of international concerns in art therapy. People working in the cross-cultural modalities are invited to send manuscripts, or to submit special features or photographs. For more information, write to the Editor, or to Dr. McNiff, Dean of the Arts Institute, Lesley College, Cambridge, MA 02138.

Call for Manuscripts
Do you have photographs (black and white, glossy) that you would like to submit for review and possible publication in Art Therapy? Also, why not send in that 'perfect' color photo that might be a good cover of the journal? You are invited to submit them for consideration. Simply identify on the back with your name, title, and other pertinent information and mail to the AATA Office. If the work is from a patient or client, a release form must be signed and on file.

ENJOY REDUCED RATE!

SUBSCRIBE NOW—AND SAVE 50% OR MORE! The Arts in Psychotherapy is a quarterly journal in its 13th successful year of serving practitioners, scholars and students of the arts in psychotherapy, mental health and education. It publishes refereed articles (including illustrations) by art, dance/movement, music, poetry, and drama psychotherapists and by psychiatrists and psychologists which reflect advances in theory, research and practice. There are no restrictions on philosophical orientation or application.

AN IMPORTANT SOURCE for news and summaries of national and international conferences and current educational information relevant to the creative arts in therapy. THE ARTS IN PSYCHOTHERAPY contains book reviews, welcomes letters to the editors, dialogue among contributors: has International Editorial and Advisory Boards of highly respected specialists who represent a wide spectrum of experience. It appeals to scholars and practitioners of the arts in psychotherapy and to psychiatrists and psychologists.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treat-
ment of people. The journal provides a scholarly for-
um for divergent points of view on art therapy and strives to present a broad spectrum of ideas in ther-
apy, practice, and research. An emphasis will be placed on the visual arts but articles in related disci-
plines that have relevance to art therapists will also be
published.

BEST COPY AVAILABLE
In the fall of 1985, two major professional conferences were held that served to bring together art therapists and creative arts therapists, to enlighten them about professional concerns and to promote positive social interaction. The first of these—The American Art Therapy Association Annual Conference—was held in New Orleans, Louisiana, in October. The second—The National Coalition of Arts Therapy Associations (NCATA)—occurred in November in New York City.

Each of these conferences was well attended, sparked much professional dialogue, and identified issues and concerns. Each served to bring our professional status to the forefront of human services/health related professions. In this issue of Art Therapy the reader will find a comprehensive overview of the American Art Therapy Association Conference. For those readers who wish to obtain more specific information about a paper, workshop, open forum, panel, pre- and post-conference course, or any of the other highlights of the conference, he/she may write directly to the presenter (an address is given in each category to help direct the correspondence to the appropriate person). The A.A.T.A. Conference Committees are listed elsewhere in this issue. Many people should be thanked for a highly successful Conference: the Conference and Program Chairpersons; the Program Committee members and consultants; the Arrangements Committee Chairperson and committee members; the presenters, exhibitors, "behind-the-scene workers," and everyone who devoted long and hard hours for the profession.

Although a comprehensive listing of the NCATA Conference is not printed in this issue, the program ("Creative Arts Therapies: Interaction/Interplay") was filled with insightful papers, panel presentations, forums and special events. Dr. Kenneth L. Bruscia, Conference Chairperson, and the many committees are to be congratulated for presenting the first NCATA Conference, and one that was highly successful and popular. The new NCATA Chair is David Read Johnson, PhD, RDT, Department of Psychiatry, Yale University, New Haven, CT 06520. I am certain that he would enjoy hearing from members of A.A.T.A. relative to our future professional relationships with NCATA.

In this issue Margaret L. Smart's article, "Expanded Work Settings for Art Therapy," illustrates the need for the art therapist to explore alternate job possibilities (i.e., varied and unique settings) as well as to continue with our more "traditional" settings. She implores the reader to broaden definitions of the uses of art therapy and the settings "in which it might profitably be practiced."

Judith A. Rubin's article, "From Psychopathology to Psychotherapy Through Art Expression: A Focus on Hans Prinzhorn and Others," is an important one for its historical relevance, with particular focus on one of our major predecessors ("...though he cannot be called the Grandfather of Art Therapy, Prinzhorn probably functioned as kind of Uncle, almost as important as his fellow Viennese, Sigmund Freud.") as well as other people who contributed to our professional development, growth and understanding of art and mental illness and mental health.

Frances E. Anderson and Doris B. Arrington offer a timely—and welcome—article on grant writing, "Grants—Demystifying the Mystique and Creating Job Connections." Included are some key pointers for the person intending to write a grant (establishing goals and objectives, writing a capability statement, detailed program description, etc.) and the authors have inserted humorous aspects into what is often considered a "dry" topic.

As a follow-up to the most recent A.A.T.A. Conference (Louisiana), Chris Costner Sizemore was invited to submit a statement that could be published in Art Therapy. With references to her keynote address, Mrs. Sizemore not only supplied photographs, newspaper clippings and an audiotape (on which most of her comments in the article are based), but we have had numerous telephone conversations as well. During the preliminary and continued work relative to this article, it has been my pleasure to be associated with this kind and gracious lady. She is currently at work on a collection of artwork and poetry, titled The Attic Child, as well as a follow-up book to I'm Eve, recording the richness of life she has experienced since becoming one integrated personality and offering advice and insight that only someone who has emerged from mental illness could. To illustrate her positive outlook, Mrs. Sizemore emphasizes the importance of good psychiatric treatment, family support, a personal desire to be well, and faith in God, in a total view of her road to recovery.

One reminder: don't forget to select those photographs that might be appropriate for publication in Art Therapy. Black and white glossy photos are considered for publication, and color prints are considered for the cover. Clearance statements must be submitted with the photograph, and documentation should be included. Why not take time right now to gather together some photographs that you have been intending to submit?

AATA Conference Overview

The 16th annual Conference of the American Art Therapy Association was held in New Orleans, Louisiana, from October 24-27, 1985. The Conference and committee chairpersons and the presenters and participants are to be congratulated for their involvement and support in making the New Orleans Conference a highly successful one.

Beginning here and continuing on the following pages is a listing of the presenters with a brief overview of the presentations, workshops, papers, pre- and post-conference courses and other highlights of the Conference. Following the presenters' names is an address of the primary presenter, or the address of the first person listed in the event that more than one presenter is listed for a session. In lieu of the AATA Proceedings, this information is offered so that readers may communicate directly with the presenter(s) for any additional information desired. This listing is printed as it appeared in the Conference program and, therefore, has not been edited for this journal.

March 1986, ART THERAPY 3
PRE- AND POST-CONFERENCE COURSES

The Association is again pleased to offer special courses of study prior to and following the Conference. The courses include didactic/experiential instruction at the graduate level, and are taught by art therapy educators. There is a fee for each course, which covers the instructor’s honorarium, equipment/supplies and administrative costs. Each course is available for one college credit at an advanced undergraduate or graduate level from the University of Illinois through the office of Continuing Education.

PRE-CONFERENCE COURSES

I. Phenomenology: A New Approach to Art Therapy
Malia Belensky, PhD, ATR, 7037 31st St. NW, Washington, DC 20015
Theoretically based on philosophical phenomenology and applied to art therapy, this approach synthesizes phenomenological concepts of consciousness, intentionality, and meaning with relevant elements of psychology of art, principles of Gestalt psychology of art, and some concepts from clinical psychology. This is followed by the phenomenological method of art therapy, carefully tested over a span of fifteen years in practice, supervision, and teaching. Workshops, demonstrations, displays, role-playing, and hand-outs. Open to art therapists and graduate art therapy students only.

II. Mandala and Art Therapy
Phyllis Frame, MA, ATR, Educator, Piedmont College; Consultant, Private Practice, Demorest, GA 30535
This is a workshop to deepen understanding of the mandala as a powerful diagnostic and therapeutic tool in art therapy. It will be particularly valuable for the art therapist interested in the meaning of archetypal imagery in clients' work and will include an introduction to Joan Kellogg’s theory of color and the archetypal stages found in the great round of the mandala. The workshop includes illustrative slides and a mandala art experience.

III. Theory and Practice of Verbal and Non-Verbal Responses to Clients and Their Art Work
Mildred Lachman-Chapin, MEd, ATR, Assistant Professor of Art Therapy, Graduate Art Therapy Program, Vermont College of Norwich University, Montpelier, VT 05602
This course for experienced clinicians will examine clients’ needs for closeness and distancing and the kinds of responses the art therapist can make in words, body language, and art. Attention is given to levels of clients’ needs. Appropriate therapist reaction to these needs in terms of works and/or art is examined. Attendees will study their uses of language and art work as ways to diminish or accentuate the psychic distance between clients and themselves. Theoretical material will include Winnicott, Kohut, Erickson, and Carini. Case materials will be presented. Attendees will participate in workshop explorations. Open to practicing, trained art therapists only.

IV. Imagery in Biofeedback and Art Therapy
Roberta Shoemaker, MFA, ATR, Associate Professor, Art Therapy, Emporia State College, Peter Parks, MS, Emporia, KS 66801
This course is designed to explore the healing potential of imagery through a presentation of the latest research in the field of biofeedback, the companion neurological observations of how and why biofeedback works, and a presentation of a surprisingly parallel conceptualization of the neurological observation of how and why art therapy works effectively as a healing process. Experiential biofeedback-assisted relaxation, guided imagery sessions, and discussion will then be incorporated into therapeutic art activities with a parallel discussion. The goal of this course is to assist clinical art therapists in broadening and reinforcing their skills in using imagery within the framework of wholistic growth. This will be done via the presentation of the Evolutionary Developmental Continuum (a neurological conceptualization for pre-verbal therapies) and through the presentation of established biofeedback experiences utilizing imagery and a synthesis and comparison of the valuable aspects of these approaches.

V. The Diagnostic Drawing Series: Its Use in Clinical Practice
Barry M. Cohen, MA, ATR, Director of Expressive Therapies, The Mount Vernon Hospital, 855 Richmond Hwy. #302, Alexandria, VA 22309
Adrienne Kwapien, MA, Art Therapist, Fairfax Hospital
Anne Mills, Art Therapist, Fairfax Hospital
Maryellen Smolenski, ATR, Art Psychotherapist, St. Elizabeth Medical Center
The Diagnostic Drawing Series (DDS), winner of the 1989 AATA Research Assistance Grant, is presented as a tool for use in the clinical setting in a lecture and workshop format. The series, designed for use in a psychiatric setting, is also utilized as a training tool for art therapy interns. Pre-registrants will be sent the DDS protocol in advance and are invited to bring a single series for group discussion. This course is designed with both the student and practicing professional in mind.

(Note: This is a half-day course and is offered twice: VI-A 8:30 a.m.-12:30 p.m. and VI-B 1:30 p.m.-5:30 p.m.)

POST-CONFERENCE COURSES

VI. Art as Therapy in Mid-Life: Changing Images of Women
Sally Brucker, MA, ATR, Art Therapist, St. Elizabeth’s Hospital, Washington, DC 20037
Jane Gilbert, ATR
Presentation of theoretical and case material will lead to an understanding of salient clinical issues regarding mid-life women seeking treatment. Depression in mid-life will be addressed. Art therapy techniques will be explored as a means of drawing upon resources and working on issues related to emotional and physical changes as well as cultural biases.

VII. Problem Oriented Art Therapy
Abby Callisch, MS, ATR, Professor of Art Therapy, School of the Art Institute of Chicago, Chicago, IL 60603
Therapy, School of the Art Institute of Chicago
This course will teach the participants the structure, application, and principles of short-term, task-centered art therapy. The process will be elucidated through both experiential participa-
tion and didactic supplementation and exploration. After choosing the problem, each member will follow the step-by-step exploration through the combined use of individual art-work and the verbal feedback from other participants.

VIII. New Dimensions of Interpreting Archetypes Complexes, and Symbolic Imagery in Creative Art Therapy
Joseph Garai, PhD, ATR, Professor Emeritus, Pratt Institute, Brooklyn, NY 11205
Jungian archetypes, including animus/animus, birth/rebirth, fool/wise man, nurturant mother/evil witch, stem from the collective unconscious. Through experiential exercises students learn to interpret dreams, fantasies, and art work as revelations of intrapsychic and interpersonal conflicts, and as a means to achieve authenticity, autonomy, individuation, and self-actualization.

IX. Helping Children Master Stress Through Art Therapy
Evadne McNeil, PhD, ATR, 646 Park Blvd., Glen Ellyn, IL 60137
Through lecture, slides, and case histories, course participants will learn to identify the stresses attendant to traumatic events in children's lives. Art therapy interventions will be designed in relationship to a child's chronological and developmental needs, to the event, and to the context.

SPECIAL MEETINGS AND EVENTS

Opening Reception
Come and meet your fellow Conference attendees and the Conference exhibitors at a special opening reception sponsored by AATA. The exhibit hall will be open for a special preview during the reception and a cash bar with complimentary hors d'oeuvres will be available to all Conference attendees. Attendance is free.

Walking Tour Royal Street Art Galleries
Join your colleagues for a guided walking tour through the many and varied art galleries located on Royal Street in the French Quarter of New Orleans. The tour will begin at the hotel and end in the French Quarter. After the tour, plan to spend some time experiencing the French Quarter nightlife or take a short taxi ride back to the hotel. The walking tour is free.

Keynote Luncheon “Seven Artists in One Body”
Chris Coster Sizemore
Chris Sizemore’s keynote address will be open to all Conference attendees and a buffet luncheon will be available to those wishing to take advantage of it. Buffet luncheon tickets can be purchased for $15.00. Combine your special keynote experience with an authentic New Orleans-style luncheon for a real treat.

“A Special Time with Christine Sizemore”
Reception/Art Exhibit
Take advantage of this special time to meet Christine Sizemore, have her autograph her books, and view her art work. Cash bar and complimentary hors d’oeuvres will be available for all Conference attendees. Come and greet our special guest at this reception to be held in her honor.

“Meet the Ole Timers” Conversation and Reception
Come and spend some time with the founders and honorary life members of AATA who have made art therapy history. This special reception, planned with students in mind, is open to all who wish to meet those who have built our profession. Cash bar and complimentary hors d’oeuvres will be available for all Conference attendees.

New Orleans Museum of Art
Private Tour and Reception
Join your fellow Conference attendees for a private tour and reception in New Orleans’ only fine art museum. Cocktails and hors d’oeuvres will be served throughout the reception and the entire museum will be open especially for AATA Conference attendees. Shuttle buses will run from the hotel to the museum and back throughout the entire two-hour reception to allow attendance at all Saturday evening functions, both inside the hotel and out. Tickets for the tour and reception are $12.00 and include a free round trip shuttle bus ride.

Masquerade Ball
Celebrate art therapy in New Orleans at the Annual Masquerade Ball, New Orleans style! A Dixieland band, New Orleans special cocktails, and tempting snacks are on tap and, when combined with the creative costumes of the attendees, will result in a festive, unforgettable evening for all. Masquerade Ball tickets are $10.00. Make your reservations and plan for a rousing final Conference evening.

“Fireside Chat” with Executive Board

Annual Business Meeting

Student Mini-Conference

Alumni Gatherings

Closing Luncheon
The 16th Annual Conference will close with a special screening of the Second Annual Film Festival winning entry, presentation of awards, and installation of 1985-86 AATA officers. The festivities are open to all Conference attendees and a buffet brunch will be available to all those who wish to partake of the delicious New Orleans-style cuisine—for the last time during their current visit! Brunch tickets will be $15.00. Join your colleagues for one “last hurray!”

Riverboat Cruise
For those who wish to spend their final afternoon in New Orleans on a unique sightseeing trip, a special cruise on the Mississippi River has been arranged. The cruise tickets include a round-trip shuttle between the hotel and the boat dock and a two-hour riverboat cruise. Come and view the city of New Orleans from a quite different vantage point. Cruise tickets are $8.00.
EXHIBITS

OPEN STUDIO

For those who wish to indulge their creative needs during the Conference, an Open Studio is again available to delegates on Thursday and Friday, 10:00 a.m.–5:00 p.m. and Saturday, 10:00 a.m.–7:00 p.m. in the Rosedown Room. The Open Studio will be well-stocked with basic art supplies/materials and facilitated by art therapists. Don’t forget, this is a good opportunity to create your special mask for the Masquerade Ball!

EXHIBITS

As part of efforts to expand educational opportunities available to delegates during AATA’s Annual Conference, coordinators have designed an Exhibit Area that includes the latest in professional resources, brochures, and educational information. The Exhibit Area is located in the French Market. Please take advantage of this excellent opportunity to learn more about the tools, processes, and products of your profession!

16th Annual AATA Conference Exhibitors

AATA Placement Office
Anti Coloring Book Corporation
CRDL Incorproated
Davis Publications
Evan Publishing
George Washington University
Hahnemann University
Institute for Expressive Analysis
Lesley College
Maginns and Associates

University of Illinois at Chicago
University of New Mexico
Vermont College of Norwich University
Wright State University

“SEVEN ARTISTS IN ONE BODY”

An exhibit of artwork done by Keynote Speaker Christine Sizemore (“The Three Faces of Eve”) will be on display in Ballroom C throughout the Conference. Stop by, view the exhibit, and Chris’ Keynote Address will hold more meaning.

“THE ART OF THE ALCOHOLIC”

In this display, approximately 50 works of art will be presented. The work exhibited was completed in two art therapy programs of inpatient treatment programs for alcoholics. The artwork is both skillful and sensitive and shows the inner feelings of the alcoholic, struggling to reach sobriety. This display will show how adult and adolescent alcoholics have worked through the recovery process to deal with: (1) feelings of denial, loss, and unmanageability; (2) treatment and positive future goals; (3) issues of forgiveness, anger, guilt, low self-esteem, resentments, self-pity, and self-centeredness; and (4) the final stage of the progression, “HOPE.”

SECOND ANNUAL FILM FESTIVAL

AATA proudly presents its Second Annual Film Festival this year in conjunction with the 16th Annual Conference. Festival films in the professional, amateur, and student categories will be screened and reviewed throughout the Conference. Please consult the program schedule for screening times. (For last minute changes and information on entrants, please see the Film Festival display outside the Royale Room.) Special showings of the winning entries from the First Annual Film Festival are also scheduled throughout the Conference. The films and videos entered in the Festival are:

“Art As Language” Rawley A. Silver, EdD, HLM, ATR, Producer
“Art Therapy with Children with Cancer” Audio-Visual Department, Memorial Medical Center, Producer; Sandy Gurewitz, MA
“Art With Elders in Long-Term Care: A Visual Legacy” Mary Ann Merker-Benton, Producer; Mary Lou Coles, MA
“Because It’s There” Frank Muriel and David P. Wohl, Producers; Susan LaMantia O’Connor, ATR
“Draw Me A Picture” Jill Gray and Janise Finn, Producers
“Expressions” Richard Wieske, Producer
“Grandma’s Bottle Village” Allie Light and Irving Saraf, Producers, Light-Saraf Films
“Hundred and Two Mature” Allie Light and Irving Saraf, Producers, Light-Saraf Films
“Joey: Expressions of Loss” Ann Dillhoefer Bussard, Producer
“Kaleidoscopic Meditation” Cheryl Finn, Producer
“Lori: Art Therapy and Self Discovery” Helen Landgarten, MA, HLM, ATR, Executive Producer
“Possum Trot” Allie Light and Irving Saraf, Producers, Light-Saraf Films
“Quilts in Women’s Lives” Pat Ferraro, Producer

Grand Prize Trophy Winner

OPEN FORUMS

Discussion of the Future of Pre- and Post-Conference Courses for AATA
Pat Buoye Allen, MA, ATR, Assistant Professor of Art Therapy, University of Illinois, RO. Box 4348, Chicago, IL 60680
Discussion will center around the results of a survey recently completed regarding the views of art therapy training program directors toward Pre- and Post-Conference Courses. In an effort to move toward greater standardization in the planning and offering of Pre- and Post-Conference Courses, responses will be examined and discussed.

Art Therapy: What Now?
Moderator: Robin F. Goodman, MA, ATR, Art Therapist, Mount Sinai Hospital and New York University, 77 East 12th St. #3B, New York, NY 10003.
Susan Anand, Art Therapist, Consultant, Willow Developmental Center; University of Mississippi Medical Center, Department of Psychiatry.
Nancy Knapp, MA, ATR, Art Psychotherapist and Assistant Behavioral Scientist, Harbor UCLA Medical Center
A presentation by a panel of art therapists who have taken different directions in their art therapy careers will be followed by a discussion of issues in professional development.

Art Therapy Registration (ATR): How To...
Ronald E. Hays, MA, ATR, Chair, Standards Committee, American Art Therapy Association, Hahnamen Medical College, 230 North Broad St., New College Bidg, Philadelphia, PA 19102.
Questions and Answers About the Assembly of Affiliate Societies
Nancy Steinberg, MA, ATR, Speaker, Assembly of Affiliate Societies, American Art Therapy Association, Inc., 306 Park Ridge Circle, Marietta, GA 30067.
Non-Affiliate and Affiliate Societies alike are invited to this informal gathering. The value, purpose, and importance of having an Assembly of Affiliate Societies will be discussed. Information on affiliation procedures (application) will be available.

Group Assessment Tools
Alan J. Miller, MA, Psychiatric Institute of Houston, West Oaks Hospital, 6500 Hornwood, Houston, TX 77074

Sun Wheel: Color and Healing
Paula Englehorn, MA, ATR, MFCC, Educator/Practitioner, Eagle Rock Trail Art Therapy Institute, 2885, Santa Rosa, CA 95405
Lillian Rhinehart, MA, ATR, Educator/Practitioner, Eagle Rock Trail Art Therapy Institute
This is the first part of a two-part presentation. Part 2 will be presented during the Saturday Open Forum session from 7:30 a.m. to 8:45 a.m.

Writing for Publication in Art Therapy
Gary C. Barlow, EdD, ATR, Editor, Art Therapy: Journal of the American Therapy Association, 228 Creative Arts Center, Wright State University, Dayton, OH 45435
Harriet Wadeson, PhD, ATR, Chair, Publications Committee, American Art Therapy Association, Inc.
Writing for publication in art therapy will focus on the AATA journal, Art Therapy, and other publications. Presenters will discuss selection of topics, preparing manuscripts, and steps prior to submitting an article. Requirements for the journal will be discussed. Questions/answers will be included and sharing of ideas for publications encouraged.

Art Therapy in a Large Urban School System: Strategies for Implementation
Chairpersons:
Janet Bush, MCAT, Coordinator, Art Therapy Program, Dade County Public Schools, 1450 NE 2nd Ave, Rm. 929, Miami, FL 33132
Patricia Iasi, MED, ATR, Art Therapist, Day Treatment Program, Bertha Abes Children Center
Panelists:
Audrey Elkinson, Art Therapist, Dade County Public Schools
Enid Garber, Art Therapist, Dade County Public Schools
Maryann Hamilton, Art Therapist, Dade County Public Schools
Susan Webb, Art Therapist, Dade County Public Schools

This presentation will concentrate on art therapy as a current approach to the education and treatment of emotionally handicapped and severely emotionally disturbed students. The Dade County Public Schools, Miami, Florida, which has embarked on this educational frontier, believes that the gains to be realized from art therapy services are considerable.

Art Therapy with the Disabled: Clarifying Roles in Multiple Settings
Carole Kunkle-Miller, PhD, ATR, Art Therapist/Coordinator, Western Pennsylvania School for
the Deaf, Carlow College, 3117 Dobson St.,
Pittsburgh, PA 15219
Virginia Minar, ATR, Art and Exceptional Education Teacher/Therapist, School District of West Allis/West Milwaukee
John DeFrancisco, ATR, Art Therapist
The changing roles of art therapists working with individuals with disabilities in educational and therapeutic settings will be examined. This open forum will allow time for discussion of common problems and collective brainstorming of solutions. Time will be allotted for networking by art therapists working within specific settings.

Introducing the ‘Getting to Know You’ Book
Dorothy Webman, 1820 Comm Avenue,
Brighton, MA 02135

Open Forum on Undergraduate Programs Preparing Students for Graduate Art Therapy Studies
Geraldine H. Williams, ATR, Art Therapy Program, College of Fine Arts, Ohio University, Athens, OH 45701

Art Therapy Research: How to...
Janie Rhine, PhD, ATR, HLM, Chair, Research Committee, American Art Therapy Association, Inc., 1031 E. College St., Iowa City, IA 52240

How to Answer a Call for Papers
Dee Spring, MA, ATR, MFCC, 1985 Program Chair, Conference Committee, American Art Therapy Association, Inc., 361 Arapaho St., Ventura, CA 93001
Pat Buoye Allen, MA, ATR, 1984 Program Chair, Conference Committee, American Art Therapy Association, Inc.

Art Therapy in Employee Assistance Programs
Dianne Meixner, MA, ATR, P.O. Box 8153,
Minneapolis, MN 55408

GENERAL SESSIONS

Opening Address
“Welcome to the 16th Annual Conference”
Gladys Agell, MA, ATR, President, American Art Therapy Association, Inc.

KEYNOTE LUNCHEON

Seven Artists in One Body

Chris Sizemore

The 1985 American Art Therapy Association Conference is proud to present Christine Sizemore, “The Three Faces of Eve,” and her original art work for the Keynote Address.

Art therapists work with varied populations, but seldom, if ever, encounter a multiple personality. The artwork and story of Christine Sizemore is unique and has been described as both primitive and classic, fantasy and realism. Chris, like other multiples, had several artists who resided in one body, each exhibiting a particular style, theme, content, form, and composition in the art work produced.

Chris Sizemore is not only “a legend of psychiatric phenomenon” as described by the Poston Times, but a gifted artist who produced works of art which will not only enlighten art therapists about the once thought to be “rare” dissociative disorder, but also teach the art therapist about the seven artists who created with the same hands. Her mystifying experience included a collection of artists who respected each other and would not touch each other’s work, although personalities fought for recognition and attention within one body and wanted to “outdo” each other. Although the artists competed with each other, they had a special respect for each other's work. Her paintings are done by artists who knew not how to paint, but created as a defense against the oblivion of insanity.

PAPERS

Art Therapy and Disability: Do We Need Special Competencies to Be Effective?
Carol Kunkel-Miller, PhD, ATR, Art Therapist/Coordinator, Western Pennsylvania School for the Deaf, Carlow College, 3117 Dobson St., Pittsburgh, PA 15219

The development and results of a national survey conducted with 300 art therapists practicing with individuals with disabilities will be described. In this study, a list of special competencies generated from the literature, art therapy experts and field tested by practitioners will be identified. Implications for future training of these specialists will be discussed.

Functional Art Therapy and Developmentally Disabled Adults: Self-Concept and Behavior
Connie Livingston-Dunn, MA, ATR, Activity Therapist III, Dixon Developmental Center; Director, Art Therapy Clinical Program, Mount Mary College, 107 E. Oregon St., Polo, IL 61064

An overview of functional art therapy is presented and applied to development of self-concept with developmentally disabled adults with severe behavioral problems. Physical and/or mental handicaps contribute to the development of a poor self-concept which may be manifested in behavioral problems that preclude placement from institutions to less restrictive environments.

Fusion of Symbols, Confusion of Boundaries: Perception in Alzheimer’s Disease Patients
Judith Wald, MA, ATR, Art Therapist, Activity Therapy Supervisor, Burke Rehabilitation Center, 188 Lakeview Ave., Apt. J4, New Canaan, CT 06840

The art work of patients in an advanced stage of Alzheimer’s disease is related to neurological and psychological theories of memory and perception. Fused symbols and boundary confusion are examined in terms of Rorschach, Freudian, and Ego psychologies, discussing the unconscious processes revealed by the physical and emotional regression.
Child Abuse: A Longitudinal Study of Change in Abusive Families

Judi Levy-Monelias, MA, Art Therapist, Department of Children's Services, Los Angeles County; Art Therapist, Family Counseling Agency of West San Gabriel Valley, 6000 Canterbury Dr., #D316, Culver City, CA 90230

This study is based on the psychological and emotional impact of child abuse. It is psychodynamic/psychosocial in its approach and is presented in three parts. Four families were asked to do drawings related to categories of 1) discipline, 2) anger, and 3) love. The directives were duplicated from a previous study done one year earlier with the same families. The drawings depict various changes (i.e., positive, negative, none at all) in abusive families.

Thou Shalt Not Be Aware: Alice Miller's Ideas Applied to Art Therapy

JoEl M. Vogt, MA, Art Therapist/Staff Therapist, Matrix, 4627 W. 62, Fairway, KS 66205

This overview of Alice Miller's ideas is based on her books and applied to the art therapy program at Matrix, a long-term outpatient mental health facility where clients work through early childhood developmental stages and memories which often include images of abuse, neglect and abandonment. Slides of artwork are included.

Comparative Group Art Therapy Research

Marcia L. Rosal, PhD, ATR, Research Scholar, University of Queensland, 412 Allegheny Ave., Pittsburgh, PA 15239

This paper focuses on group art therapy outcome research comparing two forms of art therapy. Each form of art therapy will be thoroughly outlined and illustrated. Similarities and differences of the two art therapy groups will be discussed in terms of the two outcome measures evaluating the efficacy of the group art therapy interventions.

A Jungian Study of Selected Visual Constructs by Mainstream Community-Minded Women

Doris Arrington, MA, ATR, NCC, Director, Master in Art Therapy Program, College of Notre Dame, 30 Knollcrest, Hillsborough, CA 94010

The presentation will focus on the Visual Preference Test (VPT) researched spring 1985 seeking to measure selected visual constructs (graphic signs and symbols) based on Jungian archetypal symbols of Feminine, Masculine, Self, and Transformation. Participants will have an opportunity to take the VPT and the Bem Inventory and to correlate their results with previous research.

The Use of Personal Construct Drawings as an Art Therapeutic Outcome Measure

Marcia L. Rosal, PhD, ATR, Research Scholar, University of Queensland, 412 Allegheny Ave., Pittsburgh, PA 15239

This paper will focus on uses of personal con-

struct drawings as an evaluative tool in art therapy practice and research. This information is based on research using a personal construct activity with behavior disordered students involved in an art therapy intervention. The discussion of the paper will be on the adaptability of the instrument and its use in the evaluation of art therapy treatment programs and research.

Body Image Therapy: The Art of Change with Eating Disorder Patients

Mari M. Fleming, MA, MFCC, ATR, Art Therapist, Consultant, Marshall Hale Hospital; Assistant Professor, California State University, George Washington University, 1431 Glendale Ave., Berkeley, CA 94708

Body Image Therapy is a major treatment component of the eating disorder unit in this inpatient setting. Art, movement, and imagery are used to explore distortions in body image, sources in individual and family dynamics and cultural influences. Art messages convey the individual's reality; the art process allows exploration of new possibilities.

The Use of Art Psychotherapy in the Treatment of Anorexia Nervosa

Renée Kreisher, MS, Coordinator/Therapist, Partial Hospitalization Program, North Penn Mental Health/Mental Retardation, 502 Ruah St., Bloomsburg, PA 17812

Anorexia nervosa has become a type of epidemic that is sweeping the country. It is an extremely complex psychosomatic illness that has often been resistant to the more traditional forms of treatment. It is felt that the use of art therapy can provide these individuals with a sense of control and a realistic projection of their body image, allowing them to develop more constructive coping strategies.

Communication and Self-Expression Through Creative Arts Experience: Art, Music, Movement

Elizabeth Spear Rogers, MA, ATR, Art Therapist, Coordinator, Matter-At-Hand, Albright-Knox Art Gallery, 1256 Colvin Blvd., Kenmore, NY 14223

Charlotte L. Lee, MA, Recreation Therapist, People, Inc.

This presentation documents the collaborative efforts of two art therapists working in an art gallery and a day treatment center for the adult developmentally disabled. Program goals addressed two areas of personal development: awareness of self and awareness of others. Art, music, and movement experiences will be illustrated by videotape.

Art Therapy with the Learning Disabled: Self-Esteem, Sublimation, or Insight

Laurie Wilson, PhD, ATR, Art Therapist, Art Therapy Educator, New York University, 521 Hartford Rd., South Orange, NJ 07079

Art therapy with the learning disabled is usually performed in either educational or mental health settings. Pressures for work focusing on re-
habilitation compete with the need to address emotional and psychological issues. Case material and clinical observations will deal with issues of appropriate goals and modes of treatment.

Damsels, Dragons, and Rusty Armor: The Borderline Pilgrimage Through Art
Bruce L. Moon, MA, MDiv, ATR, Art Psychotherapist, Supervisor, Activity Program, Harding Hospital, 1697 Bunty Station Rd., Delaware, OH 43015
This paper explores the metaphoric journey of adolescent borderline personality patients as they participate in intensive group art psychotherapy in the milieu at the Harding Hospital. Emphasis is placed on three areas: 1) theory of borderline personality development, 2) treatment methodology, and 3) recurring metaphoric themes of the borderline struggle.

Which Way to Success in Art Therapy?
Aina O. Nucho, PhD, ATR, ACSW, Associate Professor, University of Maryland, 2124 Cedar Circle Dr., Baltimore, MD 21228
Two types of obstacles to forming a successful therapeutic alliance with adults who have no art background are discussed: a) obstacles arising within the client and b) obstacles that arise within the therapist. Specific strategies for circumventing both types of obstacles are suggested and illustrated with drawings made by art therapists.

The Death of a Parent: A Child’s View
Audrey Di Marla, MA, ATR, Adjunct Assistant Professor, Graduate Training Program in Art Therapy, George Washington University; Art Therapist, North Community Mental Health Center, 1711 Mass. Ave. N.W., Washington, DC 20036
Losing a parent is difficult at any age. For a child—whose degree of dependency is great and whose understanding of death is small—the loss can be traumatic. This presentation illustrates how, through art therapy, children at three different stages of development (ages 6, 8, and 10) addressed the death of their parents.

Family Art Therapy With the Deaf
Ellen G. Horovitz, MA, ATR, Art Therapist/Psychotherapist, Hillside Children’s Center, 1183 Monroe Ave., Rochester, NY 14620
This presentation covers an in-depth look at family art therapy spanning one and one half years with two deaf/hearing impaired children placed in Hillside Children’s Center’s Residential Treatment Facility for deaf children. This treatment center is the only one of its kind in New York State and is a joint venture between both Rochester School for the Deaf (RSD) (the educational component) and Hillside Children’s Center (HCC) (the clinical component). This paper purports the efficacy of coupling family art therapy with individual and group art therapy to expedite mental health recovery in these youngsters.

Level of Ego Development as Reflected in Patients’ Drawings
Frances Fisher Kaplan, MPS, ATR, Supervisor, Creative Art Therapies, Carrier Foundation, 20 Exeter St., Morris Plains, NJ 07950
This paper presents the results of a research project investigating the relationship between level of ego development and degree of sophistication of family drawings. Some attention is given to related research, as well as to the possible implications for drawing analysis and for the practice of art therapy.

Children of War: The Use of Art Therapy in Working with Southeast Asian Refugee Children
Ronna McC-Hammond, MPS, Social Worker/Art Therapist, St. Dominic’s Home, 29 Dickinson Ave., Nyack, NY 10960
The presenter will describe the use of art therapy in working with Cambodian and Vietnamese children during their internment in Southeast Asian refugee camps. Slides of children’s artwork will be shown to illustrate the use of the arts in response to war. The presenter strongly recommends the viewing of recent film release, “The Killing Fields,” as prerequisite to this presentation.

Nightmares, Dreams, and Art Therapy In a Vietnam Veterans Group
Irene E. Corbit, MA, ATR, Art Psychotherapist, Private Practice, Center for Creative Resources, 7722 Braesview Lane, Houston, TX 77071
Irene E. Corbit, MA, ATR, Art Psychotherapist, Private Practice, Center for Creative Resources
This presentation explores the nightmares, the dreams, and the art work of Vietnam veterans participating in a hospital dream group. We will discuss how the nature and severity of these nightmares can change as a result of the veterans’ participation in the group.

Commonalities in Symbolic Language: Survivors of Traumatic Events
Moderator: Nana Zissis, OTR, Occupational Therapist, Adult Psychiatric Hospital, University of Michigan Medical Center, Ann Arbor, MI 48109
Dee Spring, MA, ATR, MFCC, Consultant/Therapist/Diplomate, American Institute for Counseling and Psychotherapy; Private Practice; Ventura Health Care Services
Deborah Golub, EdD, ATR, Co-Author
Sexual abuse, war, catastrophic events, violent crime and physical abuse are traumatic events which are characterized by inescapability and uncontrollability. These events create a trauma which has a companion defined as Post Traumatic Stress Disorder (PTSD) with resultant symbolic language. This language is exhibited in a visual dialogue through a unique communication system. The commonalities of this symbolic language, attached to the “Quiet Trauma,” will be explored and discussed in this state of the art presentation.
Covert Messages in Art: The Therapist as Artist
Don Jones, ATR, LM, Director, Adjunct Therapy, Harding Hospital, 490 Mid Drive, Worthington, OH 43085

Society has always been curious about what manner of creature the creative artist is and what makes him or her tick. Plato implies, "an inspired neurotic," Aristotle, "an exquisitely introspective psychologist." An ATR artist-therapist shares a dialogue between himself as "artist" and "therapist" while viewing his art retrospectively.

Two Sides of the Mirror: The Therapeutic Significance of Portraiture
Laura V. Loumeau, MPS, Art Therapist, Mount Sinai Hospital, 79-04 149th St., Apt. 3-I, Flushing, NY 11367
Iris L. Schlossberg, MPS, Art Therapist, Carrier Foundation

The psychological and theoretical aspects of mirror symbolism as well as mirror as a tool for examining the inner self will be explored using the diverse theories of object relations and Jungian psychology. Attention is also given to aesthetic applications of mirror symbolism. Specifically, we will discuss the use of portrait drawing as a means of fostering insight, integration and recognition of one’s authentic self. Participants will view patients’ portraits of each other as well as examples of self-portraits.

The Heart as a Key Symbol in Art Psychotherapy Treatment and Diagnosis
Bernard O. Stone, MFA, ATR, Director, Art Psychotherapy Department, Bethesda Hospital, 445 Walnut Hills Dr., Zanesville, OH 43701

The author's color slides and lecture will clearly illustrate conscious and unconscious meanings associated with graphic heart projections. Spon- taneous paintings collected from four psychiatric hospitals form the data base for planning, psychodynamics, research, and the individuality of affect and metaphors.

U.S. Study Group on Symbolic Language of Sexually Abused Individuals
Dee Spring, MS, ATR, Consultant/Therapist, Private Practice, Ventura County, 361 Arapaho St., Ventura, CA 93001

The purpose of this group is to provide a communication system by means of a national network to study the relationship between sexual abuse, its companion post-traumatic stress, and the resultant symbolic language. This involves data collection and investigation of a treatment model for determining levels of PTSD which appears to correlate with the symbolic language produced by this population. This group would further embrace the investigation of what appears to be a natural phenomenological detection system for silent victims of sexual abuse (those who have never told a soul and may have been hospitalized or institutionalized for years without the “real problem” being discovered).

Feminist Art Therapy in the Eighties
Status of Women Committee, “Introduction”
Jane Gilbert, MEd, ATR, PO Box 137, Orland, ME 04472

Women and Work: Where Are We Today?
Jane Gilbert, MEd, ATR, PO Box 137, Orland, ME 04472

An overview of the situation of women in our society will make clear why we need to be feminists in the eighties. There will be an update on the advances and setbacks of women’s economic and sociocultural status with some inferences drawn and suggestions for the future both in society and within this organization.

In a Different Image: Are ‘Male’ Pressures Shaping a ‘Female’ Art Therapy Profession?
Harriet Wadeson, PhD, ATR, 1020 West Oakdale, Chicago, IL 60657

In its headlong thrust to be accepted and respected, art therapy strives to play the mental health game according to established rules. These are rules developed by primarily male patriarchal mental health and academic establishments. This presentation will attempt to bring awareness of the male pressures which often go unnoticed and unrecognized, in order to assist our predominantly “female” profession to develop in a congruent and self-consistent way.

The Integration of Power and Compassion
Judith Gerberg, MA, ATR, LM, 35 West 82nd St. #BB, New York, NY 10024

What images must we create in order to achieve the integration of power and compassion? What are our potentialities as women, artists, and therapists? What is the unique contribution we can make to the spaceship Earth, as the strong women we already are?

The Place of Politics in the Art Therapy Process
Lou King, PhD, 205 Richmond SE, Albuquerque, NM 87106

The majority of hospital patients will eventually reenter a world that initially overwhelmed them, and they will need to have the most comprehensive understanding possible of that world if they are to function well in it. As women, they will need to understand not only the obvious aspects of their oppression, but the subtle ones as well. Our approach to therapy will be one-sided if we only give our attention to the personal, inner life of the psyche and ignore the realities of the environment in which the person lives. Attending to the environment necessarily entails not only a consideration of the home and work life of the patient/client, but a consideration of the institutions influencing or governing the realities of their lives as well, especially the lives of women. What does the inclusion of these political realities mean? In terms of how we approach treatment issues such as passivity, depression, abuse, manipulation, seduction, lack of self-esteem, self-worth, etc? How will a consideration of politics affect the way we process
the images and verbalizations of women patients/clients? Are there times when it is inappropriate to include the political in the treatment process? These questions and others will be examined and addressed.

The Homeless and Art Therapy: An Exploratory Study
Kay Stovall, MA, 3732-B Seventh Ave., San Diego, CA 92103

Do the drawings of the homeless reflect their radically different lifestyle? Preliminary research using art therapy techniques in collecting and analyzing spontaneous drawings of homeless individuals is examined. Background information on homelessness, characteristics of the population, and their response to art materials is presented. Slides of drawings by the homeless illustrate the presentation.

Art Therapy with Adolescents in a Crisis Intervention Facility
Jean Spates, BA, 407 Columbia SE, Albuquerque, NM 87106
Amy Sehr, BA

The purpose of this paper is to introduce the use of art therapy with adolescents in a short term facility. The visual presentation is accompanied by actual casework showing the effectiveness of art therapy when used in this setting. It will also show the importance of utilizing visualization to accelerate the art therapy process.

An Art Support Group for Bereaved Children and Adolescents
Barbara Betker McIntyre, BA, Art Therapist, Grand Traverse Area Hospice, Route #1, Williamsburg, MI 49690
Mary Raymer, ACSW, Director, Grand Traverse Area Hospice

The pilot arts program at our area hospice involves an art support group for bereaved children and adolescents. The group uses art expression to express and resolve feelings and experiences associated with grief. Four exhibiting artists and an art therapist facilitate the group. The grief process for children and adolescents, accompanying art work, group dynamics, and program implementation will be presented by the hospice director and art therapist.

The Visual Language of Multiplicity (MPD Disorder)
Dee Spring, MA, ATR, Specialist in Victim Recovery, Ventura Health Care Services, Private Practice, 361 Arapaho St., Ventura, CA 93001

This presentation with slides will focus on artistic visual dialogues created by MPD patients before and after diagnosis. The primary purpose will be to introduce the use of visual language as an artistic identifier for multiple personalities and their alternates through styles of drawing which can be used both as a tool for therapy and a tool for integration.

"I Have Never Lived In This World Before"
Ellen David, RN, ATR, 2610 April Drive, Birmingham, AL 35243

This visual/verbal presentation shares experiences, observations, and techniques used by an RN/art therapist to detect information and promote therapeutic alliance between therapist/alters and alter/alters aiming toward awareness or integration. The audiences preparedness concerning creativity, intuition, spontaneity, emotional maturity, knowledge, and compassion will be challenged. Handouts provided.

"The Case of Billy Milligan"
Don Jones, ATR, LM, Director, Adjunct Therapy, Harding Hospital, 490 Mid Drive, Worthington, OH 43085

This paper considers the dynamics of multiple personality development and illustrates the use of art therapy treatment in one such case. The book, The Minds of Billy Milligan, by Daniel Keyes is based on a landmark legal decision which declared "Billy" not guilty by reason of multiplicity.

A World View of Art Therapy
Bobbi Stoll, MA, ATR, MFCC, Marriage, Family, and Child Therapist, Art Therapist, Private Practice, 8020 Briar Summit Dr., Los Angeles, CA 90046

This session will detail the results of a 1985 survey of art therapists and institutions of art therapy from 20 countries. It will shed light on the question of "What's happening with art therapy in . . .?" by providing a world view of the direction and development of our profession and discussion of the major similarities and differences in practice and theory.

New Horizons: Interfacing of the Art Therapy Movement with the Art Establishment
Robert E. Ault, MFA, ATR, Art Therapist, The Menninger Foundation, 1508 Boswell, Topeka, KS 66604

Art therapy conceptualized as a movement of ideas rather than as a client-centered professional can be integrated into governmental and/or operational arts agencies. Specific strategies and political moves as utilized successfully in one state arts commission are outlined. These resulted in official guidelines for funding of arts therapies projects.

Short-Term Inpatient Art Therapy: An Eclectic Approach
Michael J. Swiderski, MS, ATR, Art Therapist, Mansfield General Hospital, 432 Shepard Rd., Mansfield, OH 44907

This paper discusses frustrations and difficulties which are inherent in the practice of short-term, inpatient art therapy in general hospital psychiatric units. It points out the need for art therapists to develop an eclectic approach, and it outlines three different models of short-term group art therapy.
Expanding Concepts of Visual Images Through Increased Understanding of Artistic Development
Betty Jo Troeger, PhD, Assistant Professor, Florida State University, 123 Ed. Bldg., Tallahassee, FL 32306
This presentation will focus on helping art therapists assimilate current information related to art growth and development into existing concepts of interpreting visual images of clients. Cultural influences on art learning and individual learning styles will be linked to applications in art therapy practices with children, adolescents, and adults.

Addressing Countertransference Through Image Making
Barbara Fieh, MA, Art Therapist, Institute for Therapy Through the Arts, Ravenwood Hospital, 1635 W. Touhy Ave. #1N, Chicago, IL 60626
This paper is an examination of countertransference issues through images. My own art work is used to clarify dynamics within therapeutic relationships that occurred on an inpatient psychiatric unit, with two acute adult populations. It is my hope that this paper will encourage art therapists to use their own images in therapeutic work.

Themes of Self-Destruction: Indicators of Suicidal Ideation in Art Therapy
Carol Thayer Cox, MA, ATR, Art Therapist, Acotlink Academy, 1024 Plymouth Dr., Stafford, VA 22554
The primary objective of this paper is to establish the value of art therapy in the expression and communication of suicidal ideation. Ten themes of self-destruction, extracted from a theoretical review of motives and characteristics of suicide, will be used as guidelines for graphic indicators in several case presentations involving self-destructive behavior.

Creative Process and Psychopathology: Some Neurocognitive Considerations
Patricia A. St. John, EdD, Assistant Professor of Art, University of Massachusetts, Fine Arts Center 460, Amherst, MA 01003
Creative process has been studied from a neurocognitive perspective. Exploration of the relationships among perceptual style, creative process, and psychopathology suggests a dichotomous model. This model is presented and discussed within the context of the well-functioning artist and under the stress of psychopathology. Usefulness of the model within art therapy assessment and treatment is considered.

The Use of Art Therapy in the Treatment of Premenstrual Syndrome
Therese M. Halas, MA, ATR, Adjunct Professor, Arizona State University: Art Therapist, Private Practice, 4541 N. 7th St., Phoenix, AZ 85014
Art therapy has been used as an aid in the diagnosis and treatment for premenstrual syndrome sufferers at a comprehensive treatment center for PMS. The paper includes a detailed description of the physical and psychological symptoms of PMS and the techniques of art therapy used with individuals, families, and groups. Case studies will be presented.

The Art of the Alcoholic
Sherry Kreitman, BFA, Art and Recreational Therapist, Center for Comprehensive Alcoholism Treatment, 2334 Wheeler, Cincinnati, OH 45219
This slide presentation will illustrate the use of art therapy with adult and adolescent alcoholics in two residential, chemical dependency/inpatient treatment programs. Art therapy will be demonstrated as a component of the inpatient treatment program: understanding the disease, exploring feelings and working towards sobriety. Case studies of adolescent alcoholics, treatment processes, and art work will be presented along with a multi-media presentation of an original production by the alcoholics.

DX-RX-TX: Creative Uses of Art Therapy Assessment Probes
Don Jones, ATR, LM, Director, Adjunct Therapy, Harding Hospital, 490 Mid Dr., Worthington, OH 43085
Of prime importance to the clinician is creating and administering flexible protocol that give immediate clues to an individual patient's preoccupations, anxieties, defenses, coping style, and (often neglected) assets. A senior art therapist presents a package of assessment techniques illustrating individualized creative arts interviews versus general psychological testing approaches.

Recognizing and Activating Multiple Intelligences: Professionals/Patients Meeting of Minds
Janie Rhyne, PhD, ATR, HLM, Psychotherapist, Private Practice, 1051 E. College St., Iowa City, IA 52240
Psychotherapy allies both therapists and clients in finding ways of making sense out of actual experiences: when patients and professionals are of different minds, how can the alliance work? Systematic study of drawings made by persons from both groups shows various ideas about sense and nonsense. Paper and slide presentation.

From Art to Science: The Formal Analysis of an Artist's Symbolic Universe
Albert J. Levis, MD, Director, Center for the Study of Normative Behavior, 2750 Whitney Avenue, Hamden, CT 06518
The presenter will introduce the ten levels of scientific analysis of the Formal Analysis Profile and then apply them in organizing information.
music, poetry, and slides, participants will enrich their understanding of the goddesses with the goal of making images of the goddess within.

Art in Motion: Integrating Art and Dance Therapies as a Treatment Modality with Adult Psychiatric Patients
Stewart Ault, MA, ATR, Art Therapist, Maimonides Medical Center, 423 Hicks St., #4E, Brooklyn, NY 11201
Patricia Capello, MA, ADTR, Dance Therapist, Maimonides Medical Center

Through lecture and workshop experience, the presenters will discuss and demonstrate their specific technique combining the expressive and creative potentials of art therapy and dance therapy processes. Using slides and videotape, we will share examples of works created by adult, psychiatric patients in a partial hospitalization setting.

Learning to Use the Therapist’s Visual Inductions: An Innovation in Clinical Supervision
Robert Wolf, MPS, ATR, Psychoanalyst/Art Therapist, Private Practice, College of New Rochelle, 148-16 85th Ave., Briarwood, NY 11435

This workshop will demonstrate how an art therapist can use his own visual inductions, spontaneous images which occur in response to patient seen in clinical practice, to explore and more effectively understand the patient’s inner object world. Emphasis will be placed on uncovering transference and countertransference dynamics and developing treatment strategies.

Uncovering Our Outer Mask...
Elizabeth Spear Rogers, MA, ATR, Art Therapist, Coordinator, Matter-At-Hand, Albright-Knox Gallery, 1256 Colvin Blvd, Kenmore, NY 14223
Elizabeth Cunningham, Student

The workshop will cover the collaborative efforts of an art therapist and a graduate student working with children who had difficulties identifying and expressing their emotions. A brief presentation with visual documentation will provide workshop participants with techniques to view how students’ learning problems in academic areas and various developmental needs were addressed. Workshop participants will then explore first-hand many of these original techniques.

A Visual Exploration of the Interface Between the Art Psychotherapeutic Process of Healing and Insight
Arthur Robbins, EdD, ATR, Professor, Pratt Institute, 325 West End Ave., New York, NY 10023

This workshop will explore a variety of interventions associated with the treatment of psychosomatic illness. Participants will first observe how personal conflicts can be converted into disguised somatic expressions. Then alternate methods of healing will be introduced as a means of resolving conflict. Discussion will fol-
low regarding such issues as the integration of uncovering techniques within the context of a positive healing experience.

Telephone Supervision: Working with the Visual Through Non-Visual Communication
Beth Gonzalez-Dolgin, M.S., ATR, Art Therapy Faculty and Supervisor, Pratt Institute, 700 Washington Dr., Centerport, NY 11721

The study of a unique form of supervision will be shared by means of viewing and hearing creative expression of those who have been a part of it. Creative use of technology for the purposes of advancing the field of art therapy will be explored. Workshop participants are asked to bring a piece of art done by their supervisor or a supervisee which will be used to understand feelings brought up by the supervisory experience.

A Training Workshop on Art Therapy and PMS
Therese M. Halas, MA, ATR, Adjunct Professor, Arizona State University; Art Therapist, Private Practice, 4541 N. 7th St., Phoenix, AZ 85014

(Prerequisite: “The Use of Art Therapy in the Treatment of Premenstrual Syndrome” presented 10:15 a.m. to 12:30 p.m. Saturday, October 26)

This experiential workshop is designed to further train art therapists in the techniques developed especially for use with the PMS population. It will include advanced methods of diagnosis and the use of art therapy with the PMS patient and significant others.

Dali and Magritte: Naturalists of the Imaginary, Stimulate Creative Expression
Virginia Minar, MS, ATR, Art and Exceptional Education Teacher/Therapist, School District of West Allis/West Milwaukee, 308 East Dean Road, Milwaukee, WI 53217

Many emotionally disturbed adolescents have difficulty understanding real/unreal concepts. The workshop will follow a procedure that motivates them to work with their imagination by selecting and organizing imagery into a creative collage. Group discussion clarifies the difference between fact and fantasy, concrete and abstract reality.

The Integration of Aesthetic Form Within the Treatment of Borderline Conditions
Arthur Robbins, EdD, ATR, Professor, Pratt Institute, 325 West End Ave., New York, NY 10023

Participants will explore a variety of ego states commonly associated with a borderline condition. They will then confront problems of self cohesion in the context of altering moods and defensive patterns. Participants will have the opportunity to explore different methods of confrontation that promote an aesthetic integration of content and form associated with self-cohesion. Discussion will follow after the experiential section.
1985 Conference

ANOTHER GLANCE

At right, conference participants created masks to wear at the popular Masquerade Ball. The annual conference offers many opportunities for informal exchange. Below left are Don Jones and Rawley Silver. Below right are Shaun McNiff and Robert Ault.

Photographs by Beth Nord
Conversation with Chris Costner Sizemore

Editor’s Comments:

The publication of *The Three Faces of Eve* in 1957 literally turned the psychiatric community upside down, as two doctors used Chris Costner Sizemore’s case history to present this rare disorder of multiple personality to the public. In 1977 Mrs. Sizemore revealed her identity as “Eve” as well as the story of the emergence of 22 personalities in over 40 years. Her autobiography titled *I’m Eve* was published in 1977.

It is an intense journey that the reader takes as he/she becomes acquainted with the various personalities—the Bell Lady, the Strawberry Girl, the Retrace Lady, the Freckle Lady, the Card Girl, Jane, and Eve, to name just a few. Also, a powerful experience follows the final integration of personalities as Mrs. Sizemore tells of her feelings of emptiness, and how she thought they (the various personalities) would return. She had to have grief therapy for the death(s) after it was over (“I had died so many times!”) She, occasionally, wished that they would come back because “I didn’t know how to deal with my life.”

Chris Costner Sizemore’s story continues to intrigue the world. Medical and law enforcement communities look to her for the wisdom and knowledge based on her experiences. Persons with mental illness, their families and friends, seek her advice and
see her as a symbol of hope for recovery. She has dedicated much time and energy to helping others, primarily through various state mental health associations. For her efforts in trying to dispel the needless stigma of mental illness, the National Mental Health Association honored her with its prestigious Clifford W. Beers Award in 1982.

In addition to our numerous telephone conversations, the audiotape dialogue that she so thoughtfully provided, articles and newspaper clippings that were submitted, some references are taken from publicity materials listing background information, biographical data, and her campaign for mental health issues.

The last sentence of her comments ("...I have just begun to live.") is prophetic, and it demonstrates the tremendous positive energy and direction that is a part of Chris Costner Sizemore's life.

—Gary C. Barlow, EdD, ATR

"On My Life with Multiple Personalities"
Comments by Chris Costner Sizemore

First of all, I wish to express my appreciation for the pleasure of participating in the A.A.T.A. Conference. I am grateful for the warm welcome and for the camaraderie that all of you afforded my husband and me. A great honor was bestowed on me by the A.A.T.A. when they chose to hang my art exhibit at the Conference in New Orleans.

When we arrived I knew little about art therapy, but I left feeling excited about your work, totally energized, and determined to try and do more to help my fellow man. Therefore, I will give you a little background material on my case history.

For a period of over forty years, I was a mental patient. I had the disorder known as multiple personality—the existence of two or more personalities in one body at the same time. It is classified as a defense mechanism—a unique coping mechanism where the personality actually creates satellites to face the realities that appear unbearable. I coexisted with two or more personalities from the age of two. I'm not sure exactly what caused this disorder, but I do believe that it may have been hurtful events that occurred before I was old enough to deal with them.

In my research with other therapists and with other multiples, I have discovered that this neurosis begins before the age of five and that it is caused by childhood trauma; in my own case, it was a violent death experience at the age of two.

My case was diagnosed in 1952 by Dr. Corbet H. Thigpen and Dr. Hervey M. Cleckley in Augusta, Georgia. I was under their care for two and a half years, and it was from my case history that they wrote the book The Three Faces of Eve (1957) from which that motion picture was made. During the last 17 years of this illness I was under the care of two Northern Virginia doctors; it was in the office of Dr. Tony A. Tsitos that the final three personalities integrated. It was a violent integration, when one personality announced hysterically that she had killed another one. Dr. Tsitos recognized the importance of this breakthrough.

You might be interested to know that my personalities followed a definite pattern. There were always three at a time. Three would manifest themselves. Then they would die and then three more would emerge. They actually thought of themselves as dying, and this certainly is reflected in their art work. They experienced death so much that they actually wrote wills, packed away their memorabilia—and some of them even shrouded themselves for death and just did not come back anymore.

In each group of my personalities there was an amnesiac. The dominant personality was never aware of the action of the other two personalities and sometimes when she was surfaced in the body, the other personalities could talk to her from a recessive space. In each group of personalities as a little girl, I had a bad little girl, and a good little girl, and one of an indifferent personality.

"There were always three [personalities] at a time. Three would manifest themselves. Then they would die and then three more would emerge."

As I grew into womanhood, it became a wife/mother image, then a fun-loving, life-loving party girl—and the third personality in each group was the intellect of the three.

As a small child, I was not aware that everyone else was not just like me. It was only after I started school and entered the real world that I recognized that I was indeed different from other people. I began to have severe headaches, a feeling of weakness and inertia, and then long periods of amnesia. That's how my case was originally diagnosed—as a strange kind of amnesia. I think this is true of the diagnosis of many multiples; they are misdiagnosed.
I will share with you my last three personalities. Because of the complexity, I won't attempt to get into all of the 22 personalities that I exhibited over a period of 40 years. I was integrated at the age of 46 (11 years ago) and it has been eight years since I've had any therapy at all.

In existence at that time was the "Purple Lady," who thought that she was 58 years old. She sprayed her hair gray, she wore purple garments, she painted purple pictures, and she was just obsessed with the color purple. Coexisting with her was the "Strawberry Girl" who thought that she was 21 years old. She wore long dresses, went barefoot, wore long red wigs, and ate only strawberries.* At that time I weighed 179 pounds, and the "Strawberry Girl" thought she was thin! When she looked in the mirror, she saw a thin image rather than the obese person that I really was.

Coexisting with those two personalities was the "Retrace Lady," and her hang-up was that she simply would not retrace her tracks no matter where she went. If she was only a block away from home, she would drive a mile around to return from another direction. She thought, "If I just don't repeat anything, then I cannot make the mistakes the others have made, and then I will be the survivor." And that's what it was all about—it was a battle for survival.

"With a mixture of clay and water I designed murals on the sides of the outside of the buildings wherever we happened to live."

I think it is important for people to know that there are physical aspects involved in multiplicity, as well as the emotional ones. I had left-handed and right-handed personalities, those who were deaf, those who were blind, and some who were mute. Also, one of my personalities "The Purple Lady," (who thought she was 58) required bifocals to read. At the same time, "The Strawberry Girl," (who thought she was 21) could read form the telephone directory without glasses. "The Retrace Lady," who was 46 (my own actual chronological age) was already using reading glasses. There are some things we simply cannot explain about multiple personality.

Unfortunately, art therapy was never introduced as a part of my formal therapy; however, painting and writing became therapy for me without my knowing it. My creative efforts seemed to be the only acceptable accomplishments in my life. The few family members who saw my art thought it was academically good, but very strange and very weird. No one realized that my very soul was imprinted on that canvas. Nor was there a professional to observe from a psychological point of view and help determine the path I was struggling to follow out of this wilderness of pain.

My first attempts at art I call "Sand Art," because I drew in the sand with sticks. This was during the great depression, and there was no money for paints and canvases or crayons. And from the "Sand Art" I went into what I refer to as "Barn Art." With a mixture of clay and water I designed murals on the outside of the buildings wherever we happened to live. Memories of these experiences and these days have developed into a series that I call "The Attic Child."

It was not until 1963 that I actually painted a picture—it is called "The Three Faces of Eve," and the artist was "The Bell Lady." Seven of my personalities were artists, and their styles and techniques were totally different from each other. I continue to paint today, and I have a style that is my very own and different from theirs—even though, at times, some of their knowledge will appear on my canvas, and I realize that I can draw on the expertise of seven other artists!

I have discovered in my travels and in my research that all multiples are creative and therefore need the assistance available to them through art therapy. I am honored to share with you a part of my life experiences as a multiple personality patient, and I thank you as art therapists for the important, the necessary, and the greatly needed work that you are doing. You are not only providing for the psychiatric community another valuable tool with which to diagnose, to better understand and to provide proper treatment for the mentally disturbed—but I believe that art therapy, within itself, is a healing modality.

Since the services of an art therapist were not available to me, I am certainly in a position to recognize the absence of that assistance and the importance of your work to others. On behalf of those who cannot help themselves, and will never have the opportunity to voice their gratitude, I thank you for caring and may God bless you in your efforts to heal.

At the Conference I shared a couple of poems with the members. The first one I wrote right after the integration, and was still feeling the pain of the departure of the other personalities. It is titled "Why Me, God?"

Sometimes my soul is torn by the sound of soundless mirth
And my thoughts are often pressed to justify its worth.
I'm urged to ever strive to loose the great facade
As shadows from my past come back,
I whisper "Why me, God?"

Ed. Note: Many of the personalities were named by Chris Szemore's daughter, for things that they liked or collected.
"...all multiples are creative [and] therefore need the assistance available to them through art therapy."

This last poem I recently wrote (about six months ago). It is titled "Wholeness."

How present I become, as though there were no more yesterdays.
Sudden silences separate the moments, while I walk that crooked mile
That only faith can make straight.
Star shine encircles me with grace,
Butterfly wings sing a lullaby and reveal pink fragrant rosebeams.
My trembling soul reaches for the hand of God—beyond the realm of angels—
And a soft "Amen" gently brushes the edge of my face.

In any interview, I tell people that there are four things that have brought me successfully to the present time. They are:

1. Good psychiatric treatment. It is vitally important for the multiple to have good therapy.
2. Family support. I had a fine family support system, and I think that love can do wonders for any of us.
3. My desire to be a well person. I feel that the patient must help himself or herself.
4. Last, but not least, my faith in God.
   It took all four of these things to bring me to where I presently am. Although it is probably needless to tell you, I feel as though I have just begun to live.

Guidelines for Authors
Please submit four (4) copies of manuscripts to: Art Therapy Editor, Gary Barlow, Ed., ATR, Wright State University, Creative Arts Center, 228 Creative Arts Center, Dayton, OH 45435. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.
Expanded Work Settings for Art Therapy

Margaret L. Smart, BA, MSW

Margaret L. Smart, BA, MSW is in private practice in Palo Alto, California. She is a member of the American Art Therapy Association, Inc. and the Northern California Art Therapy Association.

This paper identifies expanded work settings for art therapy, such as Employee Assistance Programs, as a potential employment resource for art therapists. The nature, number and scope of services of these programs is discussed, as well as the prejudice against art therapy that might exist within firms that provide the services. Examples of the value of art therapy in such settings are provided. Art therapists are challenged to broaden their own definition of the uses of art therapy and the settings in which it might be profitably practiced.

To be shaken out of the rut of ordinary perception, to be shown for a few timeless hours the outer and the inner world, not as they appear to an animal obsessed with words and notions but as they are apprehended, directly and unconditionally, by Mind at Large — this is an experience of inestimable value to everyone.

Aldous Huxley (1934)

In the summer of 1984, I was in the process of leaving long-time, full-time employment to start a private practice. To facilitate this transition, I looked for a part time position with a mental health or other counseling agency. The search led me to a firm that was identified as an Employee Assistance Program. They were looking for experienced therapists to provide short term counseling in one of their several offices. I was hired for twenty hours per week.

**Employee Assistance Program**

Employee Assistance Program is the term used to identify certain health benefits for employees in both the public and private sector. The term is usually used by employers to designate a program of limited counseling services that employees can obtain as part of their health management benefit package. The term is also used as a general label for those counseling firms that contract with employers to provide the counseling service. Presently, there are over 5000 such firms in the United States. It is estimated that these firms serve a potential client population in excess of one million people.*

Employee Assistance Programs first came into being in the 1930s at the time alcoholism was beginning to be defined as a disease rather than the result of personal moral weakness. Originally the initials “EAP” stood for Employee Alcoholism Program and the services were limited to those workers who were having work problems because of alcohol addiction. The availability of counseling and related services was considered to be a more appropriate response to disease than were reprimand and firing. Additionally, the cost of such a service was usually small in comparison to that of hiring and training new employees. The programs were designed to provide crisis intervention, assessment of employee need, and a referral to community resources for ongoing service. The programs were staffed by human services professionals, primarily psychologists and social workers, and were normally situated at the work site.

As the programs grew, employers began to contract out the work to counseling firms and they were moved off-site. At the same time, personnel officers became aware that it was not only alcoholism or other addictions that interfered with employee productivity, but that employee output also suffered when employees were under the emotional stress that might come from personal or family problems. For this reason, although the main thrust is still to provide treatment for substance abuse problems, many employers have extended the benefits of employees whose job functioning was impaired because of any emotional, family or work-related problem.

The value of employee assistance programs to industry has been buoyed by research from a variety of sources. The National Institute on Alcohol Abuse and Alcoholism estimates that one worker in 10 has an alcohol abuse problem, and that two workers in 10 suffers from either a drug or alcohol abuse or mental illness difficulty. In dollars and cents, according to 1983 figures from Research Triangle Institute, the total cost to society in lost productivity from the three causes exceeds $102.9 billion per year. A study of 500 employees at one division of AT&T found that providing early treatment for troubled workers, particularly those with alcohol problems, reduced their absenteeism rate from an average of 18 to 7 days a year. (Foreman, 1985)

"[An] Employee Assistance Program [identifies] certain health benefits for employees in both the public and private sector."

Silicon Valley EAP Program

The EAP in which I worked is located in Santa Clara County, California—otherwise known as Silicon Valley. The firm has contracts with approximately 40 different companies, with a total employee population among those companies at around 70,000. Since all contracts also provide services to dependents, the potential client population for the firm exceeds 225,000 people.* The contracts usually provide between three to five counseling sessions per "personal crisis." In some cases the therapist is to do only an assessment and referral, and in others the employee is free to remain with the EAP firm for ongoing, longer term therapy. Usually, however, the counseling is expected to be of a short-term nature, with referrals elsewhere if long-term psychotherapeutic or psychiatric services are deemed necessary.

Upon beginning employment, I was advised that the therapeutic approach was traditional and that the firm was not "into" enhancement, enrichment, or encounter. The directions focused on assessment, short-term problem-solving and/or referral. The firm’s clientele was defined as individuals who would profit mainly from a rational, "reality-focused" form of counseling rather than any therapeutic interventions that might be construed as "mind expanding."

My own style of therapy, developed over a period of 15 years, is a combination of the traditional and experiential modes of psychotherapy. I had studied Gestalt therapy in the early 1970s and found it to be an especially potent therapeutic tool. About five years ago, I began to use drawings in conjunction with Gestalt therapy and dream work. At about that same time, I took a position as a family counselor in a child abuse prevention program. I found myself turning more and more to the use of art in my work. Art became an important vehicle to facilitate communication between myself and my clients as well as between family members themselves. Because of my education and experience, I hold a firm belief in the value of experiential and non-verbal methods of intervention in ongoing as well as diagnostic work with both adults and children, I asked for, and received, permission to do limited Gestalt work and to use art therapy in diagnostic work with children.

The viewpoint of the EAP management that experiential and art therapy had limited value in their firm seemed to be saying that traditional "talk therapy" was real therapy whereas experiential or expressive "non-verbal" therapies were esoteric in nature and were not quite as useful as the "real stuff." Personal experience has led me to conclude that this viewpoint may be professionally widespread. For example, the Civilian Health and Medical Program of the Uniformed Services (CHAMPUS) Handbook (January, 1983) specifically excludes "mind expansion," such as Gestalt therapy and meditation, from coverage. The main criticism of the experiential, expressive modes of therapy is that the proponents of such therapies are selling "quick cures" and tend to delude their clients into believing that a "cure" can be effected quickly without the years of painful "work" that is the accepted part and parcel of traditional therapy. This attitude is not only quite narrow in its bias against non-verbal forms of therapy, but seriously limits the scope of interventions that a therapist might consider appropriate for any given client.

Nonverbal Therapy and Brain Research

The prejudice against, or perhaps a misunderstanding of, non-verbal, non-rational forms of therapy is not new to art therapists. Books on art therapy usually devote a few paragraphs to the concern that art therapy is seen as merely "messing around" or having only limited benefit in the world of psychotherapy. (Landgarten, 1981; Wadeson, 1980) Art thera-

*The author acknowledges the contribution of Dr. Stephen Remington, who made many of the points contained in this section.

...many employers have extended the benefits of employees whose job functioning was impaired because of any emotional, family or work-related problem."
In his book *How to Tap into Your Own Genius*, Thomas Cowan (1984) suggests that one revert to childlike ways to tap creative processes. Dr. Cowan recognizes the second class position of imagery and meditation as problem-solving methods. In his book, he offers a series of exercises that are designed to open ourselves to the use of the symbols and images generated by the brain's right hemisphere as a problem-solving method.

**Art Therapy and the Business World**

In the 1960s there was some integration of humanistic and encounter methods into the business world in an attempt to improve productivity, upgrade communication between staff, and enhance employee morale. This human relations theory of management (McGregor, 1960) fell into disrepute because of the excessive attention given to communication and insufficient attention paid to producing the product.

In the 1980s there has been a continuing emphasis on the value of the rational and technical approaches in business to the exclusion of the humanistic approach. This would seem to be a further move away from the intuitive; and yet some of the most popular management textbooks have tended to include a more non-rational approach as appropriate for achieving improved employee morale and productivity. (Peters and Waterman, 1982)

This is not to say that firms are sponsoring encounter or problem-solving through art groups. But there has been a move toward encouraging open and creative thinking among all their employees. Along with this trend has been the continued support of short-term personal counseling as an appropriate benefit for employees. The benefit is available at firms that are considered forward-thinking and concerned with the human needs as well as the production capacity of their employees.

In the EAP firm where I worked, the client population was like other counseling agencies in the nature of the presenting problems. However, in Silicon Valley, most clients were engineers, computer programmers, technical writers and other support staff whose work was concerned with the creation and production of computer-oriented products. They were career oriented people, and at least one third were men. They were all working in an environment that demanded high productivity, job excellence, attention to detail and adherence to deadlines.

What many also had in common was a knowledge that they had a problem that was interfering with work, and that their company was providing a means to deal in some way with resolving that problem. Although discouraged from using mind expanding type interventions with these clients, I found myself leaning more and more toward the inclusion of drawings in diagnostic and on-going work. I considered appropriate all interventions that would facilitate client understanding and problem resolutions regardless of any management prejudice that might exist. I had no art supplies except paper and crayons; however,

---

*Figure 1*
the use of these in many situations proved to be valuable to the client in basic art therapy sessions.

Case Example #1: George

George (pseudonym), one of my first clients, was a 44-year-old engineer. He was divorced and the father of two young sons. He had been living with a woman for over three years, but she had recently left his home, suggesting that he "get into therapy." George said he was depressed over the breakup. He did not know why she had left him. He was seeking some understanding of this plus some help in adjusting to being "single" again. George's eyes were dull in appearance. He spoke quietly and without emotion. He said he was not aware of feeling angry. He felt empty. George had very effectively cut himself off from his feelings and self.

It seemed important to use a technique to "connect him to himself," yet I was wary of introducing experiential techniques into the therapy. However, it was apparent that simply talking about his difficulties was not bringing him any closer to understanding himself. George, like many other well-educated, highly verbal individuals, was extremely skilled at using language as a defense against feelings. As long as he continued only to talk, therapy would move slowly.

In the third session, I suggested that George draw a sketch of himself plus a graphic symbol for himself (Figure 1); the figure of the man was as lifeless as George himself. He gave it the title "Man Standing." As he studied the picture he saw himself, as if for the first time, as someone who was going nowhere in neither his work nor personal life. The symbol George drew was a volcano. When first drawn, it did not include the ladder, helicopter nor fire coming from the cone that is now visible in the picture.

