The understandings that emerge from this exploration can be simply summarized. For the five art therapists interviewed, scholarship is not an impersonal endeavor disconnected from their personal history. It is an aspiration of significance in their personal and professional development, connected to their values and beliefs as psychotherapists and women. Educationally and professionally these women have experienced intimidation, alienation, and ambivalence regarding participation in research, partly as a result of their own tendencies to understand quantitative empirical research as the methodology of choice and partly as a result of their perceptions that the art process resists methodological rigor. They also perceived, however, that broader definitions of research, involvement with mentors engaged in research endeavors, and ongoing support have impacted and could continue to impact these obstacles to participation. All five expressed enthusiasm for continued development of their identity as researchers.

The findings of this research project open up possibilities for new kinds of understandings about research in the field of art therapy. For the art therapists interviewed, research is an extremely personal, process-oriented endeavor that needs specific kinds of encouragement to overcome deeply rooted resistance. It is my hope that the stories of these five art therapists and the consequent understandings will help the field of art therapy explore and define meaningful connections between its theories, its clinical practice, and its research methodologies.

Revisioning/Revisiting

Suzanne Calomeris, MA,
La Grande, OR

These watercolor and ink images were produced in early 1995. They allude to my move from an Australian coastal metropolis to a tiny, inland, rural town in Oregon. The spirals, ever expanding, can be a symbol for the self. Exchanges that occur in the work result from interfacing with new environments and cultures.

Imagery assists the processing of my personal sense of boundaries—physical, emotional, spiritual, and professional—in relation to everything else that is.

Visual references are made to some Aboriginal ways of depicting landscapes.

The images are 3" x 5", using watercolor with ink(s) on paper.

Art Therapies and Clients with Eating Disorders: Fragile Board
309 pp., $29.95, paper. ISBN 1-85302-256-X
Reviewed by Barbara Sprayregen, PsyD, A.T.R., Arlington, MA

There is, unfortunately, far too little literature on the interface between art therapy and eating disorders. I was, therefore, very excited to learn about the publication of *Art Therapies and Clients with Eating Disorders: Fragile Board*. This is a good book that makes a substantial contribution to a difficult area of clinical work. Ditty Doktor, editor of the book, is a British dramatherapist who brings together a group of knowledgeable, experienced, talented arts therapists who work and reside primarily in England. The book also includes powerful artwork and writing by a recovered anorexic and working artist.

*Art Therapies and Clients with Eating Disorders: Fragile Board* is divided into six sections: Introduction, Art Therapy, Dramatherapy, Psychodrama, Dance and Movement Therapy, and Music Therapy. Doktor begins the introduction by providing a sociocultural, psychological, and biomedical context for the existence of eating disorders. She clearly discusses the complex factors which contribute to the etiology of eating disorders. She goes on to define anorexia and bulimia, according to DSM-III, and to describe the various modalities that comprise the arts therapies. Her discussion then turns to the area of treatment where she advocates a multidisciplinary approach in which medical, cognitive behavioral, and psychodynamic components are all given attention.

Doktor espouses a hypothesis about why the arts therapies are appropriate for treating the population of eating disordered clients. In a section of her chapter “Acting Out” therapies for ‘acting out’ clients,” she elaborates:

*The arts therapies practice direct action within their art modality in the therapy. It is important to consider how this acting out can be transformed into a therapeutic form of action, which allows for internal change. This is especially important for acting out client groups such as clients with eating disorders, as they are seen in a psychodynamic framework as acting out through the body their underlying emotional conflicts. (p. 16)*

Like most British arts therapists, she uses an object relationally based, developmental perspective to understand the origins of eating disorders.

Artist Elise Warriner completes the introduction with a moving account of her recovery from anorexia, in which art therapy played an important role. She asserts, “Strange as it may seem anorexia and illustration have at least one thing in common. They are both about expressing oneself without words, yet one is destructive and the other creative” (p. 24).

Part II contains three excellent chapters on art therapy which I will briefly summarize. Joy Schaverien discusses “The Picture as a Transactional Object in the Treatment of Anorexia.” Her work refers primarily to individual art therapy with hospitalized patients. She takes an object relational, developmental perspective to understanding anorexia as a presymbolic level of experience or a concretizing of experience. Her theoretical approach is multilevelled and elucidating. Two of her greatest influences in this chapter appear to be D.W. Winnicott and Christopher Bollas. She weaves an illustrative case into her narrative. She writes:

*The client’s relationship to food may be understood to be a means of negotiating and mediating between the internal world and the external environment...the art object may temporarily, and unconsciously, become a substitute for the use of food. It may serve a positive function as a transactional object. (p. 31)*

Mary Jane Rust describes her outpatient group art therapy for women who are compulsive eaters. She contrasts three different groups she ran and looks at group members’ styles of drawing and interaction in relation to a developmental formulation about the origins of eating disorders. This chapter is useful, among other reasons, for its attention to the interpersonal aspects of the treatment of compulsive eating problems. Rust recognizes the way that imagery in group work becomes a vehicle for sharing and dialoguing about members’ inner worlds. She states, “Art therapy is one way of bringing...issues to light, of helping conflicts to move from being locked in the concreteness of the body to a place where they can be imagined, expressed, thought and spoken about” (p. 49).

The final chapter on art therapy was written by Paola Luzzatto. She describes a technique she has developed for creating and using what she refers to as a “Self-World Image” in the treatment of anorexic patients. She hypothesizes that the basic conflict for many anorexic patients involves becoming entrapped within their own defensive processes. She metaphorically labels this the “mental double trap of the anorexic patient.” The double trap is composed of three essential elements: a small and helpless self, an enclosure which both protects and imprisons the fragile self, and an indication of persecutory, dangerous forces in the environment or even within the enclosure. She elaborates, “The double trap may be seen as a graphic illustration of what Guntrip (1982, p. 425) calls a ‘static closed sadomasochistic system of internal bad-objects’” (p. 64). She describes how she works with the double trap using the symbolic images to help the diminished self gain a sense of empowerment. According to Luzzatto, “The persecutor must lose its power as an internal object...the little self must gain strength. The need for the prison will then decrease” (p. 67). She describes her 16-week treatment of a male anorexic using this therapeutic approach.
Following the section on Art Therapy, the book goes on to cover Dramatherapy, Psychotherapy, Dance Therapy, and Music Therapy. As an art therapist, I found the remaining chapters to be theoretically rich and clinically useful. For example, Linda Winn’s chapter discusses how she has successfully integrated art and dramatherapy in developing inservice training programs for staff who work with eating disordered clients. Dance therapist Sally L. Totenhier describes her “Body Image Therapy” technique which uses both image making and body work. Music therapist P.J. Rogers contributes an excellent chapter on “Sexual Abuse and Eating Disorders.” While some sections cover techniques of music making or drama that I would not feel competent to use with clients, I found it enlightening to learn more about how expressive therapists work in their chosen modalities.

I found Arts Therapies and Clients with Eating Disorders to be a very valuable book. It is probably especially interesting for clinicians who resonate with object relations approaches to treatment and for clinicians who enjoy an emphasis on theory. The book appears to be more theoretically oriented than writings by North American art therapists. Maybe it seems that way to me because of the various authors’ clear and consistent grounding in a similar object relations perspective. This book will probably be less useful for novice therapists, because it is heavy on theory and contains limited illustrations and technical advice.

I have found only one other book that discusses arts therapies with the growing population of eating disordered clients. It is titled Experimental Therapies for Eating Disorders (1989). In this very good book, chapters are devoted to art, psychodrama, dance, music, poetry, hypnosis, and other related approaches. Unfortunately it is never cited in Arts Therapies and Clients with Eating Disorders. In fact, throughout my reading of the various chapters, I was continually surprised to find only one reference to any American art therapist. It seems a great loss that there is such a lack of dialogue and collaboration between arts therapists on different sides of the Atlantic Ocean.

Wet-into-Wet Watercolor: The Complete Guide to an Essential Watercolor Technique

144 pp., 200 color illustrations. $29.95 cloth.
ISBN 0-8230-57715-1

Reviewed by Tara Marean, MS, A.T.R., Croton-on-Hudson, NY

Writing for the beginning to intermediate watercolorist, Gail Speckmann, author of Wet-Into-Wet Watercolor: The Complete Guide to an Essential Watercolor Technique, provides the reader with an explicit guide to painting with wet-into-wet watercolor techniques. The watercolorist who follows the techniques presented by Speckmann will develop an in-depth understanding of the materials, approaches, techniques, and applications of wet-into-wet watercolor. This book is not meant to address issues art therapists face when using watercolors with patients, nor does it suggest projects specifically for use in art therapy. Using the techniques presented in this book, the art therapist will expand her/his ways of using watercolor with patients.

It is valid to ask why an art therapy journal would publish a review of a book devoted solely to a specific art technique. It is accepted that art therapists must possess a high level of mastery of the materials they use. Wadeson (1980) states

...it is necessary for the art therapist to be familiar with what may be evoked by the different media, what advantages each offers and what limitations each has, so that the media may be selected appropriately. (p. 18)

The ability of watercolor to float and settle and to spread and bloom creates unique opportunities and challenges for art therapy patients.

Robbins (1984) says

Watercolor, with its unpredictability and transparent nature, is hard to control and necessitates a willingness to be spontaneous, accept change, relinquish omnipotence. Being faced with issues of control and mess can bring to the surface conflicts of disorder and shame associated with internal objects. (p.193)

Possessing powerful symbolic qualities, watercolor is a staple in most art therapists’ supply closets. Therefore, it is imperative that its nature be fully understood. Rubin (1984) explains

Such an awareness can only be gained through substantial personal experience with medium, tool or process... Only an art therapist who can assist a patient in the use of the medium is legitimately entitled to offer it. (p. 12)

Speckmann’s guide provides the reader with a superb account of how to use watercolors. She begins with a 26-page account of materials. Informative descriptions of the behavior of inorganic earth pigments (ochers, siennas, and umbers), inorganic mineral pigments (cadmiums, cobalts, manganesees, and oxides), and organic carbon pigments (septa and indigas) are carefully presented. She follows this with a description of possible palette choices, including recommended watercolor paint brands. While this brand-specific information is important to the working watercolorist, Speckmann’s recommendations may be outside the average art therapist’s budget. For example, Speckmann prefers Holbein’s Juvenile Brilliant #1, available in 0.47 oz. tubes ($7.15. A.I. Friedman, NY, 1995), or Holbein’s Aureolin ($12.35. A.I. Friedman, NY, 1995). Other recommendations include Grumbacher’s Davy Gray, 0.25 oz. ($2.00. Artist’s Buying Club, NY, 1995), and Windsor Newton Red in 0.47 oz. tubes ($11.60. Artist’s Buying Club, NY, 1995). If the art therapist’s budget allows for tube watercolors at all, she or he would be looking for something like Fantasia, a set of 12.406 oz. tubes ($5.00. Nasco, California, 1995). An even more likely choice is the Crayola* Whole Pan Set of 6 colors ($4.95. Nasco, California, 1995).

Speckmann continues with a full and wonderful description of watercolor brushes and paper. While the brands of products described will not match most art therapists’ budgets, under-
standing the qualities of paper weight and texture, brush quality, and pigment properties may enable art therapists to purchase less expensive substitutes capable of meeting their specific needs. This information also may offer direction for patients who intend to continue painting on their own.

Speckmann offers innovative options for equipping the studio. Art therapists may find useful her suggested uses for surgical gloves, blow dryers, shower heads, and plastic squeeze bottle. She recommends using a food baster to direct a stream of water at the paper, along with spray bottles to keep the paper moist. All items offer new possibilities for the art therapy experience.

The next 38 pages address basic approaches: working on saturated paper, painting by sections, and various approaches. Throughout this section, Speckmann provides highly detailed instructions. For example, in describing one stage of wetness, she says,

Saturated and shiny: no standing water, but enough wetness on the surface in which the paint can do some very free and exciting things. Keep the paper perfectly horizontal once you have the image you want. You can wipe away some moisture by touching the point of a paper towel in places where the paint will not be disturbed. Wipe away excess moisture from the edges. (p. 39)

Of equal clarity is Speckmann’s description of paint consistency and the fully loaded paint brush. Speckmann carefully and completely tells how to accomplish each painting process, from the proper angled tip of the supporting board to techniques for lifting paint. Each approach is clearly demonstrated by a color photograph of a completed work followed by many specific exercises designed to explore the technique. Each exercise is clarified by several additional color photographs of examples.

Describing one problem art therapists may face when using watercolors with patients, Robbins states

Watercolor... runs all over the wet space that is provided, potentially causing a great deal of anxiety to the person with loose ego boundaries or fear of fusion. (p. 112)

A solution can be drawn from Speckmann’s approach to painting by sections. She demonstrates “…a clear example of how painting by sections helps you control the boundaries of color area” (p. 51).

Especially useful to the art therapist is the section on masking. Again, the author’s learning techniques to help control the paints’ boundaries provide tools to help patients explore watercolors. She offers many innovative ways to control the spread of paints.

Speckmann’s techniques of pouring paint, textural effects, and lifting color lend well to the art therapist’s knowledge of the use of watercolor.

Gail Speckmann so thorughly presents her techniques throughout her book that the final chapter, “Applications,” seems almost redundant, except perhaps for fine tuning what she has already taught the reader.

As a watercolorist, I commend Speckmann for using words that paint descriptions so well that I could see them while reading. It was hard for this reviewer to continue reading, because I wanted to paint each exercise as it was presented. As an art therapist, I recommend that all art therapists who use watercolor with their patients read this book.

Video Review
Courage: Together We Heal! Mural Messages from Incest Survivors
30 minutes, color, VHS. Purchase only: $95 (includes a 25-page monograph on the subject). Available from Frances E. Anderson, 5620 Art Department, Illinois State University, Normal, IL 61761-5620.
Reviewed by Marcia L. Rosal, PhD, A.T.R.-BC, Louisville, KY

Courage: Together We Heal! Mural Messages from Incest Survivors begins with vivid images of clay tiles produced by women involved in a 9-week art therapy group. Beautiful, yet haunting images set the tone for this sensitive documentary of a group art therapy program for women survivors of childhood sexual abuse. Clay, as the medium of choice for these abuse survivors, is the focus of the art therapy. A critique of the theoretical discussion, the experiences of the participants, and vignettes from the group experience are the focus of this review.

During the opening sequences of the video, we hear the words of one group member who describes working with the clay as tapping “the true depth of my potential.” The use of clay as the primary medium for the group is profound. We learn that clay has specific inherent qualities suited to the therapeutic work of incest survivors. First, the narrator discusses the psychological issues of women who suffer from the lingering effects of sexual abuse. When it is revealed that two goals of therapy for this group are to (a) integrate intellect and affect, and (b) gain a sense of mastery and control, the choice of clay as a primary modality is clear to the art therapist. Nonetheless, the narrator notes outlines aspects of working with clay that can help survivors: (a) the tactile aspect of working with clay helps survivors reconnect with their bodies; (b) working with clay can be playful and help survivors experience playful aspects of self; (c) working with clay is a sensory experience and provides an avenue to getting in touch
with affect; and (d) clay is a success-oriented medium and as survivors experience success with using clay, a sense of mastery and increased self-esteem are noted.

Finally, the narrator provides an overview of the 9-week treatment plan. Using both still shots of clay products and sequences from the group, the viewer is led through the series of art therapy experiences developed for the group members.

First, the women are introduced to the clay by asking them to make both pinch pots and pots molded on their elbows. The making of pinch pots is a positive, simple means to succeed and a safe way of getting in touch with and expressing anger. To enhance group cohesion, some pinch pots are created by passing around a ball of clay and allowing all members to contribute to the final project. Through the creation of elbow pots, several members tap into physical pain and physical memories. One woman describes her elbow pot as a “torn vagina” and another notes that the “pots looked sexual.”

Several sessions are devoted to using clay to create the family of origin and the family of choice. Therapists are careful to explain to group members, ahead of time, that both families will be depicted. Prior knowledge, particularly of the family of choice, helps members through the difficulty of making figures from the family of origin. Creating family members from clay taps into the survivor’s anger. However, the group is a safe environment for reexperiencing the anger toward relatives who abused them, or who did not protect them from abuse. Expression of anger within the context of the group and the “working through” stage are vital for the therapeutic process. After confronting the anger associated with the family of origin, constructing a family of choice provides an opportunity for healing. The universality of members’ difficult feelings unifies the group. Group members receive first-hand experience about having a choice of who to let into their lives.

During the last two sessions, group members create “message tiles” for other survivors and future group members gives the women a sense of purpose, develops a connection with a network of peers, and provides another avenue for healing. The message tiles are integrated into a mural which is hung in the clinic for all to witness.

In 30 minutes, which is the running time of the video, the viewer is exposed to the issues and needs of incest victims and to one model of media usage in the treatment of sexual abuse. Although the video contains examples of clay as an avenue for process in therapy, the main focus of the art therapy is product-oriented. The goal of the video is achieved by presenting a unique group art therapy approach with specific parameters and limitations. However, the video has three characteristics which preclude in-depth discussion on a multitude of issues associated with conducting an art therapy group for survivors of sexual abuse: (a) the presentation of a specific group art therapy format, (b) the time-limited nature of the group, and (c) the use of one medium to explore sexual abuse issues.

The video contains some explicit language and when group members share their experiences, a great deal of emotion is witnessed. Therefore, the video should be used for educational purposes only. It is also recommended that viewers read the accompanying monograph for further information and as a springboard for discussion and analysis.

In conclusion, the video is a comprehensive overview of one model of group art therapy. Both the issues of sexual abuse and the use of clay in therapy are carefully balanced and competently documented. Finally, the video is practical, reliably produced and chronicles the art therapy process of a sensitive population with great compassion.

2600 South First Street Springfield • Illinois • 62794-9265
ADDICTIONS
Presenters: Lynn Jones, Holly Feen and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley and James Consoli
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The art therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN SCHOOLS
Presenters: Janet Bush and Sarah Hite (third presenter to be announced)
This symposium will provide participants with the administrative procedures for implementing art therapy services and programs in schools. Topics will focus on the uses of art therapy in schools; roles and responsibilities of school art therapists; techniques and strategies for working with students; training and preparation of school personnel; and the funding and marketing procedures required for school art therapy programs. Participants will be prepared to transfer techniques and strategies for implementing art therapy services and programs to school settings.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Gallinan and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

GOING FOR THE GOLD: GRANTS AND RESEARCH IN ART THERAPY
Presenters: Frances Anderson, Vija Lusebrink and Doris Arlington
Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90’s. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal “in process”.

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchiodi, Julie Epperson and Deborah Good
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. “Children at risk” are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitations which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchiodi and Anita Mester (third presenter to be announced)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterberg, Simonott, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life threatening illness will be addressed.

ADOLESCENT ART THERAPY
Presenters: Kris Sly-Linton (three other presenters to be announced)
The Adolescent Art Therapy Symposium will cover a wide range of topics designed to address a specific focus area requested by the sponsoring organization. This is a somewhat unique approach to the traditional symposia format but considering the multiplicity of problems regarding the treatment of adolescents today, it was felt this would be a way to make each symposium more pertinent to the intended audience. The four person team headed by Kris Sly-Linton, A.T.R.-BC, was coordinated to include professional art therapists that can provide the expertise required to address the following areas: Special Populations of Adolescents, Program Focus, and Teens and Family Systems.
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the Journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:
- Tuberculosis: Art Therapy with Patients in Isolation
- Art Therapy on a Hospital Burn Unit
- The Children’s Diagnostic Drawing Series
- Essential Legal Issues for Art Therapists in Private Practice
- Diagnosis or Dilemma: Drawings of Sexually Abused Children

Art Therapy is available to AATA Members as part of their membership. Non-Members may subscribe at the following annual rates:

Individuals: $50.00 (U.S.) - $74.00 (Foreign)
Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:

Members: $12.50 - Non-Members: $23.00

Make checks or money orders payable to AATA and return with this subscription order form to:
American Art Therapy Association, Inc.
1202 Allanson Road
Mundelein, Illinois 60060

THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board elected by the membership. AATA committees actively work on governmental affairs, clinical issues and professional development. AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films, and awards.

PURPOSE
• The progressive development of the therapeutic use of art.
• The advancement of standards of practice, ethical standards, education, and research.
• The provision of professional communication and exchange with colleagues.
• The provision of legislative efforts to promote and improve the status of professional practice.
• The promotion of the field of art therapy through the dissemination of public information.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:
Publications
• Art Therapy: Journal of the American Art Therapy Association (published quarterly).
• AATA Newsletter (published quarterly).
• Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, films, and the membership directory.
• AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
• Mailings of professional interest.

Services
• Insurance, including professional liability, major medical, life and disability through Maginnis & Associates.
• Access to national experts in art therapy.

AATA Conferences
• Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
• Governmental affairs activities including Congressional review and monitoring.
• State legislative and regulatory activities.
• Promotion of recognition and reimbursement of art therapists by third-party payors.
• National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
• Development of model job description and recommendations for licensing standards.
• Development and implementation of national Education Standards for approval of graduate level Art Therapy programs.
• Development and implementation of nationally recognized Standards of Practice and Code of Ethics of Professional Art Therapists.

Applications received between:
Jan. 1 - May 31: Full dues payment; membership expires December 31 of same year.
June 1 - Sept. 30: Half year dues plus $5.00 payment; membership expires December 31 of same year.
Oct. 1 - Dec. 31: Full dues payment; membership for the remainder of the current year and the next full year.

CATEGORIES AND FEES
Professional - By application review process only; approved members may vote, hold office and serve on committees.

• Professional Member - Individuals who have completed educational training in art therapy; dues are $85.00/year.
• Credentialled Professional Member - Individuals who have been dually approved for Professional Membership by AATA and Registration (A.T.R.) by the ATCB: AATA dues are $85.00/year. Annual A.T.R. Maintenance fee is billed separately by the ATCB.

Associate - Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. Such members may not vote, hold office, or serve on committees. Dues are $85.00/year.

Student - Individuals who are currently taking full-time course work in art therapy or a related field. Requires a current statement from the institution of learning indicating full time status and course work content (6 graduate or 12 undergraduate credits.) Student members may not vote or hold office, but may serve on the Student Subcommittee of Membership. Dues are $35.00/year.

Contributing - Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120.00/year.

Retired - Individuals who are at least 65 years of age and who are no longer practicing. Retired members receive publications and reduced fees, but may not vote or hold office. Dues are $35.00/year. Application provided upon request.

Foreign AATA members MUST include an additional $17.50 above required dues when submitting payment to cover the cost of foreign postage.

ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to each copy of your manuscript:

Name:___________________________________________

Degrees/Credentials:______________________________________

Address:_______________________________________________

Phone numbers:  Home__________________  Work__________________

Type of Submission (check one):

☐ Article  ☐ Viewpoints  ☐ Brief Report

☐ Film/Video Review  ☐ Book Review

Title of Submission:__________________________________________

Checklist:

☐ Five (5) copies, typewritten on 8 1/2" x 11" paper.

☐ Black and white photos of original artwork plus four (4) photocopies of each.

☐ Abstract of 75-125 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author's Signature________________________________________ Date__________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy* uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. **Manuscripts that do not conform to these guidelines will be returned to the author without review.**

**Manuscript Categories**

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
6. **Comments.** Brief comments on articles published in *Art Therapy*, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each manuscript to Editor, *Art Therapy: Journal of the American Art Therapy Association*, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original articles that are not under consideration by another periodical or publisher are acceptable.
3. Manuscripts must be typewritten on 8 1/2" x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 75-125 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors' names, position(s), titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author's responsibility to secure such permissions; a copy of the copyright holder's written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client-patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any manuscript accepted for publication in *Art Therapy* will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in theory, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois, 60060 U.S.A. Telephone (847)949-6664; FAX (847)956-4580. Non-members may subscribe at the following annual rates: $90 (U.S.) and $74 (Foreign); institutions $77 (U.S.) and $100 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 U.S.A. (847)949-6664.

This journal is abstracted in: Resources in Education (ERIC), Art Bibliographies Current Tities, Art Bibliographies Modern, and PsycINFO.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to American Art Therapy Association, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

MISSION STATEMENT: The American Art Therapy Association, Inc. (AATA) is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing. Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

About the Cover: “Yggdrasill,” 30” x 22”; spray enamel, watercolor, charcoal on watercolor paper, by Linda Klein, MA, MFA, A.T.R., LMHC. In Norse mythology, the tree Yggdrasill is the center of the divine world and upholds the universe even as the main pillars uphold the house. When it appears in its full stature, it has already begun to decay. It suffers greater torment than humans can know; and its fate—and image—is bound up with the fate of Odin, the chief Norse god, who, in the most mysterious moment in Norse mythology, hanged himself for nine full nights “on that tree of which none know from what root it rises” in his quest for wisdom.
Gender, like multiculturalism, greatly impacts the work of art therapists. However, little formal attention has been specifically paid to gender-related topics in art therapy literature. This special issue of the Journal focuses on gender and art therapy, addressing several important subjects, including the following: a feminist perspective on art therapy research (Burt); gay and lesbian issues (Brody, Addison); men's experience of depression (Barbee); and transgender/gender dysphoria issues (Piccirillo, Shere. Drin).

Surprisingly, very few submissions were received on the subject of women and art therapy. Women's issues have resurfaced over the years in art therapies (Malchiodi, 1994a; Wish, 1994) and at annual art therapy conferences (Abbenante, 1993; Speer, 1994), but seem to continually falter despite the need for attention to these issues. Without a doubt, women's issues pervade art therapists' work: domestic violence (Malchiodi, 1990; Riley, 1993; Riley, 1994a; Riley, 1994b); sexual abuse/assault; single-parent households and reinvented roles for women (Riley, 1994b); and women's health issues (Malchiodi, 1994a), to name a few. The role of art therapy with women is the subject of a forthcoming book (Hogan, 1996), underscoring the continuing importance of this issue in the 90s.

Specific diagnoses such as depression, agoraphobia, anxiety, and dissociative disorders are more often given to women (Figueras-McDonough & Sarri, 1987). The assignment of these diagnoses may involve a degree of gender bias, but it is generally true that women more frequently consult therapists than men. Therefore, it is likely that most art therapists see more female than male clients in their practices.

Although women's issues pervade the profession, art therapy has not come up to speed in including paradigms from women's studies (as well as related gender perspectives) within its framework. Little progress has been made in addressing the problems of utilizing male-dominated approaches with female clients or addressing why art therapists are "spellbound" (Abbenante, 1993) by psychoanalytic theories, rather than incorporating philosophies that might more effectively speak to the needs of women (Malchiodi, 1994a; Malchiodi & Riley, 1995). Art therapy as a profession is largely female (LaBrie & Rosa, 1994) and art therapists' personal struggles as women have affected the robustness of the profession, particularly in the area of education and training (Malchiodi, 1993) and in research (Junge, 1992; Burt in this issue). How can it be that among so many women there is so little feminist consciousness and so little attention paid to women's issues?

Art therapy's lack of attention to the inclusion of women's studies in the theory and application of art therapy is strikingly apparent in a sample question listed in the Certification Examination in Art Therapy Bulletin of Information (ATCB, 1994). The following example was the very first question presented in the Bulletin:

The artwork of an adolescent girl reveals several persistent themes, including eagerness to be accepted by peers, concern about her appearance, concern about what other people think of her, and apprehension about her future. According to Erikson, the girl is at what stage of psychosexual development?

A) Autonomy vs. shame; B) Identity vs. role confusion; C) Intimacy vs. isolation; D) Industry vs. inferiority. (*The question was flawed in that the term "psychosocial" referred to Freud's theory; "psychosocial" was the term used by Erikson.*)

The correct answer is "B" (identity vs. role confusion) and by the Erikson schema is the fifth stage in his psychosocial development theory. This question has its choice of subject (an adolescent female) and theory may be a good example of art therapy's neglect of feminist paradigms in education and philosophy. It is fairly common knowledge for more than a decade that the work of Carol Gilligan (1982) and others have brought to question Erikson's developmental stages, particularly in the stage of adolescence. Although Erikson left his sequence of life stages unchanged, even he eventually noted that there was a different sequence for females in his developmental schema, particularly in adolescence.

This observation may be perceived by some as attacking the efforts of the Certification Committee and the test question developers. However, in reality, it is the lack of attention by the larger community of therapists, writers, researchers, and educators that is reflected in the inclusion of this question in the ATCB bulletin. It is also remarkable that neither the bulletin of information nor the Certification Exam Study Guide (ATCB, 1994) suggests any references to the works on development such as Gilligan; only Erikson and Freud are listed along with pre-1980 works by Peter Blas on adolescence. If these references were submitted by art therapy educators and art therapists at large, then the profession may need to reexamine its own gender biases, particularly in the areas of human development.

There is another area which art therapists may explore in order to become more gender-sensitive in their clinical work, writing, and research. It is the issue of what artmaking means to female clients, or for that matter, what artmaking means to clients in general, male or female. Again, my thinking about artmaking with female clients was derived from yet another question on the 1995 Certification Examination Bulletin (ATCB, 1995) that went like this:

In an art therapy session, a client uses colored pencils to create a stereotypical image of a vase with flowers. Which of the following
media are most appropriate to offer to help the client create more personally expressive images?
A: Charcoal, B: Marblon, C: Pastel, D: Collage Materials.

The answer according to the bulletin is "C," paint, which is generally accepted by the profession as more personally expressive. Although this may be the logical selection given the choices, is it that easy to say that paint is the solution to personal expressiveness in all such cases? In thinking about women's preferences for materials, a female client came to mind who was very limited in her range of expression with a pencil, and created a great deal of stereotypical imagery as described in the sample question. However, when given the opportunity to express herself through making a quilt, a traditionally female art form and much like collage, she found a personally expressive voice and a freedom in making art not found through other materials, including paint. Gender is not the only factor when helping a client find a material that is most expressive for him/her; attention to cultural background and class or societal status may also affect the choice of art modality and materials.

In order to understand how clients see artmaking, art therapists may have to let go of how we have decided their artmaking should be. What I am suggesting is that instead of simply looking at visual arts as a specific continuum of expressive materials (e.g., paints) to tighter, more controlled material (e.g., pencils), art therapists might want to also take a somewhat different approach: to be receptive to how the individual (according to gender, culture, class, etc.) finds connection and self-expressiveness in art forms themselves, rather than a materials-only approach.

Another way to specifically increase understanding of how women are using art for self-expression is to consider some of the recent exhibits that are bringing women's personal and political issues to attention through visual arts. One is The Clothesline Project (Meyer, Lancaster, & Peck, 1995), a display of shirts made by or in honor of survivors of battering, incest, homophobic violence, assault, and/or rape. Another example is Healing Legacies, a traveling show sponsored by the Breast Cancer Action Group, a national breast cancer awareness and activist organization. This slide registry and traveling exhibition contains a wide variety of visual art and writing by women who have had breast cancer; the show includes works by more well-known artists such as Matuschka and Nancy Fried, as well as women who chose to confront and make public their feelings about breast cancer through the arts. By considering how these two projects successfully use art as therapy and as a voice for women, art therapists may come to redefine their own ways of working with their female clients.

These are a very few modest ideas to reframe and redefine art therapy's views of female clients in treatment, and are only a beginning. Women's issues are one of many areas of gender that art therapists need to further explore in their work. Other areas, such as men's issues, lesbian and gay concerns, and other gender topics also need further awareness and consideration within the field. By more closely examining the impact of gender, in addition to culture and class, art therapists will be able to more adequately address the treatment of their client, bringing greater understanding of clients' individual needs and deepening their experience of art therapy.

Letters to the Editor

I deeply resent being quoted out of context to deliberately distort the meaning of my words as Janis Timm-Bottos has done in the opening sentence of her Viewpoints article, “Artsstreet: Joining Community Through Art” (Vol. 12, No. 3, 1995, p. 184). The article opens: “A psychotherapist, especially an art therapist, should dive deep into the wrecks of psychic disasters, not merely skim the surface to look down from a distance at the barnacled, dismembered vessels on the bottom of the sea.” (Wadson, 1994, p. 153) She sets me up as the strawman to knock down to justify her way of working with the community. In fact, read in context, I had preceded the statement she quoted with: “Surface swimming sometimes makes me feel that I’m not doing my job,” and followed it with: “Often, however, I find myself splashing the surface with clients as they wrestle with their daily antagonists—spouses, bosses, co-workers.” My article was titled “Diving and Snorkeling: The Depths and Shallows of Therapy.” The whole point was to illustrate the movement between depths and shallows.

Timm-Bottos concludes her article by stating: “...being a lousy swimmer motivates me to find options for working, besides making a living by diving alone toward the bottom of the sea” (p. 186). She distorts my metaphor again. The therapist doesn’t dive alone; she follows her client. It’s Timm-Bottos’ clients who must dive alone; she is too “lousy” a swimmer to follow them.

Harriet Wadson, PhD, A.TR.-BC, HLM

In David Henley’s article in Art Therapy (Vol. 12, No. 3) some inaccuracies as well as some misconceptions about the Open Studio Concept and practice need to be addressed. He refers to the Art Therapy Department at Pilsen Little Village Community Health Center. This agency services a variety of populations in the Latino community. Some of these populations include chronically mentally ill, abused children, and dual diagnosis clients. To correct Mr. Henley Dayna Block was not a student or an intern; she was running the Art Therapy Department. Deborah Gadiel was working on her Master’s Thesis on the open studio concept. Deborah established the open studio in 1990 and has run the Art Therapy Department since 1992. Clients have benefited from art therapy as well as open studio for six years. To our knowledge Mr. Henley has no first-hand experience with the art therapy program at Pilsen. We are wondering on what he is basing all of his assumptions about our work and its effect on the clients at Pilsen.

Artwork, ours as well as clients’, was always visible in the studio. We offered standard art therapy as well as open studio time. We are clear on the value of standard art therapy sessions as well as the different opportunities available in open studio. Obviously during an art therapy session neither of us left the client at a table gaping at us as we furiously worked on our own artwork.

Mr. Henley refers to an image of a pregnant nude in his article. There were several of these paintings, some abstract some more realistic. They were Dayna’s self-portraits. She was struggling with her pregnancy and these paintings helped her gain clarity. Teenagers who were often battling hormones, sexuality, and the possibility of pregnancy commented on the series. Adults used these paintings to discuss issues of vulnerability and life choices. This artwork became a springboard for them. Many of these discussions would not have occurred without these paintings. Pregnancy, motherhood, and sexuality are a part of everyone’s life. This is how we entered the world. However, it was easier for most people, clients and staff, to refer to a painting, instead of her body. Obviously, it is a bit more removed.

It our experience at Pilsen, viewing us work on our own pieces encouraged clients whether they were walking by the art studio or participating in open studio time. They observed it is worthwhile to make images, and even with years of experience using art materials the point often comes when the artist struggles with her/his piece. This presents an opportunity to discuss metaphoric life struggles. Struggling with an image allows one to explore difficult feelings or prohibitive patterns. This promotes awareness as well as options and resolutions. Clients saw us as human beings with similar emotions modeling a safe outlet for them.

The clients that derive many benefits from an open studio setting are chronically mentally ill (CMI) clients. Instead of applying Third Hand interventions, which are applied in almost every arena of their life, they take responsibility for their own supplies and process. They make their own decisions in the open studio. This includes the most basic decision of whether or not to participate. In an open studio, the artist/artist’s energy goes into their own art making. The clients do not participate to appease the therapist. However, when the group feels the energy of one or two artists actively engaged in their work, they will get up of their own volition and start painting, drawing, and so forth. The clients who choose to sit are asserting their independence, and their presence is part of the open studio.

Henley comments on the clients’ “naive capabilities” as well as their desire to “emulate” our work. In our experience, Pilsen clients are interested in other people’s imagery, not intimidated. Deborah annually arranges a field trip for CMI clients to view the MFA Show of the School of The Art Institute of Chicago. This show contains raw imagery, sophisticated conceptual work, and even installations that include body fluids. The CMI clients look forward to this event and can relate as artists because they have a vast repertoire of their own image-making experience to draw from. Provocative artwork is challenging to all who view it. This presents opportunities to relate and share very human
responses regardless of one's level of functioning. We react to the experience of viewing the work together, thus creating more empathy among staff and clients. Their familiarity with an open studio setting allows clients to be comfortable with a wide range of imagery: from the MFA Show to the Open Studio Project.

Deborah has also brought the CMI clients to make art at The Open Studio Project. Clients' participation with us in an open studio grounds them in working autonomously in the Open Studio Project as well as other environments. One of the most severe clients was working on a piece and talking to Dayna about G-d, death, hell, and paradise, his major preoccupation. She was painting a piece with skeletons, crosses, cauldrons, cherubs, and a cow. After a while he noticed the painting and asked her about it. She explained that she thinks about some of the same things he thinks about and for her it is more manageable, less overwhelming, to put them on paper. This made sense to him; he worked the rest of the 3-hour session, made two pieces, and participated in the discussion, which is unusual for him. Rather than intimidate these clients, other people's imagery motivates and empowers them.

Everyone has everything inside them including insanity whether one is diagnosed or not. We are as alike as we are different. Art is one of the few ways we can experience that duality together. The open studio allows us to share that experience.

We value the difference between art therapy and open studio. We do not have young children (feral or otherwise), the population with which Henley is most familiar. Their lack of maturity and motor coordination would hinder our participation as artists creating the atmosphere in the open studio. So do not worry David; participants are not expecting a Third Hand to fill water buckets or a therapist to stand encouragingly behind them. They are expecting another human being to be as fully engaged in the creative process as themselves to help create the energy to sustain and support everyone's personal vision.

Dayna B. Block
Deborah Galiel, A.T.R.

I must applaud you for the Viewpoints contributions of Terry Tibbetts, Harriet Wadeson, and Robert Wolf and for your thoughtful editorial. I find that art therapists are often mired in their own credulity when accountability is demanded and properly expected. It is a difficult exertion, essentially based on self-knowledge. Art therapists, like the common ilk, have amongst us, those who are unwilling to examine their own motives and exclude the basis of analysis. I can not foretell, but know that the struggle for clarity and reason has always been tumultuous, and so the task requires fortitude and stamina...fundamentally because growth is an aggressive act and thus we defend, resist, and retreat.

Thank you for your determination to publish a periodical which is relevant and revealing.

Lee Foster, A.T.R.

ART THERAPY: DEFINITION OF THE PROFESSION

Art therapy is a human service profession that utilizes art media, images, the creative art process, and patient/client responses to the created products as reflections of an individual's development, abilities, personality, interests, concerns, and conflicts. Art therapy practice is based on knowledge of human developmental and psychological theories which are implemented in the full spectrum of models of assessment and treatment including educational, psychodynamic, cognitive, transpersonal, and other therapeutic means of reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem.

Art therapy is an effective treatment for the developmentally, medically, educationally, socially, or psychologically impaired; and is practiced in mental health, rehabilitation, medical, educational, and forensic institutions. Populations of all ages, races, and ethnic backgrounds are served by art therapists in individual, couples, family, and group therapy formats.

Educational, professional, and ethical standards for art therapists are regulated by the American Art Therapy Association, Inc. (AATA). The Art Therapy Credentials Board, Inc. (ATCB), an independent organization, grants post-graduate registration (A.T.R.) after reviewing documentation of completion of graduate education and post-graduate supervised experience. The Registered Art Therapist who successfully completes the written examination administered by the ATCB is qualified as Board Certified (A.T.R.-BC), a credential requiring maintenance through continuing education credits.

The art therapy definition was developed by the American Art Therapy Association, Inc. Board of Directors in November 1995.
THE AMERICAN ART THERAPY ASSOCIATION
26th ANNUAL CONFERENCE
Town & Country Hotel/San Diego, California
NOVEMBER 8-12, 1995

Wednesday, November 8, 1995
Workshops
The Kinetic Circus Character Drawing (K-C-C-D) Procedure: An Art Based Assessment Technique/Michael J. Hanes
Psychopomp*perry/Matthew Bernier
Illuminating Wisdom in Older Adults/Bernadette Callanan
Increasing the Range of Self-Expression: Combining Poetry with Art Therapy/Virginia Minar
Finding a "Home": Community Artmaking/Jants Timm-Bottos, Louise Kahn
Art Therapy and Multiculturalism: Fad or Reality? Anna Hucox, Janise Escobar
The Healing Link: Music, Imagery, and the Body/Mind Connection/Stephanie Merritt

Panels
Outcome Studies for Art and Recreation Therapy: A Collaborative Effort/Paula Hecte, Denise Chatham, Elaine Parks
School-Based Art Therapy Earthquake Trauma Reduction Program/Suzanne Silverstein, Mindi Neuborn, Carol Palmer, Mirta Stilman, Marcy Stafsky, Joyce Weder-Ballard
The Multidisciplinary Treatment of Attention Deficit (Hyperactivity) Disorder Includes Art Therapy Groups/Diane S. Sofran, Frank M. Sofran, Susan Finkelstein
The Future of Our Past/Michelle Nienkamp, Nancy J. Gray, Kimberly J. Wathen

Thursday, November 9, 1995
Weaving New Visions/Lori Vance, Karen McCormick, Lynn Kapitan

Papers
Collaborative Co-Therapy: Art Therapy as Adjunct Within Outpatient Private Practice Team Treatment/Susan Roller, Kathleen Adams
The Image-Making Process: Withstanding the Course of Non-Production/Michael J. Hanes
Art and Healing: Practitioner, Process, and Audience—A Dialogue/Mart M. Fleming, Jennifer Colby
The Power of Language in the Art Therapeutic Relationship/Susan Spaniol, Marta Cattanaco
Relying on the Kindness of Strangers' Social Policy: Art Therapy and Poverty/Nancy Mayer Knaup
Couple Compatibility Assessment Using the Mari® Card Test and Mandala Drawings/Phyllis Frame
The Art of Crime/Paula Hecte, Linda Gant
Establishing Medical Art Therapy in a New Outpatient Pediatric Pain Management Service/Janet K. Long

A Vision Made Reality: Establishing Alliances in a Pediatric Art Therapy Program/Laura A. Black, Kerith L. Glass
A Men's Group Using Imagery as a Predominant Way of Knowing/Robert Schoenholtz
The Correctional Officer and the Art Therapist: An Unlikely Alliance/David E. Gassell
Going for the Gold: Art Therapy Grant Collaborations with Allied Professionals/Frances E. Andersen, Lisa N. Brown, Patricia Ceresoli
Art Therapy and Latin America: Answering the Call for New Methodologies/Mary E. Flanery
Survival of Aboriginal Culture Through Art: Implications for Cross-Cultural Art Therapy/Phyllis F. Kaplan, Michael Campanelli
Incorporating the Mandala to Center Children Diagnosed as ADD and ADHD/Valerie Smitheman-Brown
Mirror Drawings: A Reflection of the Therapeutic Process/Gene Marie Shopp, Sue Chambers Wallingford

Student Section/Helen Landgarten
Continuing the Search: Expanding a Professional World View Through Multicultural Influences/Michael Franklin
The Dynamics of Art & Music Therapy in Forensic Settings/Reid M. Dowen, Cindy Y. Wegik
Art Therapy in Pediatric Rehabilitation/Julia Andersen
Searching for the Appropriate Treatment Map: Integrating Object Relations and Family Systems Theories/James Consoli, Gustie Kloor
About the Words in Art Therapy/Karin Dannecker
Mandala Artwork by DID Clients: A Synthesis of Two Theoretical Models/Barry M. Cohen, Carol Tunny Cox

Results of Recent Research Studies Identifying Recurring Visual Symbols and Construct Choices/Doris Arrington, Pamela Hayes, Estelle Rubinstein
Amish Ego, Soul and Art/Dubbie Simms
Heart Imagery: Multiple Messages and Metaphors/Lisa Kay

Posters
The Gorilla Did It! Meeting Art Therapy and Reading Goals Together/Peggy Dunn-Snoca
Research Findings: Art Therapists' (A.T.R.'s) Preferences Utilizing Artistic Mediums/Frank Goyf, Jr., Roz Busken
Behind Bars and Barbed Wire/Linda Milligan
Intergenerational Connections: A Collaborative Art Experience Between Nursing Home Residents and Children Residing in Transitional Shelters/Allison Hurstz, Linda Lec Lavel

Focus Groups
Mari® Card Test and Mandala Study Group/Phyllis Frame
Navigating the Conference: A Student Orientation/Rebecca A. Wilkinson
Online Art Therapy Communication/Barbara Lety, Cathy Malchiodi
Open Forums
Regional Symposia/Jacquelyn Martin
Governmental Affairs/Terry Toone
Clinical Committee/Linda Chapman
Ethics/Cay Drachnik
Membership/Cindy Rosa
Education/Brice Moon

Workshops
The Art of Healing with the Human Energy Field Using Sound/Dorotha Huer-Kramer
Understanding the Spiritual Dimension of a Person Using BATA/Ellen G. Horovitz-Darby

Panels
Art and Art Therapy and the Seductive Environment/Edith Kramer, Lani Gertty, Denaen Henley, Katherine Williams
The China Connection/Harriet Wadeson, Delegates
Art Therapy in Context: Honoring Women's Voices in Our Work/Cathy Malchoth, Shirley Riley
Research in Art Therapy Education - A Dialogue/Marcia L. Rosal, Debra Lienesch, Sarah Hite
Archetypal Art Therapy Defined/Joan Abbenante, Ginger Mongiello, Jeannie Wemcke, Linney Wix

Mexican Fiesta

Friday, November 10, 1995
Master Supervision Groups
Ethics/Cay Drachnik, Christianne Wilkinson
Post Traumatic Stress Disorder/Martha Haeseler
Deaf/Hearing Impaired/Ellen G. Horovitz-Darby
Addictions/Marte Wilson
Transferrential Dynamics Within the Workplace/Cam Busch, Lani Gertty

General Session
Art Therapy Perspectives on Managed Care/Laura Greenstone, Linda Gantt, Sandra Gravas, Ron Hays, Bobbi Stoll, Edward J. Stygar, Jr., Terry Toone

Papers
Sex Differences in the Fantasies and Self-Images of Delinquent and Non-Delinquent Adolescents/Bailey Silver
Art Therapy as Containment in the Stabilization of Dissociative Identity Disorder/Tammy Nelson
Will Children's War Images Lead Us to Peace? Professional Collaborations for Unity/Beth Gonzalez-Dolginsko
Reflecting on Ten Years of Art Therapy for Children Who Are Grieving/Barbara Beteru McIntyre, Julie Adams
Art Therapist as Member of Medical Multi Disciplinary Burn Team/Johanna Russell
Art Therapy Used to Adapt Coping Behaviors of Adult Daughters of Alcoholica/Carol A. Dikovitsky
Art Therapy Interventions with Adolescents Who Are Victims of Trauma/Donna Testa Oehiya
Art Therapy in Head Start—Preventive Mental Health Services for Disadvantaged Children/Sarneet Talwar, Gussie Kloser
Imagine/Connect: A Collaborative Approach to Art Therapy in a Clinical Setting/Carlen Jmenez
From Hurtful Hands to Healing Hands: Collaborative Treatment of Multiple Personality Disorder/Tamara McDougall Herl

Attachment Organization in the Imagery of Addicts and Implications for Treatment/Elizabeth Holt, Donna Kaiser
Art Therapy with Laryngectomy Patients/Susan Ainsley Anand, Vinod K. Anand
Art Work of Aggressive Organic Geriatric Males, Pre and Post Estrogen Therapy/Roseann Drew-L notes, Paul N. Bryman
Holding Onto the Rainbow—Stereotyped Symbols in Patient's Art as Facilitators/Joan Martina

Student Section/Sharzai McNeff
Visual and Tactile Interventions in Healing: Sundray with Mastectomy Patients/Vija B. Losebrink, Krystin Seifres
Through the Viewfinder: Focus on the Ego of Sexually Assaulted Females/Alexandra Elliot-Frissac
Coming to Our Senses: The Somatic Roots of Art Therapy/Suzanne Locell

Mutual Benefits: Art Therapy and a Specialized School in a Psychiatric Program/Dorrie Gassak
Children Having Children: Art Therapy in a Community Based Early Adolescent Pregnancy Program/Mary Jo Merzner-Willy, Gloria Stiles
Integrating Art Therapy and Biofeedback—A New Perspective on Reducing Children's Stress/Carlo DeLuzi
Using the Wall Symbol in Art Therapy With Cancer Patients/Hilde Engelen
Perspective on Clayworks in Art Therapy/Thang Gork, Jr.
Patient-Focused Care and the Future of Art Therapists in Hospitals/Susan Chesney-King

Special Lecture
Cancer—Creativity and Self-Repair: Theoretical and Clinical Considerations on Art Psychotherapy with Cancer Patients/Lester Dresfuss-Kattan

Discussion Groups
Adults with Cancer/Virginia Minar
Children with Cancer/Robin Goodman
Chronic Disease/Vija Losebrink
AIDS/HIV/Sandra White

Posters
Realms of Art Therapy/Benuka Sundaram
Opportunities for Children with Disabilities: Artmaking and Assistive Devices/Carol Kiweli
Art Therapy with Addictions with an Emphasis on Substance Abuse. Work and Relationship Addictions/Holly Fern-Colligan

Focus Groups
Beyond Art Therapy: Creating Effective Continuity of Care Within Mental Health Communities/Deborah Behnke, Bonnie Bluestein
Lesbian, Gay and Bisexual Caucus/Mary Brigid
Doctoral Programs for Art Therapists/Linda Gantt

Student Section—Welcome to AATA/Brice Moon, Virginia Minar, Mary St. Clair

Open Forums
Chapter Affiliates/Nancy Warner Morrison
Archives/Nancy Mayer Knapp
Public Relations/Gail Roy
Mosaic Committee/Anna Hikos
Art Therapy Credentials Board/Nancy Hall

Workshop
It's Not Fair! Art Therapy with Bereaved Children and Adolescents/Patricia Ibs
26TH ANNUAL CONFERENCE

Panels
Portals and Passages/Harriet Wadsworth, Robert Ault, Marnette Junga, Rose Marano-Getter

Finding Meaning in Art: Art Therapists in Collaboration with One Another/Carol T. Cox, Josie Abbenante, Barry M. Cohen, Paula Engellhorn, Mark Fleming, Wendy Miller, Lillian Rhinehart, Laurie Wilson

Art-Based Diagnosis: Fact or Fantasy/Katherine J. Williams, Gladys Agell, Linda Ganst, Robin Goodstein

Models of School Art Therapy: Three Perspectives/Sarah Hitz, Carmen Drenn, Peggy Dunn-Snow

The Clothesline Project: Therapy, Education and Activism/Katherine A. Meyer, Marian K. Lancaster, Ellaine Peck, Laura Myer

Wholistic Art Therapy: An Idea Whose Time Has Come/Roberta Shoemaker-Beal, Arts Garrett, Sondy Celler, Ellen Horovitz-Darby, Svs. Sarchich

Performance Art
Four Lives: A Folk Musical/Bruce Moon
Elder Voices/Laurie Ellen Neusadt, Stuart Stotts

Saturday, November 11, 1995

Master Supervision Groups
Traumatic Brain Injury/Patricia St John
Issues for the Private Practitioner/Patricia D. Issa

Eating Disorders/Paola Lazzatto

Homelessness/Sr. Dorothy McLoughlin, Sr. Marie Larkin

Abuse and Dissociation/Deborah Good

Slide Show Members’ Artwork

Keynote
Mood Disorders and Artistic Creativity/Kay Redfield Jamison

Papers
Collaborating with Artists: Individual and Group Healing/Diane Burdick Gage, Ellen Spriet

Mediation and Art Therapy: Its Many Uses with the Geriatric Patient/Linda Lusta-Madoli

Art as a Way of Knowing: From Therapist to Steward/Pat B. Allen

The Myth of Collaboration: The Peace Bridge Project/Lori Vance, Civtul Clark

A Practical Review and Integration of All Diagnostic Drawing Series Research Findings/Anne Mills

The Cutting Edge: Self-Mutilation Seen in a Larger Context/Sam Phillips

Planting the Seed of Art Therapy Awareness: Educating Allied Professionals as Undergraduates/Barbara Parker-Bell

Return from Dissociation/Barbara Sohal

Development of a Model to Disseminate the Art Scale of Allied Professionals/Betty Jo Thief

Visual Communication—Art Therapy for Interdisciplinary Higher Education Research/Julia Byers

The Studio Experience in Art Therapy Training/Linoey Wre

Mirroring Through Art to Repair the Damaged Self/Delmore Kramer Weinberg

Functions of an Art Therapist’s Art/Helen B. Lindsell

Queenly Maiden: A Case Study in Archetypal Art Therapy/Barbara A. Falcman

Moving the Image: Art and Movement Therapy with Older People/Jean B. Bevan, Judith B. Funderburk

Student Section/Arthur Robbins

Posters
The Family Book Group/Ellie Ehrlich

Statue of Liberty in Holland: From Artist to Art-Psychotherapist/Susan M. Schell-Dikkers

26TH ANNUAL CONFERENCE

Workshops
A Collaborative Model: Utilizing Art and Music Therapy with At Risk Adolescents/Susan D. Lived, Sheila Feeny Shaw
Weaving Poetry into Art Therapy/Randy M. Vick

Panels
Integrating Art Therapy in a Day Treatment Program with Inner City Adolescents/Eileen P. McGann, Greg Pagan, Harriet Harris
Shaping Affect and Meaning in Learning to be an Art Therapist/Arthur Robbins, Laurel Thompson, Elaine Rapp, Pierre Boenig
Mural Making in the Therapeutic Community: Five Projects and Views/Leland Peterson, Sandra Goldman, Richard Sorrentino, Jane Cameron, Anne-Marie Levesque

Conference Courses
Art Making as Complementary Medicine: Art Therapy with Medical Populations/Cathy Malchiotti
The Multi-Disciplinary Model for Treatment of Attention Deficit Disorder/Diane Safran, Frank Safran, Susan Finkelstein
Women's Narratives and Their Art Therapy Illustrations/Shirley Riley
Kinesthetic Imagining: Exploring Body as Therapeutic Vessel and Healing Guide/Susanne Lowell
Art Therapy Inquiry: New Research Opportunities/Debra Luesch
An Intermodal Approach to Mandala Theory Using Art, Dance, Music, Poetry/Carol T. Cox, Peggy O. Heller, Carolyn Sonnen, Virky N. Wilder
The Ulman Personality Assessment Procedure/Gladys Aygel
Celebrating Differences: Exploring and Treasuring Our Cultures/Lant A. Geity, Martha P. Haesler, Andrea Ramany
Incorporating Art-Making in Play Therapy: A Child-Centered Approach/Linda Lee McCarty
Drawing on Strength: Feminist Art Therapy with Victims of Domestic Violence/Kathryn A. Webb
Introduction to the Diagnostic Drawing Series: An Art Therapy Assessment for Adults and Children/Barry M. Cohen, Anne Mills, Barbara Solot

1996 CALENDAR OF EVENTS

APRIL
The American Society of Group Psychotherapy and Psychodrama will convene for its 1996 Annual Meeting "Seventy-Five Years of Psychodrama: So Much More to Explore" April 18-22, 1996 in Houston, Texas. Conference participants will learn new methods and share ideas which place value on empowerment, community building and interdependence. The 1996 Annual Meeting will include a celebration of the diamond jubilee of psychodrama and explore its relationships with creative arts therapies, education, counseling, and the workplace. Individuals interested in receiving registration information should contact the ASGPP National Office, 6728 Old McLean Village Drive, McLean, Virginia 22101, (703)556-9222, fax (703)556-8729, and e-mail: Degnon@AOL.com.

MAY
The 16th Annual Conference of the National Association for Poetry Therapy, "Words For Life" will take place at the Columbia Inn in Columbia, Maryland, May 2-5, 1996. Lucille Clifton and Jack Coulehan, MD, will be the keynote speakers. Call (516)944-9791 for more information.

Kaleidoscope® Kids, Inc. will be holding the 3rd Conference and Networking Symposium on Pediatric Hospice-Home Care and Related Issues Inpatient Care at the Omni Charlotte Hotel in Charlotte, North Carolina on May 10-12, 1996. Write for more information to Kaleidoscope Kids, Inc., P.O. Box 1659, Mt. Pleasant, South Carolina 29465.

JUNE
The 31st Annual Conference of the Association for the Care of Children's Health (ACCH) will be held at the Albuquerque Convention Center in Albuquerque, New Mexico, June 9-12, 1996. The theme for the year's conference is "Humanizing Healthcare: Renewing the Spirit of Our Work." Clinicians, administrators, educators, researchers, policy-makers, pediatric facility designers, family members, and others are invited to register. For a preliminary conference program or further information, contact the ACCH Conference Office at (301)993-2487.

OCTOBER
The International Stress Management Association will conduct ISMA-6 on October 5-8, 1996 in Sydney, Australia in cooperation with several other organizations. For more information call (619)635-4698, fax (619)635-4699, or Internet: NOSTRESS@sanac.USIU.edu.

NOVEMBER
The 27th Annual American Art Therapy Association (AATA) 1996 Conference "Many Paths; Multicultural Perspectives in Art Therapy" will be held on November 13-17, 1996 at Adams Mark Hotel in Philadelphia, Pennsylvania.

2245
Acceptance Speech for the Honorary Life Membership Award of the American Art Therapy Association

Vija B. Lusebrink, PhD, A.T.R.-BC

Vija B. Lusebrink, PhD, A.T.R.-BC, Professor Emerita, University of Louisville, Kentucky, has been an art therapy educator for 22 years. She was on the faculty of the Expressive Therapies Program, University of Louisville, from 1974 to 1998, and as a Professor and Director since 1986. She also has been a guest lecturer at the College of Notre Dame, Belmont, California, Florida State University, Tallahassee, Florida, and the University of New Mexico, Albuquerque, New Mexico, among others.

Dr. Lusebrink has published many articles and has written a book, Imagery and Visual Expression in Therapy (1990). She has given many presentations at the Annual Conferences of the American Art Therapy Association (AATA), the Association for the Study of Mental Imagery, World Conferences on Imagery, as well as at the Annual Meeting of the American Psychiatric Association and the Annual Convention of the American Psychological Association.

Dr. Lusebrink has been active in AATA as a member of the Standards Committee, 1973–75, Peer Standards Review Board, 1975–77, Program Co-Chair of the 6th Annual Conference of AATA, Member of the Nominating Committee, 1981 and its chair in 1989, Honors Committee, 1982–83, Professional Ethics Board, 1986–87, and Member of the Research Committee, 1990–93 and its chair in 1992. She is a member of the Kentucky Art Therapy Association and a Honorary Life Member of the Northern California Art Therapy Association. She is a member of the Editorial Boards of Art Therapy: Journal of the American Art Therapy Association and The Arts in Psychotherapy.

I am deeply honored by being chosen to receive the Honorable Life Member Award of the American Art Therapy Association, and I want to thank all who made this come true.

In my work as an art therapist, I have received a number of titles in working with my patients. I have been named by them, depending on the individual and circumstances, a Russian spy (because of my accent); Lady Vija (because one of my patients thought that he was a Lord and that we were married); and Cat Lady (I had a third eye because I could relate to their drawings and paintings). I guess, I also have been known as the tough Dragon Lady among the students of the Expressive Therapies program at the University of Louisville. I never dreamt, though, that I would be named an Honorary Life Member of AATA.

Looking back on my many years as art therapist and art edu-

1995 Distinguished Service Award Speech

Randy M. Vick, MS, A.T.R.-BC

Randy M. Vick, MS, A.T.R.-BC, graduated from Emporia State University and has practiced art therapy for the past 14 years. His most recent clinical position was as Director of Expressive Therapies in Psychiatry at Michael Reese Hospital, Chicago, where he continues work on an art therapy research project. His current position is Assistant Professor in the Master of Arts in Art Therapy program at The School of the Art Institute of Chicago where his duties include the coordination of internship placements.

He has been President (1985–87), Conference Co-chair (1985), and Program Co-chair (1983–85) for the Illinois Art Therapy Association which awarded him its Distinguished Service Award in 1993.

For the past several years, Randy has worked as part of the team which developed the ATCB certification exam by refining knowledge areas, writing questions, and reviewing the '95 exam in its final stages. Randy also served on the Clinical Committee (1989–93) where he represented both AATA and NCATA at the Mental Health Advisory Committee of the JCAHO. In this capacity he functioned as a member of a rehabilitation therapies coali-
tion which provided input to the Commission as standards relating to these disciplines were developed.

With the 1994 Silver Anniversary conference he completed a five-year term as AATA's Conference Chair, a position he helped to develop. Prior to this he served as Program Chair (1989) and Local Arrangements Chair (1988). Randy is currently on the AATA Board of Directors and has liaison responsibilities to Art Therapy and the Public Relations and Research committees.

I'm pleased and proud to accept this Distinguished Service Award, and as an additional act of service to you all I am going to keep my remarks brief. I have absolute empathy for Cathy Moon in her role as "time cop" and so will do my part to keep us on schedule.

I want to thank Virginia Minar, Cathy Malchiodi, Marcia Rosal, and Debbie Good who placed my name in nomination for this award as well as the Honors Committee and the AATA Board. It's very gratifying to have your accomplishments recognized by your professional peers.

Eight years ago I was contacted by Linda Gantt who discussed the idea of serving as Local Arrangements Chair for the 1988 conference in Chicago. Things progressed nicely, time passed, and I must have proven myself a worthy pigeon since I was eventually asked to make a long-term commitment to apprentice to the Conference Committee. In this role I was to develop the conference manual and serve as Conference Chair (a role previously seen as part of the duties of the President-Elect) for a multiyear term. The symmetry of beginning and ending my tour of duty in my hometown appealed to me so I signed on through the Chicago conference of 1994. Such are the dangers of aesthetics. That is how I became such a fixture at these little get-togethers, serving in turn the Drachnik, Gantt, Goodman, and Stoll administrations.

During these years I've thought a great deal about our annual meeting and the function it plays in the life of our association and our profession. Comparisons are made to trade conventions and family reunions, but these concepts are insufficient. The metaphor I prefer is that of a village. But not by any means your typical town. Ours is a strange, Brigadoonish sort of place which appears as if by magic out of the mists at the appointed time and place. Now, in the play the legendary town is manifest for one day then sleeps for one hundred years until it's next appearance. I must admit that while working on these events the reverse often seemed true; our actual schedule is four days of intense activity followed by a year of relative rest. Different, too, is Brigadoon's pattern of returning to the same Scottish moor each time while we spring up in a new location every year.

Within the bounds of our new town square, we return to our community life with a vigor that would put the singing and dancing inhabitants of that mythical Highland village to shame. Here we greet old friends, buy some books, swap stories, and get a bite to eat, but the primary commerce of our town is in ideas. The trade, barter, and marketing of theories and experiences of art therapy are at the core of these gatherings. When the allotted time is up we disperse, exhausted but body perhaps but reenergized professionally and personally for the work we return to in our "other" homes.

In the play a miracle is given as the reason for the magical appearance of the village, but the work of many hands is what makes this city work. I've been very fortunate to have had the chance over these years to work with many gifted colleagues. Program Chairs Patricia Isis, Cecily Mermann, Rene Bouchard, Cathy Moon, and Barb Fish and dozens of committee members, and Ed Styar and the AATA National Office staff all have contributed countless hours to these events. If there is magic here it's Mary Buckley whose behind-the-scenes coordination and eye for details make her a true unsung hero.

To this talented mix I brought my creativity, organizational skills, and sense of humor. I put in some long hours, had a good deal of fun, and endured some aggravations—yet by this honor can see it was appreciated. Thank you very much.

Service Award
(awarded posthumously)

Nancy Schoebel, 1952-1990

This award was given to honor the dedication and service of Nancy Schoebel to the American Art Therapy Association and to the profession of art therapy. In the 1970's, Nancy represented the AATA in working on legislative issues for the LACAT, the forerunner of the National Creative Arts Therapies Association (NCATA). She was instrumental in the inclusion of art therapy as a service available under Public Law 94-142, and thus paved the way for art therapists in the schools. She served on the AATA's Board as Governmental Affairs Chair from 1981-1985 and was an activist for NCATA's legislative committee. She served as the President of the Potomac Art Therapy Association and at the time of her death was finalizing her work as Co-chair of the Program Committee for NCATA's conference in 1990.
Beyond Practice: A Postmodern Feminist Perspective on Art Therapy Research

Helene Burt, DTATI, A.T.R., Toronto, Ontario

Abstract

The profession of art therapy has failed to integrate gender issues and feminism into the art therapy literature and research. One of the ways gender has had an impact on the profession is through beliefs about research. There has always been a pervasive assumption among art therapists that we need to do more quantitative research in order to further the aims of the profession. This article discusses the relationship between this assumption and the lack of attention to gender. With the hope of generating a dialogue about gender issues in art therapy and art therapy research, this article examines whether there are research methodologies that are less gender biased than others and whether there are research methods which are particularly suited to art therapy.

Introduction: Is Feminism a Four-Letter Word?

In 1988 I presented at the American Art Therapy Association's annual conference, held that year in Chicago. At the time I was employed at a large and innovative adolescent and family treatment center in Calgary, Alberta. I was the only art therapist in Calgary and in the province of Alberta. Therefore, it was quite an inspiration to be surrounded by several hundred fellow art therapists for four days to focus on “Professionalism in Practice,” the theme of the conference. My art therapy colleagues were not only professional but also highly educated and committed people, many with extensive clinical experience. They were also primarily female. I remember looking around the huge banquet hall in which we all gathered to hear the keynote speaker. There were hundreds of women and only a handful of men. I was somewhat perturbed when the keynote speaker turned out to be a well-known male psychoanalyst from Europe who was not an art therapist. I was astounded when he proceeded to give a lecture on the personal relationship between Gauguin and Van Gogh. I asked myself, “Why had all these bright professional women traveled so far and paid so much money to be delivered an irrelevant talk by a male psychoanalyst?” I felt disrespected, and the conference theme seemed particularly ironic to me given this lack of regard for our own needs as professionals.

In the most recent American Art Therapy Association Membership Survey (La Brie & Rosa, 1994) respondents were asked to identify their gender. Eighty-six percent of the respondents were women, 8% men, and 6% did not respond to the question. In a previous survey (Gordon & Manning, 1991) completed four years earlier, more respondents answered this question 92.8% being female, 6.8% male, and 4% not responding to the question. It is impossible to say whether the percentage of men entering the field has actually risen by 1.2%. At any rate if this represents the rate of growth of men entering the field, it will be a long time before our profession can be considered anything other than a “woman’s profession.”

One of the strongest social, political, and philosophical forces of the last century has been feminism. Feminism has strongly influenced the way we conceptualize the therapeutic process. Strangely enough, the art therapy literature maintains a denial and ignorance of feminism quite distinct from other mental health literature. This was evident in a search I conducted on the CD-ROM PsycLit (1877-1994). I located all cataloged articles and book chapters from 1877 to 1994 which had both the words “art therapy” and “feminism” in them. During this 6 1/2 year period, 357 articles had been written which mentioned “art therapy.” Out of these 357 articles, two also mentioned “feminism.” Out of the 166 book chapters which mentioned “art therapy” none mentioned “feminism.” Wondering how this compared to other fields, I did searches in art therapy, psychology, psychiatry, social work, psychotherapy, family therapy, and occupational therapy.

My research indicates art therapy can hold a claim to being the field which has paid the least attention to feminism. Since it has been feminism which has revealed the power differential between men and women in our society as well as the gender bias in psychological theory and practice, the profession of art therapy seems to be operating without an awareness of the sociopolitical structure that opposes women both as helping professionals and who are clients who utilize health care. This presents a major block to our growth as a profession. If we are not aware of the ways in which gender impacts the power or lack of power of women in our society, then we will likely not become aware of the ways gender impacts our work and the growth of our profession. In this way we will remain powerless to effect any change and never obtain the level of recognition we should have.

In 1989 feminism was briefly mentioned in the art therapy literature. This is when both the art therapy journals had the courage to mention the word feminism appeared. Wadeson (1989) challenged art therapists to look at gender issues in her article, “In a different image: Are ‘male’ pressures shaping the “female” art therapy professions?” Wadeson explored the gender bias in clinical theory and research and highlighted the need for research about women to be within the context of women's expe-
rience. In the same way, Wadeson maintained, art therapy research methods should develop out of the context of the art therapist’s experience rather than out of the context of other professions.

Talbott-Green (1989) also dared use the word feminist in her article, “Feminist scholarship: Spitting into the mouth of the gods.” Talbott-Green discussed the gender bias in editorial policies and in research which has effectively silenced our voices both as art therapists and as women. She asks,

As a member of the mental health establishment, as a psychotherapist, do you feel you have representation, control, autonomy, and access to power equal to that which the “real” therapists have? Do you get equal pay for equal work and responsibility for treatment? Is your important knowledge being published and disseminated among a wide audience of mental health professionals? (Talbott-Green, 1989, p. 260)

One of the ways in which our lack of attention to gender has made an impact on our profession is through our beliefs about research. There has always been a pervasive assumption among art therapists that we need to do more quantitative research in order to further the aims of our profession. This article discusses the relationship between this assumption and our lack of attention to gender. With the hope of generating a dialogue about gender issues in art therapy and art therapy research, this article examines whether there are research methods that are less gender biased than others and whether there are research methods which are particularly suited to art therapy.