We worked with the picture. He described himself, via the sketch, as inactive and forbidding. The helicopter and ladder were added as he entertained the idea of how someone might get close to him, and how difficult that might be. The wispy, some-

"The prejudice against, or perhaps a misunderstanding of, non-verbal, non-rational forms of therapy is not new to art therapists."

what reddened fumes emanating from the cone were added to signify that there was perhaps more feeling inside than he would allow to be expressed.

The use of the art therapy technique served to increase George's awareness about himself and how he might be acting in ways that were truly self-defeating. As a result of the art exercise and his interaction with his art production, George did organize himself to pursue some work goals with fresh vigor. Also, his therapy took a new direction because he now understood that he needed to develop his capacity for intimacy before he could expect that someone would want to share her life with him.

Case Example #2: Anne

Another client was Anne (pseudonym), who held a technical writing position in a large company. She was twenty-eight-years of age and married. She liked her work and felt she was good at it, and yet often felt overwhelmed by the pressures of deadlines and other job demands. She had previously worked in more low key service work that left time for personally rewarding activities. But she had left that in order to earn the higher salaries available in the computer industry. At the time she came for counseling, she was beginning to doubt her competency. She was feeling fragmented, unable to concentrate, and obsessed with thoughts of failure. In the first interview we dealt with the realities of the job and how that fit with her personal goals, which were to be successful financially and personally.

In the second interview, I suggested that she complete a realistic sketch as well as a symbolic drawing of herself (Figure 2). The realistic drawing came as no surprise to Anne. She related immediately to the

Figure 2
Art Therapy as a Viable Method

Koestler (1959) stated that every creative act involves a new innocence of perception, liberated from the cataract of accepted belief. Surely, in each of these cases, the creative act constituted a turning point for the client. Not only did each gain an increased awareness of the self-defeating behavior, but each was able to mobilize his or her energy to move away from that behavior to take action to correct the situation.

Art therapy was a key part of a short-term, assessment type therapeutic approach for these clients. Not all the clients whom I saw were either open to (or appropriate candidates for) the expressive approach to connecting with their behavior. However, for those who were, and these were many, it provided a valuable avenue to cut through defenses redirecting energy from non-productive to productive behavior. In each case, the client effectively used a nonrational, art oriented approach to solve a real problem.

There is a place for art therapy in short-term, evaluative therapy. The question appears to be whether or not there is a place for art therapists in organizations such as EAP firms. The burden for opening up this employment resource to art therapists rests with the therapists themselves. It will be necessary, of course, to demonstrate the value of art therapy to those who are in a position to hire therapists. Beyond that, however, I believe it will be necessary for art therapists to begin to view their skills as applicable in a broader range of settings. This will demand that art therapists be willing to become generalists as well as having a specialized focus.

There may be objections to this proposal on the part of art therapists; however, it would appear that inte-

From Psychopathology to Psychotherapy Through Art Expression: A Focus on Hans Prinzhorn and Others

Judith A. Rubin, PhD, ATR, HLM

Judith A. Rubin, PhD, ATR, HLM is an art therapist in private practice. She is also Clinical Assistant Professor, Department of Psychiatry, University of Pittsburgh and Faculty-by-Invitation, Pittsburgh Psychoanalytic Institute.

This article is condensed from a paper presented in connection with the Prinzhorn Exhibit, University of Miami, Miami, Florida, February 1985. Reference is made to the “magic power of the image” (Kris, 1952) and to modern healers as they practice art therapy. Major writers in art therapy, psychiatry and psychology from the 1800s and 1900s are identified, with reference to their contributions to mental health and the healing process. Focus is given to the contribution of Hans Prinzhorn, whose monograph published in 1922 (translated: The Pictorial Works of a Mental Patient: A Contribution to the Psychology and Psychopathology of the “Ges-taltung”) is considered a hallmark in art therapy and mental health literature. Several hundred items from his collection of art by mental patients were included in the exhibit; these works serve as a testimony to the wisdom—although considered revolutionary at the time—of the creative Viennese art historian and psychiatrist, Hans Prinzhorn.

Although the use of art for healing and for mastery is at least as old as the paintings on cave walls, only recently has the “magic power of the image” (Kris, 1952) been harnessed by modern healers in the form of Art Therapy. There are ancient precursors, like fertility figures or voodoo effigies—both thought to have magical powers. Sand painting is only one of many rituals involving the creation of visual imagery for the purpose of healing physical or psychic pain. While all of these are practiced by the medicine man or shaman—the healer—sometimes art is used by the individual in an attempt at self-healing or to signal to others his or her need for help.

Similarly, individuals caught in the turmoil of serious mental illness—threatened by loss of contact with reality—have sometimes found themselves compelled to create art. Such productions, found as often on scraps of paper or walls as on canvas, began to intrigue mental health professionals toward the end of the 19th century. At that time, a few psychiatrists began to collect the drawings, paintings, sculptures and needlework made spontaneously by their patients. Although most doctors “regarded them only as curiosities” (Plokker, 1965, p. 83), there were a few notable exceptions. Paul-Max Simon, a French psychiatrist, was actually the first to publish serious studies of the drawings of the mentally ill (1876, 1888). He was followed by Cesare Lombroso (1887), whose equation of genius with insanity is less common today, but still apparent in the attitudes of many who consider creativity synonymous with a kind of madness.

In any case, both of these early workers appreciated, even before the advent of depth psychology, that patients’ products were related to their conflicts; that as confusing as they often were, they made a kind of psycho-logical sense (MacGregor, 1983). In 1906 Fritz Mohr, a German psychiatrist, described the first “drawing tests.” Although these involved the copying of figures, like the present-day Bender Gestalt Test (Bender, 1938), his work led to the more freely expressive use of figure drawings, family drawings, and free drawings in both clinical psychology and art therapy. And, in a study of the art of the mentally ill, a French psychiatrist named Reja (1901) described three types—infantile, ornamental, and symbolic—and noted similarities between the art work of patients and that of both children and primitive people.

In 1918 Paul Schilder, the psychiatrist who originated the concept of the “body image,” published a monograph (Wahn und Erkenntnis) in which he compared art by one of his patients to the avant-garde works of the time; suggesting that while both seemed “mad” to the layman, there was indeed sense in both. Another individual case study by Swiss psychiatrist Walter Morgenthaler on the art of Adolph Wölfli, a paranoid schizophrenic, appeared in 1921 with a title (Ein Geisteskranker als Künstler) variously translated as: A Mental Patient as Artist or Psychopathology and Pictorial Expression. Wölfli’s considerable technical skill and visually pleas-
Prinzhorn himself does not discuss Art Therapy, a term which had not yet been coined, though it is intriguing that he does describe an approach to artistic invention first noted by Leonardo DaVinci, which anticipated the development of what is probably the most common stimulus used by art therapists today: the scribble drawing. Prinzhorn quotes Leonardo about how artists can be stimulated by ambiguous visual phenomena like spots on the wall, ashes in the fire, or clouds in the sky. He then goes on to describe an approach strikingly similar to the scribble technique later elaborated by Florence Cane (1951) and by her sister, art therapy pioneer Margaret Naumburg (1966): “Suppose that one scribbles aimlessly on a sheet of paper while averting his eyes, and covers as much of the sheet as possible with a confusion of lines of variously strong and variously projecting curves and only then, looking for the first time, lets himself be inspired to some composition or other, whether figure or landscape.” (Prinzhorn, 1922, p. 19)

As those who have used it can attest, the technique is indeed a powerful one in eliciting meaningful imagery.

In a similarly modern-sounding statement, Prinzhorn declares at the outset of his study that he will not fall into the trap he thinks captured earlier students of psychiatric art of looking for “dagnostically useful signs in the pictures by various patients.” Although there may be exceptions, this author would agree for the most part with his statement that “crude characteristics can be found, but anyone unable to make a diagnosis without the drawings will certainly not have an easier time with them.” (1922, p. 3) Prinzhorn wisely renounced the temptation to conduct a “blind analysis” of the artists on the basis of their creations: “We believe, in other words, that even the best psychiatric and psychopathological methods will not protect us from drawing nonsensical conclusions about our heterogeneous material.” (1922, p. 4)

In my own earliest work, which was with hospitalized schizophrenic children, this issue was still very
"Although trained psychologists, psychiatrists, and art therapists are taught to see certain “signs” in patient art as clues to organicity or particular pathology, sophisticated clinicians are conservative about making either diagnostic or predictive judgments on the basis of art products alone, especially with only a limited sample of productions."

much alive, although it had been over 40 years since the publication of Prinzhorn's book. The chairman of my department asked how the art of the schizophrenic youngsters was different from that of the normal children, who I also saw weekly in an after-school recreation program.

Despite a literature suggesting consistent signs or characteristics, it was difficult to pinpoint specific differences in the art work of the two groups. However, direct observation of the children's behavior with the therapist and the art materials enabled one to easily distinguish between the two populations, since the schizophrenic children appeared and acted quiet differently.

In order to look more systematically at the question of whether their art work differed, a study was designed in which a group of normal youngsters, matched for age and sex, was seen for a series of individual art interviews. They were given a free choice of media and topic, as were the hospitalized children. Products were then randomly selected from work by both populations, and presented as slides to 40 judges varying in experience with children, art, and psychopathology.

When the judges were asked if they thought they could discriminate the work of schizophrenic from that of normal youngsters, most of them replied in the affirmative. They were then asked to identify each of 40 items (half from each population, presented in random order) as schizophrenic or non-schizophrenic, and to note their degree of certainty as well as the reasons for their decision. In an effort to achieve greater accuracy with a larger sample of art work, groups of products from a single session were also presented in the order in which they had been done, with the same judgments requested.

Only three of the 40 judges were able to judge correctly beyond chance expectation on both single items and groups of products. It was found that two of the three were in the group of ten judges with no experience in child art or psychopathology. When given information on chronological age or sex, their accuracy was no greater. What did emerge, which enables us to understand the historic impact of Prinzhorn's book, was a significant correlation between judged normality and judgments of aesthetic value (which were made at the end on the forty single products)—suggesting that what looks "good" also looks "normal" to most judges (Rubin & Schachter, 1972).

Although trained psychologists, psychiatrists, and art therapists are taught to see certain "signs" in patient art as clues to organicity or particular pathology, sophisticated clinicians are conservative about making either diagnostic or predictive judgments on the basis of art products alone, especially with only a limited sample of productions. As the author has written elsewhere:

"Of course, there are meanings in products, in formal qualities and in content; but they are not to be found in neat formulas or simple recipes, much as we might crave easy answers. Those generalizations which are in current usage are useful as an indication of possibilities, sometimes probabilities, but never certainties. Human beings, after all, are complex creatures, and so is their expressive behavior and the products that arise therefrom." (Rubin, 1984)

Anyone who works with people in art is familiar with the phenomenon of intra-individual variability—that, as Dewdney noted in his work with adult patients: "An individual can produce so wide a range of subject matter, mood, and style, that frequently two drawings done within an hour by the same person have no noticeable common feature of style or content." (1967, p. 16) And, as Kellogg (1969, p. 191) has so graphically illustrated, normal children can vary widely in their drawing of even the same subject under standardized conditions in the course of a single week.

Because of this phenomenon, and the contradictory research findings on the diagnostic use of patient art, the author and her colleagues conducted a normative study, using 180 boys and girls from ages 4 to 12. Each child did four “person” drawings in pencil with the same instructions on a Monday, Tuesday, and on the following Monday and Tuesday. After the coded drawings were scored, using the Goodenough-Harris scale—a developmental measure correlating significantly with I.Q. tests (Harris, 1963)—the variability in each child and each age group (20 Ss) was assessed using a standard deviation among the four scores. Content and visual variability were also scored, and both correlated significantly with each other and with score variability. This suggests that all were facets of the same phenomenon. (Rubin, Schachter & Ragins, 1983)

The developmental “line” that emerged was, however, a surprise, since it was not a straight line of gradually decreasing variability with age as had been expected, but rather a cyclical picture with low at ages 5 and 10, and peaks at age: 4 and 8, as well as an upswing at 12. The results of this study, like that of the early one, should serve as a caution. How consistent are people at different developmental levels? And how does consistency/variability relate to other correlates, like creativity (if variability is viewed as flexibility) or emotional disturbance (if variability is seen as instability)? Are the artists represented in the Prinzhorn exhibit more or less variable or consistent in their work? Or is what we see simply a reflection of someone's selection process? In any case, although we are
now often able to observe the act of creation, and we do know a good deal more about our patients than did Prinzhorn about the artists whose work he collected, we can still admire and approve of the caution he exercised in making diagnostic generalizations from the products themselves.

Prinzhorn was also skeptical of another approach to the use of art in mental health, one which was just beginning and which formed one of the roots of the field of Art Therapy. Although very little had been published at the time he wrote, Freud had printed a drawing by the father of Little Hans, the first case of child analysis, in 1905 (Freud, 1905, p. 13, Figure 1). After his father drew a picture of a giraffe, Hans made "a short stroke, and then added a bit more to it, remarking 'Its widdler's longer!'" And in 1918, the founder of psychoanalysis had published the famous case of the Wolf Man, describing how the patient did a drawing of his dream, though it isn't clear from the text whether it was done spontaneously or at Freud's request: "He added a drawing of the tree with the wolves, which confirmed his description." (Freud, 1918, p. 30)

Although Prinzhorn doesn't refer to Freud specifically, he does state that "Psychoanalysts have made repeated attempts to use pictures by persons under analysis as aids in the analysis, i.e. to interpret them symbolically. It has even become fashionable for patients to try to express their conflict symbolically in pictures, regardless of whether they have had previous training or not." (1922, p. 262) In a footnote, he refers specifically to material published by two analysts, some of which has since been translated into English (Pfister, 1913). Prinzhorn also notes that "nothing has so far been published of the very fascinating and problematic pictorial work which originated in the course of C.G. Jung's work as objective manifestation of psychic developmental phases." Although he notes that "comparative material from this quarter [presumably Jung] would be especially welcome in answering the questions as they have been formulated here" (1922, p. 262), he does not refer to any published work.

"Prinzhorn quotes Leonardo about how artists can be stimulated by ambiguous visual phenomena like spots on the wall, ashes in the fire, or clouds in the sky."

This seems to value the therapeutic potential of work in art.

In fact, Prinzhorn's aesthetic bias seems to color his usual objectivity, when he remarks about the art that analysts have received from patients: "The pictures which have resulted have so far unfortunately been interesting only for their contents and have been inconsequential as configurations. In our opinion it is most improbable that they will ever lead to any insights into the problems of configuration, and we feel compelled to emphasize by a few basic remarks what separates our approach from the symbolic analysis which is purely concerned with content."

Later in the same paragraph he makes clear his preference for a visual, formal, aesthetic approach to patient creations as works of art, seeing such an approach as having the potential to answer larger and more important questions. He also makes a provocative statement which all art therapists would do well to heed: "Anybody unable to experience a picture visually without feeling a compulsive desire to explain or unmask may be a good psychologist, but he necessarily bypasses the essence of the creation."

He goes on: "We acknowledge every psychological insight as such, but at the same time we are certain that it leads away from the work to a knowledge of intimate facts. We put the accent on the universal components and subordinate everything else to them, fully conscious that we thereby go counter to the inescapable temper of the times to which we must all make obeisance." (p. 262)

One wonders what Prinzhorn would have said today, had he witnessed the development of the use of art in mental health for assessment as well as for treatment. It is likely that he would have respected Clinical Psychologists like Dale Harris (1963), Elizabeth Koppitz (1968) and Ema-neul Hammer (1958), whose sophisticated use of drawings for the evaluation of both developmental and dynamic pathology has contributed much to differential diagnosis and decision-making. He probably would have also respected Play Therapists like Virginia Axline (1947) and Clark Moustakas (1953), or Child Analysts like Melanie Klein (1932) and Anna Freud (1946), all of whom found it necessary to provide young children with a wide range of nonverbal modes of communication, including art materials. Further, he would have approved of the development of Occupational Therapy, which in its earliest days, and still in many places, occupies institutionalized patients with constructive activities using art and craft materials.

What is puzzling is that Prinzhorn clearly recognized the intensity of the creative "urge" in these patients, who produced art in spite of the lack of easily available supplies or support systems. He even proposed the rather modern notion, later suggested by Freud and most recently by British psychiatrist R. D. Laing, that people may sometimes get sick in order to get well—that there is a creative purpose in mental illness. Laing's patient, Mary Barnes, is a case in point. Mary, in her most severely regressed state, did what only infants sometimes do—smear her feces to make pictures on the wall. Her therapist therefore decided to offer her paints when she began to improve. She engaged in a veritable frenzy of creative activity, eventually recovering from her psychotic illness and even becoming a fairly successful painter. (Barnes & Berke, 1971)

Given his recognition of the urgency behind spontaneous art and the potential creative self-healing involved, one would think Prinzhorn would have been especially delighted by the development of the field of Art Therapy, where the practitioners are artists as well as therapists. It is hard to imagine an art therapist "unable to experience pictures visually without feeling a compulsive desire to explain
Personal Experiences

When I was 17 years old, a high school friend died in an accident. Feeling numb, I went to the funeral, then returned to the camp at which I was working as an arts and crafts counselor. I succumbed to a high fever which lasted several days. Upon recovery, I felt a strong need to go into the woods and paint, which I did on my first day off. The painting was not of my friend Peter, but someone playing the piano—making music—and it was in dark reds, purples and blacks. It was a cry of anguish, a scream of pain caught and therefore tamed. It was also a new object in the world, perhaps a replacement for the person who was gone, as well as a tangible testament. The doing of it afforded tremendous relief. It did not take away the hurt and the ache, but it did help in releasing some of the rage, and in giving form to the confused feelings which threatened to overwhelm me.

Similarly, on a walk through the woods I once came across another self-initiated use of art to cope with an overwhelming event. A rural man had carved a powerful totem-like sculpture from a tree trunk, in part to mourn the untimely death of his young wife. His explanation was that he "just had to do something," and the activity of creating the larger-than-life carving seemed to fit his need—also filling the void left by his dreadful, personal loss.

Yet another person comes to mind—a seven-year-old boy—whose mother had committed suicide, and who was having a difficult time talking about it. Visiting his home shortly before the event, I had seen a "message" he had made (for himself and others) on the mantlepiece. On one side it said "Trouble," and inside were cutout cardboard weapons with which he hoped to "help" his mom (who had already made an unsuccessful suicide attempt). Following his mother’s suicide and funeral, the boy came to me for an art session. He worried about getting messy with chalk and fingerpaint because "My mommy would yell at me." He tried hard to "keep in the lines," but eventually relaxed and let himself enjoy the regressive tactile pleasure of the fingerpaints, saying they were "good and smudgy." He saw a dog in his abstract painting, and told me that it must have been the dog I he had wanted so very badly, but could not have because of his mother’s depressive illness.

He then made a much messier, darker finger-painting, and commented anxiously on how angry his mother would be if she could see him. He wondered aloud whether she was angry at him, and if his being bad or wanting the wrong things (i.e. dog) had anything to do with her leaving him. His story about the finger-painting was that it was a road, but "You'll never find your way out...No one can stop me...They'll never find their way out. They'll feel so sad...they'll be stuck there forever." He placed his hand in the black paint, lifted it up to show me, and then smashed it aggressively down onto the paper, expressing nonverbally his rage at his mother for abandoning him. One year later he came again for a visit, and in this session he symbolically represented his mother's suicide in a drawing. In this story, a pink person falls off a road (his mother had jumped off a bridge). Later, he dramatized with clay and tools; his dramatization were a crash, an emergency, and an operation in which he (the doctor) unsuccessfully tried to restore the injured clay patient. He was productive, and his art work represented not only an opportunity to release his anger and frustration, but also to clarify and to cope in fantasy with the painful reality he had to accept.

or to unmask;" and there is no question that art therapists promote what he also valued: "the essence of creation." One also wonders why it never occurred to him to suggest that creative activities be provided as therapy. The only plausible explanation is that he was offended, as are many contemporary clinicians, by reductionistic approaches which threaten to destroy creative work in the process of explaining it away.

Nevertheless, though he cannot be called the Grandfather of Art Therapy, Prinzhorn probably functioned as a kind of Uncle, almost as important as his fellow Viennese, Sigmund Freud. Freud developed the notion that the symbolism in visual imagery was dynamically significant, primarily through his psycho-analytic work with dreams. (1900) Moreover, at the time that Art Therapy was being "born," with Margaret Naumburg—probably the truest Mother of the field—beginning her work at the New York State Psychiatric Institute in the early 1940s, she and others were reacting strongly to the impact of Prinzhorn's fascinating book. Perhaps most important, its beautiful color reproductions and intriguing illustrations familiarized the average psychiatrist—perhaps for the first time—with the expressive potential of the art of the mentally ill.

Since then, there has been a good deal of growth in both Europe and the United States in the activities provided for psychiatric patients, sometimes under the rubric of Occupational Therapy, sometimes Recreational Therapy or Therapeutic Recreation. In Western Europe, art activities in mental hospitals are often called "Cultural" or "Creative" Therapy. Plokker, a Dutch psychiatrist, writing in 1962, contrasted Prinzhorn's era with the situation then in Holland, where "an attempt has been made to stimulate patients in this direction...There are now charmingly furnished and well-equipped studios in many institutions where work is carried out under the direction of specialists." (p. 4) He went on to state that the "so-called 'cultural therapy' (painting, drawing, modeling, music-making, singing, dancing, etc.) now plays an important part both with
sufferers from psychoses and also in the case of neurotic patients.” (Ibid., p. 5)

Plokker, in his book *Art from the Mentally Disturbed*, discussed “Painting as Therapy,” noting how it is sometimes used in one or more of the following ways: as occupational therapy, for purposes of diagnosis, to follow the course of the illness, and for catharsis. Somewhat critically he asked what remains a vital question for art therapists: “Does the patient improve because he has released his tension in drawings and the like, or is the fact that he can express these tensions in pictures already proof his mental condition is improving?” (p. 120)

Plokker ends with the following ambivalent caveat: “Summarising, it must be recognized that there can scarcely yet be any question of purposeful art therapy, since it is still in its initial stages. For the present, we can only work descriptively, collect and exchange data. It is impossible to draw far-reaching conclusions. It is certainly expected that this form of therapy can exert a favourable influence on the mental condition of the patient, on his mood, his attitude towards reality and his own self, perhaps even to his illness and that it will, as a part of general more active therapy, consequently be able to make its contribution to the treatment of those who are mentally disturbed.” (p. 128)

Otto Billig, a psychiatrist sharing Prinzhorn’s interest in psychopathological art, has made a major contribution to the cross-cultural understanding of the phenomenon of schizophrenic creations through a recent study in collaboration with B. G. Burton-Bradley, a New Guinea psychiatrist. *The Painted Message*, published in 1978, compares the art of patients from different cultures who have the same disease. This work, like that of many other investigators, represents a logical extension of what Prinzhorn so ably began: his attempt to relate the art and thought of the mentally ill to the art and thought of others—such as children and primitives—and to better grasp the one through comprehending the other.

But perhaps the most direct modern-day descendants of Hans Prinzhorn are those psychiatrists (mostly European) who founded the International Society of Psychopathology of Expression (I.S.P.E.) in Verona, Italy in 1959. In 1966, Dr. Irene Jakab, an active member of that group who had recently come to the United States, founded the American Society of Psychopathology of Expression (A.S.P.E.). (cf. Jakab, 1968) This interdisciplinary group, in existence for several years prior to the American Art Therapy Association, served as a gathering point and communication center for art therapists from all over the country. Physicians like Irene Jakab in A.S.P.E. and I.S.P.E., not only helped art therapists to meet each other and those from related disciplines; they also served as mentors, trainers, and promoters of this field all over the world.

Psychiatrists interested in the psychopathology of expression tend to be art-lovers themselves. Often they are artists, having tasted the deep and satisfying pleasures of the creative process. The physician has usually been in the leadership, decision-making, and hiring role in most mental health settings. Such a person has often been the impetus for the development of an art therapy program.

Margaret Naumberg, for instance, would never have had the chance to try out her theories had it not been for the facilitating role of psychiatrist Nolan D.C. Lewis, Director of the New York State Psychiatric Institute. (Naumberg, 1947, 1950, 1953) Similarly, Don Jones, a past President and founding member of the American Art Therapy Association (AATA), recently (1983) told how his own "cathartic paintings" of a psychiatric hospital where he worked during World War II came to the attention of psychiatrist Karl Menninger, and led to an invitation to start an art therapy program at the Menninger Foundation Hospital in Topeka, Kansas. Psychoanalyst Paul Fink provided Myra Levick, the first President of AATA and founder of the first graduate training program in art therapy at Hahnemann Medical College, important support and guidance. Nor would the author have had the opportunity to develop and grow as an art therapist, had there not been a similarly nurturing psychiatrist, Marvin I. Shapiro, who invited her to come and work at the Pittsburgh Child Guidance Center in 1969.

In other words, although Prinzhorn himself was less impressed with early psychoanalytic uses of patient art than he was with a purely aesthetic approach, his psychiatric descendants have not only studied the work of the mentally ill, but have also supported the work of an emerging group of art therapists.

Although Art Therapy as such did not exist at the time that Prinzhorn made his collection of spontaneous patient art, there is no question that the impact of his monograph on the psychiatric community helped to fertilize the soil in which Art Therapy was later able to take root and grow. The very fact that patients so often chose to express themselves through art, helped psychiatrists to value such modes for their communicative as well as their aesthetic potential. The growing number of books and articles about Art Therapy today reflects the rapid expansion of the field.

In state hospitals, like the institutions in which Prinzhorn’s artists worked, and in many other kinds of psychiatric, medical, rehabilitative and educational settings, art therapists today do both diagnosis and therapy—with individuals, families and groups. We have come a long way from the days when mental patients had to rescue paper from wastebaskets in order to express themselves pictorially. We owe a debt of thanks to Hans Prinzhorn, for opening the eyes of the worlds of
“Although Art Therapy as such did not exist at the time that Prinzhorn made his collection of spontaneous patient art, there is no question that the impact of his monograph on the psychiatric community helped to fertilize the soil in which Art Therapy was later able to take root and grow.”

both Psychiatry and Art to the creative urge that sometimes bursts forth in the mentally ill. And we are indebted, too, to his modern-day descendants, the art-loving psychiatrists, for enabling us to help many people in treatment settings to enjoy the benefits of creative activity through Art Therapy.

Grants—Demystifying the Mystique and Creating Job Connections

Frances E. Anderson, EdD, ATR
Doris B. Arrington, MA, ATR

Frances E. Anderson, EdD, ATR is Professor of Art, College of Fine Arts, Illinois State University, Normal, Illinois. Doris B. Arrington, MA, ATR, is Director, Master in Art Therapy Program, College of Notre Dame, Belmont, California.

Since 1980, graduate students at the College of Notre Dame have had the option of writing a grant in lieu of a thesis. Some of these successful projects are detailed by the program’s Director to demonstrate that grants can be viable avenues toward creating jobs. Then, the senior author shares some of her insights and specific guidelines (based on more than 15 years of successfully obtaining grants resulting in funding in excess of $250,000) to assist readers in writing their own grant proposals.

GRANT WRITING CAN BE:

1. Grants can be Financially Beneficial!
2. “Grant” is a five letter word that should be a four letter word!
3. Grants are Political!
4. PROMISES, PROMISES, PROMISES!
5. Grants can be Unbelievably Easy!
6. You’ve heard about the Oldest Profession...and the Second Oldest Profession...Well, Grants are a combination of both. You prostitute your mind, your body and your soul.
7. Grant Writing can be Simple!
8. If you don’t do it, it doesn’t get done!
9. Grant Writing can be Painfully Disappointing!
10. The submission date is THE DAY AFTER you receive the guidelines and the forms.
11. Grant writing is knowing your Buzz Words!
12. From the time you submit your grant until the time it’s reviewed, the buzz words have changed!
13. Grant writing can be Rewarding!
14. Nightmares at 3 o’clock in the morning.
15. Grant writing can be Uncomplicated!
16. What if I get it? How am I going to do it?!
17. Doing a grant can be a wonderful Group Experience!
18. It’s not WHAT you do, but WHOM you KNOW!
19. Getting you first grant is like applying for a job without any Prior Experience.
20. Getting grants is like being rich...Those who HAVE, GET.
21. Getting a grant is Ego Building!
22. After the first month, you realize that you really need five times as much money to do half as much as you promised!
23. Getting a grant can be Tough and Competitive!
24. Things your Mother NEVER told you!
25. A successful grant can give you High Visibility and Professional Integrity!
26. Three quarters of the way through the grant you KNOW you should have lied about your budget... YOU’RE OUT OF MONEY!
27. Grant writing and getting it funded can be a heady Professional Experience!
28. The funding agency GIVETH and the funding agency TAKETH away!
29. Grant writing can be a good way to Create a Job.
30. Grants are like puppy love...they don’t last.
31. Doing a grant is a wonderful Professional Experience.
32. Implementing a grant is like jogging—IT FEELS SO GOOD WHEN YOU STOP!
33. A grant can be a Life Long Professional Journey!
34. Having a grant is like having a fish in your icebox...it smells after three days!
Grantsersonship and the Job Market

While the above list of statements are all true, there is an important point to make about grants and the art therapy profession. As we all know, most art therapists must often create their own jobs. No agency, hospital or special school is "rolling out the red carpet" or clamoring for art therapy or eagerly trying to hire art therapists. As art therapists, we must assume the responsibility for carving out our own niches in the "real world." One relatively unexplored means to do this is by writing and obtaining grants.

In fact, this is one option open to graduate students at the College of Notre Dame. Since 1980, over 40 percent of the college's art therapy students have opted to write a grant in lieu of a thesis. One quarter of these grants have been funded and another quarter are still pending. Of those that were not funded, one half resulted in either full or part-time art therapy jobs due to the students' efforts.

Perhaps it might be helpful to briefly describe some of the funded projects and some of those proposals that led to an art therapy job. One of the first grants funded to do art therapy as counseling in public schools, was written in 1980 by one of the first graduates of the College of Notre Dame program. D. Anderson was facing layoff from his regular job as an art teacher in an alternative high school. He submitted a proposal for an art therapy program to the city of San Francisco. In 1981 that grant was funded, and since then has been refunded.

Mr. G. Loughlin, a teacher of learning disabled children, worked with the Cupertino, California School District to write a grant to establish a classroom for seriously emotionally disturbed children; both verbal and art therapy were to be a part of the regular classroom structure. While the grant was not funded, Mr. Loughlin, working with the same school district, has since established just such a program with supplemental funding from Santa Clara County in California.

V. Appleton, in 1981, wrote a grant to work as an art and play therapist with another art therapist in the St. Francis Bothin Burn Unit in San Francisco County. This grant was funded, and she has continued to work as full-time staff in the hospital's burn unit. She has had ongoing funding for her work since then.

C. Malchioci, another student who moved out of California, used a grant to introduce herself to her new location. She wrote a proposal for using art therapy with battered children. The YWCA funded this project and Ms. Malchioci has continued to submit grants since 1981. To date she has been funded in amounts of approximately $100,000.

Often just going through the process of writing a grant for a private or public agency has helped the student to clarify his/her own role as an art therapist. This process has helped to clearly communicate to the potential funding source the merits of art therapy with a particular clientele.

In 1981, P. Keefe, a graduate and a volunteer at the Crystal Springs Rehabilitation Center in San Mateo County, California, wrote a grant to the state for a Visiting Artist Program. While the specific grant was not funded, Ms. Keefe generated such agency support that the rehabilitation facility hired her. Since then she has continued to bring the center positive public acclaim through organizing ongoing art exhibits of her handicapped clientele.

In another case, T. Moskin wrote a grant in 1982 to fund an art therapist to work in a halfway house for schizophrenics. While the grant was not funded, within a year that very facility, Hawthorn House in San Mateo County, hired an art therapist. A similar situation occurred for yet another student, C. Volberg. Although a grant for enhancing self-esteem through creative expression at a short term residential crisis shelter for adolescents was not funded, she was later hired by the facility.

Another student, V. Crittenden, wrote a grant for an art therapy program within the San Mateo County Women's Correctional Center. Again, the grant was not funded, but from a church group she received alternate funding for this program.

In 1982, B. Stevenson wrote a grant for work with deaf and hard of hearing children. While the grant was not funded, Ms. Stevenson was no longer "mystified" by the grant writing process. Based on her prior experience in grant writing, she was instrumental in successfully obtaining a $20,000 seed grant for Touchstone, a support group for hospitalized children in Santa Clara County.

In 1983, P. Farver wrote an art therapy component for inclusion in the ongoing program in residential homes for disabled adults. Art therapy was used as a communication component in the Individualized Living Skills Grant which the facility received. This funded project was a model program in living skills in Shasta County, California.

That same year M. Anderson wrote a grant (an art-as-therapy focus) to run 10 hours weekly as a part of a residential drug treatment program in East Palo Alto. Although the grant was not funded, the drug treatment center staff was so impressed by the work being done by two art therapy volunteers that both were hired by the facility.

In a similar case in 1984, S. Gleeson submitted a grant for an art therapy program for children who were victims of violence in their own homes. She did not get the grant—but she was later hired by Santa Clara County to work with those battered children.

In 1984, D. Landes wrote a grant for art therapy services for sexually abused children. This was not funded, but the Family Services Agency of San Mateo County wants to consider the proposal again, and will do so when Ms. Landes returns to work after maternity leave.

Recently two students, D. Perry and M. Hunter, who were interning at the Creative Living Center, a day care facility for emotionally disturbed adults, submitted a grant to Marin County, California to cover the salaries of two art therapists for three years. Interestingly, the proposal was returned to the facility with the notation that the amount of monies March 1986, ART THERAPY 35
requested WAS TOO SMALL TO COVER A THREE YEAR PROGRAM. The students were asked to increase the budget and resubmit the proposal. They have done that, and the project is pending.

Thus, we can see from these examples that when people go through the rigors of preparing and submitting a grant, jobs have often resulted, even when the particular grant proposal was not successful. Many art therapists may be extremely overwhelmed by the prospect of undertaking the task of writing a grant. For this reason we have included some suggestions that might help in "demystifying" the grantwriting process.

Some Key Pointers on Grant Writing

First, the agency or foundation is in the business of giving out money. You are helping someone do his/her job. IF YOU DO NOT ASK, YOU DO NOT GET. It will be important to remember that most major corporations have one person in charge of corporate giving. This can be a boring job—and the arts are interesting areas. Thus you have an "in." Also, it is important to realize that large corporations want good public relations—a good image. Art therapy and art for the handicapped are areas that have a "real" mission and an intrinsically good image. Therefore, the program will often sell itself.

Second, if you are approaching a corporation or agency, do research on that funding source. Find out what the funding priorities are of the agency—or find out what sorts of projects the corporation tends to fund. (Most corporations tend to have a pet project or area they like to fund.) You will want to make a visit to that corporation and bring your written grant proposal. Give out ONLY the first page, which should be a summary of your proposed project. This is probably all you should give out. (But have the rest in your pocket, just in case the agency or corporation wants to see it.)

Third, find out what language the corporation or agency speaks. Use that language. If you do not use THEIR language, they will NOT understand what your proposal is about.

Fourth, find out what funding limits the corporation or agency uses as a guideline. If an agency only gives out five thousand dollar grants, then it would be silly to submit a grant for thirty thousand.

Fifth, find out what forms and formats are used and USE those specific forms and formats. In other words, tailor your grant to fit the specific agency or corporation. DO NOT SEND OUT A STANDARD GRANT PROPOSAL FORM TO EVERYONE.

Now comes the hard part—the proposal itself. You should remember two key points:

KISS!
Keep It Short and Simple!
If you cannot scan it, can it.

Most grants should be no longer than 10 pages. No one wants to wade through pages and pages of text.

All grant proposals include the following general categories. Some may be called by another title. But, A ROSE IS A ROSE IS A ROSE!

1. INTRODUCTION/ABSTRACT. Limit this to one page and use LARGE type. It will be helpful to begin with the following statement as an INTRODUCTION. (You fill in the blanks!) YOU ____________________________ (your hospital or institution) seek $ ______ from _______________

Corporation for ____________________________ (Specify what: a program, an evaluation, an arts festival, etc.;) for the time period ______ to ______. Matching funds will come from _________. (Examples: Board contributions, NCAH, California Arts Council).

This project follows ______ number of years of successful festival programs, etc.

2. PROBLEM STATEMENT. (This is sometimes called the "Rationale" or "Needs Assessment.") You are solving some societal problem. It is even better if you have several. You may want to establish the problem via citing research that relates to the issue. Or you may want to clearly document a specific need. If you intend to establish a specific NEED, then you may have to conduct a survey or poll (i.e. a needs assessment) of agencies or clientele. Then you can say: a survey of the all the art teachers in the Bay Area reveals that none have received special training to work with emotionally disturbed children." Or, "A poll of the museums in the area reveals no programs for handicapped visitors." Or, "A preliminary art therapy program in the women's correctional facility revealed that clients were better able to make decisions and to take responsibility for their own actions as a result of participation in the art therapy program. NO other service had the same results; thus, this proposal is being submitted to provide funds to continue this program."

3. GOALS/OBJECTIVES. It will be important to state goals in quantifiable terms. This means that you will need to translate statements like "A greater appreciation for the artistic/therapeutic process will result" as: "The goal is a 10 percent increase in persons served by the program in two months." It will be essential to use objectives that are easy to measure.

4. CAPABILITY STATEMENT. (Sometimes this section is combined with the "Problem Statement" described earlier.) This statement is essentially why you should get money. Show how your project will be cost effective. It also will be important to indicate how long you have been doing this sort of activity. Evidence, such as demand for the program and your services and other testimonials, would be appropriate here. Also, if you are submitting a proposal for your institution, corporations are extremely concerned about your institution's management structure. Is it a good structure, i.e. one which can carry out the programs for which you are requesting funds? THE
“...by going through the rigors of preparing and submitting a grant, jobs have often resulted, even when the particular grant proposal was not successful.”

STRENGTH OF THE ORGANIZATION IS VERY IMPORTANT.

5. DETAILED PROGRAM DESCRIPTION. (Sometimes this section is called “Methods.”) In this section you would include: Plan of Action, Treatment Plans, and Time Line for accomplishing the project. It would be very important to briefly describe week by week what you intend to do. For example, “Week One: Interview potential clientele, meet with project staff, select clientele for project, get legal clearance forms signed. Week Two: Program begins, baseline measured, observations recorded, art work photographed.”

6. EVALUATION. Justification for your project is essential—not just because ART IS ART, OR ART THERAPY IS GOOD—but because you have to be accountable for the effectiveness of your project to laypersons who are not convinced that art therapy has value. It will be important to provide some pre/post measures such as: paper and pencil tests of self-concept; house-tree-person drawings; observational checklists of client behaviors; third party measures of social interactions; video tapes of sessions; visual documentations of work being done; unsolicited comments from clientele; and reports of progress from other staff members who have the same clientele in other programs.

You also should include how you will disseminate information about the program. This would include some outcome such as: an art exhibit, a videotape, a slide/tape package, a presentation at a regional or national conference, an article in a newspaper or professional journal. You should remember that the funding agency wants to see some tangible outcome of its funding of your program. You want to provide good public relations for art therapy, your specific program and the funding agency or corporation.

7. FUTURE FUNDING. It also will be important to include plans for future funding of this kind of program. Future funding might be via clientele fees, grants from other agencies, or corporation grants.

8. BUDGET. Give a detailed accounting of all items. Be sure that you check on actual costs of items and briefly explain why you have included the items in your budget. It will also be important to list the value of “in-kind” contributions (any support other than actual dollars such as provision of space, use of office equipment, secretarial help) after the rest of the budget. Do not hesitate to include ALL possible in-kind contributions. This accounting makes your project look better—that is, the agency knows that you are really giving them something.

9. FINANCIAL STATEMENTS. This section is important only if you represent a nonprofit institution asking for a grant. If you are submitting your proposal through some agency, you should include that agency’s Internal Revenue Service Tax exempt statement. It will be important to establish the “financial soundness” of the agency through which you are submitting your grant proposal. No agency or corporation will give monies to an institution that is not financially sound. NO ONE WANTS TO GIVE MONEY TO A SINKING SHIP!

10. REFERENCES. You should include FULL bibliographic citations for all studies and/or experts cited in each and every part of your proposal narrative. You should find out what style manual (i.e. Turabian, American Psychological Association Manual, etc.) is preferred by the funding agency and use that format.

11. LETTER OF APPROVAL FROM AGENCY. This is necessary only if you are submitting your grant via an agency. Your grant proposal should then include a letter from the agency saying they approve of your proposed project.

12. PROMOTIONAL MATERIALS. Again, this would be important if you are submitting your grant through an agency.

13. RESUMES OF ALL STAFF INVOLVED. Some Federal agencies have a special one page form that you must use for each staff person involved. It will be important that you include only current and pertinent information in the staff vitae. The funding agency is not interested if you were president of your high school cheerleaders or a halfback on the soccer team. Do not forget KISS!

14. LETTERS OF SUPPORT. Get testimonials from “neutral,” highly visible persons. It will be very important to find out what impresses the agency/corporation to which you are submitting the proposal. If this is a Federal agency, try to get congresspersons to send letters. If the project is an individual submission, get letters from state arts councils, the American Art Therapy Association, or other related professional organizations such as the American Association of Mental Deficiency, Easter Seals or the local chapter of the Muscular Dystrophy Association. Another potentially strong source of support could be letters from parents in local associations for handicapped children.

“Often just going through the process of writing a grant for a private or public agency has helped the student to clarify his/her own role as an art therapist.”
“Art therapy and art for the handicapped are areas that have a ‘real’ mission and an intrinsically good image.”

Other Helpful Hints

In writing a grant proposal, should you ask for more funding than you think you can get? Do not hesitate to be as realistic and honest as you can in your proposal. It is usually a wise idea to plan a program that will cost a little more than you think the agency might fund. Often projects are approved, but for 10 to 20 percent less money than are requested. If you have to cut your budget, be sure you also eliminate a part of your proposed program. Generally most Federal agencies cut budgets as a usual practice.

If you are a little unsure in writing a grant, team up with someone who may know the jargon of the corporation or agency and work with that person. This was how the senior author got her first major Federal grant.

It may also be helpful to get a highly visible expert or professional who is already known in the field to serve as the Project Director—purely as an honorary title with no actual time spent on the project. This may mean that your name does not appear as the initiator of the project or as the person who will run the project (even though you will be implementing the grant). This means that your ego will not get the strokes for writing and doing the grant—but it COULD mean the project will get funded. You may have to make the tough decision to give up “kudos” in order to get the grant. This was how one major grant was obtained by the senior author. She had to list two highly visible professionals as the Project Directors. She did not get the top billing for the project—nor credit for running the project. However, this was the only way that the proposal could be funded AND IMPLEMENTED at her facility.

Most universities have a grants office with lists and books of corporations’ foundations and agencies that give out funds. These books are divided by geographic location and by topics/areas in which they award funds. A rule of thumb is that the closer you or your agency is to the funding source geographically, the easier it is to get your project funded. Sometimes it is easier to go for a smaller grant that is funded by a local group or business than to go for a huge project that would be funded by a Federal agency.

It also is very helpful to peruse a funded grant or two written for the same type of corporation or agency for which you are planning a proposal. It is always easier to follow someone else’s successful model.

If you fail, try, try again. The competition for grant funds is tough and one out of 10 or 20 might get funded. Also, know that, at least for Federal grants, the funding agency will send you the reviewers’ comments on your proposal so you can “clean up your act.” We know of one person who applied 10 times to a private agency before she scored. PERSISTENCE PAYS. IF YOU DON’T ASK, YOU DON’T GET.

We hope that this information has been helpful to you. We feel that writing grants is never easy—but rewarding. Even if you are not funded, the process may well lead to a job and, at the very least, you will be spreading the good news about art therapy to the uninitiated.

Resources
(Listed in priority order, not in alphabetical order)

1. Someone with grant writing experience.

Editor’s Note:
Excellent references that may be found in any library are: The Foundation Directory (specializing in foundations), the Catalogue of Federal Domestic Assistance (listings of governmental funding programs), and the Annual Register of Grant Support (a comprehensive register).

For information on periodical literature, newspapers, library materials, institutional grants offices, and subscription information services, an excellent source is as follows:

“You want to provide good public relations for art therapy, your specific program and the funding agency or corporation.”
The Fantasy of Art Therapy Enters the Mainstream

Harriet Wadeson, PhD, ATR

Well Gang, we’ve made it! Some say it was Margaret Naumburg who put art therapy on the map. Others look back to Prinzhorn. But at this moment, I would like to credit Andrea Freud Loewenstein. (Freud?) Yes, Andrea Freud Loewenstein, for introducing art therapy into our culture’s fantasy life through her creation of Sonya, art therapist at Redburn Prison for Women in her novel, This Place (Pandora Press, Routledge & Kegan Paul, Boston, 1984). Although art therapists have expounded in the written word prolifically over the years, our audience has consisted mainly of other professionals. But now we have captured the imagination of at least one contributor to our current culture. As members of a profession with creative expression at the core of its efficacy, art therapists readily recognize the import of a novel’s main character created as an art therapist. Her appearance in this form for our society is comparable to such a creation in a dream or portrait created by an individual. What this means is that art therapy is no longer simply understood rationally as an extant mode of treatment. Now it is also imbued with the power of fantasy as it strikes sparks in the imaginations of those who create our culture and shape our ideas and images. In other words, art therapy has entered the world of art in the forceful and influential appearance of Sonya.

Andrea Freud Loewenstein’s novel is told in the four voices of its central characters, two prison inmates, a social worker, and the art therapist. Sonya is new to the prison system and is at first a breath of fresh air and courage in a world of oppression and intimidation. Loewenstein is particularly vivid in her wonderful word-pictures of the inmates’ first ventures into art and Sonya’s own sculptures inspired by prison life. Sonya is portrayed as a warm, open, sensuous free spirit—a sympathetic character among the tough, crazy, or self-destructive prisoners and the rigid non-caring staff. Alas, however, her rosy glow fades, and to the credit of the novel’s complexity, those who initially appeared weaker are those we truly care about at the end. So, how does art therapy fare? Sonya lets us down, as she does everyone with whom she is involved. Interestingly, one of her gravest mistakes is to underestimate the power of art for a psychotic inmate whom she appeared to be helping. As one of the four “voices” of the story, this inmate’s thoughts are available to us so that we can see the power her art and her art therapist held for her. Although this power and Sonya’s lack of comprehension of it lead to the tragic denouement of the central characters’ lives, we are nonetheless left with the impression that it is the system and its insensitive administrators that are at fault, as well as our society, rather than the central characters of the book.

This Place is a compelling novel that moves swiftly through the intricate relationships in the world of a women’s prison. We come to know and care about its unheroic heroines and learn about a world we seldom see. I am not attempting a book review here, but rather noting art therapy’s place in this particular novel. Its central position emphasizes its significance to the author and by extension to those who are influenced by her writing. That the person of the art therapist is ultimately selfish and disconnected from those to whom she has been important appears to be her personal failure rather than an attribute of her profession. The major detrimental reflection on art therapy is that Sonya apparently is not very well trained, particularly in her disastrous handling of termination.

Sonya is but one art therapist. As we capture the imaginations of other culture creators, more of us will be created. Just as we read of good and evil doctors, priests, nurses, artists, so art therapists will probably come in all sizes, shapes and colors. What puts us on the imaginative map is that the power of our work is such that dreams are made of.
Book Reviews

Handbook on Adolescence
Carl P. Malmquist, MD, New York, New York: Jason Aronson, 1985
877 pages

Reviewer Shirley Riley, MA, ATR, MFCC, is Senior Staff Family and Child Division of Didi Hirsch Community Mental Health Center; and a member of the faculty of Loyola Marymount University Master’s program in Clinical Art Therapy. She is also Field Placement Coordinator, Supervisor, and Instructor with a major focus on work with adolescents.

For those of us who deal with adolescents or with adults having residual problems of adolescence, it is a joyful occasion to find Carl Malmquist’s book again available. This second edition was recently republished, and we hope will remain on the market for an extended period of time.

The art therapist becomes a more valuable member of assessment and treatment planning for the adolescent when she compares her observations of material in the artwork with the “norms” of pubertal and adolescent development. The youth in treatment is often the youth with some discord between chronological and maturational growth. Either physical or emotional pacing is out of phase with how society, family or self expects the young person to perform.

Art therapists cannot look to a great deal of material in their own literature for help in adolescent treatment. However, they can be effective if they have a broad understanding of adolescent development and of the psychological problems that arise when this development malfunctions.

For this reason, I recommend Handbook of Adolescence. I have not found any other text to contain this amount of valuable information under one cover. Malmquist devotes the first chapters to defining the stages of adolescent development, from preadolescence through early, middle and late adolescence. He then is concerned with biographical growth and sex-role standards. These sections are basic to all books on this age period; Malmquist not only informs us about what to look for, but also how the adolescent himself/herself sees the importance of these issues.

The author then moves on to the problems that we see in the mental health setting: antisocial behaviors, neurotic and character disorders, and finally the psychotic. He ends with a look at the judicial system.

The last chapter is a valuable contribution for beginning therapists, as well as for those of us who need some refreshing concerning the particular thera-

peutic approach that is necessary in the treatment of adolescents.

This extensive text (877 pages) is worth the time and effort required to take in that amount of material. Carl Malmquist is a recognized authority on the treatment of adolescence, and his thoughts on masked depression and on suicide, hysteria and youth’s view of death are most helpful. Adolescence is a period of life where the person often acts in such a disturbed manner that assessment and planning of therapy goals are very demanding. Avoiding the pitfalls of unwarranted labels, premature hospitalization, or neglected therapeutic support when needed is of the greatest concern to the therapist responsible for this age group.

The clinical art therapist who is familiar with the theoretical material can use the art product and related verbalizations offered by the adolescent client to responsibly make better treatment decisions. The art work often reveals the incongruence between chronological age and developmental age, which cannot be seen as clearly in the youth’s behavior. However, without the knowledge of what to expect from the adolescent in terms of normality or pathology (the material available in this text); all the art work produced may not be useful in helping the therapist find a way to solve the problems that bring the youngster into treatment.

The book is written with the thought that the adolescent lives in a family and in a society, and is acted upon by schools, mental health institutions and judicial institutions. This approach, which confirms that the youth is embedded in a system and not a “psychological entity” unto himself, is an additional strength of this excellent volume.

I recommend that individual practitioners of art therapy and educators of art therapy students review this text and utilize it both for their treatment of adolescents and for their teaching of that specialized skill.
These two books describe the process of sandplay therapy with children and adults, from a Jungian perspective. Dora Kalff’s book provides a brief theoretical introduction, based mainly on the work of Carl Jung, Erich Neumann, and Eastern thought. She then presents the case histories of seven children and two young adults. Estelle Weinrib gives us a much longer introduction to various aspects of sandplay (88 pages), and a detailed account of the treatment of a young man, in his late twenties, over an 18-month period. Both writers make extensive use of black and white and colored photographs of their clients’ sand trays. Weinrib also offers a useful glossary of some key Jungian concepts. Both sets of bibliographies, unfortunately, leave out major references cited in the text.

What is sandplay therapy and how successful are these writers in conveying the practice of sandplay? Both rightly inform us that the experience involves much more than sandplay. The practitioner needs to be grounded in theory, to have a knowledge of the language of symbols, and to be aware of and know how to use transference and countertransference phenomena. Both therapists use many other approaches—play, painting, story writing, dream analysis, etc.—depending on the needs of their clients.

Children, of course, have played in sand, earth, dirt and mud since time immemorial. There is something very freeing about the tactile experience of sinking your hands and arms in wet sand, tunneling, burrowing and playing in it with small toys. The use of sandplay in therapy can be traced back to the English pediatrician, Margaret Lowenfeld, who established the Institute of Child Psychology in London in the 1930s. In her youth, Lowenfeld read H.G. Wells’ book, Floor Games (1912), where he described the many invigorating hours he spent on the floor playing with his children. Lowenfeld had sand and water trays built for her clinic, and gathered many small toys together in a box. The children came to refer to this box as “the world” and Lowenfeld called her approach the “World Technique.” The method was brought to the United States by Charlotte Buhler, who used it primarily for diagnostic purposes.

Dora Kalff, a gifted pianist, was encouraged by Jung to become a child psychotherapist. She met Lowenfeld in London at an international conference in the late 1950s and studied with her for a while, before returning to Switzerland to use the method from a Jungian perspective. Kalff worked first with children and then adults. She noticed that through play, conflicts were expressed and healing occurred. Weinrib, a Jungian analyst and a former student of Kalff’s, gives a good description of the basic components of sandplay. The basic equipment is a rectangular tray, 28 x 19 x 3 inches, half-filled with sand, and lined with sheet metal or heavy plastic painted light blue. Sand can thus be moved around to create an image of sea, lake, pond, or river. Many miniature toys are arranged on open shelves, so the client can choose as he or she wishes. The toys should represent a wide range of symbolic objects sufficient to create a miniature “world.” The clients are encouraged to play or create as they wish. The therapist sits quietly at a little distance observing, listening, empathizing, experiencing and thinking, but verbalizing only a little. After the session is over, the therapist may request comments and associations, or may ask the client to tell a story about the sand picture or to explain a particular area. The therapist does not offer interpretations, nor does she press or confront the client at this time. After the client has left, the sandtray is photographed, and is then dismantled. Later, towards the end of therapy, the slides or prints might be shown to the client, and used as a basis for deeper understanding.

In many ways the two books are quite similar. Indeed Weinrib quotes Kalff liberally throughout her volume. In both the theoretical and practical areas, Weinrib expands on Kalff’s work. She hypothesizes that a healthy mother-child relationship constellates, between the ages of two and three, the archetype of the Self. This constellation is manifested in mandala images, and reflects a unity of the conscious (in Jungian terms the “ego”) and unconscious mind. This experience of “wholeness” becomes internalized, and greatly facilitates the next stage of psychological life which is the various aspects of ego development.

Often clients come to therapy impaired in ego functions, due to primary damage to this mother-child unity, and to the lack of an internalized image of wholeness. Sandplay, because it operates on a matri-
archal level of consciousness (i.e., on a preverbal symbolic level), offers a “free and protected space” where instinctual struggles can be expressed, reenacted and resolved through play. The miniature figures become “containers of feeling,” which help to externalize conflicting emotions and to give rise to new healing symbols. At this stage, interpretations do not have to be made by the therapist because they are “known” and experienced by the client on the “felt” level. Mrs. Kalff’s case histories give many examples of symbolic resolutions and the freeing of libido, passion and energy for new growth.

There is a depth and an integrity to Mrs. Kalff’s book that is somehow missing in Weinrib’s work. The experience, sensitivity and wisdom of a highly skilled psychotherapist emerges clearly in Kalff’s writing. The success of her work reminds me of Jung’s observation that much of the outcome of psychotherapy depends on the relationship the therapist has to his or her unconscious.

In contrast, I found the theory and practice sections of Images of the Self disjointed and repetitious. The book did not flow or evolve coherently for me. Likewise, the case study was replete with so many archetypal symbolic amplifications, that I found myself losing touch with the immediacy of the client himself, his struggles and resistances. I see this as a potential danger in the Jungian approach—that the therapist’s fascination with the meaning of symbols and their historical and cultural evolution, can detract from empathizing with the present psychological experiences of the client.

Rosegarden and Labyrinth: A Study in Art Education

Seonaid Robertson, Dallas, TX: Spring Publications, 1982.

Reviewer Judith Snider is a graduate student in the Department of Counselling Psychology, Faculty of Education, University of British Columbia.

In Rosegarden and Labyrinth, Robertson takes the reader on a journey following much the same course she herself travelled in search of answers to questions about art and art education. How can art be a vehicle in the process of finding a way to one’s center, to one’s core? How can art teachers develop the awareness and sensitivity to facilitate that process? The answers to these questions becomes clearer as Robertson discusses the concrete, practical details of her work with eleven and twelve-year-old English school children, with fourteen and fifteen-year-old working class boys in a coal mining town, and with a group of teachers. Woven into these discussions is an exploration of symbols and of two archetypal images—the Rosegarden and the Labyrinth.

Robertson’s interest in archetypal themes and their place in the teaching of art eventually led to a more formal research project. She had the assistance of twelve teachers, who volunteered to use selected evocative themes in their work with 11- to 17-year-old youngsters. In testing her hypothesis that relevant topics were what inspired the creation of haunting art work, Robertson learned that there were some themes which produced, in the artist, an intense state of concentration, a deep satisfaction with the product and a feeling of being more “centered.” These archetypal themes, which root the artist in the traditions of the past, and at the same time have a revitalizing effect, are at the core of Robertson’s concept of art education.

Rosegarden and Labyrinth offers an excellent critique of what often passes for art education—and puts forward an alternative approach that is much broader than that expressed in much of the current literature.

Robertson views art and the teaching of art in the context of a world in turmoil, one in which the development of the human soul has not been a priority. In art lessons with children and adults, Robertson takes into account their life experience and their current situations and aspirations. In so doing, she is able to educate on many levels. For example, she might even include in a clay session with miners’ sons, whose fathers are a lot of power in their homes, a discussion of early matriarchal communities.

Unlike some art educators, whose focus might be on the achievement of a quality product—often as a result of learning a series of techniques—Robertson’s focus is on the process. She does not try to make her students artists, but rather gives them an opportunity to become “utterly absorbed in an activity which will take them down through the layers of their own personalities, extending their limits of experience.” (p. 90).

Robertson also offers many practical suggestions. While she describes the ideal art lesson as one in which each student works on his or her own project, receiving individual help from the teacher, she is also aware of the realities of the system. If it is necessary to teach a large group together, Robertson recommends that children have the right to opt out of the activity until the creative urge strikes. Specific techniques used in her work with adolescents and adults are also described in detail, and useful tips, such as how to assist a student locked into stereotyped images, are
presented. She also has included in her book the list of painting themes used in her research.

An important question for art educators and art therapists is the relationship between technique and spontaneous self-expression; this issue is addressed several times in this book. According to Robertson, techniques should not be learned for their own sake, only insofar as they contribute to the creative act. The art lesson, in her opinion, should alternate between the expression of spontaneous feeling, and more deliberate exercises exploring different media and techniques.

For those art teachers and art therapists who view art as more than mere self-expression or the study of techniques, and like Seonaid Robertson, see it as a process of spiritual searching, *Rosegarden and Labyrinth* can be a valuable tool in helping others to carry out that search.

Journal Multi-cultural Theme... Papers Still Accepted

Dr. Shaun McNiff, ATR, and Dr. Gary Barlow, ATR, continue to plan an issue of *Art Therapy* focusing on multi-cultural issues and the sharing of international concerns in art therapy. People working in the cross-cultural modalities are invited to send manuscripts, or to submit special features or photographs. For more information, write to the Editor, or to Dr. McNiff, Dean of the Arts Institute, Lesley College, Cambridge, MA 02138.

***

Call for Photographs

Do you have photographs (black and white, glossy) that you would like to submit for review and possible publication in *Art Therapy*? Or maybe you have that ideal color photo that might be a good cover for the journal. You are invited to submit them for consideration. Simply identify, on the back of the photo, the title, something about the artist, and other pertinent information. If the work is from a patient or client, a release form must be signed and on file. Please send photographs to Gary Barlow, *Art Therapy* editor, at the above address.

Projective Drawings Workshops Planned

The American Projective Drawing Institute will offer two Summer Workshops this year in New York City: Basic July 21, 22, 23; Advanced and Cases Seminar July 23, 24, 25. *The Clinical Application of Projective Drawings*, Hammer, E.F. (Ed.), Charles Thomas, Publisher, 2600 South First St., Springfield, Illinois 62717, is suggested as preparation for the workshops. For information write to Dr. Emanuel Hammer, 381 West End Avenue, New York, New York 10024.
GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or holding office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic practice of art therapy, including those who conduct research, provide training, or work in the arts in psychotherapy, including dance, music, poetry, and drama by psychotherapists and by psychiatrists and psychologists which reflect advances in theory, research and practice. There are no restrictions on philosophical orientation or application.

AN IMPORTANT SOURCE for news and summaries of national and international conferences and current educational information relevant to the creative arts in therapy, THE ARTS IN PSYCHOTHERAPY contains book reviews, welcomes letters to the editors, dialogue among contributors, has International Editorial and Advisory Boards of highly respected specialists who represent a wide spectrum of experience. It appeals to scholars and practitioners of the arts in psychotherapy and to psychiatrists and psychologists.

THE EDITORS WELCOME ORIGINAL MANUSCRIPTS.

Bits and Pieces

With this issue, the American Art Therapy Association begins its journal publication with a new management firm, Stiggar and Willis—(Edward Stiggar, Executive Director of A.A.T.A., and Robert Willis, Assistant Executive Director)—located in Mundelein, Illinois. As Editor, I have been working with Sharon Purtell who will be closely associated with the publication responsibilities of A.A.T.A. Assembling an issue of Art Therapy requires the balancing of a myriad of details, and I have been helped immensely by the thoughtfulness and insight Sharon has exhibited. Her work on this issue is much appreciated, and I look forward to our work together on the future issues of the journal. Welcome to our new Executive Director, Assistant Executive Director, and to the office staff and personnel!

Occasionally, one who is entrusted with a job such as Editor of a professional publication must step back (translation: maintaining a distance) and take an objective look at the product and the people responsible for it. In the day-to-day and month-to-month work on a publication, one can become so enmeshed with the product that it is sometimes difficult to maintain this “objective separateness.” Nevertheless, now that eight issues of Art Therapy have been published, I am attempting this objective evaluation for purposes of looking to the future and to the publication in the years ahead. At this time it is important to publicly give heartfelt and sincere thanks to the many persons who are committed in helping this journal to continue to increase its professional significance. Thanks go to the Editorial Board members for their devoted work toward making the journal a major publication in our field, and for their responsibilities for the various sections within each issue . . . and certainly I value highly the skill and contagious enthusiasm of the dedicated Contributing Editors (their names are listed in each issue) who read the manuscripts, offer suggestions to the Editor, and serve as a creative force behind the journal. Appreciation is offered to the many others (readers; professionals in art therapy and other related fields; designers, printers, publishers and technicians; academicians) who have offered advice and direction . . . and to those of you who have jotted a note or telephoned regarding your support and constructive comments about the format, design, articles or other points relative to an issue. All comments are welcome, and since the journal is your journal, I am pleased that you are helping to let it “speak” for you.

Some readers have been concerned that their articles are not processed as quickly as they would hope. My apologies go to you for what has been, occasionally, unnecessary delays. Part of this, of course, has been due to the change from the previous management firm location in Reston, Virginia, to our National Office located in Illinois. Also, during the past few months, the submission of articles has increased. Please keep in mind that each article is sent to Editorial Board members for review and recommendations; these are then sent back to the Editor for final decisions that are then passed on to the authors. Please be patient—but keep those articles coming! It is gratifying to realize that in our profession we do have great numbers of people who are writing and documenting for publication.

Contained within this issue are thought-provoking articles covering a variety of subjects. Debra B. Greenspoon presents “Multiple Family Group Art Therapy,” as a treatment modality with, as she points out, “little recognition in the literature.” The cases presented offer the A, B, C, and D families as productive individual units, then becoming increasingly intertwined and mixed in a more complex pattern as the families move into multiple processes.

Pat Levinson offers an article titled “Identification of Child Abuse in the Art and Play Products of the Pediatric Burn Patients.” Art and play therapy are utilized as projective modalities in the Bothin Burn Center, San Francisco. With the intensive focus on child abuse, the author states that “this article is based upon nine years of looking at art and play products and extrapolating recurring, pervasive themes that are often used as legal, admissible evidence in child abuse cases.”

David R. Henley’s article “Approaching Artistic Sublimation in Low-Functioning Individuals” presents a thoughtful view of art and process with special populations. He states, “It is now known that the retarded, the autistic, and the severely multiply handicapped child is capable of creating highly unusual and provocative works of art.” The reader is introduced to Robert, a young man with Down’s Syndrome, and with severe mental retardation. Henley’s discussion of artistic sublimation in low-functioning persons tenders much content for thought and discussion.

In the article “The Influence of Art-Making on the Transference Relationship,” Harriet Wade shows presents focus on the art therapist, the art-making process, transference portraits, transference to the institution, and counter-transference issues for our understanding and deliberation. Examples (words and pictures) within each of these categories are given, illustrating brief vignettes as they have occurred when the author served as an art therapist with clients.

Finally, make plans now to attend the American Art Therapy Association’s 17th Annual Conference, to be held in Los Angeles, California in November. Details are included in this issue. The theme of Conference is “Coming of Age,” and it promises to be a good one. I look forward to seeing you there.

Gary C. Barlow, EdD, ATR
Editor, Art Therapy

52 ART THERAPY, July 1986
Multiple-Family Group Art Therapy

Debra B. Greenspoon, MA, ATR, has a private practice in Los Angeles and is a part-time faculty member in the Graduate Department of Clinical Art Therapy at Loyola Marymount University.

This article explores multiple-family group art therapy through the development of a theoretical framework and the exploration of case material. Pertinent literature is briefly examined in order to establish a treatment model and rationale. The remainder of the article presents examples of artwork in an ongoing multiple-family art therapy group, focusing on the utilization of this process for both assessment and intervention.

Multiple-family art therapy is a new treatment modality with little recognition in the literature. It is based on integrating family art therapy with multiple-family group therapy, a combination that enhances the benefits of each and provides a unique opportunity for the families involved. This article presents an overview of a year and one-half long multiple family art therapy group, with focus given to its particular benefits.

Review of Multiple-Family Therapy Literature

A survey of the literature on multiple-family group therapy suggests that the core benefits of this modality can be divided into three categories. Since all the authors examined (Blinder, Colman, and Kessler, 1965; Cunningham and Matthews, 1982; Davies, Ellenson and Young, 1966; Donner and Gamson, 1968; Leichter and Schulman, 1972; and Leichter and Schulman, 1974) articulate similar viewpoints about these groups, their writings are assimilated and divided into the three categories perceived by this writer.

The first benefit addressed by the researchers was the exposure to different systems experienced by the families involved in a multiple-family group. There was unilateral agreement that the interfamilial interactions impacted on the intrafamilial behaviors and insights. Blinder, Colman, Curry and Kessler (1965) explain how “the scrutiny of all the other families present acts as a powerful counterforce against the system remaining closed.” (p. 564)

Leichter and Schulman (1974) reinforce this idea of the potential impact of one family on another when they say “the exposure to different systems may be the only way to shake up their own.” (p. 96) Davis, Ellenson and Young (1966) discuss the process involved in the way one family can affect another: “In conjoint family group therapy, the members of a family increase their awareness of other families’ processes and apply this knowledge to understanding their own family process.” (p. 145)

In addition to the potential for exposure between different family systems, multiple-family therapy also provides access to parental substitutes for the children in the group. Leichter and Schulman (1974) discuss the way in which the collective resources of the parents make available diverse strengths to meet the children’s needs. When they claim that “Multi-family group therapy can be very helpful for the family with a missing parent—usually the father” (p. 96), they are referring to the way in which these groups can help supplement the often depleted resources of the single parent. On a more dynamic level, Leichter and Schulman (1972) point out how the provision of parental substitutes offers opportunities for the family members to experiment with new behaviors: “In multi-family therapy group, each individual has a chance, in the presence of his actual family, to transfer onto other group members as well as to try himself out in ways which his own family is not yet able to tolerate.” (p. 176)

The third category of benefits involves the concept of intergenerational communication. Leichter and Schulman (1974) address the value of facilitating interaction between children and parents of different families. They express an understanding of how such interaction can enrich the intergenerational rapport in the original family. “While it is very difficult for children and parents to change the image they have of each other, in the multi-family group, adults and young people have a chance to experience the universality of human needs and emotions across family boundaries.” (p. 101)

This division into benefit categories (i.e., system impact, parental substitution and intergenerational empathy) provides a framework to understand the value of multiple-family groups and ultimately to explore the multiple-family art therapy modality. It is important, however, to first review the literature that discusses the value of art therapy techniques in work with families.

Review of Family Art Therapy Literature

Several authors (Kwiatowska, 1978; Landgarten, 1981; Rubin, 1978; and Wadson, 1980) have articulated the value of utilizing art expression to facilitate family therapy goals. The benefits of family art therapy seem to emerge into two main categories: diagnostic clarification through evaluation of the art process, and facili-
tation of change through the art tasks themselves.

The concept of using art as a diagnostic tool for individual psychopathology is supported by authors of many disciplines, but it seems to be the art therapists who have contributed most to the exploration of its use in family assessment. Langgarten (1981) articulates the unique role graphic expression can play. She states, "The artwork is concrete evidence of the family's interactional performance. Where verbal dynamics reveal the family's manifest style of communication, nonverbal visual elements provide a dimension for displaying the subtle mechanisms which are in operation." (p. 21) Because the art process is an activity that minimizes the generational differences in communication abilities, it can involve all family members simultaneously and record the dynamics, the roles and the defense mechanisms at play in the whole system. In addition the graphic expression remains a concrete record for the ongoing assessment of change over the treatment period.

Art expression utilized in family therapy can have a second important function, that of aiding the therapeutic goals themselves. Wadeson (1980) suggests how the art process can release blocked communications and rigidified roles: "Although role relationships are often inflexible or assumed initially, the introduction of this new mode of expression can supply leverage so that a family may provide more space within itself for the movement of its members, both in family roles and position." (p. 281) Landgarten (1981) points out the way a directed art process can facilitate the goals of a systems approach to family work, "Within the art therapy approach, a large portion of the intrusion is accomplished through the dynamically oriented method of requesting families to create mutual art tasks with a variety of themes, art media and at times, role designations, which are therapeutically based." (p. 23)

The few authors who do discuss multiple-family group art therapy (Landgarten, 1981; Rubin, 1978; Wadeson, 1980) list a variety of benefits that echo the previously cited literature. They discuss how the art process offers a variety of communication experiences that can be utilized by all family members simultaneously, and how the multiple-family process offers unique opportunities for recognition and exploration of the communications.

Introduction to Multiple-Family Art Therapy Group

The multiple-family art therapy group, identified in following sections, was an outgrowth of a multimodality day treatment department in a large residential facility for children. Three families were initially selected for participation and a fourth was added after one of the original families left the group. Each of the families was composed of a single mother and a latency age child enrolled in the day treatment program with only one of the families having a second sibling. (See Diagram No. 1.)

Issues of separation and autonomy pervaded the difficulties in all these families as the overwhelmed, depleted mothers struggled with responses to the special needs of their ego-damaged children.

Beginning Stages of Group

In the early weeks of this group, emphasis was placed on helping the families gain familiarity with this modality of self-expression and become acquainted with one another. Consequently, very little initial direction was given and most of the products from this stage grew out of "free choice" experimentation with the materials. Several examples have been selected to illustrate the way in which the artwork provided not only a diagnostic picture of these families but also a vehicle for them to connect and find support through the acknowledgement of mutual struggles.

Figures 1 and 2 were created by the A. family. Both the marker drawing and the clay sculpture depict the affective state (depressed) and the core difficulty (isolation) of this family. The drawing, created by Mrs. A. and Billy A., is not only impoverished but also separated into two unintegrated parts. Mrs. A. (using a blue marker) drew about her frustrated response to her sons bickering while Billy A. (with a green marker) concentrated on the home, identifying mother's bedroom and symbolizing the sibling rivalry for her attentions with the two-sided ascending stairway. Mrs. A. and Billy A. spoke about this drawing sadly, recognizing its representation of their relationship but concerned about the group's reception of this depiction of a family crisis. The clay sculpture, created two sessions later by Mrs. A. and her two sons, represents a much more invested participation in the art process for the...
entire A. family. Although Mrs. A. portrays herself as passive, self-enclosed and unavailable, the self-satisfied peaceful quality of her figure stimulated Mrs. A. to comment on her conflicts between her own needs and the demands of her sons. Both Billy A.'s and Bobby A.'s self-representations suggest the idiosyncratic manners in which they respond to their mother's struggles: Billy A. with efforts at compensation (his small arms try to embrace the family) and Bobby A. with acting out behaviors (the legs of a trouble causing wizard perch on his head). This sculpture and the drawing which preceded it combine to accurately reflect the manner in which the A. family presented itself in the beginning stage of this multiple-family art therapy group. Beginning to risk self-disclosure, the A. family found safety in this group which provided for them as individuals and encouraged them to interact as a family.