Postmodernism and Empirical Research Methods

Harding (1991) defines three distinct streams of feminist research: empirical feminist research, feminist standpoint research, and postmodern feminist research. Empirical feminists recognize that there have been gender inequalities in pre feminist research, as for example in Kohlberg’s (1958) work which proposed a model of moral development in human beings. Kohlberg’s model of moral development is based on a longitudinal study which he conducted with a group of 84 men over a 20-year period, from childhood to adulthood. He drew some interesting conclusions but did not include any women in his study. Therefore, when he generalized his results, women rarely reached as high a moral developmental stage as did men. An empirical feminist research approach, recognizing that these results are biased, might use the same research design but this time include women in the study. An empirical feminist would view the exclusion of women from the study as the problem and view inclusion as the solution.

A feminist standpoint researcher would maintain that inclusion is not enough. In the example of Kohlberg’s research, the results are biased not just because women were not included, but also because the theoretical assumptions on which he based his research are gender biased. A feminist standpoint researcher would question and rethink from women’s perspective, the traditional models of development, accepted norms of mental health, and other gender-biased theoretical assumptions. Subsequent research would utilize theory based on feminist frameworks such as relational theory (Jordan et al., 1991), a feminist theory of women’s development. Bettridge (1994), for example, utilized relational theory to deconstruct traditional theories about adolescent female suicide attempts and to give new meaning, from a feminist perspective, to their behavior. Traditional developmental theory viewed suicide attempts by adolescent females as indicative of a pathologically dependent and manipulative personality structure. Bettridge’s research strongly discounts the traditional perspective, finding that adolescent female suicide attempts are no more dependent than adolescent female nonattempts. In Bettridge’s research, adolescent female suicide attempts emerge as part of a quest for more supportive interpersonal relationships.

Taking this a step further, a postmodern feminist research perspective would challenge the feminist standpoint perspective by pointing out that it is not enough to conceptualize from a feminine perspective. We also must acknowledge differences among women. A postmodern feminist would address race, ethnicity, culture, sexuality, class, age, and all other sociopolitical aspects of life human beings experience, in the research process. Postmodern feminism continues the examination of how meaning and knowledge are constructed with a focus on who is asking which question about whom. Both feminist standpoint and postmodern feminist researchers understand that it is not so much the search for answers which guides the research process, but more the kinds of questions we ask and how we ask them. There is a recognition that the answers we find will always be defined by the questions we ask.

“Hard” and “Soft” Science and Methodology

Psychology has always been viewed as a “soft” science, while the “hard” sciences, like biology, are based on things you can see. The metaphor of “hard and soft” is humorous at best given that it is obvious which type of science, hard or soft, is considered best. Equally humorous are speculations as to how this metaphor originated. Within psychology, we also have hard research methods (quantitative) and soft research methods (qualitative). Art therapists, like other professionals, have wanted to produce scientific research in order to be taken seriously. As in psychology, the emphasis has been on quantitative research methods. Qualitative methods have not been viewed as very scientific, and many of the current ways of conducting qualitative research do not fit with the assumptions science makes.

It has always been science that defined what was real, knowable, and relevant. Science is based on certain unprovable assumptions which are necessary for conducting scientific discourse. These assumptions are as follows:

1. Nature is orderly.
2. We can know Nature.
3. Knowledge is superior to ignorance.
4. All natural phenomena have natural causes.
5. Nothing is self-evident. Everything must be objectively proven.
6. Knowledge is derived from the acquisition of experience.

(Frankfort-Nachmanis & Nachmanis, 1992)

These assumptions are fine for biology, although they obviously don’t explain the phenomena of spirituality or supernaturalism. When it comes to human psychology, these assumptions serve only those who created the assumptions—those in power.
who, either through gender, class, race, or culture, had the privilege to define science. "All natural phenomenon have natural causes" is an assumption which serves medicine and psychiatry particularly well. If everything has a biological cause, then we should be able to come up with the biological cure and not have to solve problems by dealing with such issues as oppression of certain groups, poverty, violence, and so forth. This particular assumption also serves the economically powerful pharmaceutical companies quite well.

The premise "Nothing is self-evident," or everything must be proven by an objective method, disguises a second implicit and more dangerous assumption—that there is such a thing as objectivity. In fact, everything that can possibly be known or understood changes depending on who is receiving it and under what circumstances. Therefore, if we are to ask a research question such as, "What does the imagery of women who have been sexually abused look like?" then we need to know what women are talking about, for example, are we talking about a white middle class Canadian woman or are we talking about a Somali woman of color who has just emigrated to Canada? We also need to know who the researcher is and what his or her particular set of biases and beliefs are. While science claims to be impartial, the assumptions it is based on serve the dominant group all too well.

Art Therapy and the Research Process

The research process, as defined by scientists, necessitates an experiment which consists of the following elements: theory, problem, hypothesis, research design, measurement, data collection, data analysis, and generalization. Art therapy research has primarily been in the form of clinical case presentations or quantitative studies utilizing art therapy assessment tools such as the Diagnostic Drawing Series (DDS) (Cohen, Mills, & Kijak, 1994) with various different populations. Clinical case presentations are not considered hard research as there is no research design and one cannot generalize from the data. Neither is there any way of measuring validity or reliability, two essential components of measurement. Art therapy studies which utilize measurement tools, such as the DDS, meet the requirements of the scientific research process and work hard to achieve validity and reliability. Validity is concerned with the question, "Is one measuring what one intended to measure?" An art therapy example would be, "Does the image of the eye in a client's artwork indicate paranoia?" The validity would be determined by how strongly the researcher could prove that the image of an eye was a measurement of paranoia rather than of something else. Reliability refers to the extent to which a measuring instrument has variable errors; that is, do its results vary from time to time or from environment to environment? In the above example, if the researcher found that the eye indicated paranoia with a group of participants on a given day but then retested the same group on another day and found that the eye did not indicate paranoia, then the reliability of the measuring instrument would be suspect.

The Viability of the Diagnostic Drawing Series

The DDS is described as "the only assessment tool in art therapy that is supported by extensive diagnostic and procedural research" (Cohen, Mills, & Kijak, 1994, p. 109). While I was able to locate seven published studies (Cohen, Hammer, & Singer, 1988; Couch, 1994; Guibro-Leavitt, 1995; Kessler, 1994; Leavitt, 1986; Neale, 1994; Rankin, 1994) which have been conducted using the DDS between 1982 and 1994, I do not think these claims are quite substantiated. The first study by Cohen, Hammer, and Singer (1988) concluded, "There appeared to be limited congruence between psychiatric diagnoses and DDS results" (p. 11). Guibro-Leavitt (1989) investigated the validity of the DDS as a tool to measure depression in children and adolescents. Guibro-Leavitt observed that the detection of depression in this population had largely relied on self-reporting and on the assessments of clinicians and parents which, according to Guibro-Leavitt, have only equivocal validity. However, Guibro-Leavitt's results forced her to conclude that the assessments of clinicians had stronger validity than the DDS.

Although Couch (1994) found differences between her control group of elderly people and her subject group of elderly people with organic mental syndromes and disorders, she acknowledged that her study is limited in that the control group was not representative and the raters were not blind. These two elements usually result in biased results. Kessler's (1994) study of eating disordered patients had no control group, which, without which her study has no intrinsic validity. In other words, without a comparison group of patients who did not have eating disorders, one cannot determine whether the images Kessler found in the artwork of patients with eating disorders differs from the artwork of patients without eating disorders. Therefore, one cannot even suggest that these images are indicative of eating disorders. Both Neale's (1994) and Rankin's (1994) studies have some interesting and convincing results but so many limitations that, by the standards of empirical research methods, the results do not have much weight.

Gender Bias in Psychiatry and Psychology

The DDS research demonstrates what happens when we try to fit art therapy into patriarchal paradigms like the medical model: we lose the value of the art therapy process and further elevate the medical model's position of power. If art therapists wish to produce research which utilizes the medical model, they should at least be aware of the second-hand oppression our clients experience when we utilize a gender-biased assessment tool such as the DDS. Cohen et al. (1994) described how the test was developed:

The graphic profiles of the drawings in the Series are correlated with concurring diagnoses assigned by psychiatrists and psychologists at the time of the collection of the pictures; it is from this correlation that the name Diagnostic Drawing Series is derived. (p. 105)

In other words, the researchers chose drawings done by groups of people who represented each diagnostic category and from these drawings concluded that certain characteristics were indicative of certain diagnostic categories. Ironically, the authors claim:

In addition the DDS is the only published art therapy assessment tool linked to the standards of the DSM III-R (APA, 1980). As it is not predicated on any one particular model of art therapy or verbal
psychotherapy, it can be used by all art therapists as a sort of lingua franca. (Cohen et al., 1994, p. 106)

It is precisely because the DDS is based on the DSM III-R that the DDS is predicated on a particular model of psychotherapy—psychoanalysis. The characteristics which are pathologized in the DSM III-R and their etiology are based on psychoanalytic beliefs about human development and standards of mental health. The feminist critique of psychoanalytic theory (Jordan et al., 1995; Kaschak, 1992; Sturdivant, 1980) revealed how psychoanalysis legitimized sex-role stereotypes by embedding them in quasiscientific theories of behavior and development like the Oedipal stage of development.

Furthermore, the connection between the DDS and DSM-III-R results in an inherent gender bias in the DDS as a measurement tool. Even though the DSM III-R claims to be an impartial descriptive inventory of symptoms, the fact that certain symptoms are pathologized in the first place is based on a white, middle-class, heterosexual male definition of what is normal. The DSM III-R did not have women or minorities involved in its creation. The DSM-IV (APA, 1994) did, but it’s too little too late—the damage has been done. Diagnostic categories are viewed as objective truth rather than as the highly subjective truth of the dominant group in our society which continues to oppress women, other races, cultures, and sexualities. The DSM pathologizes those issues which are problems to those in power in a patriarchal society.

Certain diagnoses are assigned much more frequently to women than men (Rothblum & Franks, 1987). These "women’s diagnoses" include Depression, Agoraphobia, Sexual Dysfunction, Simple Phobias, Anxiety States, Somatization Disorder, Multiple Personality Disorder, Psychogenic Pain Disorder, Histrionic Personality Disorder, Borderline Personality Disorder, and Dependent Personality Disorder (Rothblum & Franks, 1987, p. 351). In a 1970 study by Broderman, Clarkson, Rosenkranz, and Vogel, clinically trained therapists (psychologists, psychiatrists, and social workers) were asked to determine their criteria for healthiness in men, women, and adults in general. The researchers found that the therapists had the same criteria for men and for adults in general but quite different criteria for women. Healthy women differed from healthy men (and therefore healthy adults) by being more submissive, less independent, less adventurous, more easily excitable in minor crises, having their feelings more easily hurt, being more emotional, more concerned about their appearance, less objective, and disliking math and science. The same characteristics which define "healthy" women are the hallmarks of the "female" diagnoses. The primary symptoms of these diagnoses—dependency, emotional, fear of being alone—are all qualities which our society considers essential components of femininity.

A good example of gender bias in the DSM is the diagnostic category of Borderline Personality Disorder (BPD). Of those assigned the diagnosis of BPD, 88% to 78% are women (Ogata, Silk & Goodrich, 1990). The DSM-IV found that 75% of those assigned this diagnosis are female. The diagnostic criteria for BPD as outlined in the DSM-IV includes some of these same characteristics therapists view as "healthy" in women. Therapists see healthy women as "less independent"; the DSM-IV notes the BPD client suffers from a fear of being alone and a need to have other people with her. The healthy woman is viewed as "more emotional"; the DSM-IV states the BPD client suffers from "affective instability." The healthy woman is viewed as more easily excited in minor crises and having her feelings more easily hurt; the DSM-IV notes the BPD client is "very sensitive to environmental circumstances." This gender bias creates a link between the personality characteristics of healthy women and the personality characteristics of BPD clients. We must then ask to what degree BPD is an extreme manifestation of the condition of being feminine as it is defined by psychiatry and psychology.

"Matricentric" Research

The quality of the mother-child relationship has been viewed as the single, most influential factor in the development of BPD. Much of the accepted, traditional literature concerning the etiology and treatment of BPD clients has its origin in theory developed by Mahler (1971) who noted certain similarities between the psychological makeup of BPD adults and the separation-individuation issues of young children. Mahler hypothesized that derailments in the rapprochement subphase of the separation-individuation process led to the development in adulthood of BPD. This premise was then further expanded by theorists like Kernberg (1975), Adle (1985), and Masterson (1975). A mother who was unable to meet the child's needs for mirroring or who could not tolerate the child's need to separate and individuate was usually the cause. However, BPD etiological theory does not take into account other crucial relationships and life experiences in the BPD client's history.

Birns (1985) questions the prevalent and tenacious belief that the mother-child relationship is the primary contributing factor to either the wellness or pathology of humans. Freud set a precedent with his statement that the mother-infant relationship was "unique, without parallel, laid down unilaterally for a whole lifetime as the first and strongest love object and as prototype of all later love relations for both sexes" (Birns, 1985, p. 2). Birns points out the lack of evidence to substantiate this and presents current research which challenges this influential belief.

Birns begins by criticizing the ways in which Bowlby arrived at his conclusions. Bowlby observed orphaned children being raised in an institution who were mentally and physically handicapped and concluded that this was due to maternal deprivation. Bowlby also used Harlowe's experiments with monkeys from which he concluded that factors other than food provision were important in child development, particularly, in his view, the mother-infant bond. Subsequent research was designed to further substantiate these initial theories rather than scientifically test them as hypotheses. Bowlby's theory was not based on actual longitudinal studies, the only type of research design which would yield valid information. In fact, Birns reveals, longitudinal studies which have been undertaken to explore the mother-infant relationship as a predictor have shown, as in a study done from 1929 to 1957 at the Fels Research Institute, that maternal-infancy ratings do not correlate with later behavior. The New York longitudinal study conducted by Chess and Thomas found that the major predicting risk factor of adult behavior is the temperament of the child and not poor mothering (Birns, 1985).

This focus on the mother-infant relationship naturally resulted in a lack of research into the significance of the father-
infant relationship and other re-relationships in a child's development. Lewis (1986) refers to this as the "legacy of matricentric research" (p. 229). Silverstein (1991) points out the failure of child development researchers to explore the effects of paternal emotional distance on a child's development. The BPD literature on parent-child relationships is a good example of "matricentric research" as it focused on the mother's overinvolvement (Adler, 1985; Masterson, 1975) but failed to explore the effects of paternal underinvolvement. When paternal emotional distance has been noted (Goldberg, 1985), it is viewed as pathological rather than typical. Masterson and Rinsley (1975) were quite unashamed in "mother-blaming":

This paper describes the role of the mother's faulty libidinal availability in the development of the borderline syndrome. It describes in terms of object relations theory the effects of alternating maternal libidinal availability and withdrawal, at the time of separation-individuation (rapprochement subphase), upon the development of the psychic structure of the borderline patient." (p. 163)

Research as recent as 1991 (Frank & Paris, 1991) continues to utilize Masterson and Rinsley's formulation.

Sexual Abuse

"Matricentric" research also made invisible the childhood trauma many people diagnosed with BPD have experienced. For example, a history of childhood sexual abuse has been consistently found in a large majority of cases. Ogata, Silk, and Goodrich, in their 1990 study, found the incidence of sexual abuse in the BPD population to be as high as 71%, yet the focus was instead on separation-individuation issues in the mother-child relationship. Saunders and Arnold (1991) in reviewing and reframing the core features of the diagnoses—primitive defenses, unstable relationships, identity disturbance, inability to be alone, and self-destructiveness—demonstrates how these features are more easily understood as responses to the trauma of childhood sexual abuse. They give the example of splitting which Kernberg (1975) viewed as a major defense mechanism and indicator of BPD pathology originating in the mother-infant dyad. In a deconstruction of Kernberg's interpretation, Saunders and Arnold point out that splitting is far more likely to be generated from a pathological relationship between the incestuous father or other perpetrator and the child. For example, the child victim of incest is expected to integrate the polarities of the loving parent on the one hand, and the sexually abusive parent on the other. The authors note that, in this light, splitting would seem more a reflection of an internalization of the child's actual experiences of being sexually abused and, therefore, more of a learned response to this trauma than a defense mechanism against rage towards the mother.

Again, it is the questions asked which guide the research, not necessarily the search for answers. If anyone had thought to ask why so many women with BPD were victims of childhood sexual abuse, BPD theory and treatment would look very different today. Given gender bias in psychiatry and psychology, how can art therapy research methods based on the DSM or on patriarchal theories of development yield anything but gender bias results?

Are Qualitative Research Methods the Answer?

Qualitative research methods have appealed to many feminist researchers as a method of choice because the emphasis is on listening rather than quantifying and on learning from the individual participant rather than on generalizing the findings. In qualitative research the data are often the actual words of the participant. This has appealed to feminist researchers because women's voices were silenced in previous research.

The following characteristics of qualitative research are outlined by Bogdan & Biklen (1992). Qualitative research has the natural setting as the direct source of data and the researcher as the primary instrument. Qualitative research is descriptive and the data collected are in the form of words or pictures rather than numbers. Qualitative researchers are concerned with process rather than simply with outcomes or products, for example, understanding how people make meaning and how certain terms and labels come to be applied. Qualitative researchers tend to analyze their data inductively rather than searching out data or evidence to prove or disprove hypotheses before entering the study. Theory emerges from the bottom up, as in the approach developed by Glaser and Strauss (1967) called "Grounded Theory," rather than from the top down. "Meaning" is of primary concern to qualitative researchers who are interested in the ways different people make sense of their lives. This makes room for and stimulates interest in groups other than the dominant one.

If we look at the basic principles of feminism—"the personal is political," choice, and equalization of power—one of the differences between quantitative and qualitative methodology begins to emerge. Quantitative research, because of its emphasis and alignment with the scientific experiment, assumes a stance of objectivity which, as we discussed above, is an illusion. Qualitative research, on the other hand, has stressed the subjectivity of the researcher. "All researchers are affected by observers' bias... Qualitative researchers try to acknowledge and take into account their own biases as a method of dealing with them" (Bogden & Biklen, 1992, pp. 46–47). Most qualitative studies include a section, often titled "Stance of the Researcher," in which are outlined the researcher's biases. Just as feminism held that no one is separate from his or her social context, so does qualitative methodology recognize that no research is separate from the context from which it emerges.

While there is an affinity between feminist research and qualitative methods, can we go so far as to say that there is a feminist methodology? In her feminist research Gilligan (1982) utilized both quantitative and qualitative methodologies. Gilligan observed that there were two distinct ways of talking about the relationship between the other and the self and also in speaking of moral problems. Gilligan looked at Kohlberg's (1958) research noting the gender bias which resulted when Kohlberg, who did not include women in his study, claimed universality for his theory of moral development. Gilligan did three studies, utilizing projectives, surveys, and interviews, and from the data she gathered developed a different way of understanding the moral development of women. Gilligan's work reversed some of the harm done by past research when women's voices were excluded.
Belenky, Clinchy, Goldberger, and Tarule (1986) in their book, *Women's Way of Knowing: The Development of Self, Voice, and Mind*, listened closely to what women had to say about their experience and understood this as distinct from men's experience. Using qualitative methodology they sought to learn from women about their learning processes and how they constructed meaning in their lives. Both Gilligan's and Belenky et al.'s studies proceed from a feminist standpoint and use qualitative methodology. Even so, both have been criticized for their lack of attention to differences between women and, for only studying groups of white, middle-class women. Regardless of methodology, by assuming homogeneity among all women, even feminist research can be biased through exclusion.

**Conclusion**

Feminist research is defined not by the methodology but by the type of questions asked and how they are asked. Neither quantitative nor qualitative methodology is by definition feminist. In the same way neither methodology is more suited to art therapy research than the other. Feminist art therapy research must emerge from an awareness of the power differential between the genders. As I have attempted to argue throughout this paper, art therapists must ask themselves what the goals of our research are and whether our research tools, instruments, and theories are free of bias.

Finally, I leave the reader with the words and images of Isabella, a participant in my doctoral dissertation study. Isabella's account of her healing process speaks to the value of art therapy in helping her make the connection between her symptoms and the childhood trauma she experienced. In her own words, Isabella's story emerges as one of rebirth and triumph rather than one of pathology:

> It's the connection between these three pictures that just blew my mind (Figures 1, 2, and 3).

> These ones (Figures 1 and 2) I did maybe 15 years ago. They were just images that were sitting in my head late at night and wouldn't let me go to sleep until I'd painted them. They’re totems, to me initially they were these totem poles up North. And I've always had that sunset in my dreams. I used to sit and watch it every night. And I'd been in a book store and just saw the title, *Totem and Taboo*, Freud's book. And I never related any of this to myself except the totems. I kept seeing these totems in my head, one head stuck on a pole. And so I just had to paint it and it had to be up North where that sunset is and, you know at night up North, how even everything that's green is black at night. And I just saw these images of this head, screaming head stuck on a pole.

> And then this Spring, just recently I did this one here (Figure 3) of this vulture just about to ram its beak down the mouth of this little bird—it's a combination of a bird and a bat and I'd just had a dream about it a few nights before where there was this little baby bird, it was called a bird, but it had the wings of a bat and the body of a bird and it had all this blood running out of its mouth and I kept trying to comfort it but it wouldn't let me hold it. And then I started thinking about when I was first admitted to the hospital because I couldn't eat anymore. I kept feeling there was something stuck in my throat and I'd lost about twenty-five pounds. I just couldn't eat. And I started feeling that there's this penis rammed down my throat, a penis down my throat. And then I remembered these pictures of these heads stuck on a stick and screaming, something caught to their throat. And then I remembered the dreams I'd had about my grandfather and how so many times in my therapy I just felt like there was a cock rammed down my throat. Then I saw this hat in there, the hat in my grandfather's bedroom. This hat looked like Winston Churchill's hat. And I just felt like he was this vulture preying on me, raping me, in all different kinds of ways and the effect that it had on me. It killed me. And I just felt it was the end of me, my grandfather raping me in this incestuous way... And these two pictures now are inseparable for me (Figures 2 and 3).

> I was thinking about this last night—what would have happened if I hadn't started doing art therapy. I think I probably would have just lived my life on the level of toleration—this is my life. I just have to put up with it. This vague...of not really knowing what had happened to me.
I probably would have always been stuck living with not really knowing and just having to live like that. Because what art therapy does for me, it just refines the whole process and makes it so vivid. And I draw because I need to draw—it's not like a hobby. It's something I'm driven to do. Because it satisfies my need to know and to understand what happened to me and to really experience it. I think I would have gone through life living like I was looking through binoculars which were out of focus. And art therapy has helped me focus and see really clearly. I think probably I just would have lived my life out-of-focus.

And it's also a tool that I'll always have—it isn't dependent on other people. And I think people are really interdependent—I think in psychiatry dependency gets a bad name lots of times. But we are really dependent on each other. Without any kind of therapy I would have been dead. I think we should give dependency a good name. It's all right.

I need to show people visually what happened to me. And I have a real need for that. Art therapy allows me to do that, allows me to show myself but... I want that kind of warm support. I think it's healthy to want it. I was brought up thinking it was unhealthy to want it but it's a normal, human need. I guess that's what art therapy has allowed me to do is to really show people visually and very clearly what happened to me and see that I don't have to protect anybody from it. It's kind of like bringing a restricted movie home and being afraid to show it to my parents. Now I feel I can take these restricted pictures out and show them to people—they don't go, "Ooh! It's horrible! You're a nasty, dirty person." My art therapist and all these people just look and say, "These are great pictures." And that to me is a shock. 'Cause I really want to be responded to in a positive way even if I'm saying something that isn't pleasant. God! I'd hate to think what my life would be like if I hadn't gotten into this. But I don't see how I could have gone any other way. I feel like the Fates have been guiding me and I feel like I have this guardian angel.

And this whole process to me is sacred. And my writing teacher was saying that, she's really into spirituality, and she says, "The process of making the unconscious conscious is a sacred process." And that's what all this means to me now. (Burt, 1995)

Becoming Visible: An Art Therapy Support Group for Isolated Low-Income Lesbians

Rachel Brody, MPS, A.T.R., Hudson, NY

Abstract

The special strength of art therapy is that it encourages us to envision, on our own terms, our definitions of self and reality. Since it provides an opportunity to make oneself seen, art therapy has a special resonance for lesbians because of their historical invisibility and isolation. This paper discusses the imagery and process of an art therapy support group for low-income isolated lesbians, through five related "lenses": (1) women's relational dynamics and the centrality of relationships in lesbians' lives; (2) trauma; (3) socioeconomic class; (4) lesbian identity, visibility, culture, and gender; and (5) transference. An intertwined constellation of themes—safety, danger, gender, aggression, sexuality, power, intimacy, isolation, autonomy, and family—is traced through the progress of the group's interactions and visual productions.

Introduction

There is a dearth of published material in the creative arts therapies concerning lesbians and gay men. At the time of this writing, only one paper makes lesbian/gay identity and related clinical issues its central focus (Brody, 1994). Although there is extensive lesbian/gay-affirmative literature (Boston Lesbian Psychologies Collective, 1987; Brown, 1989; Burch, 1993; Cass, 1979; de Montefiores & Schultz, 1978; Falco, 1991; Gonsiorek, 1985, 1988; Greene & Herek, 1994; Lenihan, 1985; Silverstein, 1991; Stein & Cohen, 1986), none of it specifically discusses therapeutic groups for lesbians. It is only in the writing of this paper that I was able to appreciate fully the complexity of the Lesbian Support Group's intrapsychic and group dynamics.

Lesbian Support Group (LSG)

The Lesbian Support Group (LSG) was created in response to requests from lesbians living at the YWCA in a small, family-oriented, and conservative Northeastern city where no visible lesbian community or lesbian-affirming services existed. By providing a safe place where lesbians felt they belonged and could be themselves, the LSG was intended to reduce isolation and to build self-esteem, self-awareness, trust, social skills, mutual respect, and a sense of community.

The LSG met once a week for 90 minutes over a period of 12 weeks, after two informational orientation meetings. It was made clear that members were expected to refrain from sexual contact with one another, but because isolation was a primary problem, social contact was not discouraged (Anthony, 1982). Individual interviews, supplemented by a self-administered written questionnaire, were conducted to assess, gather histories, determine goals and expectations, and establish a safe relationship with the leader. All eight of the prospective members were accepted into the group, although three dropped out over the course of the 12 weeks. The remaining five came fairly regularly, although two had ongoing problems with childcare which interfered with attendance. (During four sessions childcare was provided by a YWCA resident, but the YWCA withdrew its permission for on-site childcare because of liability concerns. No fee was charged for the group or for childcare.) Media/techniques included mural, drawing, collage, clay, journaling, and photography. Bibliotherapy was also employed in the form of a lending library of lesbian-affirmative books and periodicals. Members borrowed the readings but rarely referred to them in session.

Group Demographics

Members ranged in age from 18 to 50. Seven were of Anglo-European descent; one was of Puerto Rican descent. Four were mothers, and one member's partner was pregnant. Six were in recovery from drug and/or alcohol abuse, and seven reported histories of physical and/or sexual abuse. Most had little ongoing positive contact with any larger lesbian community or friendship groups and were estranged from family. Five reported knowing as children that they were attracted to females; three discovered their lesbian feelings as adults. Seven were in relationships; four of these relationships were of less than a year's duration. Two did not identify exclusively as lesbians.

All members of the group had had some previous positive experience of group or individual therapy. Seven had graduated high school. Five had had some college education and of these, one had a Bachelor's degree and another had a graduate degree. Five were employed in unskilled low-paying jobs, two had skilled blue-collar jobs, and one was a full-time high school student and was unemployed. All had received, or were currently receiving, some form of public assistance, SSI, Medicaid, disability, or food stamps.

Clinical and Cultural Context

Before presenting the clinical material generated in the LSG, it is helpful to see it in the context of the clinical and cultural factors that shaped its development. Five of these factors will be examined, as if through a series of lenses, each bringing a facet of the LSG's nature into sharper focus. Some of these factors are common, to varying degrees, to many of the clients that
art therapists see. The intent is to illustrate the distinct ways in which they are heightened for lesbians, bearing in mind that lesbians are as diverse as any other group of human beings. The LSG was not a random or typical collection of lesbians; what is true of this particular client group will not necessarily be true of all lesbians.

**Lens #1: Women's Relational Dynamics**

The theoretical perspective that is most relevant to the LSG focuses on the centrality of relationships in women's lives, which is further intensified in all-female environments in which women prioritize women. Object relations theory provides a useful starting point to look at these dynamics. Because their primary caretakers are female like themselves, girls develop a sense of self which allows for greater fluidity, mutuality, and empathy than is encouraged in boys (Chodorow, 1978). "Self-in-relation theory" (Jordan, Kaplan, Miller, Stiver, & Surrey, 1991) expands on the notion of a linear movement away from merger and toward "separation-individuation" (Mahler, Pine, & Bergman, 1975) by describing a developmental path along which "relationship and identity develop in synchrony" (Surrey, 1991, p. 63).

Among lesbians, women's general capacity for intense relational intimacy is augmented, as are a tendency toward merger, a softening of boundaries (Burch, 1986), and "conflicts over power, nurturing, and dependence" (Burch, 1987, p. 140). It is critical, however, to measure lesbian relationships against the norms of lesbian culture, which, unlike heterosexual norms, consider the capacity for emotional intensity, and the oscillation between separateness and merger not as a pathology but as a strength. Lesbians place a high value on the "sense of an autonomous self within the assumption of relationship to others" (Vargo, 1987, p. 167).

Self-in-relation theory provides a framework through which to view relationship dynamics among lesbians in general, and the LSG members' patterns of intimacy, autonomy, and isolation, in particular. Group themes continually circled around questions of how to balance one's own needs and wishes with others' and how to develop and maintain a sense of individual identity in the context of intimate relationships. It is in this relational matrix that the group members tested their expectations of themselves and one another, of how much sameness and/or difference they could expect and tolerate without rage or overmerger. Although any therapeutic group will elicit issues of self-in-relation, I cannot overemphasize that this is an especially charged aspect of lesbians' lives. Groups or dyads of heterosexual women may experience the intense intimacy described among lesbian women. However, among lesbians, this intimacy acquires another dimension because of a primary commitment to and sexualization of relationships with women.

The "flip side" of intimacy is power, which was disturbing to the LSG members. Because a feminist concept of equality is generally valued among lesbians, "many lesbians are acutely attuned to inequalities in power" (Burch, 1987, p. 127); real or perceived differences among them can be experienced as a deeply troubling power imbalance. From another angle, Falco (1991) explains that, "because the social power ascribed to men in this culture is absent in the lesbian relationship [or group], many lesbians assume that power struggles will not exist in their relationships, and thus have difficulty recognizing them and dealing with them directly" (p. 114).

**Lens #2: Trauma**

Lesbians report histories of trauma in the same numbers as heterosexual women (National Institute of Mental Health, 1987, cited in Falco, 1991). However, the LSG was a *de facto* abuse survivors' group, although that was not its intended function. I can only speculate that it attracted lesbians with abuse histories because they were especially in need of support but could not afford long-term therapy. Abuse had damaged and distorted the group members' patterns of self-in-relation, which interfaced the group's potential for lesbian relational intimacy with the emotional sequelae of trauma, including shame, guilt, rage, fear, mistrust, helplessness, flooding, numbing, dissociation, hypervigilance, and low self-esteem (Herman, 1992; van der Kolk, 1987).

The members of the LSG showed an immense hunger and expectation for connection and an inadequate empathy and self-empathy to achieve it comfortably or predictably. Trust in the group was further complicated by three members' revelations that they had been abusive to their children or partners. It is, of course, not uncommon for survivors to perpetuate the cycle of abuse by identifying with the aggressor and re-creating and repeating the original traumatic events in an attempt at mastery or undoing (Krugman, 1987).

**Lens #3: Socioeconomic Class**

The LSG targeted and primarily attracted women with limited financial resources. For most of the members, their marginal economic status contributed to isolation from the lesbian community and hence to their need for a local group, as they could not afford childcare, transportation, or access to lesbian culture. Their devalued and stigmatized socioeconomic status augmented the group members' feelings of low self-esteem, anger, and powerlessness, as did the control exerted over them by larger social systems. The LSG members, while constrained by the limited educational and economic opportunities for low-income women, were also, of necessity, quite resourceful and self-reliant.

**Lens #4: Lesbian Identity, Visibility, Culture, and Gender**

Most lesbians form their initial self-concept in families, religions, schools, and communities where only heterosexual feelings and behavior are validated and promoted and where same-sex attractions and relationships are discouraged and denied, sometimes violently. Rich calls this "compulsory heterosexuality" (1980), which makes eroticism between women invisible, limits their awareness of and access to the full range of sexual possibilities, and circumscribes the process of achieving a genuine sense of sexual identity. This results, to varying degrees, in internalizing the dominant culture's homophobia (Margolles, Becker, & Jackson-Brewer, 1987) and its stigmatization of homosexuality (Hetrick & Martin, 1987). To the extent that one has positive contact with the larger lesbian community, the effects of internalized homophobia are mitigated by finding a place among one's own people where one feels valued, included, and accepted. Even for those who are at ease with their lesbianism and who have supportive families, partners, employers, and friends, a wariness and tendency to self-monitor are still necessary survival skills, which can carry over into relationships with other lesbians.
Within the LSG, lesbian pride was embryonic and internalized homophobia had a dominant if subterranean pull on the group dynamics. The group members, while very clear that they had no wish to be heterosexual, had experienced little family or societal support for their lesbian identities, which made the task of valuing and supporting one another especially challenging. Since it is part of the leader's task to "model being genuine" (de Montefiores, 1986, p. 99), I informed the group that I was a lesbian and had begun the LSG out of a desire to foster lesbian pride, visibility, and community. My self-disclosure enabled me to model a defining aspect of my own identity which is also a deep source of my empathy: "Being genuine promotes self-esteem because it requires both acceptance of whoever we are and relating to another within the framework of acceptance of self" (de Montefiores, p. 99).

Establishing one's lesbian identity takes place amidst what is known in the lesbian community as "lesbian invisibility." Just as among heterosexuals, traditionally male values and language define social and sexual norms for both women and men, in the lesbian/gay community a similar pattern has been operative. As a result, the diversity of lesbian lives has been subsumed by the myth of a monolithic "gay" culture. (Gay male culture has also been hidden, but to a lesser extent.) Although lesbian visibility is on the rise, for many lesbians it is dangerous, if not life-threatening, to "come out," and many heterosexuals still believe they do not know any lesbians. Lesbians lives and history have been masked and buried. Many lesbians have limited knowledge of what it means to be a woman who loves women and lacks language adequate to express it. The inadequacy of existing language gives added meaning to the group's repeated acknowledgment that their most productive work was done through the art. "Let the talk come from the art, instead of the other way around, the art brings it all up, anyway," said one member. "The art is the good part, the talking is awful," said another.