The B. family responded differently to the beginning stages of this group. More skeptical about the benevolent nature of this modality, Mrs. B. and Marla B. maintained an ironic attitude toward their art projects. Nevertheless, Figures 3 and 4 illustrate the manner in which the art process provided this highly defended family with a way to share its pain. The B. family members began Figure 3 by tracing and designing outlines of their hands on separate pieces of paper. In the process Marla B. duplicated her mother's color selection and flamboyant style of embellishment, signifying her attempts to connect and identify with her parent. Mrs. B.'s bandaged self-representation, followed by her admonishment to Marla B. that her daughter's hand must "only lightly touch hers," served, however, to thwart Marla B.'s enthusiasm. In apparent reaction Marla B. stated that the project was unfinished and drew in the cat, explaining how it had eaten the missing half of the heart she hastily sketched above Mrs. B.'s hand. It seems likely that Marla B.'s spontaneous additions represent a regressive reaction (i.e. the age-appropriate effort to identify, once frustrated, became an aggressive effort to incorporate). This symptomatic solution to the interactive conflicts in the family reflected the coping patterns the B. family characteristically utilized. Graphically illustrated in the artwork, this interaction became available for observation by the therapists, by the family itself and no less importantly, by the other group members. Thus began the first step in this family's evolution toward mutually shared self-expression. In the plasticine sculpture of Figure 4, Marla B. repeated her self-representational symbol of the cat, this time even more clearly...
releasing her aggression in the cat's direct attack on her mother's equally self-representational parrot. Like Mrs. A.'s self-contained clay sculpture, Mrs. B.'s self-representation suggests self-absorption and unavailability. The children's artwork appears to be a reaction to this dynamic.

The C. family's first attempts at family art projects were less successful, and its failures evoked strong responses in the other group members. Figure 5, a marker drawing that quickly disintegrated into hostile chaos, accurately portrayed the state of the relationship between Mrs. C. and Natalie C. The group's reaction to this depiction of the interaction between emerging adolescent anger and a parent's impoverished ability to contain it, was strong. The severity of the disturbance evident in the drawing shocked the families into acknowledgement of a system other than their own, but more importantly, it provoked the members to express empathy. Figure 6 represents an equally unsuccessful attempt for the C. family to work together on the same piece of paper, but this time observation of the process helped the group members gain understanding of the interaction. Mrs. C. and Natalie C. began work on this collage by individually choosing pictures that interested them but making no conjoint decisions about theme or topic. Each then glued their selections on the page in a relatively integrated manner. Without any discussion, Mrs. C. drew a line that linked all the pictures together with the title, "The Tree of Life." This addition appeared to agitate Natalie C. and she impulsively removed the pictures she had selected, thus leaving the collage in the disintegrated state it appears in Figure 6. Mrs. C.'s tendency to merge with her daughter provoked Natalie's brutal attempts at separation and resulted in this graphic representation of the family's pain. This was the first art project to stimulate an interactive group discussion in which the other mothers shared their perceptions that things might have worked out better had Mrs. C. conferred with her daughter about linking the pictures. This discussion served to mark the transition from the beginning stage of the group where emphasis was on facilitating self-expression to the middle stage of the group which would encourage group responses to each family's art productions.

Initially, the three families in this group responded very differently to the self-expressive potential in the art materials. The materials they selected, the way they worked together, the degree of self-exposure they could tolerate and the manner in which they discussed their projects all combined to present a rich picture of each family to the group as a whole. The art process was invaluable in providing these families with a nonthreatening expressive modality and the multiple-family aspect provided relief from isolation, a sense of universality in their struggles and a glimmer of hope for these conflicted families.

**Middle Stages of Group**

As the group members felt more familiar and comfortable with each other, they moved into a middle stage of development by identifying issues and exploring problem-solving methods. In order to increase discussion and interaction among group members, directed art tasks were employed that focused on exploring their symptomatic interactions. The next four figures illustrate the ways in which directed art tasks helped to shift the focus of the group from conflict to solution.

The collage in Figure 7 was produced by Mrs. A. and Billy A. on an evening when Bobby A. was not in attendance. In response to the therapist's suggestion that the family select pictures of people expressing feelings, the A. family created this work portraying an empathic exchange. Billy A. and Mrs. A. took such delight in this process that they went on to produce several more collages, using the pictures to develop dialogues of care between the characters. It appears that the collage process provided the family
with the distance required for them to express the positive feelings between them that were difficult for them to acknowledge in more direct ways. The other families in the group were touched by these poignant expressions and Mrs. C.'s verbalized response included her observation of Billy A.'s contained behavior as an apparent consequence of the expression. Mrs. C.'s comments reflected the fact that she was utilizing her observation of the A. family to augment her understanding of her own interactions with her daughter. This is a clear example of how the art process (providing opportunities for projected self-expression) combined with the multiple-family process (providing exposure to different family systems) to offer the families a unique experience.

The task assigned for Figure 8 was also focused on augmenting system self-expression in order to explore the families’ solutions to problematic interactions. Each family was encouraged to divide the page into individual sections and develop each section to represent the family members. In the verbal explanation of this project, Mrs. B. explained her section (on the right side) as a depiction of the learning process. This overly intellectualized and convoluted expression suggests the defenses Mrs. B. uses to avoid recognition of her daughter’s needs and her own affective state. Marla B.’s section (on the left side) suggests her dependent struggles (baby kangaroo follow their mother and the open-mouthed snake has incorporated in its oral cavity the nagging maternal command, “Clean your room.”) As the B. family members discussed their work, they recognized the lack of connectedness but did not explore their reactions to each other. However, Mrs. A. insightfully pointed out that disconnectedness was simply the “other side” of this family’s usually aggressive interaction. The art process had provided for a safe expression of family issues which became available for discussion as universal concerns in the multiple-family group.

Figures 9 and 10 also grew out of an assigned task, requesting that each individual use the art materials to create a statement he/she wanted to make to the rest of his/her family. The collages in Figures 9 and 10, done respectively by Mrs. C. and Natalie C., are remarkably complementary. Mrs. C.’s collage focuses on the theme of maternal caretaking while Natalie’s presents images of children, several of whom appear to be begging or receiving nourishment. Although it was difficult for this family to discuss these projects, the group was quick to notice the similarities of theme. The group members acknowledged that some families required separation onto two different sheets of paper to create complementary communications (i.e. C. family in Figures 9 and 10) while other families did not (i.e. A. family in Figure 7).

Figures 7 through 10 illustrate how, as the families began to risk increased self-disclosure, art discoveries were used to help facilitate expanded expressions. These directives were presented with guidance in the use of art materials, and to understand the ways in which members responded to each other.

**Working Stages of Group**

The group evolved into a third and working stage of development as the interpersonal interactions intensified and as the members began to initiate whole group projects.

"...to increase discussion and interaction among group members, directed art tasks were employed that focused on exploring their symptomatic interactions."
With this shift in emphasis from individual and family self-expression toward large group communication, the therapeutic goals evolved as well, moving on to encourage each family to seek alternatives to the problematic interactive patterns that had already emerged in their art projects. The large group focus provided these depleted families with the additional resources to augment their problem-solving skills and their affective repertoire.

Figure 11 is a large mural created conjointly by the B. and C. families. To begin, Mrs. B., Marla B., Mrs. C., and Natalie C. were each requested to draw individual representations of a house, a tree and a person. Once completed, the images were cut out and pasted onto the large mural paper and each person in turn added more details to the picture as a whole. Selected details from this mural illustrate the way the symbolic expression facilitated experimentation with intergenerational and interfamilial communications. The first interaction example is the one between the two mothers, symbolized in the juxtaposition of the tree and figure in the upper left corner. Mrs. C. inquired whether she might place her small black girl adjacent to Mrs. B.'s apparently strong and nurturing tree. Mrs. C. seemed to be asking for support from this other single mother who was perceived as more capable. From earlier art projects one can remember that the parenting skills of both mothers are limited but in this union, the first interaction completed in the mural, the two seemed to bolster each other with their strengths. In response Mrs. B. placed her "princess on a horse" figure adjacent to Mrs. C.'s tree in the lower right.

With an understanding of the connection between the two mothers in this mural, one can examine the ways both daughters responded to this pooling of maternal resources. The first response involves the rivers and bridges drawn on this mural. Mrs. C.'s river was the first addition to the mural and it runs from her cut out girl figure to the opposite corner of the paper. After its completion, Mrs. B. drew a path from her isolated castle and a bridge which crossed Mrs. C.'s river, again suggesting the two mothers' union. Most significant, however, is Natalie C.'s apparent response; her drawing (in red) duplicated Mrs. B.'s path and bridge but runs from her own house, across her mother's river and merges with Mrs. B.'s own path.
can be speculated that the combined maternal strength allowed this angry girl to alter her brutal, provocative dynamic with her mother and interact positively with the maternal symbols. Less available to play the victim, Mrs. C.'s strength, supported by Mrs. B., provoked an alternative kind of reaction in her generally hostile daughter.

Marla B., unlike Natalie C., did not respond to the maternal union, by moderating her usual aggression. On the contrary, she utilized the opportunity to directly express the anger that had previously been discharged in her artwork. After her mother placed the "horseback princess" near Mrs. C.'s tree, Marla B. drew the sword carrying murderer hanging upside down from the tree, stealthily awaiting the princess's proximity. This symbolic expression provoked Marla B.'s mother into drawing the equally aggressive dragon in the bottom left corner which in turn provoked Marla B. to verbally express her feelings of being "ganged up on." As she wrote these words on her house, she was taking a big step in her developing capacity to communicate affectionately within her family. Within the process of this mural, old behavior patterns were challenged; as mothers found mutual support, children responded to bolstered parental strength and risked behavior previously not tolerated by their family system.

Figures 12 and 13 further exemplify the therapeutic potential in multiple-family art expression. Figure 12 is a plasticene sculpture created by the D. family during its first group meeting, a year after the group had begun. Mrs. D. and Aaron D. had been asked to introduce themselves to the other group members by making animal self-representations. This juxtaposition of Aaron D.'s wild beast, barely contained by a rickety cage, with Mrs. D.'s overwhelmed looking French poodle, accurately reflects the dynamics in this family. As new members in a group which had achieved a high degree of intimacy, the D. family members became quite anxious as they discussed their project, becoming aware of its undeniable disclosures. Their anxiety triggered an empathic response in the A. family members who inquired if they could assist Aaron D. and Mrs. D. Figure 13 illustrates the way the A. family modified the D. family's original work. Interestingly, this was done across generational as well as familial boundaries as Bobby A. built a protective shelter for Mrs. D.'s dog and Mrs. A. created a controlling rider for Aaron D.'s "out of control" monster. As the A. family offered support for the newer and more anxious D. family they were, of course, addressing their own needs, experimenting with different kinds of responses to family patterns that troubled all the families in this group.

The working stage of this multiple-family art therapy group, illustrated by Figures 11 through 13, continued for many months as all four families deepened their involvement with each other. Prior to Thanksgiving, after the group had met for over

"The working stage of this multiple-family art therapy group... continued for many months as all four families deepened their involvement with each other."
one year, the participants suggested ways of celebrating holidays together. The suggestion, met with eager enthusiasm, was the catalyst for the work illustrated in Figure 14.

This Thanksgiving meal was produced cooperatively by the A., C., and D. families. The creation of this nurturing and festive project was a valuable experience for these isolated and resource-limited families. The symbolic celebration reflected the manner in which this group had become an extended family experience with a pooling of emotional strengths and resources. A look at two details from this symbolic process illustrates this project’s value. The salad in the lower center of the table was begun by Mrs. A. and added to by the other mothers. All spoke of their concerns for their children’s nutritional needs as they cut and pasted representations of fresh vegetables. The bowl of salad can be understood as a collaboration of maternal resources, providing more for the children than any of the mothers could have done as individuals.

After adding to the salad, Mrs. D. retreated from the group to carefully create tissue paper napkins, apparently somewhat disconcerted by the intimacy of the project and needing to distance herself from this shared provision of food. The art process allowed Mrs. D. to find her own level of participation (making napkins was perhaps ego-syntonic with her need to tidy spilled, i.e. shared, material) while still remaining involved with the group. All four families were delighted with Figure 14 and continued to initiate similar kinds of projects each time a holiday occurred.

Figures 11 through 14 have illustrated the working stage of this group, which has become a very valuable experience for all the families involved. The artwork has taken on an interactive and exploratory quality where the participants are beginning to make attempts, both consciously and unconsciously, to alter the behavioral/communication patterns that had been made obvious in the artwork produced in the earlier stages of this group.

The combination of these fourteen art projects provides an overview of how multiple-family group art therapy can be of value for a particular population. These single parent families, isolated and shattered, were able to find relief in the process of communication and self-expression, inherent in this modality.

Identification of Child Abuse in the Art and Play Products of the Pediatric Burn Patients

Pat Levinson, ATR, MFCC, is a member of the Dominican College Graduate School in Counseling Psychology, California. She is a Fellow, the Menninger Foundation, and a member of the American Burn Association, the Association for the Care of Children in Hospitals, A.A.T.A. member, and Director of Art and Play Psychotherapy, St. Francis Memorial Hospital Burn Unit.

This article deals with the identification of child abuse and neglect in a burn center setting utilizing art and play therapy (APT) as a projective base, a diagnostic and investigative tool, and a treatment modality. APT is a blend of the psychotherapeutic technique and creative process. Providing developmentally appropriate materials and techniques facilitates the communication necessary for the child to tell how he/she was burned. Consistent and repetitive themes of hurting and sadism in the play are combined with observations from the medical team, and give indications as to how the child had been abused. Conflicting versions of how the injury was sustained provoke suspicion, and often inappropriate family interaction may be observed. When a pervasive play theme indicating abuse emerges, appropriate steps are taken to notify the attending physician, the medical social worker, and child protective services. The therapist, after locating the problem area, moves from non-directive play to a structured play (release therapy) modality. This article is based upon nine years of looking at art and play products and extrapolating recurring, pervasive themes that are often used as legal, admissible evidence in child abuse cases.

Introduction

Play is the work of childhood and is a serious business for the child in crisis. Play imitates life. It is the primary autotherapeutic tool the child naturally possesses for self-healing, communicating problem areas, and defusing traumatic experiences. APT gives form to feeling and facilitates self-expression. The child will reveal in play what he cannot express outright.

APT as a treatment modality provides a safety valve for explosive feelings. By providing a forum for self-expression, the therapist, non-judgmentally, gives the child a variety of opportunities to tell his/her personal story.

Being hurt by one’s parents is always a dilemma for the child, who, of course, needs his/her parents. It is frightening for the child to indict his/her parents, and he/she will not explicitly do so. It is only with the protective qualities play affords that the child will dare to express a story of child abuse. The microcosm of the play world is much less threatening than the macrocosm of the real world and is without retribution.

Patients and Methods

During a five-year period 122 children between the ages of one and thirteen years were admitted to the Bothin Burn Center of Saint Francis Memorial Hospital. Four were cases of child abuse; sixteen involved suspected abuse or neglect; and ten were cases of lack of supervision. All children participated in the Art and Play (APT) program. Each child received three sessions per week.

Extent of burn injury ranged from 10% to 62% of total body surface, the average being approximately 20% total body surface. Sessions began as soon as the child became sufficiently alert to participate, provided they did not interfere with primary medical care.

The therapist recorded each session in the patient’s chart, highlighting the following: the patient’s affect (mood); interaction with the therapist, medical staff, parents, and product; what the child produced in the session—i.e., painting, story, graffitied or intubated Surgi-Doll, or hospital miniatures; and what was said by the child about each product. The therapist also noted recurring play themes.

These records were subpoenaed and used as evidence if the abuse case went to court. The therapist was deposed on a number of occasions and testified in court as an expert witness in therapeutic play.

The therapist charted all of the evaluations. Assessments of contents of play were discussed on a daily or weekly basis in Psychosocial Pediatric Rounds attended by the medical social worker, the child psychiatrist, the child artist and play therapist, the adolescent art therapist, resident physicians and interested members of the burn team.

The psychotherapeutic technique initially used was nondirective. This modality is permissive, nonjudgmental, supportive, reflective and helps to establish an atmosphere of flexibility and creative spontaneity. Trust and empathy are achieved in this first phase of cooperative effort in a safety zone.

As the play continued, problem areas began to emerge and the thera-
pist encouraged the child to "play through" a significant trauma. In this second phase of play, the therapist used release therapy designed for children who have had a significant traumatic event. The major principle of release therapy is in the use of the acting-out principle in play to the highest degree. Release therapy is structured play.

When the therapist became absolutely sure of the pervasive play theme, her role was much less passive; she encouraged play in problem areas. The therapist set up situations similar to the event. An example is as follows:

1. **Set-up:** Two doll house figures (boys) were put into the garage of the doll house by the therapist.

2. **Narrative:** Two little boys were playing. One had matches, the other a lighter. What happened?

The psychotherapist had a specific identified goal when she used this approach: a cathartic re-experience of the burn injury. It seemed to be in the child’s best interest to share the specifics of the burn injury, including: confessions, feelings of guilt, blame, fear and anger—all highly charged feelings. The child could act them out, with support in the hospital setting.

**Results**

When the child used art and play to tell stories of burn experiences over and over again, he/she venti-
lated feelings. Moods elevated and cooperation increased. The children formed close attachments to Burn Center staff and felt protected in the setting. These transference issues were dealt with in appropriate ways during the course of treatment.

**Case 1.**

C. was admitted for reconstructive surgery, and APT was done some years after the initial acute injury. She was a six-year-old female who, four years previously, had suffered 45% total body surface area burn injuries of the lower abdomen and legs. C. was in the first grade in school and was a slow learner requiring special tutoring in reading. She lived with her mother and grandmother, who were significant family members in her life. Her father visited regularly and contributed to her care financially.

C. had been held in scalding water at the age of two by the babysitter who was prosecuted for this act of abuse. The mother was at the movies during the time of the burn injury.

C. first worked on the Surgi-Doll. She painted genital burns on it in exactly the same area of the body where she had been burned (Fig. 1). C. was extremely creative and became quite absorbed in this project. She once looked up and declared, "This really happened, to me!"

Two of her paintings were sexual in nature depicting large, black penises that scared children, who ran away. C.'s affect while talking about her pictures was embarrassed and giggling. She was self-conscious when talking about sex.

C.'s mother told us that the child had been taking money from the boys at school in return for showing them her genital scars. This occurred after school in a park on the way home.

Child sex abuse became a clear play theme. The medical social worker, the psychiatrist and the clinical psychotherapist referred this child to a local family mental health clinic upon discharge from the Burn Center.

In this case child abuse was well established. APT confirmed the sexual nature of the abuse.

In other cases there was a strong suspicion of abuse or neglect, but no consistent story surfaced in the play due to parental interference. The child told many versions of the burn injury, was clearly coached by the parents, and changed the story to accommodate the parents. The following case is illustrative:

**Case 2.**

L. was a three-year-old male who sustained 20% mixed partial and full thickness burns due to scalding nine days prior to admission. The mother had been hospitalized at the time,
and the father treated the burn injury at home. Because the child became febrile, the mother insisted upon medical evaluation.

The injury occurred while father went to empty garbage. When father returned, the child was screaming because of the water being too hot. Apparently L. had turned on the hot water and tried to get out of the tub but fell back in. The attending physician was alerted in this case that child abuse was a possibility.

L. had been attending pre-school for the prior ten months. He enjoyed painting and playing with his puppy. He played in an age appropriate manner, demonstrating normal skills and interests: trucks, trains, space men, and animals.

L. was clearly attached to his mother and she to him. They were affectionate towards each other. L.’s behavior towards father was guarded. A parent was always present during play therapy sessions, which was not unusual in families with hospitalized pre-schoolers. The father was quiet.

L. played in the doll house each session. He especially wanted to play with the miniature bathtub. All of the figures received multiple baths in hot water. One key figure became the theme—a miniature boy who received many baths that were “too hot.” The therapist became suspicious when the doll house boy was splashed with hot water from a bucket and “got burned.” The boy in the doll house then turned off the hot water. At one point the doll house father turned on the hot water himself and burned the boy. The play became confused. The mother began to correct L.

After sharing the contents of the play sessions in weekly psychosocial pediatric rounds attended by the medical social worker, the child psychiatrist, the pediatrician and interested medical personnel, the decision was made to report the case to Child Protective Services (CPS) as suspected child abuse.

Discharge planning included the following: (1) CPS was to monitor the home; (2) The family was to participate in ongoing psychotherapy; (3) The family was not to change residences; (4) The child was to attend burn clinic on a regular basis; and (5) The child was to receive follow-up care from the visiting nurse and the play therapist in the home. The family agreed to these conditions because they did not want to lose L. to foster care. Compliance was mandatory.

At the last minute, before discharge, L. changed the story once again, telling us he had lied. “Daddy didn’t do it,” he said.

Case 3.

D. was a four-year-old male who suffered a 70% first and second degree injury reportedly from scald burns sustained in hot bath water. The parents reported drawing his bath. The patient stated he got in, and “jumped right out.” Parents reported that he complained of the water being too hot, but that he was lying on his back with water up to his chin. Neither parent felt that the water was too hot. D. began to complain that his feet hurt, and the mother noted blisters. He was put to bed but continued to fuss. Mother was aware of blisters on his chest, heels, elbows and back. He was taken to the Emergency Room of the hospital.

D.’s affect was angry. He rolled around the burn unit on his hot wheels, hitting other children. His play was hostile—giving shots to Surgi-Dolls in the eyes, fingertips, or genitalia. His drawing “The Smiling Shark” (Fig. 2) expressed ambiguous feelings about his caregivers. His house drawings were all bright red, indicating intense feelings about his home. One day he drew a huge, evil-looking man, and called it “Daddy.”

In a play session, he took all of the figures and furniture out of the doll house, then threw them up in the air and let them crash saying, “It’s all bad.” Three weeks before discharge D. drowned both parents in doll house bathtub and shot them with the squirt gun (Fig. 3). D. enjoyed this activity, taking great satisfaction in symbolically punishing his parents. This child was discharged into the care of foster parents.

Case 4.

Sometimes a picture of neglect surfaced in the play. Children were not adequately supervised.

O., a six-year-old male, and two other children were playing with gasoline when an explosion occurred, resulting in burn injury. O.

Fig. 2

Drawing titled “The Smiling Shark” expressed a child’s ambiguous feelings about caregivers.

“As the play continued, problem areas began to emerge and the therapist encouraged the child to ‘play through’ a significant trauma.”
sustained 22% total body surface area full thickness injury to face, hands and arms. His eight-year-old brother was also burned, and a third child died. O's mother was angry at the babysitter. Mother became increasingly depressed and nervous.

O's first drawings were all of jail bars. He was frightened and asked repeatedly in detail if the police had come out. The three boys had taken two screens out of a neighbor's garage, entered the garage, picked up an open can of gasoline, crawled into a construction tunnel, and (because it was dark) lit a match (Fig. 4).

Discharge planning included referring the family for psychotherapy, play therapy in the home, and the services of the visiting nurse.

Case 5.

An example of unsupervised play was the case of A., a ten-year-old boy who sat on a generator and sustained a 6% electrical burn injury to his right foot. A. was thrown twenty feet into the air as he was shocked by the generator.

In his drawing A. expressed his feelings about the accident and the impending loss of his toe (Fig. 5) saying, "I'm lucky to be alive."

Case 6.

Another case of unsupervised play and possible neglect was J., an eight-year-old male who suffered an electrical burn injury from contacting a live wire in a large tree. The patient was climbing the tree when the branch suddenly broke. He grabbed onto a power line which was conducting electricity at 7200 volts. The patient became stuck in the tree. His brother went to assist him, and both fell several feet down. J. was immediately brought to a neighbor's house. An ambulance was called, and the paramedic team started an IV at the home. They then transported J. to the Burn Center. The calculated extent of the injury was 80% of total body surface area.

The surgeon recommended waiting sufficiently to allow demarcation of the injury to the extremities to occur prior to any definitive therapy or surgery. On his thirteenth day of hospitalization, J.'s fingers (2 through 5) on his left hand were amputated to the metacarpophalangeal joints. The hospital course was fifty days. The patient underwent multiple debridement and grafting procedures.

J. lived with his mother and four siblings. He was accident prone. There was suspicion of sexual abuse of the female sibling by the father. The parents were divorced. The younger brother was also accident prone and was admitted to the Emergency Room twice during J.'s hospitalization. The family was considered at high risk.

J.'s play was age appropriate; he preferred "Star Wars" miniatures, transformers and toys of a mechanical nature. He also enjoyed dramatic play with dinosaur miniatures, and there was a tendency to always lose at checkers.

J.'s first drawing depicted the accident (Fig. 6). He told the story as he drew the picture. He said he felt

"The psychotherapist had a specific identified goal: a cathartic re-experience of the burn injury."

---

Fig. 3

Fig. 4
Drawing: Three young boys take screen out of neighbor's garage, pick up open can of gasoline, crawl into construction tunnel and light a match.
guilty about "doing such a dumb thing" and blamed the electric company for "hiding the wire in the branches of the tree."

Possibly due to the long healing period inherent in his injury, J. began to feel that he was possessed by the devil. He spoke in a raspy and frightened voice of his demon. This subject became a play theme which was explored with dramatic play techniques.

In the story-making the demon was finally destroyed after nearly taking over the child's psyche. It was destroyed in a church by a priest using holy water. The story was tape recorded and played back to J., further divesting the demon of its powers over the child. At that point the play theme ceased, as did "the voice."

On the fiftieth day J. was discharged with a referral for follow-up psychiatric care for the entire family. The discharge plan included a recommendation that the mother enroll in Parent Effectiveness Training. Home visits by the visiting nurse, the art and play therapists were scheduled.

When there was physical evidence of child abuse (e.g., an immersion line or police report), corroboration often surfaced in play activity. In this way, cases of suspected abuse were sometimes confirmed as children recreated the details of their situations in the doll house, on the Surgi-Dolls, in miniature play, or with the graphic arts materials.

Frequently, the abuser became the abused in the play world. This was a safe way for the child to gain a sense of mastery and a degree of control over an untenable situation at home or school.

APT defused potentially overwhelming situations and helped the child cope with feelings about the burn injury, the hospital, and the family. Problems were examined, and solutions were explored.

Family systems were closely observed on the burn unit and in private or group counseling sessions. Interaction between parents and children was closely observed by the therapist. Some children did not trust specific adults, and seemed to prefer members of the medical staff. Many demonstrated avoidant behavior toward their parents and were calmer when the parents left the unit.

APT was made available for selected children in the home. This allowed check-ups on the children's emotional adjustment post-discharge. APT was a nonthreatening way to observe the home situation.

Summary

During a five-year period, children treated at Saint Francis Memorial Hospital's Bothin Burn Center received individual APT sessions designed to meet their special needs and to detect child abuse when present.

The play focused upon recurring play themes. Nondirective therapy

"When there was physical evidence of child abuse, corroboration often surfaced in play activity."
was used until the problem area was identified. Release therapy was then used in a structured play format for more focused play.

Children responded to this approach and revealed the story of the burn injury symbolically with toys and art materials, miniatures and puppets. The process confirmed that play is an imitation of life.

Often the child’s affect improved in the Burn Center and became more relaxed, open and age appropriate. Children felt safe and well cared for in the hospital setting.

In a patient population of 122 children, 4.9% were cases of abuse, 19.5% were cases of suspected abuse or neglect, and 12.2% were cases of lack of supervision. The clinical observations indicated that APT was demonstrated as an effective tool for the detection and confirmation of suspected child abuse in pediatric burn patients.

Approaching Artistic Sublimation in Low-Functioning Individuals

David R. Henley, ATR is art therapist at the Katzenbach School for the Deaf, West Trenton, New Jersey, and the Jewish Guild for the Blind, New York, New York. Mr. Henley is certified as both teacher of the handicapped and as an art teacher.

The treatment of low-functioning individuals in an adaptive art therapy program was conducted using the “art as therapy” approach. Both the theoretical formulations of Edith Kramer and Viktor Lowenfeld were used to devise practical strategies that addressed the clients intellectual and emotional handicaps. Emphasis upon the pursuit of both aesthetic and therapeutic goals is illustrated in a case treatment study that involved a severely retarded client with Down’s syndrome. The author’s contention is that in exceptional instances, these clients are capable of approaching artistic sublimation, and deriving the quoted benefits from such a process.

Overview

It has been almost four decades since Viktor Lowenfeld first expressed his conviction that it is our therapeutic and educational responsibility to bring to fruition the full creative potential of all individuals regardless of the severity of their disabilities. The seminal chapter “Therapeutic Aspects of Art Education,” that last appeared in the third edition of Creative and Mental Growth, (Lowenfeld, 1957) implied that we must recognize the need for making available meaningful art experiences specifically adapted for the handicapped person. Lowenfeld further asserted that the professionals working with low-functioning populations must possess an understanding of not only the disabilities under review, but also the psychological implications that arise from being subjected to a disability. The idea of a profoundly retarded or cerebral palseid child having complex psychodynamic issues addressed effectively by an art specialist is still an idea alien to many in the mental health and educational field.

Lowenfeld’s remarkable insight has since paved the way for other art therapy—art education theoreticians and practitioners, particularly Edith Kramer, who is recognized as a leading exponent of integrating the skills of artist, therapist and teacher, in her work with exceptional children. Throughout Kramer’s writings, there is a continued emphasis upon the inherent and evocative powers of the visual art process as a restorative measure of emotional health. Kramer’s belief in the integrative properties of the art experience has laid the foundation for many other practitioners who utilize the concept of “art as therapy.” (Kramer, 1977) It has been only in recent years that this approach has been seriously applied to those low-functioning clients, who had previously been relegated to kit/craft art and poured-mold ceramic workshops. It is now recognized that the retarded, autistic, or the severely multiply handicapped child is capable of creating highly unusual and provocative works of art. This artistic giftedness in many instances, seems to be inextricably tied to the very congenital conditions that comprise the individuals handicap. (Selle, 1983) Yet to foster the expression of this special potential, the art therapist must be prepared to function as both an artist and teacher, as well as a therapist.

To guide and give creative form to this potential, one must rely upon the skills, insights and aesthetic sensitivity that we ourselves have developed as seasoned, practicing artists. Only then can we empathize with the client’s frustration in the face of creative stagnation or intimidation, or share their exhilaration upon successfully giving aesthetic form to their innervation.

Art therapists structure, adapt and continually compensate for the client’s disabilities. They also develop strategies and adaptive equipment that attempts to ease or surmount any orthopedic involvement or sensory impairment, thus insuring full participation and an opportunity for a successful art experience.

The art therapist promotes the therapeutic process, and relies upon an understanding of individual and group dynamics, constantly assessing emotional need and intervening according to insight and professional intuition. Ultimately, it is the quality of these therapeutic interventions that is the measure of worth of a program.

The diversity of these dual-capacities implies that there must be a shifting of emphasis in response to

“... the art therapist must be prepared to function as both an artist and teacher, as well as a therapist.”

July 1986, ART THERAPY  67
meeting the individual need of the child. Those interventions that foster aesthetic sensitivity, cognitive problem solving or therapeutic growth, should not be viewed as conflicting nor should they be dichotomized. The therapist must strive to engage the client’s intellectual, manual and imaginative faculties toward an “effort of supreme integration.” (Kramer, 1971, p. 68)

The resulting art product may or may not reflect a greater degree of autonomy, or reflect the inner unity of such an integration. By encouraging the child to mobilize his or her resources, regardless of how meager, the art therapist should strive to promote and set the stage for such achievements. The initial art productions or precursor attempts will then constitute a graphic expression of the individual self: a reference point which reflects the child’s sensory impressions, developmental readiness and potential for projecting ideas and concerns through the art medium. One respects these aspects of even the most developmentally arrested child and utilizes them as points of departure from which to plan strategies and formulate treatment goals that promote the growth process.

Concept of Kramer’s Artistic Sublimation

Throughout the writings of Edith Kramer, there is constant reference to the concept of sublimation as an ultimate goal in art and therapy. (Kramer, 1971, pp. 67-71; 1979, pp. 75-131) Kramer has formulated the theory of drive neutralization through the process of artistic sublimation, with regard to clients whose level of functioning is relatively within the normal range. Kramer asserts that the individual must possess sufficient ego, so that a symbolic linkage is achieved between the instinctual drives and those of more complex ideation. This concept presupposes the mental capacity to evoke ideas and perceive analogies which involve both the primary and secondary processes. In accordance with this thinking, the severely retarded, autistic or multiply handicapped, low-functioning individuals would be capable of only the precursors of sublimation, since the ego is arrested at such a formative stage of development. (Kramer, 1979, p. 104)

One can attempt however, to expand upon Kramer’s definition of sublimation by identifying instances where low-functioning individuals have successfully benefited from the struggle with intrapsychic conflict during the art process and, as Kramer’s theory requires, “effect some fundamental change in the balance of inner forces.” (Kramer, 1979, p. 104)

The following case history traces the artistic development of one severely retarded young man, who was treated by focusing on “art as therapy.” The approach in this treatment summary reflects the author’s commitment to and pursuit of both aesthetic and therapeutic goals with a client previously considered too low-functioning to benefit from either.

Despite a protracted period of artistic stagnation and resistance to change, this individual eventually expanded his limited repertoire of self-expressive avenues, and approached a form of artistic sublimation.

History

Robert is a young man born with Down’s syndrome resulting in severe mental retardation. With an IQ of 24 and a mental age of 3.2 years, Robert had limited receptive language and very little expressive language other than several responses that communicated his most basic needs and concerns. At the time of this study, Robert resided in a large residential institution for the severe and profoundly retarded. His current placement is a residential group home that offers a more normalized and stimulating home environment.

After participating in a recreational art program for many years, Robert’s level of art expression and skill development had plateaued at a rudimentary yet eccentric style. This eccentric style reflects the years of accumulated personal experiences, sensory impressions and established set of personal preferences. The resulting idiosyncracies combined with a certain giftedness in the graphic arts and contributed, in this case, to a highly evolved form of self-expression that cannot be accurately correlated to a normal child at a comparable stage of mental development.

After several months of art education/therapy, Robert’s art work took a dramatic turn, developing in an expansive direction at a rapid pace. This progression was prompted by several interventions that evidently engaged and stimulated both cognitive and emotional faculties, resulting in sweeping structural changes in artistic style, affective expression and elaboration of ideas.

Art Productions

For the past six years, Robert had been leaving his lines of ink unchanged—they appeared woven in a grid format, relying upon the shape of the paper for form and support. Figure 1 illustrates a detailed look at this formula that is worked out in a highly perseverative style based upon repetition in the stereotypical sense. The artwork is virtually imprisoned in endless combinations of linear grids. The coils, spirals and
helixes that are sometimes crossected by a single or series of lines, create an interesting yet suffocating design. Figure 2 attests to this obsession of filling every crevice with tightly compressed line work. In this piece Robert had completed the drawing and then assisted in its matting. Not satisfied with the clean white mat surrounding the piece, he retrieved the picture off the wall and continued to work the mat until it too was covered with a dense black grid. Although there is overriding compulsivity in these pieces, further study reveals in especially the photographic enlargement (Figure 1) that there is a certain complexity and diversity in the line work; these gave an indication to the author that a degree of artistic potential awaited to be developed.

The intervention that aimed at fostering an initial artistic breakthrough, lay in the author’s changing the shape of the standard rectangular drawing paper that Robert habitually relied upon. Knowing that Robert had a consuming interest in baseball memorabilia, the author pre-cut an 8” white paper shape in the form of a circle and presented it as a “baseball.” Robert shingly accepted this gift and then slipped it under his rectangular work already in progress. The author did not suggest or direct the use of this new shape, but gave it as a gift with no strings attached.

After a week, Robert returned to the art session with his familiar pad of grids in varying stages of completion, and again, began drawing according to his formula. At one point he seemed distracted with his current effort, eventually interrupting the piece altogether. Much to the author’s amazement, Robert then retrieved the paper circle which evidently had been smuggled into the session safely buried within his stack of papers. Robert seemed somewhat embarrassed, as he contemplated this alien form. After intermittently looking around and over his shoulder, he further deliberated for a few moments, chose a blue marker, then commenced drawing his lines following the new and unfamiliar boundaries of the circle.

The resulting piece (Figure 3) represents a first departure from the endless works of repetition, toward a new variation of stylistic change. While the composition is still highly dependent upon the periphery for support, it has not dictated its content. Whereas in the previous productions there was an intense need to fill the entire pictorial space, there are now two bold white forms or
"...we rely upon our understanding of individual and group dynamics, constantly assessing emotional need and intervening according to our insight and professional intuition."

voids, which symmetrically offset the involved interplay of the central line work. While there is still a sense of tension and compression, there is also a respite from the habitual rigidity toward increasing resilience and elasticity. There is now a balanced integration created by the intense core and the cushioning white forms, giving the piece a heightened sense of compositional awareness. There is a new affective element in evidence (as the addition of red color had been deeply positioned within the central core). Robert's previous pieces were predominantly monochromatic, with color used on occasion in a fragmentary and arbitrary way. Color in this drawing may have been manipulated consciously as an element of design, imparting the suggestion of new emotional content to the self-expression. The choice and positioning of color is possibly reflective of the affective stirrings over the internal struggles and changes beginning to take place. The two white forms tend to insulate the inner "fire red," which seems to be actively spreading within the piece.

In the follow-up sessions, Robert was presented with a choice between another precut circle, a square and several sizes of rectangular white drawing paper. He chose the all-familiar rectangle and black ballpoint pen, then reverted back to the usual style of weaving countless lines into a mass. The author did not intervene or attempt to prevent this apparent regression. Under the therapist's supervision, Robert was allowed to retreat, to effectively mobilize his defenses and withdraw to a more tenable position. By supporting and accommodating this apparent regression, Robert was afforded a pressure-free atmosphere that allowed him to digest the formidable risks he had taken in the previous piece. The unparalleled intensity and fineness of the linework in this new piece, seemed to graphically portray an attempt to sew and bind up any erratic loose ends that threatened to unravel, and thus leave him exposed or vulnerable.

As this drawing evolved however, it became clear that this piece was yet another interesting departure from the norm. The expectation was that Robert would defer further experimentation in favor of reverting back to the security of his static style of compulsivity. This presumption proved wrong as Robert had finally given form to the linework by creating a horizon line which partitions the piece bi-laterally. (Figure 4) The lower half appears as a tightly threaded land-ass, which almost shimmers in its intensity. In direct contrast, is the untouched whiteness which is suggestive of an atmosphere. The white expanse seems to offer an insulating, buffering respite from the compulsivity of the grid. The horizon forms a solidly grounded profile which is boldly designed with a strong sense of scale and composition. The profile, read from left to right, presents a straight line which is really composed of many segmented sections, running horizontally until it encounters a sheer cliff face, ascends vertically, reaches a gently curved peak, then descends off the paper. This landscape makes use of several unusual grades and directions, creating a

"After participating in recreational art] for many years, Robert's level of art expression and skill development had plateaued at a rudimentary yet eccentric style."
fairly sophisticated interplay of positive/negative form, movement, rhythm and contrast. While there is still overriding compulsivity in this piece, it has been given a more expansive form that imparts a degree of increasing resilience and strength.

In the author's view, there is an air of victory in this piece; the peak seems to stand in silent repose, restful and almost contemplative after its waging of inner struggle. The previous period of stagnation, the lack of experimentation and weakened boundaries have all been symbolically expressed in a powerful work of graphic art.

After creating this culminating piece, Robert's art work alternated between weaving more lines and leaving open space, allowing for a more dynamic use of the pictorial field. Among the significant later works, were a number of fully threaded pictures which seemed to be evolving in an equally static and compulsive style as the very first drawings. The author felt inclined to intervene more forcefully in these instances, by asking Robert if he may draw a line on the work in progress. Robert nodded in agreement, allowing the author to draw a diagonal line stretching from corner to corner, in contrast to the strictly square format underway. The rationale for this intervention, was to foster a continuation of improvisational technique and discourage further lapsing into perseveration and stagnation. The author was confident that Robert could withstand such a transgression and possibly make creative use of its concept. Robert did indeed profit from this diagonal, by utilizing its structure from which to experiment with new combinations and patterns of linework.

In the following session, Robert displayed further influence from this intervention, as he independently began with two purple diagonals which formed opposing triangles. (Figure 5) He then turned to a green marker and blocked in the supportive structure around these newly emerged forms. This piece is additionally striking in that the entire form floats independent of the borders of the paper. This represented yet another breakthrough for this client, who for years had sought the protection of the paper's perimeter. The contrast in color again invests the piece with affective sensitivity, thus highlighting the newly emphasized dynamic treatment of form.

The last work in this series illustrates a further relaxation of defenses and continued graphic experimentation. Six weeks after working the original precut circle, Robert chose (for the first time) the circle shape from among his preferred rectangles and squares.

He began this piece (Figure 6) by drawing in pen, two elliptical forms that are situated bilaterally and indi-rectly utilize the form of the paper for support. After arranging these elements, Robert unexpectedly resisted the compulsion to continue in his linear mode, instead choosing oil crayon to block in the color. The red which had previously been placed in the interior of the first composition, has now migrated and surfaced to the outer borders. Replacing the fierylike core are several soft gradations of blue which are in turn, encased in a jacket of cool grey. While this piece does not rival Figure 4 for aesthetic strength and emotional intensity, it does reflect an important step in therapeutic progress.

Discussion

In treating cases where there is severe cognitive and developmental arrest, the clinician must often address the client's limited modes of expression that habitually rely upon primitive mechanisms of defense.

Perseveration is a pervasive form of defense for the retarded person, rooted in the early rocking movements during infancy, then carried on indefinitely as a self-stimulatory mannerism into adulthood. These self-stimulatory movements (i.e., rocking, hand flashing, head weaving, teeth grinding) serve an adaptive function especially for the institutionalized person who is retarded, by dispelling the buildup of libidinal and aggressive energy.
This discharge is considerably more benign and pleasurable than the more aberrant self-stimulatory behaviors (i.e., head-banging, pica, rumination). The static qualities of self-stimulation can be traced to a sensorially deprived environment, where normalized modes of expression and nurturing and interactive role models are not available. This creates a bind, where the retarded individual is left to his own limited resources to express feelings such as frustration, anxiety and anger.

It is this varied form of rhythmic motion which is repeatedly exercised and translated in graphic terms, throughout this client's many art productions. One suspects that the compulsivity evident in these delicate grids, spun with equal care and precision, reflects the need for the same unyielding repetition present in his institutional lifestyle. On the few occasions that Robert's daily activity schedule was interrupted or changed, the author observed an increase in agitated and sometimes tantrum behavior. This observation then raises the question as to whether Robert's reconvening the motif over the course of many years, contributed to the preservation of autonomy, by binding the anxiety that resulted from any threatening irregularity. The rigidity of both his lifestyle and art style additionally posed the question as to where to initially intervene with respect to the client's evidently fragile defenses. The immediate goals were to develop a sufficient bond of therapist/client trust; this allowed for the cautious loosening of rigid defenses, leading toward the expansion of the graphic vocabulary, with the aesthetic progress being ideally reflected in the client's overall functioning.

To help accomplish this goal, the author referred to Kramer's concept of "auxiliary ego." (Kramer, 1971) This concept is the use of the art therapist's own autonomy as a support system that facilitates the client's art expression and emotional growth. As facilitators, we rely upon our own maturity as artists and on our psychotherapeutic skills to guide and instruct—especially the low-functioning client—through the art process. One can set the stage for this process by creating a stimulating yet secure environment, by clearly demonstrating the art techniques and by encouraging experimentation with the medium in anyway that is appropriate and pleasurable. It may be additionally useful for the art therapist to participate in the art making, so long as this does not work in opposition to the therapeutic goals, and does not intimidate or infringe upon the client's work time. Parallel drawing or painting may assist in easing the client's anxiety over having to "draw on command" or be a reluctant center of attention particularly if it is an individual session. Having the art therapist engaged in the art process may also create a studio atmosphere, where everyone has mobilized his or her creative energies and is taking stimulation and inspiration from others in the art room. As previously stated, low-functioning clients who are institutionalized, and are often without intact families or friends, are often in dire need of individuals who serve in this context—as normal behaving, productive and creatively functioning role models. As our sense of values and commitment to the visual arts are communicated, we encourage the client to identify and emulate us as practicing artists. As the art process becomes more familiar, as technical and aesthetic problems begin to be addressed, the client may eventually develop a highly individual style of artwork. At this point the art therapist may decide to empathically comment upon the artwork in a manner similar to a studio critic. Without becoming overly abstract or ethereal, the art therapist can point out strengths, interesting elements and emerging directions that can be comprehended in some capacity by the client/artist who has reached this level of sophistication. In this way one creates a sense of camaraderie and parity, accepting the client efforts as work that is worthy of serious study and appreciation.

Before achieving such long term objectives for low-functioning art therapy clients, the art therapist must stand ready to accept protracted periods of resistance, stagnation or regression. The rate and nature of the creative growth sometimes occur in the smallest of increments. Every effort must be made to preserve a relaxed atmosphere in which the art process can unfold without regard to overly rigid pre-set expectation. The especially fragile, rigid defenses employed by low-functioning clients make them especially liable to withdraw or act out if threatened. As art therapists, it is important to aid in the reducing of this threat by intervening cautiously, intuiting when to exhort the

72 ART THERAPY, July 1986
client to extend himself/herself, or when to allow the client a respite from this potentially anxiety provoking process.

With the establishing of these therapeutic prerequisites, we may then begin to structure the art experience so as to encourage the development of more adaptive defenses and the taking of more creative risks. With the lessening of client resistance may come the advent of artistic exploration and the opportunity to release previously repressed affect. Despite the incapacity of low-functioning clients to depict this material in realistic representational terms, they can nonetheless make potential use of this liberated energy. (Naumburg, 1966)

Since the majority of these clients have poor expressive language, they may better articulate their concerns through the non-verbal means of graphic expression. However, as shown in the illustrated case study, and in innumerable other clinical instances, this phenomenon can also precipitate regression in varying degrees of severity. Yet regression can be viewed as being a vital element for the mobilization of creative energies (Kramer, 1978, Kris, 1952). Kramer points out that, for this process to be beneficial rather than destructive, the activation of primary process material must occur only when the ego can resist the pull toward permanent regression. If the client is unable to withstand such pressures, a pathological regression can ensue, thus hindering any previous maturational gains.

The regression undergone in the presented case study may be that rare instance when a low-functioning client successfully regressed in the "service of the ego," (Kramer, 1978; Kris, 1952) thus allowing for new insights to emerge and the opportunity for artistic sublimation to possibly occur. Inherent within this progression and temporary regression was a subtle yet clearly discernable upward spiraling movement. Although the client carried the graphic repetitions through to each piece, they were developed in an expansive direction. However, Kramer has regarded repetitions such as these as simply pleasurable and benign exercises that do not signify the presence of intrapsychic conflict. Kramer has viewed the dynamics of this change as a relinquishing of one fixation for a more variegated one, with little benefit to ego maturation. Thus, it is the lack of perceptible reconciliation with the inner turmoil which prohibits Kramer from designating the process (such as in the case of Robert) as true artistic sublimation.

It is certainly impossible to prove whether Robert actually bound and discharged his anxieties by recreating countless grid drawings. It is also conjective to say that he consciously confronted his pain and then took pleasure in mastering such feelings through his art. Yet the dramatic evolution of these art productions attests to the increase in creative energies as well as a shift toward greater aesthetic diversity. Regardless of whether Robert actually attained a form of sublimation, each work constituted a new beginning that enhanced this client's previously limited powers of creative self-expression.

Summary

The use of anecdotal case history material that essentially describes a particularly intriguing client, is by its very nature, a limited vehicle for sophisticated study. Without the systematic collection of data from a large and representative sampling of clients with similar deficits, we cannot begin to measure the full creative potential of this population. This account may be instructive however, since it describes in detail the course of a highly idiosyncratic art process and how such dynamics are affected by the therapists interventions. The low functioning client may never be able to verbalize his or her intentions, express his or her reactions or realistically depict ideas or concerns through the art imagery. The art therapist must then adjust interventions using the subtleties of body movement, gesture, patterns of behavior or forms of self-stimulation to discern the appropriate point of departure from which to begin treatment.

Fusion of Symbols, Confusion of Boundaries: Percept Contamination in the Art Work of Alzheimer’s Disease Patients

Judith Wald, MS, ATR, the Burke Rehabilitation Center, White Plains, New York.

Art work consisting of fused images and hybrid organisms is representational of the perceptual, conceptual, and psychological confusion resulting from Alzheimer’s disease. As this dementing illness progresses to an advanced stage, boundaries become confused and visual symbols merge to form bizarre amalgamations. As the patient regresses in psychological defense against the neuroperceptual breakdown, unconscious aspects often surface in the drawings. These phenomena are researched in terms of neurological theories of memory and perception, interrelated with Rorschach psychology, Freudian psychology, and the ego psychology of Spitz and Jacobson.

The emotional regression as viewed through art productions parallels the physiological regression in the Alzheimer patient.

Introduction

A bird with a feminine eye, skirt, legs, and shoes, entitled “aminalis” (Figure 1). A house with a mouth, chin, and arms (Figure 2). A face within a face (Figure 3).

Neologisms? Graphic flights of fancy evoking half-humans, half-animals of mythical origin, like the centaur and the mermaid? Pictorial personifications? No, these are not Chagall-like dreams of childhood memories merged with the mundane, nor are they Picasso-like attempts to evolve new visual concepts through artistic creativity. They are, in fact, reflections of the perceptual, conceptual, and psychological confusion resulting from Alzheimer’s disease. This art work was done by patients in an advanced stage of this dementing illness.

As an art therapist working with these patients when they were higher functioning, I have seen them make more coherent art work. Originally, each of these patients drew, when given a free-subject choice, what I would call “personal symbols.” Their visual vocabulary had some personal significance to them. Patient A drew houses, people, and a flower or tree with round blossoms (Figure 4). Patient B drew people, cats, flowers, and curlicue lines. Patient C drew triangular trees, houses, circles, stripes, and wrote “Merry Christmas” and “Happy New Year” (Figure 5). Patient D drew people, houses, animals, and wavy lines. As their disease progressed, these symbols merged to form bizarre amalgamations.

These striking fused and confused images are “mirrors to the mind” (The Chronicle, 1984, p. 7) of the Alzheimer’s disease patient. What do they tell us about the perceptual, neurological breakdown occurring in the brain? What do they tell us about their psychological regression? How are the physical and emotional declines interrelated? Does the emotional regression, viewed through art productions, parallel the physiological regression? Like a pathologist studies disease through microscopic examination of pathological tissue, the art therapist can examine conscious and unconscious personality structure through art work. These questions are explored within this article.
Neurologic and Perceptual Aspects of Alzheimer's Disease

Alzheimer's disease is a neuropathological organic brain disease, characterized clinically by memory loss, perceptual confusion, intellectual deterioration, and pathologically by specific patterns of specific lesions. Unable to learn new material, unable to organize old concepts, the patient progressively degenerates to a helpless condition. Some patients develop delusions, personality disorders, and hallucinations. Motor deficiencies may occur at a later stage.

These symptoms of Alzheimer's disease are expressed graphically and described verbally in art therapy sessions. Characteristics of their art work range from regression, perseveration, simplification, fragmentation, disorganization, distortions, to perceptual rotation, overlapping configurations, confused perspective, and incomprehensible work (Wald, 1983). In order to better understand the misperceptions evident in patients' art work, focus should be given to the loss of memory and perceptual confusion that is so central to the Alzheimer patient.

Memory and perception are closely related, for one must perceive before one can remember. Perception is "a mental representation of an object, while the memory image is a mental representation of a perception" (Hall, 1954, pp. 24-25). Psychologists and neurologists describe perception as cognitive processes involving the sensory system, the motor system, the perceptual system, and the memory system. Sensory stimuli send messages through neural pathways to the principle organ of the nervous system, the brain, which in turn processes and acts upon nerve signals. Since our perception of reality is based primarily on our interpretation of the information our senses provide, any deficiency or distortion in the sensory mechanism or any change in the perceptual apparatus can cause us to experience a distorted reality (Wolanin, 1981). Some theories of memory describe three types of neu-
rons: the afferent, or sensory neurons; the efferent, or motor cells; and the internunciatoy, or asociative cells. Memory seems to rely on billions of the associative cells (Halacy, 1970). Researchers report evidence of changes in the neuron structure and the connections between them (the synapses) as the basis of learning and memory. Neurotransmitters carry messages from the axon of one neuron to the dendrite of the next neuron—researchers note an increase in the number of synapses in the dendrite shafts and a swelling of the heads of the dendrite spine as memory is stored (Bloom, Lazerson, & Hofstadter, 1985). Theorizing that memory is the actual growth of new connections between neurons, memory loss with age can be understood as stemming from degeneration of these connections (Halacy, 1970). The pathophysiology of Alzheimer's disease includes neurotransmitter loss and imbalance, notably of the forebrain cholinergic system. Neurofibrillary tangles, granulovascular plaques, and cortical atrophy characterize the Alzheimer brain upon autopsy.

Fused Images

Having reviewed the perceptual, neurologcal deterioration of Alzheimer's disease, let us return to the "fused images" initially described in patients' art works. This occurrence, that I have encountered in about 5% of my patients, is a phenomenon similar to Freud's concept of "condensation" in his theory of dreams and what Rorschach defined as "contamination"—the illogical combination of two or more ideas (Meili-Dworetzki, 1956). Rorschach psychologists further define contamination as "two incompetent percepts combined into one without the percever being aware of their incompatibility" (Alcock, 1963, p. 165). This mode of perception is even rare in the response of psychotic patients, and occurs more often with chronic or deteriorated paranoids, in schizoid children, schizophrenic adults, and adults with organic brain syndromes.

What do these fused images tell us about the psychological regression of these Alzheimer's disease patients? Have they become psychotic? Rorschach literature describes the similarites and differences between the psychotic and the adult organic, and notes that mixed conditions can occur:

The psychotic shows little or no concern for the "goodness of fit" between his percept and the reality. He is quick to distort reality to suit his inner needs . . . and may be quite bland about the gross bizarreness of his response. The adult organic by contrast reveals an impairment in perception of which he may be painfully aware but unable to effect a change. . . . The adult organic will generally indicate some effort at reality testing and some discontent or uneasiness about his responses. . . . The adult organic also tends to be quite concrete and suffers in the capacity to use abstractions. By contrast, the psychotic may or may not show impairment in ability to abstract (DeCato & Piotrowski, 1977, pp. 14-15).

Klopper and Spiegelman also differentiate that "the organically-impaired subject is genuinely confused; the schizophrenic patient only appears confused—he is just 'not there.' The organic psychotic, however, tends to show both kinds of confusion and often resolves his difficulty by responding with whatever pops into his head, regardless of stimulus" (1956, p. 287).

Of the four Alzheimer patients whose fused images revealed percept contamination, two showed other definite signs of psychosis in their art work. Both Patient B and Patient D drew x-ray-vision bodies, that is, drew the skeletal structure within a body, simultaneously portraying the internal and the external. Patient A and Patient B both manifested paranoid tendencies: Patient A drew people's eyes looking suspiciously to one side (Figure 6); Patient B drew multiple eyes and monsters (Figure 7). Patient C expressed a complex delusional system in an attempt to cover up incongruities with confabulations and a proper social facade. Four other patients with psychotic ideations did not draw such overt fused images, but their verbal descriptions of their art productions—descriptions of snakes in a face, bizarre stories—revealed percept contamination. This artistic fusion of personal symbols or the bizarre verbal descriptions of their art work therefore alerts one to the possibility of psychosis. In another sense, it points to a perceptual problem manifesting itself in what could be called "boundary confusion."

Boundary Confusion

Boundary confusion is evident in various ways in the Alzheimer patient's art work. Figure collisions is an example. Some patients draw off the edge of their paper, on another's drawing, onto the table cloth, even onto the vertical flap of the table cloth. Other patients use their neighbor's paintbox or, paint their own paintbox rather than the paper. Perceptual confusion of boundaries also occurs in the perseverative drawing of a person within a person: a face within a body (Figure 8), a face with--

"Like a pathologist studies disease through microscopic examination of pathological tissue, the art therapist can examine conscious and unconscious personality structure through art work."

in a face (Figure 3), a face within an eye or nose (Figure 9, 10). For example, the patient seems to view the circle he drew for the eye as the outline for another face, which he proceeds to draw in turn within its boundaries; Patients B, C, and D, as well as five other patients, manifested this interesting phenomenon. Patient A would focus on one part, such as a shoe, rather than on the whole entity. Loss of boundaries is seen in drawing facial parts without a circle to enclose them. Logical parts (an arm, an ear, legs) are omitted, repeated, or misplaced on people, animals, and inanimate objects (Figure 11, 12). Behaviorally, boundary confusion is displayed by a patient taking food from his neighbor’s plate, following another around,
mistaking another’s pocketbook or coat for his own.

Unconscious Processes

A face within an eye draws one visually, symbolically, and psychologically deeper into the unconscious. Delving further into the study of the unconscious processes revealed in these patients’ art work brings one to descriptions of condensation, contamination, interception, and fusions as primary process manifestations (Holt, 1977).

In terms of Freudian psychology, this art work mirrors the primary process mode of thinking to which these patients have regressed. Primary process thinking originates from the id portion of the personality. In its earliest form, the id is a reflex apparatus that discharges sensory excitations through motor pathways, releasing tension by impulsive motor activity and image formation. Primary process develops in the id as a result of frustration in an attempt:

to discharge tension by establishing what Freud called “an identity of perception” [i.e. . . .] the id considers the memory image to be identical with the perception itself. For the id, the memory of food [for example] is exactly the same as having the food itself. The id fails to distinguish between a subjective memory image and an objective perception of the real object (Hall, 1954, p. 25).

Indeed, these patients have largely regressed to id-level functioning, acting impulsively, irrationally, and asocially. Secondary process, that is, problem solving and realistic thinking, the main function of the ego, is defective in the Alzheimer patient.

The fusion of subjective memory image and objective perception of the real object is described in psychoanalytic literature by the ego psychologists in the early stages of personality development preceding ego formation in the young infant. The ego psychologists, in particular Hartman, Spitz, Jacobson, Blanck and Blanck, describe an “undifferentiated matrix” before birth containing potential ego, id, drive, affect, psyche, and soma (Blanck & Blanck, 1979). Development is viewed as interrelated, proceeding through numerous grades of differentiation and organization:

Before differentiation, the human infant is a psycho-physiological organism. Soon after birth, . . . differentiation begins. Still living “in the body,” the child also lives in the immediacy of the interaction in the dyadic experience as self and object images remain merged. The separa-

tion-individuation process whereby major aspects of psychic structuring take place, coincides with the gradual sorting out of self from object images and of gradual selective identification, the process by which attributes of the object become transformed into parts of the self-images (Blanck & Blanck, 1979, p. 73).

According to Mahler, the differentiation of the self-images from object images is vital to the process of ego organization (in Blanck & Blanck, 1979).

Similarly, Spitz defines the establishment of the rudimentary ego and the structuring of perception by the three-month old infants “smiling response to a percept with Gestalt attributes” (1959, p. 16). In Freudian terms, it establishes that something that is present in the ego as an image can also be perceived in reality. According to Spitz, at this milestone of development, the infant has progressed from the primary narcissistic stage of non-differentiation, turning from inner sensation to outer perception. As memory traces are laid down and become available, reality testing can begin, directed object relations originate and can be observed. Psychoanalytically, the psychic apparatus divides into conscious and unconscious parts and
"...artistic fusion of personal symbols or the bizarre verbal descriptions of their art work therefore alerts one to the possibility of psychosis."

the differentiation of an ego and an id establish a psychic structure and the first example of the functioning of thought processes.

Having defined the first organizer of the psyche as the appearance of the smiling response, Spitz describes the second organizer of the psyche occurring during eighth-month anxiety, when the infant is able to distinguish familiar persons from unfamiliar ones. The third organizer occurs after 18 months of age with the acquisition of speech, marking the inception of complex mental operations.

The recognition of a facial Gestalt, the ability to differentiate between different facial Gestalts, and the acquisition of language point to marking of boundaries—psychological, physical, and perceptual boundaries between the self and object representations. The late stage Alzheimer patient can no longer recognize loved ones, nor differentiate between different people, nor make a coherent sentence. When structuralization and self-identity breakdown due to organic brain disease or psychosis, the psychological apparatus reacts with the defense of regression to protect itself; "considering the nature of developmental processes and their profound dependency upon the process of separation-individuation, it is little wonder that the human being is prone to regress to the 'safety' of oneness" (Blanch & Blanck, 1979, p. 145).

Pathological indications in art work, seen in confusion, merging, and loss of boundaries, reflect the malformation occurring in the organizing process, which is a main function of the ego. The Alzheimer patient's personal visual symbols merge in a similar way that a child's first object images and perceptions of different objects merge into varying image composites. According to Jacobson, "at the first, our image of the self is, like the primitive object image, not a firm unit. Emerging from sensations hardly distinguishable from perceptions of the gratifying part object, it is fused and confused at first with the object images which reflect mainly the incessant fluctuations of the primitive mental state" (1973, p. 20).

The capacity for perception, discrimination, and evaluation, all which are malfunctioning in the Alzheimer patient, are necessary for a clear self-image and object images. The first primitive type of identification in the infant is "achieved by refluxion of self and object images, ... accompanied by a temporary weakening of perceptive functions, and hence a return from the level of beginning ego formation to an earlier, less differentiated state" (Jacobson, 1973, p. 40). At this time, object relations and self-identity return to the earliest wishful fantasies of merging and being one with the mother. Therefore, as the infant fantasizes of fusion with his love object (mother), borrowing from the mother's ego for his own need fulfillments, the demented or psychotic adult is compelled to lean heavily on his caretaker's ego for need gratification, support, or control. Regressed Alzheimer patients frequently ask for their mothers, who they say is waiting at home for them. In art therapy, the patient looks to the therapist as his/her ego organizer, asking for directions, compliments, encouragement, and validation. As patients deteriorate, they characteristically copy another patient's drawing; they may borrow the other's name, go over another's line in a group picture, or fuse images.

Jacobson further expounds that the processes of aging and physical decline ... might involve a decrease in the cathexis of the periphery, of perceptive and motor functions, resulting in a rise of the cathexis of the body organs, with concomitant regressive drive defusion to the point of prevalence of destructive drive energy, which must again be discharged through physiological channels in the body (1973, p. 17).

With progressive organic changes leading to deterioration occurring at all levels—physical, perceptual, intellectual, psychological—particularly with a psychotic component, the patient regresses to this early primary process stage. caretakers often acknowledge that they best manage to deal with their regressed spouse or parent by regarding him or her as a helpless child.

Conclusion

The bizarre fused images and the hybrid organisms created by some Alzheimer patients in their art work led this author to an inquiry of their deeper meanings. Similar phenomena were defined by Freud as condensation in dreams and by Rorschach as percept contamination. The neuro-perceptual pathology of Alzheimer's disease can be related to theories of memory and perception. A clear perception requires intact memory, perceptual, sensory, and

"The Alzheimer patient's personal visual symbols merge in a similar way that a child's first object images and perceptions of different objects merge into varying image composites."
motor systems and their healthy interrelationships. As the patients described in this article, regressed in psychological defense against the neuro-perceptual breakdown, unconscious aspects surfaced in their drawings. Comparing the psychotic and the organic patient indicated that fused visual images can signal a psychotic component in the Alzheimer patient.

The patients appeared to be reacting on a primary process, id-directed level. The fusion of self and object images, and other manifestations of boundary confusion, can be regarded as problems in the separation-individuation process. Ego psychologists described the fusion of memory image and objective perception in early stages of personality development preceding ego formation in the young infant; a reverse comparison can be made between the merging self and object images in the young child and the regressed, late stage Alzheimer patient. Indeed, Spitz's schema of psychological and perceptual formation leading to ego formation, which is dependent upon the ability to distinguish one percept from another (i.e., at seeing a boundary between self and object images), also helps to clarify this process. Defects in a patient's art work, seen in confusion, merging, and loss of boundaries can be viewed in terms of malfunctioning of the organizing process of the ego.

The patient regresses, needing to fuse once again self and object images. The patient remerges with mother or caretaker, who can take over the patient's ego's failing ability to organize and coordinate sensory, instinctual and emotional experiences with idealational process, perceptive, and executive functions. The emotional regression as viewed through art productions parallels the physiological regression in the Alzheimer patient.

The Influence of Art-Making on the Transference Relationship

Harriet Wadeson, PhD, ATR. Director of the Graduate Art Therapy Department, University of Illinois, Chicago, Illinois.

The art produced in art therapy cannot be fully understood without appreciation of the transference relationship which forms its context. In both client and art therapist there is the awareness that the art will be used to further the therapeutic process, that its purpose is therapy. To a large extent, the art becomes the meeting place of client and art therapist. These conditions exert a powerful influence on the nature of the art product’s development. I’m not suggesting that clients and patients set about to make art that is therapeutic (whatever they may believe that to be), but rather that their expectations around the sort of processing to which it will be subjected and their expectations of the way it will be received by the art therapist are significant determiners of the nature of the art expression.

Against this background are further considerations of how art-making may influence transference phenomena. These include both the person of the art therapist and the process of making art in art therapy. It is also important to consider art therapy’s important potential to hold a mirror up to the transference relationship in the form of transference portraits. These portraits may picture transference to the treatment facility and to other staff members, as well as to the art therapist. Finally, art-making may induce some unique counter-transference phenomena as well.

The Art Therapist

In considering the “person” of the art therapist, it is important to recognize that transference is not a random occurrence. Although transference is an unconscious process that may be a part of any human relationship, there are some situations that encourage its development more than others. Those involving authority figures evoking a “child-to-parent” sort of transference are the most obvious. In fact, the major thrust of a psychoanalysis is the facilitation and resolution of the “transference neurosis.”

When I think of the selectivity involved in transference reactions, the image of a coat hook comes to mind. Certain personal characteristics in particular situations provide convenient hooks on which to hang a transference. The art therapist, by the very nature of his or her work, furnishes some very accommodating hooks for some heavy transference garments.

An art therapist is a provider. Other therapists certainly provide as well, but in addition to all the intangibles a therapist may give (such as interest, care, attention, insight), we also provide tangible supplies. I recall the exclamation of an adolescent upon seeing the art materials on her initial visit to my office at the National Institutes of Health: “All this for free?” She had been making art for a long time, and to her my office looked like heaven. She hadn’t even interacted much with me yet, and already I was perceived as the all-giving mother. (Naturally, meager supplies could evoke feelings toward a withholding parent.)

Because the patient or client is called upon to make a product in art therapy and because art-making is not an activity in which most people feel very skilled, the art therapist may readily be experienced as a critical parent, a harsh judge whose approval, the patient believes, will not be forthcoming. Figure 1 is an expression of such feelings. In this case, a young woman in a private practice art therapy group wrote the following about her picture:

The first thing that came to my mind was a finger pointed at me. I appear small, weak, helpless—I’m looking at the ground. The feelings that the smaller figure evoke in me are helplessness, worthlessness, rejection and depression. The small figure is also angry but can’t express it to the ov. rearing larger figure. The larger figure represents my mother, but it also represents the many older authoritarian females in my life that I have feared. The older female figure is chewing me out, demanding that I be perfect and refusing to listen to me. I still cry when an older woman has authority over me. I feel that I am reliving a scene with my mother (whose approval I constantly strove for) when she would

"To a large extent, the art becomes the meeting place of client and art therapist."

408
reprove me or criticize me. Disapproval seems to mean worthlessness, but this only occurs with older women.

The client acknowledged an approach/avoidance feeling towards me which was partially based in her early experience of being judged unworthy by her mother. For example, she gave me these written comments almost immediately after I requested them (to please me), and then was certain I wouldn’t use them (disapproval). In this case the critical parent perception spread well beyond the art-making activity. It even included writing about the picture.

Another “parental hook” is one who knows the meaning of things. Young children turn to their parents (especially their mothers) to explain things and to make the world comprehensible to them. Art expression often has about it an element of mystery. Patients may suspect that their art has hidden meaning that the art therapist can read to which they themselves are blind. We have all probably had clients request us to tell them what their pictures mean. This dependency on an all-knowing mother (or father) at times even conveys the perception of a sorcerer or god-like being. Figure 2 is an example. A young woman in another private practice art therapy group wrote the following about her idealized image of me:

I see Harriet as a goddess. I want her to be a goddess, for how else can she help me out of my dungeon. If I am so low down in the ground, she must be high in the sky to pull me up. Then we can both be on earth, human. I know Harriet is not a goddess. She is human and earthy, the earth mother. She too has a shield against the pain radiating inside, like me. But she glows. She carries a goddess behind her—a many-armed Hindu goddess. This is how I relate to her, as a goddess, loved and feared. I cannot get near—I can barely put myself in the picture so close.
"Certain personal characteristics in particular situations provide convenient hooks on which to hang a transference."

Expectedly, the power given the art therapist as one who is nurturing and all-knowing evokes negative feelings as dependency needs are frustrated. An art therapy student (not in a program in which I taught) had seen me at a professional meeting and felt unbalanced in the brevity and superficiality of our relating there, as compared with the therapy sessions. These feelings gave rise to her picture of her relationship with me (Figure 3). She wrote the following about it:

I picture myself as a hungry little blue bird looking kind of helpless, cut off, pathetic. I have to wait to be fed by Mother bird. The red diagonal is my anger. I am angry about being kept dependent. The little bird would like more nurturing without having to ask.

Figure 4, also an example of negative transference, was drawn by another private practice group member. She was able to make good use of it in examining issues of power and control. She wrote the following about it:

Originally, I had in mind as I began to depict the therapist, an all-loving, all-caring figure. As the picture evolved, it developed into something quite different. I saw myself as the doll-like figure arching back rigidly from this all-too-sweet woman. The blue surrounding me indicated my way of distancing myself and the red in the figure expressed my anger and fear of being possessed and of being deceived by her. The woman’s expression appears very sadistic and her grasp almost a squeezing-to-death action. The green

around the woman figure was used to denote growth which she wanted and could help foster in the child. As I flipped the drawing and became the woman, I was able to identify with her as the way I keep people at a distance and how I feel the need to be all-controlling and powerful.

Occasionally a patient treated by a variety of staff in a treatment facility may find in the art therapist a "messenger-type transference hook." This might be particularly likely for people who have communicated through one parent to another. The art therapist readily becomes a "messenger" because the art product is such a tangible message.

Figure 5 is an example of such a transference reaction to her psychiatrist by a hospitalized manic-depressive woman who was very angry at her psychiatrist because she felt he underestimated her abilities. Underneath the anger were painful feelings associated with his confirmation of her own self doubts. She had been militantly religious, but at this time felt extremely disappointed about not being "saved." She drew Jesus crucified with bullet-holes in the shape of a cross in his heart. Beside him is herself, smiling and holding a salt shaker. She said she would like to crucify him again, shoot bullets through his heart and pour salt in the wounds. She joked about "twisting off Jesus’ penis." Then, amidst sobs, angry outbursts and sarcastic glee, she said her revenge on her psychiatrist would be "to twist off his peter, but I really don’t think he has one." There is a clear connection in her rage at her doctor, Jesus, the neglectful husband she divorced and her alcoholic father—all men whom she felt cared for inadequately.

In this example the art therapist was probably used as a messenger to convey the patient’s anger to her psychiatrist. But to consider this picture as serving only that purpose is to miss its obvious facilitation of ventilation of feeling with the concomitant opportunity for exploring those feelings through imagistic metaphor and sharing them with another (the art therapist). In this case, such communication was probably easier than dealing directly with the psychiatrist.

The Art-Making Process

As noted earlier, the "person" of the art therapist, by the nature of his or her work, may readily evoke certain transference projections. But be-

"Patients may suspect that their art has hidden meaning that the art therapist can read to which they themselves are blind."
Beyond that, the process of art-making in art therapy sessions may also stir up old familiar feelings or patterns of behavior in the way a client relates to the art therapist.

Although people undergoing any sort of psychotherapy often feel exposed, they may feel particularly vulnerable around the unexpected aspects of themselves that are sometimes revealed in their art. Figure 6 is an especially clear representation of these feelings accompanied by sexual overtones. A middle-aged man hospitalized for anxiety and depression had intended to depict "The Thinker" but instead produced a picture of himself nude, working at an easel with his head gazing at him from a framed picture on the wall. He titled the painting "Session at Art Therapy." In the picture, he is revealed naked to me, while I am "safely ensconced in a frame" and have no body. He explained that this way I could not be "active." The lack of mutuality and balance in this situation is one in which the patient may feel exposed, evaluated and judged in producing a product which may be self-revealing in ways the patient feels unable to control.

Many of those who come to art therapy have not participated in art activities since childhood. Often they feel thrown back to school days. Some enjoy the regressive feelings stimulated by the art materials, but many are embarrassed by what they consider the child-like appearance of their work. The regressive nature of artwork for those unaccustomed to it sometimes leaves art therapy clients feeling deskilled and ineffectual. This aspect of transference to the process is usually readily overcome with the help of a sensitive art therapist.

In group therapy there is an expectable sibling-like rivalry for the attention of the therapist, but in group art therapy it may take on the added dimension of producing art that will interest the therapist and help to establish a position among peers. Figure 7 is a depiction of the art therapy group in which the art therapist is the largest central "dark sun" with the group members orbiting around her.