The expression of gender identity is one area where lesbian culture has made some unique statements. While numerous Native American cultures recognize more than two genders (Williams, 1986), gender identity in mainstream culture is narrowly defined as either/or, female/male, biologically determined duality. Lesbians employ some more imaginative gender categories for which there are not adequate labels, but which are often described in terms of a butch/femme continuum (Loulan, 1990; Nestle, 1981, 1992). Although these terms elude a simple definition, most lesbians agree on how they apply to individuals (Loulan, 1990). Butch/femme has something to do with conventional and archetypal notions of masculinity and femininity, but in a lesbian context, these concepts become more flexible, more metaphoric, more playful, less tied to biology, and allow for a range of nuance and paradox. Indeed, butch/femme—the idea of gender variations among women—is best conceptualized as a circle formed by bending the poles of the continuum until they meet, allowing for an infinite number of locations on the circumference. One's place on this circle is defined more by external presentation and core self-concept than by sexual behavior or power position.

Nestle (1981) describes butch/femme as a "deeply Lesbian language of stance, dress, gesture, loving, courage, and autonomy" (p. 100, italics added, capitalization in original). In the LSG these notions of gender informed the members' individual identities and the group dynamics; the fact that they were never explicitly named until the final session was not accidental. Identifying in terms of butch/femme is to let oneself be seen, to take a visibly sexual stance, and to open up discussion of sex and the range of sexuality. The group's reticence maintained the safety and privacy they may have needed, at the expense of appearing somewhat neutered and desexualized to one another. Although the group members did not often assert their gendered/sexualized selves, butch/femme statements emerged in the group dynamics and artwork, which will be seen later on. Art therapy opens up a singularly useful perspective for interpreting butch/femme imagery as an authentic lesbian visual language.

Another aspect of lesbian culture that affected the LSG is its distinct social dynamics. On the one hand, group norms in the lesbian community place a high value on introspection, personal growth, and the use of therapy (Morgan & Eliason, 1969). On the other hand, the combination of women's intense relational tendencies, internalized homophobia, and lesbians' need for supportive community in a hostile world can put an inordinate pressure on lesbian groups to provide more than any group is capable of doing (Pearlman, 1987). Expecting both too much and too little from one's much-needed, yet devalued sisters, has been a common tendency in the lesbian community, that leads to an intolerance of diversity and a "demand for sameness" (Pearlman, p. 315).

One way in which this demand for sameness manifested itself in the LSG was in attitudes toward bisexuality. In the context of the group, I considered bisexuality "only in its inherent inclusion of a lesbian orientation" (Weille, 1993, p. 152) and conducted the LSG as a lesbian support group. However, the fact that two members were sexually active with men during the course of the group was a source of suspicion and polarization, about which I will say more later.

Lens #5: Transference

Given the power of relationships among lesbians, transfereces among group members acquire a special intensity as well. The room may be packed with various transferential layers, as lesbians can be responding to one another simultaneously as reflections of mother, daughter, sibling, lover, rival, friend, and self. There are also particular styles of transference related to male figures, given the broad range of gender identity and self-presentation among lesbians. Relational intensity among lesbians often heightens group responsiveness, both real and transferential, to passion or libido, whether sexual or rageful. Like women in general, the LSG found it difficult and uncomfortable to display and respond to overt expressions of anger and power. The transferential meanings of anger and sexuality as expressed in the LSG were further colored by the members' abuse histories. Sexual trauma blurs the boundaries between sex, anger, and power, amplifying and distorting the sexual charge to anger and the power-related charge to sexuality. These women felt little healthy power of their own, having experienced terrifying powerlessness at the hands of their abusers.

One might expect the sexual charge in a lesbian group to highlight the sexual transfereces. However, a self-protective lesbian invisibility kept members shielded from themselves, one another, and myself; the transfereces related to parents, chil-
Group Process

The group intended to offer a consistent structure of time, place, and materials, and to encourage and guide group members in making their own agenda for the content of the sessions. This was not a comfortable process for any of us, but my goal was to provide just enough direction to facilitate expression and interaction, and to allow the members to wrestle with their individual and collective priorities and dynamics (Wallar, 1993). During much of the time I was leading the LSG, I felt inadequate, overwhelmed, and frustrated; “it wasn’t coming together,” as one member observed. Attendance was inconsistent: On no two occasions was the same configuration of members present, which limited group cohesion and made for an unpredictable group culture.

Sessions began with a loosely structured check-in, from which I would try to elicit an underlying theme for the group to develop in the artwork. The group tended to get stuck in the talk, and transitioning to the art was not a predictable process, even when I actively encouraged it. On the whole, however, it was art-making that facilitated the group process by allowing members to self-soothe and make themselves seen nonverbally. Tension and anxiety were kept to a tolerable level during artmaking and the more art-oriented sessions, and the affective tone became more intimate, relaxed, and playful. When the group worked on individual projects, I did artwork as well, using it to offer feedback regarding the group process.

In addition to written progress notes, I created a visual record of my spontaneous responses to each session and to the group’s imagery in particular (Figure 1), which allowed me to view the group process simultaneously as a linear progression and as a gestalt. These drawings were not done in the presence of the group, nor were they shared with the group. This visual progress note (VPN) allows sessions to be compared using several criteria: light/dark, bounded/unbounded, centered/chaotic, loose/tight. Overall, there is a rhythm to the sessions, resulting in a checkerboard pattern which embodies the LSG’s push/pull dynamic, as well as what is perhaps an especially lesbian struggle with cycles of joining and separating.

I will now take the reader on a journey through the group’s process and artwork. I have grouped the sessions into beginning, middle, and end phases: each phase is named after the most representative image that emerged from it. The first phase, “This Is My Island,” was characterized by the isolation and guardedness that made productivity interaction almost impossible. The second phase, “Surviving the Black Spot,” was shaped by an immersion in shared pain. The third phase, “The Ladder,” was characterized by attempts at reaching out and bridging gaps. (All group members are referred to by pseudonyms.)

Sessions #1–4: “This Is My Island”

In the first session members were asked to draw a “full-body self-portrait” in pencil, on 8 1/2” x 11” paper (an evaluative drawing which would be used again in the final session). The drawings revealed distorted and depersonalized body images and a high degree of vulnerability, damage, and defendedness. This, combined with the emergent and highly charged theme of family, set the stage for the group dynamics to follow.

The next week, the words “family values” in Michelle’s collage (Figure 2) catalyzed discussion of motherhood, childhood, physical abuse, and alcoholism. The lesbian erotic content of Maureen’s and Elaine’s collages (Figures 3 and 4 respectively) was not addressed by the group, a tendency that would continue. These two collages were provocative and embodied perhaps too nakedly the subterranean group themes: the ambivalently intertwined realities of safety, danger, aggression, tenderness, female-ness, sexuality, and power. As the group progressed, this uneasy mix was acted out more than it was consciously processed.

Maureen’s collage shows a lack of integration between words and images, an early sign of the ongoing disparity between the LSG’s verbal and visual material. Following the group’s lead, I attended to what they found safe to address and did not actively encourage them to “see” the specifically lesbian imagery. I would have had to call the group’s attention to it overtly for them to acknowledge it, and even then they might not have pursued it. In the LSG, talking often served the function of the “closet,” of defense, the language lesbians use to cover themselves. It was safer to get into arguments than to examine one another’s imagery.

Seeing, being seen, and a particular attention to visual statements have been essential parts of lesbian culture. There are visual conventions by which some lesbians identify themselves and recognize one another: styles of hair, clothing, jewelry, and body language. Lesbians look for validation and reality testing in one another’s visual cues. But looking has often been surreptitious. It is dangerous for women really to look at one another, or by extension, at their art. In the LSG, as in the larger world, it was easier for women to give themselves permission to look at and recognize the more acceptable, nonlesbian images. The group’s muteness in response to the obvious lesbian imagery reveals their discomfort in giving voice to “the love that dare not speak its name.”

Regardless of the group’s ability to address overtly lesbian imagery, it was important to supply them with lesbian as well as mainstream magazines for collage. By offering a diversity of images from their own culture, I hoped to provide the building blocks for an ego-syntonic visual language. Session #2 ended with a pervasive feeling of sadness, a briefly sustained unifying moment in which the women silently identified and resonated with one another’s art and emotions.

In Sessions #3 and #4 “family values” and parenting were again the dominant initial topics. The discussions were somewhat intellectualized, awkward, and detached from the undercurrents of sadness and anger that broke through at times. The group members did not yet have the trust or cohesion to share intimate stories with any comfort and could easily be overwhelmed by one another’s pain. There was some acknowledgment when I asked if parenting was safer to talk about than specifically “lesbian issues.” I suggested murals in both of these sessions, hoping to nudge the group into closer contact and elicit members’ emotional responses to one another and to intimacy. Both the product and process of the first mural, following the directive “what it feels like to be a woman,” reflected members’ vulnerability and
Figure 1

Author's Visual Progress Note (Sequence of drawings reads from left to right, top to bottom)

1. A ragged holding environment, containing the members' wounded and defended self-portraits.
2. A selection of their images framed by images from my own collage: a stormy sea, flowers, a bowl of fruit. They are different "fruits" occupying the same bowl, surrounded by tempestuousness and growth. References to my imagery are as dominant as theirs, reflecting my sense of the necessity for a strong leader to hold the group together.
3. I combined Hannah's drawing of an empty womb with Elaine's glittery heart image into a large red heart with a central hole, perched on Rita's wounded vulva image, surrounded by brittle defenses and separated by a lightning bolt from the fireball of Maureen's rage, a paired and discordant composite picture of womanhood.
4. Contains the most white space of all my VPAs, suggesting the force of homophobia, creating a guarded distance and reduced visibility.
5. A deep black smear, an enlargement of Elaine's from the previous session, containing a few small bits of color, representing the gifts of mutual support the women extended verbally and through art.
6. My stallion figure, sweating heavily, with the members, represented by their animals, hiding behind sharp fragments. The group was strained to the breaking point. Why did this "support group" seem so bent on self-destruction?
7. Contains miniatures of the group's images as well as a small blurred outline of Elaine's son who screamed and banged at the door. His form echoes Michelle's crumpled "fetus" and Hannah's fan-shaped reaching-out image, the pain of childhood and parenthood inescapably haunting this group.
8. This composite of the members' imagery reflects the session's more fluid interaction.
9. This VPN I find the most aesthetically unappealing and unbalanced. Three members and I are represented by the clay objects we made. Mine, the most detailed and developed, is placed centrally. Theses are connected more closely to mine than to one another, my presence acting both as a bridge and a barrier. In this session about partners and loneliness, were the transfers to me and fears of one another too strong for them to respond more directly to one another?
10. A peaceful, warm, and centered image in rose and gold, reflecting a nurturing and balanced session.
11. Not a balanced or attractive image, but it accurately mirrors the characteristic imagery and dynamics among the three members present. Michelle's crescent moon and Rita's linked chain are turned toward and identified with each other, while Hannah's eye observes.
12. Images from the final self-portraits contained within my heart: Hannah's direct gaze, Michelle's sturdy turtle, and Rita's life-sustaining fruit.
defenses and echoed their initial self-portraits, one woman's image of a tiny woman inside a red and blue vulva (Figure 5) being the smallest and most poignant. Another group member ended this session on an angry note, complaining that the group focused on parenting to the exclusion of lesbian issues.

In the following week's mural on "what it feels like to be a lesbian," most used a small area of the paper with plenty of space between them. Rita's image (Figure 6) represents the rigidity of heterosexual society (black and white lower circle) contrasted with the more variegated lesbian/gay world (upper circle). Her "island" is closer to the latter, but still set apart. Maureen's "island" (Figure 7) suggests some warmth and intimacy, as well as a silencing "shhh"; the others' imagery referred to relationships, isolation, conflict, and the feeling of being judged. Another member said she intended to draw a plant emerging from an underground seed, but ended up with a small black smudge. She became tearful explaining that the "art triggered something that I want to talk about, a lesbian issue, but I'm scared to," and agreed to save it for next time. While I had felt the group move a little closer, my VPN contains the most white space of all my VPs, suggesting the force of homophobia, both internalized and external, creating a guarded distance and reducing visibility.

**Session #5-7: "Surviving the Black Spot"**

In the previous sessions there had been a pull toward disclosure of painful secrets. Given the hostility, guardedness, and
irregular attendance. I had held back from leading the group down these shadowy paths until we had a stronger foundation. Nevertheless, the momentum of the group was carrying us along in this direction. By telling the story she had saved from the previous time, Elaine led us in "moving into the black spot" (Robbins, 1989, p. 125). It was as if we had entered the previous week's mural through her small black smudge, which opened into a frightening landscape familiar to most of the group members.

Elaine told of a recent brief relationship which had turned violent, culminating in her partner's threatening to kill her. She had severed ties with this woman, but still feared for herself and her young child. Others shared their own experiences of having been stalked, abused, or harassed. Other members acknowledged that they had, in Rita's words, "turned it around and became the one on top," becoming abusive to others, and expressed a shared self-hatred for having been victims. The group was putting forth some of its ugliness, daring one another to witness, tolerate, to accept, or abandon. I validated their courage in admitting that violence exists among women, a fact that the lesbian community has been reluctant to accept. With 15 minutes left to the session, I returned to Hannah's earlier wish to protect Elaine, "to make a tent around her," suggesting that the group make some protective art for Elaine to take with her. A few did, but the session ended without any definitive closure.

The next week, after this excursion into the black spot of anger, shame, guilt, and fear, I assumed that the group needed to retreat, repair defenses, and self-soothe, so I asked everyone to select an animal figure and create a "safe environment" for it. In Maureen's safe place (Figure 8), a red cat sits in a vulva-shaped "boat" on a river, flanked by deep green foliage: "Being inside a woman's genitals is the only safe place," she said. Interpreted through the lens of lesbian gender, this is very "femme" imagery, as Maureen's imagery often was: a "pussy" in a vaginal boat. It is noteworthy that Hannah and Jessica whose self-presentations, like Maureen's, are within the conventional boundaries of "feminine," also chose cats as animal self-symbols. Rita and Michelle, who in Session #12 would both self-identify as "butch," chose turtles. While it is tempting to speculate how the group might have interpreted these differences, this material remained unexplored. It is obvious, however, that these symbolic identity choices point to the sometimes subtle but significant gender identity differences among women, differences that affected the group dynamics.

As they had in the previous sessions, the group members continued to disregard the specifically lesbian sexual content of Maureen's work. This fueled Maureen's anger and mirrored the group's resistance to intimacy, defending against what they had in common. Although there was some subgrouping and some positive feeling among individuals, the group was not coalescing. While Maureen wanted to focus on "adult lesbian issues," she was most active in provoking discord. As the oldest member, perceived as the angry abusive mother, she became the scapegoat. Toward the end of Session #6 hostility reemerged, as Maureen aggressively lectured Jessica, who feared she was pregnant again,
on responsibility, youth, and motherhood. Rita echoed Maureen, angrily voicing dissatisfaction at having bisexuals in the group. This was another source of conflict which was finally being aired openly. These angry outbursts occurred at the end of the session, making closure difficult.

My VPN for this session is so faint as to be invisible. It shows my stallion figure, sweating heavily, with the members, represented by their animals, hiding behind sharp fragments. I left this session feeling that the group was strained to the breaking point and was splintering. I felt angry and inadequate. Why did this “support group” seem bent on self-destruction?

In preparing for Session #7, I made a drawing of an outer space skyscape: planets, clouds, and comets against a dark red ground, anticipating, as it turned out, the floating, isolated quality of the group’s work that evening, as well as its underlying fiery affect. Themes emerging from this session revolved around connection, autonomy, and isolation, embodied in the imagery and in the overtly expressed concerns. Everyone seemed fearful of risk, uncertain about reaching out, and not terribly empathic, but held together by a shared isolation and pain: “Art is the only constant here,” remarked Michelle. Jessica’s questions about how a teenage lesbian might find a partner led Rita and Michelle to challenge her belief that “having a woman will make it all better.” Hannah’s art echoed Jessica’s concerns, voicing her frequent laments, poignant yet intellectualized, about being “whole” and asking whether a lover is necessary for that. This was expressed, however, in the context of her bisexual boyfriend’s leaving her for a man: her active heterosexual side continued to keep others at a distance. Rita’s art conveyed her self-protective isolation, comprised of several abstracted linear shapes—suggesting planets, chains, spirals, and a spinning top—carefully built up into a rich surface of glue and glitter floating on black paper. This session gave me the feeling of people peering out from their shelters in the aftermath of a hurricane: Is it OK to show myself? Will I be knocked down? Did anyone else survive?

Sessions #8-12: “The Ladder”

In Session #8, the group acknowledged, and was at least temporarily able to tolerate and process, some of its taboos and hidden agendas. This openness fostered a more fluid, energized, and good-humored exchange than had previously occurred. It began, however, with angry comments from Rita and Maureen about bisexuality. Anticipating such a conflict, I had made no reference to bisexuals in advertising the group, hoping to attract women who identified with the label lesbian. Having accepted all of them into the group, on the grounds that Hannah and Jessica, too, needed support for their lesbian side, I was still aware that this was not a satisfactory solution.

Leading this group reminded me of that “lesbian, heterosexual, and bisexual are concepts, and that real people do not fit neatly into conceptual frameworks. Just as gender is best thought of as a circle with an infinite number of points on its circumference, so is sexual orientation. It is important to keep in mind that sexual identity, behavior, attraction, and fantasy are not always congruent for all women at all stages of their lives (Golden, 1987). It is worth noting that Hannah and Jessica, the least identified as lesbians, ‘felt most comfortable in the group and seemed less pressured by internalized homophobia, since their socially acceptable heterosexual side allowed them to move through and “pass” in the straight world with greater ease. I could not dismiss the others’ wariness of them. I could identify with those who were exclusively lesbian and could understand their vulnerability and guardedness about exposing the most private and stigmatized part of themselves to women who at least appeared to benefit from a degree of heterosexual privilege. Hannah talked more freely about her boyfriend and Jessica about her pregnancy scare than the others did about their female partners. But I could not dismiss Hannah’s observation that “biphoria” (Ochs & Deihl, 1992) was at least as rampant among gay people as among heterosexuals, nor could I ignore the fact that Jessica now felt like quitting the group, although she desperately wanted to be with women. It is likely, too, that her youthful candor about wanting a female lover may have been experienced by the others as seductive and may have been as disturbing to them as her bisexuality.

Again, the artwork provided some refuge from these polarities, allowing for more lighthearted, respectful, and empathic interaction. I asked the group members to draw individual self-symbols and then pass them around, encouraging each woman to respond visually to the others’ artwork, adding what they felt it needed. Maureen’s self-symbol (Figure 9) was a two-headed flower, carefully drawn in pencil, to which others added color. Rita explained to Maureen that, “I put sun on the sleeping, gen-

Figure 9
ther side, to wake it up and the moon on the, um, angry side to put it to sleep," feedback which Maureen accepted with some humor. Rita's addition to Hannah's drawing (Figure 10) was similarly affectionate. "Her art is so swirly and abstract, it takes her a long time to get anywhere. I gave her a ladder in black and white, a shortcut." In art therapy terms, I interpret this as Rita balancing Hannah's "round lines" with her own characteristically pragmatic and direct "straight lines." In lesbian terms, this aspect of Rita's contribution to Hannah's drawing can also be understood as a "butch" response to Hannah's "femme" style.

Understanding the LSG's dynamics is enriched by an awareness of the gallantry in Rita's offerings to both Hannah and Maureen that is an expression of her particular gender spirit. Rita, a construction worker, gave Hannah a ladder, a tool, a very butch gift, literally gave Maureen the sun, the moon, and the stars. In her gifts and in the warmth with which they were received there was a playful, genuine, probably unconscious exchange of lesbian sexualized energy. This validation, however unconscious, may be why the session ended on an unusually positive note and may have allowed the members to tolerate a little more intimacy and difference. Maureen, however, dropped out of the group after this session, with no formal or explicit explanation.

Her departure increased the others' comfort, and Session #10 was perhaps the most satisfying; it is represented as the most peaceful, warm, and centered image in my VMP. Members were considerate and responsive during the initial check-in, which flowed in an unusually organic way. Each woman was dealing with an aspect of self-nurturing and self-assertion: Jessica had "come out" in a poem written for her high school English class, which had been well-received by her teacher; Hannah was trying to make decisions based on her own best interests, without being swayed by pressures from her complicated network of friends, lovers, and ex-lovers; Rita was evolving her own definition of family and had decided not to attend her brother's wedding because her partner had not been invited; and Michelle was coping with flashbacks of childhood abuse by using a variety of supports (12-step meetings, individual therapy, and friends). I suggested they use polaroid photos as a starting point for building images of "taking care of myself." Taking one another's pictures afforded the opportunity for playful and attentive interaction. There was a playpen in the room we were using, which was sometimes used for childcare and two of the women posed themselves in it. Michelle—usually tense, angry, and sad—laughed freely as she posed in black jeans, boots, leather jacket, and spiky hairstyle in the playpen with a tiny blue teddy bear and her "magic wand" toy, appreciating her defenses as she lowered them, enjoying the irony of her butch self-presentation: "I have a lot of armor and portray a tough image, but it's the gentle things that really make me feel safe."

In the final session, in the casual atmosphere as we shared a celebratory pizza, Rita commented on an article that had impressed her in one of the periodicals in the LSG lending library—an interview with Leslie Feinberg, author of Stone Butch Blues (1993), who discusses her overlapping identities as a "butch lesbian," a "passing" woman, a biological female who passes for a man," and "transgendered lesbian" (Brownworth, 1993). This catalyzed a discussion of butch/femme and its relation to the members' gender identities. Although lesbian culture provides more opportunity than the mainstream for a range of gender identity without pathologizing the variations, it does not always afford individuals the opportunity to talk openly about it. Butch/femme is a particularly lesbian topic, of the sort that this group had not ventured to explore before. I asked why this was and Michelle responded that, "We're just bonding now, it took this long to feel comfortable." We moved on to the evening's planned agenda for closure, but I was left wondering if that was the whole answer. This seemed like another "doorknob" revelation, risking intimacy in the safety of impending separation.

I asked each woman to say what the group had meant to her, and they responded with surprising honesty, humor, warmth, and appreciation, ready to separate and able to accept both the positive and negative aspects. I gave each member my impressions of their struggles, growth, and difficulties in the group, and then asked them to draw self-portraits as they had done in Session #1.

When they were finished, I brought out their initial self-portraits and asked them to compare the two. Just as they had softened in relation to one another, there was a softening in their self-portraits as well. Rita commented, "I'm inside a fruit, like when I was talking about Leslie Feinberg having a 'strong core.' I'm a seed, growing. This one is more comforting than the first one. In that one I see my butch stuff, strong and muscular, but there's nothing else on the page. I'm all alone." Similarly, Michelle said, "The first one was just the elements of nature. The second one has a living creature in it, too. And see, the turtle is gray. The first one is just black and white lines." Hannah remarked, "It's my face this time, not hiding behind a symbol." For all three, the artwork reflected a significant change; In each pair of self-portraits, the second showed more signs of life, more safety, more relatedness, and healthier defenses.

**Observations of the LSG**

While this was nominally a support group, it was not an easy or comfortable group to participate in. Again and again, it was the commonalities as much as the differences that made it difficult for the LSG members to coalesce and identify with one another. Their traumatic histories, low socioeconomic status, internalized homophobia, and devaluation as women contributed to an overdetermined sense of stigma, shame, self-hatred, rage, and powerlessness which reduced self-awareness and self-
expression and fostered isolation. A limited sense of lesbian identity, as individuals and members of a larger community, equipped them with meager tools for making their authentic selves visible, while the emotional intensity among lesbians was played out with a negative emphasis.

I have perhaps focused excessively on the destructive forces in the LSG and not enough on what made it work, if only intermittently. First, these women are survivors of economic hardship, trauma, isolation, stigma, and addiction. The causes of their pain were sources of strength as well, fueling their resiliency, resourcefulness, and creativity. Being socialized into women’s patterns of empathic relatedness, which is intensified among lesbians, reinforced their wish and nascent capacity for intimacy, community, and healing. When the group was formed, most members were on their way up from having “hit bottom,” and in the process of recovery in both the narrow and more global senses of the word. They had retained the capacity for love, warmth, humor, and hope despite the many strikes against them, and were able to seek out and use available resources. They persevered in this group because however painful, it nourished them and they recognized it. They also had the strength to be true to themselves, living and loving as lesbian/bisexual women, because this, too, sustained them.

This was a productive and meaningful group for those who stayed with it. More often than not, their pain was witnessed, accepted, and mirrored; risk-taking in the service of intimacy, self-assertion, and self-nurturing was validated, and playful creativity was encouraged. Being in the group may also have supported the women enough to risk becoming more visible in their own worlds, as when Rita came out to a co-worker and also took a stronger stand against her family’s homophobia or when Jessica came out in her high school. In the final session, members expressed appreciation for one another and identified how they had changed in the context of the group, a form of growth-in-relation embodied in their final self-portraits.

Conclusion

This paper has examined how a group of isolated low-income lesbian/bisexual women expressed themselves and interacted with one another in an art therapy support group. Lesbian-affirmative, feminist, and trauma theories have been employed to illuminate the cultural and clinical background against which this particular kind of client group must be viewed. I have attempted to define the specifically lesbian aspects of the LSG and the special role of art therapy with this population. It is the area of overlap between what is uniquely lesbian and what is uniquely art therapy that strikes me as especially compelling and worthy of further development.

The concept of visibility can be a guide to this exploration. I was surprised by the extent to which lesbian invisibility was operative even in a group whose purpose was to minimize it. It was easier for the group to focus on more general issues and on their differences than to explore, actively and openly, the subjective lesbian experience. In large part, this is because these women did not have an adequate language, grounded in their own experience, to do so. The special strength of art therapy is that it encourages us to envision, on our own terms, our definitions of self and of reality. Artwork was more effective than talk in building group cohesion because it allowed for more immediate, personal imagery and provided a less circumscribed language for making the self genuinely visible. This links the LSG members to their history, to lesbian poets and artists whose goal has been to explore “the dream of a common language” (Rich, 1978) and build “another mother tongue” (Grahm, 1984).

The group’s search for an authentic language has been paralleled in the process of writing this paper. In trying to define the lesbian-specific content of the group, I have recognized that my own wariness, my habitual self-monitoring of what to share with a general audience and what to protect, mirrors the group’s process and the experience of lesbian/gay people in general. Some of these concerns include: How best to explain a part of my personal world to my professional world? How much to explain? What language will be understood? What may be misunderstood?

I find that this process has resulted in what should be considered a rough map to a previously uncharted territory. I hope that my colleagues will join in filling in this map and in expanding art therapy theory more fully to encompass lesbian/gay/bisexual people. “Normative creativity” (Brown, 1989, p. 451)—the ability to create one’s own forms, when the existing forms are not adequate—is a strength of lesbians and gay men, and I would add, of art therapists. As both lesbian/gay culture and art therapy develop and diversify, we can be empowered by one another’s public statements to articulate our own, and in doing so, help our clients to do the same.

Editor’s Note: The Lesbian Support Group was made possible, in part, by a grant from a local foundation, Holding Our Own, a Fund for Women.

BECOMING VISIBLE

Men’s Roles and Their Experience of Depression

Michael Barbee, MDiv, MA, San Francisco, CA

Abstract

Previous research has suggested that a significant source of depression in men is found in conflicts with sex role expectations. These societal expectations are reflected in both men’s symptomatology and coping mechanisms. A descriptive pilot study was undertaken with five inpatient depressed men using a combination of questionnaires and drawing tasks. Subjects completed the Beck Depression Inventory, Depression Coping Questionnaire, and Bern Sex Role Inventory, as well as four drawings depicting themselves in male roles and two reflecting self-concept. Role drawings were subject-rated on a personal construct grid according to perceived conflict in each role. Support was found for significant sex role conflict being strongly correlated with these subjects’ presenting problems at admission for depression. Each man’s biographical information and data were analyzed and compared to examine the lives of five individuals in order to gain useful information for working with this population.

Introduction

A theme of the growing body of literature in the area of men’s studies is that the present period in our culture causes increasing stress on men due to changing sex role expectations. Although the women’s movement has illuminated the rewards of being male in this society, men are learning that these material, social, and political benefits come at a high cost. High rates of ulcers, heart attacks, hypertension, and earlier death for males are attributed to traditional male sex roles in this culture. This increased stress is seen most among men whose view of male sex roles has not changed with the culture (Pleck, 1989).

Pleck (1989) proposes a “sex role strain” paradigm which includes the concepts that sex roles are operationally defined, that they are contradictory and inconsistent, that their violation leads to social condemnation and negative psychological consequences, and that these consequences are greater for males. Attempting to live by the cultural stereotypes which dichotomize behavior and character traits into masculine-feminine results in men’s avoidance of all behavior associated with being feminine. Meth (1990) outlined six patterns of gender role conflict resulting from this narrow definition of being masculine: restrictive emotionality, homophobia, power and competition issues, restricted sexual and affectional behaviors, obsession with achievement, and health problems.

It is commonly accepted that almost twice as many women as men suffer from depression (DSM III-R, 1987), and until recently the reasons for this assumption or its accuracy have not been questioned. Most research involving men and depression compares gender differences in depressive symptomatology and attributional and coping style differences between the sexes. Studies reviewed on sex differences in depression supported the idea that societal sex role expectations cannot be ignored in studying the experience of depression in men.

In their examination of the “changing faces of masculinity,” Connell, Radican, and Martin (1989) noted that although many books about men have been published in recent years, there has been very little research conducted and the books are often limited by their adherence to the theory that men’s fulfillment is contingent on living out a particular male sex role. These authors suggest research methods to improve on this approach, including the “life history” method which values the individual experience of particular men. This approach aids in the development of new theory and research with a given population through its openness to all findings which develop rather than to the goal of proving preconceived hypotheses. Neimeyer and Resnikoff (1982) stated that the primary objective of this qualitative research is to uncover private meaning structures and their impact on behavior. While quantitative methods may be applied usefully to the question, “How depressed is the client?” they are of less utility in answering, “What is the experience and functional value of depression?” Hammond (1989), in an article on alternate research paradigms, emphasized that these interpretive methods place an emphasis on the illumination of meaning. It is an assumption of qualitative research that men’s depression can be effectively treated only if its meaning and experience in the lives of individuals are understood.

Published art therapy literature reveals very little regarding theory and treatment of depression and almost nothing about working with adult male clients. Wadeson (1980) described some characteristics of the art of depressed patients in her research at the National Institute of Mental Health as having less color, more empty space, less investment or effort toward completion, more depressive affect or less affect, and an overall feeling of emptiness. She also found a greater resistance to art therapy tasks among depressed patients in general.

Nucho (1982) proposed an equation to guide art therapists in treating depressed clients, which states that the experience of depression is a result of increased demands with decreased supports and resources. Treatment consists of building supports and resources in the four components of the self-system: (1) the body self; (2) the achieving self; (3) the identification self; and (4) the interpersonal self. These components broadly cover the presenting problems in the particular inpatient male population in this study and societal role expectations.

The art therapy component of this research is based partially on the personal construct theory of George Kelly (1955). Kelly emphasized the role of the subject as co-experimenter and active participant in the therapeutic process. Kelly believed that an individual’s behavior could be understood only in light of his or her personal constructs and not by external measures imposed by
others. Constructive alternativism, the assumption that all individuals are capable of changing or replacing their present interpretation of events, underlies the therapist's ability to assist the client. By understanding these constructs, the therapist can assist the client in adjusting them to fit reality. Shedding light on problems with present role constructs is a major emphasis in therapy with the population in this study, and drawings and other expressive therapy techniques fit well into this approach.

Methodology and Procedures

The researcher worked as an art therapy intern for 9 months with a population which included inpatient men in a private psychiatric hospital. The therapeutic programming emphasized men's issues and their place in mental health. The components of the program included a men's verbal therapy group, a men's expressive therapy group run by the researcher, and a psychoeducational program. The expressive therapy group was held for 1 hour each morning. Basic materials were used within a psycho-dynamic approach to allow patients to identify and express feelings in a safe and creative way and to give personal shape and meaning to issues which they shared.

Art produced by these men often contains the characteristics mentioned by Wadeson. They also exhibited resistance to art therapy, which stemmed from depression and the patients' belief that art is a child's activity and something with which they are uncomfortable as adult males. Anger was the feeling most readily identified and was almost always viewed as destructive in its expression. Hurt and sadness often lay beneath the cover of anger, anger apparently being a more sex-role-appropriate feeling for men to own and express.

It was also observed that these clients brought a very cognitive approach to treatment, wanting clear answers to their problems (i.e., a "fix it" approach). The art therapy component provided an openness to ambiguity and existential issues as a complement to more cognitive psychoeducational material. Over time, as patients gave up their search for easy answers, they often became more open to the expressive therapy modality.

Hypothesis

It was hypothesized that a correlation would be found between these men's lived sex roles, as reported and as depicted in their drawings, and their presenting problems in depression. The purpose of this study was to establish an information base regarding the personal experiences of depressed men in relation to their sex roles. The study was intended as a descriptive pilot study in a relatively new area of research, that is, depressed men's experiences and their visual depictions. Instruments used to gather this data included three self-report questionnaires and an art exercise designed by the author, comprised of six assigned drawings.

Subjects

The study included a selective sample of men who were admitted to the adult acute psychiatric unit for an episode of major depression as defined by the DSM III-R (1987) over a 2-month period. Those who participated were Caucasian men living near a mid-size Midwestern city and having employment or insurance coverage to allow their stay in a for-profit private facility. Subjects ranged in age from 30 to 61. Patients with diagnoses including psychotic features, personality disorders, organic syndromes, or substance abuse or dependency in combination with depression were not used. Information was gathered during 1- to 2-hour interviews with the researcher, who also served as art therapist on the unit.

These men's depression exhibited itself in some common presenting problems. Most patients complained of some or all of the following: crisis in a marriage or primary relationship, inability to fulfill male role expectations to work and provide for others; somatic complaints; lack of satisfactory relationship with father as a child or currently; blunted affect; isolating behaviors; and little identity apart from instrumental sex roles.