When I have encouraged patients to try out the art materials, they have sometimes responded initially by indicating that they were making a picture for me. They saw the art as an activity and product I wanted rather than as something they were doing for themselves. They behaved like cooperative, obedient children trying to please mommie or teacher.
Shortly before a Christmas holiday, a six-year old child diagnosed as minimally brain damaged, in treatment for disruptive behavior in school and at home, drew a picture of Santa Claus, Figure 8. He said that Santa would give his first present to me. In contrast to reports of his problematic behavior elsewhere, he liked art therapy and tried to please me. His next picture, Figure 9, was a picture of me. This was produced spontaneously and was very much in the nature of a gift for me. Although he reacted to frustration or over-stimulation with disruptive behavior in peer situations, in a one-to-one relationship he was a “good little boy” trying to please mommie or teacher.

Transference Portraits

Like this child’s picture of me, many of the examples presented here are portraits conveying various aspects of the nature of the transference relationship. Perhaps most difficult to articulate is that aspect of art therapy that resembles the early relationship between mother and child in which the mother looks on attentively and lovingly as the young child plays. The mother’s witnessing the activity and viewing the final product, whether it be a picture, mud pie, a house of blocks, or some other creation, is often an essential component of the experience for the child. Seldom in our subsequent lives do any of us receive this sort of loving delight in what we do. (And many, of course, never experienced this kind of devotion even in early childhood.) At times the art therapy relationship has a feeling of loving devotion as the art therapist watches and encourages the patient’s progress, giving full attention to whatever the patient produces.

A depressed young woman who was hospitalized at the National Institutes of Health following a suicide attempt, drew Figure 10 shortly before discharge. In art therapy she had explored family relationships and her reaction to the death of her mother (when the patient was eleven) following a long illness during which the patient cared for her. In the drawing she has depicted NIH as a ghost-like figure (possibly her mother) watching her as a young child building. The title she gave it, “Parental Vigilance,” further expresses her transference to the institution as a whole, in addition to her art therapy experience. Seldom is this aspect of the transference expressed so explicitly.

Transference to the Institution

The art products provide an especially clear, dramatic, and revealing reflection of transference phenomena. As such, they may refract various facets of the transference. Transference to the treatment facility is one such important aspect as evidenced in Figure 10.

Often particular experiences of institutionalization evoke transference reactions, sometimes of even delusional proportions. Figure 11 is an example. In it a young man hospitalized for acute schizophrenia at the
"The art products provide an especially clear, dramatic, and revealing reflection of transference phenomena."

National Institutes of Health portrayed an experience in the unit dayroom. He has drawn himself seated on the sofa, and watching a TV program involving a theft. He believed that the three people in the picture—himself, an aide in the chair, and a female patient—had committed the crime. These three were the only black members of the unit’s population at the time. He thought the female patient’s pocketbook was filled with the money they had stolen, as was the suitcase beside the sofa. When the aide moved the suitcase to the nursing station, the male patient was convinced that the other two were attempting to cut him out of his share of the stolen money. The formation of this delusion appeared based in the patient’s general sense of guilt, his transference reaction to the institution and to the triangular nature of the relationship among the three blacks on an otherwise white ward.  

Figure 12, a depiction of life on the same ward drawn by another schizophrenic patient, illustrates aspects of transference to the institution in the eye looking through the seclusion room window, the barred window of the seclusion room, the rushing doctor, pharmacological mood determinants, as well as the anger and sadness she was feeling.

The seclusion room represented in Figure 12 appeared spontaneously in many of the pictures of patients on this ward. The young woman who drew herself there in Figure 13 believed that she was in a gas chamber watched by a “silent guard” outside the door. The incarcerating aspect of institutionalization clearly provoked some transference reactions of delusional proportions to the institution itself. Note the contrast in these experiences of NIH compared with "Parental Vigilance," Figure 10.

Countertransference

It is easier for therapists to discuss and illustrate transference than it is to look at countertransference. Nevertheless, art therapy may evoke some unique countertransference phenomena as well. We may enter the mode of art teacher or achievement-oriented parent and encourage clients and patients to produce "good art," sometimes at the expense of a larger acceptance of whatever they do or their own self-determination. In this way, our needs may collude with the helpless quality of a patient’s transference. Seldom do we do this overtly. It is much more likely to be a subtle influence through which the patient comes to see where our interests lie.

Because we treasure the art-making process and delight in our own accomplishments in this activity, it is

---

4See Wadeson, H. and Carpenter, W., “Impact of the seclusion room experience.” Journal of Nervous and Mental Disorders. 163: 318-328.

not unlikely that at times we may envy our skillful patients both their artistic talent and the excitement of their imagery.

Along the same lines we may envy their patienthood in art therapy. There have been many occasions when I have seen patients immerse themselves in the art materials that I personally find so inviting. The tender mother-child relationship that art therapy may evoke (discussed previously and exemplified by Figure 10) may arouse longing in the therapist for the child position. The loving acceptance the art therapy patient receives may appear very appealing to those of us who love making art, especially when compared with what may have been the harsher reception our art might have received in traditional art training. Envy of our patients, along these and other lines, most often arises from feelings of inadequacy usually rooted in the imperfect nurturing that most of us experienced in early childhood.

Countertransference manifests itself in innumerable ways, but there are a few to which art therapy is especially subject. A defensive maneuver on the part of the therapist may be to set himself/herself above the patient. In art therapy, judgment of patient art is a readily accessible vehicle for such positioning. The art therapist can judge the art, interpret it, use it for assessment and diagnosis. Obviously, there are expectable aspects of the art therapist’s work and not simply countertransference maneuvers. The point is that the ambiguity and sometimes mystery of art expression makes it a ready sphere for the enactment of power ploys on the part of the art therapist. Since on most treatment teams the art therapist is the expert on art expression, he/she is not likely to be challenged by other staff on such judgments.

*“Often particular experiences of institutionalization evoke transference reactions, sometimes of even delusional proportions.”*

Communication through art made by the art therapist may also become a countertransference vehicle. For example, a young female student established an art therapy group composed of men with chronic disorders. She made an abstract picture of each man conveying her impressions of him at the group’s onset and then at its ending some months later. These pictures were gifts for the men, and the group’s dynamics appeared to center around competition.
for the female art therapist's affection. Without awareness, she was directing the group in such a way as to satisfy her own needs.

The anxiety generated by countertransference issues around the need for control may be manifested in art therapy in an over-structuring of sessions. Rather than being responsive to clients' needs, the art therapist may plan activities in advance without being sufficiently flexible to adapt to immediate conditions and needs. This is especially likely to occur in group art therapy where the session may feel more difficult to control. It is sometimes in this way that art therapy becomes "gimmicky."

Conclusion

Art therapy is more than just art or just therapy. The combination forms a special sort of synthesis. As a form of therapy, as opposed to art expression alone, the process of art therapy cannot be fully understood without accounting for the matrix of the patient-therapist relationship in which it evolves. The unique synthesis of art and therapy gives rise to a special sort of transference relationship. The art therapist is readily seen as nurturer, judge, sorcerer, or messenger; and the art-making process can readily lead to feelings of regression and exposure as well as mastery under the care of loving guidance.

In addition to the many facets of transference which the "person" of the art therapist and the art therapy activity may evoke, is the significant potential the art expression carries for revealing the nature of the transference experience. As such, the substance of art therapy itself (art-making in relationship to another) furnishes its own means of understanding.

It not only becomes the meeting place of art therapist and client, but advances the therapy by reflecting images of the therapeutic relationship, thereby clarifying dimensions of transference phenomena. These images then become further grist for the therapeutic mill.

Finally, working with patients and clients through art may also stimulate some unique countertransference reactions. It is important for art therapists and the staff with whom they work to be aware of the forms of transference and countertransference that art therapy may evoke.

"It is easier for therapists to discuss and illustrate transference than it is to look at countertransference."

"Writing for Publication in Art Therapy"

Cynthia Levy, ATR, author, (pen name of Levee).

This is in response to the open forum "Writing for Publication in Art Therapy" I attended at the 1985 American Art Therapy Association Conference. I am a registered Art Therapist, and a published poet, fiction writer and book reviewer who studied in the Masters of Creative Writing program at San Francisco State University.

After hearing the discussion on writing for publication in art therapy, I want to comment that two reasons I write are: (1) to share, and (2) because I have something to say. When my writing is because of my art therapy work, it is crucial for me to remember that my identity as a Healer comes before my identity as an Author. Gladys Agell, outgoing president of A.A.T.A., spoke about art therapists needing to hold on to their identities (i.e., in her opening address at the Conference). I agree I don’t want to become molded into a corporate structure of attaché cases and silk shirts, even though my job depends on surviving in a corporate structure.

The work of the arts and the Creative Arts Therapies is not created in the image of the Medical Model. Though art therapists may desire to publish, we have the freedom to turn to the arts as a model for sharing our work and being heard and seen. Private viewings and sharings of a picture or poem with one or two friends can be extremely valuable for an individual’s growth and development. The actual picture or poem may best not be viewed by the public because of the artist’s own vulnerability at being in process and not having enough objectivity or distance with his/her work to have the strength to share publicly at that time. Sharing work publicly can be an entirely different process than sharing work with a small group of friends. Private sharing can be a special experience to be treasured. Robert Bly, a better-known-than-most poet, wrote an article in *Coda, Poets & Writers Newsletter*, about the mad rush in these times for young writers to publish early. I have been warned of the dangers of being public before the work or the person need be.

Since our professional ethics are that the patient’s healing comes first, then the patient is most important. Our publishing articles using our patient’s work is next. Our greatest strength and contribution towards healing ourselves, our patients, our systems, and our planet, lies in art therapists retaining our own authentic identities and remembering to look to the artistic process, going inside and doing what we must because we must, and sharing with the world when to share is part of the healing creative process.

**Art Therapist’s Portfolio**

*VIEWPOINTS* provides a forum for sharing ideas and graphics about issues facing art therapists. It also encourages the submission of photographs of art by art therapists with an accompanying statement describing the work’s meaningfulness to its creator. Submit black and white glossy photographs and four copies of the written material to: Viewpoints, ART THERAPY, 505 E. Hawley St., Mundelein, IL 60060.

The artwork was submitted by Patricia Ann Tindall from Memphis, Tennessee. She was a founder of the Tennessee Regional Art Therapy Association, and has over ten years of experience in art therapy. Ms. Tindall was instrumental in designing and implementing an art therapy program in a school system in Tennessee that served as a pilot program using art therapy with learning disabled children in an open space classroom.
The Lowenfeld Lectures: Viktor Lowenfeld on Art Education and Therapy

John A. Michael, Editor, EdD, Professor Emeritus, Art Education, Miami University, Oxford, Ohio.

Reviewed by Rawley Silver, EdD, ATR, HLM. Silver is author of the Silver Drawing Test, Stimulus Drawing and Techniques, and Developing Cognitive and Creative Skills Through Art.

If you are in your twenties or thirties, it may come as a surprise that Viktor Lowenfeld’s famous book, CREATIVE AND MENTAL GROWTH, once included a chapter titled, “Therapeutic Aspects of Art Education.” This 74-page chapter appeared until the fifth printing of the third edition. After his death in 1960, his book was revised and his chapter on art therapy disappeared without a trace.

In the early 1960s, art education was uncomfortable with art therapy. Art teachers were under the thumb of abstract expressionism, figurative art was taboo, and the time-honored occupation of working your way through college by posing for the life-drawing classes had disappeared. Many art schools had discontinued representation in any art form.

It is not surprising, therefore, that the chapter on art therapy was eliminated from Lowenfeld’s book in subsequent editions, or that students in art education and art therapy never knew what they were missing.

Now they can know, thanks to two of Lowenfeld’s former students. One had taped his lectures and the other has edited the tapes into the book that is the subject of this review. The first student, Ellen Abell, inspired by his lectures, had obtained his permission to tape them at Pennsylvania State University in 1958, just two years before his death. She had wanted to publish the tapes but after years of inactivity and in failing health, she turned to a fellow-student, John H. Michael, now Professor of Art Education at Miami University. He edited the lectures with the help of others who transcribed the tapes into longhand, and typed them. The 31 lectures have now been published by The Pennsylvania State University Press, 1982.

Section III of this work, titled, “Art Education Therapy,” includes four lectures on the therapeutic aspects of art education. These are: “Psychotic-Neurotic Considerations; A Case Study of Virginia, a Neurotic Child; A Case Study of Aggie, a Mongoloid Individual; and A Case Study of Camilla, a Deaf-Blind Child.”

From my point of view, this book should be required reading not only for art therapy students but also for art education students so that they can judge for themselves the work of a pioneer in both fields.

Viktor Lowenfeld is another of the refugees from Nazism who has made valuable and lasting contributions not only to us but also to the world at large. His books have been translated into Arabic, Chinese, Danish, German, Hebrew, Italian, Japanese, Norwegian, Spanish, and Swedish. One can only wonder whether his chapter on art therapy is missing from the foreign editions. If so, it is hoped that these Lectures will follow them, even if they can never catch up.

July 1986, ART THERAPY 91
EDUCATING THE CREATIVE ARTS THERAPIST

By Shaun McNiff
Leesley College, Cambridge, Massachusetts

This is the first comprehensive study of higher education in the burgeoning arts therapies. It is a timely, valuable book for everyone involved at the more than 200 schools now offering related courses and programs.

After introducing the context for the creative arts therapies, the text reviews pertinent historic trends in higher education, particularly disciplinary interdependence. Discussions of early training programs, academic milieu and current educational approaches are used to define the profession through education. Music, dance, art, poetry and drama therapies are brought into play, as are artist therapists and psychodrama.

The author delineates characteristics of academic training programs: types of schools, undergraduate and graduate programs, degrees, prerequisites, coursework, the thesis, and related topics. He explicates the elements common to all the creative arts therapies, specific media competencies, supervision and evaluation, an artistic theory of mental health, and student and faculty characteristics. A dialogue among leading educators on key issues in the education of the creative arts therapist concludes the book.

'86, 296 pp., $20.75

THE ARTS AND PSYCHOTHERAPY by Shaun McNiff. "Though [its] approach may be controversial, the book will be interesting, provocative, and valuable to clinicians who use any of the arts in a therapeutic context."—Contemporary Psychology, '81, $19.75

A MANUAL OF SEQUENTIAL ART ACTIVITIES FOR CLASSIFIED CHILDREN AND ADOLESCENTS by Rocco A. L. Fugaro. This book shows how to apply art activities with children who are classified as impaired, maladjusted or depressed. '85, $25.75

ART THERAPY ACTIVITIES AND LESSON PLANS FOR INDIVIDUALS AND GROUPS by P. J. Furrer. The author cleverly details art activities and lessons that promote awareness, foster acceptance, and encourage experimentation and exploration. '82, $12.75

HOFSTRA UNIVERSITY
HEMPSTEAD, NEW YORK 11550

Hofstra University is pleased to announce a new interdisciplinary graduate program:

M.S. in Special Education and Art Therapy

This Interdisciplinary program is designed to prepare candidates with competencies both in Art Therapy and in Special Education. Graduates will be qualified to work with handicapped individuals as teachers in Special Education and as Art Therapists who can work as therapeutic team members in a variety of hospital and rehabilitative settings. Professional preparation will provide candidates with experiences in the use of art therapy in the treatment of persons with emotional, mental, physical disabilities, other handicapping conditions and those with special learning needs.

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office.

Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office.

Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office.

Contact the AATA National Office for an application.

Annual Dues: $80

ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

The guest Contributing Co-Editor for this issue of *Art Therapy* is Shaun McNiff. Shaun is Professor of Expressive Therapy and Dean of the Institute for the Arts and Human Development at Lesley College, Cambridge, Massachusetts. He was a pioneer and is a major figure in education, theory and practice of the creative arts therapies. His experience as a consultant and teacher in other countries, as well as the United States, is well-known and highly respected. Dr. McNiff has written two landmark books in our professional field. *The Arts and Psychotherapy* was widely received and acclaimed, and his most recent book, *Educating the Creative Arts Therapist*, is the first comprehensive study of higher education and art therapy.

Dr. McNiff and I have worked for over a year on groundwork plans for the development of a multicultural, international issue in art therapy. Because of the growing interest—and positive responses—to this idea from persons in the United States, and in other countries, we have decided to introduce some of the “international flavor” in this issue, but to continue with the idea in succeeding issues (over the next few years) incorporating articles from various cultures and countries, as they become available and are ready for publication. Certainly Dr. McNiff has set the stage for the encouragement to international authors to submit articles, and I am happy to announce that we are receiving requests for information as well as some initial draft articles from authors in Holland, France, Germany, and other countries. I believe that this added dimension will help each of us with our global understanding of the nature of our profession.

Within this issue is a major article introduced by Dr. McNiff, followed by an interview/dialogue with James Hillman. This insightful, thought-provoking dialogue serves to illuminate aspects of art therapy and therapy in general. As McNiff points out in his introduction to the dialogue, “Hillman does have immediate relevance to all art therapists if we approach his writings as one of many important viewpoints on the nature of the image. What he can unquestionably do for our profession, whether we all agree with what he says or not, is introduce an essential perspective, respecting the integrity of the image and providing cautions as to how we approach it.” James Hillman is one of the major writers in the psychological field, and his ideas are dynamic and provoking. We are indeed fortunate to be able to include this dialogue/interview in this issue, and his contribution is greatly appreciated.

A second article is by Howard McConeghey, titled “Archetypal Art Therapy Is Cross-Cultural Art Therapy.” With reference to the cross-cultural aspects, McConeghey states that “It is this collective or archetypal aspect in art therapy which by its very nature is cross-cultural.” The article offers much to consider, and is presented by a major thinker, writer, philosopher, and humanitarian in art therapy and education.

The third article focuses on art therapy in Israel, and is authored by Lenore Steinhardt. Steinhardt’s article is one of our first ones on art therapy as it is organized and practiced in another country, and we present this excellent contribution as one of the first “international” entries into what we know will be an important part of our professional literature in art therapy.

The fourth article is titled “Art Therapy for Acculturation Problems of Hispanic Clients,” by Gilda Prieto Moreno and Harriet Wadeson. The authors discuss roles in Hispanic families, acculturation problems and art therapy practice in a mental health center. Photographs of individual art work, and recommendations for therapy with people who have been relocated are presented in an insightful way. Directions and/or suggestions are given for the art therapist who may work with clients from various cultural backgrounds.

Because much content in this issue is either directly or indirectly related to “dialogue,” it seems appropriate to issue an invitation to the readers to extend this dialogue. Let us hear your thoughts and ideas on content, relevance of issues, and send in your suggestions for consideration. Perhaps you have an idea for “Viewpoints,” or you might need some help in expanding that article that you are writing. Perhaps a letter to the editor might be relevant, or a telephone call to discuss the possibility of a future article. Let’s keep this dialogue going.

Thanks to all of you who are submitting articles to *Art Therapy*. We have recently been inundated with articles, and they are being sent for review as quickly as possible. During the first few months of publication, there seemed to be an “easy flow” of articles and, therefore, the pace was slower. However, with the recent increase of submissions, we are re-grouping and reassessing our procedures so that we can better serve the authors who are submitting articles. Please bear with us. It is gratifying to observe the tremendously growing interest in *Art Therapy*, and the desire to be a part of the profession through our journal. Thanks to all of you, and for the constructive ideas and suggestions.

The 1987 A.A.T.A. Conference is nearly upon us. An exciting program has been planned for the Los Angeles meeting, and congratulations are sent to all of the planners and coordinators of this massive undertaking. See you at the Conference!

Gary C. Barlow, Ed.D., ATR
Editor, *Art Therapy*
A Dialogue with James Hillman

Shaun McNiff is a Professor of Expressive Therapy and Dean, Institute for the Arts and Human Development at Lesley College, Cambridge, Massachusetts.

Introduction

James Hillman stands out among psychological writers of the twentieth century as an inspirational and useful ally to the art therapy profession. Howard McConeghey, Professor and Director of the art therapy graduate program at the University of New Mexico, has been suggesting this for many years. Hillman’s value to art therapy lies in his demonstration of how to reverse the most fundamental theoretical presuppositions and habitual behaviors of psychotherapy. Rather than analyzing art through the methods of psychology, he urges psychology and psychotherapy to engage art. In the tradition of Friedrich Nietzsche, one of the most influential philosophers of the late nineteenth century, Hillman calls for the breaking of the containers of professions that limit vitality. He urges us to create new metaphors for what we do, or better yet, resurrect ancient continuities of culture.

The psychological writings of James Hillman are particularly useful to art therapy because of the primacy of the image in his thought and his practice of psychoanalysis and therapy. Rather than approaching images as clinical data serving rational systems of analysis, Hillman approaches the image as the embodiment of the psyche. The image lives; is treated with respect; is distinct from the person of the client and the therapist; is to be interpreted and understood, phenomenologically, on its own terms; is sacred, and a manifestation of “the gods” themselves. This psychology of the image presents an extraordinary challenge to art therapy. Are we capable of understanding and heightening the wisdom, complexities and gifts of images? Are we capable of allowing images to speak for themselves, and hearing, or seeing, what they communicate to us?

Prerequisite knowledge is needed for our profession to fully engage the image. This guidance cannot be gained exclusively through contemporary systems of psychological analysis and psychotherapeutic practice. The image can be fully understood only through cooperative studies of culture, the fine arts, literature, history, religion, philosophy, and myth. Where the appeal of many popular contemporary psychologies lies in their ability to contain experience, and place it within conceptual boundaries, Hillman does the reverse. He challenges our ability to open and embrace diversity, and readily acknowledges what he does not know. Describing himself as polemical, he questions dogmatism and the unconscious acceptance of psychological principles simply on the basis of their position within the mainstream. Like Socrates, Hillman serves as a gadfly, sting the anaesthetized mentality within us, and stimulating an awakening of critical judgment.

What is perhaps most unusual about James Hillman is his ability to complement philosophical inquiry with an exemplary respect for the animal, as revealed in the statements made here to the readers of Art Therapy. He is as committed to the act, as to the idea, and minimizes distinctions between the two. Hillman goes beyond Dionysian/Apollonian dualites and introduces us to polymorphic modes of understanding. It is from the perspective of polytheism, constantly evoked by Hillman, that his work can be best understood. The image can say different things, some of which may contradict one another. Our response to the image will predictably change. There is no single, correct interpretation of an artwork or dream, although there will be some that suit the image better than others. There is no single human ego responsible for the creation of the image. The images have a live force unto themselves, and do not belong to individual people. “The dreamer is in the image rather than the image.
in the dreamer” (Archetypal Psychology, p. 6).

Hillman is sharply critical of the “creative ego” which he sees as usurping a “godlike capacity.” He not only helps to respect the rights of images, dreams and artworks that we too often approach with interpretations that are more likely to reveal our internal preoccupations, but he suggests how we might lighten the loads of our clients who feel the unspoken burden, of being “creative,” within the art context. Hillman perceives the world as continuous creation. If we approach our clients with attitudes of helping images to emerge naturally, we might just help to further the “quality” of what comes forth. It is the single ego function that most restricts the vitality of the many faceted person. Not only does the “ego personality” limit our ability to discover “other persons” within ourselves but it subjects non-human entities to inferior status. Hillman reverses the most accepted tenets of psychiatry and psychology: he believes that the multiple rather than the single personality is an expression of well-being and that the idea of a single ego oppresses the many forms of the psyche; he and his patients talk to animals, stones and pictures and they believe that these things talk to them. According to orthodox psychiatry, Hillman’s work must be a manifestation of madness and he would not disagree, having said that within the context of how the psychological establishment defines health, “my books can be used to increase your sickness.” He speaks of the soul, rather than the unconscious; imagination and poetics rather than technology; and so forth. He encourages art therapy to find its metaphors for healing within art. Hillman challenges the very essence of technological belief systems when he describes “the poetic basis of mind.”

In his essay on “psychological language” Hillman expresses his distrust of psychological terminology, and especially its concepts of psychopathology where “the language of the field and the speech of the soul seem to go most at cross-purposes. . . . The language of psychology insults the soul. It would sterilize metaphors into abstractions. We are made ill because it is ill” (The Myth of Analysis, p. 121). However, a principal focus of his writings is pathology. His complaint is with how it has been “viewed, treated and condemned.”

James Hillman wants psychotherapy and psychology “to move towards art.” He supports art therapists who desire to speak, and act, as artists, without abandoning respect for the context within which we work, and the many other disciplines and points of view that are embodied by the present mental health field. Hillman is not suggesting a new artistic monothecism or dominance, but speaks against those beliefs and traditions that suppress the artistic, the sacred, the poetic, variety, soul and imagination. He speaks to us as an artist. His polytheistic psychological thought can be particularly useful to those in our profession, artists, psychotherapists and teachers, who are uncomfortable with a single identity.

Every psychology is for James Hillman a confession, a religious activity. He discourages us from following the great psychologists in being “Freudian,” “Jungian,” etc. Instead, he urges us to “be psychological,” with the inspiration and guidance of their work. I believe that the same applies to his own writings. It would be a mistake to consider Hillman’s ideas about the nature of images, for example, as either being right or wrong, acceptable or unacceptable. That is precisely the type of dualistic and dogmatic response that he questions. Hillman does have immediate relevance to all art therapists if we approach his writings as one of many important viewpoints on the nature of the image. What he can unquestionably do for our profession, whether we all agree with what he says or not, is introduce an essential perspective, respecting the integrity of the image and providing cautions as to how we approach it. He demonstrates the need for learning and cultural knowledge combined in his case with a lifetime of clinical and artistic experience. Hillman’s involvement with ideas does not suggest separation from the commonplace, what is practical and useful. He draws from Blake and Keats in describing his “work” in the world as “soul-making.” He is also critical of idealistic and spiritual ascent, preferring descent into the world, what he calls “insearct.” Hillman cites Wallace Stevens to support this mission: “The way through the world is more difficult to find than the way beyond it.”

James Hillman now lives in Thompson, Connecticut near the Massachusetts border and works as a Jungian analyst, author and lecturer. He grew up in New Jersey, attended Georgetown University, earned his Bachelors and Masters degrees at Trinity College, Dublin, and his Ph.D. at the University of Zurich (summa cum laude). Dr. Hillman lived in Europe for thirty-two years and served for ten of them as director of studies at the Jung Institute in Zurich. He returned to the United States in 1978 to accept an appointment as Professor of Psychology and Senior Fellow in the Institute of Philosophic Studies at the University of Dallas where he was later Dean of the Graduate School. Since the 1960's Dr. Hillman has regularly been a main speaker at the Eranos lectures in Ascona, Switzerland. In 1972 he was invited to give the Dwight Harrington Terry lectures at Yale University on the topic of archetypal psychology and he has also taught semesters at Syracuse University in the Department of Religion and at the University of Chicago.

In 1986 Dr. Hillman was a guest professor at the Institute for the Arts and Human Development at Lesley College where the dialogue presented here took place. Written notes
rather than electronic recording equipment were used. The text was expanded afterwards through correspondence.

The writings of James Hillman have been translated into nine languages and his books include:

Shaun McNiff: Do you ever think about where images come from?

James Hillman: I try to never think about origins, neither about myself nor about the universe. These things lead into the past and away from phenomena. In practice it is an escape from what is. I live to speculate, but I am appalled by the money that is spent on determining where the universe came from. I am interested in the fantasy of origins, why it grips people. You catch cold and you want to know where it came from: how, who, when, etc. . . . causal thinking; into the past—away from the sneezing. We are so baffled and perplexed by symptoms, images, poems and dreams. The image can be baffling. I begin with Jung’s idea that psyche is image. The image is the unmediated. It just appears. If that is the case, the image does not originate elsewhere. Going to the past for an explanation is the reduction of the image to something already known. We want to place it somewhere familiar, avoid its perplexity. Traditional psychotherapy is a system of avoidance. Jung said, start with what is, there, now. Do not interrupt it.

In our culture we are historical materialists. We favor the past in a literalistic way. We are stuck with the efficient and immediate cause. We have lost the formal cause (Aristotle and Thomas Aquinas), the way the dream or thing is put together, that which forms it in a certain way. The psyche takes the residues of yesterday and forms it today. Aristotle and St. Thomas also had the final cause, that for the sake of which something happens. The final cause, the intention or purpose in each event is crucial to looking at life psychologically.

S.M.: Is there an existential terror or simple reluctance to look at the situations before us for what they are, in themselves? I feel that within an art therapy context, analytic interpretation according to a particular psychological system stops the process of dialogue, it establishes a distance between people, and between the person and the phenomena. A participant in one of my art therapy training groups said that this kind of interpretation can be likened to talking about a person or an image, as opposed to talking with them.

J.H.: Much of what I write is intensely polemic and against what I see an excess of. One of these excesses is an addiction to meaning. We attach ourselves to meaning and lose the image or dream. Abstract interpretations take us away from the image. I try not to reduce big trucks to power drives and little dogs to feelings. Our psychological language is conceptual. It does not have images. We need metaphoric interpretations, rather than symbolic ones. Putting meaning onto something is often an avoidance. Another avoidance is identifying your feelings with the image.

I do not say, become the truck, or the little dog. That is the “I,” the ego, swallowing the dream. You are not the dog, the truck. They are independent psychic events. It is important to feel what you feel vis a vis the truck and the dog; not what they feel.

There is also the problem of ownership. People will soon be owning the Gods, by feeling what they feel. Very pretentious! If a fox comes to you in a dream, it is not yours, anymore than a fox that comes to you in the forest. You are one figure in the dream. What comes to you is not yours. The ego is not the owner.

S.M.: You are suggesting that the drawing, the art work, is distinct from the person. It has a life of its own.

J.H.: When Plotinus said, about the Gods, “It is for them to come to me, not for me to go to them,” he was probably talking against magic and therapy: attempts to make the Gods do things you want them to do. Like Prayer. “For them to come to me” as a visitation. Now, take this in terms of images: images, whether in dreams, in poems, in dayfantasies, or in art. If they come to you, then you respond as best you can; you record the dream, you enter the fantasy, question it, talk.

November 1986, ART THERAPY 101

430
about it, and if it is a painting under your hand, you shape it as best you can. All along, you could have in the back of your mind the idea that what comes to you may be a visitor, a “God.” That was the moral of the old tale of Baucis and Philemon: they let some broken down vagrants into their little house, who turned out to be Gods. Mercury and Apollo, I think. This notion of the image as a visitor, a visitation—rather than some thing creative, created by “me”—also helps account for why it’s so damned hard to make a poem or a picture. If, as Jung says, a God is what crosses your path, what comes in you and is against your conscious intention, the image forces you to receive it, and even serve it with your hands, with your words, with your movements.

S.M.: What do you think of approaches to therapy that stress role play, becoming the image, the fox?

J.H.: By becoming the fox, I lose the religiosity of the other, which carries something different and moves on its own. Is it acceptable to the fox for me to act like a fox. Isn’t it insulting to be imitated? Any theory of animals has to be acceptable to the animals. I don’t think they would vote for Descartes or St. Thomas. You see, I will not make a distinction in my respect, in my regard for the animal, between an outer gorilla in the Congo and a gorilla in my fantasy or dream. I am like a very archaic caveman: what comes to me is the animal and I have to be in good shape not to offend it. When an indigenous healer puts on a leopard mask, the leopard is there. He has the leopard’s permission. It’s not my ego playing a role. It is bringing the Gods onto the stage. The God’s, the animals, do the healing through the masked man. They know what’s what. Instinct is the word we use in psychology for the knowing of the Gods and the animals.

S.M.: You pay less attention to the ego in a dream or artwork and more attention to the animals, or other figures. They are as you say “the forces or powers which were once called Gods.”

J.H.: A rule of thumb might be: everything is right in the dream except for the ego. I do not question the other things in a dream as much as I question the behavior and attitudes of the dream ego. It is usually defensive, or hysterical, or anxious, or just plain dumb. By “dream ego” I mean the “I” that is walking around in the dream and with whom the dreamer feels identified in the morning. Often what feels right is merely “right” because it fits the ego attitude. Feeling is not the only cue. People are awfully identified with what they feel. We are overly reacting to the rationalism of Descartes, the Victorian age. Psychic value might lie where our feelings most rebel, where the defense is hiding. Analytic work goes against nature, against the naive. Rather than judge your work by the feeling you have about it, judge your feeling by the image you are having. By working on images in art therapy we sophisticate the feeling.

S.M.: Is this a guide to the interpretation of art?

J.H.: Well, I’m afraid I’ll get caught in presenting an opinion and taking it literally, so let’s move warily. Art gives a feeling—some feeling—maybe rich and sweet, or even repulsion, or most likely upset and bafflement. You have first to feel what you feel, and then disengage from it, and look into it. The best way to disengage from the immediacy of the feeling is to look to the image. I ask what is the feeling like: describe it. That rich and sweet feeling, makes me see a woman, swoon, or makes me think of pastry, or I want to touch it. I never stay with the feeling as it is, good or bad. Put the words “good” and “bad” back on the shelf. Get images.

S.M.: For example?

J.H.: A man dreams he is flying at incredible speed in and around stars seeing wonderful lights in a vehicle piloted by James Dean. He wakes up happy and feeling good, he says. In another dream, he meets a girl from childhood who looked down on him for being puny, and in this dream, in her kitchen, she says “don’t go away.” He wakes up happy and feeling good. Now, there are two kinds of feeling good. “Good” doesn’t say anything by itself: we need to see the images that make him feel good and these are very, very different “places to be.” The first has the puer prospects of crashing, of being spacey, of being spiritually dazzled by “stardom.” The second feeling good refers to finding and brings with it the rejected puny feelings of himself which are now accepted, even wanted, by this early love. It’s pretty evident that feeling good says very little while the difference between the girl and James Dean, between the high space and the common kitchen, between speed and cooking, between the power and the puniness—these say a lot. Of course, it helps to have a symbolic, archetypal, mythical background against which the images can be placed, which give the images depth and cultural resonance. I mean knowing something about animals helps give that girl more value, as knowing something about the puer helps you see the attraction in flying, and so on.

S.M.: Psychotherapy training has historically placed more emphasis on...
analysis within a tightly circumscribed context that reinforces the therapist’s knowledge of the particular system. Your approach to “knowledge” is more ambitious, broader and expressive of the multiplicities of culture. It is many dimensional rather than one-dimensional. Knowing is complemented by imagining. This makes for a lively cooperation.

J.H.: My work is the revitalization of the imagination, the ability to live imaginatively in many ways. In recent years I enjoy therapy enormously, probably because I am not concerned with the feeling. I have let it go. I am not busily concerned with transference, the relationship. In the past I was working at it too hard. I was overly concerned. Therapy is never a one-to-one relationship. There are many more persons in the room than the two people who think that they are the only ones there. I do not think that the one-to-one relationship with the analyst is enough. There has to be a relationship to the world. What was wrong for me before, was that my feeling was under a director. Another was the attempt to do therapy “very well.” But I can’t explain a thing with biography. These are just stories.

S.M.: You certainly do reverse the most fundamental beliefs of the psychotherapeutic community. You have described therapy as a work of love.

J.H.: It is a love of the psyche; not the other person. We have to be very careful of locating love in the personal relationship. Isn’t it the same with art? You love the dance, the music—not your dance partner or the other person playing in the quartet. Of course, your common engagement brings love into the personal field, but it starts in the love that is at the same time the work.

S.M.: How does this apply to a painting? Do you love the painting itself or the psyche that it emerges from?

J.H.: It’s probably more like a tremendous captivating interest in what’s going on in the painting that you are working on. You can’t leave it, you keep finding new things to touch, you’re exploring and bothered and preoccupied—but it isn’t love of the painting as a thing—you know: “I just love that one!” Now, the other person brings the possibility with him or her into the consulting room, a possibility “to paint,” or “to make love.” You see what I mean here? It’s not the other person, it’s the psyche that constellates an erotic response. But our culture, our Christian culture especially, because of its repression of eros and sexuality, because of its defying “the person,” because of its commandment to love confuses us and we believe we love, or must love, the other person.

It gets horrifying. Therapists become Christian Pygmalions: we not only fall in love with what we are working on, the other person, but believe that this love will bring the other person to life. Meanwhile we aren’t making anything, no painting, no psyche, no nothing. Just indulging feelings under the self-deception that this is therapeutic.

S.M.: I am sure that your orientation to “love of psyche” rather than to “love of the other” has provoked passionate criticism. It can be said that “you do not seem concerned with the patient or client as a person in difficulties”; that you are more concerned with “art” and “imagination” than with the person’s life; that your work “separates art from life and becomes aestheticism or ‘art pour l’art’ images for their own sake and not for the person’s life.”

J.H.: You are right. It does sound as if this were my attitude. But in actual cases this is not the way it is. In actual cases life and imagination are not at all that separated. The way a person imagines his life is the way he lives it. We live imagination, not just life, for even “life” with its problems and troubles is a specifically organized narrative of experience, a way of styling or imagining, that sees and feels things in terms of “problems and troubles.” What I try to do with actual cases is discover the imagination shaping and informing the problems and troubles and then work them out on the level of images.

Most problems and troubles have been worried over by the patient for years. I can’t add much there. They know far more about their lives and how they cope that I can advise or inquire into. But what they usually don’t have are images that can take them right out of the Catch 22 situations that have them trapped. “Should I stay with my drunken husband: should I leave and be on welfare and the kids without a father?” Back and forth, in the stew. Until one day a black crow comes into a dream, or a painting, a talking crow. I encourage the patient to talk with the old crow, and that bird turns out to be very savvy and very tough, and begins to take her (the patient) under her wing. And its not just the figure of the crow, its the whole opening of imagination that gets her out of her trappedness—not out of the trappedness of the marriage, but of the narrow confines of her mind in which she has trapped her marriage, her mind that could not imagine beyond that Catch 22 puzzle. She begins to fantasize and not just worry, to speculate and not just think it all through one more
time. A little bit of freedom, and a little less guilt. It is amazing how people’s lives loosen up when they gain better footing in fantasy and how much more self-confident they become.

S.M.: The “attempt to do therapy very well” is where the profession reaches toward art, where the professional becomes an artist working independently.

J.H.: I enjoy being professional.

S.M.: What does “professional” mean to you?

J.H.: I enjoy my knowledge and my skill. I enjoy the ability to form a vision of what’s going on, to give form to what is presented, to be right there with reactions, and to sense the blunders as I make them, or soon after. I enjoy my trained nose for psychotherapy. I enjoy being baited and not getting caught . . . all sorts of things. I even enjoy being founded on the fathers of the profession, Freud and Jung, being a member of a school. But, and there is a huge “but” here: I disassociate myself from any professional model, or what Jungians call “persona.” That is, I don’t look at myself in terms of a model, from the outside in terms of rules, or standards, or procedures. I don’t think of myself as a therapist while I’m in the act of doing therapy. That keeps me from literalizing what I do as “therapy.” I think of myself as anything but a professional when I am actually practicing my profession. Then I maybe am a cook or an alchemist or a teacher or a bullfighter or a schemer—undercover spy . . . anything. Because therapy is so tied into feeling professional and professional feeling, I try to keep clear of a model that would bind my actual feelings. I don’t know whether the patients are happier. I don’t know.

S.M.: You have been asked, “Are the images happier?”

J.H.: In some situations they are. The voices that the patients bring, that they speak with, are definitely in better shape. They are relieved. They have come out of the closet. There is a release of the demons from hell, an opening of the gates of hell. They can move into a closer relationship to the person they are associated with.

We are so indoctrinated to think that the repressed are unhappy. We cannot imagine that the images love us. Let’s not look at love as a feeling but rather think about it as a repetition . . . it keeps visiting us, wanting to be a guest, there when we need it, entering into a conversation with us. We can lose our images by ignoring them. If we see the images as demons, then they are things that we do not want to lose contact with. We are afraid of the image appearing in the form of spiders. We diagnose them as crazy when they can be friends, or at least partners, advisors, coaches, etc. Spiders are beings who drop in on us, spin, and catch noisome, buzzing distractions. They are very purposive.

Some people interrogate images. The images clam up and do not want to say anything about their personal lives, who else they might be seeing. Sometimes the image gets hurt. We think that we will have dreams and ideas forever. One ought to be grateful to have a dream. It is worth respecting, spending time with. It is not just a fountain. Artists are afraid of losing contact. They relate to Mercury and have more respect for the inexplicable spontaneity of the image.

S.M.: How do we relate to the polytheism of an image?

J.H.: In our culture we tend to take voices and figures as commands. We receive contradictory commands which do not cause the same kind of confusion in a polytheistic culture. They hear things differently. Their language structures are different. For instance, other cultures are not so hung-up with the logic of contradiction, or on differences between past, present or future, or between the intention or fantasy to do something and the actual deed.

“Because therapy is so tied into feeling professional and professional feeling, I try to keep clear of a model that would bind my actual feelings.”

S.M.: How do we learn to let the image speak to us?

J.H.: Abstain from declaring the meaning. Polytheism cannot appear until the feeling judgment of good/bad, like/dislike is bracketed out. Painting tries like crazy to break us from the feeling that we know what it means. Then the many possibilities begin to appear.

There is always a list of possible interpretations. Multiple narratives emerge from the complexity of the image. If we say that the meaning is none of these, and just describe the physical characteristics of the image, then we place it back into the genre of social realism, another interpretation.

The first step is to withhold meaning.

The second is to realize that every one of the tales reveals the polytheism of the image.

Third, it is a matter of determining which is the better tale; which one sticks to the image, is authentic, is the fecund way of talking about it. Does the tale release other things? Fecundity is important. Does it spark an image in the observer? The response that is as imaginative as the image is an adequate response. The longer it lasts has something to do with the fecundity of the image.

“A posteriori” judgment tries to fit the image into the case. I am more interested in the material than the case. At Yale in 1973 my wife and I did interpretations of dreams in seminars without personal information. The structure of the dream then told the person who submitted
the dream anonymously a great
deaL.

Stories change. People tell themselves in and out of stories. Usually the ego is served by the narrative. Generally, a story tends to be about a single figure and this is why I am cautious of narrative: it serves the speaker, the ego, making him or making her the hero or the victim or the superior observer or the loyal servant—but I want to know more about the other figures. “The images speak because they want to speak” as Mary Watkins says, and not because they represent some aspect of the ego. They are not representatives, they are ambassadors, full plenipotentiaries with lots to say. Unfortunately, we don’t have an adequate philosophical context for these voices other than magic or madness. Our secular humanism, rationalism and doctrinal religiosity do not work for them. It only supports the solitary ego. We desperately need a cosmology that allows the image to speak. So of course there is so much loneliness and neediness because our psychology does not allow us to talk to our selves, our elves. We aren’t ever actually alone, even if our secular cosmology and transcendent theology have left us there.

S.M.: Art therapy needs theory and methods, a cosmology, indigenous to art.

J.H.: Part of the job of the art therapist is to be superior. You need something that can hold what you are doing. You need a philosophy; a religious understanding . . . not techniques. But beware of the new.

S.M.: Art can be distinguished from “creative expression” because of the discipline involved. It may take years to perfect a particular gesture. Art also involves decision making, a critical moment, determining when to stop and what needs to be omitted.

J.H.: I am concerned with the place of the critic in imaginative work. When an image appears, a critic appears. Puritanism begins with the smashing of the image, as with Cromwell. That is not criticism. The wrong critic completely negates artistic expression, and says that we should not be doing it at all. There has to be a ghost trap for catching these wrong critics.

With the idea of the critic comes the suggestion that there is an “other” that we have to communicate with. The image wants itself to be articulated as well as possible. It lays a claim on the hand to be right- ly and deeply presented. The critic is within the image. There is some urge within the image to be realized. The critic compels us to listen well. Why are we so responsible for getting it right, as with writing down a dream correctly? Getting to the dream involves an aesthetic precision. I am trying to get to the phenomenonology of the experience. I critically evaluate whether or not the person is listening to the dream, image or figure. My job is to sensitize people to what they are actually doing.

The hand helps us to get through things. A basic metaphor of the arts therapies is the hand, and this is why they can do so much. The hand is tremendously important for resolving things. There is an animal sense to this. The hand is thinking about what it does. When I write, I have to get the thought down and through my hand in order to express it. With the animal, consciousness is in the doing of the act.

At the University of New Mexico a number of years ago I was working with Howard McConeghey in an art therapy seminar. We were dealing with the issue of what to do if a patient was having difficulty making a perfectly round image. A student said that she would give the patient technical advice on how to make the image round. I asked her: “Do you trust the hand that cannot make it round?” Howard said: “If he cannot make it round, he does not have an image of roundness.” The image is what the hand is capable of.

S.M.: How do you see the image within the context of art therapy? Do we create images?

J.H.: Paintings can help us to find images “inside” ourselves, rather than psychological concepts, that can be helpful when we meet new situations. Psychology and clinical language do not use images. I try not to read a painting in terms of the artist. I see it as psyche presenting itself in images through the hand of the artist. Images appear before us. I do not want to say that we make images. Paintings can be perceived as images of the psychic condition. Imagination manifests itself in the painting. I am not as interested in the biography of the artist. Jung spoke of how we must regain resources beyond the personal, and that this is where healing begins.

S.M.: You are presenting art therapy with the task of looking at paintings to find a resource of healing images that we can take inside us, to be used instead of clinical language. You suggest using the physical phenomenon rather than the conceptual abstraction.

J.H.: Art therapy should consider having a wide range of physical metaphors for the work. For example, alchemy, cooking, freezing, fire, etc. You need to introduce artistic metaphors as distinguished from technological ones. Medical metaphors, such as “suturing,” “closing,” “splinting,” can be more useful to us than the medical model. Metaphors from sport are helpful in therapy . . . “Go for the daylight; find the hole.” The tacit knowledge of the running back in football contrasts to the technical drawings of the television analyst. The running back is in tune with the interference, the blocker he is running with; it is intuitive, a body sense. Therapy is packed with situations of this kind, where people dance together. We need to find metaphors for what takes place in art therapy.

S.M.: In art therapy we do use...
language. It is often essential for dialogue, for depth and the engagement of the image.

J.H.: Language is so conceptual, so dead in the academic world. It's not much better in the media or business or science. Just think of the robotic language of the men who landed on the moon. Why send people into space if they talk like machines. Language has become so stiff and creaky and just plain dull that many psychologists believe now that wordlessness is better than speaking. They think the grunt and the omn take us where words cannot. I think just the contrary. Rhetoric is our animal nature: speech is phylogenetically built into our throats, lips and tongue structure. We are the only species to talk: it's as much part of our animal nature as the leopard's spots. We don't have tails to wave about and show off like sleek fur. We display ourselves in words. And people have been storytelling since the beginning, using words to evoke, to inspire, or remember, or to just to enhance and dramatize, what's going on. And those descriptions are not a recounting of what happened, second level and removed. The stories are themselves an event, a show, that is aesthetic right from the start. It's essential not to abandon language. Let's treasure it. Psyche needs logos; it needs psychology. The soul enjoys words and ideas.

S.M.: You have worked for many years in the Jungian tradition. Do the conceptual abstractions of Jungian psychology get in the way of the image speaking for itself?

J.H.: If the word evokes only doctrine, then it is not useful. The concept gets in the way of the image. My own intellectualism can hurt the presentation of the image and distance me from it. What is being suggested here is the inherent intelligence in the image. To talk about the world in terms of the imagination implies that everything has intelligence and does not require the imposition of structure by a meaning giving mind. Rather than an abstract order, the world is a text, or a work of art, that can be read, or understood. Our aesthetic sense is necessary for living sensibly in the world. We just need to pay closer attention to it, and less to ourselves and how we feel about it.

S.M.: The perception of aesthetic sensibility as a fundamental element of well-being may help art therapy to see itself as a primary mode of therapy, rather than attaching itself in a secondary role to the medical and behavioral science models. I have often felt that the stronger the aesthetic experience is, the more comprehensive the healing is.

J.H.: We all feel this, yet it is so hard to legitimize. We all know that powerful aesthetic experiences are healing: whether in a concert hall, a museum, by the ocean . . . even the people who decide about grants and allocate funds know the importance of the aesthetic in their lives, yet when it comes to justifying money spent on art, let alone art therapy, they have a terrible time. Why is this? What is wrong with our formulations that at once vitiate our experiences?

S.M.: In the popular mind the arts are perceived as recreation and entertainment. They have been disassociated from their historic philosophical functions. Can you give an example of an aesthetic experience in therapy as contrasted to an analytic one?

J.H.: In Korean ceramics, there is no question of symmetry or asymmetry. No "opposites." There is a bowl or a jar. That bowl or jar can be classified as asymmetrical: it tilts, it has more thickness on one side, or a crack. But to think of asymmetry, immediately raises "symmetry" in the mind: that is, the mind walks away from what is here, the jar, into a pair of opposites: symmetry/asymmetry. Immediately we have moved from the image to a concept. Now, the making of this bowl or jar, as such, "overcomes" the mental process of self-division. The bowl experi-enced aesthetically (not conceptually) either by the hand and eye in the making, or the hand and eye in the appreciating, heals the oppositional tendency, the problem-making tendency.

S.M.: The unity of opposites is a tidy abstraction, especially when we are perceived as progressing toward integration.

J.H.: The evolutionary model has to do with towardness. Why is unity so important? There is not a single philosopher in the history of the West who will condemn unity. The Neo-Platonists suggested that unity is a quality of any event. There are any number of unities. There is not any over-all unity. There is a phenomenal unity.

S.M.: How does this apply to the image?

J.H.: An image is not going anywhere. One of the problems of therapy is that it is so damn goal directed. A painting cannot go anywhere. It is what it is. Picasso said of himself: "I do not develop. I am." Unfortunately therapy does not think this way but approaches things in terms of where they are going. The painting can be a manifestation rather than a development. In the language of the psychotherapeutic genre, people come to therapy in January and want to get to summer.

S.M.: James Joyce spoke of art works as "epiphanies," manifestations that reveal the divine.

J.H.: Is there any relationship between the different works, the epiphanies? Is there a development, a Darwinian evolution? We are caught in the narrative of development. Another model would be a chain of epiphanies, separate events, strung on a necklace, maybe interchangeable beads for other necklaces.

S.M.: Are developmental psychologies, and humanistic approaches to "becoming a person," future oriented distractions from "being"?

J.H.: I go with a "via negativa"
which for me means not letting the mind get ahead of itself. We get in the way of the animal by preknowing things. Western philosophy always gives the animal a low place. The restoration of the animal in our psyche is primary and for that reason alone. The contemporary animal rights movement is significant. There is something revolutionary in restoring animal consciousness. We have the black movement, the women's movement and now the animal movement.

The most important dreams for me are those with animals. I am not as interested in parents as in animals. I go after the animal. The animal knows what it wants; it has a nose, modes of protection; it is ecologically in the world... the ego in the form of Hercules slays the animal. "Ego" is the classic mechanism of defense.

Before getting involved with concepts of ego, consciousness, specific pathologies, etc., I want to know what the person is doing. In therapy I look for a figure to talk to, an animal, a rock, an image that the person can relate to. It might be useful to make a circle to sit in, or a person can go to a stone and sit there with his or her back to it... or a tree. We are trying to find ritualized acts. Breathing is another way. There are ways to get out of crazy states. A person that I worked with got out by just breathing. These modes offer imaginal containers. Belief in the larger strength, the more important value of an animal, stone, or tree is what matters. This is animism.

S.M.: You bring mind back to the physical world.

J.H.: I do not try to define consciousness. I would never try. I attempt to find the metaphor that is being used to define consciousness.

S.M.: The arts engage the soul, and its conflicts, directly, through the language of the soul, rather than always feeling the need to translate the image into psychological concepts for analysis.

J.H.: Yes. That's exactly right! Through art therapy, we meet disorders of imagination with imagination. Other therapies use foreign systems. But still ideas belong. Ideas are vitally important. Rather than rejecting ideas, can we envision an imagining intellect? Intellect is one of the places of the spirit. It is an art, a theatre. Intellect can dance too.

S.M.: With others?

J.H.: We tend to be herd animals. We are socialized. Suffering on the animal level is caused by separation from the herd. Let's bring the pathology into the fantasy of the animal. Human communities have periods when the person is separated for the purpose of initiation, but the isolation is still within a context. The patient needs a context, a ritual, within the community for the psychosis rather than being opposed to the community. Jung does us damage in separating the individual from the collective, in romanticizing the individual.

S.M.: In our language we use animal and herd metaphors disparagingly. Pathology is conceived in terms of animals—eating like a hog, bull headed, stubborn as a mule... "Dog, pig, rat, snake, beast!" The American College Dictionary defines animal as "an inhuman person; brutish or beastlike person... pertaining to the physical or carnal nature of man, rather than his spiritual or intellectual nature." You reverse these values and emphasize the virtues of animals. Humans have a tendency to elevate themselves at the expense of animals. Our fears of sensuousness and of our animal nature are revealed in how we form the image of the devil with animal and serpentine features. D.H. Lawrence does the reverse too in perceiving "the plumed serpent" as a manifestation of divinity.

J.H.: We have prejudiced animals by referring to them as "brutal" and "beastial." It is the Cartesian dualism that has turned peaceful beings into brutes, pigs, bitches, lizards, monkeys, apes... derogatory things. In dreams animals can appear as saviours, as teachers. The main problem is the dreamer's fear of the animal. The dream, or the image, is to be connected to an animal rather than be interpreted. If you call the cow in a patient's painting, "your mother," then you lose it. You insult both the cow and the mother. It may be a hurt cow, or a nasty cow with horns. It is important to keep using the word cow. Where is your cow? Is it a hurt cow?

People get upset when an animal is dying in a dream. A small bird is dying. Rather than referring to the bird as your dying spirit, you can say that this little bird is in dire straits, and has come into your dream. Now what?

We can learn from fairy tales. The person who gets through, is the one who speaks to the animals, as opposed to those who ignore the animal or see it as inferior. We have to work our way through the brutal aspect of our reactions to animals, and not project the brutality onto them. What you do to the animal, it does to you.

There is a specificity about animals. It is very different when an eagle comes to you in a dream than when a pig comes. Wherever Islam went in the 7th and 8th centuries, the pigs got it. They were killed as unclean. Pigs have been our companions for thousands of years, yet even Christ cast demons into swine. They are so rejected! When we talk about animals generically in terms of

"Through art therapy, we meet disorders of imagination with imagination."

November 1986, ART THERAPY 107
“instinct,” this simply groups them all together. The Irish saint is the one who can talk to the animals. Sainthood involves living in connection with the animals, and knowing the language of each kind.

S.M.: And appreciating their differences?

J.H.: Different birds have different meanings in dreams and imagery. It is important to distinguish the birds from one another. Even 100 years ago people sat for hours in carts, reins in their hands, staring at the moving butts of horses. They lived the life and smell of horses. Animals were close to daily life. People knew how to live with them. We can read our cats and dogs, but do you realize how they can read us? This has to do with external animals, but probably our internal animals are watching us, and watching over us, too.

As we get farther away from the animals in daily life, it worries me. What good is it to be in the ecology movement and still beat the animal in your dreams. Animals have a natural piety; they don’t get out of hand. The human being is not first in all cultures. With the bushman we are ranked fourth.

S.M.: You are resurrecting an aboriginal respect for all forms of life.

J.H.: If a bug appears in a dream, we stamp our feet on it. We want to immediately get the insecticide. Going “bugs” is going crazy. The pesticide industry is psychologically based. In California they realized that the total cost of pesticides and herbicides is greater per year than the loss of the crops would be if left untreated. If the Carlos Castaneda series were about bugs and worms instead of eagles, I might like it.

People who have never been with animals still have intense animal familiars. They do establish a living connection with them. I even think it is necessary to go look at animals. Ask your patient to take a day in the aquarium or zoo. The sacred quality of animals is what I try to get at in therapy, the numinosity, respect, fear, the eternal. The American Indians believed that the buffalo disappeared in the fall and came up through the earth in the spring, the same buffalo, eternal.

S.M.: How do you relate to the killing of animals?

J.H.: In a dream the pet dog may have to be put away because the sweet, domesticated spirit has to go. The butcher is an important figure in dreams because he knows the art of dismembering the animal. Slaying can be getting to the essence, penetrating, not running from it.

With the butcher, the dismembering is to get through the sentimentality of the animal. Some of the old sentimentality says never hurt an animal. This relates to Dionysian mythology and his being torn apart, and dismembered by the maenades, and then put back together again. It is not merely hurtful and ugly—like Yankees feel at the bullfight who turn away their eyes. It is an opening. It is a ritual, and a different motif than talking with the animal or flying with the animal. The butcher knows how not to damage the soul of the animal. It is hard for us to find the right way to deal with the animal because it is either so worthless or sentimentalized within our society.

If an animal comes to an American Indian during a dream, it might be the beginning of a vision quest. If a particular animal comes to us, we need to spend a great deal of time thinking about it and looking at it. We might study its natural history and the distinctive features of its way of being. Why does the animal come to you? What does it want from you?

S.M.: This animism and your respect for art as a primary therapeutic metaphor are in sharp contrast to the technological values of contemporary mental health systems?

J.H.: The early psychoanalytic community was totally un-technological. It was an artistic community with Rank coming in from high school, Freud analyzing his daughter...what a marvelous, crazy bunch! Our minds have become technological. “Figure” has become number rather than shape. “It doesn’t figure.” The technological approach assumes that things can be “figured out” and “fixed.”

Therapy is caught in the literary genre of social realism...not the genre of lyric or epic. Life work is perceived as struggle and dense. Therapeutic work is directed at those who are oppressed. It is a depressive genre. The concept of social realism is closely associated with depression, working with “hard reality.” But social realism is a genre, a form of art. When social realism is combined with developmentalism and the notion that everybody is supposed to grow, it is exhausting. The model produces burn-out. We might consider other models to work in, a totally different context.

S.M.: It is difficult for art therapists to go all the way with the artistic metaphor, to stand alone with it. There is a fear of losing something, the relationship to the mainstream of the mental health tradition.

J.H.: O my goodness! “The mainstream of the mental health tradition.” Pardon me, but that sounds like the KGB! What mainstream? You mean case management and workups and files and supervision tricks...I am being nasty because I don’t believe that there can be a mainstream unless there is a spring, a deep source—and now I am contradicting myself regarding “origins.” But rivers rise from a deep clear riverhead: and what is the riverhead of the mainstream in men-
sional health? It's not Freud, or Jung or even Alfred Adler, or William James—it's something vapid as "the ethics of good works" or simply bureaucratic, "agency," KGB, keeping people in line, getting them back to work, and so on. The mainstream works for the government. I see therapy as subversive: it is intensely anarchic and intensely communal: both; but it is not mainstream in that collective sense that I am insulted by: paperwork, tinkering, disguised churchiness.

S.M.: And drugs! The mainstream has swallowed the revolutionary origins. The most influential teachers in history have been those who have most radically reversed what we take most for granted, that help us to see that what we value the most may in fact be limiting us. The creation of a different context for the practice of therapy, an artistic context perhaps, is not easy for the art therapist. You are referring to a political aspect of art therapy. The art therapist in a hospital setting, or working with children in a school or in an agency will not prosper by going against the system. We have worked very hard to make favorable impressions.

J.H.: This is an important question. I don't believe much attention has been paid to the politics of art therapy—except for the politics of therapy in general (Laing and Cooper or the Marxists and the feminists).

S.M.: Minority and cultural groups.

J.H.: I see an inherent conflict between artistry and art therapy. They require different politics. Let's take Blake as the model for artistry: he was a nut working alone, almost antisocial. The Romantic Artist. Art therapy, however, is paid for by insurance companies, state funds, taxpayers finally. Of course, its aims will tend toward conformism, conservatism. How does the individual art therapist work through this dilemma?

S.M.: Art therapists are interested in being useful within a context of artistic liberation.

J.H.: To do something very well, with dedication—even if one has no great talent, is artisanship. Its like making things for the village that are useful: pots, woodwork, weavings. This can be intensely communal, because these are functional objects serving communal needs. At the same time, the intensity of expression, the personal shape given by the hands, the "individuality" of the piece as a formed image is intensely anarchic: it isn't intended to conform to anything but to itself, fully. That last is very important: because if you lose the individuality of the dilemma, your focus is not on the thing and the hands and the image (while working) but on a societal production. Only indirectly is what one makes a societal product. Of course, all along the struggle with invisible community values, the battle against collective stupidities, is going on in the shaping of the product. It's the old problem of how to keep the moral and social aspect of art from taking over, and yet not losing it altogether in l'art pour l'art. When I write something, for instance, I am intensely communal, out to break up cliches, trying to get my ideas readable, wanting them to have effect on therapists and be helpful to souls in their messes. But—and this "but" is crucial—I never write directly in that direction: my main concern as I write is the careful formation of the work itself and this tends again and again to be intensely anarchic (individualized), forgetting the actual community. I am often at the point of not caring at all if it is ever read by anyone.

S.M.: You caution against evangelical attitudes toward creativity.

J.H.: Archetypal theory helps us to understand that there is always another side of the coin. When you are being positive always keep in mind that there is the negative somewhere. When the negative feeling is repressed it will appear. Wherever you find disturbance, that is where the psyche will be working. I emphasize the importance of destruction, and hatred. They are the acids that motivate. Certain art therapists may be obsessed with the notion that we are all creative. Creativity becomes a one-sided model, having lost its shadow of destruction, and becomes a dangerous word. There is an inflation of creativity today. People do not read poetry, they just write it. Our notion of creativity dispenses with learning. Creativity has become a shibboleth to art therapists and an awful, impossible burden is placed on people "to be creative." Belief in the endless flow of creativity is problematic. We need more than just expression; we need to give form. The classic alchemical formula is "dissolve and coagulate." In addition to flow there must also be coagulation.

S.M.: Can you describe how the artist or the art therapist might engage destruction?

J.H.: Your question is really a very good one. Or should I say bad ones. Let me first make clear that to engage in the patient's destruction is not to release the devil, or abreast the emotion. Get it out, get it down on paper in big red blotches, or dig your nails into the clay. We are not in the business of exorcism. Devils are resources, and very difficult to distinguish from angels, who once had beating animal-wings and were fiery and huge. So, if you are working with destruction you are interested in it and not trying to get rid of it. Second, you are not even trying to improve it so it is less destructive. Rather, you may be trying to get its expression more formed, more verbal or dimensional, less hulky say, and more articulated, where articulated means both more verbalized and more jointed and connected and differentiated. Then third, you have to have some joy in your own destructiveness: I think Swift must have loved writing his hatred into stories and essays. Or Bosch and Goya. Therapists are often goody-goody, or do-gooders,
and awfully ashamed of their hatred for the patient, or the hatred and anger that the patient evokes in them. What do you hate? What precisely? Picture it yourself, and get into it with the patient: maybe both of you together can work on this hateful quality.

S.M.: Is there any truth to art being a projection of the person?

J.H.: Sure there is, though I prefer not to see art that way. I think it's this view of art that art therapy most uses, which overvalues the "person" and undervalue the "art." Certainly tribal art and medieval art were not projection of the person. No artists, but plenty of art. I think this view is the ego-artist view; just not interesting and it leads to all the psycho-biography stuff, of dirty-minded gossip about people and explaining their writings or paintings in terms of their impotency, or mistresses, or drinking, or their poor old mothers. But—if you were to imagine "person" differently, then I'd say, yes, it’s a projection of the person: it’s a "pro-jection," a throwing forward and outward of the impersonal elements that make up personality. The maker’s soul is in the work, thrown out there (projected) into visibility. But what this soul is, that can’t be defined with the usual notion of person that psychology employs. Too limited. Soul has historical and cultural and archaic levels that are most un-biographical and impersonal.

S.M.: At the beginning of this dialogue, you mentioned that each teaching situation, or engagement, is an opportunity to learn something new. Has this discussion of your work in relation to art therapy been of use?

J.H.: I learned how quick I shoot off at the mouth! You know questions like this bring out my opinions. I leap for the bait. An old fish like me ought to be more wily. I also learned that I have tremendous sympathy for the plight of art therapists... they could really be the carriers of imagination into the culture at the grassroots level. They have access that artists themselves don’t have, and that psychologists have wasted. I really do want to encourage them with all my heart.
Archetypal Art Therapy Is Cross-Cultural Art Therapy

Howard McConeghey, Ed.D., is a Professor of Art Education, Department of Art Education, College of Education at the University of New Mexico, Albuquerque.

This paper uses the term “Archetypal” following C. G. Jung who took this term from St. Augustine because it means a typos (imprint), an archaic or primal pattern. It is considered to be a universal aspect which crosses cultural barriers and is thus valid for all cultures and individuals.

Such cross-cultural or archetypal elements are presumed to reach the deepest layers of the unconscious and therefore to be of primary importance in therapy.

Citing Navajo and Tibetan sand paintings, the Mandala is used as an example of archetypal symbols. Its use is mentioned in addition, in Medieval European alchemy, in prehistoric drawings and pictographs, in circular activities in space and time and in the art of children and dreams of modern persons.

Finally the role of modern art and artists in expressing unconscious, thus cross-cultural, feelings is discussed. From the post-Impressionists the expressive focus in modern art has been on inner and psychological concerns. This concern preceded that of depth psychology of Freud and Jung and art therapists. The contrast between materialistic science and Vico’s New Science based on myth and human beginnings, is related to Jung’s “objective or transpersonal” psyche which is therefore considered cross-cultural.

In the end it is suggested that the title of the essay could be turned around to read, “Cross-Cultural Art Therapy Is Archetypal Art Therapy.”

Archetypal Art Therapy Is Cross-Cultural Art Therapy

Cross-cultural psychotherapy is a vehicle for the study of the therapeutic process in relation to the many variables of human behavior and universal phenomena. Clarification of transcendental therapeutic elements does not contradict the need for sensitivity to, and knowledge of, the specific qualities of different cultural and clinical situations.

Shaun McNiff

The title of this essay is in itself an important statement. Art therapy which crosses cultural barriers will be more than personal, will be collective and therefore will be archetypal. When the therapist can see the collective significance in a patient’s image, he or she is seeing the cross-cultural, archetypal situation in the pathology of the patient. The image extends beyond the merely personal layer of the unconscious. The patient’s problem is not then entirely a personal affair, but something which crosses individual boundaries and those of any single culture, to touch upon the problems of mankind in general. The pathology of the individual may be a reflection of the pathology of the culture. The poet, Theodore Roethke asks:

What’s madness but nobility of soul
At odds with circumstance . . .

Although the ability to apply a cross-cultural point of view is of great therapeutic importance, modern psychotherapy is not always alert to this fact. In ancient times it was well known that the raising of the personal disease to a higher and more impersonal level had a curative effect. Often contemporary psychotherapy takes into account only our rational psychology—thus missing the collective and thereby the cross-cultural depth where much therapy first becomes possible.

In earlier traditions a great deal of practical therapy was built upon this principle of raising the merely personal ailment to the universal. Ancient Greek medicine also worked with personal problems in the same way. Myth or image arises from the archetypal material which is constellated by the disease, and the therapeutic effect consists in connecting the patient with this archetypal meaning. The therapist’s task is to express the archetypal situation—to show the patient that a particular ailment is not solely his or hers, but is a universal ailment. The patient is in the company of humankind and the Gods. This knowledge produces a healing effect.

Psychological suffering always isolates the patient from the so-called normal masses, and to understand that the conflict is cross-cultural and not just a personal failure is of great significance. This archetypal—and cross-cultural—point of view lifts the individual out of himself and connects him with humanity. C. G. Jung said,

That outlook is very important, because a neurotic feels tremendously isolated and ashamed of his neurosis. But if he knows his problem to be general and not merely personal, it makes all the difference. (Jung, 1968)

The image extends beyond the merely personal layer of the unconscious.

November 1986, ART THERAPY 111
Although the ability to apply a cross-cultural point of view is of great therapeutic importance, modern psychotherapy is not always alert to this fact.

Art therapy which is at all therapeutic goes beyond the personal and conscious to the collective and unconscious. Because it is collective, it is therefore cross-cultural. The term "archetypal" was taken by Jung from St. Augustine because it means a *typos* (imprint), an archaic or primal pattern. He tells us that:

the deepest we can reach in our exploration of the unconscious mind is the layer where man is no longer a distinct individual... On this collective level we are no longer separate individuals... Because the basic structure of the mind is the same in everybody we cannot make distinctions when we experience on that level. On the deepest level of the psyche the therapist experiences the same archetypal situation as the patient and can help the patient to relate to that deeper level of himself or herself. There we do not know if something has happened to you or to me. (ibid.)

On the personal level the therapist cannot know what the figures in the art work mean to the patient. The therapist must ask, "What is your context, what is the psychological context in which each figure is embedded?" A conscientious therapist will begin by saying to himself or herself, "I do not understand this work." Can the therapist know what the figure of a woman, for example, conveys to a particular patient’s mind? Of course not; how could he/she? Only when patients have given their associations can the therapist know in what mental tissue the personal image is embedded. In Jungian terms that is called amplification. Amplification can help the therapist find the personal context—discover what complexes form the patient’s personality. However, merely to discover the complexes is not enough. The therapeutic purpose is to learn what patients are doing with their complexes; that is the practical question that really matters in therapy.

In dealing with the personal unconscious the therapist must rely upon the patient’s associations. The therapist cannot know the personal meaning of any figure in the patient’s art work. Jung said, “I always welcome that feeling of incompetence because then I know I shall put some good work into my attempt to understand the image.” (1968) This is the infirmity of the therapist and it cannot be overcome. According to Jung “Only through our feebleness and incapacity are we linked up with the unconscious, with the lower world of instincts and with our fellow beings... in our inferiority we are linked up with mankind as well as with the world of our instincts.” Again, the poet says,

In a dark time the eye begins to see...

Art therapy is always dependent upon the patient for the context of the personal image. The patient has a life of his/her own. The therapist cannot add something to the personality of the patient. On the other hand, the therapist can help the patient to realize the underlying archetypal reality which forms or unlocks a complex. When we come to an archetypal image, a good therapist will know more than the average patient. Here the therapist can begin to think. In dealing with the personal unconscious the therapist is wise not to think too much or to add anything to the associations of the patient. But the archetypal or collective is no longer personal. We all have the same basic structure of mind and at the archetypal level the therapist can associate for the patient, and even provide the necessary context because, presumably, the therapist will have greater knowledge of myth, legend and image, just as the shaman in primitive healing knows the lore of the tribe or the collective culture, the therapist must provide the material from the collective in order to help the patient understand the archetypal nature of the complex. Mircea Eliade said that myths reveal the structure of reality, and the multiple modalities of being in the world. (Eliade, 1963) That is why they are the exemplary models of human behavior; they disclose the true stories, they are realities. The Navajo healing chants, for example, consist of “a complex of songs, prayers, rituals and sand paintings centering around myths of heroes and heroines who have made journeys to the land of the Gods (Yei) to acquire supernatural power.” (Sandler, 1972) “Essential in Navajo healing is the placement of the patient in profound and intimate relationship to the past, his physical surroundings and his social group." (ibid.) “The medicine man draws the individual into the great cosmic network of which he is an integral part in body and mind, back to the beginnings of life and consciousness. Through the myths and paintings he became part of the symbolic history of the Navajo people. He has a place in...e unity of the whole.” (ibid.) The medicine man must undergo a long period of training and appren-
ticeship after he has been chosen to become the healer. He must know the cultural myths, images and rites. Just so, the art therapist must have a rich background in myth and legend in order to help the patient connect with the structure of reality and multiple realities of being in the world as Eliade suggests, and to place the patient “in profound and intimate relationship to the past, his physical surroundings and his social group” as Sandner tells us the Navajo medicine man seeks to do.

These sand paintings are made in the form of a circle or mandala, the symbol or archetype of wholeness. The mandala may serve as an example of a cross-cultural symbol as will be seen in the following paragraphs.

In Sanskrit the word “mandala” means circle or magic circle. The circular sun wheel is an exceedingly archaic idea, perhaps the oldest religious idea there is. It can be traced to the Mesolithic or Paleolithic ages. This sun-wheel image is a circle divided into 4 or 8 portions—a divided circle which appears throughout the whole history of humankind as well as in the dreams of modern individuals. Jung suggests that “We might assume that the invention of the wheel started from this vision. Many of our modern inventions came from mythological anticipations and primordial images... Our conscious scientific mind started in the matrix of the unconscious mind.” (Jung, 1968)

The Tibetans, too, make mandala-like sand paintings on the temple floor. Like Navajo sand paintings, these are oriented to the four directions bringing the powers of these ruling directions into relationship around the center. They are made for certain initiation rites. Both the Tibetan and Navajo mandalas are expected to bring about important transformation in the participants.

In medieval European alchemy, the form of the quadrata circuli represents the synthesis of the four elements—air, earth, fire and water—which are metaphorically continually falling apart and must be brought together through alchemical processes. The mandala also appears as dance patterns in Dervish monasteries. These Dervish orders perform ecstatic dancing ceremonies which include spinning and whirling patterns—a magic circle.

As psychological phenomena mandala patterns may appear spontaneously in the dreams and drawings of modern patients. They seem to function as an inner order and wholeness which may serve to counter-balance the confusion and disorder of certain psychic states. The mandala is a manifestation of the archetype of wholeness. It is a cross-cultural or collective unconscious manifestation of what Levi-Brunel has called participation mystique.

Cross-cultural correspondences are only possible because of this underlying collective structure of the human psyche. Fundamentally, we are identical with everybody and everything on this primitive or primordial level.

Black Elk, the Ogalalalai Sioux Indian, describes the power of the mandala circle projected into space and time.

Everything the Power of the world does is done in a circle. The sky is round, and I have heard that the earth is round like a ball, and so are all the stars. The wind, in its greatest power, whirls. Birds make their nests in circle, for theirs is the same religion as ours. The sun comes forth and goes down in a circle. The moon does the same, and both are round. Even the seasons form a great circle in their changing, and always come back again to where they were. The life of man is a circle from childhood to childhood, and so it is in everything where power moves. Our tepees were round like the nests of birds, and these were always set in a circle, the nation’s hoop, a nest of many nests, where the Great Spirit meant for us to hatch our children. (Neihardt, 1979)

As Shaun McNiff points out, “healing, creativity and spirituality have been closely associated in all cultures since ancient times.” (McNiff, 1984) He tells us that the early depth psychologist, C. J. Jung, has been “the most influential theorist articulating the presence of universal symbolic forms and the existence of motivational forces of a "collective character." (unpublished paper) McNiff is certainly the most important voice at present speaking for recognition of cross-cultural art therapy.

Modern artists have spoken of art as “reflecting our state of mind.” (Gauguin) In fact, artists recognized the depth of expression a coming from the unconscious mind before Freud “discovered” the importance of unconscious motivations in psychotherapy. Behind the optical reality of impressionistic surface in Van Gogh’s works he beheld and portrayed a reality “that extended deep into the soul.” The depth psychologists who were to follow began to look to things as the mirror of the

Cross-cultural correspondences are only possible because of this underlying collective structure of the human psyche.
soul. Werner Haftmann (1960), the art historian, says:

One thing Cezanne knew above all else, namely, that rigorous inexorable construction of form does not result in formalism but rather enables the work to clasp its hands, as it were, in prayer and paint the way to a realm which more religious epochs called "revelation"—and Cezanne said "Nature is more depth than surface, the colors are the expression of the surface of this depth; they rise up from the roots of the world.

James Hillman, the first to name his depth psychology archetypal psychology—"because it reflected the deepened theory of Jung's later work to solve psychological problems beyond scientific models"—echoes Cezanne's thought when he says, "I think the only way we can get at the soul of an object is to think of it as a form or a shape or a face, an image, and it displays its own image, its imagination." (Hillman, 1983)

Modern art transforms the world, which appears to the eye, into a world that takes on reality in the human mind. It recreates the outside world in a metaphor of colored forms, whose symbolic character can at the same time make visible the real response of the artist's inner world—the totality of self and world. With Gauguin, Van Gogh, and Cezanne and their followers, art reached a frontier "where nature dissolves and recedes into the shadow, where the contours of our inner world loom more distinctly in the twilight, where nature and the mind become curiously indistinguishable." (Haftmann, 1960)

This, it seems to me, must be recognized as the beginning of the idea of art as therapeutic and the beginning of concerns similar to the depth psychology of Freud and Jung which followed. Art therapists are not always aware that this idea came first in art and only later in psychotherapy through Jung, followed by art therapy itself. However, since archetypal is primordial we may say that these ideas have existed since the beginning of time.

The impressive achievements of modern science are based on foundations resting in Bacon, Galileo and Descartes; but Vico's New Science already in 1730 proclaimed that myth, correctly understood, could yield the science of humankind. Vico's science of humankind may be called psychology because in it, as in archetypal psychology, the human realm becomes unusually autonomous—with its own principles of development which are more directly reflected in mythology than in natural science as such. Modern science is of necessity limited to the actual. It does not speculate about things that do not appear in physical form. However, Vico insisted that science "must begin where its subject begins," with human beings. Myth is the key here as Eliade has indicated. It is a weakening to the divine, the poetic and the mythological. Roberts Avens points out that . . .

In Jungian psychology 'soul' has an objective or collective aspect which shows itself in our capacity to conceive, imagine, behave, and be moved according to fundamental patterns called 'archetypes.' The empirical knowledge of archetypes is derived mainly from philosophy, ethnology, the arts, religion and mythology. Jung believes that these fields contain the most adequate formulations of the objective or transpersonal psyche. (Avens, 1980)

It is this collective or archetypal aspect in art therapy which by its very nature is cross-cultural. It is also this universal aspect which is most profoundly healing.

Thus we might not only say that archetypal art therapy is cross-cultural art therapy, but also the other way around, cross-cultural art therapy is archetypal art therapy.

"Art Therapy in Israel"

Lenore Steinhardt, MA, ATR, BA in Fine Arts, the University of California, Berkeley, MA in Expressive Therapy, Lesley College, Cambridge, Massachusetts. Ms. Steinhardt is a registered art therapist (A.T.R.) with the American Art Therapy Association, and a member of I.C.E.T.—the Israeli Creative Expressive Therapy Association.

The socio-cultural composition of Israel is identified, with focus on the cultural diversity flourishing in the backgrounds of basic Jewish identity. The art therapist in Israel, often practicing within the volunteer status, must maintain acceptance of a variety of origins as a norm, and understanding these culturally diverse populations while respecting the contributions of all people. Within this setting, art therapy can offer an experience of direct unimpeded creative self-expression and can give people opportunities to cut through divisive mental barriers. The history of the development of art therapy in Israel is included with identification of various types of settings in which the art therapist may practice. Illustrations are included from children, prisoners, soldiers, and veterans.

The multi-ethnic modern day state of Israel is one of the true melting pots of the world. Images of rich cultural diversity flourish on the background of a basic Jewish identity, reflecting the myriad of socio-cultural systems in which Jews lived in the Diaspora. Israel today is a cross-cultural fact, a fluid society constantly adapting to conditions in the modern world, and constantly absorbing new immigrants from vastly different social systems such as South America, Ethiopia and the Far East. In the daily press, news about Israel is often extreme, charged with exultation or tension, rejoicing or disaster. The images are often polarized, pitting secular against religious, war against peace, Arab against Jew, or workers against bureaucracy. And in accordance with the national character, the public is usually vociferously involved.

The very socio-cultural composition of the country could also be seen as encompassing a variety of extremes. The first waves of immigration from Eastern Europe in the early 1900’s were ardently Zionist and democratic in outlook. Social institutions such as the Kibbutz were formed and developed with an eye to building a society for future generations. Independence of men and women in personal expression, self-development and choosing one’s own mate (rather than a pre-arranged marriage), as well as the individual’s responsibility to a group other than the immediate family, set the tone of the new society. With the establishment of the State of Israel in 1948, great waves of people arrived, some as refugees of the Holocaust, some in mass airlifts such as from Yemen, or total evacuation from Iraq, Libya, Kurdistan, and Tripolitania in which whole families immigrated. From Morocco, Persia and Turkey, immigrants arrived alone or with part-families. Each individual ethnic or cultural group had specific traditions governing religious and social practices, education of children, the position of women, and the individual’s responsibility for him/herself in the wider society. Immigrants of European or American origin and Holocaust survivors were able by and large to adjust to Israeli society and integrate themselves into daily life.

Immigrants from Middle Eastern countries, with their close and interdependent family ties, headed by an all-powerful father, believing in magic and supernatural phenomena as life-controlling forces, had a more difficult adjustment to this society, which did not resemble their expectations of it. Israeli society received all these different immigrants simultaneously, and not having yet established an identity of it’s own, also had difficulty in absorbing these various groups with efficiency and understanding. (Palgi, 1966)

Tolerance of diversity of this kind and acceptance of diversity as a social norm are not general characteristics of individual ethnic groups, who frequently maintain themselves by closing their system to foreign values and ostracizing outsiders. Today, almost 40 years after the founding of the State, this diversity remains evident in disagreements and antagonisms between groups of different origins and religious persuasions, often paralleled by economic disparity between them.

The difficulties of adjustment in such a complex, fluid society may cause stress and emotional imbalance on parents and children. Other areas of stress can be connected to the region’s political situation, the demands of the educational system, the position of women in religious or secular society, the continuing effect of the Holocaust on children and grandchildren of the survivors, a difficult economic situation, and divorce.

However, there is also a steady and definitely rising trend towards inter-ethnic marriage, from 13.6% in 1966 to 19% in 1974. Phyllis Palgi, an anthropologist specializing in the Israeli family, predicts a more uniform type of family life in the future. “...One can identify a trend towards convergence and homogeneity rather than cultural pluralism or more diversity.” (Palgi, 1977)
Israeli art therapists, in contrast to ethnic groups who have their own stereotypes about each other, must maintain acceptance of a wide variety of origins as a norm, and accept variety in human society as an enrichment rather than a threat. They must fit into the spaces between culturally diverse populations, aware that clients may regard cultural differences as dividers among people. They must work to enable clients to maintain self-respect and dignity while trying to arrive at the human essence of each, the universal factors relevant to every person’s emotional health.

Within this confluence of Eastern and Western culture, of ancient and modern, of secular and religious lifestyles, art therapy can offer an experience of direct unimpeded creative self-expression. The opportunity to interact spontaneously with art materials also gives people an opportunity to cut through divisive mental barriers and reveal their commonality.

Art Therapy in Israel

In contrast to the longer history of Dance and Music therapy in Israel, Art therapy as a distinct profession had very few people actively practicing prior to 1980, although artists and art teachers had long worked with emotionally disturbed people in hospitals and clinical centers. In 1980, new immigrants and Israelis trained professionally as art therapists in other countries began working in mental health settings. In addition, professional art therapy training programs became available for the first time in Israel, attracting people from the arts, education, social work and psychology. The advent of professional training with a student body composed mainly of mature people, many of whom had attained professional status in other fields, gave impetus to the practice of art therapy, and filtered it increasingly into the awareness of mental health institutions and into the Board of Education.

Increased numbers of professionally trained people also generated a host of practicum sites where none had existed before. Trainees began to work in mental hospitals, day-treatment centers, community centers, schools, organizations for children with various handicaps, orphanages and old-age homes. Thus, many ethnic groups were reached and people with different levels of physical and emotional disability benefited from art therapy. Indeed, one striking aspect of the spread of art therapy in Israel, is the demand for it and its applicability to different populations. The success of a five-day intensive workshop given in an Arab village to local school teachers and educators resulted in Arab teachers regularly participating in similar workshops given to Jewish school teachers in Tel Aviv, resulting in true non-verbal and verbal communication in a crucially important area.

An art therapist working with Ethiopian children just a week after their arrival in Israel was impressed by the naturally direct, spontaneously done clay figurines (Figure 1). A few sessions later, the children’s clay work expressed their schooling and "retraining" in adjusting to a new society, with sculptures of airplanes, cars and transistor radios. General enrichment courses for speech therapists, occupational therapists and special education teachers in the school system include art therapy as an additional tool in their work. These groups also provide a common ground for social interaction and integration between Israeli-born educators and new immigrant teachers, and art therapy becomes here a means of self-expression leading to increased group cohesion.

The Israeli art therapist, working as a matter of course within such varied settings becomes aware that this is a profession that can answer the specific needs of specific populations, with flexibility. In beginning art therapy groups, the often used exercise of drawing and decorating one’s name as a presentation of self demonstrates the variety of approaches of different groups. A ten-year-old girl living in the Galilee drew a lovely field of flowers to decorate her name which she wrote in acrostic fashion. Her name—Maya—spelled out in Hebrew the first letters of "Yom Kippur War," (Milchemet Yom Hakipurim). She explained her bright flower picture by saying that at the moment there was no war. Drawing and decorating one’s name became a serious opportunity for the participants of the workshop given in an Arab village. (Shlonsky, 1985) The group leader

Fig. 1 Clay figurines done by Ethiopian new immigrant child in Israel.
spoke in Hebrew but asked that all interpersonal conversation, and poetry written in conjunction with the name drawings be in the mother tongue. She was able to sense their communication and did not often avail herself of the translator. Name drawings of both men and women here show an unhurried taking of time to present one's name with respect, together with a noticeable decorative sense, a softness of execution, and a feeling of contact with nature (Figures 2A, 2B, 3A, 3B). This writer has used name-drawing in regular and special education art classes in a Junior High School. The results are often beautiful and dynamic works of art, as well as more satisfying personal and peer group awareness (Figure 4).
Finding budgets to pay for art therapy services in a country usually in a state of economic crisis is fairly difficult. Many public institutions cannot provide paying jobs, and if they do salaries may be relatively symbolic. However, the fact that art therapists are welcome volunteers where not long ago their profession was unknown, indicates acceptance and a newly created demand. Paying jobs for art therapists seem to exist mainly in special education work with children in Therapy Centers run by the Board of Education. Mental hospitals, outpatient facilities, and evening post-hospitalization clubs also use art therapy as a regular form of treatment, but more often than not on a volunteer basis. Some art therapy work done in prisons has been paid for by special financial arrangements, as have occasional workshops done with army personnel (Figures 5A, 5B, 5C).

Art therapy as an additional tool for other professions is much in demand, and in general, art therapy courses are well attended by those seeking personal enrichment and new tools and directions in their own work. The Board of Education has recently created a position of Coordinator of Creative Arts Therapy in response to this demand. The coordinator organizes workshops throughout the country and trains local group leaders who will continue work in their areas. Thus teachers, counselors, speech and occupational therapists, and others in the educational system can widen their repertoire with basic art therapy methods.

Art Therapy with Children in Public Facilities

Children receive art therapy scheduled in the afternoon at Therapy Centers for children from normal schools. There are Therapy Centers for organically impaired children, schools designated for special education, schools in children’s wards of mental hospitals, and in children’s outpatient clinics. The largest em-

changing slang and dances or pop heroes do not resemble their parent's choices. The first of these Centers was founded in Tel Aviv in 1967, followed two years later by another based on the same model. Growth of these Centers continued, with art recognized from the start as an effective non-verbal tool of treatment. In comparison to the recent availability of professionally trained art therapists, early groups were usually staffed by artists or art teachers with a background in special education. Children attend their groups once or twice weekly, according to their individual therapeutic program. Because creative arts therapy groups are usually of no more than six or seven children and run as afternoon extracurricular arts activities (more intimate and personally geared than ordinary art classes), children feel as though they are participating in a regular, albeit special group, and the stigma of being "singled out" and referred for therapy is considerably lessened. Parents' groups may also be part of the services offered in the Therapy Center. Together with the Center psychologist, this writer has co-led parents' groups which represent the usual wide distribution of ethnic groups in the area. The sessions utilized a combined directive psychological approach and art therapy. In reviewing work done in art therapy with parents, or with their children, I find that ethnic difference does not diminish a client's ability to trust in the therapist, nor affect his/her own abilities to use art and personal symbols creatively.

Art Therapy with Adults in Public Facilities

Psychiatric hospitals, and post-hospitalization hostels and evening clubs encompass much of the art therapy work being done today with the emotionally disturbed adult population. Acknowledgement of art therapy as a valuable therapeutic resource compatible to hospital and post-hospitalization treatment is confirmed by requests for as many volunteers and practicum students as possible. It is hoped that cooperation between mental health facilities, and schools offering professional art therapy training will eventually lead to more, permanent and officially paying jobs for art therapists in these settings. Meanwhile, in addition to the definite call for volunteers, several art therapists have become regular staff members of a mental hospital, and an outpatient day clinic.

In speaking with art therapists working in facilities for the adult mentally ill, I found that patient groups comprise cross sections of both Sephardic and Ashkenazi populations, may include Israeli Arabs, other minority groups, and new immigrants of different origins, and are generally representative of middle to lower middle class economic levels. Patients may suffer from the stresses which ordinary life, or life in Israel can create. The effects of battle shock on soldiers, the culture shock of some new immigrants, the shock of terrorism, are some examples of stress specific to Israel (Figures 7A, 7B). In using art therapy as treatment, the degree of mental illness, rather than ethnic or cultural background is the determinant of effectiveness, response to art, and ability to be creative.

The kibbutz network has it's own therapeutic clinics, and the policy is to keep mentally ill kibbutz members in their own kibbutzim while receiving treatment. Several kibbutz members who have studied art therapy in professional training programs have been given facilities to practice art therapy on their own kibbutz with kibbutz members, and they receive supervision from a psychologist attached to the kibbutz clinic.

Summary

Art therapy as a distinct profession has been acknowledged within the last five years as a valuable resource and contribution to the therapeutic professions in Israel. In addi-
Fig. 7A Self image of soldier with head wound and disabled foot, drawn after several years in therapy. The right-hand figure is labeled “before injury,” and the left-hand figure labeled “after injury.” Figure 7B shows the continued state of depression of the patient and the desire to die, rather than live in a state of uselessness. Here, train tracks lead to a graveyard. On a tombstone is written “guilty.” (Patient’s name has been deleted.)

Fig. 7B War-disabled patient depicts depression and desire to die rather than live in a state of uselessness. Train tracks lead to graveyard; on tombstone is written “guilty” (of not having died). Patient’s name has been deleted under the word “guilty.”

tion to trained art therapists, psychologists, social workers, educators and others in helping professions increasingly study art therapy to stimulate their own creativity and widen their repertoire as therapists. Art therapy is now differentiated from art education with special populations, and the professionally trained art therapist works in specific capacities related directly to therapy. With increased numbers of people entering the field, working conditions can begin to be improved. These conditions include the basic requirements of a closed and intimate room, adequate space, materials and time, and staff consultations, access to case material and professional supervision. In work with children, for example, misunderstanding of art therapy as an educational tool may account for inadequate working conditions or supervisory deficits. The art therapists, frequently alone in their profession among the many others in a facility, may experience a sense of isolation. Thus there is a need of forming support groups in lieu of adequate personal support in work settings.

In view of continuing budget cuts in public spending, art therapists in many facilities may continue on a volunteer basis, repaid only by personal satisfaction and the reward of accompanying their clients’ creative search and growth. However, as the trend of acceptance continues, it is likely that an increase of official positions will result.

As an art therapist, I have been fortunate in experiencing acceptance and cooperation from the Board of Education, and also in being rewarded in the trust of my clients. When accompanying others in their personal process, in centering themselves creatively, and using art materials as extensions and mirrors of themselves, the differences between us, whether cultural or personal in origin, are far less important than what we have and feel in common. Here the socialization process inherent in group work truly begins. Both
children and adults may be referred for art therapy for similar reasons. They may not be able or willing to express their needs verbally. They may be uncooperative to other forms of therapy which they feel as more threatening. They may be unable to communicate with others, and the small-group creative experience provides an ideal initial experience of support and contact with peers, for them.

Channeling energy into creative expression rather than conflict becomes a powerful tool for self-revelation and group cohesion, and clears a path through the complicated array of values such as one experiences in Israel. Attaining a center of personal clarity, balance and awareness provides a more effective and spontaneous method of coping with the conflicts of everyday life. I have heard young children express their feeling about their own completed creative effort as "doing my own thing," or "doing what I had to do." The art therapist can be a valuable participant in this rich tapestry of people, who with all their diversity, may yet come to see themselves as one people, one nation.

Art Therapy for Acculturation Problems of Hispanic Clients

Gilda Prieto Moreno, M.A., ATR, Art Therapist at Casa Central, Community Agency, Chicago and Harriet Wadeson, Ph.D., ATR, Director, Art Therapy Graduate Program, The University of Illinois at Chicago, and author of Art Psychotherapy (John Wiley, 1980)

This article focuses on art therapy for acculturation problems evidenced by Hispanic clients. Hispanics represent the second largest minority group in the United States, but there are insufficient mental health providers. An encouraging factor is that centers around the country are studying culturally sensitive therapeutic modalities, and this should help in the delivery of services in future years. In this article discussion is given to roles in Hispanic families, and to acculturation issues. Art therapy for Hispanics at a Chicago mental health center is described, including art therapy assessments and results, accompanied by photographs of clients’ art work. The article concludes with an art therapy group, including processes and media, a case example from the group, and reference to other Hispanics and immigrants.

Introduction

For years, the mental health needs of the marginal sectors of our society have been avoided or neglected. Although the community health centers developed in 1963 were intended to serve groups unable to afford mental health care in private institutions (Lang and Munoz, 1982), and have in fact provided a significant service to the population at large, for ethnic minorities the challenge of community health remains essentially unmet (Arce, 1976).

Hispanics represent the second largest minority group in the United States; there are estimated to be from 11 to 16.6 million Hispanics in the country. Yet this population is often neglected by mental health service providers:

The delivery of psychotherapeutic and other forms of mental health treatment has historically been aimed at white, non-Hispanic middle upper classes. The Hispanic has too often received insufficient or inappropriate mental health care—a fact well documented in the literature (Becerra, Karno, Escobar, 1982).

Studies indicate that the Spanish-speaking, Spanish-surnamed patients who do seek mental health services typically receive less, and briefer forms of therapy than Anglo-American patients (Santisteban, 1980).

Lack of bicultural therapists who are sensitive to the needs of a particular group poses a significant impediment in providing appropriate treatment. Even if the therapist speaks Spanish, but is unable to relate to the client’s issues because he or she lacks knowledge about the cultural idiosyncracies that might be involved in the presenting problems, the client is unlikely to engage with confidence in a therapeutic relationship.

In addition, the availability of a mental health center in a “barrio” (neighborhood) is an important factor. Often, immigrants are limited to public transportation. The location of a center almost predetermines which population it will serve (Acosta et al., 1982).

One encouraging factor is that there are centers around the country studying culturally sensitive therapeutic modalities, although the need for trained professionals is so great that the Hispanic community will not be served adequately for many years.

Given these circumstances, one of the authors (Moreno) was highly motivated to work with an Hispanic population. She has written:

My experience in working with Hispanics has brought me closer to my culture of origin. I was born in Cuba, and at the age of two moved to the U.S. We lived in a primarily Hispanic neighborhood, and my mother never worked, so until the age of five I did not interact within the Anglo community. Kindergarten was my first true encounter with English and the beginning of my own process of acculturation. In working with the Hispanic population, I have understood more fully how this process has molded my personality and idiosyncratic characteristics. In a need to understand more fully my Hispanic clients, I relate to my own migratory experience in recognizing the feelings of loss, isolation, and helplessness that my clients stressed over and over again.

Roles in Hispanic Families

In addition to needs for help created or exacerbated by the stress im-

Lack of bicultural therapists who are sensitive to the needs of a particular group poses a significant impediment in providing appropriate treatment.
posed by the change in cultural habitat, difficulties are increased by characteristics of the Hispanic culture that mitigate against seeking psychotherapy initially and progressing in it subsequently. In order to be of assistance to this population, it is necessary to comprehend these structural aspects of its social dynamics.

"The key to the understanding of any cultural group is knowledge of its family structure and ideology" (Carillo, 1982). In the Hispanic culture, the family is a source of support and acceptance. For this reason, it is not uncommon for an Hispanic individual faced with a problem first to seek help or advice from a family member, and only in extreme cases turn to a mental health professional.

It is not unusual for Hispanic groups to be characterized by the tradition of an extended family system (Carillo, 1982). This system can include grandparents, parents, children, cousins, aunts, uncles, and "compadres," a Spanish word which signifies godparents or close friends. In many instances these individuals have specific roles or areas of expertise within the family. Because of this family network, Hispanic family members may appear to be over-dependent on each other, when in reality they are acting appropriately within their cultural context.

Most characteristic of Hispanic families is the rigidity which characterizes the sex roles and the adherence to gender-appropriate behavior. Researchers note that sex roles among these groups tend to be more clearly defined than in other cultures (Santisteban, 1980). This stereotypic behavior can fluctuate according to the amount of acculturation an individual has experienced. As a father, a man is seen as the breadwinner and authoritarian figure of the household; no major decisions are made without him. Parenting and household chores are not perceived as his responsibility. Since most of his duties deal with activities outside of the home, it is not surprising to find that Hispanic men enjoy a great deal more freedom than the women.

The Hispanic woman is described as being submissive, unable to take care of herself and expected to be sexually "pure." Generally in Latin cultures the weight of preservation of the family falls on the mother (Padilla, and Ruiz, 1973); she is expected to deny all her needs and pursue the satisfaction of her family. Aunts, uncles, cousins, grandparents and "compadres" share a very important role in the Hispanic family. In cases where the mother needs to go out of the home, the grandmother or aunt may serve as an auxiliary parent. For migrating or exiled families, this has been a significant factor in their economic survival. It has allowed the mother to go out and work and still feel that her children are well cared for. This approach does call for flexibility within the traditional roles, however, and can present an imbalance in the family system.

Acculturation

When Hispanic families arrive in this country both parents may need to work because of economic pressures. The father, who had traditionally held the role of breadwinner, must now share this position with his wife. The mother who had perceived herself as being the primary caretaker of the family must share this role with an aunt or grandmother who will now look after the children. Even the children are challenged by their peers about their seemingly dependent behaviors. Almost like a domino effect, everyone in the family must readjust and assimilate a new role.

Often the degree to which a family as a unit can acculturate correlates with the emotional stability of its individual members (Carillo, 1982). A study of 110 Cuban mothers (Szapocznik, 1976) indicated that the number of years in the U.S. had little to do with successful acculturation, but that personality and behavioral attitudes were much more significant in determining an individual’s adaptability.

The most widely accepted analysis of acculturation is that of Gordon, written in 1964 (Santisteban, 1980). He delineates seven stages which an individual must undergo in order to become acculturated. He explains how a person can assimilate a new culture, first behaviorally and later, as he or she resolves internal conflicts, structurally. Structural assimilation is the more difficult task since it involves such aspects as change in patterns of dress, manner and language.

Current research has shown that acculturation in and of itself can produce an imbalance in the family structure. Studies conducted by Scoppetta, Szapocznik, and King (1977), have revealed that acculturation rate has a great deal to do with age. They found that young people acculturate more rapidly than older members of a cultural system.

Another significant variable in acculturation rate is sex. Because of the roles which Hispanic women have held traditionally, it is not unusual to find that men acculturate faster than women (Santisteban, 1980). Traditionally in Hispanic cultures, men have been better educated and more mobile within their commu-

Because of this family network, Hispanic family members may appear to be overdependent on each other, when in reality they are acting appropriately within their cultural context.
nities than women. This has allowed them to be more receptive and flexible when arriving in a new culture.

Due to the extreme stress experienced by many Hispanic women as they assimilate into a new culture, they may present such symptoms as depression, extreme anxiety, and excessive drug taking (in the form of sedatives and tranquilizers) and increasing alcohol abuse (Szapocznik, 1978). Some of the symptoms which males may present because the homeostasis of the family has been altered are alcohol abuse, unemployment, involvement with illegal activity, and child and spouse abuse (Rodriguez, 1980).

As previously mentioned, younger people acculturate more successfully than older people. Children who migrate to the U.S. and receive education here are found to acculturate much more rapidly than their parents. There appear to be two main factors involved in this process. First, children are not as rigid as adults in accepting and trying out new ideas. Therefore, they do not feel as stressed by new experiences. Further, as children go to school, they learn to interact in their host culture, while at the same time they have the assurance that they can return to their families and continue to function within their original context. This allows the children to grow within the new culture while at the same time feeling supported by their families. Unfortunately, adults do not often find themselves in such supportive situations.

The Use of Art Therapy for Hispanics in a Mental Health Center

The day treatment program at Chicago’s Northwest Community Center services approximately forty people every day. It is composed of bilingual and bicultural staff who work primarily with a chronic population. Some of the clients have been coming to the center for the past ten years. The purpose of the day treatment center is to give people who are chronically mentally ill a place where they can socialize and be functional. In addition to psychotherapy, various daily activities that constitute its program include: discussion of current events, arts and crafts, community affairs, parties, job training, exercise, trips, discussion of public services, and games. Added to these regular activities, art therapy was introduced for both treatment and assessment. All art therapy sessions were conducted in Spanish.

Art Therapy Assessment

The goal of the art therapy assessment was to aid the therapist in becoming more aware of the acculturation issues that might be relevant to the client’s presenting problem. This assessment was designed to be used primarily at the time of intake or as an appropriate intervention in the course of therapy.

Since the male clientele at the Center were resistant to art therapy (see Art Therapy Group below), those who participated in the assessment study consisted of fifteen women. They shared many common characteristics: limited education, depression, and withdrawal. Many of the women were not very articulate. Because of these characteristics, it appeared that art expression might be facilitating. It would provide a less stressful form of communication because the clients would not be pressured to speak at length.

All assessments were administered individually and lasted approximately one hour. Pastels and 18” x 24” paper were used. At the beginning of the session, an explanation was given of how the assessment would be used to enhance communication between the client and the therapist. It was also explained that the assessment was part of a study being conducted to develop more culturally sensitive therapeutic approaches which might be used with the Hispanic population in the future.

Criteria for inclusion in the study were as follows: the participants had to have lived in the U.S. for at least five years and must have lived in their country of origin for at least the first twelve years of their life. They had to have been born in an Hispanic country, and must still speak fluent Spanish. Although there was some resistance, for the most part the women were cooperative and willing to experience something which they had not done since they were very young—drawing. The opportunity of taking part in a project that could help other immigrants was very appealing to most of the women.

Of the fifteen women referred for assessment, a questionnaire administered prior to the art tasks determined the following: the majority were Catholic, more than half had reached only the sixth grade or less, more than half were divorced and only two spoke English. Only two of the fifteen women had ever worked in the U.S., and all of them stated their primary reason for coming to the U.S. was either economic difficulty or that they had been brought by other family members.

The possibility of some of these characteristics prompting these women’s presenting problems is very strong. Low socioeconomic status and educational levels add to helplessness and hinder upward mobility.

The Art Assessment consisted of four drawings as follows:

1. Draw anything which comes to your mind.
2. What can you tell me about your drawing?
B. Is there anything that made you think of these images?
(Rationale: Warm-up and production of spontaneous images.)

2. Draw a memory from your life in your country of origin.
   A. What can you tell me about your drawing?
   B. What else can you tell me about your life in your country of origin?
      (Rationale: Relationship to the culture of origin.)

3. Draw something significant from your life in Chicago.
   A. What can you tell me about your drawing?
   B. Is there something else you can tell me about your life in Chicago?
      (Rationale: Assessment of current functioning.)

4. Draw something or someone from your country of origin you would like to have in the U.S.
   A. Can you tell me more about your drawing?
   B. Why is this important for you?
      (Rationale: Comparison of past and present life situations and relationship to present adjustment.)

Assessment Results

One prominent theme in almost all the assessments was unresolved feelings over a loss of some kind, such as family members left behind or the family home. When talking about these images a great deal of pain was usually expressed.

Free Picture:

Figure 1 is the first picture drawn by a single parent who has five children, three of whom are retarded. She has no family in Chicago and feels that she cannot go back to Mexico because she would have no means of supporting her family. Her husband left, she claims, because he could no longer deal with the family situation. She said that her drawing depicted how she felt on the day of the assessment. She said she felt as if she was going around in circles and could not get out. The colors were intended to signify her many problems and her inability to solve them.

Memory from Country of Origin:

The importance of family, friends, and homeland appear as a predominant motif in all the pictures. Many of these themes were emphasized in the literature. Through the images of their former homes, the women were able to tell stories about their childhood or early adolescence. These were often memories that they had not thought about for a long time. (Figure 2)

When discussing their pictures, the women talked about their childhood and how they had lived most of their lives deprived of many things, but at least they felt they had a house they could call their own and they were free to visit friends and family. They compared this to their lives in Chicago. Here they feel enclosed and isolated from other people. They complained about living in overcrowded buildings where people do not want to be bothered by each other. Many expressed feelings of helplessness because they believe they can do nothing to change the course their lives have taken.

When these women left their homeland, they left behind many people and places they cherished. After many years, they still have not come to terms with these losses. Figure 3 was drawn by a
Life in Chicago:

Several of the drawings exemplify how uninvested these women are in developing their own lives in Chicago. One woman said that when she thought of Chicago, she thought about a plane leaving O'Hare Airport for Puerto Rico. (Figure 5)

Several depicted their children as representative of their lives in Chicago, and one said her children were the only reason she stayed in the U.S., that without them she would have nothing. The emptiness found in most of the pictures possibly reflects these women's present life situations. Most of them have few or no interests or activities outside of their families. Their investment in life in Chicago appears limited.

Something from Country of Origin You Would Like to Have Here:

In the final group of drawings, there were three basic themes which the women drew consistently. These were images that represented palm trees, houses or family life, or a member of the extended family. The women appeared to be missing both significant people and a place that was familiar. Complementing the lack of investment in their lives in Chicago was an often poignant longing expressed in this last drawing, such as Figure 6, titled “My Family in Puerto Rico.”

The assessment provided information about life in the origin country compared to present life to assess the acculturation process. According to Carballo (1970), the acculturation process has two major variables: the antecedent, or those having to do with the level of the individual's functioning in his or her country of origin, and the intervening variables of how well the individual can integrate his or her previous level of functioning into the host culture. The art therapy assessment utilized images and associations to them to explore these variables.

When the assessment was used as part of the intake procedure, its sensitivity to the acculturation process became a very useful tool. It enabled a more accurate diagnosis, identification of significant issues, and appropriate treatment planning and therapist assignment. One of the results was to facilitate communication be-

Fig. 4 “My Mom, My Daughter, and Myself”

43-year-old woman who portrayed her parents, mentioning that it was very difficult for her to accept the fact that she may never see them again. She said that they were now getting old and that she feared they would die before she could see them.

Figure 4 represents the client's presenting problem of having ambivalent or guilt feelings about her daughter living in Puerto Rico while she is in the U.S. She drew a picture of herself, her daughter and her mother. She said that this is how she wished it could be, but, because of financial difficulties, she has to remain in the U.S. Her daughter is being raised by the maternal grandmother.
tween the client and art therapist. Through the use of art and themes related to the process of accultura-
tion, many relevant feelings and memories were disclosed that could be explored in ongoing art therapy.

An interesting aftermath of the assessment was that one group of women dedicated one of their meet-
ings to discuss it. In the group setting, they explored and shared what their feelings and experience had been while doing these drawings. The group agreed that the memory of their country of origin always provoked unresolved feelings around the losses they have sus-
tained.

Art Therapy Group

Little has been written or studied on specifically what the treatment of choice for Hispanics might be. What the literature does suggest is that traditional modalities have not been successful and that research should continue to provide more appropriate models for the Hispanic populations. With these factors in mind, art therapy was introduced at Northwest Community Mental Health Center in an effort to add to the therapeutic resources.

The group was to be an open one so that new members could enter as they joined the day treatment cen-
ter. Because the population was a chronic one, the atmosphere of the group was to be as relaxed as possible, and only those people who wished to discuss their art work did so. No tasks were assigned. The size of the group fluctuated from four to six members. The group met for approximately twenty sessions over a five month period.

Early on, the men in the group dropped out. They said that they could not draw and they would not. This was not the case; some of them drew very well. It appears that they felt threatened by the art work since it was something over which they did not have full control.

The media available to the group were craypas, crayons, magic markers, tempera, and collage materials. Participants were especially comfortable with collage-making because it involved a series of steps that seemed very appropriate to the Hispanic way of socializing. The group would begin to look at magazines and share the pictures with other members. Their own issues would be presented, but in a way that felt non-threatening. During the session the group members spontaneously dis-
cussed their own work or commented on the work of others. This appeared to facilitate communication and set a very relaxed atmosphere where a variety of topics were discussed. As they drew and verbalized some of their conflicts, group mem-
bers were able to interrelate and support each other. The group provided a safe atmosphere where they could discuss the hardships of their present life circumstances while at the same time they reminisced about their lives in their country of origin.

One topic that came up very often was how difficult it had been to adjust to the cold. All of the women in the group were born and raised in Puerto Rico, where the temperature is warm all year round. The draw-
ings often depicted palm trees, fruit and the sun, and the discussion of them centered on the difficulties of adjusting to a new culture.

Most of the people whose pictures are presented here have lived in the U.S. from ten to fifteen years, yet their pictures related minimally to their current life situations. Nora’s drawings depicted palm trees, flowers, the sun, a chicken and her-
self (Figure 7). Nora’s verbal com-

Fig. 7 "Palm Trees and Me"

Fig. 8 "My House in Puerto Rico"

Fig. 9 "My House in Chicago"

Communications were very minimal. She was withdrawn, does not know how to read or write, and has never attended school. When she first came to the group, her drawings were light and small. As the group developed, so did Nora's ability to communicate through her art. She expressed her concerns and found joy in her own accomplishments.

It was very common for people from the rural areas to live in a house such as the one drawn by Maria in Figure 8. In Figure 9, another group member's house looks like an apartment building in Chicago, but it is still surrounded by palm trees. Most of the houses drawn, however, did not have the appearance of northern homes, but resembled the airy, thatch-like homes on stilts still seen in the Caribbean islands. For these women it appeared that home was a place far away in a very different kind of land.

The group members gained a great deal of satisfaction from their finished drawings. They were very proud to show their pictures, and they made sure that anyone who wanted could discuss her picture. There women rarely do anything just for themselves, but in this group they were able to dedicate time to their own issues and feelings. Here was a place where they could explore themselves without feeling guilty. It was important for them to

Although most of the images were simple, they were familiar and evoked poignant feelings shared by all the group members.
have a place where they could share the many aspects of their present life situation.

The communication that was achieved was brought about through the expression in images. Although most of the images were simple, they were familiar and evoked poignant feelings shared by all the group members. Through these images the women were able to look at hardships in their present situation and reminisce about the homes they had left in their country of origin. Having an Hispanic therapist who was bilingual, bicultural and an immigrant herself, facilitated communication and trust in the group. For this chronically ill population of isolated individuals, the group’s main thrust was supportive in nature. The familiar shared images that resulted from spontaneous art expression promoted experiences of universality, one of the significant curative factors in group psychotherapy (Yalom, 1975).

Case Example

One group member who appeared to benefit greatly from the group’s input was Ileana. Ileana is a 27-year-old Hispanic female who has been in the U.S. for approximately eight years. She was referred to the center because she was physically abusive toward her child. The child was eventually removed from the home and placed with the maternal grandmother for protective custody.

During the course of the group, Ileana explored the responsibility and pressures of being a single parent. In her art work one can see both adult and child-like images (Figure 10). In this collage she depicted clothes of which she is very conscious, accessories for her home, which she described as one of her “dreams,” and toys for her little girl.

The reunification with her child and her extended family remained a clear goal throughout her therapy. In Figure 11 she depicted herself in Puerto Rico, enjoying her family. Through the use of art, Ileana was able to visualize and later verbalize her hopes and what steps she would need to take in order to attain them.

Other Hispanics

Not all Hispanics in therapy need specially designed therapeutic programs. There are, and will continue

Fig. 10 “Dreams of Clothes, Toys and Other Things”

Fig. 11 “In Puerto Rico with My Family”
to be, clients who have a middle-class orientation and who seek agency services in the same manner as non-immigrant clients (Mezio, 1979). These people will be able to adjust to the present system. The less educated, unskilled poor, monolingual Hispanic clients represent a group of people who are particularly vulnerable in our society and who often need new, flexible and innovative models for the delivery of mental health services.

Other Immigrants

Many of the issues that surfaced in the Hispanic art therapy group are not unique to the Hispanic community, such as inadequate housing, being a single parent, and the handicaps of being mentally ill. On the other hand, patterns of family organization, socialization, resources, and approaches to seeking help bear particular cultural characteristics.

Applicable to other immigrant populations would be the understanding of these factors necessary for the Hispanic immigrants as well as such definitive factors as the use of bilingual and bicultural therapists. The awareness of the idiosyncrasies of the immigrant’s cultural background and an understanding of feelings about the home that has been left in relation to present life circumstances will enhance the effectiveness of the therapy. Art expression can be a useful tool in tapping the images and feelings associated with these conditions. For these populations, it is particularly likely that verbalization may pose problems, thereby reinforcing communication through art as an especially useful modality.

Conclusion

In this article we have specifically dealt with the plight of Hispanic immigrants or refugees. Their experiences of loss and isolation can also be seen in other migratory groups who have left familiar places and loved ones behind.

Today the United States is faced with an influx of migrants who bring with them a variety of needs and expectations. This article presents a beginning in the use of art expression and shared images in helping the many people whose lives have been disrupted through relocation and who feel like strangers in our country.

References

Art and the Wish To Die

Reviewer Aaron Sheon is Professor of Art History at the University of Pittsburgh in Pittsburgh, Pennsylvania.

The author explained in the preface that the idea for this book came from his background as a psychologist studying “unpredicted death.” Dr. Cutter and his wife Dorothy, a professional artist, began to thumb through books about art and found in eighteen months of browsing “more than two hundred fifty artists who had painted suicide themes and a smaller number who had themselves committed suicide.” Armed with this information they prepared a small exhibit of “suicidal art work arranged historically from the Renaissance to the present.” Eventually they felt that such exhibitions might aid in the prevention of self-injury behavior. Their idea was that any person contemplating suicide might look at their exhibition and be dissuaded. Even though Dr. Cutter admitted that specialists in health fields doubted the efficacy of this notion, and that there was “much resistance to my ideas,” he felt that he should persist. This book is the result of his efforts.

There are several problems that severely weaken the author’s premise. He believed that the book’s examples of “suicidal art” have “far more impact on the public than do ‘scientific words.’” There has been no testing of this belief, but the author feels that when, at meetings, he showed the slides of these images and some colored commercial reproductions, “the viewer has an experience not unlike going to a museum or concert... Being exposed to a one- or two-hour concentration of self-injury themes in visual art is an emotional experience.... No one has ever committed suicide or attempted self-injury because of viewing this art.” He feels that somehow the viewers of this image collection have been changed emotionally, and that they will in some way never again think of self-injury or suicide.

Since there is no evidence that this imagery does indeed change attitudes, and no attempt was made to test his theory, he makes analogies with how advertising affects people. His book, with its messages about the need to stop suicide and self-injury, will work wonders, he feels, when combined with his “suicidal art” collection.

The images are strewn throughout the book with little explanation of their original intent. There can be no doubt that in the Renaissance and Baroque periods images of Cleopatra and Dido committing suicide were favorites of artists, but their relevance to his theory or the likelihood of using them to prevent suicides or self-injury seems quite dim.

Dr. Cutter’s approach seems to be that if there is a knife or a dead body in a painting, he will use it in his collection. Works of art with no relevance to suicide or self-injury are included on some pages, and we are left to guess why they are there. There are even some curious tables that give a gloss of scientific statistical support for his efforts, but which in reality are worthless, because his random sampling of imagery can hardly be called complete.

Another weakness is the naive attempt to explain the artist’s intention in creating a particular image. Instead of seeking information about the artist or the work, the author has given his pronouncement and makes it sound as if he had been at the artist’s side as he or she painted. Discussions of works are frequently filled with incorrect interpretations. His comments about prints by the Pop Artists Andy Warhol and Roy Lichtenstein, for example, seem sophomoric. Surprisingly little attention has been given to the art history meanings of specific themes and the context of their use in an historic situation.
The Special Artist's Handbook (Art Activities and Adaptive Aids for Handicapped Students)

Reviewed by Virginia Minar, MS, ATR, Art Therapy Instructor at Alverno College, Milwaukee, Wisconsin, and a former Art-Exceptional Education Teacher/Therapist with the West Allis-West Milwaukee School District in Wisconsin.

Because of this reviewer's area of concentration in art therapy for exceptional children, special interest was given to this book since Ms. Rodriguez has had the experience of teaching art in both regular and special classrooms for over 15 years in the Philadelphia Public Schools. She has also supervised training experiences for Art Education and Art Therapy students from several universities.

The book is divided into four sections, with Part II "Art Activities" comprising two-thirds of the material presented. Each student-centered activity lists materials needed, pre-session preparation, directions, and suggestions for further development. Adaptations of the activity are then written for each of the handicapping conditions described in Part I, "The Handicaps." It is with these adaptations that the strength of the book is evident.

Ms. Rodriguez exhibits her experience and knowledge in the sensitive way in which she addresses the students' particular needs for individual creative growth. These adaptations are valuable, in that they break down steps for the less able student and expand the activity to challenge the more capable student. Although she refers to Public Law 94-142, she does not deal with writing goals and objectives for the required IEP (Individualized Educational Plan). It would have been helpful to show some remedial objectives for each activity.

I appreciated the interesting suggestions made for motivating the gifted [student], since there is so little attention given to providing stimulating art experiences for these students. The adaptations written for the socially and emotionally disturbed children are particularly interesting and useful for art therapists working with those populations. The suggestions are open-ended enough to allow for insightful personalization. Since many emotionally disturbed children exhibit gifted and talented characteristics, the adaptations for that category might also be utilized.

In Part I, the author sensitively handles "Myths, Prejudices, and Misconceptions." Definitions and characteristics of major handicapping conditions and exceptionals are presented in a concise and usable format that describes the major skills they may lack and the remediation they may require. The categories covered are: Severely and Profoundly Impaired; Mentally Retarded; Trainable Mentally Retarded; Educable Mentally Retarded; Socially and Emotionally Disturbed; Learning Disabled; Physically Handicapped; Sensory Losses (Hearing Impaired and Visually Handicapped/Blind); and Gifted.

At the end of this section, Ms. Rodriguez pictorially shows sign language for the most important words used in the art classroom. While this limited sign vocabulary would not be sufficient for an individual working exclusively with the hearing impaired, it is a way to make mainstreamed students feel that you are interested in communicating directly with them.

Part III, "Adaptive Aids and Materials," deals with suggestions of simple ways to adapt tools and materials to enable students to participate, as independently as possible, in the art activities. Part IV, "The Art Classroom," addresses environmental concerns for the special student including furniture, equipment, lighting, storage and display. Safety considerations are presented, including a list of art materials not recommended and some safer alternatives.

The Special Artist's Handbook is one of the best resource books available on this subject. It is well done, because Ms. Rodriguez writes from practical experience describing tested methods and activities, rather than limiting herself to only a theoretical point of view. While the material covered is written for elementary school children, it is certainly adaptable for the secondary level. I highly recommend this work for art educators and art therapists working in public schools, or in other settings where art experiences are provided for children/students with handicapping conditions.
Mommy, Daddy, Look What I’m Saying: What Children Are Telling You Through Their Art

The inner world of children is communicated through their art work. Consequently art productions represent a nonverbal behavioral key to assessing developmental well-being. In Mommy, Daddy, Look What I’m Saying, Dr. Myra Levick asserts that art is a key that parents as well as art therapists can use, if they only understand how. Generously, this is just what Dr. Levick proposes to teach. By sharing some of the art psychotherapist’s “tools of the trade,” the author informs parents how to use art as a way of deciphering what their children are saying.

The three most essential tools shared are: (1) how to read danger signals in art productions; (2) how to provide the kind of environment in which children will feel safe and free to communicate through art; and, most importantly, (3) how to use an understanding of normal artistic development as a standard from which abnormal development can be differentiated.

The first step in this last process is to acquire a knowledge of normal developmental sequences; to this end, the last half of the book is devoted. Much of the information is imparted through the dramatic device of two fictional children, whose growth from birth to 12 years illustrates the stages of psychological and artistic development. One of the book’s central concepts is that artistic development is related to, and is an expression of, emotional, intellectual and verbal development, and that it, therefore, reveals the latter. This is given visible proof through the presentation of children’s drawings and paintings that are impressively utilized throughout the book. These communicate more clearly than words the interrelatedness of developmental capacities.

There are some pertinent questions for us to consider: Is it really helpful for parents to look at their children’s art from a diagnostic perspective? Is there a danger that parents will relate to their child’s art like sleuths, anxiously alert to discover warning signals? Might not the child be robbed of something as a result?

Most likely, the answers [to the above questions] lie in the individual parent’s way of using this information, and of the art-therapist’s help to parents in furthering the understanding of the ingredients, methods, approaches, forms and intricacies of child art. I suspect that Mommy, Daddy, Look What I’m Saying will be an informative and educative reference book that will be used by many parents as well as art therapy professionals. Having acquired knowledge about artistic as well as other areas of development, parents can hopefully approach their child’s creations with enhanced sensitivity and appreciation.
The first edition of *Child Art Therapy* was a major contribution to the field of art therapy and to any field focusing on the study of children and their art. This revised edition updates the information contained in the first edition, and “explores the author’s recent experiences in the field, including work with deaf children and multimodal therapy involving the closely related activities of art therapy and play therapy.” The book is profusely illustrated with children’s paintings and drawings and clay work as well as spontaneous photographs of children at work and play. The organization seems clear and concise: Part I presents “The context” within which subsequent information is presented. Within this first part is “Framework for Freedom,” and “Conditions for Creative Growth.” In this first part author Rubin presents most comfortably her theoretical base, personal experiences, and discusses methodology and materials—“. . . thinking about appropriate facilitating conditions for growth, something I assume necessary in order to help human beings to actualize their inner creative potential.” Materials, space, time, order, safety, respect, interest, pleasure, and support are amplified as necessary conditions for growth and for the development of creative potential.

Subsequent sections include “The Individual,” “The Family and the Group,” and “The Community” followed by a section that is most enlightening and important for the art therapist; this final section—one that could be inadvertently overlooked because of its low-key title, “General Issues”—is a cornerstone of the entire book. To take this last section first, the titles of the chapters give the reader most important content: “Why and How the Art Therapist Helps,” “How the Art Therapist Learns Through Research,” and “What Child Art Therapy Is and Who Can Do It.”

There are 10½ pages of references, with over 30 entries on each page. To peruse these references is to go through a “history” of literature directly related to our field; it is a wealth of references that should not be overlooked. For example, when Rubin discusses developmental aspects of art and the child (Chapter 3), the references pertaining to this content are abundant (Lowenfeld, Piaget, Cole, Kellogg, Silver, Levick, Uhlin, Viola, Wilson and Wilson, Wolff, and others). Of particular interest to the art therapist will be Chapter 5, “Decoding Symbolic Messages.” Rubin says “In order to utilize the unstructured art interview effectively, it is important to know how to look, what to look at, what to look for, and how to make sense out of what has been observed.” She identifies various areas of vital concern: verbal and non-verbal behaviors, the interaction process, process and product, common themes, attitudes and roles, among others. In discussing the therapeutic process, brief discussions are presented on testing, trusting, risking, communicating, facing, understanding, accepting, coping and separating. Case studies are presented in Chapter 7, as well as vignettes and examples scattered throughout the book. Separate focus is given to art therapy with the handicapped child, family art therapy and evaluation, the mother-child art therapy group, group art therapy, and multimodal group therapy. Helping the “normal” child through art and helping parents through art and play offer much information related to mastering media and expressing feelings in ways that are constructive and supportive. Especially worthwhile are brief descriptive units on core issues for the infant, toddler, preschooler, school-age child and the adolescent.

One senses the importance of art therapy by listening carefully to the author as she—at times quite conversationally—presents her rationale for this modality. As an example, in the introduction to the first edition, also included in this edition, Rubin says:

My own understanding of “art therapy” is that it refers broadly to understanding and helping a person through art, and that it encompasses a wide variety of dimensions. These include the integrative aspects of the creative process itself, as well as the use of art as a tool in the service of discharge, uncovering, defense, or communication . . . it seems that for anyone, the art activity over time ranges from being central and integrative to peripheral and adjunctive and back again, serving many different possible functions. What is important is to know what is occurring when it is happening, and to have some sense of its meaning and function for that person at that moment in time. What seems equally vital to me, is that the worker have the flexibility and openness to permit the individual to flow in different di-
reactions over time, and the wisdom and creativity to
stimulate, unblock, or redirect the flow when neces-
sary. (pp 17-18)

This is an excellent edition, and a book that every art
therapist and human services professional should
have for reading, reference and research. The inter-
disciplinary theoretical emphases are presented
clearly, and speak directly to the issue of the art
therapist having a working knowledge of interre-
lated modalities. In addition to providing a valuable
resource for the art therapist, Child Art Therapy can
amplify the art therapy discipline for our colleagues
in other professions. The coverage of content is ap-
propriate and it entices the reader to want to know
more and delve further. It is a “comfortable” book to
read, and the author presents many personal
glimpses that enhance the other content being pre-
sented.

The Master of Arts in Expressive
Therapies. Certificate of
Advanced Graduate Study in
Expressive Therapies.

Offered by the Institute for the Arts
and Human Development, Lesley College
Graduate School.
For students interested in the creative modalities
of art, music, dance/movement, drama, and holistic
studies and healing arts presented in a clinical and
theoretical framework for a variety of settings.

Master of Education in Creative Arts in Learning.
For students who wish to learn how to integrate the
arts for careers in schools, cultural institutions, and
human services institutions. Specializations in story-
telling and theatre studies.

Lesley College Graduate School is pleased to
announce a new Ph.D. Program in Expressive
Therapies with a focus on higher education and
professional leadership.

Wasted Wealth: Thoughts on the Discontinuation of AATA Conference Proceedings

Pat Buoye Allen, M.A., ATR

In 1982 a decision was made to discontinue the publication of the proceedings of the AATA National Conference. Recently I have had occasion to delve into the proceedings of past conferences as I review art therapy literature for my doctoral work. These publications form an invaluable resource to chart the development of trends and ideas in the field. Frequently, art therapists present material at conferences that is new, in ferment, experimental. It may not be as formal as an article in one of the professional journals but often it is as valuable. There is a breadth of topics covered during our Conferences including workshops, accounts of which are unlikely to reach publication any other way.

Until faced with my current task of seeking views of art therapists on art therapy, I had not, I admit, fully appreciated the Conference proceedings. Using them so thoroughly has given me cause to reflect on the abolition of this publication.

Simply put, I believe it was a major error in judgment to discontinue Conference proceedings. It seems to be another way of disregarding our own valuable contributions to one another. We have silenced the most potent voice for the development of art therapy: our own. Our combined professional journals give us at most 30 or so scholarly articles on art therapy per year. A typical Conference may have over 100 presentations. Some of those who make presentations will not prepare their material to meet the more formal demands of the journals. Sometimes re-reading a selection from the proceeding can catalyze a nascent idea, having a ripple effect. The Conference draws from a far broader, more representative sample of our AATA membership. It is a more realistic compendium than our journals of what is taking place nationally, simply because the standards and aim of a Conference are different. It is to inform and report as well as to challenge in a scholarly way.

The recent innovation of selling tapes of Conference proceedings is, in my opinion, an inadequate substitute for a publication. As another option, tapes are fine. I am a visual person, I need to see text written down, to read it and re-read it, especially when I am writing something myself.

In addition, I remember a student whose presentation was published in a Conference proceeding. She was so proud to see her name in print and feel she was contributing to the field. What better way to stimulate more writing and publishing than to use the proceedings as an initial place to present ideas?

Cost has been cited as a factor. I propose adding a proceedings charge to the Conference registration fee. In addition, graduate programs ought to order these publications as texts in literature survey courses.

We are throwing away a resource of value by neglecting to publish our Conference proceedings. Our history and evolution are something to be proud of and to be preserved.

My Stars, We Need Art Therapy

As mentioned in Viewpoints previously ("The Fantasy of Art Therapy Enters the Mainstream," Vol. 3, #1), art therapy is surfacing in the fantasy life of our culture. Whether you consider it fact or fancy, astrology's celestial rhythms are also encompassing our profession these days.

The Chicago Tribune newspaper edition for March 12, 1986 ran the following in its Horoscope by Joyce Jillson:

CAPRICORN (Dec. 22 - Jan. 19): Wild dreams continue to haunt you at night. You can figure out their message if you think about them. Art therapy may loosen you up.

Discovered by Evadne McNeil, Ph.D., ATR
Submitted by Harriet Wadeson, Ph.D., ATR (a Capricorn)
Art Therapist’s Portfolio

VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. It also encourages the submission of photographs of art by art therapists with an accompanying statement describing the work’s meaningfulness to its creator. Submit black and white glossy photographs and four copies of the written material to: Viewpoints, ART THERAPY, 505 E. Hawley St., Mundelein, IL 60060.

The portfolio of children’s art work has been collected from various exchange programs between Cincinnati, Ohio and Japan. These exchange exhibits occurred during the 1970’s. Reproductions of the work from Japanese children have been made from various exhibitions. Each year there was a different theme; for example, the color reproduction on the cover of this issue is from a painting titled “Wishes to be a Spring Goddess,” and occurred in the early 1970’s from an exhibit that emphasized what each child wanted to be—either real or imaginary. In each exhibit, there was work that included a variety of media: drawings, paintings, mixed media, and other similar materials that could be found in a classroom or art room.

Mr. Isao Takasugi was the Secretary General of the Japanese Children’s Art Association. The Association was comprised of over 60 elementary and junior high schools throughout Japan, and the Center for the Association had its headquarters in Tokyo where each year’s exhibit was held.

For the use of these reproductions, appreciation is given to the children who participated in the exhibits. Grateful recognition and thanks are also given to Mr. Takasugi and to the Children’s Art Association. A special “thank you” goes to Lane V. McCombs of Cincinnati, Ohio, who was instrumental in organizing the exchange of children’s art work over the years.

This column provides a forum for information exchange among clinicians and educators. Items relevant to research and to programmatic, historical, or clinical developments may be submitted. Contributions should be sent to Brief Communications, ART THERAPY AATA, 505 East Hawley Street, Mundelein, IL 60060.

The National Academy of Television Arts and Sciences presented a Community Service Emmy Award on August 26, 1986, for the film “Child at Risk.” This award is the first one ever given to a Public Broadcasting Service station (Channel 8, Houston, Texas). This documentary was chosen as the winner from over 187 entries from across the United States. Felice Cohen, ATR, serves as the art therapist in this film that focuses on child abuse and incest. It is now being used as a training film for police departments throughout the country, and it has also won a silver award for Community Service Documentary at the Houston International Film Festival as well as a gold medal at the New York Film Festival. The film will be aired nationally this year.

Congratulations to Felice Cohen for a job superbly done in an area that is receiving focused attention by all human service personnel professionals.

NEW BOOK REVIEW JOURNAL ISSUED BY AMERICAN ORTHOPSYCHIATRIC ASSOCIATION

A different kind of mental health journal is being introduced in March 1986 by the publisher of the American Journal of Orthopsychiatry.

READINGS: A Journal of Reviews and Commentary in Mental Health will be the field’s only interdisciplinary journal to focus exclusively on book reviews. Featuring essay-reviews by the outstanding thinkers in the behavioral sciences, READINGS will be an essential forum for the debate of both new ideas and traditional concepts. READINGS’ Overview section of one-paragraph reviews will cover the new literature quickly and comprehensively. All will be contained in a handsome professional journal, highlighted by black-and-white photography.

Issued quarterly, READINGS will be an easy and interesting way to keep current on all book publishing relevant to mental health and human behavior.

For more information about READINGS, contact: Ernest Herman, Editor, 212/354-5770.

MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

American Art Therapy Association, Inc. 505 E. Hawley St., Mundelein, IL 60060 (312) 949-6064
As in previous post-conference issues of Art Therapy, we are publishing a program overview of the most recent conference of the American Art Therapy Association (Los Angeles). We are pleased to offer to the readers this listing (reassorted here in specific categories) with the name and address of the primary presenter. This is done for the art therapist who wishes additional information on any particular topic; he or she may write directly to the presenter pertaining to summaries, additional information, reading lists, or other presentation materials.

Congratulations to Robert Ault, the most recent recipient of the Honorary Life Member distinction, awarded by the American Art Therapy Association. Bob is worthy of this honor, and he joins the ranks of other worthy individuals who have been presented this most prestigious award. As newer members of A.A.T.A. may not know, he was an original founder of our Association. It seems important, as we expand our communication and dialogue with other professionals and groups, that our Association continues with this process—that of selecting recipients for this designation. It is important to honor members who have shown their commitment to the field, who have shared their dedication, knowledge and leadership. The act of honoring members with an award of this caliber “speaks well” for our profession. We are pleased to present Bob Ault’s acceptance speech as it was delivered at the Los Angeles A.A.T.A. Conference.

One of our articles in this issue, titled “An Art Support Group for Bereaved Children and Adolescents,” by Mary Raymer and Barbara Betker McIntyre, speaks to an issue that the authors say is often overlooked and frequently misdiagnosed as pathology. The article bears serious consideration, and offers three condensed cases from a support group begun in Michigan. For additional information on the particulars of how the authors began the group with Council for the Arts funding, the reader may wish to communicate directly with Raymer and McIntyre.

A second article is “Utilizing Imagery and the Unconscious to Explore and Resolve the Trauma of Sexual Abuse.” Author Marsha Yates, in collaboration with Kim Pawley, follows Martha Williams (pseudonym) through her history of child abuse, reexperiencing the past and coming to a realization of fears, integrating and accepting these feelings, exploring methods of control, redefining relationships and moving toward personal integration. It is an intense journey that we take with Martha as we begin to sense the history, the “now,” and the processes that help to bring to fruition some of these intense feelings, understandings, confrontations and resolutions. The format is somewhat unusual, as the narrative was supplied, in large part, by the client and woven into the entire fabric of the article, along with the overall organization supplied by authors Yates and Pawley. We are introduced to Martha, and to the gradual step-by-step process, obviously presented here in a condensed version.

“The Therapeutic Effects of Combining Apple Macintosh Computers and Creativity Software in Art Therapy Sessions” is an article that is both timely—relative to current technological equipment in use—and appropriate for the art therapist who needs to be introduced to perhaps an unfamiliar “territory.” Following an introduction and background, the reader is presented with information on the computer, hardware and software with details that simplify the total operation (such as using the “mouse”) and graphic packages (i.e., MacPaint™, VideoWorks™ and MusicWorks™). Case study 1 illustrates extensive work with E.M.C., a 12-year-old child with behavioral and emotional problems, and Case study 2 describes work with D.C., a 17-year-old female adolescent. In each case, the computer was an important aspect of the therapy program. In the concluding section, author Canter lists six areas that are important results of a three month study on computers and creativity software used by children and adolescents with learning disabilities. The author says that further research in using computers and software with children, adolescents, adults and older populations is needed; this article is an important step in helping to make the reader more aware of computers and their use in therapy.

Once again, keep the articles coming. I am pleased with the response to Art Therapy, and your suggestions and comments have been—and will continue to be—valued and appreciated. If you have suggestions for future “theme issues,” send along your ideas.

Believe it or not, it is not too early to begin thinking about the next A.A.T.A. Conference. It will be held in Miami, Florida, and the theme is “New Directions in the 80’s.” Watch the A.A.T.A. publications for more information as Conference time draws nearer.

Have a pleasant spring!

Gary C. Barlow, Ed.D., ATR
Editor, Art Therapy

AATA Conference Overview

The 17th annual Conference of the American Art Therapy Association was held in Los Angeles, California, from November 12-16, 1986. The committees and their chairpersons, and the presenters and participants, are to be congratulated for their participation in helping to make the California meeting a most successful and professionally rewarding one. Special thanks must be given to Cay Drachnik, Conference Chair, and Joan Ungar, Program Chair, for their dedication and professionalism in the initial stages of planning and throughout the Conference to the completion of the meeting.

Beginning here and continuing on the following pages is a listing of the presentations, workshops, papers, forums, meetings, symposia, pre- and post-conference courses, and other highlights of the Conference. Included with the presentations is the name and address of the single presenter, or the address of the first person listed in the case of multiple presenters for a session. In lieu of the past AATA Proceedings, the information is offered in this format so that readers may communicate directly with the primary presenter for any additional information desired on the specific topic listed. Each entry is printed as it appeared in the Conference program, although categories (such as "Papers") have been grouped together for the reader's convenience. The information has not been edited relative to any changes that may have occurred at the Conference.

PRE-CONFERENCE COURSES CHAIRMAN:
Cathy A. Malchiodi, MA, ATR

PRE-CONFERENCE COURSES CO-CHAIRMAN:
Pat Buoye Allen, MA, ATR
PRE-CONFERENCE COURSES

COURSE #1—The Ulman Assessment Series
Glady Agell, ATR, Associate Professor; Director, Art Therapy Program, Vermont College of Norwich University, Montpellier, VT 05602.
Elinor Ulman, HLM, DAT, ATR, Associate Professor, George Washington University, Washington, DC 20052.
This is an experiential course covering an art therapy projective personality assessment, the Ulman Assessment Series (UAS). Enrollees are expected to participate in the drawing procedure and should be attired for studio work. The course is an eight-hour course; assigned readings should be completed in advance. On receipt of notice of enrollment, a bibliography will be sent to the student.

COURSE #2—Footprints of Our Minds, Mirrors of Our Lives—Photos as Therapy Tools
Judy Weiser, MS Ed, MSW, RSW, Director, PhotoTherapy Centre, 1107 Homer St., Suite #304, Vancouver, BC Canada V6B 2Y1.
Photos by themselves have no meaning, yet all those we take or choose to respond to are in some way ‘self-portraits.’ Shooting, responding to, or interacting with them can stimulate thoughts, memories, and feelings not otherwise accessible. Using client snapshots and interactions or dialogues with them as tools in counseling allows connection with those more emotional, intuitive, and less-protected parts of people. Prior knowledge about, or contact with cameras or photography is not necessary for workshop. Participants are asked, however, to bring along to the workshop a couple dozen various snapshots taken or collected (even if torn from magazines) that are meaningful.

COURSE #3—the Sand Tray Dialogue
Lillian Rhinehart, MA, MFCC, ATR, Educator, Eagle Rock Trail Art Therapy Institute, 1475 Los Alamitos Rd., Santa Rosa, CA 95405.
Paula Englehorn, MA, MFCC, ATR, Educator, Eagle Rock Trail Art Therapy Institute.
The focus of this course will be to demonstrate to professionals the Sand Tray Dialogue process as an adjunct tool. Jungian Psychology, Gestalt Therapy, and the elements of the sand tray experience form the foundation of the Sand Tray Dialogue experience. The course is open to professionals. Those who intend to take the course would find it helpful to read Dora Kalff's Sandplay or Evelyn Dundas' Symbols Come Alive in the Sand.

COURSE #4—Family Art Assessment
Joan Phillips, MA, MS, ATR, Private Practitioner/Consultant, 430 S. Lahoma, Norman, OK 73069.
This course is designed to introduce the field of family art therapy and art assessment as well as offer additional theoretical/methodological considerations in assessing families. Major family therapy approaches of Bowen, Whitaker and Minocin will be discussed and interfaced with family art assessment. Specific methodology will be demonstrated experientially and through case materials. Various styles of observational records and the importance of family art therapy/assessment as part of multidisciplinary treatment will also be shared.

COURSE #5—Systematic Study of Visual Languaging in Drawings of Primary Emotional Experiences
Marcia Rosal, Univ. of Louisville, Expressive Therapies, Louisville, KY 40292.
Balancing learning through both instruction and experience, this course offers a way of using simple drawings to develop more understanding of how people use visual language in expressing and communicating thoughts and feelings. Theoretical approaches are from study of configurations as perceptions of personal realities and are adapted to providing a method for recognizing and recording how form in itself can be understood as a conveyer of messages in visual language. Applicable both to basic research and in working with clients. Illustrative slides will be shown. Required reading: two articles in Proceedings of AATA Conferences (1979 & 1980): Rhine, J. "Expanding Our Comprehension of Visual Imagery" (1979) and "Personal Dramas of Transition" (1980).

COURSE #6—Therapy with Children From Violent Homes
Cathy A. Malchiodi, MA, ATR, Assistant Professor, University of Utah, AAC 161 Dept. PF Art, Salt Lake City, UT 84112.
Ivo R. Peterson, MFA, Drama Therapist, Assistant Professor, Cardinal Stritch College, Milwaukee, WI.
This course is designed to teach therapeutic art modalities to professionals who work with child populations in domestic violence shelters and other situations involving children traumatized by abuse or domestic violence. Through discussion, participation and visuals, attendees will learn how to utilize a variety of creative art therapy interventions with client populations and to understand diagnostic implications, symbols and reoccurring themes in the expressions of abused children and incest victims. Required reading: Creative Art Modalities with Children From Violent Homes by the authors.

COURSE #7—Dream Interpretation Through Archetypes and Eidetic Imagery for Art Therapists
Joseph Garai, PhD, ATR, Professor Emeritus, Pratt Institute, 155 W. 68th St., Apt. 26-A, New York, NY 10023.
The theoretical part of this course will familiarize students with the basic principles of dream theories developed by Freud, Jung, Erikson, and Perls. The didactic-experiential part requires participants to draw with multicolored crayons or craypas and model with plasticine clay a recent or a recurrent dream. These dreams are then interpreted through archetypes and eidetic imagery. The course instructor will assist students in interpreting dreams in the framework of Freud, Jung, Erikson, and Perls. The purpose is to provide the students with basic skills in dream interpretation and to increase their work with clients of many different patient populations.

COURSE #8—Grants: Creating Job Connections
Frances E. Anderson, EdD, ATR, Professor of Art, University of Illinois, 311 Orlando Ave., Normal, IL 61761.
Doris Arrington, EdD, ATR, Director, Art Therapy Program, College of Notre Dame, Belmont, CA 94002.
A hands-on grant writing workshop that includes: identifying finding sources for art therapy jobs and programs, "do's" and "don'ts" of grant writing, why proposals fail, how to locate and approach funding agencies, critiques of selected grant proposals. Participants are asked to bring 15 copies of a brief (no more than 5 type pages) preliminary grant proposal to the workshop (this is required if they want credit for the course.)
or, is strongly recommended if participants want to get the most out of the workshop experience. This workshop is open to all levels of participants but will be oriented to those with little or no grant writing experience. Required reading: "Grants: Demystifying the Mystique" and "Creating Job Connections" by the instructors, which appear in Art Therapy, March 1986.

COURSE #9—The Rainbow Phenomenon: Toward a Psychology of Color

Roberta J. H. Shoemaker, MFA, ATR, Emporia State University, Art Therapy Art Dept., Emporia, KS 66801.

A difficulty in studying the psychology of color usage in art work has been conflicting writings and research. This course will present a cohesive psychology based on the rainbow phenomenon as an organizational frame of reference that is reflective of color in physiology and levels of psychological coping styles. Current research findings and experiential work will be included.

COURSE #10—Bitter Roots: Child Abuse and Multiple Personality

Dee Spring, MA, ATR, MFCC, Art Therapist, Vista Del Mar Hospital, 5159 Teton Lane, Ventura, CA 93003.

This workshop is designed to teach the fundamental treatment approaches to multiple personality through the use of art work and hypnosis. The combination of these two techniques produces an interpretation of symbolic language which may lead to bringing repressed memories to consciousness through hypnotherapy. The use of clay in exploring normal ego states will be used as a method of understanding Multiple Personality Disorder.

OPENING CEREMONY

President’s Address—“Identity in the 90’s”
Sandra Graves, PhD, ATR

OPENING RECEPTION

Start the conference by renewing old friendships and making new acquaintances at the Wine and Cheese reception, Thursday, November 13, 1986.

CLOSING RECEPTION

A closing reception for all attendees will be held on Saturday, November 15, 1986 to provide an enjoyable time period for social interaction with your peers prior to leaving the conference.

STERN’S BOOK FAIR

Stern’s Book Fair will be set up in the San Bernardino Room, Thursday, November 13 through Saturday, November 15.

OPEN STUDIO

For those who wish to indulge their creative needs during the Conference, an Open Studio is again available to delegates in the La Brea Room from 9:00 A.M.—5:00 P.M., Thursday, Nov. 13, 1986 through Saturday, Nov. 15, 1986. The Open Studio will be well stocked with basic art supplies/materials and facilitated by Art Therapists.

AATA NATIONAL OFFICE

The AATA National Office will be set up in the La Cienega Room for the entire conference.

MEETINGS

ANNUAL BUSINESS MEETING

The AATA Annual Meeting will be conducted Friday, Nov. 14, 1986, 3:15 P.M.—6:15 P.M. in the San Diego and San Jose Rooms. Individuals who are Professional and Credentialled Professional (voting) members are requested to attend. The Association also welcomes all conference delegates to attend this important meeting.

Maxine Junge, MSW, LCSW, ATR

GENERAL SESSION

The Alchemy of Creativity

Jean Shinoda Bolen, MD, 2021 Webster St., San Francisco, CA 94115

The alchemical influence of Aphrodite, Goddess (archetype) of Love and Beauty can be found in creative work and in therapy. Whenever a therapist en-
gaged in bringing forth the potential in another person
or an artist is deeply absorbed in his or her work, a
quality of consciousness is present that is similar to
being in love. To become aware of Aphrodite's influence
on creative process and be knowledgeable about the
Pygmalion effect in therapy, is to become conscious of the power of Aphrodite and the risks and
rewards of alchemy.

SYMPOSIA

SYMPOSIUM A: ARCHETYPAL

Alchemy, Myth, Metaphor: Matters of the Imagination
Janet Osborn, 500 11th St. NW, Albuquerque, NM
87102
(All Levels)
A descent into the bizarre and fascinating visual world
of Hieronymous Bosch (15c. painter) from an alchemical, mythological, and metaphorical perspective.
Images from his 'Garden of Earthly Delights' are explored within the imaginal realm expanding our understand-
ing and awareness beyond literal interpretations.

Inner Guide as the Wise Helper and Healer
Vija B. Lusebrink, PhD, ATR, Expressive Therapies,
University of Louisville, Louisville, KY 40292
(All Levels)
The concept of inner guide is considered from the
perspective of Jungian thought and Jung's experience,
with examples of its representation in folklore and art. Discussion includes spontaneous manifestations
of inner guide in therapy, and the benefits and difficulties encountered in introducing the concept of
inner guide in art therapy.