Measures

The methodology was designed to allow both structured responses to standard measurement tools and individual expression of unique life experiences, including self-rating of drawings, to combine both objective measures used in other studies and the subjective art task designed by the author. Subjects completed: (a) the Beck Depression Inventory (BDI) (Beck, Ward, Mendelson, Mock, & Erbaugh, 1961); (b) the Bem Sex Role Inventory (BSRI) (Bem, 1974), developed to measure androgyny and including 60 items divided between personality characteristics commonly considered to be masculine, feminine, or neutral (e.g., independent, sensitive, analytical) rated along a Likert scale; and (c) the Depression Coping Questionnaire (DCQ) (Kleinke, Staneski, & Mason, 1982) which compares strategies of men and women in coping with depression and consists of 29 items rated on a Likert scale, including coping by active and passive, cognitive and affective, and social and isolative strategies. The BDI was chosen as the quantitative scale for depression as it was most used in the literature surveyed; the BSRI and DCQ provided validated measures for identifying males' particular experience of depression.

Subjects were asked to complete six drawings with a Number 2 pencil on 8 1/2" x 11" white paper. These materials were chosen since they are familiar and not specialized "art" tools, and to provide a size which was least threatening since patients were often observed to request a smaller format than the often-used 18" x 24" drawing paper. The drawings included depicting self in four roles: (a) at work, (b) with current family, (c) as a child with family of origin, and (d) with a friend. Two additional drawings relating to self-concept were requested—depiction of self currently and ideal self. The use of the role drawings was derived from current literature on themes of therapy with men—work, intimacy, friendship, and father relationship (Meth & Pasick, 1990). The two self-concept drawings were designed to elicit the subjects' view of themselves in their own terms and to evaluate how present-self and ideal-self relate to roles they fill as men.

Subjects then ranked the four role drawings on four criteria: the role in which they (a) felt most competent, (b) felt the most frustration, (c) felt the most comfortable, and (d) felt they shared the most with others. Ranking was intentionally broad to bring out subjects' individual interpretations. Drawings were ranked

from one to four along these criteria and plotted on a 4 × 4 repertoire grid based on Kelly's (1955) work (Table 1).

In addition to the questionnaire and art data, biographical information was gained from subjects’ hospital records and from conversations during the interview process. The above material was obtained during 1- to 3-hour interviews with the author, and subjects were informed that they were participating in a study to gain knowledge of their particular experience of depression.

Results

Results of Questionnaires

The BDI responses of the five subjects in this study showed significant scores in the moderate to severe range of 24, 25, 27, and 31, with one subject having a score of only 2. The subjects reported the following symptoms most often: decision-making problems (highest score), sense of failure, lack of satisfaction, fatigue, lack of sexual interest, sadness, hopelessness, social withdrawal, problems with work, and somatic complaints. No subject checked feelings of guilt, self-blame, suicidal ideation, or changes in appetite or weight. These responses, including those of the subject who was reluctant to report symptoms, are supported by Hammen and Peters (1977). Their research found no difference in degree of depression between genders, but did find significant differences in reported symptomology on the BDI. Men were more likely to experience an inability to cry, loss of social interest, a sense of failure, and somatic complaints, suggesting men’s suppression of overt depressive symptoms. It is possible that this suppression of symptoms may be correlated with sex role stereotyped expectations regarding depression’s acceptability as a man’s problem.

DCQ responses revealed significant coping through “ignoring the problem” and “self-blame,” followed by “watching TV, meditating or relaxing, cutting down on responsibilities,” and “confronting the problem and attempting to find a way out.” The reported self-blame conflicts with the subjects’ answers on the BDI. However, suppression of symptoms is again highly used, with some subjects referring to their behavior before admission or for the first days of hospitalization as “hiding” or “escaping.” Active responses such as confronting the problem emphasize a cognitive approach consistent with these subjects’ approach to treatment. Kleinske and Stanski (1982), developers of the DCQ, found that men were more likely to experience lack of appetite, pessimism, lack of satisfaction, irritability, and sleep problems, were more likely to focus on physical problems and use of drugs, and were unlikely to seek help. They found high BDI scores associated with isolation and escape.

On the BSRI, two subjects rated themselves higher on feminine and lowest on masculine characteristics (Table 2), with the remaining three rating themselves somewhat higher on masculine traits. Total scores ranged from 235 to 311. Individual ratings along the Likert scale were either polar (1 or 7) or median (3, 4, 5) on all traits. The two subjects who scored low on masculine traits often made some audible reaction to items such as “leader,” “competitive,” “forceful,” “strong personality,” and “makes decisions easily,” indicating some lack of self-esteem because of these “deficits.” These findings are inconclusive, but may give support to the theory that sex role strain is related to depression and that highly masculine individuals use greater distracting mechanisms. The BSRI was developed from the theory that androgynous persons exhibit more flexible behavior than sex-typed persons. Bem (1974) theorized that individuals with sex-typed behavior would exhibit behavior consistent with stereotypically masculine or feminine roles. Research using this instrument in the study of sex differences in depression (Glazerbrook & Munjas, 1986) did not support a higher rate of depression in sex-typed individuals, but did support a high correlation between sex role strain and depression. Conway, Giannopoulos, and Steffenhauer (1990) found high masculinity associated with greater distracting mechanisms.

Results of Drawings

The overall characteristics of the drawings seem to corroborate with Wade's (1980) findings regarding the drawing of depressed individuals, both male and female. These subjects' drawings reflect large amounts of empty space, less investment, and very little affective content. Two subjects expressed resistance to the task and were much more comfortable with talking. This resistance was common with this population in the clinical setting in which the research took place. All but one subject used stick figures or nonpersonal symbols.

Drawings of “How I am at work” seemed less difficult for these men, who could easily think of a way to depict themselves in a role in which they had high investment and relied on heavily for self-esteem. Four of the five subjects' drawings were given negative connotations related to performance level, interpersonal factors, or not being appreciated. Rating on subjects' grids for work drawings reflected the factor of this role in their presenting problems or as a role in which they were comfortable because they could see their accomplishments.

Figure 1, a computer disc with a line through it, depicts Ralph’s feelings of having his work negated, since the company he worked for had laid him off and was not using his software. At age 38, he had no prior mental health care when he was admitted for depression, anxiety, and abdominal pain. He complained
of weight loss, insomnia, and crying spells, and presented with severe stressors directly related to role fulfillment—loss of job and provider role, a six-month marital separation, the ending of a homosexual relationship, and determination fed by guilt to return to his family as father and husband. He had used avoidance to a significant degree by often working as many as three jobs at one time.

Current family drawing: "We’re the strongest mirrors of presenting problems in their depiction of marital strife. Two drawings represented confusion, two focused on activities which took attention away from problems, and one showed the relationship’s periodic explosions. Men’s roles in the family were seen as leading to the subjects’ depression and led three of them into extended verbal explanations of their frustration and confusion regarding their role in the family. Grid placement for this role was either most or least on the comfort scale.

Figure 2 is typical of Gerry’s drawings, all using the same symbols. It shows this 46-year-old man’s relationship with his fourth wife as a series of explosions with intermittent periods of peace. He described this relationship as a constant struggle to fill a role through unsuccessful attempts at compromise and coping. He felt that this pattern was unalterable. Gerry’s father had committed suicide and his mother had been chronically depressed. Although he had been unemployed for 2 years and had two mentally handicapped adults to care for, he was unable to identify any source of depression. His drawings reflect his isolation, hopelessness, and suicidality, with his “ideal self” showing a flat line for “peace” but seeming to convey peace which comes through death.

All but one family-of-origin drawing contained human figures, with two families holding hands and three strongly reflect-
they had achieved in the hospital. Two others showed current states of confusion or rigidity, while a fifth depicted the marital relationship versus the individual. All of the ideal self drawings showed men who had reached a certain level of self-growth and peace, with one finding resolution in marriage. Only one of these did not depict a person. These self drawings seemed to aid the subjects thinking about the future and how they would like to see themselves. Though each had had suicidal thoughts, all were able to picture a hopeful future.

Figure 5 shows Doug’s sense of himself as rigid and hard in geometric lines. He had felt an increasing inability to communicate with others, including his wife. A quiet man of 52, he did not feel very respected as a high school teacher, and his own adolescent daughter did not share his values regarding sexuality. An older daughter had had two children out of wedlock. A child of missionary parents, he felt he was failing in the parental role. His ideal self drawing depicts him in softer lines with a warm, more human face, reflecting his desire to move away from rigidity and to be more accepting and sharing emotionally with others.

In mapping the four role drawings along a personal construct grid, no common themes were revealed. Rather, the grids reflected the individual experience of each subject and corresponded to male role stressors in each of their lives which seemed to have a strong relation to their depression. Table 1 shows Bill’s construct grid, reflecting his verbalized presenting concern with his role at work where he experienced great frustration and no positive associations. He finds greatest competence and sharing in a friendship represented by two people over a chessboard, yet this friendship is no longer active. Bill continues to have no positive feelings regarding his family of origin, even after several years of personal work. His emphasis on these roles may be denying the stress in his current family, rated highly on competence, comfort, and sharing, though he had been separated from his third wife for several months. His drawing of them shows two symbols birdwatching—nonpersonal and with attention completely focused away from the relationship.

Discussion

Findings supported the prediction that sex role conflict is related to an individual’s experience with depression. It was expected that subjects’ responses on the BDI, DCQ, and BSRI would be similar to those of several previous studies. Subjects reported expected findings of suppression of overt symptoms of depression, with mixed findings regarding masculinity/femininity scores. With no subject scoring higher on gender neutral items, there may be indirect support for Bem’s theory of sex-typed persons having less flexible coping mechanisms.

Drawings reflected a lack of affective content, a large amount of blank space, and light pressure found in other research by art therapists. Each man in the study was able to use drawings in a unique way to reflect both his roles and their importance and differences between self-concept and ideal self. Grid ratings strongly reflected presenting problems upon admission and emotional content or denial found in role drawings.

Findings cannot be generalized beyond the narrow population used in this study. Research in the literature is also quite limited, most often using college students. Although subjects were excluded who had complicating diagnoses of organic syndromes, personality disorders, or chemical dependency, it may be that a large number of men with depressive symptomology fall into these diagnostic categories, especially chemical dependency.

The purpose of this study was to gain an information base regarding the personal experiences of depressed men in relation to their sex roles. The responses of these five individuals give rich information regarding men’s experience with their own depression and how roles are related. In fact, many male patients had never used depression as a term for what they were experiencing, their response being “they tell me I’m depressed.” This kind of descriptive data seems crucial in developing informed interventions. Rather than imposing a diagnosis which is not meaningful to some men, we can learn from their personal descriptions and language to present a diagnosis to which they can relate.

The findings of this study and others involving sex role conflict and depression in men seem to have significant implications for clinical practice with men. Clinicians should be aware of men’s reluctance to seek professional help, the difficulty of diagnosing depression in many men due to suppression of overt symptoms, and the tendency of males to emphasize somatic concerns and approach their problems in a very cognitive, problem-solving manner. Art therapists may face strong resistance to expressive techniques by men who are depressed.
Roles which men play, such as father/son, spouse, provider, and friend, should be respected for their significance in the lives of individuals who may have little identity apart from them, especially when experiencing severe depression. Assessment should include the degree of investment in and fulfillment of these roles in individual lives. As men often have trouble identifying depression in themselves and are often confused regarding its source, psychoeducational material plays an important role in working with this population.

This pilot study may offer creative ideas for future research with a population about whom little is written. Personal construct theory seems to offer an opening into the experiences of men, and grids might be enlarged in future studies with no assigned categories so that subjects assert their own values and perspectives. These responses could be correlated to current literature to validate findings regarding the importance of gender roles in the lives of men. The repertory grid used with drawings is a natural tool for the expressive therapist, providing a way to integrate art tasks on a cognitive level with which men may be more comfortable. From such information gathered from a larger and more diverse sample, it may be possible to develop a questionnaire which is more specific to the population in rating degree of depression, expression of symptoms, and ways men cope with this illness.

In Search of an Accurate Likeness: Art Therapy with Transgender Persons Living with AIDS

Emily Piccirillo, MA, A.T.R.

Abstract

The purpose of this paper is to introduce art therapists to a “differently gendered” population—transgender males with AIDS—through basic terminology and art expressions. Three cases are discussed, with both art processes and products presented. Special attention is paid to the significant role art played in their relationship with the residential community where they lived, and to the ways it served their efforts to resolve their older (e.g., transgenderism) and newer (e.g., AIDS diagnosis) issues. Distinctive and common themes are considered, along with the special challenges and benefits that come with working with this population.

Introduction

It is important to begin by defining some basic terms that apply to this paper, since their meanings can vary by context:

SEX: being male or female as defined by biology, genetics, and the anatomy, specifically the genitals.

SEXUAL ORIENTATION: whether one is attracted to male or female partners, both, or neither.

GENDER: presenting with masculine or feminine qualities, largely dependent on cultural associations, ascribed societal roles, and stereotypical mannerisms.

GENDER IDENTITY: one’s inner, subjective sense of being male or female, a complex core self-perception. (Spordone, 1994)

It is helpful to clearly distinguish the clients being discussed in this paper as transgender males rather than transvestites, who typically are straight men with male gender identities but who are drawn to dressing as women for well-defined episodes of feminine behavior. Instead, these clients are transgender or pre-operative transsexuals, believing themselves to be straight women born into the wrong sex physical body. According to the DSM-IV, they each meet the criteria for the diagnosis of 302.85, Gender Identity Disorder (American Psychiatric Association, 1994). While they prefer male partners, they do not identify themselves as gay since they do not feel they belong to their male bodies. However, using the formal language above, they are male by sex, homosexual by sexual orientation, and of mixed gender, but with female gender identities. Most often, the result of such an intense conflict of differences is difficulty establishing a stable sense of self with persistent cognitive dissonance and “gender dysphoria” fueling efforts to resolve the conflict with reassignment surgery and hormone treatments (Doorn, Poormentina, & Verschoor, 1994).

All three clients discussed in this paper reported identifying more with females than males as children. As they entered adulthood, they took significant steps to transform themselves from male to female. They spent years routinely cross-dressing as women, publicly adopting female names and images while living in a subculture of prostitution and drugs. They attempted to conceal their genital truth in hopes of appealing to men who identified themselves as straight. All three had begun “corrective” measures focused on their secondary sex characteristics by modifying breasts to varying degrees through implants or hormone supplements, but none had reassignment of the primary sex organs. When they entered treatment for HIV, this process was arrested. When they were admitted to an AIDS long-term care facility, they became involved with art therapy, which presented a new format for their “self-seeking” (Doorn et al., 1994).

These are very complex cases with many layers of treatment issues, but this paper focuses on the role of art therapy in these clients’ struggles with their sex, gender identities, HIV seropositivity, and social relations. It is safe to assume that the principal reason these individuals were mainstreamed was their need for medical attention. Still, their sense of being marginalized in society persisted—initially because of their gender/sex issues, as well as being poor men of color and later compounded by the stigma of AIDS.

Treatment of such clients may expose the therapist’s elemental prejudices and raise basic questions about conventional assumptions about the self in association with others, especially between the sexes. Without familiar cues to guide us in differentiating men from women, transgenders clash with the dominant culture, unnerving many and tending to provoke apprehension and intense discomfort (Kando, 1973). In fact, they are often held suspect and seen as deviant, since they violate society’s codes of conformity and prohibitions, and they raise the specter of sexuality (Docter, 1988). Such clients are very vulnerable to judgement and abuse and pose a tremendous challenge in any setting (Money, 1988).

Stoller (1985) postulates that as a part of maturation and character development, boys are typically taught and encouraged to erect intrapsychic barriers, called symbiotic anxiety, to protect against the feminizing influence of the early maternal bond. In an adult community, transgenders seem to be treated as disturbing reminders of these feminine effects that threaten dissolution; the presence of these individuals activates the defensive shield that prevents these effects from intruding into consciousness. Consequently, “masculine” men are inclined to be the most reactive, warning, “I don’t care what he is, as long as he stays away from me.” They view the transgender as a failure, unable to resist
the impulse toward the intense primary pleasure that they have renounced. Unfortunately, a transgender's poor boundaries only reinforce and aggravate this alienating trend.

The unique, creative expressions of these individuals directly reflect their personal constellations of issues, beliefs, and losses and solutions. Their art pieces suggest themes and patterns, yet articulate their distinct, richly personal worlds. They serve not only as visible realizations of ambiguous realities, but also serve to advance understanding of them by others, accommodating the need for distance as it arises.

Chris

Upon admission, Chris, a 44-year-old African-American transgender male, instantly demonstrated a need for excessive special attention, making multiple requests and registering complaints. Because of his womanly contours and feminine features, with elaborate make-up, jewelry, and shirts revealing large breast implants, I asked Chris directly if he wanted to be addressed as female or male. As with his neutral name, he convincingly expressed a relaxed indifference, stating, “I’m a chick with a dick, a shernale; I don’t care which is used.” During placement, staff variably referred to Chris as both “he” and “she,” as did most of the other residents. Generally, Chris seemed comfortable with maintaining an androgynous duality, and he allowed his physical appearance to shift with his mood. I found it wise to routinely refer to Chris as a female; this habit served her well during disputes, a preemptive strike against name-calling.

Chris’s early personal history was marked by a fragmented, unstable family. She was guarded when asked for details, preferring to limit information to a few fond remarks about her mother. While she kept tenuous ties, she left home in her early teens and seemed quite alone in the world. Still, prior to placement she had lived with her pimp in a loose format resembling a traditional straight relationship. He ended their relationship abruptly when she tested HIV-positive.

Chris had substantial difficulty relating well to others. She introduced herself forcefully, at times trying to make a genuine positive impression, but she usually antagonized others with a manipulative, controlling style. Even with careful intervention, she gradually became more irritable during contacts. Her conversations became more bizarre and confused, with loose associations and a marked tendency to distort and misunderstand what others said. Despite significant episodes of anxiety, hostility, and disruptiveness, she refused psychotropic medications, and finally, after a year’s stay, an administrative discharge became necessary.

During Chris’s stay at the facility, strong delusional features started to surface, both grandiose and paranoid. She had begun to read about Egyptology; the fact that Egyptian society sanctioned its young men to use cosmetics and look effeminate first attracted her to this subject, seeing this as a kind of formalized gender ambiguity and cross-dressing. As she struggled to transcend her complex predicament and achieve a sense of belonging, she soon decided that many aspects of the ancient Egyptian belief system and mythology had profound personal relevance to her. Her ideas quickly proceeded into magical metaphysical realms. While she knew it was against facility policy, she regularly lit candles and incense in her room, turning her garbage can into an altar. She wore fresh flowers and crystals and selected her clothing by color, believing that certain colors had healing energies. She developed a habit of glueing a decorative plastic gem to the center of her forehead, believing this “solar eye” would infuse her with the power to cure herself. While any of these unusual practices might have complemented her illness well, she was unable to incorporate them reasonably in a balanced manner.

Similarly, her interpretations of Egyptology revealed psychotic thought processes. Adding miscellaneous notions from a host of modern and tribal religions, Chris invented her own comprehensive eclectic spirituality, identity, and view of the cosmos. She incorporated extraterrestrials into her beliefs and made aggressive efforts to convert others to this newly synthesized faith.

She also experimented with new names for herself, all derived from her study of ancient Egypt. She finally composed her own variation, Neithia, based on an identification with Neith, a primeval Egyptian deity of both war and mortuary practices who was neither male nor female but was reported to prefer a female appearance (Lurker, 1980). Believing herself to be an eternal divine being, Chris could then begin to accept and even celebrate her androgynous humanness on this temporary plane. She could reframe her approaching death by claiming passage into the underworld and resurrection as areas of expertise. From this association, she developed a sense of herself as immortal royalty, an heir to a dynasty with many specific gods and goddesses as her direct ancestors. Also, in discovering African-American roots in this noble race, she gained a valuable source of self-esteem and inspiration.

Since ancient Egyptian belief was organized around an endless cycle of existence, with elaborate rituals that marked the intervals of transformation, it fused physical sexuality, death, and the renewal of life. It even claimed that dual-sex supreme gods, like Neith, could be self-engendered. This greatly appealed to Chris, with her expressed desire to become known as a special survivor of HIV, because it suggested she could shape her own destiny and ultimately re-create herself if necessary.

Clearly among Chris’ strengths were her imagination and creativity, giving me a special opportunity to play a positive role in her treatment. She actively declined organized art groups but was very motivated to produce spontaneous images on her own. She showed an ease with a range of materials but usually preferred to use colored pencils, with small, selective additions of glitter and dried flowers. Her artwork served as a direct manifestation of her personal process of organizing her chaos. She covered all of her walls from floor to ceiling, her dresser, and both sides of her door with dozens of drawings. In adherence to Egyptian tradition, she even placed on the walls on either side of her bed depictions of jackals ready to escort her into the afterworld in case she died during her sleep.

Most of her art pieces are characterized by a hypersymbolism, in part due to her intelligence and severe distress but also because of the density of meanings in Egyptian iconography. Her artwork testifies to her intense strivings to fight hopeless and helpless feelings, and to transform her experience from passive to active. It expresses her extraordinary efforts to resolve her existential questions and fears of death, to find peace and meaning in her difficult life, and to establish a connection with higher powers as a source of comfort, guidance, salvation, and a homeland. While Chris lacked the ego integrity and interpersonal skills
to hold her ground in reality and the structured community, her artwork reflects some success with her core issues.

Her first piece, a collage of xenixed images from a clip art book (Figure 1), incorporates many themes that were elaborated later in treatment. From the start, Chris clearly stated that her artwork was about “birth depicting life, with birth, sex, and death as aspects of the same thing.” Note in the upper right corner the sphinx with the face divided vertically, in the center the joined face and skull, the skull with the two young girls doubling as the features (inside square), the madonna, and the mummy. The eye and the ear may represent paranoia. In many subsequent pieces, she used snakes to represent danger and predators.

Figure 2 is a birth image. The central figure is Isis as a mother preparing to suckle the infant Horus (Lurker, 1980). The focus is on “ka”—the creative and preserving power of life symbolized by the upraised arms. It is the energy that lives on after death and is passed on through regeneration, providing two ways to prevail after dying. The ankhu on the right is the universal sign of life. Isis was worshiped for her magic and her maternal protection of mortal children from the hazards of the world. Chris’s desire for a child and a nurturing childhood of her own became most explicit in this drawing.

Figure 3 depicts the goddess of the heavens, Nut, swimming in the seasky. As the mother of the solar god Re and lunar god Osiris, she is shown lifting them up as the sun and the moon, presenting them as sources of renewed life for the deceased (Wilkinson, 1994). The floating face beneath the water is Chris’s addition, suggesting her feeling of being engulfed by her situation yet sustained and accompanied by healing potential, perhaps the blissful uterine condition of the original mother. There are such signs that she did not adequately achieve effective separation/individuation from her mother, resulting in a strong regressive pull towards such a symbiotic fusion (Stoller, 1985). Figure 4 illustrates a legend from the Book of the Dead showing the air god Shu separating his daughter, the sky goddess Nut, from his son, the earth god Geb. Shu is assisted by two ram-headed gods representing souls (Lurker, 1980). As a whole it is believed to symbolize both the cosmos and a coffin. There is a tense sexuality in this piece, with an apparent incestuous component. The struggle taking place seems to reflect Chris’s efforts to
sort things out, to distinguish the elements of her world so it would be organized and sensible. Again, she has included the united duality of the eternal and the mortal and the female and the male.

These are some of the more coherent images that Chris created, with many others that scrambled the traditional relationships of deities. When we discussed her pieces, it was hard to follow her complicated claims about the content, admittedly due, in part, to my limited knowledge of Egyptology but mostly as a consequence of her shifting use of terms and names. These impulsive, disorderly expressions were idiomatic of her desperate ways of coping with her overwhelming life situation.

Kevin

Kevin was 26 when he was admitted and remained a resident until he died nearly a year later. He was of mixed ethnicity, primarily Latino and Polynesian, with a slight, graceful build. His appealing interpersonal style was both gentle and sweet, often shy and marked by a refined elegance. In contrast to Chris, he appeared more masculine and was easy to like. However, he stayed on the periphery of the community, expressing a preference for alliances with staff due to the uncertainty of when his peers might die.

While Kevin had never known his father, he often spoke about his mother, whom he seemed to remember as both loving and neglectful. He was deeply attached to and protective of her. His mother reported that as a pregnant teenager she had resolved to give him up for adoption but then changed her mind when she saw “how beautiful he was.” This had established for Kevin a basic sense of being precious and captivating, even though his mother abandoned him for long periods. He and his mother cared intensely for each other despite the bluffing of roles and her unreliability.

Kevin was newly blind from CMV retinitis, a common opportunistic infection among persons with AIDS. It robbed him of his vision in just a few months. Still just beginning to come to terms with this tremendous loss, he continued for a long time to entertain unrealistic hopes that surgery would reverse this condition. He was very fashion-conscious, and like many other residents, clothing and accessories, especially nonprescription eyeglasses, helped him feel he was participating in life and articulated his keen sense of individual style.

From the start, Kevin expressed a strong desire to keep his lack of vision from interfering with his functioning, following through with mobility training and selectively requesting assistance from others as he needed it. He joined the available activities, striving to adapt. It was during this period that he decided to create the life-size doll pictured in Figures 5, 6, and 7. While the doll started casually during an art group as an idea for a hand puppet, it quickly grew beyond that sketchy concept into a lengthy individual project. As it evolved, the doll became the primary locus of Kevin’s many existential concerns, serving as an effective medium for life review and resolution.

To begin, he selected blue fabric, “like the ocean or the sky.” Aside from this poetic reference, this color choice also suggests depersonalization and may indicate an underlying sense of being alien to his world and his body and (forgive the literal cliche) of being “blue” about his life situation. To establish the design and set the basic proportions of the doll, he spontaneously asked me to measure his own limbs, head, and torso. The process involved significant intervals of time because I quickly discovered the therapeutic value of his making every decision about the fine details while I did most of the sewing. I consciously tried to limit my role to functioning as his hands and eyes for practical purposes. He followed each major step of the process with many further adjustments.

The secondary sex characteristics became highly developed, but the genitals remained blank, as if unknown. At one point he considered the addition of pubic hair but never committed to the idea. Instead he focused mostly on the face, breast, and buttocks. The addition of the plastic gemstones began as sequins with the clear intention of attracting attention to “her best features.” The mouth was carefully created to meet his requirements of thick sexy lips with pink inside (see Figure 6). Because he insisted on the mouth being able to grasp a cigarette, it seems likely that this orifice functioned as a displaced vagina. He devised the innovation of putting buttonholes on the earlobes in order to be able to easily accessorize various outfits. The holes in Kevin’s own ears were torn and frayed, telling evidence of his prior lifestyle.

He wanted the limbs jointed so he could easily bring her into different situations and “so she can pose if she wants.” The hands we created by simply tracing his own; by foregoiing the articulation of each finger they resembled mittens, reflecting his limited autonomy and dependency needs. He had difficulty choosing how to handle the feet, finally opting to stuff socks and attach them permanently.
Half in jest, Kevin considered completing the project with the two of us each signing a butt cheek, but he decided instead to create a small birth certificate to mark her official arrival in the world. After much soul-searching he named her “Naomi Vanessa Paula Iman Jackson” because she was “the total babe,” with each name taken from a prominent, glamorous black female. He called her “Vanessa” for short. Subsequently, he seldom made public appearances without her, even bringing her with him for routine meals in the dining room and when he traveled throughout the facility. He scheduled his visits to the patio so that he could share her with the children in the facility’s developmental disabilities unit and took great satisfaction in hearing their squeals of delight. Otherwise, he kept Vanessa dressed in a sweatsuit in his bed and slept with her nightly. He died with her there at his side, and his mother discussed with me the logistics of transforming the doll into a panel for the Names Project.

Our sessions together also provided Kevin with private opportunities to discuss the various attendant issues, as he illustrated each small step of the creative process with stories from his past. He tended to refer to his female side in the past tense, seeming reluctant to own it, yet reported experiencing his sexuality as female. This discrepancy may have been based on an intense wish for God’s acceptance and his renewed Christian faith. His explorations of the scriptures initially produced a crisis as he feared his history placed him “beyond redemption.” As with many persons living with AIDS, he was eventually able to focus on divine forgiveness as a source of solace and healing (Winiarski, 1991), supported by a baptism. With his spiritual questions largely answered, he could safely capture and embody his female aspects in a permanent, finite form.

Through all of Kevin’s shifting and soul-searching, Vanessa stayed with him as a constant companion, an unusual kind of consistent, unconditional presence that seemed to give him comfort. She remained neutral as he grappled with all four areas of his sexual self, as defined by this paper’s basic terms. One day he would conclude that he was really gay and proud of it, and then the next he longed to “just marry a woman and have a bunch of kids.” Some times he was a stranger to his body, lamenting that he could never again return to the days of hormones, designer gowns, and drag balls, only later to decide that he was quite content just the way he was.

Perhaps Vanessa also reflected the enduring alliances he established with his many female caregivers, signifying the corrective restitution of his maternal bond. Without a stable, internalized good object, he still found a way to create an externalized surrogate in a reliable compromise solution. Kevin’s regrets about not having children of his own were also addressed through Vanessa, as she simulated offspring. She served, additionally, as a novel means of making contact with other actual children. When Kevin took Vanessa to visit the disabled children in the facility, he took on the persona of a father who had thoughtfully arranged a playdate for them to spend time together. Lastly, by having her at his side in his bed each night, she was always available to address his periodic defensive wish to appear as a straight man. With a female lover. This triumvirate of child, parent, and partner captured the complexity of his early experiences with his mother.
Bobby

Bobby was a 30-year-old African-American male when he was admitted to the facility. He made his presence felt from the moment he first walked onto the unit, joking and chatting with everyone with an easy, loud laugh and robust demeanor. His wildly fluctuating gender identity manifested in sudden marked changes in appearance, voice, and behavior, usually in response to subtle shifts in the social context. One minute he would squeal, whine, and giggle in girlish or infantile tones; the next he would bellow in macho bass tones.

Being hypersexual, Bobby's intrusive behavior included touching, tickling, and pinching both men and women. He tended to wear tight clothes that revealed the residual breasts he had from prior hormone use; a favorite outfit might be hot pants with a T-shirt covered with pairs of pigs explicitly demonstrating a range of sexual positions. (He even eroticized jewelry-making, declaring, "I like anything where things get put into holes.") Such a lack of restraint quickly becomes generalized into the notion of transgenders as immoral (Docter, 1988). Clearly, limits needed to be set on a regular basis to compensate for his poor social judgement and lack of boundaries.

Initially, I was presented with the challenge of integrating Bobby into the activities I provided in the facility. His brazenly unconventional tendencies quickly provoked hostility and fear in his male peers. But as soon as they began to reflexively refer to Bobby as "she" and "her" in the course of conversation, this open acknowledgement seemed to ease tensions. In time, they were able to tolerate, if not accept, his presence, directly setting limits with him in accordance with the modeling done by staff. Since he also could be insulting and demanding, on occasion his inappropriate behavior would escalate to a point where he would need to be ejected from a group.

Bobby was engaged in similar tensions with his family, especially his mother, who communicated a strong desire for Bobby to give up his earlier lifestyle of cross-dressing and behaving as a female. She played on his eagerness to please her as well as his belief in divine judgment, evoking shame and fear of risking rejection by both God and her. In fact, he seemed to have only minimally individuated from his mother, phoning her many times each day to report trivial events in appeals for her approval. His ongoing identity crisis and overall anxiety seemed rooted in his arrested relationship with her and her highly conditional reaction to his gender confusion. In fact, after much initial resistance to consider using art materials, his first breakthrough happened as Mother's Day approached and he decided to make a distinctly masculine picture to give to his mother (Figure 9). Initially, his frequent use of the heart and cross in his work seemed vital to his internal conflicts. Much later, when Figure 10 was created, he had become more spontaneous in his productions and able to reveal his truer transgender self with the inclusion of small breasts.

Unable to relinquish his sense of himself as "a woman born into the wrong body cut I got a little extra something down there," Bobby carried around a photo of himself as "Jaince," his former female street identity. Figure 11 was one of his most prized images, and he related to the face as one in which he could see himself. The conspicuous absence of a similarly well-defined body strongly suggests his lack of readiness regarding his
physical condition. He battled with a desire to paint his fingernails and wear lipstick; Halloween was the one time each year he allowed himself to indulge in full make-up and hairstyling, demonstrating expertise by creating a very attractive female appearance. When a volunteer gave him a Barbie doll, he made a wardrobe for her, engaging his repressed inclination to cross-dress. Figure 12 is a typical picture of Bobby's, full of bright colors and shapes and a central female. His humor was often organized around his transgenderism, excusing himself to go to the ladies room and saying “Let your wife do it for you” when offering others his generous assistance. He enjoyed dancing while singing his favorite song “I'm Every Woman.”

Bobby maintained that a seizure disorder was the reason for his admission and only occasionally admitted he was HIV-positive, insisting “But it's not the bad kind because I'm not skinny.” In fact, he was overweight, carrying most of it in his belly. He would hold his belly as if he were pregnant, joking with other men, both staff and peers, about them being his father. He would speculate about the due date and decided to name the baby Janice. Once, he inflated a rubber glove, stuffed it under his shirt, and began parading around the room. This fantasy could take on delusional proportions, with him stating that he had the internal reproductive organs of a woman and that he could be inseminated through anal sex. He would often refer to his daily medications as birth control pills.

Despite the persistent strains in his life, Bobby could usually find consolation in his Christian beliefs and was very vocal about his gratitude for the positive, pleasing things in his life. He wore a large cross around his neck, taking comfort in his belief that God would “get it right the next time” by reincarnating him.
as a woman. When he spoke, he often seemed to be testifying to God, commenting on the warmth of sunlight, the colors of an evening sky and especially the support he got from others.

Bobby's artwork usually served him well socially, easing his adjustment to placement and providing a medium for exploring interpersonal distance. His prolific tendencies became controversial, however, since he soon covered the walls of the dining room with nearly 100 drawings. Eventually he was persuaded to transfer most of them to his own room where their number quickly doubled. Due to his profound need to feel liked, Bobby actively strived to accommodate the terms of his new environment. He was still in the facility when I resigned my position, having fully established himself as a vital, central member of the community and creating pictures on a daily basis.

While Bobby easily met the criteria for "full-blown" status for admission, his seropositivity was recent news to him. It was rare to see his denial fluctuate openly, and most of his artwork reflected a highly defended individual. Typically, the main elements of his images are surrounded by a pattern of forms, either fractured geometries, dots, or asterisks. These alternately seem to protect and impinge. Some figures appear to be boxed in by them. They generally appear to help maintain control and bind anxiety, much as Bobby's staticky chatter filled the air, suggesting a damaged, impulse-disordered self.

Figure 13 is a clear sign of Bobby's internal and external crises. In addition to the customary field of shapes, its unusual content reveals an acute awareness of his situation in the midst of his web of illusion. It communicates his feeling of being trapped in his reality, depicting his self as a solitary, poisonous, black widow spider. The idea of an HIV-positive person's bodily fluids being dangerous is explicit here. Also, according to Cirlot (1971), the spider is a primeval female symbol of destiny as it weaves the thread of each person's life, simultaneously building and destroying it. This image may represent the impinging web of his mother's femininity from which he cannot seem to separate and individuate; he may feel irreparably infected by femininity as well as the virus (Stoller, 1985).