Art Therapy with a Hemodialysis Patient
Cathy Schueler, 708 Hermosa NE, Albuquerque, NM
87110
(All Levels)
The hemodialysis patient faces up to 24 hours weakly
in semi-isolation with limited mobility and shares
many of the same issues as medical hospital inpa-
tients. They are not inpatients however, and life in and
outside of the hospital must somehow be bridged.
Through a young Navajo man's imagery, this case
study emphasizes the need and untapped potential
for art therapy within the hemodialysis population
using an imaginal approach.

SYMPOSIUM B: ADOLESCENCE

Stages of Social Development Indicated in Drawings by
Adolescents
Mary Francey, PhD, Assistant Professor, University of
Utah, Department of Art, 161 AAC, Salt Lake City, UT
84112
(All Levels)
This paper is an exploration of how visual images pro-
duced by adolescents can reveal level of social develop-
ment at which the person is functioning. Determina-
tion of stage of social development makes it possible
for the teacher or therapist to design appropriate re-
medial or clinical interventions, and to avoid unre-
alistic expectations of performance or behavior.

SYMPOSIUM C: ASSESSMENT

Sex Differences in the Emotional Content of Drawings
Rawley A. Silver, EdD, HLM, ATR, Consultant, 1600
Harrison Ave. #105A, Mamaroneck, NY 10543
(All Levels)
A slide presentation of a projective drawing technique
and research findings. The study included 326 sub-
jects, their drawings rated for negative or positive
emotional content on a 7 point scale. Significant dif-
ferences were found in drawings by males and females in four age groups: third graders, high school
seniors, adults and the elderly.

The Diagnostic Drawing Series: Phase II—Research
Findings
Barry M. Cohen, MA, ATR, Director, Expressive
Therapies, Mt. Vernon Hospital, 8559 Richmond
Highway #302, Alexandria, VA 22309
(All Levels)
The AATA research assistance grant facilitated ex-
pansion of this seminal study to a national level.
Three years of clinical use and refinements to re-
search instruments have resulted in the statistical
data to be presented. Clinicians and students are en-
couraged to join the first integrative database of art
therapy assessments.
The Rating of Personal Construct Drawings to Measure Behavior Change
Marcia Rosal, PhD, ATR, Assistant Professor, University of Louisville, Expressive Therapies, Louisville, KY 40204
(All Levels)
Thirty-six behavior disordered students involved in group art therapy evaluation research completed eight personal construct drawings as a pre- and post-test measure. This paper will focus on the ratings of these drawings as a measure of behavior change and as a tool to discriminate between students involved in art therapy and students in the control group.

SYMPOSIUM D: ELDERLY

Art with Elderly In Long-Term Care: Restoring Confidence, Pride and Life
Mary Lou Coles, MA, ATR, Activity Director, Hillhaven Convalescent Home, 477 30th Ave., San Francisco, CA 94121
(All Levels)
The "Art with Elders" program, in Oakland, CA, has been recognized, internationally, as a successful model art program which improves the quality of life of the institutionalized elderly through the creative process and life-long learning. Art becomes the avenue to connect with others, the environment, and the community at large.

Alzheimer's Disease: The Effects on the Individual and the Family System
Gretchen Jaenike, BA, Work-Study, University of Louisville, Expressive Therapies, Louisville, KY 40292
(All Levels)
The intent of this paper is to explain the role of art therapy with the Alzheimer's Disease victim. This information was collected from research done directly with Alzheimer's victims, the geriatric population and interventions with the involved family. The discussion will include the use of art therapy to aid in the family capability of coping with the effects brought on by this disease.

Art Therapy Group Work with Aphasic Stroke Victims in a Residential Geriatric Facility
Diane L. Tumblin, MS, ATR, Associate Director, Adjunctive Therapies, Easter VA Medical Authority, Community Mental Health Center, P.O. Box 1980, Norfolk, VA 23501
(Basic)
The art therapy group described in this paper was specifically designed for work with the aphasic geriatric patient. The group is based upon twelve highly structured art tasks involving a variety of media. The techniques and materials used in this group were devised to address the problems with cognition, comprehension, and performance of skills that exist with aphasic stroke victims. The presentation of the techniques and media used are contained in the paper, as well as slides of the residents' work. A discussion of the group and the need for art therapists to be involved in geriatric health care is also included.

SYMPOSIUM E: PSYCHODYNAMIC

Creativity and Psychopathology: Introducing Two Contemporary Women In Paris
Ellen Handler Spitz, PhD, Assistant Professor, New York University, 37 Iselin Terrace, Larchmont, NY 10538
(All Levels)
The language barrier and institutional parochialism have kept Americans ignorant of fascinating recent developments in French psychoanalytic thought. Janice Chassagne-Smirgel and Joyce McDougal, both training analysts at the Paris Psychoanalytical Society, are writing currently on issues of import to art therapists and drawing directly upon their analysis of artists. Their interests include psychosomatic symptomatology, sexual perversions and fantasies, and the theoretical difficulties of differentiating symptom from symbol, psychological destruction from construction, and psychopathology from creativity.

Censorship or Intervention: "But You Said We Could Draw Whatever We Wanted"
Martha P. Haeseler, BA, ATR, Art Therapist, Private Practice, Director of Recreation Therapy, Yale-Haven Hospital, 54 Water St., Guilford, CT 06437
(All Levels)
When self-destructive or aggressive images come up in artwork what interventions does the art therapist make and why? Discussion includes theoretical considerations and case material illustrating how the art therapist helps the client move from artwork as re-enactment of violence to artwork as metaphor for more complex internal states.

SYMPOSIUM F: COLOR

Significance of Color in Art Therapy: Focus on Therapy and Clinical Application
PANEL Sondra Geller, MA, ATR; 718 21st St. NW Bldg H, George Washington Univ., Washington, DC 20052; Mala Betensky, PhD, ATR; Paula Engelholm, MA, ATR, MFCC; Joan Kellog, MA, ATR; Lillian Rhinehart, MA, ATR, MFCC; Roberta Shoemaker, MFA, ATR; Edith Wallace, MD, PhD
(All Levels)
A panel of art therapy practitioners, educators/researchers and a Jungian analyst will talk about the significance of color in art therapy. Focus will be on in-depth discussions of existing theoretical perspectives and their clinical application in art therapy. There will be time for questions and answers.

SYMPOSIUM G: CREATIVITY

Conflict and Creativity: Reflections on the Contributions of Otto Rank
Ellen Handler Spitz, PhD, Adj. Assistant Professor, New York University, 37 Iselin Terrace, Larchmont, NY 10538
(All Levels)
Unlike psychoanalysts who merely reduce the conflicts of the artist to special cases of more general phenomena, Otto Rank (1884-1939), saw the artist and his struggles as fundamental and worthy of study
in their own right. His pages, often overlooked today, speak with passion and empathy of the uniqueness of the artist's experience. This presentation seeks to introduce his major ideas to art therapists—many of whom are also practicing artists.

Creative Process/Therapeutic Process: Parallels and Interfaces

Cathie Malchiodi, MA, ATR, University of Utah, AAC 161 Dept. PF Art, Salt Lake City, UT 84112; Mariagnese Cattaneo-Knill, PhD, ATR; Jane Gilbert, ATR; Moderator: Harriet Wadeson, PhD, ACSW, ATR (All Levels)

A panel of art therapists/practicing artists will discuss their personal creative processes as visual artists. How each creates and produces art will be related and paralleled to the role creativity plays in art therapy and the therapeutic process.

Facilitating the Creative Process with Art Therapy

Eva Nordell, RN, PhD, ATR, Assistant Professor, University of Illinois at Chicago, 646 Park Blvd., Glen Ellyn, IL 60137 (All Levels)

The bonding model of creativity will be used to illustrate the path by which art therapy facilitates the creative life processes. Case material will be presented to exemplify how art therapy can be followed and how art therapy interventions can be designed by using the creativity model.

SYMPOSIUM I: ADOLESCENTS

Group Art Therapy with Adolescents: Theory and Application

Debra B. Greenspoon, MA, ATR, Lecturer, Loyola Marymount University, 664 Kelton Ave., Los Angeles, CA 90024 (All Levels)

This paper will attempt to provide a theoretical framework for the use of group art therapy with severely disturbed adolescents. It will begin with a brief review of the literature supporting the use of group therapy in general and group art therapy in particular with this population. It will then discuss the details of a long-term art therapy group with four adolescent girls, exploring the art work produced by the young women to illustrate a variety of issues involving group process.

Art Therapy and the Developmental Tasks of Adolescence

Kay Stovall, MA, Art Therapist, Mercy Hospital and Medical Center, 3732 B Seventh Ave., San Diego, CA 92103 (Intermediate)

Using Peter Bloch's description of the tasks of adolescent development from a psychoanalytic perspective, the presentation integrates art therapy techniques to provide a practical and theoretical model. Illustrated with slides of adolescent artwork and clinical material.

SYMPOSIUM II: FAMILY

Family Art Psychotherapy: A Systemic Approach to Change, Theory and Demonstrations Through Role Play

Shirley Riley, MA, ATR, MFCC, 960 Roscomare Rd., Los Angeles, CA 90077 (All Levels)

This presentation will be concerned with discussing and demonstrating some of the techniques a clinical art therapist might use early in treatment to facilitate change within the family system. Some reading on systems approach is recommended for the audience: Lyn Hoffman, Foundations of Family Therapy; Peggy Papp, The Process of Change; Shirley Riley, "Draw Me a Paradox" Art Therapy Journal, Vol. 2, No. 3, 1985; Helen Landgarten, Family Art Psychotherapy (to be published).

Combating "Holiday Stress": A Series of Art Therapy Groups for Families with Multiple Problems

Kathleen Ball, MA, Counselor, Peanut Butter and Jelly Therapeutic School, 19 Hacienda Ct., Los Lunas, NM 87031 (All Levels)

Art therapy was used in a series of parent group discussions to deal with holiday related issues. These low income families often lacked social support systems and felt financial pressure, especially during the holiday season. The art work also helped deeper issues to surface, such as drug use and sexual abuse.

The Use of Art Therapy in Strategic Family Therapy

Virginia Fry Shaver, MA, ATR, Director of Counseling, St. Stephen's Church, 3448 Rum River Dr., Anoka, MN 55303 (Intermediate)

This presentation will emphasize the use of art therapy in Strategic Family Therapy. Previous knowledge of art therapy and family therapy will be expected. Lecture, demonstration, and slides will be used to show how the non-verbal approach of art therapy can be combined with Strategic Family Therapy to give effective treatment to dysfunctional families.

SYMPOSIUM J: MENTAL HEALTH

Short-Term Inpatient Group Art Psychotherapy: New Directions

Barbara Sprayregen, MA, ATR, Art Therapist, McLean Hospital, 6 Colonial Village Drive #11, Arlington, MA 02174 (All Levels)

This presentation will consider effects on art psychotherapy groups of the present shift to shorter lengths of inpatient psychiatric hospitalization. Using actual vignettes, it will closely view brief group art psychotherapy formats that attempt to integrate a directive and structured, here and now approach with art therapy techniques.

The Art Therapist and the Anti-Psychotherapy Movement

Anne Mills, MA Candidate, Art Therapist, The Fairfax Hospital, 8559 Richmond Hwy., #302, Alexandria, VA 22302 (All Levels)

What is the figure without a ground? In day-to-day work, we often adopt strategies or perceptions that neglect the broader socio-political context of our therapy work. The ideas of "anti-psychiatry" will allow us to consider one way to reframe ground and figure.
A Thoroughly Processed Product—Art Therapy in a Prevocational Setting
Pat Young, Founder, Director, Bristol Place Corp., 2600 Grand Ave. S., Minneapolis, MN 55408
(Basic)
Those who have experienced chronic mental illness face bleak prospects when they attempt to re-enter the mainstream. This presentation will introduce participants to an innovative prevocational program, using art therapy. A process and product orientation can be creatively combined to help the mentally ill in taking charge of their lives.

SYMPOSIUM K: COLOR
Current Research on Color by Art Therapists
PANEL Barry M. Cohen, MA, ATR, 8559 Richmond Hwy. #302, Alexandria, VA 22309;
Carol T. Cox, MA, ATR; Cheryl S. Earwood, MA, ATR; Jeannette K. Fino, MAT, ATR; Mari Fleming, MA, ATR; MFCC; Phyllis Frame, MA, ATR; Sondra Geller, MA, ATR; Vija B. Lusebrink, PhD, ATR;
Bonnie Smith May, M.A., ATR; Lucy Sollers Wood, MFA, ATR; Moderator: Linda M. Gantt, MA, ATR.
(All Levels)
Art therapists will present their most recent work in the area of color research. This panel represents a continuation of the strong interest regarding color research generated at the 1985 AATA Symposium on Color. It will focus on the need for documented information about color to help validate systems for assessment and treatment in art therapy.

SYMPOSIUM L: TRAUMA/ABUSE
Gaining Mastery Over Victimization
Dee Spring, MA, ATR, NCC, MFCC, Art Therapist, Vista Del Mar Hospital and Private Practice, 5159 Teton Lane, Ventura, CA 93003
(Intermediate)
Art work created by sexually abused individuals reflects a pattern of compulsion-repetition which is congruent with an accommodation syndrome. Components of accommodation syndromes and compulsive-repetitive patterns will be presented as a means of fostering understanding of the lifelong effects of sexual abuse and the individual’s need to gain mastery over the victimization.

Effects of Psychological Trauma on Children
Suzanne Silverstein, MA, ATR, President, Center for the Study of Psychological Trauma, 3143 So. Barrington #E, West Los Angeles, CA 90066
(All Levels)
This panel will describe a non-profit organization which addresses the needs of children who have experienced psychological trauma directly and indirectly. Developmental aspects of psychic trauma in children will be addressed. Central American children who suffer trauma due to warfare in their homeland will be explored plus the culture shock they experience with immigrating to the United States. Examples of art work will be given throughout each presentation.

SYMPOSIUM M: ARCHETYPE
Myth, Metaphor and Imagination in Art Therapy: A Case Study
Josie Abbenante, MA, ATR, Lecturer II/Art Therapist, University of New Mexico, 303½ 12th NW, Albuquerque, NM 87102
(All Levels)
The dramatic panel presentation during which the panelists will review the art therapy process of a client, incorporating the tenets of archetypal psychology. Demonstration of the transformation of literal to imaginal and back to the therapy session. We will “articulate a psychology that reflects the passionate importance of the individual soul.” (Hillman)

The Sensibility of the Sensuous: imagination and the Reality in Art Therapy
Howard McConaghey, PhD, EdD, Professor, University of New Mexico, Dept. of Art Education, College of Education, Albuquerque, NM 87131
(All Levels)
Art therapy is image therapy. Art work is imagined image. “We get more sense (significance) from the image the more we note its sense (data).” A retraining of the senses is suggested to help the therapist grasp the image metaphorically. Image and interpretation are presented in non-personal, archetypal perspective.

SYMPOSIUM N: PROFESSIONAL
An Inclusive History of Art Therapy In the United States
Maxine Junge, MSW, LCSW, ATR, Assistant Director and Assistant Professor, Loyola Marymount University, 3451 Greenfield Ave., Los Angeles, CA 90034
(All Levels)
This paper charts the course of the development of the profession of art therapy in the United States during the last fifty-five years. Thus far, what little history has been written has tended to concentrate on events and personalities from the East Coast. With a more comprehensive framework, this paper traces developments across the country and within the vicissitudes of our sometimes tumultuous and divergent history attempts to suggest the richness and potential of our discipline. Art therapy is viewed against the larger background of the history of mental health during these times. The question of the future of the profession is also addressed.

Three Tracks of Art Therapy: Similarities and Differences
Bobb Stoll, MA, ATR, MFCC, 8020 Briar Summit Dr., Los Angeles, CA 90046; Virginia M. Minar, MS, ATR; Lewis Shupe, PhD, ATR; Carol Kunkele-Miller, ATR; Jules Weiss, MA, ATR
(Basic)
The panelists will present material for a comparative analysis of art therapy along three tracks: Clinical Art Therapy, Art Therapy in Schools and Rehabilitative Art Therapy. The areas to be discussed along all three tracks are: competencies/standards of practice; appropriate theoretical base and education to supplie-
ment art therapy; specific areas of legislative interest; colleagues and related professional alliances; required/desired certification, license or registration; appropriate settings and population.

SYMPOSIUM O: ARCHETYPAL

Jungian Sandtray as a Modality of Art Therapy (Lecture with Question and Answer Period)

Donna Hanna-Chase, MA, ATR, MFCC, Co-Coordinator Early Childhood Program, Child Guidance Center, Inc., 710 E. Palmdale, Orange, CA 92665

(Basic)

This paper presents the practical aspects of the Jungian Sandtray technique as a modality of Art Therapy. It assumes the reader’s knowledge of Art Therapy, Jungian Psychology, and psychodynamic process. Focus is on the Sandtray creation process as a means of personal expression with emphasis on materials, procedures, and evaluation.

A Method of Visualization Applied to the Treatment of Chronic Illness

Elsa LaFlamme, PhD, ATR, Psychotherapist, Comprehensive Psychological, 101 Hospital Loop Suite 214, Albuquerque, NM 87109

(Intermediate)

Research case study demonstrating the use of imagery in the treatment of chronic illness, methods for visualization and centering, analysis of subjects’ unique metaphorical language, the interactive relationship between illness and the process of individuation and the significant role of transformational imagery in health and ego functioning.

SYMPOSIUM P: DEATH/LOSS

Art Making as an Aid in Bereavement

Pat Buoye Allen, MA, ATR, Assistant Professor, University of Illinois, 300 S. Wesley Ave., Oak Park, IL 60302

(All Levels)

This paper will describe art therapy as a component of hospice services for bereaved children and families. Art making can play an important role in preventing mental health problems that are sometimes a complication of normal grieving. Case examples will be included as well as an overview of hospice philosophy and theories on bereavement.

Death in the Media Age: Children Picture the Shuttle Explosion

Audrey Di Maria, MA, ATR, Adj. Assistant Professor, George Washington University, 1711 Massachusetts Ave. NW, Apt #301, Washington, DC 20036

(All Levels)

In the weeks following the explosion of the Challenger, “experts” described the impact of the event on the children who had witnessed it. Pictures by 25 emotionally disturbed children (ages 6-13) will be presented, with reference to the children’s conceptual understanding of death and in light of their experiences of trauma, separation, and loss.

The Utilization of Art Therapy in Helping Children Deal with Loss

Sister Mary Duffy, MA, Social Worker/Amt Therapist, Maryvale, 122 South Ramona Ave., Monterey Park, CA 91754

(Basic & All Levels)

This paper presents ways art therapy can help children deal with feelings of loss. The breaking up of family life and helping children deal with it have lead to a development of art processes presented here. Attention was given to the Kinetic Family Drawing and the House, Tree, Person Test, as a measure of growth. Also included are common symbols and themes these children seem to use in their art. It shows that art can be used to increase children’s feelings of worth and help them to function better in their families suffering from losses through death and divorce.

SYMPOSIUM Q: EATING DISORDERS

The Use of Art Therapy in an In-Patient Eating Disorder Unit

Nancy Mayhew, MA, ATR, Private Practice, 494 S. Marengo Ave., Pasadena, CA 91101

(Intermediate)

This presentation will discuss the use of art therapy in group treatment with hospitalized anorexic and bulimic patients over a three year period. The major issues and dynamics of this population will be illustrated by slides of patients’ art. Several case histories will be shown. Emphasis will be on psychodynamically oriented treatment and presentation of unconscious material in the art. Thirty-five slides will be shown from patients ranging in age from twelve to forty.

Hungry Love—An Art Therapy Treatment Approach with the Eating Disorder Patient

Iris Schlossberg, MPS, ATR, Art Therapist, Carrier Foundation, 80 Garrison Pl., East Windsor, NY 08520

(Intermediate)

The clinical use of art correlated with object relations theory in the treatment of eating-disordered patients will be explored as well as therapeutic interventions related to particular dynamics of bulimics and anorexics. Attention will be given to various group art therapy techniques that may help our patients to renegotiate conflicted areas of development in order to move ahead towards autonomy and self-regulating behavior.

PAPERS

Characteristics of the Art of the Endogenously and Exogenously Depressed

Janice Musante, MA, ATR, Art Therapist, Box 306F RD3, Moscow, PA 18444; Cydney Savage, BFA, Student

(All Levels)

The purpose of this paper is to examine similarities and differences in drawing style, placement and symbolism of the art of the endogenously and exogenously depressed through a series of six draw-
Footprints of Our Minds, Mirrors of Our Lives—Photos as Therapy Tools

Judy Weiser, MS Ed., MSW, RSW, Director, Photo-Therapy Centre, 1107 Homer St. Suite #304, Vancouver, BC Canada V6B 2Y1

(All Levels)

Photos by themselves have no meaning, yet all those we take or choose to respond to are in some ways ‘self-portraits.’ Shooting, responding to, or interacting with them can stimulate thoughts, memories, and feelings not otherwise accessible. Learn about Photo-Therapy—adjunctive tools using ordinary snapshots as catalysts for exploring nonverbal/buried information and emotions.

Art as Depth Psychology

Shaun McNiff, PhD, ATR, Professor & Dean, Lesley College Graduate School, 29 Everett St., Cambridge, MA 02238

(All Levels)

Art therapy will serve society’s needs for in-depth psychological investigation if it defines itself with theory and methods indigenous to art. Images of sexuality, destruction, aggression and spiritual contemplation will be discussed with the goal of heightening sensibility and imagination, rather than restricting their power through inappropriate interpretation and labeling.

Art Therapy Program Development: Grant Application to Implementation

Nancy Greene, MA, Special Ed Teacher/Chemical Dep Counselor, Hopevale School/Bry-Lin Hospital, 25 Ludwig Ave., West Seneca, NY 14224

(All Levels)

The nature of this presentation involves the step-by-step process in obtaining a grant to initiate an art therapy program in the residential school for emotionally disturbed female adolescents; and the actual implementation of that art therapy program through the use of case material.

The Artist Against Art Therapy—Resistance in the Creative Personality

Laura V. Loumbeau, MPS, Art Therapist, Mt. Sinai Medical Center, 79-04 149th Street Apt 3-I, Flushing, NY 11367

(All Levels)

Resistances in art therapy treatment associated with the artist/patient will be examined. One of these is the Narcissistic threat to the Personas imposed by this modality. Another is an underlying belief in the myth of “Mad Genius”; to be cured may mean to be stripped of the creative core of self. Facile use of the art product as a defensive shield will also be discussed.

Art Therapy—Coming of Age: A Personal/Profession/ Psychodynamic Perspective

Judith Rubin, PhD, HLM, ATR, 128 N. Craig St, Pittsburgh, PA 15213

(All Levels)

The author—who has experienced a variety of art roles over the years—reflects on her own and the profession’s journey—from periods characterized by the acquisition of skills, knowledge, and identity—to those involving their use in the service of others; patients, students, fellow professionals, and the public.

The Ecology of Human Development: Implications for Art Therapy

Barbara Bickett, MA, University of Louisville, 1967 Goldsmith Ln. Apt D-3, Louisville, KY 40218

(All Levels)

The theory of ecology of human development proposed by Bronfenbrenner may hold possible implications for group art therapy specifically within the family setting. Baslow’s Conceptual Model of group therapy will be used to chart the ecological model. Application to the group art therapy process will be demonstrated within the networking of the family system.

Mothers of Incest Victims in Group Therapy

Maralynn Haggard Siegelis, MS, Art Therapist, Counseling Inter, Passageways Counseling Center, 36163 Fremont Blvd. #92, Fremont, CA 94536

(Intermediate & Advanced)

Art therapy was used with a group of mothers of incest victims. A variety of therapeutic issues typical of these mothers is discussed as well as a description of art therapy techniques used in addressing these issues. The group focused on the mother’s individual needs as well as her family role in the tragedy of incest.

Clinical Art Therapy in an Outpatient Clinic

Shirley Riley, ATR, MFCC, Art Psychotherapist, Loyola Marymount University, 960 Roscomare Rd., Los Angeles, CA 90077

(All Levels)

This paper attempts to demonstrate that an outpatient clinic will profit both in the sense of improved services for its clients and greater cost efficiency if it engages a clinical art therapist as a staff member. The problematic areas of treatment that respond best to intervention with art therapy are illustrated; family therapy, adoption issues, child abuse, suicide, and adolescent groups. An emphasis on systems approach correlated with evaluation of developmental status of the family members is a central theme of this paper. Discussion period, slides/illustrations.

Case Studies in Multiple Personality

Dee Spring, MA, ATR, NCC, MFCC, Vista Del Mar Hospital and Private Practice, 5159 Teton Lane, Ventura, CA 93003

The complex and mystifying psychopathology of multiple personality will be explored through the artistic productions of three patients diagnosed with Multiple Personality Disorder. The use of art therapy with this population lends itself to a particular dimension in the fight for integration and unity of the alters and different drawing styles provides a specialized dimension for exploring individual constructs, systems, attachments, behaviors and functions.

March 1987, ART THERAPY 11
Georgia O'Keefe, Themes and Resonances: An Art Therapist's Viewpoint
Maxine Junge, MSW, LCSW, ATR, Associate Director & Assistant Professor, Loyola Marymount University, 3451 Greenfield Ave., Los Angeles, CA 90034
(All Levels)
This paper explores repetitive themes reflected in Georgia O'Keefe's life and art. In particular, from a feminist developmental perspective, it focuses on the psychological implications of separation and individuation and postulates a midlife crisis revolving around these issues, predicted, reflected, and resolved in O'Keefe's artwork.

Art Therapy as Primary Treatment for Co-Dependents: Alcoholism Outpatient Treatment
Dianne Seger, MA, Art Therapist/Consultant, Horizon Human Services, Corp. II, 115 Claremont Ave., Buffalo, NY 14222
(All Levels)
This presentation will review the use of art therapy as the primary treatment modality with co-dependents in an outpatient alcoholism treatment program. The problems of integrating art therapy into such an agency from its inception will also be discussed. Case material will be presented.

Privacy and Confidentiality In Art Therapy: An Ethical Dilemma
Laurie Wilson, PhD, ATR, Director AT, New York University, 321 Hartford Road, South Orange, NJ 07079
(All Levels)
The problem of confidentiality in art therapy centers upon the use of patient artwork in presentations and publications. Though patients' identities may be disguised in discussion of their personal histories, their artwork usually remains uniquely identifiable even when signatures have been concealed. Questions, issues and recommendations will be presented.

Making Art Therapy Available to the General Public Through College Extension Classes
Sue Anne Foster, MA, ATR, Extension Instructor, American River College, 6965 Auburn Blvd., Citrus Heights, CA 95621
(All Levels)
Art therapy processes may be adapted for college extension classes. The results of five years of teaching such courses will be shared including how to establish such a course, guidelines and precautions in facilitating the experiences, and the employment and professional benefits of working with motivated, self-selected adults.

People with AIDS: An Exploratory Study Employing the Art Therapy Modality
Susan Kleinman, MA, 3143 S. Barrington #E, West Los Angeles, CA 90066
(Basic & All Levels)
This presentation will be based on information and findings from my research paper written for the Masters Degree in Art Therapy at Loyola Marymount University, Los Angeles, CA. Final results of the paper are in progress. Slides of the participants' artwork will be incorporated into the presentation.

The Homeless and Art Therapy: Facilitating Communication Through Art
Kay Slavoll, MA, Art Therapist, Mercy Hospital and Medical Center, 3732 B Seventh Ave., San Diego, CA 92103
(All Levels)
Report on an art therapy group for the downtown homeless and community members. Art materials were used to create an environment for expressing opinions, sharing experiences and gaining insight despite radically different lifestyles. Background information on homelessness. Slides of artwork illustrate the presentation.

WORKSHOPS

Art Therapy as an AA Treatment Component: A Six Task Series
Diane K. McEligott, ATR, Art Therapist, Brawner Psychiatric Institute, 1599 Piedmont Ave., Atlanta, GA 30324
(Intermediate & Advanced)
This workshop presents a six-task series of techniques structured to meet the needs of a four to six week AA/NA treatment program. Topics include the etiology and symptomatology of the disease, use of art therapy as a component in achieving addiction treatment goals and development of a collaborative team approach.

Behaviorally Orientated Art Therapy
Michael J. Swiderski, ATR, Art Therapist, Mansfield General Hospital, 432 Shapard Rd., Mansfield, OH 44907
(All Levels)
While the intent of this workshop is for therapists to experience how a behaviorally sequenced art therapy group can be used to help patients gain insight into the process of therapy, participants might become aware of repressed thoughts and feelings represented in their artwork. When unconscious material comes to light during the preliminary stages of this group process, it is usually not far removed from consciousness and to some degree congruent to the participants' sense of self.

The Study of Aesthetics and Toxicity In Understanding One's Relationship to the Institutional Process
Beth Gonzalez-Dolginoko, MPS, ATR, Faculty, Pratt Institute, 19 Eaton's Neck Rd., Northport, NY 11768
(All Levels)
We are surrounded by institutions. Our family, our community, our jobs, our political, social, or religious affiliations all bring us in contact with institutions. However, how we deal with and survive in these institutions may affect us either positively or negatively. This workshop addresses how we can handle the toxic effects of institutions on us as humans and professionals in order to optimize our working environment.
Mandala Meditations
Phyllis Frame, MA, ATR, Art Therapist & Art Therapy Consultant, 3410 Ridge Rd., Charlottesville, VA 22901
(All Levels)
This workshop gives participants a chance to experience for themselves the mandala as an integrative and healing meditation. It will include guided imagery, selected music and vibrational patterns as well as mandala drawing and related written expression. The purpose is to present the mandala holistically through a variety of integrated modalities.

Butterfly Life-Cycle: Creative Arts Modality with Children from Violent Homes
Cathy A. Malchiodi, MA, ATR, Assistant Professor, University of Utah, AAC 161 Dept. PF Art, Salt Lake City, UT 84112
(Advanced)
This workshop is designed to teach a creative arts experiential to practitioners who work with children traumatized by family violence. Participants will learn to use the actual experiential and to understand its role in diagnosis and treatment of abused children.

Me and My Shadow: An Adventure Into Photo and Art Therapy
Irene E. Corbit, PhD, LPC, ATR, Art Psychotherapist, Private Practice, 7722 Braesview Lane, Houston, TX 77071
(All Levels)
This workshop will begin with a visual and didactic explanation of the Jungian concept of the shadow, the darker side of our personality which we normally repress or deny. Still photography and art will be used to express our shadow aspects as well as some psychodramatic techniques.

Footprints of Our Minds, Mirrors of our Lives—Photos as Therapy Tools
Judy Welser, MS Ed, MSW, RSW, Self-Employed, PhotoTherapy Centre, 1107 Homer St. Suite #304, Vancouver, BC Canada V6B 2Y1
(All Levels)
Photos by themselves have no meaning, yet all those we take or choose to respond to, or interact with can stimulate thoughts, memories, and feelings not otherwise accessible. Learn about PhotoTherapy—adjunctive tools using ordinary snapshots as catalysts for exploring nonverbal/buried information and emotions.

Unthinkable Anxieties: Images for Understanding Early Object Relations
Lynn Kapitan, MPS, ATR, Assistant Professor, Director of the Art Therapy Institute, Mount Mary College, 3061 N. Newhall St., Milwaukee, WI 53211
(Intermediate)
Object relations theory, useful to the creative art therapist will be validated by personal imagery in this workshop. Using a creative focus on universal anxieties associated with each stage of development, participants will learn to recognize within their own experience, the anxiety of their clients, developing empathy essential to the art therapy relationship.

The Sun Wheel and Individualization
Lillian Rhinehart, MA, ATR, MFCC, 1475 Los Alamos Road, Santa Rosa, CA 95405; Paula Engelhorn, MA, ATR, MFCC, Consultants Rainbow Bridges, Inc.
(All Levels)
Jungian psychology, Gestalt Therapy concepts, color and the wisdom of Ancient American truths are integrated in our work. We find these concepts best demonstrated through the Sun Wheel, which is an ancient medicine wheel and a Rainbow Wheel of color. The Sun Wheel provides a way for people to explore their own wheel-making and individualization.

Inner Tool Box: New Perceptions for Art Therapists In Short-Term Settings
Lynn Kapitan, MPS, ATR, Assistant Professor, Director of Art Therapy Institute, Mount Mary College, 3061 N. Newhall St., Milwaukee, WI 53211
(Intermediate)
The key to turning short-term art therapy into a more dynamic, effective approach lies in shifting the focus from the often painfully felt limitations of the setting to the therapist's use of him or herself. This workshop will help the therapist activate creative inner "tools" necessary to develop a dynamic therapeutic style needed in the short-term setting.

Imagination: Action Methods in Group Art Therapy
Leigh Files, MED, MA, ATR, Executive Director, NW Institute for the Creative Art Therapies, 1430 Pearl St., Eugene, OR 97401
(All Levels)
This experiential workshop successfully blends visual imagery with action-methods to provide the environment and tools for participants to develop their innate spontaneity and creativity, and effect change in their lives. Art therapy media and psychodramatic techniques will be utilized to explore individual and group themes. No previous experience necessary.

FORUMS

US Study Group on the Symbolic Language of Sexually Abused Individuals—2nd Annual Meeting
Dee Spring, MA, ATR, NCC, MFCC, Art Therapist, CPC Vista Del Mar Hospital and Private Practice, 5159 Teton Lane, Ventura, CA 93003

Writing for Publication in Art Therapy
Gary C. Barlow, EdD, ATR, Professor and Coordinator Art Therapy, Wright State University, 222 Creative Arts Center, Dayton, OH 45435
(All Levels)

Ethics and the Art of Art Therapy
Nancy Mayer Knapp, MA, ATR, Assistant Science Consultant/Art Therapist, Harbor, UCLA, Department of Psychiatry, 16081 St. Croix Circle, Huntington Beach, CA 92649
(All Levels)
The potency of the art process and the impact of having concrete products from therapeutic interactions present unique clinical issues for our profession. This forum will address these issues with theoretical precedents from literature as well as participants' practice and opinions. Ethical guidelines related to art itself will be formulated.

Art Therapy: Marketing to the Community
Susan Boeshart, MA, ATR, Community Relations, Harbor View Medical Center, P.O. Box 1686, La Jolla, CA 92038
(All Levels)
This open forum discussion will overview the recent trends in Mental Health Services and the resulting impact upon art therapists. A social model of the cooperative efforts of the San Diego Art Therapy Association will be presented, along with the introduction of basic marketing principles applied to this competitive market.

Meet the Author—Art and Psyche: A Study in Psychoanalysis and Aesthetics
Ellen Handler Spitz, PhD, Adj. Assistant Professor, New York University, 37 Iselin Terrace, Larchmont, NY 10538
(All Levels)
This open forum provides an opportunity to discuss issues raised in a new book which scrutinizes the way in which psychoanalysis has been applied to the work of artists. Three major problems are addressed: (1) the complex relationships between an artist's life experience and his/her work; (2) whether and how it is possible to use knowledge about the human mind to interpret works of art; and (3) what goes on in the interaction between works of art and their audiences (spectators).

What Do You Want from Membership in the AATA?
Bobbie Stoll, MA, ATR, MFCC, AATA Membership Chairman, Self-employed, Private Practice and Consultant, 8020 Briar Summit Drive, Los Angeles, CA 90046
(Basic)
The membership committee of the AATA will provide an opportunity for informal discussion, problem-solving and brainstorming related to membership issues. New directions, membership benefits and expansion of student membership are topics inviting input. What do you expect from a professional association? How does the AATA stack up?

Undergraduate Art Therapy Programs—Forum II
Geraldine H. Williams, MA, ATR, Director, Art Therapy Program, School of Art, Ohio University, Athens, OH 45701
(All Levels)
This open discussion will continue the dialogue begun at the 1985 AATA Conference. Focusing on issues of establishing guidelines for the 32 undergraduate programs currently offering art therapy studies, for establishing a new "A.T." designation for graduates of such programs, for encouraging AATA to bring more student participation into the conference planning for each year's major meetings as well as include student and faculty representatives of undergraduate programs on Educational and Standard Committee.

IND

Family Art Psychotherapy—a Review of the Book
Helen Landgarten, MA, HLM, ATR, Art Therapy/ Loyola Marymount University, Loyola Boulevard at 80th St., Los Angeles, CA 90045
The family systems theory is utilized within the art psychotherapy approach. The following chapter examples will be demonstrated: crisis intervention for a molested child; family treatment for an enopropic boy; a failure case of a family's flight into health; and separation and individuation for an adolescent.

The Art Therapist's Third Hand (Pictorial Communication and Intervention in Art Therapy)
Edith Kramer, HLM, MA, ATR, 80 Delancey Street #23, New York, NY 10002
The metaphor concerns those realms wherein the art therapist's artistic competence and imagination functions in the emphatic service of others. Clinical examples of success and failure are given. Social forces which interfere with the capacity for emphatic pictorial communication are discussed and ideas on the systematic training of the third hand are presented.

Wright State University
Dayton, Ohio 45435

Master of Art Therapy
• academic study
• clinical practicum
• media experience
  • elective options
  • arts involvement
  • program approved by AATA

ART THERAPY, March 1987
HONORARY LIFE MEMBERSHIP ACCEPTANCE SPEECH

by

Robert E. Ault, MFA, ATR

Delivered November 15, 1986, at the AATA Conference—Los Angeles, CA

Madam President, Members of the Executive Board, Members of the Honors Committee, Colleagues and Friends. I am very touched by your actions and do thank you from the bottom of my heart. I can think of nothing more meaningful than to be so honored by one's peers. You have allowed me to join a group of very special people, and for that privilege I will always be grateful.

To Roberta Shoemaker, my colleague and friend at Emporia State, I do thank you for submitting my nomination to the Honors Committee. I am most appreciative.

There are so many people in this organization that I would like to thank for having helped make my professional life so rich through the years. The list is too long to thank individually from this podium but you do know of your place in my heart. Judy, Sandy, Maxine, Mari, Trish, Julie, Myra, Helen, Shirley, Charles, Gary, Jane, Lew, Lori, Shawn, Harriet, etc., etc.—thank you.

I also wanted to have recognized and to say thanks publicly to my best friend and wife Marilynn. She more than anyone else knows of, and has shared the personal struggles and sacrifices, as well as the great pleasures of being an art therapist. I am delighted to have her here today.

There are three other people that I would like to share this moment with for they have all given generously of their life energies to this organization. First, my dear friend, mentor, and teacher Don Jones. Don has always promoted the best in all of us by his word and example. Second, I'd like to recognize Joe Garai, who I believe history will be kind to, for his scholarship and plea for all of us to humanize.

Last I'd like to share this with someone who promised she would be sitting on my shoulder today. I have greatly appreciated her counsel, her courage, and her love. She is my Houston friend Felice Cohen, and I do thank her for the phone calls.

As I pondered what I wanted to say to you today I reminisced in my mind of the old days, filled with the energy and highs of shared creativity as we put together and gave birth to our infant AATA. I also remember well the pain and the sleepless nights as we struggled to care for and nurture our beloved child. There was also the adolescent years complete with the intense swings of dependency and independence as we collectively attempted to individuate, secure, and internalize our identity as art therapists. There were moments of self-involvement, of intense contacts and struggle, as well as moments of great satisfaction. Remember, none of us at that time had a professional history as we do today. We did survive those years and moved into young adulthood where we continued to define and mold the values and ideas that bound us together. For many of us it was something like a second chance at growing up or like a shared successful analysis.

Now we are at the threshold of another stage of development, that of adults, complete with the responsibility of adulthood that calls for our attention. For some of us, it is like the time of life when you reverse roles with your parents and you become the caretaker and nurturer. I believe AATA needs that from us at this time.

John Kennedy so eloquently spoke of this by asking not what your country could do for you, but rather what you could do for your country. So it is with the idea of art therapy.

Like most of you, I have shared over the past few years the concerns about AATA, in particular its financial status. The executive board and officers have struggled so hard to maintain services where simply was not enough money available. It has been a big problem but this challenge is no different from others we've faced except that it clearly tests our commitment to the vision. We are experts at problem solving—that is what we are all about, so let's get on with it. I understand Sandy has already taken some actions in this direction and I'm delighted. We are simply beyond the stage of supporting our mission through fees and the sale of services. Universities, hospitals, schools, and churches do it by means of fund
raising and I also believe we can, and are able, to do it. I believe we should immediately develop materials soliciting not only from our membership but from others the means to set up an endowment fund. We need to nurture ourselves. Most of us already do this for other causes—why not for AATA? I believe the problem is not in resistance to the idea, but simply in the need to develop the proper mechanisms for this activity. It is the responsibility that goes with our development but we have to believe in our guts that it is worth it, or it will become an obligation and resentment rather than an opportunity to take claim of the adventure. The key is for us to understand what art therapy, as we call it, is all about and to identify it as a movement of ideas, not as a profession. It is a set of ideas that have merged into a new relationship that can have, I believe, enormous impact on our lives and on the lives of our children and their children. The time is ripe, the history is correct, the ideas are solid, and on the side of what is the best of our character. We’ve only scratched the surface of knowing about art and its relationship to healing and growth of all our citizens, not just those that are sick. We must boldly move into new arenas of what I call the “Great American Wasteland,” the vacuum created by too much emphasis on materialism, shallow values, and planned obsolescence. There is a world of individuals and organizations that need our help and we have the technology to do something about it and I hope shortly, the means. The use of visualization in thinking and problem solving, the language of images which incorporate both the affective as well as the cognitive, the understanding and development of creativity, the promotion of respect and reverence of all forms of life, and the resolution of differences between people, is our arena and challenge for the next decade. We have no choice for we’re running out of time. Our national priorities demand we become more active and enter the social struggles more directly. Currently we spend as a nation more money on a single B-1 Bomber than we do for all the arts in America. The line item in the defense budget for military bands is greater than the entire National Endowment for the Arts, and we simply have to help enlighten others to the fact we have alternatives other than through the continued use of power. Power never resolves problems between people, it only delays expression and makes it worse. Art has served as a major civilizing agent since the beginning of time and we are now in a key position with our expertise in both art and human relations to help reinstitute this age old process.

I recently interviewed Dr. Karl Menninger for the Journal and at one point he asked how many art therapists there were. I answered we had a membership of about 3000. He rather emphatically said, “there should be 30,000 by now as they are so badly needed.” I asked what he saw as a major problem facing mankind at this time and he spontaneously answered—“the bomb, the bomb, and the bomb!”

Well—I don’t want to sound like doomsday—but we are being pressured in a way that will make all our good work irrelevant if something isn’t changed.

I’ve had the experience now of seeing how art therapy can successfully be used in these social—nonpatient arenas and it is very exciting. It is not a time for remorse, it is a time of renewed commitment. It is also a time to broaden our view of art therapy—or creative living, or art enlightenment—whatever we want to call it, but let’s get on with the responsibilities of our adult lives and help create on a much broader scale, a safer and more caring society.

Again, I thank you for this honor today. I love this organization, I love its ideas, and I love the people that it attracts. It is worthy of our energies and means and I invite you into the dream.
The Therapeutic Effects of Combining Apple Macintosh Computers and Creativity Software in Art Therapy Sessions

Devorah Samet Canter, M.A., School of the Art Institute of Chicago, Associate Member of the American Art Therapy Association

The Apple Macintosh computer and existing "creativity software" can have a positive effect on learning disabilities in children and adolescents with behavioral and emotional disabilities.

The purpose of this paper is to address the potentials of integrating computers and creativity software in art therapy settings, and discuss how these new media can be used to facilitate insight for the therapist and client. Case studies will illustrate how the Macintosh and specially designed software can bring out creative expression in clients with emotional and learning disabilities.

The art therapist based the paper on a study held at an inpatient children and adolescent psychiatric hospital funded by the state of Illinois.

Continual use of the Macintosh computer and creativity software by clients with learning and emotional disabilities exemplified positive changes in their behavior. The results of the study included increased attention span, the development of visual and musical expression, self-confidence, creativity, and communicative skills.

Introduction

With the advent of personal computers, non-computer professionals are now able to afford and use them for work and entertainment. As an art therapist one can begin exploring the benefits of integrating paper, pencils, markers and pastels with computers, drawing, animation and music programs.

Art critic, Anthony Reveaux, (1985) stated that every aspect of every art form is now affected and mediated by technology. Assuming this, art therapists are challenged to use state-of-the-art technology to positively reinforce art therapy techniques.

Purpose

The Apple® Macintosh™ computer and existing creativity software can have positive effects on learning disabilities in children and adolescents with behavioral and emotional problems. The effects of art therapy techniques on children and adolescents with behavioral and emotional problems have been documented. What has not been fully studied, with this population however, is the power of the personal computer and creativity software as therapeutic tools.

There is much potential in the integration of Apple Macintosh computers and creativity software in therapeutic settings, and these new media can be used to facilitate insight for the therapist and client. Case studies will illustrate how the Macintosh and specially designed software can bring out creative expression in clients with emotional and learning disabilities. These clients may have difficulties expressing themselves through the use of common art materials, because of problems with fine motor coordination and/or impulsive or destructive personalities. Thus, clients with these problems may find computers to be a constructive and beneficial tool for them to use because of the calming effects, and the creative and intellectual challenges they offer.

Background

The art therapist (author) worked as a part-time consultant, at a state psychiatric facility, using computers and creativity software with children and adolescents. Clients were referred by their primary therapist and/or teacher to participate in an art therapy program that utilized computers and creativity software. The art therapist worked in small groups and individually with these clients over a five month period.

The art therapist's approach provided an environment for children and adolescents, much like an artist's studio. Tools were available for the clients which included a variety of tactile art media, both two and three dimensional, (paint, paper, crayons, markers, clay, wire, canvas, cardboard etc.). Apple Macintosh ('Mac') computers, drawing, music and animation software were also available for children and adolescents to work with and explore. The art therapist was available to discuss personal issues when they came up in or through the clients' art, or critique work if it was apparent that one could benefit from this type of discussion.

"What has not been fully studied . . . is the power of the personal computer and creativity software as therapeutic tools."
In group and individual art therapy sessions, children and adolescent clients were asked to choose media with which they wanted to work. Some worked on long-term projects, while others created new art work each session. Some clients worked primarily on the computer, others chose to work with a variety of art materials.

The child and adolescent involved in this study were diagnosed as having learning and developmental disabilities and anti-social personality disorders. They were living and going to school in an inpatient psychiatric hospital funded by the state of Illinois. Children and adolescents residing at the center were from low to middle class families and many were from single parent homes. Child abuse, drug related problems, suicidal attempts and depression were commonly observed problems.

The Macintosh Computer, Hardware and Software

The Macintosh computer is a pixel-based graphics (computer graphics) computer. It has many capabilities, but it's high-contrast, black and white computer graphics generation is what makes the 'Mac' really unique. The Macintosh computer's screen is small (nine inches diagonally, but its square pixels (pixel is a single dot on the screen or a single bit) make the images seem sharp.

The 'mouse' of the 'Mac' is a moveable cursor or pointer. As you move the mouse around on a flat surface it moves the cursor on the screen. The user clicks the button on the mouse to control the computer.

On the top of the screen of the Macintosh is a row of words called the 'menu bar.' Each word is the name of a menu, under which is seen another set of words which represents the choices that are available to the user. Each menu is accessed by placing the mouse cursor on the menu name itself. When the menu is opened, the user pulls the mouse cursor down the menu to select the particular command desired, thus the term 'pull down menu' is used.

On the screen of the Macintosh are windows. Each program that runs on the Macintosh runs inside a window. Each window can be resized or overlaid.

This combination of 'pull down menu,' 'windows,' and a 'mouse,' are called a graphics based user interface as opposed to a text based user interface. All the information needed to control the computer is on the computer screen. Nothing is hidden with a graphic interface. This kind of interface is called "WYSIWYG" (what you see is what you get).

The software used in this study are all graphics based and are designed to be used on the Apple Macintosh computer. MacPaint™, VideoWorks™, and MusicWorks™ were the 'creativity software' programs used by the therapist. The software and hardware work together like a record and record player. Although, with the computer and creativity software you can transform the Macintosh into a paint canvas, or drawing pad, an animation stand or a composer's sheaf of music.

MacPaint is a drawing program that uses the mouse to 'draw' on the screen of the Macintosh. MusicWorks is a music program that enables the user to place notes on a music staff and hear the results instantly. VideoWorks is an animation program, that also lets the user draw his or her own artwork and control the movements of the characters created. The program incorporates sounds and has talking capabilities. Together these three programs provided a comprehensive set of creativity tools, that clients could use to make art and express their feelings. Because of the unique 'User Interface' of the Macintosh, children or adolescents who have never used a computer before, can easily learn and adapt to new skills such as drawing and animating objects on a computer screen or composing melody lines.

Case Study I

The first case study is a 12-year-old, white, middle-class, male child with behavioral and emotional problems. Computer drawings, taken from animation sequences, created by the client, are included. For confidentiality purposes he will be referred to as E.M.C.

E.M.C. has had a long history of prior therapeutic services and has been in and out psychiatric hospitals and special schools since the age of 3½. In April 1980, a psychiatric examination was completed on E.M.C., at a major psychiatric hospital. It was reported that on the Wisc-R he achieved a score in the high average level; with a Full Scale IQ—112. On the Performance subtests, he scored consistently above average level. It was felt at this time that his visual channel for learning was much stronger than his auditory channel and that his verbal abilities may have lagged behind due to inadequate verbal stimulation in his social environment.

E.M.C. was first admitted to the hospital in April, 1981, by his mother, because of his increased aggression and defiance in the home, increasingly poor impulse control and poor judgment, hyperactivity and fire-setting. His mother was fright-
ened by his aggression in the home, and did not know how to help him. She stated that his mood had been “weird” for several months prior to this admission.

E.M.C.’s mother felt the main precipitating factor to the problem, at that time, was his father’s inconsistency in visiting the son. His visits were sporadic and infrequent a few months following their separation and divorce. E.M.C.’s mood disturbances began to slowly build up and his whining soon turned to aggression when he realized his father was not going to come home. E.M.C. also had a difficult time relating to his older sister, and his mother felt that he was jealous of any attention given by her to others.

E.M.C.’s therapist felt that his hyperactivity-like aggressive behavior was a type of depressive equivalent since he was not likely to verbalize his concerns directly, but was more apt to act out his concerns. His therapist saw him as a very needy child experiencing considerable anxiety and preoccupation with sexual matters and dealing with an underlying depression.

Since E.M.C.’s initial two-to-three month admittance, in April, 1981, he was readmitted three other times to the psychiatric unit. Each time behavioral problems at home and at school were presented as the cause for his return. He had continued to be hyperactive and violent towards friends, teachers and family.

During E.M.C.’s third admission to the hospital (May, 1985) he was introduced to the art therapist and was asked if he would like to be in art therapy. He said he wanted to come. He was told he could do whatever he liked and could choose any art materials to work with.

E.M.C. came to art therapy twice a week for an hour each session. He participated in individual and group therapy sessions. It was immediately evident that he was visually oriented and could utilize his innate visual channels for learning if he was motivated. Each session he explored using different media and was excited about making things. He was good with his hands and could draw, paint or sculpt with ease.

E.M.C., at first, enjoyed making objects that he could give away: a necklace for his mother or a toy to play with on the unit. This was not an unusual act for a child who is taken from his environment and placed in one that is unfamiliar and strange. The need to make up for the loss of personal objects can be worked through by making another object.

Through the art process E.M.C. was able to sublimate his hyperactive behavior into working with the art materials. His behavior was good in individual sessions, although in group therapy he had some difficulty working with other students. If he was not occupied at all times, he would become irritable and begin acting out.

His teachers, from the psychiatric center, were surprised, at this time, that he could spend more than 10 minutes working at anything. In his classroom and on the unit, where he lived with other children, he was noted as being impulsive, immature, rude, and hyperactive. This was in direct contrast to what was observed in the art therapy setting. There E.M.C. usually behaved well.

During this admission (May, 1985), E.M.C. was introduced to a Macintosh computer in art therapy. He immediately was drawn to it, stating his familiarity with other kinds of computers used at home to play games. He learned quickly how to set up the computer, turn it on, and start up the software programs. Working with a computer, drawing, music, and animation software enabled him to use his visual and intellectual abilities simultaneously. The software programs were challenging and interesting, so they held his attention.

In school, students and teachers tended to be negative and unfriendly towards E.M.C. because of his acting out behavior. He was unable to achieve successfully there, because he was emotionally insecure. In art therapy the computer created an environment which was creative, smart, and friendly. The computer was like a friendly teacher, it didn’t get mad about mistakes, gave individual attention, and let E.M.C. work at his own pace. Working with the computer enhanced his self-esteem because he was in control working with this media and could achieve intellectually and creatively with this tool.

On the computer E.M.C. was very articulate about the work he created and was consistent in always getting the final product perfect. He would draw on the computer in ‘fat bits’ mode. This feature allowed him to draw an image pixel by pixel (dot by dot, like an etch-a-sketch). Fat bits magnified the area in which he was drawing, so he could work in detail. After E.M.C. learned how to draw in MacPaint he began experimenting with the animation program VideoWorks. The possibility of drawing pictures and making them move around the computer screen fascinated him. The following suggests why E.M.C. responded so positively to animation.

“Animation is the art of ideas in motion. It is the construction of images, frame by frame, bit by bit. For the creative artist, it is a medium almost limitless in the concepts it can explore and display. Independent of physical reality, it can choreograph the actions of recognizable, everyday objects or zoom off into abstract spaces of fantasy. Even more special is its ability to change from one domain to another, to combine the real and the unreal, all breathing with the rhythm of thought. It can be audio-visual poetry of mixed metaphors and transformations, logical comparisons and impossible puns. Animation is a synthesis of the design of painting articulated with the tempo of music and, like the dance it’s most alive when in motion.” (Reaveux, 1977 p. 1)

The animation software, VideoWorks, provided E.M.C. an opportunity to express what was going on in his mind visually and in motion.
Unlike static images, the animation sequences could be played back on the computer and viewed like a cartoon. Like dream sequences they told a story in pictures, and dealt with many layers of consciousness.

Therapy consisted of E.M.C. mastering the computer and talking about his drawings and animations. Having the ability to instantly play back an animation was also an important step in the therapeutic process. Looking at work on the computer, session to session, allowed him to review personal issues in a pleasant and fun way. E.M.C. enjoyed talking about his animations, because he produced them himself, and he felt good about mastering the computer.

E.M.C. was able to conceptualize and produce what he wanted to express via this media. He commented how 'neat' it was to be able to make his own cartoons, and that no one else could make it except him. He also said that on the computer he could make things 'real special,' unlike what he could make with a pencil and paper. His enthusiasm in understanding this new tool allowed him to learn, listen and think about his problems in a more positive environment.

One of the first animation sequences he produced, on the Macintosh, was reflective of his thoughts about making new friends at the hospital. The animation was of a group of fish swimming (see Figure 1). When E.M.C. was asked about it, he said that one fish came into the water to find friends, so he could play. The fish were just having fun and swimming together, he said. E.M.C. used the bubbling sound from VideoWorks sound file to represent the fish talking. Drawing the fish and making them swim and talk helped E.M.C. begin thinking about and discussing how it felt for him to deal with his new relationships at the hospital.

Another animation E.M.C. created was named In Drive (see Figure 2). When asked what this animation was about, he said that the tank was driving into the Medic Building and having a battle. He commented that this was a difficult animation to do because he had to draw a landing, smoke, house, and a tank. E.M.C. did not make a personal reference to this sequence, though one might interpret the medic center as the psychiatric hospital and the tank in battle as himself. E.M.C. worked for many hours designing this animation. He was especially proud of his work and showed it off to the other clients.

Although at this time E.M.C. was still having some difficulty controlling his behavior, on the unit and in school, it was decided by his therapist that he was ready to return home. Outpatient treatment was recommended for him and his mother. Upon discharge, E.M.C. expressed interest in trying to find a computer in his community to continue creating art.

A few months later E.M.C. was readmitted to the hospital. In school and at home, he was having the same behavioral and emotional problems as before. In addition, he was soon to be 12 years old and his mother was finding him more difficult to control.

When the art therapist heard that E.M.C. had been readmitted she went to the unit where he was living and asked if he was interested in coming back to art therapy. E.M.C. greeted her warmly and immediately asked if she had the Macintosh computer.

The first animation he did upon returning to art therapy was called Alien (see Figure 3). When he was later asked to talk about it he said the animation was about aliens. Two
aliens come together and one says hello everybody. E.M.C. said, when he first came to the hospital, he made that. It talks and says hello everybody. Using the computer and animation software, E.M.C. was able to conceptualize an idea and produce what he needed to express. Having an alien say hello everybody was his way of greeting his new peers at the hospital. The fact that he said the animation sequence Alien was done when he first came back to the center, exemplified his ability to associate an image to a time period. Here again, we see E.M.C. discussing an issue through another subject matter. He visually expressed what he wanted to talk about. After finishing his animation, he could begin discussing with the art therapist, what it was like to be back at the hospital.

Keep Going (Figure 4), was one of the last animation sequences E.M.C. produced before he left the hospital for residential placement. He said it was about leaving. First it says keep it going everybody and then it says I will miss you everybody. In the animation you hear beeping sounds and you see a car, and a smiling face that he made. When E.M.C. was asked how he felt about this animation he said he felt mad and sad. He said he was sad he was leaving the hospital and mad he was leaving. Talking about the animation enabled us to begin talking about his feelings about leaving his friends, his fears toward going to live in a residential home, and his plans for the future. E.M.C.'s ability to visualize these issues allowed positive interpersonal discussions as well as a means for him to express his feelings verbally.
E.M.C.'s behavior had changed by this time. In art therapy he was able to work with other children, communicate to them how to make the computer work and have discussions in a personal and expressive manner. He showed increased attention span, positive development of visual expression, creativity, and self-esteem. E.M.C.'s teachers, therapist and staff were also noticing a change in his behavior. He was not as disruptive or hyperactive as before. His therapist felt that he still showed an underlying depressive behavior although he was not acting-out to express these feelings.

In one of E.M.C.'s final staffings, (before he was placed in a residential home for one year), his teachers and staff commented that they felt he had matured since the last time he was at the hospital. Because of this maturation he was beginning to express feelings, instead of acting them out. Since it was apparent that visual stimulators could modify E.M.C.'s behavior it was made known to his therapist and mother that he showed talent in the area of art and he was capable of visually expressing himself when given the freedom and encouragement. Art therapy and/or art classes were suggested as being part of his outpatient treatment plan. In addition having access to a computer and graphics program in his school and/or home environment were strongly recommended.

Case Study II

This case study is about a 17-year-old, white, lower to middle class, female adolescent. She was placed at the psychiatric center because of her poor impulse control and aggressive behavior toward peers and adults. She had a history of suicide attempts, depression, alcohol and polydrug abuse, truancy, verbal and physical aggression, running away, and a chaotic family environment. Drawings, taken from animation sequences she produced on the Macintosh computer, are included. For confidentiality purposes the client will be referred to as D.C.

D.C. was admitted to the psychiatric facility in the middle of November 1984 as a voluntary patient. She was 17½ when she began attending art therapy sessions. Less than a year before, she had had a baby. Her baby was placed under temporary custody of the Department of Children and Family Services (DCFS). D.C. had behavioral problems in her school and community. She had been under guardianship of DCFS since June 1964.

D.C. was bossy and her personality appeared to be cold and callous. She was known to start fights on the unit with other girls, and would lie to the milieu staff. After two weeks at the hospital, D.C.'s anger and inordinate neediness became acute and open. She verbally attacked peers and when advised that she could not touch peers she became self-abusive, hitting her head.

D.C. was a sexually aggressive adolescent, and she constantly talked about boys. It was not unusual for D.C. to have a different boyfriend each week. Besides talking about boys, D.C. would take pride in discussing her role as a gang member. She had difficulty trusting peers and adults and had very few positive role models. Manipulating others was D.C.'s way of feeling in control.

D.C.'s relationships to male peers at school remained problematic. She continued to be sexually provocative, such as touching boys inappropriately or asking questions in school such as how to spell 'masturbation.' On the unit as well as school, she viewed herself as a 'social butterfly.'

D.C. began participating in art therapy sessions in her third month at the psychiatric facility. From the very beginning D.C. enjoyed working with the art materials. She initially drew and painted 'pretty' flowers and still lifes. Eventually she engaged in a long-term, abstract sculpture project, that involved using chicken wire, wheat-paste, plaster and paint.

During the first month in art therapy, D.C.'s art work did not reflect what was going on in her life. Rather, it masked the difficulties she was going through. Her art work did not mirror her problems. She was concerned in completing a 'beautiful' piece of art. Creating art that aesthetically pleased D.C. allowed her to feel good about being productive. Once this was achieved she could build self-esteem and trust in the art therapist. The initial goals, in art therapy, at this time were building D.C.'s good feelings about working, and providing her with a positive environment for growth. Other therapeutic goals focused on dealing with her anger and impulse control.

After six weeks of working in art therapy with D.C., she stated that she was interested in coordinating art projects on her unit. This request was fulfilled by allowing her to borrow art supplies from the art therapist and having her plan art projects for the girls on her unit. D.C. enjoyed taking the responsibility of borrowing materials and returning them to the art therapy room. She asked if she could help teach art classes to other children at the hospital. She also expressed the need for additional schooling, training her to be an art teacher. This was a noteworthy shift in her behavior from being negative, to D.C. talking about wanting to take some positive control over her life and being interested in her future.

During the second month of art therapy sessions D.C. was introduced to the Apple Macintosh computer. She had worked with computers in school but never used one to create music or make art. D.C. first chose to work with the software program MusicWorks. She had experience playing the piano and quickly learned how to control the program. D.C. worked on her composition for weeks and named it D.'s Tune. She took delight in playing her song on the computer for other children and adolescent clients.

For the remaining month, in art therapy, D.C. concentrated her ef-
forts on working with the animation software, VideoWorks. She found this tool ideal for expressing her feelings about boyfriends and love. She used the program to create audio-visual love poems. It was very interesting to watch D.C. work with VideoWorks. She was quite articulate about the timing and placement of images on the screen. She chose many different sound effects for an animation, and worked on the ‘Score’ to edit, cut, and paste in frames. D.C.’s concentration while working with this program was focused. Her determination to finish what she started exemplified that she cared about what she was doing. This behavior was different from school and on her unit, where she would often start fights and be disrespectful to teachers and staff.

D.’s Boys was the name of the first animated film D.C. produced. It began with the sounds of heartbeats. At first, a large heart, with the words D.-n-Scott inside of it, moved across the screen. The words D. loves Steve appeared on the screen next, and slowly moved to the side. Following this, love is like a rock moved from one side to the other. The film ended with a six-sided star (gang sign) and the words Comps of fallen angel (see Figure 5).

This animation represented some of the issues D.C. felt were important to her. Discussing the content brought up questions about her ambivalence towards men and her affiliation with gang members. She had made the first step to begin looking at her problems. D.C. never asked for a copy of the disc, or print-out of individual drawings; creating the animation was what was important to her. She had found a productive and creative media in which she could focus her energy and thoughts. The control she normally exerted in manipulating others was sublimated into mastering the computer.

The second animation D.C. produced was called Old Boyfriends of Mine. In this film she starts off with the words, Boys, Boys, Who Needs em. I Do. John and D. appear in the middle of the screen and move out. You then see the words Fun in the Summertime, next to falling rain drops and a heart with an arrow in it. Afterwards Robert and D. appear, and it ends with Boys, Boys, Boys Who Needs Em I Do. D.C. implemented a variety of sound effects throughout the animation. She also used the program’s ‘Special Effects’ feature and picture fonts (type faces) to create illusions and designs (see Figure 6).

The computer provided a world in which D.C. could build a new set of learning skills in which she could use to transfer her way of thinking about herself and others. Her animated poems represented important aspects of her life. In an honest and straightforward way she was able to present her feelings and conflicts. With this new tool came a new way for her to think about some of the difficult issues she faced. The computer gave categories more useful than good or bad and allowed D.C. to make her own decisions. In creating her world, D.C. built an environment in which she could be successful and feel positive about her accomplishments.

Unfortunately, at this time, art therapy sessions were terminated because of financial reasons. Two months later D.C. was transferred to an adult psychiatric facility for outpatient treatment. It was felt by D.C.’s therapists that she had attained maximum benefits of the hos-
Pituitary, and that she was not in need of inpatient psychiatric care. Her prognosis was fair-to-good providing she made good use of the new outpatient treatment.

Discussion

MacPaint, MusicWorks and VideoWorks were incorporated in art therapy sessions to see if creativity software and the Macintosh computer could have positive effects on children and adolescents with learning disabilities as well as behavioral and emotional problems. The two case studies exemplified how these tools could be a therapeutic procedure that provided the right level of success, mastery and control for these clients.

Veljkov (1985) stated that creative and developmental growth in visual motor skills, eye-hand coordination, logical reasoning processes, and creative decision making could be enhanced through continual use of the Macintosh computer. Clients, in this study, who used the computer and creativity software did excel in creative and intellectual learning processes. Their ability to manipulate and control the hardware and software not only gave them a sense of self-satisfaction but allowed them to participate in a unique, stimulating, educational, and creative learning process.

Glenn, Humphrey and Kleiman (1984) found that some educators believed that computers were too complex for students with learning problems, and therefore would lead to frustration. This study found that clients with learning disabilities were able to concentrate and work longer on drawings while working at the computer because there were a variety of creative possibilities to be explored and because the Macintosh computer was easy and fun to use. Clients were enthusiastic towards using the computer and creativity software. Their art work and behavior reflected that this was a positive and rewarding experience.

Favaro (1983) found that children who were overly dependent on their teachers’ attention were likely to become distracted easily from computer tasks. He also felt that children who were apt to respond to frustration with impulsive or destructive outbursts were not yet ready to use computers. These findings were not noticed in this study. Clients that were overly dependent on the thera-

"Clients, in this study, who used the computer and creativity software did excell in creative and intellectual learning processes."
"Slow learners had very little difficulty learning how to control the computer and were intrigued by the limitless possibilities."

... clients see exactly what they just did, so if they don't like it, they could instantly change it. These kinds of features allow children and adolescents with emotional and behavioral problems to easily make quick changes without conflict, embarrassment or frustration.

Turkle's (1984) research revealed that computers can change the way people think about themselves and that personal issues are worked out by what clients were doing on the computer screen. In her study with children and computers she found that some children are able to see computers as a mirror of their mind. These children made explicit use of computational metaphors to think about themselves. She states, "By looking at the detail of how they provide a vantage point for understanding something, helps us understand how computer metaphors can turn into a new popular psychology for the culture at large" (p. 155).

In this study, the drawings and animated sequences produced on the Macintosh expressed the users' thoughts and concerns. Through drawings, animated poems and pictorial metaphors the clients disclosed personal information. These visual images produced were used in and throughout the therapeutic process. Clients were able to build self-esteem and trust in the art therapist because they felt good that they had the opportunity to successfully learn new tools and creative art processes. A combination of these results proved that using a computer and creativity software was a positive therapeutic approach.

Implementing creativity software and a Macintosh computer in art therapy sessions, at the psychiatric inpatient hospital, provided children and adolescents, with behavioral and emotional problems, new kinds of creative learning experiences, positive interpersonal communication, and state-of-the-art technological tools. Science Desk (1985) quotes Davidman as saying, "The most crucial struggle for institutionalized children is keeping up with the mainstream youths in some way... That's Goal No. 1, giving the kids what they'd normally have if they were not locked away."

Conclusion

Continual use of computers and creativity software by children and adolescents with learning disabilities exemplified positive changes in their behavior. The results of a three-month study included:

1. Increased Attention Span. Clients who normally were unable to sit or concentrate for more than 10 minutes in a classroom, would work for an hour or more at the Macintosh Computer.

2. Development of Visual Expression. Clients who normally could not express themselves verbally, found drawing and animation programs ideal tools to visually express their feelings.

3. Development of Musical Expression. Clients who were unfamiliar with music, and music composition, found themselves writing their own songs with computerized music programs on the Macintosh.

4. Development of Self-Confidence. Clients felt more in control of their environment and felt better about themselves, once they became familiar with the technology of a Macintosh and its software.

5. Development of Creativity. Creative problem solving was further developed by clients, and the output from their experiences provided positive rewards.

Art therapists using traditional art therapy techniques may find implementing computers and creativity software in their sessions to be both educational and therapeutic.
Nathan (1985) has written and lectured on the creative and educational applications for computers. He believes that the most advanced and effective use of computers requires rethinking attitudes, providing opportunities for creative experimentation and changing traditional patterns and practices. He says that, "Computers can do much more, but they cannot do these tasks for us—we must be open, thoughtful and brave enough to do them ourselves" (p. 231).

Further research in using computers and creativity software, with children, adolescents, adults, and older populations with emotional and physical problems need to be explored. As computers become more accepted as therapeutic tools other kinds of software can be developed for working with specific kinds of problems. Solving problems is a basic process in both computer "packages" and art therapy. The combination of the two provides a powerful environment for therapy.

"An Art Support Group for Bereaved Children and Adolescents"

Mary Raymer, A.C.S.W., M.S.W., is a Clinical Specialist: The Mental Health of Aging and Gerontology, Certified Gerontologist/Thanatologist, Wayne State University, Detroit, Michigan. Barbara Betker McIntyre is a Ph.D. Candidate, Union Graduate School, Cincinnati, Ohio; Associate Member, American Art Therapy Association; Member of Michigan Association of Art Therapy.

"An Art Support Group for Bereaved Children and Adolescents" provides an overview of the grieving process for children and adolescents and the utilization of creative art therapy in facilitating the process.

A hospice program in a rural area began a pilot program involving art and music therapy for bereaved youth through state arts council funds. The important goals of the art support group, as well as the dynamics and methods used to accomplish these goals are described. The overwhelming need and community support are addressed as factors for the program’s successful development and continued growth. Three case studies provide further insight into the program. The creative art therapies used to facilitate grief are noted as a preventive measure. Finally, both authors address the importance of recognizing and understanding the grief process.

Introduction

The grief process is probably the least talked about and the least understood process in the field of mental health today. It is a painful, albeit critical, time of rebuilding and reordering one’s world. It takes a long time to reach a state of emotional equilibrium; each person experiences grief differently, but it is always a time of powerful and often overwhelming emotion. Unfortunately, there is no set time frame for healing to take place. Some people recover in a little over a year, other people may take three years and some people never fully recover. While there are not easily definable “stages,” the period of bereavement is usually characterized by three general “phases” which can include a variety of symptoms.

Three Phases and Assumptions

As with any trauma, the first of these phases is shock. People frequently report numbness, the inability to feel, or feeling as if they are robots just going through the motions of every day life. The task for bereaved persons at this point is to protect themselves from feeling the full impact of the loss. This is a sort of psychological “respite” and may last for several weeks or months.

The second phase can be described as a phase of intense disorganization. Symptoms may include inability to concentrate, sleep, or eat, frequent and often uncontrollable crying, numerous somatic symptoms, rage, depression, guilt and preoccupation with the deceased. Repressing the symptoms of this phase creates a serious block to healing. The task for the bereaved person at this point is to acknowledge and feel the full impact of the loss. Feelings need to be expressed and worked through. This phase may last many months.

With proper support, the person moves to the reorganization phase which is characterized by occasional pleasantness, more pleasant and bittersweet memories of the deceased, and less intensity of feelings. The goal is not to forget the deceased, but to complete the intensely emotional relationship and to choose to reenter life with enjoyment again.

This tumultuous time of healing is exhausting, demanding and difficult for any adult to cope with. It is little wonder that children are often lost in the shuffle of the struggle. Consider your first experience with death as a child. Was it with the death of a grandparent, parent or pet? How were you told about it? How did you feel? If you are like most people, chances are that you felt confused, guilty, curious, isolated, fearful and/or angry.

An unhealthy assumption is often made by well-meaning adults that children don’t understand or are incapable of handling the truth. Generally, children take longer than adults to exhibit the symptoms of mourning and this adds to the assumption that children don’t really need any intervention. Children require the same opportunities to vent and work through their feelings as adults do; intervention for children is even more critical because this period will shape their lives for many years to come. After the death of a loved one, a child may present a
somewhat pensive attitude often mixed with sadness and anger. After a short time, often to the conster-
nation of adults, he/she may return to play with his/her toys, watch television or play with companions. This short sadness span is not a matter of unawareness of the loss, nor is it disrespectful. It is a simple matter of denial that allows the child to postpone having to deal with the tragic loss until he or she is ready. It is comparable to a bereaved adult’s disbelief of a tragic loss, a normal re-
action in the initial phase of grief. Children may make numerous demands of the living family members. This is the way they check out their relationships with those who are liv-
ing in their family constellation.