Figure 14 is a very different expression of Bobby's sense of his mortality. He was unable to see the blatant content of the image, yet it quite plainly depicts a baffled looking man apparently alive but buried up to his neck in the earth. Remarkably, he appears to be "pushing up daisies," as the clouds provide rain to nourish this troubling garden. The flowers that accompany him are analogous to his own existence in their transitory bloom and decay. They also seem to represent Bobby's efforts to stay hopeful amidst his circumstances and his intensified drive to enjoy life. Figure 15 was a preliminary sketch that Bobby promptly rejected, most probably due to its frightened expression and skeletal quality, as it graphically captures the gaunt appearance of persons with wasting syndrome in end-stage AIDS. Simply, it was too much for him to bear.

Conclusion

What can be learned from these clients? First, the nature of transgenderism and an AIDS diagnosis are inextricably linked. These two monumental challenges involve pronounced stigma, disapproval and marginalization, multiple losses and dilemmas, and an air of secrecy; both involve radical changes and feeling deeply misunderstood and beyond compassion. They also involve a globally disturbed body image and an overwhelming wish to repair it.

Due to their transgenderism, these clients were already familiar with being at odds with others and themselves, having endured a life-long incompatibility of mind and body (Doom et
Art, like the body, is the self made physical. With its promise of cathedect transformation, art took on an especially powerful significance for these individuals who desired so much real change. The use of art materials was conducive to shaping and mastering one's private and public image by experimenting with alternative identities. It is not surprising that a wide assortment of people fill their artwork. Art offered a liberating opportunity to define a distinctive whole—to say, "This is who I am" while getting support from others.

For these clients, art served their social adjustment. Its visibility spoke to their narcissism, to their grandiose wish for special attention and approval, and to their need to feel insulated. They all found ways to make it attractive, to make it resonate, and to maximize its effect on others. Art allowed them to celebrate and reinforce being different, even flamboyant, yet enabled them to fit in, possibly for the first time in their lives. The prevalence of oral elements describes their need to feel emotionally fed, their receptive sexual appetites, and their preoccupations with procreative potential.

All three used their pieces to communicate with the rest of the community, to articulate themselves, and to create a sense of connection. This triumph over isolation was quite an accomplishment, considering their intense experience with ostracism and discrimination. With all the other stressors they were facing, placement in a long-term care setting brought with it a certain imperative for them to try to find a way to adapt to mainstream society—outsiders returning to the fold. By emphasizing their strengths and affirming diversity, art therapy supported them in this process toward actualization and integration. Their finished pieces, as convincing demonstrations of mastery, earned them quick respect and favorable feedback.

The content of these clients' art challenged the heterogeneous community of the facility, surprising it with refreshing, spirited expressions through the accessible vocabulary of images. Understanding became an appealing possibility, with even the skeptics discovering familiar elements in the artwork as it provided a safe opportunity to take a moment to get better acquainted. The perplexing, and for some repulsive, ambiguity of being transgender became less threatening as the personal took hold. Moreover, the clients' artwork facilitated recognition of them as members of humanity, assuring staff and the other residents with AIDS of the universal desire to be known and accepted simply as a person, however unconventional. With the stark proximity of death, they bravely modeled exploration and disclosure. Profiting from their motivation and risks, they sent a vital reminder about survival to many around them—that suffering enables growth when you live fully in the moment, and that even in the tightest trap there is always space to move.

**Editor's Note:** Emily Piccirillo was the former Director of Activities at Broadway House for Continuing Care in Newark, New Jersey; a 60-bed special care facility for adults living with AIDS. She recently relocated to the Washington, D.C. area.

Gender Dysphoria: The Therapist's Dilemma—
The Client's Choice, Discovery and Resolution
Through Art Therapy

Abstract

The therapist's role and the dilemmas faced in treating a gender dysphoric client are discussed. Ethical and moral issues relating to transsexuality are examined from both a general and Jewish perspective. Art therapy is discussed as an appropriate treatment choice for a transsexual client. Ms. S., the client, describes how the process worked in her particular case. The author aims to shed some light and generate discussion about gender issues faced by both therapist and client.

Introduction

In his comprehensive review article, Paul (1990) suggests that the term transsexuality was coined by Cauldwell (1949), an American sexologist, and popularized by the work of Harry Benjamin (1953, 1966). In the Standards of Care manual (Walker et al., 1979, revised and reprinted 1985), which established the standards of care still used today, gender dysphoria is defined as: "That psychological state whereby a person demonstrates dissatisfaction with their sex of birth and the role, as socially defined, which applies to that sex (of birth), and who requests hormonal and surgical sex-reassignment" (p. 79).

The differential diagnosis of Gender Dysphoria or Transsexuality is complicated by the lack of pathognomonic laboratory findings or a specialized test. While Gender Dysphoria may exist as part of the pathology of certain psychiatric conditions (Levine & Lothstein, 1981; Lukianowicz, 1959), Transsexuality is no longer accepted as a diagnostic term in the DSM-IV (1994). A male or female who presents "discomfort and inappropriateness about one's assigned sex; and persistent preoccupation for at least two years with getting rid of one's primary and secondary sex characteristics and acquiring the sex characteristics of the other sex" (DSM-III-R, 1987, p. 76), is now diagnosed with Gender Identity Disorder, which is placed in the "Sexual and Gender Identity Disorders" section (pp. 532–538). While the actual criteria for diagnosis did not change much, statements such as "generally there is a moderate to severe coexisting personality disturbance" (p. 74) which tended to stigmatize the condition have been eliminated in the DSM-IV (1994).

While some studies in the past (Murray, 1985; Roberto, 1983; Verschoor & Portruga, 1988) supported the old definition of transsexualism as pathological, others like Fleming, Costos, and MacGowan (1984) found no differences in ego development between nonclinical and transsexual subjects. Lothstein (1984) further questioned the pathological findings, suggesting that the emergence of pathology in transsexual samples is correlated to the type of assessment instrument employed.

Since many of the researchers used "self report" instruments, Brems, Adams, and Skillman (1993) decided to change the testing instrument and used the Draw-A-Person test as a primary assessment tool with 247 subjects. They concluded that "overall, transsexual subjects differ significantly from psychiatric subjects, non-client subjects, men, and women, whereas these groups do not differ significantly from one another" (p. 262). They further state that transsexuals are not clearly identifiable as a psychiatric group, that does not mean, however, that as individuals within the group, they are totally free of any psychopathology. Overall, it was noted that the transsexual group produced higher quality drawings than the psychiatric group or the nonclient, male and female groups. The criteria for judging the "quality" of drawings was not discussed in the paper; therefore, it might not be wise to attach too much significance to this finding. Brems et al. (1993) also observed that the transsexual group, while not being significantly different from other populations with regard to sex-role stereotypes and definitions, "appears to endorse femininity for women to a much larger degree than other individuals." The authors do not clarify what features they consider "feminine," but from looking at examples, it seems that stereotypical depictions of softer features, developed breasts, long hair, hourglass body shape, and so forth, are considered to be more feminine. In Figure 1 you can see how Ms. S. drew the person of "self" even before total identification with being a transsexual as a "feminine" individual according to that definition. She also saw that drawing as feminine in later discussions.
The Therapist's Role

When discussing the role which a therapist should ideally play in the evaluation and treatment of transsexual clients, Pauly (1990) stresses the importance of adopting a neutral position and clarifies this by stating that "the therapist be neither advocate nor detractor. The therapist should offer support, attempt to work through issues, but not be prematurely invested in determining in favor of or against proceeding with SRS (sex reassignment surgery)" (p. 15). It is perhaps this same sentiment that led Ebner (1980) to suggest that the transsexual patient is often avoided in psychotherapy because s/he is perceived as endangering the therapist's own emotional equilibrium by stirring up too much psychic pain in the therapist. Therefore, it is not surprising that once it became clear that Ms. S. wanted to explore transsexual feelings, I had to work through my own feelings and biases before deciding to continue seeing Ms. S. as a client.

Therapists entering into any therapeutic relationship bring with them a system of belief, "weltanschauung," consisting of theoretical orientation, concepts of mental health, and personal experiences steeped in cultural background as well as moral and religious values. In addition, Brown (1990) comments that countertransference issues "are noted to be particularly relevant in the care of gender dysphoric individuals" (p. 57).

The theoretical viewpoint I employ is holistic, client-centered, and based on a team approach. The therapist's role is to be the catalyst and facilitator enabling the client to reach a resolution. It is the role of the client, however, to determine the therapeutic goals. My respect for the client as a person and of the artwork as a shared intimacy is the base for my conviction that every client actually knows what s/he needs in order to be at peace within her/his chosen way of life. The therapist's task is to facilitate the client's recognition of her/his own issues through visual communication and to help resolve those issues through building on the individual's strengths.

The formed art is not there for the therapist's benefit or interpretation; rather, it is primarily a means of communication between the client and her/his own self. I see the relationship as a triangular one, between client and therapist, client and art, art and therapist, therapist and client. Theoretically, therefore, a Gender Dysphoric client poses the same challenges as any other client.

Being in touch with one's creativity plays a pivotal role in my concept of wellness and mental health. Creativity expressed in a variety of ways exhibits flexibility and, therefore, an ability to adjust to new situations. Within this view it is not just the image itself, but the actual act of creation, the process, and the use of materials within the process which enable change to occur. The product is the object engaging the client and being altered and embellished, simulating life. Thomson (1989) advocates encouraging experimentation and involvement with the process of art-making. "One must put over the point that everything is permissible, everything which the picture calls for. Every instinctive prompting in regard to the work should be followed. This is always a response to the work as it progresses and must not be confused with 'Express your feelings!' which elicits a conscious, one track, and often cramped endeavor. If flexibility is a measure of health, it is just this two way traffic between impulse and consideration (between the primary and secondary process) that is health-giving" (p. 63).

When a person loses touch with creativity, that person's mental health suffers. That person becomes rigid, afraid of change, and uses defense mechanisms which may no longer protect, in fact may indeed be harmful. Yet often that person is afraid to or unable to take chances, make choices, or even see that there are choices available. Art therapy, therefore, can be seen as a suitable modality for working with clients manifesting Gender Dysphoria, allowing exploration and ability to look at a variety of possible solutions. Indeed that was the case of the client described in this paper, who was engaged at one time in producing and teaching art as a livelihood; for this client, art therapy was of particular relevance.

One more obstacle had to be explored: personal experiences steeped in cultural background as well as moral and religious values. My experiences start in war-torn Europe, as a Jewish child surviving the Holocaust. My formative years were spent in Israel, integrating losses and believing in the individual's right to freedom. Personal choices must take into consideration the right of others to the same freedoms. These principles can not be violated. Could I, then, deny Ms. S. a freedom of choice? No, providing I can impart the importance of the principle of responsibility for the consequences of that choice and am willing to facilitate the process of exploration and countertransference.

The religious values are somewhat more difficult issue. As a practicing Jew, I am bound by Halakah, The Way or The Jewish Law, which originates in the statutory Torah of Moses. Orthodox Jews believe that other details were spelled out and transmitted through oral law right down to the present. Moses Maimonides (1135-1204) in his monumental work, Mishne Torah, which is still used as a guide in judging current issues in Jewish law, discusses castration in the Book of Holiness.

In Chapter 16, paragraph 10, it states: "It is forbidden to damage reproductive organs, whether of humans, animals or fowl... The law that is arrived at thus states: No Jew should do thus whether on his or her own body or on other's body. Any one who castrates is liable to be whipped by Torah Law anywhere. Even the one who castrates after a castration was already performed is liable to be whipped" (pp. 104-105).

In the paragraphs which follow this quotation, Maimonides continues to elaborate in detail on various pertinent cases. He concludes that even helping a person to achieve a castration is considered undesirable, though there is not the same stringency of punishment attached as there is for castration itself.

In light of the seriousness of this viewpoint, I have to clarify that Judaism does not impose strictures of halacha on non-Jews. A client has the right to a different set of values and religious beliefs, and a therapist should have no problem accepting those. However, in order to adhere to my values for myself, as a supporter, I had to set clear boundaries. I would remain "neutral" in the way Pauly (1990) recommends and have no part in the final decision whether to proceed with the sex reassignment surgery. I would aid Ms. S. in exploring options, refer her to appropriate professionals for assessment and treatment, and remain available to her, offering support and attempting to aid by facilitating working through the issues.

The original manuscript was written in Arabic and completed in 1194. The translation in this article is the author's. The version used by the author is a traditional Hebrew language translation published in 1987.
Brief Case History

In the course of therapy, a female client expressed concern and dismay about the behavior of her then husband and father of their three-year-old daughter. She proceeded to describe cross-dressing behaviors, as well as periods of total body hair removal by her spouse. These behaviors, though not totally unfamiliar to her, have become increasingly repulsive, and she was concerned about their effect on their young daughter.

The client expressed a desire to have a family therapy session to explore relationship issues. At this stage there was no clear indication of what the real issues were. As I found out later, there may have been early indicators, but those were suppressed. The manifested purpose of therapy for both the husband and wife was a desire for personal healing and growth in order to facilitate the continuation of a relationship within an intact family unit. Our long-established trust within the therapeutic relationship left the wife confident that she would like to continue in her own individual therapy, while encouraging her husband to pursue his. When the husband (Ms. S.) expressed a desire to work with me as well, we all needed to reconsider our stand. Consulting with colleagues and the parties involved, we arrived at a rather unorthodox decision. I would continue to see both as separate, individual clients, with joint family sessions on a regular basis to assess material that was pertinent to the family unit. The daughter was provided with an art therapist specializing in child development.

In the province of Ontario, Canada, only regulated health professionals are permitted to actually render diagnosis. Since art therapy does not at present fall into this category, diagnosis is a forbidden word in the vocabulary of the art therapist. Yet, we all come across situations in which the art and the interpretation of it by the client raise the therapist’s suspicion of what the manifested problem entails. The therapist is certainly not qualified to render a diagnosis but is obligated to refer the client to a professional who is qualified to do so. I have followed this route by referring Ms. S. to a medical professional who specializes in sexual and gender disorders. Ms. S. was then referred to an institute in Toronto which is authorized to assess and recommend cases for sex reassignment surgery. When the assessment revealed that indeed the person had Gender Dysphoria, the institute suggested that Ms. S. continue to work with me and the institute as a team. At this point we had to reassess the situation and it became clear that the couple would have to go their separate ways. While Ms. S. started medical treatments with the sexual disorder specialist, I was able to support the wife through a separation process. At this point, the wife was able to terminate her therapy with me, leaving me free to resume therapy with Ms. S. in conjunction with the institute and the medical professional who oversaw the hormonal treatment.

In order to familiarize the reader with Ms. S. and what the process of art therapy meant to her, I have asked that she share her experiences through her own writing.

The Voice of Ms. S.

As I lay in my crib, my mother’s youthful, pretty face and beautiful, long, dark hair were one of my earliest memories, together with my happy acceptance that one day I would grow up to be as pretty as she was. Playing “house” with the neighbor girls, skipping, and dolls were enjoyable pursuits during my childhood. As I entered puberty, I anxiously awaited my breasts to develop, but by age 14, I reluctantly realized that damned reflection in the mirror was to be my lot in life: My breasts did not develop; I began growing facial and body hair; my beautiful choir voice disintegrated; and my penis was unlikely to be magically transformed into a vagina. I was stuck in this male body, and somehow there would have to cope. It wasn’t that I didn’t realize I appeared physically like a boy—the hateful “brush cut” bore enough evidence for that, but the fact was I didn’t feel like a boy, nor did I enjoy doing boy things like playing war, cowboys, sports, and the like. I wanted long hair, makeup, dresses, girlfriends to confide in, and to be asked out on a date by a boy.

My career explorations were revealing. I would become a minister within my religion, but found too many inconsistencies, too much hypocrisy and intolerance to continue. Philosophy had to be a better path for me—surely the pursuit of wisdom should be able to help—yet truth had little relevance amid the carefully constructed arguments and cold, unfeeling reason. What of psychology? Here, the study of the mind and its hidden recesses held great promise and would surely contain some answers to life. Alas, at the time I pursued my studies at university, psychology had a severe inferiority complex towards the “legitimate” sciences. I moved on towards a larger viewpoint; sociology with its overall perspective and comparative cross-cultural analysis would surely... Floundering through too many statistics and theorizing for my intuitive, emotional self, I began to search for a new discipline.

Art. In art, I found the union of all aspects of human existence: feelings, thoughts, myths and religion, psychology, sociology, philosophy, the sciences. All were amalgamated into a unified conception, and artists were individuals who were free from any particular dogmatic constraints associated with each separate discipline—free to probe into existence, life, and its reasons.

At this time, I had so suppressed being a woman. Thinking I had to live as a male. I did not realize what becoming an artist would reveal, and I remained blind to the obvious messages in the imagery that poured forth from my hands. Willfully blind, for if I admitted the messages how could I change my body into my proper gender? I was, unfortunately, unaware that gender institutes were in fact being set up in Canada around this time.

So, I became a professional sculptor specializing in nude figures. My first major work was an over life-size figure called “The Nightmare” completed as a graduating piece from university. It had two fronts and faces joined together where the backs should have been, one figure was sleeping but the other writhed in a paroxysm of agony. A fitting portrayal of my dilemma.

Countless other sculptures followed dividing themselves into key themes—as though the images would continue to surface and resurface, each time in slightly different form, until at last I grasped what they were saying so eloquently to me: images like “Truth” (Figure 2)—a beautiful woman emerging upwards, yet part of her still caught, immersed in a mire. “Spring and Autumn” (Figure 3) were a pair of bronzes: “Spring” was a woman holding a flowering rose and rising from a crouched position while “Autumn” was a male with eyes closed holding a withered stick and sinking downwards.

I married, changed my career, and eventually had a child. It wasn’t until I went to an art therapist to help support my
wife during her recovery as an incest survivor that everything came together. I found, like my wife, I had memories, too, but not relating to incest. Mine focused totally on being in the wrong gendered body. The memories and feelings flooded onto the pages during the art therapy sessions—images of the woman I knew I was, still trapped inside this male body and longing to achieve my rightful female form (Figures 4 & 5) and images of my life as a woman finally free to experience the proper social responses to my feminine sex (Figure 6). I moved quickly through the process with my art therapist as an invaluable, objective person—a sort of unrepressible conscience who pointed out unfailingly what my art was trying so courageously all these years to show me, and it showed far more than merely a woman in a male body. It showed a person of great sadness who was frustrated, in anguish, and sinking rapidly into a premature aging and almost lifeless hopelessness as a male.

Inside. I was not that way at all and could no longer condone trying to accept this accident of birth, this hell I was in, nor could I continue trying to live my life for others. I made the decision to embrace my life and vitality and the unknown, and within 5 months I had begun female hormones; within another 3 months I had begun living and working as a woman in accordance with the guidelines for transsexuals from the gender institute.

The realization of what I had to do was solved and acted upon. My inner anger and sad feelings were gone, and I experienced a new feeling—a sense of peace for the first time (Figures 7–10). But a host of new feelings and difficulties arose. This process was not over by any means yet, I was beginning to discover!

I had to come to terms with my feelings of regret—of not having acted upon my knowledge much earlier in my life, and the sense of wasted years, wasted decades, now that I knew a sex
change was indeed possible. A panic arose, a feeling of pressure to move quickly, oh so quickly to recapture those lost years, to make the transition not "yesterday" but much faster than that. Fortunately, everything came beautifully together for me—like being on the right path for the first time: several surgeries, the seemingly endless process of electrolysis, the money to pay for these enormous costs, the support of my employer, the loving support of friends.

Other questions came forward necessitating answers and art therapy provided the means to allow my deep inner self to reassure and answer them to my consciousness. "How to build a whole new life?" "How to make a network of friends, as a person only part way through transition?" "How to cope with those who knew me before? with rejection at times? with family and their diverse reactions ranging from militant disapproval to tentative acceptance?" "How to handle gender discrimination in the workplace from some individuals? or from those involved in the legal process towards resolution of custody and access issues on the way to divorce?" Amazingly, even a scribble would help clarify issues and solutions that were possible, as well as indicate those instances where the problem lay with others and their need to come to terms with it, in themselves. Surprisingly, art therapy could bypass emotional upsets surrounding issues and help put everything in perspective. Despite the emotionalism concealed as being intrinsic to artwork, art can be penetratingly lucid and coolly detached when needed.

One day I leafed through my portfolio of sculptural works and examined my private drawing journals. Every image became crystal clear. I could suddenly understand what had taken 18 years to sink in—and without the use of art therapy, it may well
have taken many more! I understood the visual language I had used to communicate with myself. It is true that 18 years of art work is a long time, yet I do not regret the time taken to explore whether I could in some way live in harmony and at peace with myself in the body I had been born with. I now know beyond a shadow of a doubt what my real gender is, my simple basic need to have a body in harmony with my inner gender (i.e., physical and psychological harmony), and the peace and inner fulfillment that arise from such a state (Figures 9 & 10).

Ironically, despite having been a professional artist and having always created art, even while involved in a different career, I now feel no need whatsoever to do art on my own, and so I don't. Could it be that painting and sculpting was, for me, solely the means of communication between my subconscious and consciousness? Could it be that art was used for years in the manner of self-revelation and now it sits, dormant, waiting to be utilized in a different capacity as a means of communication to others? Be all this as it may, my chisels and pastels lie silent, but there is an incredible music now within my every waking moment.

Epilogue and Conclusions

The divorce is now final. The custody issues are still not resolved. While both parents desperately want the best for their child, they differ in how to achieve this goal. The mother takes the position that she should have sole custody, with limited contact, preferably supervised. Obviously, this is a painful matter for Ms. S., who would like to have an active part in the daughter's life. There are no objective studies to suggest what is least traumatic: loss of contact with a loved and loving parent, or maintaining a close relationship with a parent who changed gender and possible confusion of her own gender identity.

In a recent article about the artwork of a postoperative female Gender Identity Disorder person, Obstfeld (1993), an art therapist working with drug abusers, comments: "Sexual reassignment had not provided as complete an escape from her 'cage' as she had hoped. Emotionally, she still seems trapped" (p. 14). Ross and Need (1989), on the other hand, have assessed the adequacy of gender reassignment surgery on the psychological adjustment of 14 male to female patients. They conclude that aside from the ability to totally pass as a woman, the lack of pre-existing psychopathology, the emotional preparedness, and the social supports available are crucial factors in determining the postoperative mental state.

As we continued to work together in preparation for a gender reassignment surgery, which will take place by the fall of 1995, the goal of therapy shifted towards working through issues related to the surgery. By preparing support systems and looking at possible difficulties, Ms. S. hoped to enhance her chances for a successful outcome. The ability to express herself creatively is a pivotal factor in her life and is currently manifesting itself in original flute and harp music performances as well as a limited return to drawing and painting on her own.

Throughout the past 2 years, Ms. S. has lived and worked as a woman. In her writing, she idealizes the process of art therapy, and it may seem from the drawings chosen by her to illustrate the process that she builds an unrealistic view of what being a woman is all about. It appears as if her entire interest revolves around wearing and walking on high heels, playing the harp, dating, and
so forth. While indeed those aspects of womanhood are important to her, she attributes this to her need to experience adolescence as a woman, in order to be able to grow through stages of maturing in her chosen gender. She is an interest to indulge in romantic liaisons and admit to wanting to make up for lost time. However, she is also engaged in exploring her fears and expectations and realistically looking at what kind of professional life and personal relationships she will be able to build in the future.

Throughout our work together, Ms. S. worked in two-dimensional media exclusively, using primarily chalk and oil pastels as well as pencils. Sculpture was abandoned as a viable art expression, for the time being, in favor of a quicker, more immediate means of expression and exploration of issues. Directive drawings were used to enhance problem-solving techniques, and projective methods were employed with Ms. S.'s own drawings to explore underlying issues of personal difficulties. Ms. S. also writes poetry which helped her in her grief work. The grief issues centered around the loss of the male self, the loss of home and friends, and in particular the realization that the decision to become female will probably result in the loss of the ability to continue parenting the young daughter.

It is reasonable to expect that the extensive preparatory work that Ms. S. accomplished will enhance her chances of emotional stability during and after the period of convalescence. There is no measure, however, which is able to assess the contribution art therapy has played in this process. Tarsh (Nauth, Tarsh, & Reid, 1993) makes the point that in any therapeutic procedure it is important to engage in follow-up studies, but in the case of sex reassignment it becomes even more important. This is because the procedure is irreversible and “may meet with the disapproval of a large part of the population” (p. 692). It may be prudent, therefore, to add compulsory follow-up and continuation of some form of psychotherapy to the requirements which must be followed in order to be eligible for sex reassignment surgery.

Reid (Nauth, Tarsh, & Reid, 1993) comments that in follow-up studies of 141 Dutch transsexuals which measured the subjective well-being of persons who underwent sex reassignment surgery on the basis of gender dysphoria, “subjective well-being was positively correlated with improved psychosocial functioning, having a steady partner, and having completed sex reassignment surgery” (p. 692). Not surprisingly, employment, acceptance by family, and integration of new gender role into day-to-day life were also cited as being directly correlated to the “feel good” factor. It is interesting to note that those who reported continued dysphoric feelings no longer ascribed them to gender problems. Reid concludes by stating, “My impression is that successfully treated transsexuals are mostly self-supporting and are not a drain on society compared with untreated, unhappy people with unresolved gender dysphoria” (p. 684). I hope, therefore, that Ms. S. will continue to engage in a process of active rehabilitation into her new gender role.

**Editor's Note:** Hannah Sherebin has a degree in nursing and is a Registered Art Therapist in private practice, an adjunct therapist for the Social Services Department of the London Jewish Community Centre, and a Practicum Supervisor for the Art Therapy Program at the University of Western Ontario, London, Ontario, Canada. Ms. S. is the client and wishes not to use her real name.

Message of Acceptance: “Gay-Friendly” Art Therapy for Homosexual Clients

Donna Addison, MS, Rockford, IL

A young adult on the psychiatric unit seemed to be having difficulty completing art therapy directives in a manner that was satisfactory to himself. While he had more than adequate artistic ability and appeared eager to participate, he seemed to struggle painfully through the process no matter what we were doing as a group.

He never had much to say about his work or about himself; he remained rather withdrawn from the group, even though he was polite and friendly. By chance, at our next session, I directed the group to make collages from a pile of magazines I had provided. In the pile I had included a variety of magazines, two of which happened to be gay-oriented publications. The patient took the gay magazines and quickly created a wonderfully expressive collage. For the first time in the group he talked of pride, of relationships, and of the struggles he experienced with his family due to his “coming out”.

I had not known about his sexual orientation before he created the collage. By “accident” I had given him a message of acceptance when I included the gay-oriented magazines in the pile. Thankfully, the group was supportive, and the patient seemed relieved. Finally, the closet door had opened.

As a professional employed in a clinical setting, I have the luxury of being an openly gay art therapist. Because of my sexual orientation, I am often able to understand what clients are talking about when they describe life “in the closet” or their struggles over losing their family due to disclosure about sexual orientation. Just a few short years ago, as a graduate student, I spent much of my energy editing my conversations with classmates, monitoring artwork created during class, and restricting important information about my long-term relationship and personal life. I remember sweating nervously as I wondered if my artwork would betray me and whether the truth would sneak out! Because I was fortunate to be surrounded by compassionate, understanding classmates and a supportive, open-minded professor, I was eventually able to “come out.” Their acceptance led to what I consider profound personal growth and to an increase in my confidence as an openly gay person functioning in society.

It also led to an interest in conducting research concerning art therapy programs and the “coming out” process in the classroom (presented in Las Vegas, 1992). Since then, I have found most professionals supportive of my lesionism, but I have also found that many still subscribe to homosexual stereotypes set forth by society. I have also noticed that the majority of professionals, homosexual professionals included, have varying degrees of homophobia. This is quite understandable given the historical lack of gay-positive research and openly gay role models in society. In fact, until just a few years ago openly gay homosexuals were less visible and most research on homosexuality focused on the “cause” of homosexuality.

“Gay-friendly” research on homosexuality has flourished over the past few years. Falco (1991) notes that there are two specialty journals for health professionals: The Journal of Homosexuality and The Journal of Gay and Lesbian Psychotherapy. Newspapers include articles on gay-related topics such as the Womyn’s Music Festival (Brozman, 1993), gay teens in high school (Robaco, 1994), and books for children of gay parents (Harlan, 1992). Mainstream publications such as Time and Newsweek feature articles on gay and lesbian issues (Henry, 1994; Leland, 1994; Mathews, 1992; Pettit, 1994; Turque, 1993). A trip to the local chain bookstore offers a vast array of gay-oriented books on everything from “coming out” information for parents (Fairchild & Hayward, 1989), to homosexual adolescents (Herron, 1985), to legal advice for homosexuals (Curry & Clifford, 1990). Gay magazines are prominently displayed as well. Several presentations related to homosexuality have been made at national art therapy conferences (most recently: Addison, Weiser, Hammond, Barbee, & Thiruvengadam, 1993; Levy, 1992; More & Penfil, 1993; Ombadykow, 1994; Penfil & More, 1992; Treacy, Levy, Addison, & Brewer, 1992; Vetterman & Abbanate, 1994). The AATA Gay, Lesbian, and Bisexual Caucus has been formed and is becoming more visible (Brigid, 1993; Levy, 1993), and articles on gay and lesbian issues are actively sought (AATA, 1994). However, until homophobia is addressed by the majority of mental health professionals and until society ends its discrimination of those who are homosexual or bisexual, we must do more.

As art therapists, we can easily make a few minor changes to create a gay-friendly atmosphere without disrupting our services or offending other clients. The first step is for art therapists to confront their homophobia. Clark (1987) notes that it is essential for therapists to confront their own feelings about homosexuality before working successfully with homosexual clients. This is imperative whether the art therapist is gay or straight. Homophobia is defined as a fear of homosexuality, prejudice
against gays and lesbians (Falco, 1991), avoidance or rejection of anyone suspected of being homosexual (Grace, 1992), belief that homosexual feelings are shameful, loathsome, and disgusting (Clark, 1987), or a cultural mandate to be silent, believing that being gay is "just sort of gross" (Loulan, 1987). Gay art therapists are just as likely to have feelings of homophobia as straight art therapists. Almost everyone is "programmed" from birth to follow a heterosexual "path." Many gays internalize the guilt and shame associated with being a member of a "deviant" minority. If art therapists feel uncomfortable treating homosexuals, or with their own homosexuality, they should examine why they are feeling uncomfortable. Siegel (1985) suggests that homophobia may be resolved through one's own therapy, literature review, contact with homosexual colleagues, and continued contact with homosexual clients. If such actions do not decrease the discomfort, or if the art therapist believes it is necessary to "cure" the patient of homosexuality, the art therapist should refer the client elsewhere.

Undoubtedly, some clients will seek a "cure" for their homosexuality. As a gay therapist and a gay person, I am deeply disturbed by such an idea. It is my convictions that "you can't fix what ain't broke"; homosexuality is not an illness and therefore it cannot be cured. Nevertheless, clients may very well seek a "cure" for homosexuality, and some clients may, as suggested by McDonald and Steinhorn (1990), "decide that although they experience themselves as lesbian or gay, they will choose to live the lifestyle of a heterosexual because the alternative is too painful" (p. 33). "Cure" or no cure. Personally, when I first realized I might be gay, I tried everything I could think of to get me to "cure" my sexual orientation—therapy, staying inebriated, getting married, avoiding other lesbians, avoiding my parents, workaholism, and denial of anything remotely related to homosexual feelings—so I am able to comprehend this type of thinking. Gratefully, the therapists I had contact with did not go along with my plans to "cure" my homosexuality. Focusing on internalized homophobia, identity formation, and relationship issues, as suggested by Falco (1991), are productive alternatives to finding the "cure" for those clients struggling with their sexual orientation. Seeking a "cure" for clients is not only a disservice, but in my opinion, it is unethical. Art therapists questioning the harm of complying with the client's wish for a cure as a treatment goal are advised to consult Stranger at the Gate (White, 1994), which includes accounts of genital mutilation, psychological torment, and countless suicides and suicide attempts by Christian men while they tried to change or be "cured." Hopefully, the need to find a "cure" will decrease as society, and therapists, are more accepting of homosexuality.

Secondly, acceptance of homosexuality must be conveyed before, during, and after the art therapy takes place. To convey a gay-friendly atmosphere before therapy begins, art therapists in private practice should have gay-oriented publications in the waiting room. Many high-quality magazines being produced by the homosexual community are attractive and informative enough to display in any waiting room and should not offend heterosexual clients. Displaying books on gay and lesbian topics in the office may provide validation and reassurance to new and continuing clients. If music is played in the waiting room or during art therapy sessions, pieces performed by gay-lesbian artists should be considered in the mix of music. First-time patients should be presented with paperwork that employs gay-friendly language—for instance, using the word partner in place of husband or wife on history forms. Art therapists monitoring their language during all phases of treatment will convey the message that they do not assume all their clients are heterosexual; words such as partner or significant other will convey a healthy acceptance of diversity to group members and may encourage homosexual clients to be honest and open. Art therapists make strong statements when they confront patients and staff who make inappropriate jokes and comments about homosexuality in the therapeutic setting. Discussion of alternative lifestyles during verbal processing should be encouraged when appropriate and done in a casual manner. Providing gay-oriented magazines during collage-making sends a subtle message of acceptance to homosexuals in the group, whether or not they choose to use the gay-oriented materials. Attention does not need to be drawn to the gay-oriented magazines; they should be available like any other publication; apologies or excuses should not be offered to heterosexual clients who may come across such magazines. As Clark (1987) notes, being neutral about gayness in an anti-gay environment is not enough to qualify as accepting; art therapists must take an active role in projecting acceptance of homosexuality as a viable option in today's world and as an acceptable topic of discussion during therapy. A lack of response from the therapist can be interpreted as negative to homosexual clients, according to McDonald and Steinhorn (1990), because "silence can imply that the listener is either too uncomfortable or too interested to respond" (p. 35). Familiarity with gay-identified symbols (i.e., pink triangles, rainbow flags, and freedom rings) may help art therapists discuss artwork with gay clients.

Finally, art therapists must actively seek information on issues related to homosexuality. Clark (1987) writes that professionals must be familiar with and understand the values, customs, and ceremonies of the people they presume to help. Stereotypes must be addressed and discarded. A myriad of excellent books on homosexuality are available at local mainstream bookstores and libraries. Gay and lesbian bookstores offer an in-depth look at homosexuality that is not available elsewhere. Attendance at pride parades, same-sex dances, and social events is an excellent way to learn more about your own homosexuality and about homosexual values, customs, and ceremonies. Members of the AATA Gay, Lesbian, Bisexual Caucus are an excellent resource for direction towards current information and literature.