A well-informed child, even after attending the funeral, may still believe that the loved one will return. One three-year-old, whose mother died of lung cancer, was sure that his mother would return. He stated that “my mother is dead but once doctors figure out a cure for cancer, she will be back when I’m big, but we have to wait until then.” An-
other child, age five, whose sister died at age three months, stated “my sister called and said she’d go to the zoo with us on Saturday.” It is at moments such as these that trusted adults have the awesome task of helping a child deal with the realities of the death. The easiest re-
action for an adult is to ignore the child’s comments; this is an unfair and unhealthy reaction. It is diffi-
cult, but important, to utilize these moments constructively as did the five-year-old’s father. “I think you wish your sister would go to the zoo with us. When we miss your sister very much, we like to think that she’s not really dead. I guess we will all be sad when we go to the zoo today.”

In conversations with adults who have suffered a loss of a loved one in their own childhood, one of the saddest experiences is the frequency with which they tell of their memo-
ries of crying alone at night in a closet or in bed. This loneliness and iso-
lation surrounding their expression of grief can be overwhelming and frightening. It is important that a child has a loved one to comfort him/her at these moments, as well as having the necessary art tools to work through the feelings.

Prolonged longing and wishing for the return of the deceased are normal in childhood, just as they are in adulthood. Knowing and understand-
ing that a loved one has gone forever is only the initial phase of ac-
cepting reality and the permanence of the loss. A child, as an adult, must grapple for a long time to adapt to an important loss.

What happens all too often, however, is that the adult, finding the child’s poignant struggle painful, turns away and avoids dealing with his/her anguish. When parents cannot deal with the struggle, it is cru-

cial that other supports be provided.

Bereaved Children and Adolescents

Bereaved children often become anxious when family members are away, fearing that they too might fail to return. It is common for a child to exhibit regressive behavior during this period of bereavement. The child may become anxious at bedtime and be fearful of leaving home. He/she may lose urine and bowel control, or may generally be restless and out of sorts. Poor school attendance, due to bodily complaints, and a decrease in ability to meet educational challenges are common symptoms.

A bereaved child commonly dreads illness, even minor ones such as colds. The child may imagine that he/she may be about to die. Be-

ereaved children who present behavior symptoms as they grapple with the loss, may be far healthier than children who deny the loss and are unable to deal with it in any manner whatsoever.

The death of a parent during ado-
lescence has unique effects because of this particular developmental phase of life. At one moment, a healthy adolescent is extremely inde-
pendent, setting off with great deter-
mination to make his/her own way in the world. The adolescent discon-
tinues many old associations and seeks new relationships. At other times, particularly after a stressful period, an adolescent often reverts to a less mature state, seeking con-
siderable parental care, sympathy and advice, quite in contrast to his/
her behavior during the independent phase. Such fluctuations be-
tween independence and depend-
ce would be considered highly abnormal at any other time in life. During adolescence, vacillation and restlessness are expressions of the normal process of maturation. The normal family constellation with two parents allows the adolescent to break away gradually on a trial basis, and to thrive at activity outside of his/her immediate family set-
ting. During these phases of intense independence, the adolescent is often critical and, at times, openly hostile to parents. The fact that the option exists to “return to home base” and be taken care of as in former years can be a comfort during this time.

The alternating ways in which a young person relates to parents must be considered as an adolescent copes with the tragic loss of a parent. It is one experience to be struggling to become independent, knowing that both parents are avail-
able when needed. It is quite a dif-
ferent experience when death re-
moves a parent or significant other in the midst of this struggle for emancipation.

A bereaved adolescent, even more than young children, may dread any illness, even of minor nature. At this developmental phase adolescents are deeply concerned about their bodies and life-threatening illness. Unresolved or ignored grief in chil-
dren leads to serious problems with self-concept and intimacy in adulthood. Substance abuse, hostile and criminal behavior, promiscuity and phobic reactions are frequently the end result of unresolved childhood loss.

28 ART THERAPY, March 1987
A Program in Action

The Grand Traverse Area Hospice of Munson Medical Center in Traverse City, Michigan is a program designed to provide supportive services for the terminally ill patient and his/her family. A main goal is to help persons live as fully as possible by providing medical, emotional and spiritual supports for them and their families. After death, the goal is to help the family heal and re-enter life’s mainstream. The bereavement program provides one-on-one and group therapy as well as crisis intervention.

In 1982, an art therapist volunteered her services to the program. Art therapy allows for the expression and communication of non-verbal images. The creative process is utilized as a means to transform pain and conflict and fosters self-awareness and growth. The person, process and product are equal in the art experience.

Art is a balance for feelings, thoughts and experiences. Art work, made spontaneously, can communicate feelings, experiences, fantasies and behavior and coping patterns through medium viewed as safer than verbal communication. In this art therapy program, usually one half of the time is spent in drawing, painting, making collages, etc., and the other half is spent sharing the actual art and feelings with the therapist and/or others. It quickly became apparent that, through art, children responded especially well. It appeared as if they responded much more quickly than through traditional verbal therapy.

Art provided a tool which improved self-esteem, was non-threatening and could be used by the child as a healthy release. “Art provided a tool which improved self-esteem, was non-threatening and could be used by the child as a healthy release.”

Our experience with art therapy for children and adolescents with hospice families has been consistently positive. Families have reported consistent improvement in communication, sleeping patterns, appetite and decreased withdrawal and aggression. A group for bereaved children and adolescents helped with the realization that others are in the “same boat.”

In 1984 a survey of all mental health agencies in our four county area indicated that there were no existing support systems for the bereaved child or adolescent. This same survey indicated that only one professional in the entire area had expertise in the field of bereavement. There seemed to be such an urgent need in our community that we decided to take action. We received many requests for help from the schools, court systems and non-hospice families.

We applied for funding with the Michigan Council for the Arts, to begin the Bereaved Children and Adolescent Support Group. The Council’s purpose is to promote the arts and Michigan artists to special populations. The arts became a tool for bereaved youth to work through; i.e. they could develop an understanding and give form to the many conflicting emotions in grief as well as enable the visiting artists to grow with the experience of facilitating such a group.

As the program developed, criteria were set for referral of children/adolescents; goals were identified for art therapy in bereavement and for methods to accomplish the goals. The group was open to children/adolescents ages four-to-nineteen who experienced a loss of a parent, sibling or significant other or was a member of a hospice family or family currently suffering an imminent loss. Youth were identified who had trouble expressing grief feelings, who were easily frustrated with verbal expression, and who were using verbal expression to deny or mask feelings. It was reiterated that previous art talent was not a prerequisite, although some children/adolescents demonstrated these skills.

The overwhelming need for a bereaved child/adolescent art support group brought initial referrals of over forty youths within a two week time span. The ideal ratio of artists/therapists to children is one-to-four, although one-to-six can still be quite effective. Artists were carefully screened for qualifications in understanding children and adolescents, previous teaching and proficient use of their media. Six artists were selected with expertise in a variety of media, and all six artists had experienced an early loss. (It is interesting to note that Fleming (1983) in a study of artists, revealed that the majority had an early loss.)

A registered music therapist was recruited to work with the group to enhance the sense of community in the group and provide music as another creative mode of expression. A hospice volunteer with expertise in child growth and development also worked with the group. With a team of expressive art therapists and artists, the possibilities for expression seemed to broaden. This unique wide range of expression enhances the bereaved youth’s choices and allows for synthesis of expression moving toward resolution and rebirth holistically. Intensive training in grief and art therapies preceded the beginning of the program.

The obtainable goals for a be-
reaved children and adolescents group using art therapy include:

1. encouraging self expression in art process and product with self and group reflection.

2. catharsis in art process and product; creative and constructive expression of feelings.

3. development of flexible but firm inner control.

4. group cohesiveness.

5. individual growth and increased self-esteem in art process and product.

Methods to accomplish these goals vary in visual art media, music, movement and dance and group discussion. During our group's training, artists were provided with experimental art therapy. A chance for artists to initiate their own methods to accomplish the goals was also afforded prior to beginning the group.

Art therapy sessions are held on a weekly basis and meet for two hour duration. We meet as a whole group at the beginning of each session for music therapy and for sharing our feelings and thoughts. Many times stories about life and death are read to stimulate discussions. Music therapy helps to provide socializing (Knill 1982). Music therapy stimulates discussion and provides a natural transition to expression in visual arts. Sometimes children write songs about pictures they draw as in these examples:

**BIRTHDAY DOG** by L.A., age 6
When I was five my father gave me Birthday Dog.
He is cute, he has tan and white ears and a hat up on top.
It was only one year ago (or maybe it was three) . . .
and I'm sad when I hold him, but it just happened!
Now he's in Heaven and he wants me to be happy.
So I come to art and draw Birthday Dog.

**THE COAT** by V.P., age 19
The coat was his
He wore it often
It was part of him

Now he's gone.
The coat is mine
I wear it often
It is part of me.
Sometimes I feel sad when I wear it;
Sometimes the feeling is happy.
But either way
I feel close to my Dad
Through this special coat.

With a variety of media (i.e. clay, fiber, wood, paint, finger paint, crayons, pastels, craypas and charcoal) youths create art. The process and product provide a means for self and group reflection and increased awareness. Jonathon (4) drew a picture of his grandmother who died a month ago; his mom is now dying of terminal lung cancer. Amy (6) drew Daddy's chair and said she misses him. Jeff (4) made a puppet and a self-discovery that his hand could control it. Laura (6) drew a picture of herself under a rainbow after she drew when Daddy died. Monsters appeared from clay. Six adolescent boys made wooden marionettes and staged a puppet show about heaven for the group. Discussion about the art always provides for self-reflection and increased awareness. Our sessions close with sharing art as a whole group. It is often easier for a child to discuss in a group when there is an art product to share.

Some of the common themes found in bereaved children and adolescent art include monsters, a symbol for children to express the many elements in nature that are out of their control (McNiff 1978). Rainbows are commonly found to create order. Various groupings of colors in rainbows show different stages in grief, such as separation from the nurturer, red and blue, and death and rebirth, purple and yellow (Shoemaker 1981). Balloons and birds expressing an upward transition of the dying appear as natural additions to a scenery. Roads and time (search of), dead trees (dampened self) and anger themes of fire, lightening, explosive sun and storms have been noted by Fleming, 1983, as common themes in early loss and have appeared in the art from the bereavement group. A lack of hands and feet in a drawing about death or feelings of an imminent loss reflect the helplessness in the traumatic experience. The sadness, pain, helplessness, rage, guilt, anger and preoccupation with the deceased that may have been repressed in other kinds of communication formats are freely expressed in a protective environment utilizing the arts.

After just 10 sessions, art staff reported that 95 percent of the youths showed consistent and documentable behavior changes as observed in peer and school relationships, and as reported by parents. With the success of art therapy for grief expression, a monthly parent/child art session was added to the program. This special session gives parents the opportunity to work creatively with their children while observing them in action. A Hospice goal is to help the bereaved family readjust as a whole to its loss. The parent/child art night serves to do just that. Interaction and communication between parent and child become greatly enhanced during the creative process. Parents involved in the parent/child night reported a valuable experience of supporting each other's creative work. The art process encourages the rebuilding of the family's world.

Art therapy as an important process in grief expression is illustrated in the following case studies.

**Case Study A**

After the death of her father, a nine-year-old girl was referred to our group by her mother. She reported difficulty with sleeping and eating. She came to the group while simultaneously seeing a Hospice social

---

"The art process encourages the rebuilding of the family's world."
worker. This young girl energetically expressed herself in media of paint and crayons during the first session. Her work seemed creative and very colorful. After completing her work, she tore up everything she accomplished saying, “I don’t like it: I can’t do anything right.” This seemed to be her way to show that “good things can’t happen to me now; I don’t want to progress past the time my daddy died.” Her behavior suggested that she was stuck in her grief work. When asked by the Hospice social worker, “What do you want to be when you grow up?” she wept and could not answer. One of the artists worked with A. in a dyad on several projects. When A. saw the work the two of them had accomplished, she was eager to do more by herself and with the artist. In a matter of a few weeks A. was pleased with her work, wanting everything to be matted. She told the Hospice social worker that “remember when you asked me what I wanted to be when I grow up? Well now I want to grow up.” Gradually her symptoms of sleeping and eating disorders disappeared. The art process when encouraged and supported in a therapeutic relationship can move an individual past his/her current limits and towards new growth. In this case, A. needed to see that she could successfully advance in her life. After a significant loss, the ability to take risks is often hindered. The art process and products help teach one to take risks which can slowly be incorporated into other life activities.

Case Study B

After the death of his mother, B., a 15-year-old boy, was referred to the Art Therapist by his older brother who reported withdrawal and somatic symptoms within the past few weeks. I called B. and talked with him about the Art Support Group. B. explained that he had no energy, spent much of his time sleeping during the day and stayed awake at night, couldn’t keep food down and was generally disinterested with life. He did agree to come to the Art Support Group. We talked about his Mom and he described a very close, dependent relationship with her. B. came early to the Art Support Group so we had time to talk together. He stated that he was not an artist. I encouraged him to paint and told him art is a way to express his feelings, experiences and thoughts towards his loss, hence it is not necessary to be an artist. He made a tree. The tree seemed to be healthy with a trunk, branches and a lot of green leaves. The drawing of a tree in a depression, however, is an expression of depressive and inadequate feelings (Buck 1950a). When others came to the group, I introduced B. to four adolescents who had been with the group for some time. B. stayed separate for a while. We began as a whole group with stories from Jill Krementz’ book How It Feels When a Parent Dies. Two stories were read, one of which was quite close to B.’s situation (i.e. an adolescent boy whose mother died of cancer). One issue presented was the boy wished he would have helped his mother more, but didn’t believe she would die. Our group talked about those feelings and most children and adolescents expressed feeling the guilt of not helping enough. We talked about believing we did all we could at the time. After our general discussion, small group work began. B. went with the adolescents who were finishing puppets and making props for the play. He interacted mostly with the artist facilitator and remained to himself while building a chair. Towards the end of the session, I spoke with B. and noticed a little more enthusiasm in his expression. He asked if he could see me alone the following day. We set a time for him to come in to the Hospice office. The next day, through discussion, I learned that B. began feeling chest pains, exhibited bulimia, and began feeling disinterested just two weeks prior when his family took a vacation. He told me at this time he “realized his mom was not coming back.” (Before, he felt that she was just away on vacation.) He also expressed a great deal of anger towards his new stepmother; particularly, he noticed she and his dad were having fun to-
A family picture of now, focusing on the house structure. The youth was able to discover through art, his conflict and fears were related to changes in the structure made by his father and stepmother.

together. He then talked about his mom. His mom was a protector and strong nurturer for him. Her absence left him with a helpless feeling as he moved from protest to despair in the grief process. I suggested that he draw a family picture, when his mom was alive. He worked hard on this (Figure 1). This picture, he explained, is when “Mom got her new car and I was watching her through the window.” I wondered why he chose the house and yard as a family picture and put only himself and Mom in the picture. It seemed to show his dependence on her. I asked him to draw a family picture of him (Figure 2). There are several themes in this picture that we discussed. B. stated the storm was his anger and fear about the way his stepmother and father were changing the house. “They are remodeling and none of Mom’s things are staying.” We talked about his fear of everyone “forgetting Mom.” We also talked about ways he could be involved in remembering Mom and decided to work on a book about her using photographs and drawings (Maxine Junge, 1985). The trees in the picture are notably smaller than

Figure 1 which suggests “feelings of isolation often associated with a need for maternal protection” (Buck 1948 & 1950a: Jolles 1952a). Indeed, his mother provided protection as he reported the comfort of having Mom call school and straighten things out when he was in trouble. Also, he was kept home from school an extra year and depended on his mother’s comfort when he was sick (which occurred quite often). He told me he received an award for missing the most days of school.

One issue B. was considering was going in the hospital. I asked him how this would change things when he came home. He thought and said, “Maybe this is not the answer.” He told me he felt better but not 100 percent better. He said it made him feel good to draw the storm (a release of anger). He then talked about a course he wanted to take at the College Observatory this summer. He said he’s always been interested in astronomy and his mother encouraged his development. He also said he would attend our Monday evening sessions. B.’s father reported satisfaction with our art group, and said B. sat out on the deck after his first session with us and talked with his stepmom and dad about things he wanted to do.

Loss of a loved one, especially one maternal, is also a loss of self-esteem. When B. experienced art and ability to build and create, this gave him a boost to become interested in life. He still will be grieving over the loss of his mom for some time. The intervention with art, however, can be perceived as a preventive measure for further withdrawal and increased somatic symptoms which could occur.

I saw B. again the following Tuesday. He said he was sorry he missed last evening but did not have a ride. I asked how he was—his appearance and expression in his face and voice showed great improvement. He said “much better.” He told me he is eating more often and stated that he used his telescope, went over to a friends, saw a parade and movie since last week. He attributed this to being involved in the art support group and our art therapy session the prior week. He brought a picture that he drew of his mom, and we discussed it. B. chose to draw another picture, and proceeded to draw one of his mom and family on the beach. This time he included all family members. He said he wants this as part of a book to make about memories of his mom. We talked about the possibility of his doing this during the Art Support Group session. B. continues to attend the Art Group.

“Loss of a loved one, especially one maternal, is also a loss of self-esteem.”
As with any other population in Art Therapy, each case is unique as is the person or family. Results are not always as dramatic when family dynamics are more complex as reported in the following on-going case study.

Case Study C

Mrs. C., a 38-year-old woman with a diagnosis of terminal brain cancer was referred to hospice by her physician. She resided at home with her husband and caregiver, Mr. C. and four daughters, H. (19), I. (18), J. (9), and K. (7). Mrs. C. needed constant supervision and the family hired a full-time caretaker while Mr. C. worked at a factory. The two oldest daughters were away at college. Their home was in a rural setting with limited resources for professional help. The home environment appeared chaotic and full of tension. The patient, having impaired mental capacity, was unable to participate in problem solving or conflict resolution. She often struck out in an aggressive and threatening manner as a result of her frustration. The two younger daughters played outside or in their rooms, thus avoiding interaction with the family.

The first art therapy session began with a group picture of “drawing things that you like.” It took a long time for J. and K. to get started. They required a great deal of encouragement, which led to a drawing of sunshine, a river, rainbows, rainbow fish, people and flowers. The composition appeared to be a struggle to find order among their chaotic home environment exemplified by the multiple rainbows. At the end of the session, they appeared less inhibited and expressed enjoyment.

Family pictures were common themes (Figures 3 and 4). K. would say, “This is dad but he’s never happy.” J. would say, “All they do is fight, fight, fight,” and draw her face in white. She felt she was not noticed in the family. Houses were drawn spontaneously by both children (Figures 5 and 6). J. always had very small doors on her houses, suggesting psychological inaccessibility. In other discussions, they were asked to remember their mom before she was sick. Both would reply, “I only remember her being sick.” This would lead them to regress to scribbling in drawing. Coupled with the small doors on houses, there seemed to be something repressed from the past.

Individual art therapy centered on discussing and expressing feelings. The family had trouble expressing and identifying feelings. Anger and “being mad” became the focus for one session. The therapist stated that angry feelings could be safely expressed through art. This statement gave permission to unleash the anger that was obviously repressed. Heavy black and red marks filled their paper. Several drawings of this nature were made in their one-hour session. The energy to draw and release anger was vibrant and ended with exhaustion.

As the children drew many rainbows dedicated to mom, dad, friends, the hospice social worker and art therapist, one picture drawn by K. led to a dramatic enactment. This was a rainbow, a pot of gold and a man. She stated “He’s mad and do you know why? Because someone else got to the pot of gold first and took all but two pieces, now some birds are taking those too.” She laughed and repeated the
When Mrs. C. was present, she was encouraged to join art therapy. She spent an hour drawing a small sunset which could be perceived as a symbol of her life coming to an end. The children showed frustration with her debilitating ability to focus on a task. Tolerance was encouraged though the anger towards mom was quite evident from the children.

During the course of therapy, it was revealed that Mrs. C. had a relation with another man two years prior to her onset of cancer. The children were aware of this and were persuaded by Mrs. C. to keep it a secret from dad. It is evident that this situation brought about many repressed emotions, particularly anger. They exhibited decreasing respect for dad as they felt he was partially responsible. (Mr. C. learned of the relationship, and was also faced with a depleting savings account.) K.’s enactment with the empty pot of gold and the angry man related to this situation and was a cathartic experience through the vehicle of art.

When Mrs. C. was diagnosed with cancer, her relationship with the other man ceased. Mr. C. became her primary caregiver. The onset of cancer left many family conflicts unresolved. These conflicts were vividly expressed in the art of the younger children. (Substantial maturity has often been noted in the younger children’s ability to cope and deal with frustrations as opposed to the older children who have not experienced art therapy.)

Mrs. C. was placed in a nursing home as continued care at home became too difficult. Home art therapy sessions were held immediately following her placement. The children were eager to draw. As J. saw a previous drawing she made, she said, “I’m going to draw that girl again.” She drew her with more balloons going up in the air. This seemed to show the lighter feeling that now existed in the home. K. drew a picture of herself, her sister and a friend going down the river in inner tubes. The moments of healthy expression expressed the relief of not having constant care for mom as well as the ability to utilize a safe way to express such feelings.

On parent/child night of the art therapy group, Mr. C. worked creatively with J. and K. The children exhibited respect toward dad for his creativity and help. It was also an important milestone for Mr. C. to attend art therapy group with other parents and children as historically he was not involved in social activities. Mr. C. seemed to gain self-esteem while working with his children and received support from them and the art therapist.

The children continue to attend group sessions accompanied by Mr. C. and are seen at home twice per month.

“Unfortunately, grief is often overlooked and pathology is diagnosed.”

Summary

In life, everyone inevitably confronts loss. When mourning and grief work are successfully completed, the individual will grow and find increased strength. As professionals, it is important that we understand and facilitate the normal manifestations of grief. Unfortunately, grief is often overlooked and pathology is diagnosed. Helping an individual through grief work eliminates many of the serious psychological, physiological, sociological and behavioral problems that occur in unresolved grief. Art expression supported in a therapeutic relationship assists the bereaved child, adolescent or adult in working through the painful process of healing. Art touches feelings, experience and thoughts. Arnheim (1967, p. 41) states that art is “... an indispensable tool in dealing with the tasks of life.”

**The Master of Arts in Expressive Therapies.**

**Certificate of Advanced Graduate Study in Expressive Therapies.**

Offered by the Institute for the Arts and Human Development

Lesley College Graduate School.

For students interested in the creative modalities of art, music, dance/movement, drama, and holistic studies and healing arts presented in a clinical and theoretical framework for a variety of settings.

**Master of Education in Creative Arts in Learning.**

For students who wish to learn how to integrate the arts for careers in schools, cultural institutions, and human services institutions. Specializations in storytelling and theater studies.

*Lesley College Graduate School is pleased to announce a new Ph.D. Program in Expressive Therapies with a focus on higher education and professional leadership.*

"Utilizing Imagery and the Unconscious to Explore and Resolve the Trauma of Sexual Abuse"

Marsha Yates, B.S., Art Education. Art Teacher at Convalescent Hospital for Children, a mental health center for emotionally disturbed children, adolescents and their families, Rochester, New York.

Ms. Yates is also in the graduate art therapy program at Vermont College at Norwich University.

Kim Pawley, M.A., A.T.R., is a collaborator on this article. Ms. Pawley was previously an art therapist and coordinator of the Creative Art Therapy Department at Convalescent Hospital for Children in Rochester, New York, and currently is an art therapist at the Psychiatric Institute of Washington, D.C.

This paper explores the process of eight months in which Martha was involved in psychotherapy. Several days following the sixth psychotherapy session, Martha created this book entitled "Spontaneous." It consisted of ten line drawings done with marker. This book was created without any conscious direction or thought, and the meaning was obscure to the client. However, the meaning became clearer as the psychotherapy process unfolded. "Spontaneous" was like a map, outlining the process which Martha needed to complete in order to resolve the issues of being sexually abused.

The author and collaborator have written the narrative as they have followed Martha Williams through an extended course of therapy. (Ed. Note: The name is a pseudonym for purposes of confidentiality, and the client is referred to as Martha in the article.) The client herself contributed most of the descriptive narrative that was reformatted by author Yates and collaborator Pawley. They worked with Martha using the book of personal drawings as the basis for graphic image communication. The content was documented exactly as it was described by the client.

Martha was involved in psychotherapy. The artwork that was depicted early in the treatment process enabled her to directly deal with and eventually resolve feelings related to a history of sexual abuse. However, this was not the reason for the client's initial involvement in psychotherapy. For many years, the family could not or would not answer persistent questions regarding the mother or her death.

Martha was three and a half years old when her mother died of an embolism. The client hoped to recall unconscious visual and sensory memories of her through hypnosis and the process of psychotherapy. During this process, Martha unexpectedly discovered that she had been sexually abused by a brother. Martha was first victimized at approximately age four, when the brother was twelve, and these sexual incidents continued until Martha was thirteen.

Within several days following the sixth psychotherapy session Martha created this book entitled "Spontaneous." This book was created spontaneously and without any conscious direction or thought. When the book was complete, the images, composition, and word placement were perfect, but the meaning was obscure. Through the process of psychotherapy, Martha felt certain she would understand the meaning of this book.

Martha now understands that "Spontaneous" was like a map, outlining the process which she needed to complete in order to resolve the issues of being sexually abused. She was unable to regain visual memories of her mother because the memories of sexual abuse strongly blocked access to them. Once Martha was able to acknowledge those horrifying memories, she was able to use hypnosis to recall the relationship with her mother and the emotional bond between them.

The following is a description of the client's visual images and process involved in creating "Spontaneous." Also included is her understanding of the meaning of the content of the book, which became clearer to her much later as the psychotherapy process unfolded.

Ambivalence about Exploring the Unconscious

Figure 1 spontaneously became the cover of the book. These are Martha's hands. Each hand reflects the different feelings that she had at the beginning of this process. One hand is opening and grasping, one hand is closed, and the other hand appears frightening. During the
early stages of psychotherapy, Martha simultaneously experienced the desire to know and understand, the need to withhold information from her conscious awareness, and the fear of knowing what she had repressed in her unconscious.

Figure 2 reflects the fear of remembering something sordid that was hidden in her unconscious. In this picture Martha was so terrified that her hair stands on end and she said "I can't look" at what is causing the fear. This image was cartoon-like and funny to Martha and she later realized that humor was an unconscious defense which reduced the intensity of feelings. Other images created in this book also appeared cartoon-like and humorous, which enabled her to tolerate the repressed rage.

Figure 3, the closed hand, represented a part of her that needed to restrain the memories and feelings with forceful determination. This was also frustrating, as Martha was also equally determined to know the truth about her past. During the first several weeks of psychotherapy, she experienced an intense need to restrain and constrict her feelings.

Reexperiencing the Past and Understanding the Source of Her Fears

Figure 4 continues to graphically exemplify her internal conflict: the will to remember against the terror of remembering. To illustrate the conflict Martha consciously chose conflicting colors of orange and blue,

"During the early states of psychotherapy, Martha simultaneously experienced the desire to know and understand, the need to withhold information from her conscious awareness, and the fear of knowing what she had repressed in her unconscious."
as well as kitchen utensils and knives crossing each other. Martha had fears and fantasies that she would lose control if she allowed herself to explore the intensity of the feelings within. She imagined herself losing control on a linoleum floor in a kitchen as this would be the most painful and unsafe place.

Figure 4 also illustrates Martha’s unconscious awareness of the sexual relationship between her brother and herself. However, Martha was not aware of the phallic content of the imagery until much later in the treatment process. After fourteen weeks of psychotherapy she began to wonder if she had been sexually abused during her childhood. Approximately three weeks later, Martha realized that she had definitely had a long-term sexual relationship with the brother. Upon later reflection of the imagery, Martha wondered if the words “beat me beat me” on the rolling pin reflected an unconscious perception that the sexual relationship with the brother may have been a form of punishment.

Author’s Note:
I am uncertain of the meaning of the black hearts. The black heart on the handle of the knife may have reflected Martha’s desire for a closeness with the brother. However, the history of incest would seem to have made that type of relationship impossible. Perhaps the other black heart on the outside of the images is a symbol for her dissociation which occurred during the sexual encounters. During these instances Martha would retreat to imaginary places in her mind in an attempt to distance herself. As the incest occurred consistently at night while she was sleeping, Martha often believed that she was experiencing a nightmare. Furthermore, when Martha attempted to tell her father about the incest he repeatedly stated: “It was a bad dream.” In this new context the fear of night during her childhood and adolescence made sense.

Figure 5 illustrates Martha’s fear of losing control and fear that the anger would overwhelm and engulf her. She was unaware of the phallic content of this imagery for many weeks. Later Martha realized that the imagery graphically exemplified the emotional trauma and suffering caused by the sexual abuse. Martha knew that she was afraid of experiencing rage at her brother. By the eighteenth psychotherapy session, Martha sensed that she must allow herself to feel the intensity of the rage within. She had denied the ongoing abuse as a child, consequently she reasoned that she must resolve this as an adult by allowing herself to feel what she had denied in the past. As Martha began to recall each of the sexual incidents in detail, she realized that she had a right to be angry, but continued to feel emotionally numb. At this point Martha was not able to experience the intensity of her own anger, for fear of losing control of it.

Integrating the Understanding

Figure 6 illustrated Martha’s need to withdraw. The important phrases are “all alone,” “no windows,” and “no observers.” The “anti-grav” meant antigravity chamber. This was an imaginary place in which her body could float. In the “anti-grav” Martha was safe to experience the intensity of her feelings. At approximately twenty-seven weeks of psychotherapy, Martha began an intense period of withdrawal from her close friends. She needed time to process the memories and experiences which had surfaced in psychotherapy. This period lasted about four weeks.

“As Martha began to recall each of the sexual incidents in detail, she realized that she had a right to be angry, but continued to feel emotionally numb.”
Accepting Feelings

Figure 7 illustrated several different aspects of these feelings. This page answered the question “What would happen if I lost total self-control?” This image portrayed the feeling of being like a tightly wound coil. If the tension was released, the coil would unwind and spin uncontrollably.

This page also illustrated Martha’s unconscious awareness of the confusion, emotional conflict, and physical twisting during the struggle of each sexual incident. Each time Martha recalled new memories of the sexual abuse during psychotherapy, she experienced the sensation of spinning, and relived the intense emotional conflict illustrated in this image.

Later Martha recalled that during each of the sexual encounters, she was aware that she could not cry out and must deny the reality of what was happening to her, despite the urge to struggle. Furthermore, she blamed herself, not only for not fighting back against the brother, but also because she had enjoyed the physical closeness to a certain extent. The crucial issue in therapy was to overcome her self-blame and guilt.

As a result of the incestuous relationship with the brother, Martha had learned that she must constantly repress, constrict, and constrain her emotions. In fact, no one had believed her when she shared the concerns about this relationship. Martha had learned to hide the secret, even from herself. She stored this enormous burden within herself, and it felt like a tightly wound coil, waiting to explode within her. This conflict greatly affected Martha’s capacity for expressing herself completely, and resulted in the fear of losing control of her feelings.

Exploring New Methods of Control

Figure 8 illustrates the “dreamlike, happy, silly” mood that Martha imagined would be possible if she were able to let her emotions free. Martha realized after thirty weeks of psychotherapy that the full head figure with wings was herself, soaring. She felt that she could now transcend the denial of her feelings and perceptions as she had been taught at home. Having fully realized that the worst imaginable events were behind her, Martha felt as if she could handle anything, and that nothing would hold her back again.

She sensed that she now was at liberty to explore and “discover” the depths of her unconscious, and that she had a greater capacity to reach her own creative potential.

Figure 9 illustrates a figure with movable limbs that are capable of twisting and turning full circle by the use of the reader’s finger. This figure seemed to be the most humorous to her, yet she lacked any understanding about the entire page at the time of its completion, and for weeks afterward. Between the twentieth and thirtieth psychotherapy sessions, Martha no longer felt emotionally numb and began to feel the rage towards her brother. Martha was also angry at her father for not protecting her and denying the reality of the situation. Martha then realized that this figure represented that her body was manipulated and used for someone else’s satisfaction.

Later in the psychotherapy process, other words on this page began to make sense to her. The phrase “backwards and up” is a reference to looking “backwards” in time at
her development and bringing "up" from her unconscious these new memories. "Establishing new methods of control" is a statement which expresses the directness and honesty with which Martha could now respond to her feelings, as opposed to the denial of them as the family taught. "To the right" is a response to a question that a co-therapist had asked in the sixth session—the one just prior to the completion of this book. He had asked: "On which side would you place the fear in your mind, and on which side would the memories of your mother belong?" It wasn't until the twenty-eighth session that Martha connected that her response to that question was also indicated on this page. Martha had stated that "the fear was on the left, and 'to the right' were 'discoveries' and memories of my mother." During the sixth session, Martha had indicated a need to explore separately and resolve the fears in her mind before she could explore the memories she sought of the mother. In fact, this was the progression of the subsequent psychotherapy sessions.

Redefining Relationships

Figure 10 was unclear to Martha at the time of rendering. At approximately the thirty-third psychotherapy session, Martha realized that the doodles represented changing patterns of responses to anger. At this time, Martha was able to overcome her fear of losing control of feelings and felt rage at both the brother and father in its totality. Martha now deals with anger more directly, rather than unconsciously denying it or using humor to suppress the anger. Martha feels more in control of her feelings.

Gradually Martha realized that she must choose between allowing herself to be furious with the brother and father, or continue to feel depressed and victimized. She realized that she needed to confront both the brother and the father and make them responsible, despite Martha’s reluctance to do so.

Martha’s brother was totally honest with her; he expressed his feelings of guilt, and a desire to undo the past between them. Martha was able to forgive him, her anger dissipated, and she felt that their relationship was strengthened.

Martha’s father responded by acknowledging that there had been an incestuous relationship between the brother and her, but he said that he was not responsible for the brother’s actions. The father did not remember Martha’s attempts to tell him about the incest during the childhood years. Martha’s feelings of intense unresolved anger resulted from his inability to listen to these concerns and protect her as a child. His constant reinforcement of a false reality, denial, and unwillingness to hear the truth seemed to be more psychologically damaging than the actual incest activity. Despite Martha’s attempts to explain to her father about the suffering caused by his lack of response, he was unable to comprehend this, or acknowledge her resulting anger towards him. Martha grieved the death of the "good father” image that enabled her to survive for so many years. With great difficulty Martha has had to accept the inadequacies of her father, and his inability to understand her emotional needs. Throughout Martha’s childhood, she had attributed this to the grief he was experiencing due to the death of Martha’s mother.

Toward Resolution

The process described in “Spontaneous” began to unfold when Martha looked more deeply at her fears, questioned them, and remembered that she had been sexually abused throughout her childhood. Midway through the psychotherapy process, Martha also became involved in an adult therapy group for women who had been sexually abused as children. Hearing other group members share their experiences enabled Martha to understand

\[2^T.A.S.A.\, \text{T}h\text{erapeutic Alternatives For Sexual Abuse. "Survivors Group" is a thirteen week program offered by Family Services of Rochester Inc.}\]
that her feelings and process towards resolution were common with the other group members. In addition, by reading on the topic of sexual abuse Martha had a greater understanding of the process of victimization. Martha realized that she was not alone.

By creating art and being involved in psychotherapy Martha learned about the healing process. She could not achieve new insights until she had completed each phase of the process. However, it was painful for her to scrutinize her thoughts and feelings during each phase and frustrating as she was anxious to complete the entire process.

During phase one Martha began to allow herself to use her unconscious to explore the feelings of her past. During phase two she began to reexperience the circumstances and trauma of the sexual abuse. During phase three she acknowledged the fears of losing control of feelings and understood the origin of these fears. During phase four Martha explored new methods of control and gained an increased capacity to express feelings. During phase five Martha acknowledged her rage and confronted those who had victimized her.

Through psychotherapy Martha learned how to gain access to her unconscious by using imagery during hypnosis and creating art.

Rather than fear and repressing her unconscious, Martha learned that her unconscious is a reservoir of feelings and thoughts that she can use as a source for new imagery. Through this imagery, psychotherapy, and perseverance Martha has worked toward resolution of difficult emotional issues. As Martha states: “I have a new enthusiasm for creating art, and I will continue to explore the relationship between my unconscious and creative selves. It is through the knowledge of my unconscious and through expression in imagery that I have been healed.”

Postscript

By collaborating with Martha on constructing this article, I achieved great insights into the power of art to reflect the unconscious. The artwork Martha created helped to clarify many conflicting feelings and helped her to more fully participate in the psychotherapy process. The artwork made in the early stages of psychotherapy and her description of the process helped me to be more sensitive to the client’s struggle to overcome intense fears of the unconscious as they worked toward self understanding and emotional resolution.

I have learned to let the client lead the direction in treatment. I realize now how important it is to allow imagery to emerge spontaneously rather than pursue or persuade images to surface in an art form. It is also extremely important for the client to find their own personal meaning for their art work at their own pace as they move through the treatment process. For Martha, the pages of her drawing book were not clear to her until the latter stages of her psychotherapy. Yet the meaning of her images will not doubt take on even more fuller meanings as she continues in her life. I now have great respect for the emotional defenses that impede on the treatment process, yet I have even more faith in the client’s efforts to seek emotional growth.

Through our discussion and by observing the intensity of the art work she created, I better understand how the trauma of sexual abuse effects the individual’s capacity to express him/herself freely and the ability to relate to others due to distorted self-perceptions. I now understand the feelings of self-guilt and blame which are, in part, due to the confliction desires for physical affection and feelings of repulsion and anger in the incestuous relationship. The client in treatment needs to have reality affirmed and conflicting feelings fully accepted and acknowledged.

The greatest gift I gained in collaborating on this article was to experience the emotional strength, courage and determination of this woman as she worked to overcome enormous obstacles and share her story with those who may learn from it.

The American Art Therapy Association, Inc.
MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

RETURN THIS APPLICATION WITH YOUR REMITTANCE
Guidelines for Authors

Please submit four (4) copies of manuscripts to: Art Therapy
Editor Gary Barlow, Ed, ATR, Wright State University, Creative
Arts Center, 228 Creative Arts Center, Dayton, OH
45435. Send manuscripts and illustrations certified mail,
with return receipt requested. Only original articles that are
not under review by another periodical are acceptable.
FORM: Typewritten, double-spaced on 8½ × 11 inch bond
paper, with at least 1½ margins.
STYLE: Prepared to conform to the Publication Manual of
the American Psychological Association (Third Edition), avail-
able from APA Headquarters, 1200 17th Street, NW,
Washington, DC 20036.
COVER PAGE: A detachable cover page to facilitate blind
review should include the full name(s) and degree(s) of the
author(s), professional affiliations, and the return mailing
address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the
main ideas of the paper is required.
SECTION HEADINGS: The organization of the paper
should be clearly indicated by headings and sub-headings,
if appropriate.
FIGURES: For line drawings, use black ink and a good
grade of white drawing paper. Photographs must be
5” × 7” black-and-white glossy prints with high contrast.
Charts, diagrams and tables should be of professional
quality, and legible enough to withstand reduction.
Write figure numbers on gummed labels and attach to
the back of all figures. Captions must be typed and sub-
mitted on a separate sheet. In the text, refer to figures as
Figure 1, Figure 2, etc.
Authors must obtain permission to reproduce the figure
from a copyrighted source.
REFERENCES: References must be typed, double-spaced,
in alphabetical order, on a separate sheet.

Welcome to summer! Many of you are looking forward to the long-awaited vacation, even though it goes much too quickly. A book that you might want to take with you is one that has once again come to my attention. It is a short paperback (only 80 pages) but it is a sensitive, moving description about a summer camp for handicapped children—a true story of how dying youngsters became kings, pirates, mountain climbers, and anything their imaginations could let them become. Ron Jones' true story is a moving, haunting story that will stay with you for a long time. *The Acorn People*, by Ron Jones, (1985) is published by Bantam Books, Inc., 666 Fifth Avenue, New York, N.Y. 10103. The cost is $2.50 plus postage.

Articles in this issue focus on research, specific assessments, and work with different populations with varying emotional or physical conditions. "Graphic Characteristics on the Draw-A-Person Test for Identification of Physical Abuse," by Frances M. Culbertson and Anna C. Revel, uses the DAP and the Wechsler Intelligence for Children to identify characteristics of physically abused children. As the authors state, "the utility of psychological assessment data providing probability statements or inferences of physical abuse in children has been minimally researched" (see Introduction to the article). Their study utilizes three groups of students: physically abused children who are learning disabled or emotionally disturbed; non-abused learning disabled children; and non-abused emotionally disturbed children. All children were given complete assessment batteries, and standard scores were obtained. Readers should find the results, in various categorical classifications, interesting and stimulating for further research and study, as well as focusing on some of the intricacies of the content.

Rawley Silver presents an article titled "Sex Differences in the Emotional Content of Drawings." Her study focused on the possible differences that may exist relative to sex or age in the expression of emotions in particular drawings completed by the subjects. As Silver states, "This study was an attempt to verify and/or amplify preliminary findings ... by using larger and more diverse populations coupled with a more controlled research design" (see Introduction to the article). Drawings were completed by boys and girls, women and men, from the Stimulus Drawings (previously published by Silver). Significant differences were found, and from an overview of the findings, the author presents a composite male description and a composite female description. The author asks some very important questions at the close of the article that might "spur us on" to continued important research using Silver's study as a foundation on which to continue. Silver, in fact, states that "These questions suggest that further research with larger and more diverse populations is worthwhile and necessary in order to build up on the knowledge already obtained" (see Discussion section).

David R. Henley's article, "Art Assessment with the Handicapped: Clinical, Aesthetic, and Ethical Considerations," asks the reader to take a close, intense look at assessment methods in non-traditional settings (such as schools and agencies that provide services for the handicapped person). He explores problems of interpretive assessment as it is used with the physically and mentally handicapped person, and offers "... case studies ... chosen for their enigmatic and contradictory content ..." (see Abstract). The author raises questions, identifies possible areas of controversy, and asks some hard questions. The historical importance of Viktor Lowenfeld (who raised the issue of the distinction between the diagnosed handicap and the emotional response to the disabling condition) serves as a foundation for the author's premises, and specific reference is given to a case as described by Emanuel Hammer. Case descriptions are presented, followed by a discussion and concluding remarks. David Henley, throughout his article, supports the premise that we should adopt a restrained, cautious approach when interpreting client or patient art work; this approach seems to be important for any art therapist to consider, but especially those who are—or will be—working with the populations described by the author.

The reader of *Art Therapy* may wish to re-read previous book reviews that pertain specifically to content contained in articles in this issue. For example, a review of The Lowenfeld Lectures: Viktor Lowenfeld on Art Education and Therapy was published in the July, 1986 issue (Volume 3, Number 2), and the Silver Drawing Test of Cognitive and Creative Skills appeared as a review in the March, 1985 issue (Volume 2, Number 1). An article, "The Stimulus Drawing Technique with Adult Psychiatric Patients, Stroke Patients, and in Adolescent Art Therapy," by Sandburg, Silver and Vilstrup is included in the October, 1984 issue (Volume 1, Number 3).

Congratulations are in order for our illustrious professional "Art Therapist/Authors" who have had new books published within the last year or two. Their contributions serve to build knowledge and give insight in our field of professional work, and their books are certainly welcome additions to our literature. Myra Levick's book *Mommy, Daddy, Look What I'm Saying: What Children Are Telling You Through Their Art* was reviewed in the November, 1986 (Volume 3, Number 3) issue of *Art Therapy*, and Shaun McNiff's book *Educating the Creative Arts Therapist, A Profile of the Profession* (1986) is reviewed in this issue. Helen Landgarten has a new book titled *Family Art Therapy*, published by Brunner/Mazel, and will be on the market this
summer. *The Artist As Therapist* (1987) by Arthur Robbins is reviewed in this issue of *Art Therapy*. Two additional books have just arrived on my desk, and will be reviewed in a future issue of *Art Therapy*. One is by Harriet Wadeson, and is titled *The Dynamics of Art Psychotherapy* (1987), published by John Wiley & Sons, and the other is *Approaches to Art Therapy, Theory and Technique* (1987, Brunner/Mazel) by Judith Rubin. These are just a few of the writers in art therapy who are active in publishing and, although it may sound meager or insufficient, my "thanks" to all of you is sincere and appreciative for the contribution that you are making.

Let's all plan to attend the National Conference in Miami, Florida. The theme is "New Directions in the '80s," and it should not only be a good series of meetings, but the locale is also inviting. Look for information elsewhere in this issue, as well as in our *Newsletter* and other special mailings.

Let me hear from you. Are there any potential authors of articles out there who need help in finalizing the draft of an article prior to submission for review? Do you need advice, or specific information? I'll be happy to talk with you by telephone, or drop a note to me requesting the information.

Gary C. Barlow, Ed.D., ATR
*Editor, Art Therapy*

---

**Journal Associate Editor Sought**

The Executive Board at its fall meeting determined that an Associate Editor of *Art Therapy*, AATA's journal, be sought. The responsibilities of the Associate Editor will be to assist Editor Gary Barlow. Since the Journal has not had an Associate Editor previously, the new Associate Editor will work with the Editor in current editorial practices, as well as further defining the duties of the position. Gary Barlow has been reappointed as Editor for a second term of four years beginning November 1987. It is anticipated that the Associate Editor may assume the Editor position in 1991.

If you are interested in applying for the Associate Editor position, please send a copy of the following to Harriet Wadeson, Publications Chair, and to Gary Barlow, Editor:

1. Resume
2. Writing sample
3. Statement of interest, including relevant background and qualifications as well as ideas for development of the Journal.

Contact Gary Barlow if you have questions regarding the editorial responsibilities in producing the Journal.

ART THERAPY EDUCATION PROGRAM LISTINGS
1987

Guidelines for Art Therapy Training are available from the AATA National Office

AATA APPROVED PROGRAMS*

The following constitute a list of graduate level training programs that have applied and received approval of the Association. Approved programs have met the standards set forth in the Guidelines for Academic, Clinical, and Institute Art Therapy Training. Approval of Programs must be renewed annually.

*Approved as of 5/87

GRADUATE DEGREE PROGRAMS:

COLLEGE OF NEW ROCHELLE, initial approval 10/84; Contact: Patricia A. St. John, EdD, ATR, Director, Graduate Art Programs, New Rochelle, NY 10805, (914) 654-5279. MS in Art Therapy.

COLLEGE OF NOTRE DAME, initial approval 10/85; Contact: Doris Arrington, EdD, ATR, Graduate Dept. of Art Therapy, Belmont, CA 94002, (415) 593-1601. ATM in Art Therapy.

EASTERN VIRGINIA MEDICAL SCHOOL, Initial approval 10/84; Contact: Masters Program in Art Therapy, P.O. Box 1980, Norfolk, VA 23501, (804) 446-5157. MS in Art Therapy.

GEORGE WASHINGTON UNIVERSITY, initial approval 10/79; Contact: Katherine J. Williams, MA, ATR, Director, 2129 G Street, Building L, Washington, DC 20052, (202) 994-6285. MA in Art Therapy.

HAHNEMANN UNIVERSITY, initial approval 10/79; Contact: Ronald E. Hays, MS, ATR, Director, or Myra Levick, PhD, ATR, HLM, Creative Arts In Therapy Program, Broad & Vine, M.S. 424, Philadelphia, PA 19102-1192, (215) 448-8076. Masters of Creative Arts in Therapy – Art Therapy (MCAT).

HOFSTRA UNIVERSITY, initial approval 10/84; Contact: Lillian C. Resnick, ATR, Coordinator, Creative Arts Therapy Program, Department of Counseling, Psychology & Research in Education, Hempstead, NY 11550, (516) 560-5755. MA in Creative Arts Therapy.

LESLEY COLLEGE, initial approval 5/82; Contact: Shaun McNiff, PhD, ATR, Director, Lesley College Graduate School Arts Institute, 29 Everett Street, Cambridge, MA 02238, (617) 868-9600. MA in Expressive Therapies.

LOYOLA MARYMOUNT UNIVERSITY, initial approval 10/79 at Immaculate Heart College; Contact: Helen Landgarten, ATR, HLM, MFCC, Director, Graduate Department of Clinical Art Therapy, 7101 West 80th Street, Los Angeles, CA 90045, (213) 642-4562. MA in Clinical Art Therapy.

MARYWOOD COLLEGE, initial approval 11/86; Contact: Sr. Dorothy McLaughlin, RSM, EdD, ATR, Art Department, Scranton, PA 18509, (717) 348-6211. MA in Art Therapy.

NEW YORK UNIVERSITY, initial approval 10/79; Contact: Laurie Wilson, PhD, ATR, Art Department, 755 East Building, 239 Greene Street, New York, NY 10003, (212) 598-3481. MA in Art Therapy.

STATE UNIVERSITY COLLEGE AT BUFFALO, initial approval 4/82; Contact: Lucy Andrus, MS, ATR, Coordinator, Art Therapy Studies, Art Education Department, BI 108, 1300 Elmwood Avenue, Buffalo, NY 14222, (716) 878-5721. MA or MS in Multidisciplinary Studies (Art Therapy).

UNIVERSITY OF ILLINOIS AT CHICAGO, initial approval 2/85; Contact: Harriet Wadeson, PhD, ATR, Art Therapy Department, School of Art and Design, Box 4348, Chicago, IL 60608, (312) 413-2328. MA in Art Therapy.

UNIVERSITY OF LOUISVILLE, initial approval 5/81; Contact: Vija B. Lusebrink, PhD, ATR, Director, Department of Expressive Therapies, Belknap Campus, Louisville, KY 40292, (502) 588-5265. MA in Art Therapy.

"ATRA" is defined as an Active Registered Art Therapist with the American Art Therapy Association, Inc.
VERMONT COLLEGE OF NORWICH UNIVERSITY, initial approval 10/79 at Goddard College; Contact: Gladys Agell, PhD, ATR, Director, M.A. Program in Art Therapy, Montpelier, VT 05602, (802) 223-8810. MA in Art Therapy.

WRIGHT STATE UNIVERSITY, initial approval 11/81; Contact: Gary C. Barlow, EdD, ATR, Director of Art Therapy, 228 Creative Arts Center, Dayton, OH 45435, (513) 873-2758. Master of Art Therapy (MAT).

CLINICAL TRAINING PROGRAM:

HARDING HOSPITAL, initial approval 11/86; Contact: Don Jones, ATR, LM, Director, Adjunctive Therapy, 445 East Granville Road, Worthington, OH 43085, (614) 885-5381. Certificate in Art Psychotherapy.

OTHER EDUCATIONAL OPPORTUNITIES

The following programs submitted information to AATA indicating their coursework offerings in art therapy. The Association does not endorse programs other than Approved Programs and the entries below are listed for informational purposes only.

It is recommended that interested persons contact program personnel directly for further information and, in addition, review AATA's Guidelines for Academic, Clinical and Institute Art Therapy Training.

DOCTORATE PROGRAMS:

HAHNEMANN UNIVERSITY, Contact: Ronald E. Hays, MS, ATR, Creative Arts In Therapy Program, Broed & Vine Street, M.S. 424, Philadelphia, PA 19102-1192, (215) 448-8076. PsyD or PhD in Clinical Psychology with specialization in Creative Arts In Therapy.

ILLINOIS STATE UNIVERSITY, Contact: Dr. Marilyn Newby, Art Department, Normal, IL 61761, (309) 438-5621. EdD with emphasis in Art Therapy.

Art Assessment with the Handicapped: Clinical, Aesthetic and Ethical Considerations

David R. Henley MA, ATR, Associate Professor and Chair, Department of Art Education and Art Therapy. The School of the Art Institute of Chicago, Chicago, Illinois. Private Practice.

Art therapists who practice in nontraditional settings such as in schools, and other agencies that provide services for the handicapped populations, are frequently challenged to defend their assessment methods. In contrast to the clinical setting, those in the educational or behavioral sphere appear to remain skeptical of the validity of interpreting client artwork.

In this article, the author explores the problems of interpretive assessment as applied to the physically and mentally handicapped person. The case studies under discussion were chosen for their enigmatic and contradictory content, thus illustrating the clinical, aesthetic and ethical problems of relying upon interpretive assessments as a major art therapeutic resource.

Overview

As an art therapist who practices in predominantly educational settings, I am often aware of a frequent topic of controversy concerning our profession—that of diagnosis; diagnosis in this context refers to the interpretive assessments of children’s artwork. Many professionals within the fields of special education and art education remain dubious of art therapists who rely heavily upon projective techniques in attempting to explain a child’s inner dynamics or predict future behaviors. They continually voice their concern to the author about how such interpretations can be overly subjective, leading to questions of validity. They consider projective assessments (especially among the handicapped populations) to be based upon stereotyping rather than empirical data, which can lead to easy rationalizations and self-fulfilling prophecies.

Psychologists from a cognitive orientation may be especially critical of clinically based-affective interpretation. Their concern is that many formulations of child artwork reflect not the child’s perceptions but are based upon adult symbolization. An example is the clinician who assesses a drawing according to its psycho-dynamic symbolism when in fact, the child had created a narrative piece almost verbatim from his/her favorite television show.

Psychologists such as Winner and Gardner (1980) call attention to the environmental factors that may affect the outcome of the child’s art production. The child whose drawn figures are positioned at the bottom of the picture—are these expressions of powerlessness and insufficiency, or is the easel positioned out of the child’s reach?

Hammer raises the question whether “a given drawing response reflects overt conscious trends or unconscious latent tendencies” (1959, p. 640). Hammer concedes that not all graphic elements necessarily reflect deep dynamic tendencies.

It is this controversy over interpretation of artwork as especially applied to children in special education programs that is the focus of this article. Exploration of the dynamics of interpretive assessments is done by drawing upon case studies that were selected because of their enigmatic and contradictory contents. Using an assessment approach developed by Lowenfeld (1957) the author explores the relationship between the child’s objective and subjective handicap as applied to his/her concept of body-image.

The discussion of diagnostic assessment is limited to two populations: the physically handicapped and the mentally handicapped. The former group includes individuals who have sustained traumatic or congenital damage to their sensory and/or bodily systems. The latter group includes those with traumatic or congenital brain damage that has resulted in mental retardation and other related neurological disorders. These two populations have been chosen because they are frequently encountered in art education therapy settings where it is applicable to use Lowenfeld’s theory and practice of client assessment.

The Lowenfeld Approach

In 1957 Lowenfeld first raised the issue as to the subtle yet important distinction between the diagnosed
handicap and the subsequent emotional response to the disabling condition. Lowenfeld contended that two individuals may share identical mental or physical defects, but their attitude toward their disability and their capacity to emotionally adjust to it may greatly differ. Lowenfeld further asserted that the successful outcome of art education-therapy hinges upon the clinician’s ability to discriminate between the diagnosed and the subjective response to the handicap. Once a baseline is established which measures the objective extent of the diagnosed disability and the subjective response, it is possible then to appraise how far the therapeutic process must proceed until both are brought into a harmonious balance.

This concept implies that the art therapist may work with a wide range of disabled populations without necessarily encountering psychopathology. For instance, a child with a congenital birth defect may function normally within his/her limitations, effectively compensating for the loss without ever thinking twice about the “problem.” Indeed, he/she may not be able to imagine life any other way, thus the handicap becomes a normal part of everyday life. In this case, the focus of the child’s art programming would be educationally or recreationally based without any cause or need for therapeutic interventions beyond an empathic and supportive environment. However, this same child may at some time enter into a new social, familial or physical situation that adversely affects his/her capacity to cope. In this case, the handicapping condition may now aggravate or precipitate increased anxiety and stress, resulting in possible emotional maladjustment. Such a predicament would then warrant art therapeutic interventions that would address these issues and attempt to neutralize them before serious emotional trauma is sustained.

The artwork produced in these circumstances may reflect the child’s situation and thus becomes a useful tool and resource of the art therapist. In this instance, the artwork can assist the clinician in identifying the onset of emotional disturbance and then follow the effects of the art therapy process during the child’s treatment.

However, in the author’s treatment approach the question of pronouncing the content in a child’s artwork as being pathological is an exceedingly cautious one. In most cases, a child within the author’s program will not be considered in need of treatment because his/her physical or mentally handicapping condition is revealed or confirmed through the artwork. The author maintains that each child should be considered to be adapting and fully adjusted until the presence of behavioral symptoms convinces us otherwise. In this way the author resists being tempted by the “hazards of gratuitous interpretations that amount to preconceived, self-fulfilling prophecies” (Hammer, 1958, p. 642).

Researchers have documented the extent to which a child’s psychomotor activities are preserved and projected through the art medium. Such psychomotor patterns will reflect, to some extent, the child’s developmental level and his/her sense of self-image. Few art therapists, art educators or critics would quarrel with the hypothesis that the artist, including the physically and mentally handicapped, projects facets of his/her personality through the art productions. Problems arise however, when the attempt is made to assign significance to these interpretations, especially in regard to diagnosing pathological material. The tendency among many is to become preoccupied with imagery that displays any form of distortion, emphasis or immaturity, and then pronounce the artist emotionally at risk on the strength of these deviations from the norm.

Hammer’s Case History

Emanual Hammer (1958) begins his seminal study on the application of projective techniques with a House-Tree-Person Test, drawn by a young man who was born without his left arm. In the figurative component of the test, the missing arm is represented, while the hand is depicted as atrophied and nonfunctional; otherwise the figure is competently drawn without any other psychomotor conflict. This issue surfaces again in the tree drawing by the presence of a broken tree limb depicted on the exact side and relative placement of the missing limb. With further documentation from the chromatic figure drawing, Hammer supports the thesis that this individual has unconsciously projected feelings of ‘insufficiency’ through the presence of the distortion. Such an interpretation would be shared by many art therapists. But in fact, the withered hand offers little real evidence suggestive of emotional

“... the art therapist may work with a wide range of disabled populations without necessarily encountering psychopathology.”
maladjustment. The drawing does graphically reflect concern or even consternation over this severe congenital defect. Yet such a concern should not support the automatic correlation between the man's acknowledgement of his handicap and the presence of the slightest emotional liability.

In this author's clinical experience, handicapped individuals routinely allude to the emotional pain, the embarrassment, the inconvenience and other affective expressions that come with living with an adventitious or congenital defect.

Such reactions, to this author’s thinking, are perfectly natural and understandable. Indeed, alluding to these emotional reactions suggests a healthy test of appropriate sensory affect. The author would become concerned however, had this man drawn his limbs perfectly intact, thus suggesting that far more primitive and delusional defense mechanisms were at work.

Thus, it is Hammer’s ‘speculative leap’ from acknowledging the handicap and his subsequent confusion over the man’s emotional response, that the author finds unsupported. However, had this man elaborated his figures with other more symptomatic symbolism, the assessment would be then reconsidered. The following case account from the author’s clinical experience illustrates such a situation.

Case Account: A Physically Handicapped Individual

Ronny was a nineteen-year-old black student participating in a studio art program at a school for hearing impaired children. Although profoundly deaf and legally blind, Ronny’s self-portrait figurative drawings were rendered anatomically intact with a somewhat rigid but firm line. Yet, as is the case of many physically handicapped individuals, Ronny’s sense of body image included an acknowledgement of being visually impaired; he always depicted the eyes as untouched whiteness of the paper surrounded by thick, black-framed glasses. Perhaps Ronny saw the thick lenses as preventing the clear image of the eye to shine forth, or maybe by omitting the eyes, Ronny was expressing some inner truth about organs that have failed and do not warrant acknowledgement or embellishment. In any case, such an omission is routine among the partially sighted who are capable of rendering their likenesses.

Ronny’s drawings were dynamic for a sensory deprived individual coping within a sheltered environment. His figures were always exploring and sometimes transcending their limitations by engaging in all kinds of action. Ronny particularly enjoyed creating scenes involving travel and modes of transportation. It seemed that by creating these scenes, Ronny would be allowed some measure of vicarious enjoyment of the pleasures that come with barrier-free movement. Such images served an adaptive and compensatory purpose for Ronny and were encouraged during his art education programming.*

*Returning to the author’s tenet that until symptomatic behavior is unequivocally demonstrated, the handicapped child should be able to create art in a nonclinical atmosphere conducive to solving aesthetic and art educational problems.

... handicapped individuals routinely allude to the emotional pain, the embarrassment, the inconvenience and other affective expressions that come with living with an adventitious or congenital defect.”
came bound together in fantasy, with each new acting role constituting ever more unattainable ego ideals. It was apparent that the issue of graduation had precipitated this identity crisis. Ronny was facing a stressful transition from the security of the residential school setting to an uncertain future back in the urban ghetto. Instead of being challenged by academic work, he was facing a worklife in a sheltered workshop which he vehemently regarded as being menial and "beneath his ability." He accused his vocational counselors as being racially biased, for steering him toward "slave labor with the retards." To combat such stress, Ronny began to ignore his teachers and counselors, preferring instead to take refuge in his delusions. Despite the sincere and sensitive reality-based interventions of all his support staff, Ronny firmly asserted that his salient goal was to pilot a 'Lockheed L-1011' after high school graduation.

During this stormy period in Ronny's life, he created several drawings that reflected the denial of his sensory and cognitive limitations. Because this mechanism of defense is potentially dangerous to confront, the author's art therapeutic interventions remained low-key. Ronny was encouraged to explore avocational and vocational alternatives in his artwork. He was shown illustrations of men working in trades that were within his abilities. With consistent and empathetic support, Ronny eventually displayed a willingness to abandon this mode of wish fulfillment. After several transitional pieces, Ronny began to demonstrate a relaxation of his denial defenses. As illustrated in Figure 2, Ronny began to confront his delusions as evidenced by his replacing himself as the pilot of the aircraft with a sighted individual. This picture suggests that Ronny had been able to renounce his unrealizable dreams and once again acknowledge his limitations of being deaf/blind. What is interesting is that Ronny is still depicted in the role of a co-pilot and in doing so, reaffirmed his need for vicarious pleasure and stimulation. This addition to the picture powerfully argues for his need of sensory stimulation and control. While Ronny had successfully again acknowledged his handicap, he had no intention of renouncing his hopes for a "better life that is usually due a deaf/blind child."

The artworks that emerged during this period give testament to the compelling resolution of an emotional conflict. The assessing of the artwork in this case took on an active, functional role of confirming and elaborating upon the nature of the conflicts that arose. In studying such

*There is often a preconceived hierarchy among those with handicaps, with those with severe/profound retardation being lowest in the pecking order.

*Ronny's quote interpreted from Signed English.
a sequence of artworks, one can clearly discern the cyclical progression, regression and reintegration during the art therapy process. Thus, Lowenfeld's goal of maintaining an even balance between handicapping condition and emotional adaptation were fully realized.

The Mentally Handicapped

In continuing our discussion, the focus remains upon assessing client artwork from the perspective of Lowenfeld's objective/subjective handicap theory and practice. In addressing the needs of the mentally handicapped, an expansion is made on an emphasis from the issues of body ego and self-concept to also encompass the developmental concerns of this population.

In studying the art of the mentally retarded person, the salient issue is for the clinician to develop the capacity to view each art production beyond the obvious predictions of developmental arrest and ideational impoverishment. While it is important for the clinician to be able to discriminate the stage at which the mentally retarded is functioning, it is more crucial that our assessments resist being encumbered by normative comparisons and other preconceptions. Although the art of mentally retarded people often is limited in representational ability, use of perspective and technical sophistication, their work can be unexpectedly fresh and expressive. As is the case with the normal populace, the incidence of artistic ability as well as the presence of psychopathology will be distributed throughout the population. Just as there may be a normal child who is gifted in a particular art form, there will be a mentally retarded counterpart who displays uncommon artistic ability within the scope of the characteristic population. The art of the retarded person in many cases, cannot be duplicated by the intact child; such art seems to integrate the deficits associated with mental retardation along with some capacity for graphic expression that results in highly idiosyncratic, original art productions (Henley, 1986).

Thus, it serves little diagnostic purpose to pronounce a child mentally retarded or developmentally disabled via the art assessments. What is of greater concern is whether this mentally retarded child is holding up under the stresses and difficulties that come with being severely sensory, physically and cognitively affected. It has been only in recent years that the mental health professions have addressed themselves to assisting the retarded child in realizing his/her potential. They have only recently been given an opportunity for normal sensory and cognitive stimulation in their educational programs. Thus it is the 'nurture' issue that stands before the 'nature' issue, when assessing the art and art process of the mentally handicapped.

Case Account: A Mentally Retarded Individual

Our first case involves a young man of twenty-one who was a non-verbal, Down's syndrome individual with severe mental retardation. John was a productive and avid recreational artist, working in the art studio in the large residential institution where he resided. Like many of his peers, John had a rigid sense of routine and a firm set of preferences. These needs were reflected in his art process, where he would only work on white paper with a black felt-tip or roller-tip pen, with his themes being exclusively figurative.

Although this procedure affected the scope of the subject matter and medium, John's treatment of the human figure was something special. Figure 3 attests to John's ability to take developmentally arrested figures and make them aesthetically interesting. It is apparent that John had remained in a schematic-dawning realism stage of development (Lowenfeld)—like most of his Down's syndrome peers. What was atypical was his ability to modulate his lines and forms using design devices that are reminiscent of Abstract Expressionism, African Primitivism, the L'Art Brut of Jean Dubuffet and even Post-Modern styles of art seen today in New York's East Village. There is a dramatic discrepancy between the seemingly regressed distorted body imagery and the sophisticated, dynamic treatment of the figurative form.

Upon assessing this piece, the art therapist would ordinarily point to the overt sexual and aggressive forms that are repeated throughout the schema. The ears (horns) or the nose, and even the elongated phallicus itself, impart a sexually charged figure of substantial pathology. The gnashing teeth and confused eyes contribute further to a sense of tension. Yet in direct contradiction to this interpretation, John's behavior was relaxed, outgoing and sexually/aggressively appropriate. Nothing in his manifest behavior suggested the slightest emotional disturbance. Figure 4 portrays the figure as being split from itself. Such disassociative features Machover (1949, p. 118) concludes, are visually suggestive of schizophrenia. The eyes and nose (?) in this piece have detached and migrated to the edge.
of the paper. The body is virtually an abstraction of considerable inventiveness and graphic power. Figure 5, a portrait rendering, makes use of distortions, omissions and simplifications that are handled with verve and skill. The composition is at once developmentally regressed and graphically sophisticated. The furtive glance of the eyes which Machover (1949, p. 48) sees as an aggressive method of social control, contributes to the enigmatic effect of the piece. The expression of dislocation and isolation make the work more powerful and disturbing. The elaboration across the midline of the face and at the chin are extraordinary cosmetic design devices.

Case Account: A Teenager with Down's Syndrome

Another Down's syndrome young man of sixteen (referred to as Chris) delighted in lifedrawing, especially models in costume. In this piece, Figure 6, the model (another Down's syndrome teenager) had painted his face, donned an electric orange wig and broad outlandish smile. These expressions are captured with a wit and humor that essentially transcends developmental criteria. The drawing possesses none of the glib, self-conscious preciousness one finds in the art of contemporary "primitives."

The work of both John and Chris emphasizes that normative comparisons between different artist populations is fraught with contradictions, misleads and limitations. In each case, the client combines material that is developmentally arrested, and psychodynamically at risk, with an innate sense of graphic design. In contrast to the psychomotor patterns, each client lived fully adjusted and creative lives, virtually untouched by pathological behaviors. These two cases are not atypical; there are numerous accounts of cases whose artists remain richly enigmatic, defying our empirical formulations and assessment skills.

Case Account: Two Mentally Retarded Individuals

In contrast, Figures 7 and 8 represent the work of two mentally retarded individuals who succumbed to pressures and stresses resulting in severe emotional disturbances. Figure 7 represents a house, figure and other fragmented forms. The house floats around the midline of the paper and is built like a fortress or prison with a ring of confining windows in the upper stories. The figure is a dribbled line which trails off into the surrounding environment. The effect is disturbing, its form and substance are tenuous, as is it's
formed that his mother, who usually visited him each Friday, would not be keeping their appointment. Once his rage had subsided over this disappointment, he became quite active within the studio—pacing, handling objects, checking the hallway. In an attempt to displace some of his agitation, and to harness his newly found energy, the author provided him with a white marker and glossy black illustration board. After several moments of hesitation and more pacing, he grasped the marker and began to draw.

The resulting portrait seems to howl in the blackened void, isolated and abandoned. The piece appears to convey the breadth of this child's inner pain and anxiety in a way that a mentally retarded child could...
never express through words. Yet despite his great distress, he was able to somehow muster the concentration, and the self-control to manipulate the medium in a powerful and poignant way. This process points to the integrative powers of the art experience that essentially transcends any question or concern over functioning level. Thus, the issue of the diagnosed handicap, which in this case is mental retardation, as applied to our assessments becomes the secondary concern. Ultimately the child’s emotional response concerns us as art therapists as this is now the focus of our assessments and our subsequent interventions.

Discussion
Throughout the case discussions, the author has proposed a restrained, cautious approach to interpreting client art work. This approach stems from clinical, aesthetic and ethical considerations that have grown out of the author’s practice with these populations.

From a clinical perspective, attention was given to the “speculative leaps” that can misguide even the most seasoned art therapist. In the first case, the author voiced concern over viewing the child’s artwork with preconceived ideas that can hinder one’s ability to effectively learn from the child and his/her art. Without integrating other empirical evidence, such as overt and covert behaviors, the art therapist cannot expect to derive maximum insight from the artwork.

For instance, in the case of Ronny, the deaf/blind child, the author accepted the idiosyncratic aspects of the artwork as being indigenous to the population. The emphasis upon deriving vicarious pleasures and stimulation through the use of fantasy was also accepted as a necessary avenue for expression in this child. The author resisted treating any of Ronny’s initial expressions as symptomatic, deeming them instead, sublimative mechanisms that aided in compensation. However, this assessment was amended once a concomitant regression of art and behavior became clear. At this point, art therapeutic interventions were instituted to support the child through this time of crisis. As the crisis was resolved, Ronny’s emotional responses to his handicap became effectively neutralized and thus ceased to remain a prevalent issue.

In the last case, the author described the art of a child who had just sustained a traumatic emotional upset. The artwork possessed many of the distortions, omissions and affect that art therapists would normally associate with emotional disturbance. While the author would ordinarily concur with this thesis, he maintains that there is more at issue here than discerning the presence of emotional lability.

Consider this autistic, brain-damaged child who at an early age, is separated from his mother and is abandoned to a residential institution. Here he competes with scores of other retarded children for the attention of a few attendants in a sensory deprived environment. He is incapable of comprehending or communicating his sense of loss, fear

“Without integrating other empirical evidence, such as overt and covert behaviors, the art therapist cannot expect to derive maximum insight from the artwork.”
and anger through verbal or any other modalities.

The drawing in Figure 8 powerfully conveys this child’s overwhelming anxiety and anger over his disappointment at not seeing his mother. To this author’s thinking, such a depiction of horror points less to emotional lability than to this boy’s power of resilience and fortitude.

Faced with impossible circumstances he was able to reintegrate sufficiently so as to communicate a very powerful and accurate truth. In such a statement, the author finds an unequivocally sane and natural reaction to an unbearable situation. Kramer considers this to be the sum and purpose of the art therapy process; to allow such inner conflicts to “become agents of extraordinary effort at integration culminating in unusually powerful artistic statements” (1979, p. 14).

It is these powerful artistic statements that bring us to the next area of concern: assessing the content and aesthetic properties of artwork in relation to the presence of emotional lability.

In the case of John, the reader was introduced to an artistic style, whereby the elements of design were once again based upon distortion disэмbody and sexual aggressive content. John’s innate sense of graphic sophistication and the presence of severe developmental arrest contributed to the highly disturbing and enigmatic quality in his artwork. Yet, despite the obvious sexual/aggressive content and the repressed or distorted sense of body-ego, John was a picture of psychic health. He remained personable, socially appropriate and well grounded to his environment despite the most vigorously distorted art productions.

John was a seasoned, practicing artist in every sense of the word. He worked constantly, he was intense in his concentration, and he preferred to work alone. His images were created in series, with a highly discernible progression regarding newly emerging directions and experimentation. His work was endowed with a high degree of originality, consistency and economy.

Thus, John’s case is instructive, since it reminds us to look beyond the artist’s “obvious sexual preoccupations,” “aggressive tendencies” and other diagnoses; these labels permeate our mainstream culture in many guises of which the sensitive art therapist always must be aware.

As any student of art history can attest, both primitive and “high art” through the ages have celebrated with a virtual obsession the issue of human sexuality. At the very center of the art process is the unconscious need to evoke imagery that elicits a dramatic visual impact.

The human figure has particularly remained the artist’s preferred object of experimentation, constantly altered and distorted in a full range of styles that provoke intense reactions from critics and the viewing public. Contemporary artists such as Francis Bacon celebrate the figure by ruthlessly inviscerating it into endless combinations. Even Andrew Wyeth, the champion of subdued figurative realism, can invoke a brooding, disturbing element in his work. (The Kuehner paintings in particular are charged with an almost uncomfortable intensity, as the subjects stare blankly at cracked walls beneath iron meat hooks. The newly emerged ‘Helga’ paintings are rendered with a caustic edge, as the model winces in some dark cellar or sits glumly in the depressed winter light. The Helga figures are invested with a coldly inanimate, clinical quality suggesting an almost autistic detachment from the subject.)