Of course, no one can "make" art therapists accept alternative lifestyles, and it is unreasonable at this time to assume that all art therapists will be tolerant of homosexuality in their personal or professional lives. As art therapists, we need to convey a message of acceptance to all our clients. Sending a message of acceptance does not mean professing one's sexuality when leading a group. It does not mean that a message from a gay art therapist will be more acceptable than a message from a heterosexual art therapist. It does not mean art therapists advocate the conversion of clients to or from homosexuality. It does not mean we need to lecture our clients needlessly about homosexual lifestyles. It means that I am free to answer questions about my life and my sexuality honestly. It means that clients are welcome to express their feelings freely. It means we accept our clients as they are, and we accept ourselves for who we are.
merely tolerate a client or co-worker, for whatever reason, we must be honest and refer the client elsewhere or seek therapy for ourselves. Our clients deserve the chance to reopen the closet door during art therapy, just as my client needed the opportunity to express himself in a safe environment after receiving subtle reassurance that his feelings were valid and acceptable, just as I needed the support of my peers before I was able to express myself and move toward personal improvement. Homosexuality may have little or nothing to do with our clients’ hospitalizations, but homosexuality is never a non-issue. Gay-friendly art therapy acknowledges homosexuality as an acceptable part of life. Such a message of acceptance just might be the catalyst for positive change in ourselves and in our clients.

Wrestling the Hydra or Can an Art Therapist Find Aesthetic Fulfillment in the Marketplace?

Harriet Wadeson, PhD, A.T.R.-BC, HLM, Evanston, IL

Part 1—The Question

When invited to present a keynote speech, I asked what subject I should address. Something practical like insurance and licensure or something to do with aesthetics was the reply. That juxtaposition, those two competing topics edging each other out in their claim for art therapists’ attention, struck me as the kernel of our dilemma. And indeed, such a choice is one art therapists must often face. There is another competing concern as well, which, for lack of a better term, I will call humanitarianism. The competition among these three divergent entities rages at the very core of who we are and what we do.

We are artists with a deep commitment to the significance of meaningful images in our lives. The creativity of those around us—clients, students, peers, supervisors, mentors—weaves an aesthetic connection as mysterious and as powerful as love.

We are therapists who circumscribe our own loneliness by being present in the lonely fortresses erected by our clients. We storm their bastions, not with verbal battering rams, but with the gentleness of acknowledging an image that breathes the sense of “I see you; at last you are understood.”

For most of us, the creativity and the caring, the art and the therapy, form a coherent and comfortable union. And if we are asked what we do as art therapists, we probably speak of that union.

But what about the practical concerns, such as licensure? These days, when one art therapist meets another, she or he is likely to ask, “Did you take the certification exam? In Illinois, where I live and work, art therapists have been lobbying to become part of a new counselor licensing act. Recently, the University of Illinois chancellor announced that we are no longer a “state-supported” university, but rather a “state-assisted” university. Faculty are expected to find external funding. Whereas publications used to be the currency of academia, now grants are. Well, I knew that when I grew up I wanted to be an artist, a therapist, a writer, and an educator. I never wanted to be a fundraiser. But now this is the side of the bread that gets the butter.

In formulating my ideas about the three components of art therapy practice—aesthetics (or art), humanitarianism (or therapy), and the practical (or the marketplace)—ideas and images about art and therapy came readily, and I found I could speak about them fairly easily. But when it came to discussing the marketplace, I found myself wandering thither and yon, from AATA to lobbying efforts, to my university. I don’t think I am alone among art therapists in being at home with art and therapy, but feeling confused, resentful, or downright angry in the political arena of the marketplace.

Obviously, I do not speak for all of us. Some of us navigate the treacherous shoals of professional politics with relative ease. Some of us are even good at it. I have been amazed at the strides AATA has made in the marketplace for art therapists during the 25 years since its creation. There are a number of ambitious art therapists who have served AATA well as Board members and committee chairs and who have advanced our profession for the benefit of all of us. The phenomenal growth of art therapy within AATA’s 25 years would not have been possible without their efforts. But I believe that most of us are not political animals. We prefer the arena of the studio or consulting room. We are more comfortable dealing with people as individuals or in small groups, rather than in masses. We want to invest ourselves in the creative connections we forge in our work with clients and students, writing budgets for grant proposals or lobbying legislatures to allow us to do our work.

So what is a poor art therapist, who loves her art and her sister creatures, to do? Can she find aesthetic or even humanitarian fulfillment in the marketplace? How does she wrestle the many-headed hydra of the seemingly dysfunctional bureaucracies that can trap her?

Part 2—The Answer?

I believe our profession has reached a crossroads, a turning point, a brink, a cusp. We have been pushed to this point by the changes in our world, most notably the imminent transformations of the health care delivery system. This system has already mutated into managed care in response to society’s economic conditions and is poised to transform precipitously with the establishment of universal health care reform. Art therapists, along with other service deliverers, are lobbying to get a slice of the health care pie, which is probably all we can hope for in light of current decreased support for mental health benefits.

Since the birth of our profession, we have struggled to define it, and identity conflict seems to be our major diagnosis. We continue to be split at the root of our age-old conflict: Are we artists or therapists? This conflict was acknowledged in our First Great Debate at the AATA Conference of 1982, “Art Psychotherapy vs. Art as Therapy,” but it was not laid to rest. These core identity issues continue to determine how we relate to those with whom we interact as well as to ourselves and have surfaced in response to the present licensure panic. Some believe we should become counselors. In some states, for exam-
plc California and Massachusetts, art therapists are already eligible for the counselors’ exam. Some suggest that art therapy should become a division of the American Counseling Association as a part of its current reorganization. In Illinois, we must standardize art therapy curricula and add some counseling courses to art therapy training to become eligible for counseling licensure. California has a similar history.

One of the strengths of our profession, I believe, is our diversity. There are many ways to practice art therapy with many different populations and many different emphases and approaches among our various training programs. Standardization of training could narrow our field. And yet it is understandable that art therapists fear that, in the shrinking mental health job market, unlicensed practitioners will be unemployed. The counselor license could add a measure of security.

Are we something quite different from counselors? As I ponder this question, I am sitting with my legs spread out before me, the right one encased in a cast. There are crutches by my side. This is my vacation, and I had planned to spend it hiking, biking, canoeing, and swimming. So what do I do with my pain, anger, and frustration at being grounded with a broken foot? Naturally, I make art—strong, active, colorful feet. How can I explain how that helps? Does the broken bone knit faster as a result? Probably not, unless a more positive attitude can aid healing, which is a possibility. In my boredom and restlessness, I find I am happiest while making art. Is it empowerment amidst my feelings of helplessness? Is it the sensuous pleasure of applying beautiful colors to pleasing shapes? Does my picture pull me out of myself and my petty frustrations into a larger sea of universal creativity? Yes, is my response to all these possibilities. If this is a part of what art therapy is about, there is nothing in these experiences that resembles counseling. There is a magic in making something of one’s own creation that distinguishes art therapy from the verbal therapies and even from the other expressive therapies. As we wrestle the hydra of the marketplace, are we in danger of losing the birthmark of our identity that distinguishes us from others, the magic that artmaking can bring?

Hegelian dialectics posit a thesis, then an antithesis, before the two are blended into a synthesis. Perhaps we are seeing such a progression in art therapy today. If the thesis is the pressure toward licensure, then the antithesis is what I will term the “art for art’s sake” approach that appears to be a reaction to the licensure panic. This view would have us remain artists who work with people in need, as “artists-in-residence.” This antithesis, being artists-in-residence, is fanciful. In these days of shriveling budgets, can we really expect an agency to pay us to come in and do our own art? Such an alternative might be supported temporarily by a grant, but few of us can afford to live solely from grant to grant.

Sometimes in seeking solutions we become mired in either-or thinking: art or therapy, clinicians or artists. And, in fact, the art versus therapy controversy has been a part of our identity embodied by our founding mothers, Naumburg and Kramer, since our birth. I think it is time to recognize that this marriage of art and therapy works, instead of behaving like children of divorce with loyalties to one parent or the other. As we seek further definition of our profession and our work, I feel strongly that the choice is not between art or therapy, or identities as artist or counselor. I believe we must be creative healers and healing creators. The question is not what we are to be, but how.

As I write, I am home two days from a trip to Northern California. Now is not the first time this western frontier has been a leading edge in defining art therapy in the marketplace. Those of us who have been in the field a few years can recall the ease with which California art therapists obtained the Marriage and Family Counseling License (MFCC) and then their extended battles when eligibility requirements were constricted. As a result, they are now required to take considerably more counseling courses, thus those who sit for the California MFCC exam are trained as counselors as well as art therapists.

A vocal group has emerged in Northern California that emphasizes personal growth in art therapy training and spirituality in art therapy practice. They do not want to become counselors, nor do they feel that the MFCC is a meaningful credential for art therapists. They have been successful in lobbying the state to recognize art therapy as an acknowledged profession that is included in California’s code of professions. Currently, they are lobbying for the right to practice as art therapists (paradoxically now prohibited) rather than as counselors.

In California, we see articulated the split that prevails but may be less apparent throughout the field: the old art versus therapy, clinical versus spiritual, analytical versus aesthetic, or whatever polarities represent the very different ways art therapy is conceptualized and practiced. So when I said the question is not what we are to be but how, this is what I was asking:

Should art therapists be trained to practice in a number of different ways appropriate to the different venues in which they wish to work and the very different needs of the varieties of populations they might serve? In some respects the diversity of our training programs already offers a broad range of options. But perhaps the need for licensure, which will certainly lead to a standardization of clinical training requirements, will force us to acknowledge that our profession embraces different kinds of art therapists and that there are enough models of art therapy practice for all of us. Training programs could then identify themselves according to their approach to art therapy and the type of work they train their graduates to do.

Personally, I like to practice art therapy in a way that is adaptive to the needs of my clients. Students can be trained in this sort of flexibility by providing a strong clinical and creative base. In Illinois, as in California, it is likely that to qualify for a counseling license students will have to take additional counseling courses. Therefore, what I envision for the future is an acknowledgement of what is more or less already in place: some training programs that are clinically based and aimed toward counselor licensure in addition to art therapy certification, or art therapy licensure in states that grant such a license; some less clinical programs that are art-based, personal-growth-based, or spiritually-based; and finally, some programs that combine both orientations but make it clear to students what additional training is needed for specific credentialing.

I believe that the advantage of having several training tracks will be the achievement of clarity and definition within the profession. Nevertheless, because both art and therapy are essential in the making of an art therapist, I would not envision training programs neglecting either, but rather preparing students to work with particular populations in the ways appropriate to
them. What is needed for this clearer definition to come about is self-evaluation by directors and faculty of training programs directed toward gaining clarity of purpose. Most important is creating the statement of purpose that describes the nature of the particular program’s training. AATA, in addition to the programs, should educate applicants about the different forms of art therapy and the appropriate training for each so applicants can make educated choices. Education would also be needed for administrators who hire art therapists and eventually for the public at large.

Beyond the issue of professional identity, there are still questions and concerns, if not panic, regarding opportunities for art therapists under health care reform provisions that might require licensure for providers and limited mental health care for patients. Despite shrinking budgets, I see some very promising directions for our profession. These are not the traditional art therapy sites in the medical/psychiatric areas that will be controlled by health care legislation, insurance companies, or health alliance systems. They are the areas of some of the greatest need in our needy society: drugs, violence, housing, education, employment, health. When we look at social problems, it is difficult to know where to begin because they are all interconnected. We don’t know how to untangle the web of suffering that plagues our cities. The challenges are massive as are the efforts needed to meet them. New and innovative interventions are required, directed toward prevention as well as amelioration.

How do we prevent violence? There are no simple answers, but clearly we must begin with the children who are both victims and witnesses of violence so they will not grow up to become violent adults. There must be programs for them in the schools and in the neighborhoods. Although such programs would have many components, central would be opportunities for children to process past and current experiences and to envision their futures. What form would be more natural for this purpose than artmaking?

We already know that art therapy is an effective form of expression for those who suffer from some of the tragic conditions of our current culture. Both child and adult survivors of childhood sexual abuse and/or family violence often find a more powerful and complete expression in the images they create than they can convey in words. Communication becomes possible, but even more important, these survivors are able to grasp and eventually integrate their own tragic histories through their art.

The AIDS epidemic is almost unbelievable in its proportions. The Plague used to conjure images of Medieval cities. Who would have thought it possible in the 20th century? Of course, art therapy does not treat the disease itself, but it helps its sufferers and their families to deal with the grief, rage, and despair accompanying physical ravagement and deterioration, social stigma, and death. Art therapy has a major role in treating other kinds of bereavement as well, including hospice work and helping children deal with deaths of family members.

The need for shelters has proliferated in recent years. The term shelter implies protection. Many of our citizens need protection. We have shelters for battered women and children, for people who are homeless, for runaway youths, for prostitutes trying to change careers. Many of these people come from backgrounds of violence and drug abuse. Art therapy is often an important activity in a shelter’s daily schedule. I recall a Chicago facility for prostitutes where art therapy is the sole mode of treatment. I also recollect a Chicago day shelter for women who are homeless that has a staff of three and one is an art therapist. Each time I have visited, I have been impressed by the abundance of client art on the walls and the shelves lining them.

Training programs can prepare students for these various populations by hiring art therapists who are expert in work with specific populations. These populations include the people who are experiencing the social ills I have mentioned: patients with AIDS, children who are HIV positive, survivors of childhood sexual abuse, and people who are homeless. Student practicum sites can also serve populations affected by social problems as well as the tried and true psychiatric hospitals and clinics. Students could work with immigrants in centers for refugees, with people who are developmentally delayed, with “lifestyles” groups for gay and lesbian patients, in childlife programs for critically ill children, in residential and day centers for the elderly, in substance abuse programs, in prisons, and in other new types of facilities that are being created each year.

I am enumerating these many settings and the problems they address to stress the extensive need for art therapy services and the varied opportunities for art therapists. I hope it has become evident to you that many of these examples do not fit under the health care umbrella but belong to our social service systems. It is true, of course, that social services are also experiencing budgetary inadequacies. Nevertheless, it is important not to become so blinded by the dazzling array of health care proposals and conflicts that we miss opportunities in other areas of massive need where we can make substantial contributions.

To return to the licensure question, do we go for counseling licensure; do we join with other expressive therapies for licensure; do we try to get licensure for art therapists; do we forget about licensure altogether? It would certainly be easier to make a decision once the new health care system is outlined so we can know how important licensure will be. On the other hand, there is a strong argument for being prepared, that is, licensed, in case it becomes a necessity.

Yet, the argument I have been advancing places art therapy in the social services systems as well, where credentialing requirements are likely to be very different. It behooves us to investigate them. My sense is that there is less licensing panic in that realm because the services I have described are more likely to be funded by social services or educational dollars. There is less likelihood of intrusion from the health care bureaucracy and greater possibilities for the inclusion of specialists to provide specific services. Furthermore, these programs are directed toward long-term societal change so cessation of symptoms does not signal an end to treatment.

Finally, I want to return to my original topic, “Wrestling the Hydra, or Can an Art Therapist Find Aesthetic Fulfillment in the Marketplace?” There is no denying the hydra, the many-mouthed monster of the bureaucratic, political regulatory systems in which each profession fights viciously to protect and maintain its own turf. Each time Hercules chopped off one of the hydra’s heads, it grew two more. Cauterization was the only effective decapitation. The fire for the necessary cauterization to make the hydra manageable must come from our own belief in ourselves and our work.
We are indeed fortunate to have at our literal fingertips the magic of transformation that artmaking can create. Yes, I believe we can find aesthetic, professional, humanitarian, and personal fulfillment in the marketplace. I believe we can do so by acknowledging and being faithful to the unique union of art and therapy, not by becoming artists doing therapy or therapists using art. The future of our profession is not to be found in a thrust toward becoming either counselors or artists-in-residence, although some of our members may do so. In the diversity I hope our profession maintains, I would support art therapists’ choices. Nevertheless, I believe our central efforts should promote awareness of the many opportunities for art therapy services I have mentioned (and others I have not even envisioned). We must find creative ways to enter new areas and design new programs.

The crossroads created by the revision of health care in the United States forces us to redefine ourselves. If we panic over licensure, we may become counselors. If we react against that possibility by becoming solely artists, we will remove ourselves from the realities of the helping professions. We must achieve a healing synthesis that is neither and both.

Yes, art therapists can find fulfillment in the marketplace. The surest route is synchronous with our personal fulfillment, the healing creativity, the creative healing, that led most of us into this field in the first place. That which we value for ourselves is what others value in us. It was always so, in both the treatment of individuals and the treatment of a profession: if we love ourselves for our own unique gifts, others will love us for them as well. By remaining the creative healers and healing creators that we are, rather than becoming something else, we will ensure that art therapy will have its own unique place among the human service systems.

Writers Need Not Be Loners

Pat B. Allen, PhD, A.T.R., LPAT, Chicago, IL

I have the good fortune of recently publishing my first book after 10 or so years of working toward this goal. In reflecting on this experience, I realize how collaborative the process of writing really is. Family, friends, and colleagues have had a hand in the creation of this work that bears my name. While the bulk of the actual writing was done alone, at different points one individual or another made a crucial contribution that enabled me to move forward. The colleague who read an early halting draft when the work was tender gave encouragement and overlooked the roughness of my expression. Later, when I was further along, my writers’ group, talented women who write everything from children’s books to essays and poetry, critiqued the form and pushed me to be a better writer. They also listened when I read a letter from an editor and helped me see encouragement where I could only read rejection. There were friends who simply asked how it was all going on a regular basis and the friend who was instrumental in the work getting a careful reading by the publisher. Every one was a welcome and necessary companion on the road to publication.

As a member of the Editorial Board of this Journal, I get to read many papers, most of which are not ready for publication. We have a process of blind review which is meant to ensure that personal prejudice or knowledge about the writer doesn’t cloud the reviewer’s judgement. and that is a good thing. But I often wish I could talk to the writer face to face. I wish I could provide more than comments on a piece of paper. As a writer, I know that anything less than an unqualified acceptance feels like rejection. I try to offer as much encouragement as possible and suggest revisions that will strengthen a paper. Yet, I know that the author may experience a sense of defeat and, hearing only the “no,” may take what Julia Cameron (1992) terms a “creative U-turn” and abandon the work. The risk of not following through is greater if the paper has been written largely in isolation.

It isn’t possible for the Editorial Board members to work intensively with each writer, that isn’t the job of the Journal. Mentoring exclusively by Board members would risk producing intellectual inbreeding and limit the range of what gets published. The development of one’s writing is a professional responsibility accomplished by establishing a network of friends and colleagues within one’s own area of interest or geographic area. For all the myth and image of writing as a solitary endeavor, that is not the whole picture. Alternating with the rigorous isolation necessary for crafting good writing is the need for sharing and collaboration.

Different sorts of collaboration are needed at different times. Sharing may be harmful in the earliest stage, when incubation is occurring. When talking about an idea can take away the urgency to write, but it is crucial once you have something down on paper. The following are some ad hoc writer’s rules that may have wider application but particularly apply to writing for this Journal.

- A good idea may come quickly, but ideas need to incubate for a long time, to grow and develop and take root. Incidental writing in a journal or notebook is a good beginning. Reviewed periodically, such jottings can yield the germ of a worthy paper. Notice what ideas come up over and over. What ideas excite you when you encounter them again?
- Rough drafts should be read first by someone who loves you unconditionally, someone who will not correct your errors but instead will urge you to elaborate, to keep going. Rough draft readers should be sympathetic to your viewpoint, able to see the gold in the mud and not need to hose away the mud at the same time. Rough drafts
need encouragement. Encouragement primes the pump of writing (O'Sullivan, 1996).

- Completed first drafts have a solid idea that has been elaborated with a beginning, middle, and a conclusion. You may have rewritten three or four times by now. Once the paper feels like "your own" and you have some clarity about what you are saying, the paper is asking for a wider reading. A more experienced writer can help you focus your main idea or prune away tangents. Someone who knows more about your subject than you do may suggest some additional references that will strengthen the literature review. This is a time for challenges, testing the strength of what you've written. Give it to someone whose writing you admire, a colleague or a friend who will give you an honest critique.

- Give your work to someone outside of art therapy. No matter what your subject area, your work should be clear enough, free enough from jargon, to make sense to someone in a related field. If it is a research study, let a colleague in psychology or social work with a research background be your reader.

- Consider sending your work to an expert in the subject area, even someone you do not know personally but feel might be helpful. Call that person first and ask if he or she is willing to read and comment on your work. Determine a time frame for yourself and ask if the person can read your work within that frame. If not, ask for suggestions of others whom you can ask. Enclose a self-addressed stamped envelope so your work can be easily returned. Write a thank-you note when your work is returned.

- After you've received some comments from others, go back and reread your work. Do the comments make sense to you? Do they inspire you to action? The mark of good feedback is that it helps you feel clearer about what you want to say. If so, get writing. If not, put the work away and let the voice of the reader fade from your ear. But, make a note to yourself to look at your paper again in a week or two. Mark the date on your calendar. Sometimes it takes a respite from writing to gain clarity.

- When you do go back, read your work aloud. How does it sound? Are there places where you stumble? If so, readers will, too.

Finally, when you think you are as close to finished as you can get, find a copy editor. This person should know grammar and punctuation and need not give a hoot about your subject. Ask the secretaries, former English majors, and school teachers among your acquaintance for help.

Then, after carefully following the "Guidelines for Authors" published in each issue of the Journal, prepare your final copies, proofread one more time, and send them off. Remember that few if any submissions need no revision. Resolve to accept suggestions with good grace. Set a deadline to make revisions and resubmit. Unlike a test in school or a gallery show where if you aren't accepted, that's that, submitting a paper for publication is a process. Don't give up easily.

Are there any dangers in getting help with your writing? Of course. It is possible to have ideas distorted or even stolen, or worst of all, killed by sharing them with the wrong person at the wrong time in your process. You have control over this. Ask for help from people you both trust and respect. Be clear about what you are asking for. In the end, trust your gut feeling about any critique you receive.

Acknowledge any help you receive in an author's note when your paper is published. If someone outside your immediate circle helped you, send him or her a copy of the paper and a note of thanks. Resolve to be a reader for others; it helps them and sharpens your own critical skills.

Am I asking a great deal? Yes. I am asking for excellence, a commitment to do the very best you can. Now that certification, and in some states licensure, is a reality, we have a paramount need to expand and strengthen the base of knowledge in the field of art therapy. Solid writing, based on well-digested experience—clinical, research, and personal—is needed. Writing is about sharing our skills, insights, and experience. Every working art therapist will have something to share along the way. If we strive to write well and participate in cooperative, collegial support of one another, we will all benefit from an increase in cogent, substantive, and lively discourse and perhaps be less lonely by doing so.

Editor's Note: Pat B. Allen, Ph.D., A.T.R., LPAT, is codirector of The Open Studio Project in Chicago, IL, and author of Art Is A Way of Knowing, Shambhala Publications. 1995.

Summer of Transition: A Visual Essay

Kate B. Hartman, MA, A.T.R., Buffalo, NY

Summer. The word brings to mind images of long swims in clear ponds, trips to the ocean, unhurried mornings, warm still afternoons, stolen moments of solitude, tending to gardens, but mostly tending to my children, who, during the academic year, share their mother with a full-time faculty position.

During the long winter I would daydream about warm days when I would write and make art and be a serene, loving mother. The summer of 1994 did not allow this flawless vision of creative tranquility: it was a summer of transition. It was a summer of adapting to unwelcomed changes and a new set of professional expectations brought on by the closing of the graduate art therapy program at the State University College of New York at Buffalo.

In response to these changes, I anticipated sitting down and letting the words and images flow. Instead, I struggled to make my ideas concrete and stared with resignation at unfinished drawings. My feelings bordered on contempt. Why was I so stuck when there was so much to say?

With the closing of the program, a long, anticipated end had come. I felt like someone who had lost a loved one. I knew the closing was coming for years as I watched my director do battle to keep our program alive. Because of our professional contributions to the college and community, we were given a number of reprieves from closing, but in another round of funding cutbacks, what we had feared for so long occurred. I thought I was making a smooth transition to my new role of training art education majors and undergraduate art therapy minors. However, during the time that summer allowed for reflection, I had to confront my loss and engage in the process of grieving. I needed to explore my feelings about not having art therapy graduate students for the first time in 14 years. I took the counsel I had given to students and clients and struggled with this process through image-making.

My first piece reveals my defenses in maintaining distance and control over the changes that were happening in my professional life (Figure 1). On an intellectual level, I explored the fact that change was occurring. The mandala is losing a part of itself, and, as the piece falls away, a new form is revealed in utero, symbolizing the new responsibilities I faced at the College. A conscious attempt is made at acceptance and optimism. The boundaries are shifting and there is no guideline. In spite of my acceptance of the College's decision and my willingness and

Figure 2 Transition. Pastel on paper. 39" x 28".
interest in assuming a new role, this image suggests that I was not yet feeling stable and secure in my new position. The circle represents my identity as an art therapist, an identity that felt challenged, but one I resolved to rigorously maintain.

A later artwork (Figure 2) indicates movement into the later stages of grieving. I am able to honestly confront my feelings although I feel overwhelmed and powerless in the face of the uninvited changes. Pastels heavily shade the top of this piece as though I am being enveloped in a dark shroud of oppression. Yet, this piece is dichotomous, reflecting the conflicting feelings I felt over my new direction. Duality is expressed in fuchsia and black, reflecting both pain and power. Wavelike lines illustrate sweeping change that felt equally overpowering and exhilarating. Sharply pointed pieces on the right of the image indicate the painful process of letting go, yet they come from a place of dynamic force and fall into an environment filled with rich blue, green, and violet. To me, these colors have always suggested serenity and balance. Despite occasional feelings of being overwhelmed, mid-life has prompted a desire for new challenges and experiences, and the movement in my image reinforces my desire to flow with this unfolding evolution.

Since the fall semester of 1994, I have been the Coordinator of Student Teaching for the Art Education Department, as well as continuing to teach students in the Art Therapy minor. My department colleagues prepare students to teach discipline-based art education. I teach students to know themselves and to examine the personal and professional issues that both promote and hinder their development as they move towards the completion of their undergraduate training. I use my skills as an art therapist to help these prospective teachers understand both themselves and their own students on a more authentic level. In so doing, I have completed my grief work by reinvesting my professional talents and energies in a new direction, with commitment and integrity.

Cohen and Cox have again made their mark. Well known in the art therapy community for their work in dissociation and MPD, both separately (Cohen, 1993; Cohen, in press) and together (Cohen & Cox, 1989; Cohen, Cox et al., 1990; Cohen, Cox et al., 1994), they have collaborated on a book for the first time. Noting the role art therapists have played “in differentiating and identifying DID” (dissociative identity disorder) Cohen and Cox “have made our contribution to this process by organizing the art of people with DID into recognizable categories, based on our empirical observations” (p. 291). This contribution is made by delineating their “integrative method,” which is “a system for ‘reading’ pictures in which meaning is derived through the synthesis of process, structure, and content elements” (p. 2). This system is richly illustrated with over 200 pieces of art, which are analyzed according to structure and meaning. This provides the bulk of the text and is broken down into chapters by themes, such as system pictures, threat pictures, and so forth.

Cohen and Cox note that no model of art therapy has addressed a practical method that focuses on structural elements in the artwork, and this book is able to do so successfully. They emphasize the need to look beneath the surface of the artwork, and a crucial element in doing this is their concept of “multi-leveledness,” or the layers of meaning in the art.

From their years of experience in working with clients with MPD/DID, Cohen and Cox are well aware that these individuals often bring their spontaneous artwork to therapists who are not trained art therapists. They state the book is written “to enhance the competency of those therapists” (p. XIX) and warn non-art therapists of the need for education and experience with the art-making process. In addition, their “integrative method” is “designed to give specialists and non-specialists alike a systematic way of making sense of any art that is produced in the context of therapy” (p. 2).

Although this book deals specifically with the artwork of individuals with MPD, it can be applied to any population. I found virtually no shortcomings of this book, but experienced art therapists may find the number of examples of artwork unnecessary, although interesting. I recommend it for inclusion in standard syllabi for art therapy training, and highly encourage any non-art therapists working with MPD clients to read it thoughtfully.

A friend of mine, a German-minority Yugoslav woman born in the Serbian province of Vojvodina, spent 1944 to 1948 in Tito's concentration camps. Images from present-day Bosnia and Herzegovina have revived her own childhood memories, including some unexpected and dreamlike apparitions.

She recalls dusk at the far edge of the flat, frigid plain beyond the camp, where a row of hundreds of strange, exotic birds suddenly appeared and floated soundlessly toward her. Silhouetted against sky, they looked to the 9-year-old like magical storks, skinny-legged, elongated by towering birdcages they carried on their backs. A fellow survivor, an adult at that time, has verified the memory and explained that these actually were women prisoners returning from forced labor with bundles of firewood.

We can marvel at the capacity of children to transform horrible landscapes. We can wonder whether our selective attention to such extraordinary re-creations represents our own need as outsiders to find meaning in the meaningless, imagination in the unimaginable. We adults can look at the art products of children and philosophize, idealize, intellectualize, analyze, categorize, pathologize. Some of us even politicize. What remains fundamental, however, is the child’s artistic representation when it is free of adult commentary.

A number of books present the art and writing of children who have lived through diverse catastrophes. Unlike clinical publications about posttraumatic art whose focus tends to be interpretive, the following collections claim no psychological authority. They merely present the images, thereby freeing us to respond directly to their emotion.

I Never Saw Another Butterfly is a classic in this genre. Newly expanded, it contains over 100 drawings and poems made by children at Terezín concentration camp in Czechoslovakia between 1942 and 1944. Many of the compositions were created during classes organized by Friedl Dicker-Brandeis, another prisoner. On the basis of her analysis of the artwork, she formulated ideas about the children’s current states of mind, and tried to use the drawing lessons for their psychological rehabilitation as well as art education.

In many cases, assigned and spontaneous work embody aspects of memory. Artists recollect present happiness, express nostalgia for lost self, and imprint current horror at Terezín. They memorize and depict SS and beatings, transports, and executions, with the same intensity as they endow past events and future dreams.

Few children of Terezín survived; the majority were transported to Auschwitz in September and October of 1944 and perished soon after. The book gives us the few, poignant biographical facts known about these young painters and writers: their dates and places of birth, barracks number, dates of transport and death. But we also have their echoing voices, their marks on paper, and this book as a memorial.

Primary school children who fled a more recent genocide in Cambodia were asked by staff at Sakaéo refugee camp to describe through drawings and writing their past and present lives, as well as images of the future. What results is the small but memorable publication entitled Children of Kampuchea, which contains 20 full-page color plates accompanied by comments in Khmer and English.

While pictures of the genocide often are graphic, their explanations underscore the brutality. Readers might speculate about reasons for the verbal restraint and stylistic discrepancy-cultural differences among adults who facilitated the creative expression, cultural proscriptions against distressing a listener, the necessity for children to ingratiate potential sponsors. In any case, the disparity raises questions common to all books reviewed: What are the inherent differences of posttraumatic representation evoked by verbal versus visual modalities? What is the meaning of artmaking to children who witnessed the murder of their country’s artists, and whose own emotional expression during the catastrophe surely would have resulted in their own death?

Children living under attack in Israeli border settlements were confined to concrete bomb shelters during the Six Days War. Day and night they heard sounds of shelling and felt the concussion of bombs in the unseen world above them. Childhood Under Fire, edited by Abba Kovner. Israeli poet and leader of the partisans of the Vilna Ghetto, presents the drawings, paintings, collages, stories, poems, letters, and diaries of young Israelis during their underground confinement.

Bits of overheard conversation among nursery children provide unsolicited and insightful attempts to understand the experience. Children of all ages: express with great tenderness their concern and longing for fathers who are away fighting. A brief preface and afterword echo the artists’ own accounts of support provided them by adult caregivers in the shelters; however, the volume is notably free of editorial intrusiveness, allowing the children to speak the anxiety, anger, sadness, confidence, and hope for themselves.

Fire from the Sky in El Salvador was recreated by Salvadoran children between the ages of 8 and 14 while living in Central American refugee camps. “This is what happened.” “This is how they killed.” “This is how our parents died,” begin the narrative reports that accompany pictures. Similarly, drawings appear to be meticulous and exact replications of those remembered events, in which the artists display great control in producing the contours of many small human figures while simultaneously allowing flames to explode from houses and swirl on the page. Although people often are drawn schematically, their weapons are detailed, their actions are specific, and their stories are chilling.

Erasures show through and make the redraws even more meaningful, particularly to the clinically oriented viewer who gains a stronger sense of the psychological impact of trauma on
the child's process of remembering and symbolizing. A campesina whose earlier version stood erect, now is decapitated—only her pink dress remains intact. A child victim is erased and drawn even smaller; a soldier is enlarged and given more space in the composition. Spontaneous revisions usually further disempower these victims, not an uncommon occurrence in the artwork of survivors generally, in the absence of therapeutic art intervention.

Detailed rendering of traumatic memories, particularly soldiers, guards, police or other individuals whom children perceive as life-threatening, appear across cultures and age groups in the posttraumatic art represented in these books. Faithful Witnesses is a trilingual (English, Arabic, French) collection of exquisite drawings and paintings made during the intifada by 4- to 14-year-old Palestinian children born and raised in refugee camps. Boullata, a visual artist who initiated the project, wondered how "the small hand that dares to lift a stone [might] attack the paper" when given a crayon or brush and the opportunity to express freely (p. 31).

The children's acuity of vision, vitality of expression, and careful and loving attention to their art are impressive, as are their sophisticated use of media, color, line, and composition. Spontaneous drawings are arranged in the book according to motifs: traditional pastoral landscapes, daily life under occupation, and visions of a peaceful future. Captions offer observations about artistic elements and cultural sources of iconography.

Boullata notes that these young artists often cleave the pictorial composition when depicting scenes with Israelis; soldiers occupy one side of the paper, Palestinians the other. Children of Soweto similarly divide boycotters and police with a single bisecting line, a barricade, or a space on the page occupied only by bullets, tear gas canisters, or stones.

Two Dogs and Freedom is a modest but powerful book containing schematic outline drawings and handwritten accounts of violence in the South African townships. All drawings depict violent confrontation—arrests, stone throwing, tear gas, beating, and shooting. Children describe traumatic scenes, the rules and restrictions that control their lives, their distrust and hypervigilance, fears and worries. They also reveal their thoughts about the future, including one 8-year-old's dream from which the book takes its title, for "a wife and two children, a boy and a girl, and a big house and two dogs and freedom" (pp. 54-55).