In practice with the handicapped population, the art therapist will indeed encounter artworks that are developmentally delayed, stereotypes, distorted or will display some other atypical qualities. Yet the presence of such qualities do not automatically imply emotional mal-adaptation on the part of the artist. What one can infer is that the artist views the world shaped by the severity of his or her defects, the enrichment of one’s environment and the support one receives by family and professional staff.

The complex interplay between these factors not only contribute to a disabling condition, but also can serve as a catalyst in forging unusually original, sometimes extraordinary styles of art.

Writing of this style of naive or eccentric art, Cardinal (1973) not only deemphasizes pathology in art, but to the contrary, asserts that there can be no “pure” art unless the artist is virtually isolated culturally and aesthetically. Only then can he or she follow an artistic vision uncontaminated by cultural norms, economic factors and aesthetic styles based upon fads and contemporary sensationalism. In some instances the art of the handicapped child meets these criteria, whereas the originality and idiosyncratic nature of the artistic vision is inextricably tied to the disabling condition (Selfe, 1983; Becker, 1982). Thus, the clinician who attempts to interpret such material cannot hope to isolate the elements of congenital disability, environmental deprivation and personal idiosyncrasy. The artwork of such an individual stands as a statement of wholeness, of who he or she is, without bowing to clinical analysis and dissection that essentially reduces one to a group of symptoms.

Concluding Remarks

The discussion of the case histories was intended to demonstrate that the intellectual dissection of visual art is essentially a contradiction in terms. The artwork presented aptly conveys the limitations, the enigmas and the possibilities of interpreting what is considered to be heavily influenced by primary process material. As primary process-based material, art remains a visual language that transcends spoken words. Such is the challenge faced by the most skilled art critic: to do justice to an image of such depth and mystery, so as to not degrade it to a mere intellectual exercise. Even
Hammer in his championing of projective techniques marvels at the “elusive flame-like spirits of his subjects who defy neat and orderly logic with their flame-like dances that flicker beyond order” (p. 639-40).

We can equate this idea with the challenges posed by our early American Indians who objected to being photographed by the white settlers. They maintained that such a contrivance would seize their spirit; in other words, the cold mechanical eye of the camera would essentially strip them of their animativeness, the vibrancy of their soul. As they reasoned that such a device could never approximate what they were, we can never expect to encapsulate the depth and meaning of the client’s visual image.

Yet despite our ambivalence, we continue to delve into the mysteries of artistic creation. We attempt to confirm, moderate and predict the outcome of our treatment process through the fervent study of client artwork. Yet we must do so cautiously and in reverence to the artwork, which tells us so much more than we can describe.

Guidelines for Authors
Please submit four (4) copies of manuscripts to: Art Therapy Editor Gary Barlow, Ed, ATR, Wright State University, Creative Arts Center, 228 Creative Arts Center, Dayton, OH 45435. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.
FORM: Typewritten, double-spaced on 8½ × 11 inch bond paper, with at least 1⅛ margins.
COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.
ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.
SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.
FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" × 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.
Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.
Authors must obtain permission to reproduce the figure from a copyrighted source.
REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.
"Sex Differences in the Emotional Content of Drawings"

Rawley Silver, Ed.D., ATR, HLM, is the author of Developing Cognitive and Creative Skills Through Art. This is her 38th publication in the field of art therapy. The paper was presented at the 1986 Annual Conference of the American Art Therapy Association, held in Los Angeles, California. She is also a painter, having had her 10th one-person exhibition in October, 1986.

This study was completed with a focus on possible differences relative to sex or age in the expression of emotions through drawings. This study was an attempt to verify and or amplify preliminary findings by the author, by using larger and more diverse populations coupled with a more controlled research design. Questions asked referred to differences between men, women, boys and girls, in their concepts of self and environment as expressed through particular drawings. The drawings were from Stimulus Drawings (Stimulus Drawings and Techniques, by Silver), followed by discussion and clarification of meanings. A 7-point scale (on a continuum) was used in evaluation, and for each drawing two scores were obtained: one for Principal Subject (i.e., a main participant, person) and one for the Environment (including people, objects or events portrayed). A determination of reliability was made through a process of interscorer agreement. Significant differences were found between males and females across all age groups (girls, boys, women and men in four age groups: third graders, high school seniors, adults and the elderly). Emerging from the findings, a composite male and a composite female are portrayed. In a closing discussion, the author offers suggestions and/or questions that can lead to further research in specific areas related to sex differences in the emotional content of drawings.

Introduction

In this study we asked if there were differences in sex or age in expressing emotions through drawings. The questions arose after examining drawings by art therapy students who had participated in a workshop on the use of Stimulus Drawings and had responded to the drawing task themselves. Their response drawings were predominantly negative—drawings about unhappy people in unpleasant situations.

Was this typical of adults? Or did these adults have unusually negative associations? In search of answers, the stimulus drawings were presented to groups of other adults and to children, and their response drawings evaluated on the 5-point Projection Scale of the Silver Drawing Test (Silver, 1983, p. 33). Results indicated that some groups tended to respond with predominantly negative themes while others responded with positive themes—happy associations and fortunate subjects.

The study reported here, was an attempt to verify and amplify the preliminary findings by using larger and more diverse populations and a more controlled research design.

One of the questions asked was whether there were differences between men and women, boys and girls, in their concepts of self and environment as expressed through drawings.

Witkin and his associates found significant differences between the sexes in laboratory tests involving perception (1954). In one test, their subjects were asked to adjust a luminous rod, surrounded by a tilted luminous frame, to the true upright position. In some trials, the subject's body was upright, in other trials, tilted. Results showed a wide range of differences in perception. At one extreme, some individuals determined the perceived upright almost exclusively in reference to the visual field. At the other extreme, some located the upright almost entirely on the basis of bodily position, uninfluenced by the field.

They also found that women tended to be more dependent on the visual field than men, while men tended to rely more on the positions of their own bodies in perceiving the rod independently of its background. Similarly, in their tilting-room-tilting-chair test, women relied less on the position of their bodies in determining the position of the rod, and were more strongly influenced by the visual field.

With children, the differences in dependence on the visual field observed at the adult level occurred at all the ages tested, down to the 8-year-old level. Not until the 17-year level, however, did the differences in scores between girls and boys tend to be statistically significant, and only at the adult level were they consistently significant.

Since perception plays an essential role in the choice of stimulus draw-

"[Are] there differences between men and women, boys and girls, in their concepts of self and environment as expressed through drawings?"
ings, we asked whether gender differences would be found in the scores of response drawings, whether males and females differ in their differentiation of self from environment. And since some groups in our preliminary study tended to respond with negative themes and others with positive themes, it was also questioned whether there were age or sex differences in the degree of negativity in response drawings.

PROCEDURES

The Stimulus Drawing Task

In this task (Silver, 1986a), participants are asked to choose two Stimulus Drawings (SDs) from among the group of 50 presented, imagine something happening between the subjects selected, then show what is happening in drawings of their own. When drawings are finished, they are given titles and then discussed, whenever possible, so that meanings can be clarified.

Copying is discouraged. Emphasis is on expressiveness rather than skill. The SDs are intended to be ambiguous in order to stimulate a flow of associations and to invite expression through visual symbols and metaphors.

Vilstrup (1983) has written a review of the Stimulus Drawing techniques. Sandburg, Silver, and Vilstrup (1984) have reported on the use of Stimulus Drawings with three populations, adapting the basic technique to the needs of the patients with whom each worked: Sandburg, with adult psychiatric patients in a day-care setting; Silver with stroke patients in a rehabilitation center; and Vilstrup with adolescents in an inpatient psychiatric setting. Response drawings may be evaluated

"Emphasis is on expressiveness rather than skill."

The Evaluation Instrument

To obtain greater precision in evaluating emotional content, the 5-point scale for evaluating response drawings was expanded into a 7-point continuum ranging from strongly negative content, such as drawings about suicide (1 point), to strongly positive content, such as drawings about honeymoons (7 points). The median score (4 points) is used for drawings that are ambivalent, unclear, or neither negative nor positive (Silver, 1986a).

For each drawing, two scores are obtained, one for the Principal Subject and one for the Environment— including the people, objects or events portrayed. This scale and scoring examples are shown in Figures 1 through 6.

To determine the reliability of the scale, a study of interscorer agreement was undertaken. Three judges independently scored 24 response drawings: four drawings selected at random from each of six populations of children and adults. The three judges, all women, were registered art therapists.

Before scoring, the art therapists met for one hour to discuss the scale and to score and discuss practice drawings. Then the 24 response drawings were presented individually at random to the art therapists who scored them without further discussion.

In the five analyses performed, agreement coefficients ranged between .924 and .549 as measured by Finn's r (Whitehurst, G. 1984). To illustrate, an r = .80 denotes 80% agreement beyond chance agreement (Silver, 1986a, 1986b). Thus the scale appears to be a reliable measure for evaluating emotional content projected into response drawings by children and adults.

Subjects

The stimulus drawing task was presented to 326 girls, boys, women and men in four age groups: third graders, high school seniors, adults and the elderly.

The elderly population consisted of 19 men and 34 women in two Senior Centers in New York, one in a suburban neighborhood, the other in New York City. The Centers provided activities, hot lunches and opportunities to socialize.

The remaining adult population consisted of 11 men and 114 women, between the ages of 20 and 30, in three groups: artists and teachers in a suburb of New York City; Special Education teachers in Albany; and art therapists from various parts of the country.

The third graders consisted of 55 boys and 58 girls in two elementary schools in a middle class socio-economic community in New Jersey.

The high school seniors consisted of 10 young men and 25 young women, the total number of students in an English class in a New York City high school.

Statistical Analyses

Response drawing scores were analyzed by means of a 2 x 4 x 2 Factorial Analysis of Variance with repeated measures on the last variable. The first variable, gender, had two levels (male and female). The second variable, age group, had four levels (third graders, high school seniors, adults and the elderly). The third variable, type of score, was the repeated variable, since for each drawing two scores were obtained (Principal Subject and Environment). From each age group, for each gender, ten subjects were randomly selected.

It was hypothesized that sex and age differences would be found in

"The stimulus drawing task was presented to . . . girls, boys, women and men in four age groups."
Scale for Evaluating Concepts of Self and Others
Through Response Drawings*

Principal Subject(s)
1 point: Strongly negative, such as dead, dying, helpless, or in grave danger
2 points: Moderately negative, such as frightened, frustrated, angry, or suffering
3 points: Mildly negative, such as sad, wistful, disappointed, dissatisfied, or unfortunate
4 points: Intermediate level, such as unclear, ambiguous, ambivalent, both negative and positive, or neither negative nor positive
5 points: Mildly positive, such as smiling, safe, active, relaxed, or enjoying something
6 points: Moderately positive, such as happy, strong, effective, aggressive, or fortunate
7 points: Strongly positive, such as loved, overcoming powerful forces, escaping, or rescuing

Environment (including people, objects, and events)
1 point: Strongly negative, such as life-threatening, dripping knives, smoking guns, tombstones, prisons
2 points: Moderately negative, such as dangerous, hostile, frustrating, stressful, rejecting, unhappy, or unfortunate
3 points: Mildly negative, such as unpleasant activities or scenes, rain, snow, heat, dark clouds, bare trees, rock, storms, sunsets
4 points: Intermediate level, such as ambiguous, ambivalent, unclear, both negative and positive, or neither negative nor positive
5 points: Mildly positive, such as pleasant activities or scenes, flowers, leafy trees, fruits, sunrise
6 points: Moderately positive, such as tasty, friendly, pleasurable, or fortunate
7 points: Strongly positive, such as loving, or deeply gratifying

*It is important to note that a high score may reflect desires rather than reality, what is wished for rather than evidence of mental health. This may be clarified in clinical follow-up.

the emotional content of response drawings as measured by the 7-point scale.

RESULTS

Significant differences were found between males and females across all age groups. Females received nearly identical scores for Principal Subject and Environment; males received higher scores for Principal Subject, lower scores for Environment.

In other words, if the rating scale is an accurate reflection of the drawings, males consistently portrayed more negative surroundings inhabited by more positively seen subjects. These differences were statistically significant, exceeding the .05 level of probability, as shown in Tables 1 and 2, and the graph, Figure 7.

These findings were supported by a Newman-Keuls Multiple Range Test of the significance of score type by sex interaction. Results were significant at the .05 level, showing that males tended to give higher ratings to Principal Subjects than to their surroundings. Female ratings showed no significant differences.

In an analysis of the entire sample of each age group, female ratings for Principal Subject and Environment were found to be significantly correlated; that is, as the ratings for Principal Subject increased, the ratings for Environment also increased.

Among Third Graders, for males, the correlation between Principal Subject and Environment scores were $r = .48$ ($p < .005$); for females, $r = .76$ ($p < .005$). Therefore, for both sexes, as Principal Subject ratings increase, Environment ratings increase.

Among High School Seniors, for males, the correlations were $r = .34$ (not significant), for females, $r = .76$ ($p < .005$).

Among Adults, for males, the correlations were $r = .18$ (n.s.), for females, $r = .67$ ($p < .005$).

Among the Elderly, for males, the correlations were $r = .19$ (n.s.), for females, $r = .60$ ($p < .005$).

Thus for every age group, female Principal Subject and Environment scores are significantly related.

Both males and females portrayed Principal Subjects more positively than they portrayed Environments. These differences also exceeded the .05 level of probability.

It is also interesting that women portrayed more negative views than men in both Principal Subject and Environment, but that they came together in old age in rating their Principal Subjects positively.

Age differences approached but did not achieve significance ($p < .10$). Nevertheless, it should be noted that of all groups, the high school girls received the highest ratings for both Principal Subject and Environment while the third grade

girls received the lowest ratings, and that the most negative perceptions of the Environment were portrayed by the elderly men.

A closer look at these findings, even though they are not statistically significant, seems worthwhile.

The Composite Male

The 8-year-old boy, who emerges from the statistical findings, portrays a threatening world, as threatening as the world of the 8-year-old girl, but unlike her, his Principal Subject tends to escape the dangers (mean scores 2.9 for Environment, 4.1 for Principal Subject). An example is shown in Figure 8.

The male adolescent, age 17 or 18, tends to perceive his Principal Subject as more powerful and his surroundings less threatening than the 8-year-old boy (Figure 9), but his Principal Subject is not quite as powerful as the Principal Subject of his female counterpart (mean scores 4.4 and 4.7 respectively), and his environment remains on the negative side while hers is on the positive side (3.3 and 4.6 respectively).

The man, age 20 to 30, reverses the negative environment-positive subject syndrome characteristic of the male groups as a whole, but the differences in mean score are slight and close to the median (Environment 4.1, Principal Subject 3.8, Figure 10).

The elderly man portrays the most negative environment of all eight groups (mean score 2.7) combined with a positively seen Principal Subject (mean score 4.4), matching the score of the elderly woman and the high school male, and exceeded only by the high school female (Figure 11).

The Composite Female

The 8-year-old girl seems to feel the most vulnerable and distressed of all the groups, with a mean score for Principal Subject, 2.8 (frightened,
Fig. 8
Response by an 8-year-old boy.

Fig. 11
Response by an elderly man.
frustrated, suffering, etc.) and for Environment, 2.9 (dangerous, stressful, etc., Figure 12).

By the age of 17 or 18, she sees her environment as positive, her mean score about as much above the median as the score of her male counterpart is below (4.4 and 3.3 respectively, Figure 6). Apparently she feels the most positive of all the groups in both Principal Subject and Environment, suggesting that girls of this age have a stronger sense of well-being and self-confidence than at the other times of their lives (mean score for Principal Subject, 4.7; for Environment, 4.6).

As she becomes a woman of 20 to 30, this confidence seems to fade. Her mean scores drop back below the median (Principal Subject, 3.3; Environment, 3.2) a greater decline than that of her male counterpart (Figure 13).

As she ages, she seems to grow stronger again, crossing the median line onto the positive side in both categories (mean score 4.4 for Principal Subject; 4.2 for Environment, Figure 14).

Discussion

To the extent that the Principal Subject of a response drawing represents the self-image of the person who draws it, and the Environment represents the way that person perceives the world, the findings of this study suggest that males, from boyhood through old age, have more self-confidence and stronger self-images than women and girls. Even though males tend to see the world as more threatening, they see themselves as overcoming the dangers.

On the other hand, women and girls tend to relate themselves to the world. When they portray unfortunate subjects, their subjects tend to inhabit unpleasant worlds while their fortunate subjects inhabit pleasant worlds.

How can these differences be explained? What leads men and boys to see themselves fighting back in a hostile world, while women and

Fig. 12
Response by an 8-year-old girl "The tiger chases the chick to eat it."
girls see themselves as part of the world, not opposing it.

Can these differences be attributed to cultural influences? biological factors? neither or both? Do they reflect strengths and weaknesses or maturity and immaturity, and if so, which sex is stronger or more mature?

Some observers seem to see gender differences like these as the result of cultural pressures, indicating a feminine weakness, lack of trust in one's self. Erica Jong, for instance, writes that women find it hard to achieve an authentic sense of self because they "are always encouraged to see themselves as role players and helpers... rather than as separate beings" (Jong, 1972).

Witkin and his associates also seem to view these differences as unfavorable to women, a matter of development, indicating feminine immaturity. They found women "less able to utilize the position of their own bodies" in perceiving the rod independently of its background or in determining the position of the room, more strongly influenced by the prevailing visual field (p. 155).

Their assumption of correlations between maturity and field independence seems contradicted by another of their findings: that a number of hospitalized mental patients gave extremely high independent performances (p. 470), suggesting that independence is not necessarily correlated with maturity. Furthermore, they acknowledge that perception is influenced "in a basic and probably primary way" by the nature of the field in which it takes place, and that differences in task structure make for important differences in perception (p. 467). The perceptual situations provided by their experiments represent only one kind of perception, and in this kind of perception, males and females seem to respond differently.

When Witkin and his associates extended their experiments beyond spatial perception, testing groups of normal men and women with Figure Drawing, TAT, and Rorschach tests as well as interviews, they found no significant differences in mean personality scores that would parallel the differences in perceptual performances (p. 488). What they found were certain personality characteristics relevant to performance in perceptual tasks. These included self-concepts, ways of managing impulses and strivings, and the nature of their subjects in relation to their environments (including other people). Field-dependence was found to be associated with passivity and low self-esteem.

Thus the field dependency associated with females may reflect the development of greater sensitivity to the environment, caused perhaps by adapting to environments that make harsher ego demands on females than on males, social environments that discourage girls from being narcissistic and aggressive, and encourage boys to want what they want when they want it.

Lewis Thomas seems to attribute gender differences, such as these, to biology, and to see them as favor-
able to females. As he observes, childhood lasts considerably longer in the human male than in the female. "There is somewhere a deep center of immaturity built into the male brain, always needing steadying and redirection" (Thomas, p. 236). He suggests that in the X chromosome (female) there is information for a qualitatively different sort of behavior than the instructions in the Y (male) chromosome, and that this difference benefits the long-term needs of the species. On "occasions when the survival of human beings is in question, I would trust that X chromosome and worry about the Y," and place the use of thermonuclear weapons "squarely in the laps of the world's women . . . I do not trust men in this matter" (p. 237).

It is important to note that the findings of gender differences reported here did not hold true for all members of the gender groups. In Wikin's studies, some men showed marked dependence on the visual field while some women showed very little dependence. In our study, many individuals, male and female, produced drawings that differed from their groups as a whole.

Although a comprehensive review of individual responses is beyond the scope of this study, the fact that some response drawings scored 1 or 2 points while others scored 6 or 7 points suggests that therapists will find individual responses useful for evaluating the emotional needs of the individuals who draw them, particularly those who may be depressed.

This study has found that response drawings by men and boys differ from drawings by women and girls to a degree that is statistically significant. These findings raise questions for further research: will

"... response drawings by men and boys differ from drawings by women and girls to a degree that is statistically significant."
additional studies support the finding that men and boys tend to represent their Principal Subjects more positively, and Environments more negatively, than women and girls. Do males and females of other cultures or subcultures respond differently? Do male raters score response drawings differently? Is the 7-point scale useful in identifying and assisting those individuals, male or female, who are depressed or at risk for suicide?

These questions suggest that further research with larger and more diverse populations is worthwhile in order to build on the knowledge obtained.

Graphic Characteristics on the Draw-A-Person Test for Identification of Physical Abuse

This study utilizes two common assessment procedures of school-aged children, the Draw-a-Person test (DAP) and the Wechsler Intelligence for Children-Revised (WISC-R) to identify characteristics of physically abused children. Sixty developmentally disabled children are included in the sample of children studied. Twenty of the children are in learning disability (LD) classes; twenty are in classes for emotionally disturbed (ED); and twenty are known physically abused (PA) children who are either in classes for learning disabled or for emotionally disturbed children. All children are of average intelligence. In the cognitive domain, different scores of the DAP and WISC-R tests are compared across the three groups of special education children. In the emotional domain, two separate DAP graphic scoring systems assessing emotional functioning of children are analyzed for significant graphic elements in the drawings. Results of the statistical analyses of the WISC-R and the DAP intellectual differences indicate that the physically abused students in special education have significantly greater minus difference scores between the WISC-R and the DAP than other developmentally disabled children. Analyses of the emotional indicators of the DAP test result in 9 graphic items that are significantly associated with physical abuse. A decision tree model is presented for identifying physical abuse in school-aged children of average intelligence.

Key Words: WISC-R, DAP, Exceptional Educational Needs.

Introduction

Psychologists who are involved in the evaluation and assessment procedures of referred children have much to offer in identifying the possibility of physical abuse. Psychological instruments can be exquisitely tuned instruments in obtaining data on self-concept, conflicts, social-emotional delays and problems of children. Delays in motor development, learning problems, hyperactive behaviors, aggressive behaviors, sudden changes in academic performance are some of the early identified characteristics associated with abused and neglected children (Martin, Conway, Kempe, 1974; Reidy, 1977; Perry, Doran, Wells, 1983). Just as teachers are being alerted to academic failures and other changes in behaviors of children in the classroom as indicators of possible child abuse, so psychologists, working with children and adolescents, must be sensitized to the instruments they use and the possibility that these instruments may provide clues to the hypothesis or identification of children who are or have been abused.

The utility of psychological assessment data providing probability statements or inferences of physical abuse in children has been minimally researched.

One study that has attempted to examine psychological assessment procedures for some diagnostic indicators of physical abuse is the study of Blain, Bergner, Lewis, and Goldstein (1981). The authors in this study employed the House-Tree-Person test (HTP) to establish factors that could identify or at least hypothesize the presence of child abuse. As they noted, the HTP test may be highly relevant in identifying child abuse as this measure has “minimal intellectual demand characteristics,” is an “unobtrusive measure,” and “can establish empirical correlations between cues and a criterion,” for detection of the abused child. Their findings proved to be useful, in differentiating physically abused children from normal and mental health, clinic children. Their findings in regard to the human figure of the HTP test pointed to the following items as possible child abuse indicators: “figure is comprised of geometric figures”; “absence of feet”; and “head is over 1/4 the total size of figure.” All factors were significant at the p < .01 level.

Another study is the exploratory research of physically abused children’s Draw-a-Person test by the authors which has provided 17 graphic...

items characteristic of children’s drawings in the DAP test (see Table 4).

Two instruments that are very frequently employed in a diagnostic workup of children referred for special education evaluation are the Wechsler Intelligence Scale for Children-Revised (WISC-R) and the Draw-a-Person test (DAP). The WISC-R is used primarily for intellectual evaluations of school-aged children from ages 6 through 16. The DAP test is used as both an intellectual assessment instrument (Harris, 1963) and as an assessment instrument for the evaluation of emotional functioning (Koppitz, 1968) for the same age range as the WISC-R. The DAP test, like the HTP test, is an unobtrusive measure, having minimal demand characteristics. However, the DAP test score is more likely than the WISC-R test score to be significantly lowered by emotional factors in the subject (Koppitz, 1968).

The present study is concerned with examining graphic differences on the DAP test as they relate to intellectual and emotional functioning of developmentally delayed, physically abused children compared to other developmentally delayed children (learning disabled, emotionally disturbed) in a school setting.

METHOD

Subjects

To clearly separate physical abuse influences on the DAP from the influences of learning-disabilities and/or emotional disabilities, the study includes three groups of students. They are known and reported physically abused children who have an LD or ED placement (PA); learning disabled children not known to be physically abused (LD); and emotionally disturbed children not known to be physically abused (ED). Students (20 in each group) were matched for sex and age. There were 13 males and 7 females; ages ranged from 6-15.10 years of age. Since intellectual functioning is considered to be an important variable of the DAP test, only those students whose WISC-R scores place them in the average or above range of intellectual functioning were considered for inclusion in the study.

Procedure

All children in this study were administered the WISC-R and DAP test as part of a more complete assessment battery to determine their eligibility for exceptional educational (special education) placement. For each child in the sample, the total standard scale scores of the WISC-R and DAP were obtained. In addition, each of the DAP test drawings were scored for emotional factors utilizing the Koppitz scoring system (Koppitz, 1968) as well as the scoring system for physical abuse factors developed by the authors. All DAP tests were scored by two psychology students not associated with the study. Inter-rater agreements were $r = .89$ for the Koppitz system, and $r = .85$ for the Culbertson-Revel system.

RESULTS

An ANOVA, $2 \times 3$, between and within design, yields the following findings: the between variables of the diagnostic category effect is significant, $F (2,57) = 5.937, p = .004$; the within subject variable test effect is significant, $F (1,57) = 4.088, p = .004$. This indicates that these subjects scored higher on the WISC-R than on the DAP. Interaction between diagnostic category and test is also significant, $F (2,57) = 8.26, p = .001$. For the WISC-R test, there is no difference between the three groups, however, for the DAP test, the PA group score is significantly lower than for the LD or ED groups (see Figure 1).

Fig. 1

WISC-R, DAP mean standard scores of physically abused children (PA), learning disabled children (LD), emotionally disturbed children (ED).

A comparison of the WISC-R – DAP difference scores for the PA, LD, ED students, using a $2 \times 3$ chi square analysis based on frequencies falling into plus or minus WISC-R – DAP differences, yields a $X^2 (2, N=60) = 8.69, p < .05$ (see Table 1). Eighty percent of the PA children have DAP scores that are less than their WISC-R scores; fifty percent of the LD children have WISC-R – DAP minus scores, and thirty percent of the ED children have such a configuration. In considering the size of the differences, there are 14 out of the
20 PA students (70%) that have score differences of minus 15 or more points, while in the learning disabled group, only 5 out of 20 (25%) have such a difference. In the emotionally disturbed group of students, only one student out of the 20 (5%) has a negative difference score this large. For both the WISC-R and the DAP tests, –15 points equals –1 S.D. from the mean score of the test. The significance difference here is $X^2(2,N = 60) = 19.95$, p<.001 (see Table 2.)

Consideration of emotional indicators as described by Koppitz, as predictive indicators of abuse, yields the following findings in the three groups as shown in Table 3.

Out of 30 items listed in the Koppitz scale, 3 items attain levels of significance of p<.05. These items are absence of transparencies, $X^2(2,N = 60) = 9.6$, p: .01; no arms, $X^2(2,N = 60) = 6.32$, p<.04; and no feet, $X^2(2,N = 60) = 7.8$, p<.02 (see Table 3). All other Koppitz items do not reach significance levels to differentiate these items as characteristic of PA children as compared to LD or ED children.

The Culbertson-Revel scoring system consists of 17 characteristics (see Table 4). There are eight items (over 47%) that reach significance levels of p<.05. The significance items are as follows:

1. Complexity of head, $X^2(2,N = 60) = 14$, p: .001;
2. Pressured lines, $X^2(2,N = 60) = 17.4$, p: .001;
3. No clothing, $X^2(2,N = 60) = 7.1$, p: .028;
4. Vacant eyes (no pupils), $X^2(2,N = 60) = 6.7$, p: .035;
5. Absence of figure in center of page, $X^2(2,N = 60) = 10$, p: .01;
6. Absence of feet, $X^2(2,N = 60) = 7.8$, p: .02;
7. Absence of arms, $X^2(2,N = 60) = 6.32$, p: .043;
8. Head over 11, $X^2(2,N = 60) = 6.2$, p: .046;

Culbertson-Revel (C-R) yields the following results:

1. Absence of feet (C-R, B, K);
2. Head over ¼ of total size of the figure (C-R, B);
3. Absence of arms (C-R, K);
4. Complexity of head over body (C-R);
5. Pressured lines (C-R);
6. No clothing (C-R);
7. Vacant eyes (C-R);
8. Absence of figure in center of page (C-R);
9. Transparency absent (K).

The graphic significance test findings (from the three scoring systems of the DAP) and the WISC-R – DAP difference scores are combined to form a decision-tree model for identification of physical abuse in children with average intelligence. This decision-tree model is as follows:

**Decision-Tree Model of Child Abuse**

1. Is there a difference of —15 points or more between the WISC-R and the DAP with the DAP score lower than the WISC-R?

   **YES**

   | Suspect child abuse, continue on: |
   | End of inquiry regarding child abuse. |

   **NO**

2. Are feet missing (C-R, B, K) (.02)?

3. Is head size ¼ or more of total size of figure (C-R, B) (.046)?

4. Are arms missing (C-R, K) (.043)?

   (Significance findings in two or more studies; significance levels from <.01 – <.05).

**YES**

| Suspect abuse if 2 out of 3 items are present, higher level of confirmation, continue on: |

**NO**

End of inquiry regarding child abuse.

5. Is the head more complex than the body (C-R) (.001)?
6. Are pressed lines present (C-R) (.001)?
7. Is figure placed elsewhere but in center of page (C-R) (.01)?
8. Is transparency of figure absent (K) (.01)?

(Significance findings in one study, and significance levels from <.001 – <.01).

**YES**

| Question of physical abuse less likely but further inquiry recommended. |

**NO**

| Physical abuse indicated when 1 out of 2 items is present. Gather additional validating data from other areas for definite confirmation. |

**Question of physical abuse is less likely but further inquiry is recommended.**

The drawing in Figure 2 of a physically abused child, referred to for special education placement is analyzed using the above proposed decision-tree model. This male child's age is 9 - 1 years. His IQ score on the Wechsler Intelligence Scale for Children - Revised is 99. His DAP IQ score is 75, resulting in a 24-point difference in the cognitive domain. Applying the decision-tree model, the following steps ensue: 1. Is there a difference of —15 points or more between the WISC-R and the DAP with the DAP score lower than the WISC-R? YES, suspect physical abuse, continue on. 2. Are feet missing? YES. 3. Is head size ¼ or more of total size of figure? YES. 4. Are arms missing? NO. Two out of three...
Discussion

It is common knowledge that children are often the last to report that they have been abused. They tend to be reticent, protective and/or fearful regarding their experiences and the impact on parents and family. Therefore, psychologists need to become more aware of the value of psychological data in generating clues or hypotheses regarding child abuse. This study has attempted to show the utility of two very commonly used tests for detection of child abuse in developmentally disabled children.

It explores graphic characteristics of physically abused, developmentally disabled children compared to other developmentally disabled children on the Draw-a-Person test (DAP) as well as the intellectual status of these children as measured by the Wechsler Intelligence Scale for Children Revised (WISC-R) and the DAP test. Findings reflect significant differences in both cognitive areas of functioning and in emotional areas of functioning of developmentally disabled, physically abused children on these commonly used psychological instruments. The differences in scores of the WISC-R and the DAP appear to yield a significant clue in the identification of suspected physical abuse. Differences of −15 points or more between WISC-R – DAP scaled scores appear to be important indicators of physical abuse in children. In addition, the study’s findings of nine graphic elements, common in the DAP figures of physically abused children, provide further confirmatory data for assessing physical abuse. A decision-tree model incorporating the significant findings of this study is proposed and needs further validation. Replications of the above findings are welcome and the necessity to include data on family functioning, medical history, behavioral and observational indices in suspected physical abuse cases before a conclusion of physical abuse is reached is recognized.

Educating the Creative Arts Therapist: A Profile of the Profession
Dr. Shaun McNiff, Charles C Thomas Publisher, 1986, x + 286 pages, $32.00.

Reviewer Irene Corbit, PhD, ATR, is an art psychotherapist in private practice in Houston, Texas, and part-time faculty, The University of Houston–Clear Lake.

Long overdue, Shaun McNiff's new book fills a void on the educational scene for creative arts therapists, educators and supervisors in the field. Although McNiff's book is ostensibly directed towards a select audience, namely creative arts therapy educators, its peripheral audience is much broader. Clinical art therapists, dance therapists, music therapists, psychodramatists, and other arts therapy specialists can gain a clearer view of their own and other's respective professions. McNiff, incidentally, in his book, views all of the creative arts therapies as a single profession "which like any other complex discipline is composed of varied areas of specialization." He sees the various creative arts therapies to be far more similar than different.

With this theme carried throughout the book, McNiff discusses trends in American higher education, definition of the profession, academic training programs, media competencies, supervision and evaluation. The statistics incorporated into the book, which will unfortunately date the book in years to come, present a current picture of the field, including universities offering programs in the arts therapies.

McNiff, it appears to me, has a purpose in his book which goes beyond describing the creative arts therapies as they have been and as they are: namely, that of projecting an image of how he feels they ideally can be. McNiff presents his "pantheon" image, an umbrella encompassing the creative arts therapies field, which would allow for separate identities and training, but which would give arts therapists power in numbers. This power in numbers would be similar to that of physicians who practice their various specializations, yet have the advantage of their "physician" umbrella which gives them tremendous legislative strength. "The more established professions of law and medicine," says McNiff, "demonstrate how variety and specialization can be achieved while maintaining an integrated professional identity."

In line with this projected, idealized consortium of creative arts therapists, McNiff looks at similarities and differences in education and training between the various arts therapies. Were these therapies to join into one association with its component parts, consistent standards in education would be necessary. Except for music therapy, the requirement for all creative arts therapies is a master's degree. The educational criterion for music therapy is a bachelor's degree. McNiff sees this lower music therapy educational standard as the most serious deterrent to any prospective unification.

McNiff looks to the future in his proposal. "Current studies of higher education and the professions," he says, "indicate that there are endless possibilities for future specializations." He names drama therapy as a developing new specialization, distinct from psychodrama, poetry therapy, phototherapy, video therapy, bibliotherapy, and, in addition, other possible art forms that may in the future develop their own therapeutic systems. McNiff feels that "the continuing practice of creating a multiplicity of association fiefdoms is not appropriate to contemporary professional education."

"Cooperation should not interfere with the creative vitality of the profession," McNiff says, "but only eliminate unreasonable, inefficient and restrictive practices." He does not foresee a system of rigid standardization, but rather that "future coalition efforts be directed toward the coordination of variety and the definition of universal elements of clinical practice and training." Other possible problems in unifying the arts therapies include "differences as to when specialization should take place, the value of liberal education on the undergraduate level, and the need for requiring graduate training for professional practice." McNiff makes clear that he would like to see requirements for registration in the various creative arts therapies as equal, or at least equivalent. I might add here that there would be a large number of arts therapists in their respec-
tive fields who would strongly resist any attempts at unifying the professions.

Although *Educating the Creative Arts Therapist* might be viewed as a forum for McNiff’s thoughts on coalition, it also has invaluable information for all of the disciplines. The part that I most welcomed, and wished had been expanded upon, maybe with some specific examples, is the section on supervising the creative arts therapist. Just as the arts therapies differ from verbal therapy, so supervision of the creative arts therapist differs from that of a verbal therapist. Should academic programs treat supervision as therapy? Should it be required that students experience personal therapy? Should a creative arts therapy student in training go into therapy with another creative arts therapist or a conventional therapist? McNiff debates these issues in his chapter on supervision and evaluation.

My favorite chapter is “An Artistic Theory of Mental Health and Therapy.” In this section McNiff differentiates between traditional therapies and the creative arts therapies. Although major advances in psychology and psychiatry have been achieved “by people with highly developed thought and practice,” McNiff feels that “the primary relationship of the artistic process to psychological thinking and psychotherapy has not been adequately investigated.”

McNiff contends that the creative arts therapist needs to re-think his/her role. “The psychiatric and medical dominance of the mental health profession is coming to an end,” he says, “and this is creating opportunities for re-thinking the basic elements of health, psychological inquiry and therapeutic transformation.” Although different, the arts therapies can be as powerful, and often more so, than traditional therapies. In this context, McNiff would like to see the creative arts therapist assume the role of primary therapist, rather than a secondary or adjunctive role. Unique in the healing arts professions, the creative arts therapist is able to re-vitalize ancient practices through the use of storytelling, drama, art, dance, and music, facilitating healing as it has been done throughout cultures, throughout time.

**The Artist As Therapist**

*Arthur Robbins, EdD, ATR, Professor of Art Therapy, Pratt Institute; Director of the Institute of Expressive Analysis; Faculty, National Psychological Association for Psychoanalysis. Human Sciences Press, Inc., 1987, 226 pages, $29.95.*

Reviewed by Gary C. Barlow, EdD, ATR, Professor and Coordinator, Art Therapy, Wright State University, Dayton, Ohio, and Editor, Art Therapy.

In the preface, Robbins gives a personal example of an early sculpture made following the death of a family member. With a working through of the experience, coupled with comments from an analyst, he says “From that very personal perspective I came to see how working with art materials could promote the healing that comes from playing with one’s personal symbols and also protect one’s defense system from excessive pressure” (p. 13). The author states that he is now particularly aware of how his past issues with aesthetics have been reflected in his development of understandings, theories, techniques and skills of art therapy. He states, however, that “What that notion of art’s role in therapy had done . . . is to create problems for my students and colleagues because it blurs the differentiations between art therapy and other psychotherapies. It does a real disservice to downplay the importance of aesthetic sensibility as fundamental to the role and function of an art therapist” (p. 15). Robbins says that this book attempts to “. . . mend the split by weaving object relations theory and principles of art and creativity into a cohesive conceptualization. The basis for that attempt is the premise that principles of aesthetics and psychology used together are invaluable aids in facilitating the therapeutic process. . . . It is desirable for the student to explore, through artistic expression, personal experiences associated with significant self—object internalizations, facets of therapeutic process, and aesthetic equivalents of psychological issues” (pp. 15-16).

For these reasons, Robbins has included in this book aspects of theoretical bases, exercises that illustrate aesthetic, artistic expression and theory blending together to formulate learning and understanding, and the translation of this learning into the practice of art therapy. Because the sections and chapters (some written by two or more authors) can “stand alone”—even though there is an obvious se-
quential flow that is apparent from the first to the last page—a brief mention is given here to the individual parts. The book covers many issues, with didactic information coupled with personal testimony and case study examples, and although the author(s) have woven these parts into a fabric, section and chapter reviews may help to give the reader a sense of the "parts" that ultimately solidify into a "whole."

Chapter 1 offers "A Theoretical Overview." The interrelationships are explored (i.e., aesthetics and therapy) with a distinction between primary and secondary processes, aesthetic integration of symbolic form (and forming) in the identity process. Subsequent headings help to lay a foundation and give a clear overview: (1) Object Relations Theory and its Classical Roots; (2) Creation of a Holding Environment Via Empathy, Transitional Space and Play; (3) Use of Aesthetics of Therapeutic Communication in the Case of Bob (a condensed case study illustrating the struggle for synthesis of life experiences); and (4) Interrelationship Between Images and Words in the Therapeutic Relationship.

In the chapter titled "Technique as a Mirror of Theory," Robbins illustrates principles for the therapist to be aware of and to follow, such as interventions ("...any input, whether verbal or nonverbal, on the part of the therapist" [p. 40]), holding, facilitating, active/inactive principles, using one's own artistry and expertise, and he points to discrepancies between the verbal and nonverbal modalities. Brief paragraphs are devoted to (1) Ongoing Interplay of Diagnosis, Developmental Issues, Aesthetic Reorganization and Technique; (2) Guiding Principles for Introducing Verbal or Nonverbal Interventions; (3) Therapist as Educator; (4) Self-Disclosure and Physical Contact by Therapist; (5) States that Cross Developmental Lines (depression, obsessionality, compulsiveness, passive aggressiveness and substance abuse); (6) Special Considerations in Working with Children; (7) Adolescence and the Adolescent; and (8) Terminal Patients and Their Families. More extensive focus is given to "Developmental Diagnosis and Technical Considerations" contained within the chapter. In the too-brief conclusion to this part, the author notes that a number of issues related to technique have been left untouched; however "the principles...remain the same. A therapist's role is to keep the therapeutic process moving, and he/she therefore introduces elements of technique, of structures, to create holding environments that will facilitate symbolic play and differentiation of self and object" (p. 60).

Chapters 3 through 7 are written by Robbins in partnership with other authors. These chapters elaborate on the theory and methods already set in place in earlier parts of the book. The chapter on "Holding Environment as Frame for Theory and Technique" (Robbins, Costa, Mitche1 and Rowan) describes the space between the client/patient and the therapist "in which we complement or mirror our patient's inner representational world" (p. 61). Work by three students in an advanced therapy seminar exemplify theoretical components of experience, representations and psychic structures. Illustrated with pictures of drawings, the three are intertwined in pair relationships and in triad, showing holding environments for the "patients" exhibited in each other's drawings. This is effective in its presentation, helping the reader to understand better the intricacies of patient/therapist relationship and the importance of understanding the holding environment.

"Aesthetics of Healing Within the Inner Representational World" is by Robbins and Rogers, and "presents the exploration of one advanced student as she copes with the artist within the therapist in search of a synthesis of aesthetic and psychodynamic forms" (p. 89). A six-part thematic structure is presented, utilizing drawing of self, experiences of deprivation, unresolved conflict, somatization, fusion and symbiosis, to personal conceptions of healing energy. Working (i.e., moving with, experiencing, sharing with distance) with the student through the various "stages" is effective here, since it clarifies the process through a systematic plan.

Robbins and Golfia-Girasek present "Materials as an Extension of the Holding Environment," with focus on the importance of having a wide range of clinical art materials at hand, as well as appropriate utilization of these materials. Sections on form, texture, color, volume, space, movement, balance and abstraction are included. The content of this chapter is a welcome addition to the media literature for the art therapist. Although the sections are brief, they offer insight into media and media usage that encourages the reader to delve deeper into content, structure, flexibility, complexity, freedom and use of materials. Much research needs to be done relative to media and/in therapy, and the authors allude to "point[ing] the way for further exploration of the psychodynamic use of materials" (p. 115) in the final statements of this chapter.

"The Institution as a Holding Environment for the Therapist" is by Dolginko and Robbins. Discussions on personal identity as a creative arts therapist, the intern in the institution, the treatment team and superiors, and countertransference are covered in this chapter. It is hoped that some of these areas (such as the intern in the institution) might be covered in more depth in future writing, although Dolginko and Robbins do introduce issues that are current and worthy of our consideration (for example, one is aware of the possibilities for discussion, insight and also for the education of others on admini-
istrative pressures of an agency, and the individual needs of the patients coupled with the art therapist’s goals, understandings and needs).

Part II illustrates clinical applications issues, such as transference and countertransference, with focus on three case studies (Jan, Rebecca and Bob). The summary highlights eight principles “implicit in my treatment of those three patients that are intimately intertwined with the transference/countertransference relationships” (pp. 172-174). These points are especially valuable in obtaining a clear understanding of Robbins’ process of therapeutic treatment as it relates to the therapist’s organizational energy system, the holding environment, aesthetic issues and therapeutic interventions, the back-and-forth movement from the art form to the therapist/client relationship, and other postulates.

“Regeneration of the Potential Life Space of the Antitherapeutic Patient” presents three cases, and “A Study in the Aesthetics of Pain, Rage, Loss and Reintegration” offers a 25-page case description of John (“John has leukemia and very much wants to live,” [p. 187] is the opening sentence of this very compelling case study).

This book is filled with insight, direction, focus, illustrations, tantalizing statements for consideration, brief hints at what needs to be pursued, and warm, personal insights. Some parts or sections seem too brief, although within the entire context of the book, they do serve as very important introductions for further consideration, and certainly they do serve as effective transitional elements. In the author’s “final word,” Robbins states “Ultimately, if we are to grow as professionals, we must develop concepts and formulations to match the complexities and depths of our therapeutic experiences. This text has been an attempt to make a small contribution in that area” (p. 214). In this reviewer’s view, he has succeeded admirably in this attempt.

MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

WHAT EVERY THERAPIST SHOULD KNOW

Appears in THE ARTS IN PSYCHOTHERAPY
AN INTERNATIONAL JOURNAL

TAKE ADVANTAGE OF THIS SPECIAL OFFER!

SUBSCRIBERS TO Art Therapy and Members of American Art Therapy Association

ENJOY REDUCED RATE!

SUBSCRIBE NOW—AND SAVE 50% OR MORE! The Arts in Psychotherapy is a quarterly journal in its 14th successful year of serving practitioners, scholars and students of the arts in psychotherapy, mental health and education. It publishes refereed articles (including illustrations) by art, dance/movement, music, poetry, and drama psychotherapists and by psychiatrists and psychologists that reflect advances in theory, research and practice. There are no restrictions on philosophical orientation or application.

AN IMPORTANT SOURCE for news and summaries of national and international conferences and current educational information relevant to the creative arts in therapy, THE ARTS IN PSYCHOTHERAPY contains book reviews, welcomes letters to the editors, dialogue among contributors; has International Editorial and Advisory Boards of highly respected specialists who represent a wide spectrum of experience. It appeals to scholars and practitioners of the arts in psychotherapy and to psychiatrists and psychologists.

THE EDITORS WELCOME ORIGINAL MANUSCRIPTS.

About Our Cover
"Picking Flowers" is the title of a painting done by a developmentally handicapped young adult in the "Arts for Transition" federally funded program in Dayton, Ohio. Winnie Ferguson, ATR, Director of the Program submitted the photo.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

Copyright © 1987 American Art Therapy Association
The following was found in Old Saint Paul’s Church in Baltimore, and the date inscribed is 1692. Many of you may be familiar with the words, but upon recent reading, I thought they might have relevance for all of us. The advice and recommendations are worthy of our consideration and somehow seem as pertinent and timely today as they must have been in the 17th century.

Go placidly amid the noise and haste, and remember what peace there may be in silence. As far as possible without surrender be on good terms with all persons. Speak your truth quietly and clearly; and listen to others, even the dull and ignorant; they too have their story. Avoid loud and aggressive persons, they are vexations to the spirit. If you compare yourself with others, you may become vain and bitter; for always there will be greater and lesser persons than yourself. Enjoy your achievements as well as your plans. Keep interested in your own career, however humble: it is a real possession in a changing fortune of time. Exercise caution in your business affairs; for the world is full of trickery. But let this not blind you to what virtue there is, nor to the strength of friends without and within. Be yourself. Especially, do not feign affection.

Neither be cynical about love; for in the face of all aridity and disenchantment it is perennial as the grass. Take kindly the counsel of the years, gracefully surrendering the things of youth. Nurture strength of spirit to shield you in sudden misfortune. But do not distress yourself with imaginings. Many fears are born of fatigue and loneliness. Beyond a wholesome discipline, be gentle with yourself. You are a child of the universe, no less than the trees and the stars; you have a right to be here. And whether or not it is clear to you, no doubt the universe is unfolding as it should. Therefore be at peace with God, whatever you conceive Him to be, and whatever your labors and aspirations, in the noisy confusion of life keep calm and act with dignity.

This issue of *Art Therapy* contains articles with important and current content. Mary Elizabeth Larose’s article on “The Use of Art Therapy with Juvenile Delinquents to Enhance Self-Image” gives an overview of art therapy work with a specific population, and the methods identified that are integral to the building of self-image and concept strength. Ellen Horovitz-Darby, in her article “Diagnosis and Assessment: Impact on Art Therapy,” points out the need for familiarity with specific diagnostic assessments and illustrates her premise by using the H-I-P, the K-F-D, the Bender Gestalt, a Cognitive Art Therapy Assessment and the Silver Drawing Test. Lillian Rhinehart and Paula Englehorn, co-authors of “The Sun Wheel: Bridge to the Unconscious,” discuss the individuation concepts of the Sun Wheel and the application to art therapy practice. As they so aptly state, “It offers art therapists a focal point for the growth inherent in the art process.” The article “Creative Analysis Involving Multi-disciplinary Evaluations of a Case Study” is presented by Edith Zierer. Recorded statements about a patient, described in this article, come from four professionals who worked on the case: the treating psychiatrist, the staff psychologist, Dr. Ernest Zierer and Edith Zierer. The emphases are on Creative Analysis in individual treatment, the testing instruments and procedures used and a brief history of the development of the method. All of these articles, collectively, offer much content for the art therapist to think about and to take necessary steps to expand upon one’s modes of assessments, delivery of services and new populations to be served.

The Use of Art Therapy with Juvenile Delinquents to Enhance Self-Image

Mary Elizabeth Larose, ACSW, ATR, member AATA, Lafourche Parish Juvenile Justice Facility, Thibodaux, LA.

The mental pictures we hold of ourselves tend to externalize and impact our relationships and life experiences. As humans we grow up accruing an image of ourselves based on feedback from relevant others. We live out our self-images often without questioning their present suitability to our lives and goals. This paper illustrates specific art techniques used with the population of a locked detention unit for adolescent offenders in an attempt to nurture the growth of a positive self-image and thereby influence behavior. Development and projection of body images are discussed as is the potential for transformation through the therapeutic use of art. Case examples from two residents of the facility are used.

I am employed as a therapist at a juvenile detention center that serves boys from ages 12 to 18 on charges that vary from truancy to murder. Art is an invaluable tool for therapy with these boys who are often low in verbal and socialization skills.

Generally, those who populate the detention unit have a shrunken ego sense, a lack of ambition and little social adaptation. They are dependent and depressed with inadequate impulse control.

As a matter of routine I have each inmate draw a picture of a person, a picture of his family, another of himself as he sees himself in the moment and then again as he would like to be in 10 years from now. Last, I have him draw his ideal situation in life.

This sequence of drawings gives me excellent clues into the child's self-concept and background. It also compels the child to examine his possibilities and desires and to shape them into life goals at the same time conceiving a more positive self image from which to operate.

Self-Projection

When an individual draws a human figure he is compelled to draw from some source. In the following statement Karen Machover (1949) elucidates this point:

Some process of selection involving identification through projection and introjection enters at some point. The individual must draw consciously upon his whole system of psychic values. The body is the most intimate point of reference in any activity. We have in the course of growth come to associate various sensations, perceptions and emotions with certain body organs. This investment in body organs or the perception of the body image as it has developed out of personal experience must somehow guide the individual who is drawing in the specific structure and content which constitutes his offering of a "person." Consequently, the drawing of a person in involving a projection of the body image provides a natural vehicle for the expression of one's body needs and conflicts. (p. 5)

Self psychologist Henry Kohut (1971) describes the self as being integrated with our most central ambitions and ideals and also with the sense we have that our body and mind form a unit in space and a continuum in time. The self is the basis of our sense of being and the independent center of initiative and perception.

Body Image Acquisition

The child learns ways of seeing the world from other people's expressions. By the age of one children are learning large amounts about rules for the expression of emotion. Children learn first how not to show emotion especially anger and learn to put on expressions, for example smiles. The tight bond between facial expressions and the feeling itself begins to stretch and yet is never totally severed. If the physical action (smiling) triggers the emotional sensation (happiness) it is possible that one could feel happy by smiling or angry by feigning an angry expression (McDermott, 1986). If one can feel happy by smiling, it is probable that one could feel more whole by tapping the source of imagination and drawing an improved self.

Michael Eigen (1980) speaks of the significance of the face in the formation of the "self-feeling." He posits that certain basic ego defects may have their origins in the facial expressions or lack of them of the primary object or the mother figure of the individual. The infant by large builds his self-image in terms of how he sees himself reflected through his parents' eyes.

"Generally, those who populate the detention unit have a shrunken ego sense, a lack of ambition and little social adaptation."
The body image is built up as a maturation process by an integration of all sensory, motor and social experiences of the child having a center of localization in the brain. The body image runs parallel with sensory motor development according to child psychiatrist Laura Bender (1976). Paul Schilder (1935) says that the child's self-image and the ability to draw a person develop in a parallel fashion. He points out that since the child is satisfied with his drawing it must represent his knowledge and sensory experience of his body. Misrepresentation of the body on paper does not represent a difficulty in a child's technical ability to draw since he or she can successfully render other objects. It represents an imperception arising form perceptual and emotional difficulties in relation to his or her own body image. This is probably because the ability to draw the human figure is not related to a simple visual gestalt so much as it is to a more complicated gestalt based on sensory impressions of all types originating from the physical and psychic life of the child, both from the past and from the present.

Transformation of Body Image

Contrary to the dogma of many behaviorists man is more than the sum of his reflexes, instincts and immediate reactions. He is all these plus his creative potential for the future. The real measure of the individual must include the element of growth as a creative power. G. E. Coghill (1929) has said:

Man is, indeed a mechanism, but he is a mechanism which within his limitations of life, sensitivity and growth is creating and operating himself. (p. 110)

P. Schilder (1939) developed a comprehensive concept of body image based on early studies in physics, neuropathology and psychoanalysis. He sees the body image as plastic, being built from earliest sensory and psychic experiences as well as by possible pathology in the brain, psyche or body and is unique for each individual.

We tend to treat people of certain physical attributes and psychological temperaments in certain ways. Thus a person's self-image is shaped by his interactions with others. Our desires, conflicts, compensations and social attitudes are somatically entrenched and influence self-projection through drawing the human figure as well as through ways of relating to others and the environment.

The creative process can serve as a means for going beyond the blockages of a learned self-image. In tapping the source of creativity one can simultaneously become in touch with the true self and at least briefly have an expanded idea of what is potential.

In the Realm of Possibilities

Patanjali, the Indian author of the Yoga Sutras describes the four bodies of man: the physical, the subtle, the causal and the supracausal. Ideas generated on the subtle level become manifest on the gross or physical level (Muktananda, 1980).

Quantum physicist D. Bohm postulated four orders of being: the explicate, implicate, potential and the fourth order of infinite energy (in Pearce, 1985). He says that what is now manifest had its origin as potentiality.

If existence is then the effect of conscious and unconscious thoughts on subtle levels it follows that by shaping the cause one can be active in influencing the effect. The therapist can function as a mediator between the material and immaterial dimensions of existence and can facilitate healthier interactions between these two spheres.

The task of repairing a neglected self-image can be achieved by encouraging and developing a patient's sense of self which may have been inadequately nurtured during critical periods of development.
tesquely large arms and hands. They are separated from a crying Jesus by a diagonal line in the center of the page. It is titled "The Separated Family" (Figure 2).

Three months later Jesus drew a picture of himself in 10 years from the present time as a service station attendant pumping gas (Figure 3). This Jesus has a happy face and although he is a stick figure his body parts are now in proportion.

When asked to draw his ideal situation in life Jesus drew a blue band of color on top of a sandy band with clouds floating above. It was entitled "Bayou Blue," which is a body of water used for hunting, fishing and recreation and is situated not far from the facility (Figure 4).

Jesus entered the unit as an aggressive, confused and angry child. By the time he did his fourth drawing Jesus was expressing a building enthusiasm for life. His aggressive actions had greatly subsided. I believe that drawing helped him to see his current situation as temporary and inspired a hope for his future.
Case Example No. 2

Jonathan was a 16 year old boy whose parents were divorced. His mother was a concerned parent.

Jonathan was depressed and overweight upon admittance. His first drawing of himself was of a heavy set boy with no hands or feet and very short arms (Figure 5). It was called “Country Boy.” The picture of his family showed both parents, his two brothers and himself. None of the family members possessed hands or feet (Figure 6). Jonathan took a long time to draw himself as he would like to be in 10 years. After much thought he drew himself in a uniform as a member of the armed forces, still without hands or feet (Figure 7).

During the session Jonathan spoke at length about his feelings of hopelessness and his trouble with alcohol and substance abuse. He said he felt he had no way to do anything about himself. During the session he began to see a little light at the end of the tunnel. His last drawing was of his ideal situation. He called it “Living Easy” and was composed of a house, tree, swing and rising sun (Figure 8). He told me it portrayed the house he would like to have when he had a job and a family. Jonathan was beginning to believe in a life after detention. He began to express an interest in getting help for his alcohol problem.

Before he left to be incarcerated at another facility I asked him to draw himself again. This time he drew a nicely built boy (Jonathan had lost weight since his entry at our unit) (Figure 9). This figure still had no arms but he did have feet well portrayed in detailed sneakers, symbols perhaps of a new feeling of capability inside himself.

"The Sun Wheel: Bridge to the Unconscious"

Lillian Rhinehart, MA, ATR, MFCC and Paula Engelhorn, MA, ATR, art therapists in private practice and founders of the Eagle Rock Trail Art Therapy Institute and Rainbow Clan, in California.

This article introduces art therapists to the individuation concepts of the Sun Wheel and how to apply these in the practice of art therapy. The concepts of the Sun Wheel encompass: 1) the circle or mandala as the greatest representation of wholeness; 2) the Rainbow color spectrum; and 3) a numerical system of one, four, twelve. The circle, the Rainbow and the numerical formation of the Sun Wheel are all ancient archetypes. Archetypes (Jung, Vol. 9, 1950), are synonymous with the word prototype, and means original model after which similar behaviors, feelings, ideas or images are patterned. Jung said, "Archetypes were and are living psychic forces that demand to be taken seriously...always they were the bringers of protection and salvation..." In combination the three archetypes of the Sun Wheel become a powerful base for individuation and collective growth.

Introduction

Jungian Psychology, Gestalt Therapy concepts, color and the wisdom of Ancient American truths are integrated in our work. We find these concepts best demonstrated through the Sun Wheel, which is an ancient medicine wheel—a Rainbow wheel of color. A medicine wheel is a circle of stones which is placed on the earth to honor all life. These ancient forms used to cover the earth. Stonehenge is but one example of this form.

This article introduces art therapists to the individuation concepts of the Sun Wheel and how to apply these in the practice of art therapy. Just as the ancient wheels of the past provided ways for people to seek balance (Storm, 1972), the return of the Sun Wheel in a time when the earth and its occupants are in need of balance is providing a way for individuals to explore the quest for wholeness.

The concepts of the Sun Wheel encompass the following elements: 1) the circle or mandala as the greatest representation of wholeness; 2) the Rainbow color spectrum; and 3) a number system of one, four, twelve. The circle, the Rainbow and the numerical formation of the Sun Wheel are all ancient archetypes. Archetypes (Jung, Vol. 9, 1950), are synonymous with the word prototype, and means original model after which similar behaviors, feelings, ideas or images are patterned. Jung said, "Archetypes were and are living psychic forces that demand to be taken seriously...always they were the bringers of protection and salvation..." In combination the three archetypes of the Sun Wheel become a powerful base for individuation and collective growth.

The Three Major Archetypes of the Sun Wheel

The Circle

There are many legends in our Native American heritage of the circle as a path to wholeness. The journey of the Hopi (Waters, 1963), is spoken of in a circle metaphor. The Hopi is born a little his journey begins with the rising of the sun. His death is like the setting of the sun. He then travels back through the underworld toward the rising of the sun, back to another birth. Within this cycle the circle is never broken. Black Elk (Neihardt, 1961), the great holy man of the Sioux, spoke eloquently of the circle: "You have noticed that everything an Indian does is in a circle, and that is because the Power of the World always works in circles, and everything tries to be round...even the seasons form a great circle in their changing, and always come back again to where they were. The life of a man is a circle, from childhood to childhood and so it is in everything where power moves." Carl Jung often referred to the circle, or the mandala, as a representation or symbol of wholeness. In Memories, Dreams, Reflections, he spoke of mandala drawings and the goal of the development of the psyche. He said, "I know that in finding the Mandala as an expression of the Self, I have attained what was for me the ultimate." (Jung, 1961). The Sun Wheel too is such a symbol. Like the mandala and like the medicine wheel, it is a statement of wholeness which represents a pathway to individuation.

The Rainbow Color Spectrum

The Sun Wheel is based on the Rainbow color spectrum. The process of individuation as expressed in Seven Arrows (Storm, 1972), is reflected in this wheel of color. Storm's book describes how we each enter the world on a particular part of the medicine wheel; the Sun Wheel is based on a similar premise. The premise of the Sun Wheel is that we each enter the world with a...
predominant color identification. This premise is also parallel to the Jungian typology system in which a way of perceiving objective reality is given at birth (Jacobi, 1943). Jung’s system also implied a color relationship to topology. In the Sun Wheel process toward individuation, people can identify color as possibly relating to their primary function.

Color is an important reality for the path of the Sun Wheel. Its importance to many Native American tribes as a way to healing and growth has been expressed over the centuries. The Navajo sand paintings have the figure of Rainbow Girl (Reichard, 1963), a healing image encircling the sand painting in protection. Each color in the painting done for healing has a specific, symbolic meaning (Villasenor, 1963). The four directions of the world, a major force for healing in Native American belief systems, are designated by specific colors (Sandner, 1979). To the Egyptian the Rainbow was more important than the spoken word (Birren, 1972). The Rainbow color spectrum plays an intricate part in the individuation process of the Sun Wheel.

Fig. 1 An Earth Sun Wheel

rather a re-emerging archetype of consciousness. (See Figure 1).

In-Depth Description of the Sun Wheel

Earth and Sky Tribes

The twelve stones marking the circumference of the Sun Wheel are divided into two distinct groups, six Earth Tribes and six Sky Tribes. The six colors of Earth and Sky echo one another. A Red Earth Tribe stone in the East, a Red Sky Tribe stone in the West; next to them an Orange Earth Tribe stone and an Orange Sky Tribe stone, and so on, with the six major colors of the Rainbow. The two halves of the Sun Wheel form a full circle of wholeness.

The union of Earth and Sky Tribes in the center of the wheel echoes the psychological truth that opposites must be reconciled for integration or individuation to occur. Individuation is defined as a quest for wholeness. The Gestaltist speaks of polarities and uniting the opposites through awareness and integration (Perls, 1969). Jungian psychology speaks of uniting opposites through the ownership of shadow elements and the integration of anima; animus energies within the individual (Jung, 1950). Many opposites can be united within the circle of the Sun Wheel. Stones in each of the two separate halves of the Sun Wheel can represent any polarity. Masculine and feminine, light and dark, man and spirit, opposites are integrated within the Sun Wheel’s Circle of Wholeness. (See Figure 2).

The Central Stone

In the Sun Wheel, the central stone represents the Light of Consciousness or the Self archetype. The Self (Jung, 1950), is the central archetype in the collective unconscious much as the Sun in the center of the solar system. It is the archetype of order and unification, harmonizing all the archetypes. It unites the personality giving it a sense of

106 ART THERAPY, October 1987

584
Americans among others, have recognized, experienced and named the powers of the Four Directions, and have assigned them four colors, usually yellow, white, red, and black. The Four Directions are powerful because they have been identified over many centuries as holding great properties. They are important resources for archetypal information. In our work with people we often ask them to identify the direction they are in right now. Through an art activity, based on the direction the person has identified, much information is added to their search for meaning. (See Figure 3.)

The Four Directional Stones

The four stones surrounding the central stone represent the Four Cardinal Directions. Native and Ancient

"In the Sun Wheel, the central stone represents the Light of Consciousness or the Self archetype."
with the Sun Wheel Individuation process we have found it to be rare that an individual has difficulty finding his/her color position on the Sun Wheel. As in astrology where meanings are associated with each sign of the zodiac, so different meanings are associated with each of the twelve color tribes. Yet the personal meanings are those we try and foster for clients and groups. It isn’t so much what the color red or blue means to the collective, but what the colors mean to each of us as unique individuals with personal histories. Likewise, it isn’t as helpful for personal growth to know the collective meanings of Earth or Sky Tribes. What is important and growth producing is the individual’s own understanding. As we travel around the Sun Wheel, each of the twelve major color stones has a message for us which can be integrated into our consciousness. (See Figure 4.)

**The Four Stepping Stones**

We come to the final formation in the Sun Wheel. Wheels must have spokes to give them strength. Four smaller stones from each color tribe form the spokes of the Sun Wheel. They are the stepping stones which in sequence from the circumference to the Center represent the four kingdoms: mineral, vegetable, animal and human. At each of the stepping stones there is a guide from one of the kingdoms to help a psychological process in ego development on our journey toward the center, toward consciousness. The guides most often represent personal psychological stages of development. They help to bring to consciousness more self-knowledge, thus allowing a movement along the path of individuation.

**Introduction to the Art of the Sun Wheel**

As we work around the Sun Wheel, we have found it an essential step to concretize the various parts of the Sun Wheel experience. We do this by having available a large variety of art materials and inviting groups to explore through the art process. The process of creating the forms and images offered through the stages of the Sun Wheel is essential to psychological development. The making of symbols as an integrative process is a very familiar one to the Native Americans who continue today to practice this art, much as they always have. Carl Jung was an early advocate of creating symbols in art form. He knew it helped unlock the mystery of their meaning (Jung, 1960). Throughout his lifetime he constantly produced drawings, paintings and stone carvings of symbols which came out of his own lifetime process of individuation. In the Sun Wheel way, the unlocking process begins with the creating, in art form, of one of the aspects of the Wheel. In a meditative process of creating the form, often its meaning and messages begin to be understood. Jung’s written dialogue can further be used as a progressive step toward a deeper understanding of the symbols that emerge (Jung, 1960).

**The Sun Wheel and Art Therapy**

We have been working with the process form with many groups over the past five years. During that time we have come to know the importance of the three archetypes: circle,
Rainbow and number. We have realized the power these archetypes add to the art experience. Other art therapists have told us there is a keen, alive, creative energy which comes forth in the art productions of people who work around the Sun Wheel. We have seen this and been awed by the level of the art work and by the excitement of the participants. In our own search we have come to know that in working with the Sun Wheel we have tapped into an ancient way of wholismaking which helps lead individuals to their own inner source of balance and growth. The creative force released through working with the Sun Wheel is the Self archetype. Our conviction is that only these clients, patients or groups who touch and experience the central archetype can begin to find healing. Reflecting upon a dream on the center of a mandala, Jung said, “The center is the goal, and everything is directed toward the center. Through this dream I understood that the Self is the principle archetype of orientation and meaning. Therein lies its healing function.” (Jung, 1961) (See Figure 5.)

How We Work With the Sun Wheel

We work with groups of creative, educated and searching people who want to grow. When we do a group, we see ourselves as facilitators who help individuals in the group to discover their own inner wisdom. Our focus is always on soliciting personal meanings from the individual. Our belief is that self knowledge is the most growth producing. Our objective is to allow this kind of knowledge to come forth through calling on the major archetypes of the Sun Wheel; meditations based on particular sections of the Sun Wheel such as the Four Directions, and asking participants to create in art form the experience the Sun Wheel has offered them. We have found it vital to offer groups a large variety of art materials—everything from paints, clay and pastels, to leather scraps, feathers and beads. We display these art materials in a lavish way and know that the rich variety of materials adds to the creative process of each participant. (See Figure 6.)

Our suggestions for the art experience always come from the Sun Wheel. We have led groups of over a hundred people walking around a Sun Wheel and finding their home or tribe color. People never seem to have any difficulty establishing their home color. Imagine a large wheel with six Rainbow colors each repeated across the wheel and then imagine 100 people walking around that wheel until they find their color. It always amazes us how quickly groups are able to do this. We have come to the conclusion that deep within each of us is the knowledge or archetype of the twelve color tribes.

Once individuals in a group have found their home color, we suggest an art activity to explore the color. We never limit how this exploration is to be done. People can explore their color in any possible way imag-
The results of such an exploration lead to a high energy level, easily observable, as groups discover that color is a reality (Merry, 1958), and that it is a tremendous resource for personal growth.

After participants have discovered a richer relationship with one color, we often ask them to see which of the Four Directions their color is near. We have already mentioned that the Four Directions hold a great deal of archetypal meaning, and through an in depth art exploration, individuals find personal meanings associated with one of the Four Cardinal Directions.

The four guides offer a variety of possible art expressions. Once the individual has discovered the home color, we can lead him or her on a guided meditation to find one of the four guides from the mineral, vegetable, animal or human kingdoms. The meditation is designed to help individuals find their guide and to ask that guide the questions which concern them. We are evoking an inner dialogue process, knowing that active imagination is a powerful tool for bringing information and insight into consciousness (Jung, 1960). An art activity follows the meditation and again people are free to express themselves in whatever art media suits their unique experience.

All of the art experiences are processed in the group after each activity. The excitement and energy are always high. We facilitate each person's awareness and often make suggestions for a progressive step that could be taken in another art expression to further develop insights.

The Sun Wheel's depth allows many art experiences which lead toward balance and individuation. Opposites, polarities, can be explored through the dimension of the Earth and Sky Tribes. Individuals can begin by exploring in an art expression their personal associations with the Earth or Sky tribe. They can explore what the opposite position of Earth or Sky tribes might hold for them.

There are four guides with each of the twelve color positions around the circumference of the Wheel. Once the guides of the home color have been explored through meditation and art experiences, another color position on the Wheel offers four more guides and the possibility for growth through further self exploration.

The Sun Wheel Individuation concept is similar to the one described in Seven Arrows (Storm, 1972). Storm speaks of the need to travel around the medicine wheel, to sit at each of the four direction positions and to perceive the specific qualities represented by each direction. (See Figure 7.) Jung speaks of individuation in a similar way. Most especially Jung’s typology parallels the medicine wheel (Jung, 1971). The individuation process of the Sun Wheel is to travel the twelve color positions and to learn what each position has to teach through meditation and art experiences. When the dimension of the four guides and the rich information available through the Four Directions are added to the color positions, the depth work available through the Sun Wheel has endless possibilities.

Our work is based with a segment of society consciously oriented to personal growth; however, we feel that the Sun Wheel Individuation possibilities can be adapted for use with many different populations, in a variety of settings. A young woman who attended one of our presentations said she was going to have the elders she worked with make a round quilt incorporating some of the principles of the Sun Wheel Individuation process. She envisioned each elder making a personal round color statement and then putting all the individual statements into a round format. The same activity could easily be done with paper and paint. The creativity of the individual art therapist will enhance such adaptations of the Sun Wheel process.

We are suggesting that whenever any of the major archetypes of the Sun Wheel are activated, the art therapy process is enhanced. Therefore, even a simple act of placing groups of people in a circle to talk about their art experiences activates the archetype of the circle and all the circle holds for growth. When we work with groups we place a representation of the Sun Wheel in the middle of the room. We have made this representation out of round cir-

"Once individuals in a group have found their home color, we suggest an art activity to explore the color."
cles of colored paper. This simple representation becomes the focal point for the group experience. We ask people to bring their art expressions back to the wheel and we discuss these expressions in a circle around the Rainbow color wheel. By this seemingly simple act we have activated the Circle, Rainbow, and numerical formation held within the structure of the Sun Wheel, and the creative process of each individual in the group is enriched.

We begin with a circle of Rainbow color and end with that circle of color. Ritual and ceremony around the circle become a natural next step and a closure to the experience. We close a workshop with a ceremony in which all participants honor each individual and the living symbol represented in the artwork, acknowledging the presence of the Self archetype of healing.

Conclusion

The Sun Wheel Individuation process is a way to work toward consciousness and balance. Through the activation of three archetypes (circle, Rainbow and numerical formation), it offers an opportunity to help groups of people discover and claim individual unconscious parts of themselves and to integrate opposites within. The Sun Wheel Individuation process depends on the art experience to help people find their own wisdom and their own inner balance. The principles of the Sun Wheel are based in the belief that the Self archetype must be activated in each individual if growth is to occur. The Sun Wheel is based in the knowledge that once the Self archetype has been activated, a co-creativity between man and Spirit is achieved and the individuation process moves forward. The Sun Wheel is a bridge to the unconscious of endless depth and variety, which offers art therapists a focal point for the growth inherent in the art experience.

Creative Analysis Involving Multidisciplinary Evaluations of a Case Study

Edith Zierer, ATR, together with her husband, Dr. Ernest Zierer, the originator of Creative Analysis, to whose memory this article is dedicated. Edith Zierer developed and augmented the method of Creative Analysis during more than 40 years of collaboration and application at various hospitals in New York and Connecticut.

After five years of intermittent psychiatric intervention, the patient described in this article was admitted to Hillside Hospital, Glen Oaks, New York, with a diagnosis of psychoneurotic hysteria, phobic type, with a paranoid component. The patient was treated in the hospital for one year after which she was released as she was much improved. The reports of the various treatment team members are juxtaposed with comments by the patient in order to facilitate an evaluation of the collaborative effectiveness of Creative Analysis as a treatment approach. The recorded statements of the treating psychiatrist, staff psychologist, and those of Dr. Ernest Zierer and his associate, Edith Zierer, are included. The examples of the patient's work in Creative Analysis demonstrate the flexibility inherent in these testing instruments to accommodate individual treatment goals as well as their validity as corroborative diagnostic and evaluative implements. A brief history of the development of Creative Analysis, its precepts and methodology, is also included.

Introduction