From a world of poverty, neglect, drugs, and violence come the insistent voices of homeless children in Washington, DC, who have documented their lives with cameras in Shooting Back. Because many scenes were shot at eye-level, we see what is central to the child's physical and psychological field of vision; at times, the faces of adults either are out of the frame or seem distant in relation. Children photographing children reveals, instead, the unconscious intimacy of a world shared. The black-and-white photos in this recent volume are so unflinching, so full of energy and careful eye, so eloquent and artistically competent as to match the best.

Readers wishing to compare the posttraumatic artwork of children with that of adults who were traumatized at a much younger age should be aware of two final, exceptional references. The first, published in a popular Moscow magazine, is an astonishing collection from among the 700 illustrations drawn by Evfrosinya Kersnovskaya in a diary that she wrote after her release from Stalinist labor camps (Ogonek, January 1990, Nos. 3, 4). Unforgettable Fire contains the breathtaking testimony of survivors of Hiroshima who felt compelled to paint what they had witnessed 30 years earlier because "Even now I can not erase the scene from my memory. Before my death I wanted to draw it and leave it for others" (p. 105).

The traumatic circumstances of the people represented in these collections are diverse. Their age varies as does the time lapse between the catastrophe and the artistic representation. Unique cultural contexts influence artists' perceptions of the event, as well as the form and content of its rendering. In addition, idiosyncratic characteristics of artists manifest differently in drawings. However, while age, personality, culture, stressor, and number of intervening years influence artistic response in unique ways, there are a number of commonalities in posttrauma art as revealed in these volumes.

First, is the profound relationship between creative impulse, and trauma, memory, and grief. (Indeed, "memory" shares its linguistic root with the words to mourn.) The books as a group cause us to consider how memory and symbolization transform each other and how the act of symbolizing mitigates traumatic anxiety, expresses grief, and becomes part of the mourning process. We contemplate how individual and collective memory relate in terms of image-making, and how memory motivates artmaking during or after trauma among children versus adults.

What compels children to create art in moments of catastrophe probably does not relate consciously to sorrow and loss in the same way as it does with adults who often approach creative process in a more conscious way; children's mastery of trauma often takes place at the symbolic level alone. However, neither age nor the amount of time since trauma seems to diminish the survivor's initial need to portray the events as remembered. The content of this portrayal may be repeated and revisited as the survivor's memory and his or her relationship to that memory change.

It is clear that the artist's unconscious impulse and the editor's/publisher’s conscious intent may vary. Some editors of the books viewed wish to memorialize, others to educate, still others to persuade. We see few fragmented and meager compositions that might be connected with pathology. The editorial choice to include pictures on the basis of aesthetic considerations, artistic talent, or dramatic reproducibility can lead viewers toward inaccurate generalizations about the posttraumatic imagery of that population, as can the decision to include only representations of horror. Editors' ideological biases about the events themselves expressed either through omission or overt statements in the text probably have little to do with the children's artistic purpose and, unfortunately, distract and detract from the more credible younger voices.

Another recurring feature in the creative process and products of these collections is the tendency to create divisions in the art. Time and space are segmented. Artists use color, elaboration, composition, and style to differentiate between victim and perpetrator, good and bad, helplessness and hope, the nostalgic before and the irrevocable after. These symbolic polarizations may relate to the sudden fragmentation of self-representation connected with the trauma, and the artist's unconscious attempt to integrate the disparate parts of identity.
The ability of children to defend graphically against the painful memory while representing it, seen, for example, in the schematic and stick figures of Salvadoran artists, suggests their attempt at integration and mastery. Artists combine traditional cultural symbols with current circumstances: Palestinian children blend stylized ancient warriors from Islamic miniatures and Assyrian bas-reliefs with their depiction of contemporary Israeli soldiers. Khmer children accommodate traditional Cambodian design and landscape to a catastrophic foreground.

The creative process and products of these child artists reveal their strength, resilience, and hope. It is not just that they make images of a peaceful, benevolent, and just world, or that they find ways to protect themselves from potentially overwhelming feelings evoked by images while embodying the toxic memories. Despite their painful experience, children respond intuitively to the pleasure and joy of interacting with art materials. Without conscious intention to heal polarities, they engage in a process which by its very nature, its demand for both analysis and synthesis, choice and surrender, is unifying and healing. Making art makes whole what has been shattered by trauma.

My psychological curiosity complicates a wholly experienced response to images. I look for particulars about the circumstances of these works of art as a potential source of interpretation and a suggestion to myself that I understand better. Were drawings and poems spontaneous or in response to a directive? Who was present and how did that presence affect imagery? Which materials and colors were available and did the child's selection of them relate to a toxic association with aspects of the trauma? How did artistic traditions of the child's culture influence symbolization? What was the drawing sequence of this composition and its place in a larger series by that artist? How did the child move while working? Were the verbal associations? Chronological age of the artist would give information by which we might assess impact of trauma on artistic development. It is important to know when drawings were made with respect to traumatic events, and what risks were involved in giving form to images and feelings.

Clearly, the finished product, or more precisely, the published reproduction of that original, is only one limited aspect of the child's creative experience; we have not seen the artist in the act of creating. Clearly, no verbal language has been invented to describe adequately the horrors, thus making even more poignant the urgent and assiduous repeated attempts by survivors to clarify to themselves and communicate to others what ultimately can never be understood by outsiders. Nevertheless, it is imperative that we keep looking. Seeing documents of witness, we become witnesses. Moved by works of art, we become artists. Both inform our relationships with survivors of trauma, ultimately teaching us about our collective selves as well.

Introduction to the Diagnostic Drawing Series
Sunday, June 2, 1996
Anne Mills, A.T.R.-BC, with opening remarks by
Barry M. Cohen, A.T.R.-BC, founder of The DDS Project

Participants in this day-long course will learn to administer and evaluate the DDS
and compile written reports using this clinical art therapy assessment tool. To be held at The Psychiatric Institute of Washington, the site of the DDS Archive, this
seminar is a "must" for those who use the DDS regularly in their work. Course
content will be based on up-to-the-minute, as yet unpublished, research findings.

Art by Abuse Survivors:
Diagnosis and Treatment Through the Lifecycle
Monday, June 3, 1996

This full-day training will provide an extraordinary perspective on the effects of
early childhood trauma as they manifest in art productions. Research-based
diagnosis of post-abuse syndromes using the Diagnostic Drawing Series (for adults
and children) will be reviewed and treatment guidelines for the use of art in
therapy will be outlined for both specialists and generalists.

Also of Interest
Trauma, Dissociation, and the Holocaust
Thursday, May 30, 1996
James Glass, Ph.D., C. Fred Alford, Ph.D., and Jerrold Post, M.D.

This 3-hour seminar, to be held at the U.S. Holocaust Memorial Museum, will
explore the dynamics of hatred, violence, and evil through a psychological analysis
of genocide. Attendees will have the afternoon to tour this "must see" facility.

THE GESTALT ART EXPERIENCE
PATTERNS THAT CONNECT

By JANIE RHYNE

REVISED EDITION

Almost a quarter-century has passed since the first publication of this highly acclaimed book. In this revised edition extensive new sections have been added at the beginning and the end. The new foreword chronicles the authors personal journeying through the 50's and 60's while the afterword speaks of patterns that connect and new directions.

"Janie Rhyne was one of the truly great original thinkers in the field of Art Therapy. In a genuinely creative act, she synthesized her varied experience with art, people and healing in this eloquently written book. Janie's ability to comprehend, digest and recombine understandings from a wide variety of intellectual disciplines allows her to present us with a way of working which is really her own unique creation."

Judith Rubin, Ph.D., A.T.R., HLM

SUPERVISION and Related Issues:
A Handbook for Professionals
by Cathy Malchiodi and Shirley Riley

A highly informative and pragmatic guide to the complexities of clinical supervision of art therapists and related mental health professionals. Supervisors, educators, and students will find this text indispensable not only in the supervisory session, but also in the classroom and in work with clients.

ART THERAPY in Theory & Practice
Ed. by Elinor Ulman and Penny Dachinger

This classic and widely used text is now coming back in print! The book provides a comprehensive introduction to the field of Art Therapy and brings together important thinking, discussion and experience of many major contributors. Art Therapy in Theory and Practice provides deep insight into the development of the discipline since its inception some thirty years ago.

Keynote Speaker • Jimmy Santiago-Baca

Jimmy Santiago-Baca, poet, author and screenplay writer of Chicano and Apache decent, is recognized as a leading spokesperson for the Hispanic community. His book, Martin and Meditations on the South Valley, received the American Book Award in 1988. In the summer of 1995, Santiago-Baca was one of the featured poets on the Bill Moyers PBS series, Language of Life. His poetry speaks to a vision of change and community transformation through creative expression.
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:
- Art Therapy: Building Barriers with Native American Clients
- LA '94 Earthquake in the Eyes of Children: Art Therapy with Elementary School Children Who Were Victims of Disaster
- Use of a Drawing Task in the Treatment of Nightmares in Combat-Related PTSD
- Outpatient Art Therapy with Multiple Personality Disorder: A Survey of Current Practice
- Art Therapy at the Crossroads: Arts and Science

Art Therapy is available to AATA Members as part of their membership.

Non-Members may subscribe at the following annual rates:
  Individuals: $50.00 (U.S.) - $74.00 (Foreign)
  Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:
  Members: $12.50 - Non-Members: $23.00

AATA REGIONAL SYMPOSIA

ADDICTIONS
Presenters: Lynn Jones, Holly Feen, and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley, and James Consoli
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The art therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN SCHOOLS
Presenters: Janet Bush, Sarah Hite, and (third presenter to be announced)
This symposium will provide participants with the administrative procedures for implementing art therapy services and programs in schools. Topics will focus on the uses of art therapy in schools; roles and responsibilities of school art therapists; techniques and strategies for working with students; training and preparation of school personnel; and the funding and marketing procedures required for school art therapy programs. Participants will be prepared to transfer techniques and strategies for implementing art therapy services and programs to school settings.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Callanan, and Judith Wald
The symposium will cover general views on ag. issues, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

GRANTS: GOING FOR THE GOLD
Presenters: Frances Anderson, Vija Lusebrink, and Doris Arrington
Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90's. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal "in process".

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchiodi, Julie Epperson, and (third presenter to be announced)
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. "Children at risk" are defined as those who are directly affected by family violence, physical and sexual abuse, neglect homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitation which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchiodi, Anita Mester, and (third presenter to be announced)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterburg, Simonton, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life threatening illness will be addressed.

ADOLESCENT ART THERAPY
Presenters: Kris Sly-Linton and (three other presenters to be announced)
The Adolescent Art Therapy Symposium will cover a wide range of topics designed to address a specific focus area requested by the sponsoring organization. This is a somewhat unique approach to the traditional symposia format but considering the multiplicity of problems regarding the treatment of adolescents today, it was felt this would be a way to make each symposium more pertinent to the intended audience. The four person team headed by Kris Sly-Linton, A.T.R.-BC, was coordinated to include professional art therapists that can provide the expertise required to address the following areas: Special Populations of Adolescents, Program Focus, and Teens and Family Systems.

These Symposia are offered at no charge to the participating Chapter.

For further information or schedule of other symposium please contact:
AATA National Office / 1935 Allison Road / Mundelein, Illinois 60060 / (847) 937-0191 / Fax: (847) 937-0193
Monday through Friday 9:00 a.m. to 5:00 p.m. Central Time
The American Art Therapy Association

THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board, elected by the membership. AATA has established standards for art therapy education, ethics, and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. AATA's dedication to continuing education and research is demonstrated through annual national conferences and regional symposia, publications, videos, and awards.

MISSION STATEMENT
The American Art Therapy Association is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing.

Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

ART THERAPY: DEFINITION OF THE PROFESSION
Art therapy is a human service profession that utilizes art media, images, the creative art process, and patient/client responses to the created products as reflections of an individual's development, abilities, personality, interests, concerns, and conflicts. Art therapy practice is based on knowledge of human developmental and psychological theories which are implemented in the full spectrum of models of assessment and treatment including educational, psychodynamic, cognitive, transpersonal, and other therapeutic means of reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem.

Art therapy is an effective treatment for the developmentally, medically, educationally, socially, or psychologically impaired; and is practiced in mental health, rehabilitation, medical, educational, and forensic institutions. Populations of all ages, races, and ethnic backgrounds are served by art therapists in individual, couples, family, and group therapy formats.

Educational, professional, and ethical standards for art therapists are regulated by the American Art Therapy Association. The Art Therapy Credentials Board, Inc. (ATCB), an independent organization, grants post-graduate registration (A.T.R.) after reviewing documentation of completion of graduate education and post-graduate supervised experience. The Registered Art Therapist who successfully completes the written examination administered by the ATCB is qualified as Board Certified (A.T.R.-BC), a credential requiring maintenance through continuing education credits.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the United States. Chapters conduct meetings and activities which promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for chapter members is passed on from the Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:

Publications
• Art Therapy: Journal of the American Art Therapy Association (published quarterly).
• AATA Newsletter (published quarterly).
• Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, videos, and the Membership Directory.
• AATA literature, such as Educational Programs List, Art Therapy Media List, Standards of Practice, and mailings of professional interest.

Services
• Insurance, including professional liability, major medical, life, and disability through Magazines & Associates.
• Access to national experts in art therapy.

AATA Meetings
• Discounts on registration fees to AATA national conferences and regional symposia.

Nationwide Advocacy
• Governmental Affairs activities including congressional review and monitoring.
• State legislative and regulatory activities.
• Promotion of recognition and reimbursement of art therapists by third-party payors.
• National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
• Development of Model Job Description and recommendations for licensing standards.
• Development and implementation of national Education Standards for approval of graduate level art therapy programs.
• Development and implementation of nationally recognized Standards of Practice and Ethical Standards for Art Therapists.

GENERAL INFORMATION
AATA and ATCB are administratively independent. Membership in AATA and registration (A.T.R.) with the ATCB require separate application and approval. A.T.R. registration applications are available from the ATCB at (312)527-6764.

For new associate, student, and contributing members only, please follow the dates below when submitting membership applications. The membership year is the calendar year 1/1 to 12/31.

Applications received between:
1/1 to 5/31
Full dues payment; membership expires 12/31 of same year.
6/1 to 9/30
Half-year dues plus $5.00 payment; membership expires 12/31 of same year.
10/1 to 12/31
Full dues payment; membership for the remainder of current year and next full year.

CATEGORIES AND FEES
Professional—By application review process only; approved members may vote, hold office, and serve on committees.
• Professional Member—Individuals who have completed educational training in art therapy. Dues are $85.00/year.
• Credentialled Professional Member—Individuals who have been dually approved for Professional Membership by AATA and registration (A.T.R.) by the ATCB. AATA dues are $85.00/year. Annual A.T.R. maintenance fee is billed separately by the ATCB.

Associate—Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. This category is not open to master's level art therapy program graduates. Associates may not vote, hold office, or serve on committees. Dues are $85.00/year.

Student—Individuals who are currently taking full-time course work in art therapy or a related field. A current statement from the institution of learning indicating full-time status and course work content (6 graduate or 12 undergraduate credits) is required. Student members may not vote or hold office, but may serve on the Student Subcommittee of the Education Committee. Dues are $35.00/year.

Contributing—Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120.00/year.

Retired—Individuals who are at least 65 years of age and who are no longer practicing. Retired associates receive publications. Retired professionals receive publications and may vote, but may not hold office. Application provided upon request. The maintenance fee is $15.00/year.

ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to each copy of your manuscript:

Name:________________________________________

Degrees/Credentials:________________________________________

Address:________________________________________

Phone numbers:  Home________________________________ Work________________________________

Type of Submission (check one):

☐ Article  ☐ Viewpoints  ☐ Brief Report
☐ Film/Video Review  ☐ Book Review

Title of Submission:________________________________________

Checklist:

☐ Five (5) copies, typewritten on 8 1/2” x 11” paper.

☐ Black and white photos of original artwork plus four (4) photocopies of each.

☐ Abstract of 75-125 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature______________________________________ Date____________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy* uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. **Manuscripts that do not conform to these guidelines will be returned to the author without review.**

**Manuscript Categories**

1. **Full-Length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.
6. **Comments.** Brief comments on articles published in *Art Therapy*, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each manuscript to Editor, *Art Therapy: Journal of the American Art Therapy Association*, 1022 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original articles that are not under consideration by another periodical or publisher are acceptable.
3. Manuscripts must be typewritten on 8 1/2" x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 75-125 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the APA *Publication Manual* for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction. Include original and four (4) photocopies.
9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs; captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. **It is the author’s responsibility to secure such permission; a copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.**
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any manuscript accepted for publication in *Art Therapy* will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1656) is published quarterly by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 U.S.A. Telephone (847)949-6664; FAX (847)566-4580. Non-members may subscribe at the following annual rates: $50 (U.S.) and $74 (Foreign); institutions $77 (U.S.) and $100 (Foreign); AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 U.S.A. (847)949-6664.

This journal is abstracted in: Resources in Education (ERIC), Art Bibliographies Current Titles, Art Bibliographies Modern, and PsycINFO.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to American Art Therapy Association, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

MISSION STATEMENT: The American Art Therapy Association, Inc. (AATA) is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing. Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

Finding Art Therapy on Databases

Cathy A. Malchiodi, MA, A.T.R., LPAT, LPCC, Editor

In "Contributions to Art Therapy Literature: A Computer Database Survey" in this issue of Art Therapy, co-authors Ziegler and Hays note in their survey of seven major computer databases that twice as many articles on these databases were authored by individuals who are not art therapists than art therapists. The databases surveyed were: CINAHL (Cumulative Index to Nursing and Allied Health Literature), ERIC (Educational Resources Information Center), HEALTH, MedLine, PSYCHLIT, SPORT Discus, and Wilson Social Sciences Index. The authors examined material from 1983–1988, tabulating the frequency of articles in which a specific reference was made to art therapy. They also attempted to determine if the authors of articles that appeared in each database were written by individuals with training, professional membership, and/or registration in the field of art therapy.

Although Ziegler and Hays note some problematic aspects in their methodology, their results certainly do underscore the fact that more non-art therapists' published articles are consistently found on databases than articles written by art therapists. They conclude that one of the main reasons for this phenomenon is the lack of inclusion of this and other art therapy journals on major computer databases. Art Therapy has only recently been reinstated on PsycINFO and ERIC; it is still impossible for researchers and students to obtain information on many articles appearing in this journal published prior to 1995. MedLine and CINAHL have yet to include Art Therapy, which explains why many healthcare professionals have difficulty accessing references to works published in this journal. Art therapy articles written by art therapists are often simply unavailable to those outside the field unless they are able to conduct a hand search of this and other art therapy journals at their local university or college library.

Why Art Therapy is Not Included in Some Databases

I am often asked by educators, researchers and students why they cannot locate references to articles in Art Therapy on some of the standard databases. First, the field of art therapy is difficult at best to classify and this may be a root cause of its database woes. Because art therapy is essentially a synthesis of the fields of visual art, psychiatry, and often several other subjects, the challenge for databases is how to categorize it. Does art therapy fit more with art, or is it more aligned with psychology? This is the very question that the profession has asked of itself over the years and is the same question asked by databases which consider including art therapy publications in their listings. For many databases the question of how to classify the subject of art therapy is unanswerable. As a result, art therapy journals may not be included because many databases do not see them as relevant to their specific subject areas and are not willing to take the time to make decisions on an article by article basis to determine if certain papers meet their criteria.

The profession also plays a part in the database problem. Although there is a great deal more literature on art therapy available today than 10 years ago, the available literature often lacks rigor (Malchiodi, 1993), including what is published in journals. The majority of large databases want to see that a journal is committed and dedicated to publishing research data. For some time, the lack of inclusion of art therapy articles in many databases has stemmed directly from the lack of published research. In a recent review of this journal, one large and prominent database specifically noted that most of the articles published in Art Therapy were “impressionistic,” involving unstructured case material and unsupported observations, rather than using more rigorous standards, including quantitative and qualitative research models, to frame findings.

Lastly, the profession of art therapy expects this journal to wear many hats: to provide theoretical and methodological discourse, to publish scholarly research, to print personal viewpoints and commentaries, to review books and media, and to include visual art and poetry. Most professional journals only provide the first two items—theoretical and methodological discourse and research articles—and publish personal views, comments and reviews in newsletters or other publications. While it is the philosophy of this journal that the inclusion of personal viewpoints, commentaries, reviews, and art are extremely important to art therapy's knowledge base, this philosophy comes at a price when it comes to inclusion on databases. In many cases, databases tend to see this practice as detracting from the strength of the overall publication.

Art Therapy as Its Own Database

An important question emerges from this discussion—what can art therapists do to make the existing, current, and future published work of art therapists accessible to other professionals and students outside the field? Although things are looking up for Art Therapy which has been reinstated on PsycINFO and selected articles are included in other databases such as ERIC, many arti-
cles will never appear on any databases whatsoever. A hand search is still required to adequately search all issues of *Art Therapy*; since this journal is only carried by a relatively small number of libraries, this cumbersome practice is often difficult at best.

There are a few proactive moves the national association can make to change this situation. First, since many articles in this journal are not included on any database, a simple cumulative index is in order, listing titles of articles and authors. This would be a good first step and a standard one that many other professional journals already offer. Distributing or selling this document to those researchers, educators, and students who contact the association for information and to periodical departments of major university libraries could be, at the very least, a modest beginning and a simple way to promote the published work of art therapists.

A larger and much more difficult project would be to develop a comprehensive database by subject and eventually abstracts; to be even more adventurous, the titles, subjects, and authors of taped presentations given at the annual conference could be included. The goal would be to produce a cross-referenced computer database by subject, title, and author, and annotations such as key words or abstracts. This type of database is similar to PsyclINFO or MedLine, where one can find information on a topic through key words, subject, title, or author searches. This is a time-consuming and costly project to undertake, but may be one of the only ways that the profession can make its own voice heard through promoting the written work of its professional members that may remain unknown or unavailable otherwise. If the field of art therapy is truly concerned about its recognition by other allied professions, government and healthcare agencies, this is a proactive step that the association can take to make the work of art therapists more well-known and accessible.

Lastly, at the conclusion of their article, Ziegler and Hays make a plea for art therapists to publish more of their work. Much of art therapy's knowledge base still remains oral history, often communicated at the annual conferences or chapter events, or in some cases, only in the classrooms of certain training programs. It is hard to say why some work presented year after year at annual conferences or in coursework remains largely unpublished. Perhaps art therapists are not inclined to spend the time it takes to write and prepare an article for publication in a journal or may be engaged in clinical or creative work which fills their time instead of writing. Or, perhaps there is a personal need to hold on to findings, ideas, protocols, and other information; seeing them in print means that this material is now available for use, public discussion, scrutiny, criticism, or creative development by others, both inside and outside of the profession. In any case, the problem of the recognition of art therapists' published works is one that every one of us in the profession shares and will undoubtedly effect the course, direction, and growth of art therapy in the years to come.

### 1996 Calendar of Events

**August**

- The 4th International "Exploration of Creativity" Conference will be held in St. Petersburg, Russia from August 17-20, 1996. The group will also travel to Lithuania and Prague, Czechoslovakia. Contact Maryanne Olsen at (201) 262-7544 or fax (201) 262-7579 for further information.

**September**

- "Illuminating the Path: The Art of Art Therapy," a juried exhibition of fine arts and crafts by regional art therapists, will open at the Floyd County Museum on September 17 and run through October 25, 1996 and is presented in conjunction with the Kentucky Art Therapy Association. This unique exhibition will encourage visitors to experience art in a new way, for new reasons. Art works will be displayed with the artists' description and reflection on the process - how the creation of the works has influenced them intellectually, emotionally, and spiritually. For more information please contact Roberta Jonkers at (502) 429-0240 or Sally Newkirk at (812) 944-7336.

**October**

- The 17th Annual Canadian Art Therapy Association Conference "Vision and Voice—Art Therapy for People with Special Needs" will be held September 27-29, 1996 at the Harbourfront Centre in Toronto, Ontario. The keynote speaker will be Debra Linesch, PhD, A.T.R., M.F.C.C, who will also be conducting a workshop during the conference weekend. For additional information contact Carol Burpee at (905) 858-9642.

**November**

- The International Stress Management Association will conduct ISMA-6 on October 5-8, 1996 in Sydney, Australia in cooperation with several other organizations. For more information, call (619) 635-4698, fax (619) 635-4669, or Internet: NOSTRESS@sanic.USU.edu.

**December**

- The 27th Annual American Art Therapy Association (AATA) 1996 Conference "Many Paths; Multicultural Perspectives in Art Therapy" will be held on November 13-17, 1996 at the Adams Mark Hotel in Philadelphia, Pennsylvania. For more information call (847) 994-6064.
Commentaries

Letters to the Editor

Thank you for including membership dialogue about the lack of art therapy research in the most recent journal (Vol. 12, Number 4). At this point in the development of the art therapy profession and given the managed health care environment, we need to be grappling with question, "How do we really know art therapy works?" As art therapy professionals, how can we be satisfied with what we have to offer if we do not scientifically know if and how it is valuable and helpful to patients. We owe it to our profession and patients to validate that art therapy approaches are effective. This can be accomplished only through the active interplay of applied art therapy and sound art therapy research. These two pursuits are not discordant with each other, but rather they should dovetail to enhance the art therapy profession.

I believe that art therapy has valuable things to offer the field of mental health, and that we can demonstrate this with well-designed art therapy studies. In doing so, we will be allying with our colleagues in the field of psychology in identifying ourselves as part of a distinct scientific discipline which studies human cognition and behavior. In addition, this will help other mental health professionals, lay people, and managed care companies better understand art therapy and our unique therapeutic skills.

Art therapy could possibly be on the cutting edge in attempting to measure people's introspective experience. Behaviorists, in their attempts to study human behavior in a scientific manner, have avoided trying to measure private events because human behavior is more easily quantifiable. Art therapy provides a concrete, potentially measurable bridge between a person's observable behavior and internal experience. Cognitive psychologists have focused on verbal reports as objective measures of a person's internal experience. However, there are problems in assuming that a person's verbal report will be an accurate measure of his or her private experience. I believe a person's art products are closer to reflecting a person's internal experience than just looking at a person's behavior or considering his or her words. If we can contribute to the field by providing a more accurate means of understanding and explaining human consciousness, then we can improve our ability to predict behavior and influence therapeutic change.

How can we facilitate sound clinical research in the art therapy field? The philosophy of our art therapy programs needs to shift to install the idea that one needs to routinely ask and scientifically explore questions such as, "Is what I am doing helpful, and how?" Requiring prerequisite courses such as History and Systems in Psychology and Research Methodology will give students a foundation for thinking about our work with people in a scientific manner. In addition, students should be required to work as research assistants as part of their field training and internships. These experiences will introduce students to the trials and tribulations of doing research so that they will be more knowledgeable about what is involved when they attempt research on their own.

Finally, there should be more funding resources available from the AATA for any professional or student member who submits an approved proposal for art-therapy-specific research. There are art therapists, such as myself, in psychology doctoral programs who would like to contribute to the art therapy process by doing art therapy research for a dissertation, but currently the only funding available from AATA is for art therapists wanting to do free-standing research (i.e., not affiliated with a graduate program) or funding after the completion of a project.

In conclusion, we as art therapists have a lot to offer our clients as well as the field of psychology. It is time for us, as a mental health profession, to begin a concerted effort to work not only as excellent clinicians, but also as scientists-practitioners in the search for the best means of understanding and treating others.

Robin Gabriels, MA, A.T.R., LPC

In response to the recent Viewpoints and attendant material addressing art therapy research (Art Therapy, Vol. 12, No. 4, 1995), I would like to suggest to Dr. Tibbetts that he stop complaining and make a few ashtrays. If he exercised his creativity to address his frustration with the rest of us, he might come up with some innovative means to catalyze research activity in art therapy.

He clearly has a grasp of the means and methodology to perform art therapy outcome studies that would be of great value to the field. By initiating an online study group, for example, or proposing a focus group or preconference course at the annual conference, he could mentor others in the skills and ideas he values so highly. If he were simply to share the protocol of his outcome study on the Internet and invite other art therapists in similar settings to replicate his work, he would be making a great contribution. This could also provide an exciting possibility to graduate thesis students in programs across the country. Replication is essential to the widespread acceptance of research findings and such a task would be within the abilities of graduate students who might not have the time or knowledge to come up with a research project completely on their own.

It is easy to point the finger at graduate programs, blame the artists, and feel righteous. But, that is precisely the sort of behavior that holds us back, wounding one another rather than seeking common ground. For creative and innovative advances to be made, in research or any other area, acting from the heart, not the spleen is required. Be generous, share your passion, not just your vitriol; spread your knowledge around, Dr. Tibbetts, and you might be surprised at the results.

Pat B. Allen, PhD, A.T.R., LPAT
I wanted first to commend you on the ongoing high quality of Art Therapy. I look forward to each new issue and have found the subjects represented stimulating and challenging. I have some concerns, however, with the ongoing "field versus discipline" debate which has been played out increasingly in this journal. I was especially struck by the Viewpoints section in the most recent issue of the journal (Tibbetts, 1995; Wolf, 1995).

In those articles I noted the continuing assumption that (a) art therapy must be either a "field" or a "discipline"—the designation "field" being preferable—and (b) that to gain credibility as a "field" (or "discipline") we must identify exclusively with the clinical/medical model of treatment or the studio/humanistic model of growth enhancement. Considering these arguments and the terms field and discipline, I observed that these terms are not necessarily exclusive of each other—rather they would seem rather complementary.

A "field," in my vision, is a wide open space where a variety of life can thrive. As the biological reference would imply, a field allows for a diversity of different species, each contributing to and supplementing the life of the whole.

"Discipline" would seem to imply a willingness to follow a belief, drive, or idea with the utmost faithfulness. In this the "discipline" would be willingness to limit attention to anything extraneous to the goal. The mastery and "perfection" of skill or understanding drive the ongoing pursuit.

The life of a "field" (in the biological and theoretical sense) is the product of the "disciplined" pursuit of many different life forms. As noted, activities are mutually supportive and the extinction of one part may be disastrous for the whole.

Tibbetts (1995) and Wolf (1995) both appear to present very disciplined views of art therapy. Yet within a view of the larger field of art therapy, there would seem to be room for both to grow along with many more without loss to one or the other.

Perhaps a consideration for the future life of our field is the recognition that within the larger framework of our profession various disciplines are developing. Each new addition offers a challenge to the status quo of our understanding of what art therapy is, and also allows for greater complexity and assurance of our survival.

On a more practical level, recognition of evolving art therapy disciplines presents a challenge in the training of future art therapists. Consideration might be given to acknowledged specialization of training programs to one or another discipline of art therapy (i.e., clinical, studio, medical, etc.). This already exists to some extent, but definition would allow greater clarity for potential students and educators.

Certification (A.T.R.-BC) has been presented as establishing "the most basic level of skill and knowledge required for a professional art therapist." Given the ongoing debate over what is most "basic" to our field, perhaps consideration should be given to developing certification specific to areas of specialization.

These responses may represent an oversimplification of the issues presented—they are meant only to present possibilities for future dialogue. My hope is that as our work continues we will be able to address the life and diversity within our profession with pleasure and excitement, not fear and protectiveness.

James J. Walker, A.T.R.-BC

References

It is my pleasure to comment upon the authors’ (Gadiel & Block) letter for Vol. 13, No. 1, 1996.

I am flattered that the authors have taken the time to respond with such conviction and interest to my article on "the studio as therapeutic intervention." And while their commentary seemed to be harshly critical, even sarcastic towards the end, I welcome the feedback; for, so few readers respond and engage authors such as myself that, indeed, any comment creates a dialogue that is preferred to indifference. I congratulate them on their fine program, yet stand by my observations and informed opinion.

David Henley, A.T.R.

"Who Owns the Artwork?" or "Do the Right Thing!"

This letter reflects the discussions of our Networking Group at the 1995 Coalition of Art Therapy Educators’ meeting in San Diego and is also a response to Cathy Malchiodi’s (1995) call for more debate on the topic of "Who Owns the Art?" Since the publication of the revised Ethical Standards for Art Therapists (1995, 2.6) stating, “Art therapists shall maintain patient treatment records...no less than seven years from completion of treatment,” the question has been raised whether the artwork done by clients in art therapy sessions is the property of the art therapists (clients), the art therapists, or the institutions.

Jonathan Braverman, AATA Legal Counsel (1995, p. 24), says that “in many instances artwork may constitute a medical record,” and recommends that art therapists photograph the artwork (with prior written consent of the client) for the records so that they can return the original work to the client. Dee Spring (1994) emphasizes the importance of maintaining photographic records and keeping "all the original assessment drawings," (p. 26) particularly because art therapists may be called on to produce artwork in a court of law if they are sued or if they are called to testify for a client.

We think that the artwork done by clients in art therapy sessions belongs to the artmakers. In the debate by art therapists and lawyers about “who owns the artwork,” one voice is missing: the client’s. Where (and if) the artwork is kept, by whom, during and after treatment, and who outside of the therapy session may see the artwork are all clinical questions to be answered together by the art therapists and client in a manner that best suits the client’s interests and wishes. Art therapists typically store their clients’ artwork so they can review them periodically with clients and sometimes with treatment teams and supervisors. Safeguarding clients’ artwork may become a means of safeguarding their “psychic baggage.” Helping clients take ownership of the work they are doing is often an important part of therapy. Clients’ desires to destroy, display, or take home artwork may also become grist for the therapeutic mill. Destruction of art car
be a cathartic act or a self-abusive gesture; display of art can be ego-enhancing or anger-provoking; taking art home can elicit empathy or misunderstanding from others. It is the art therapist’s responsibility to facilitate clients’ understanding of their motivations and the consequences of their actions related to their artwork and to encourage decisions and behavior that foster emotional growth.

No one has written that original artwork does not belong to the clients (except in the case of assessments, as cited above). However, no one has addressed a central question: What if clients refuse to give us consent to photograph the artwork? If we redefine section 2.6 of our Ethical Standards to say we must photograph clients’ artwork, we could be caught between two contradictory mandates in our ethical code—to photograph or not to photograph without consent. The specter of coercing clients is frightening, unthinkable. Our ethical code exists to ensure our clients’ rights; staying out of lawsuits should be a byproduct of our ethical behavior. Perhaps it would help us to remember the United Nations Universal Declaration of Human Rights, article 27.2 (brought to our attention by art therapist Karin Dannecker, from Berlin, Germany), which says, “Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author.” Keeping in mind that our clients own the artwork and all rights thereof will help us find our way through such ethical and moral entanglements.

Even if our clients give us permission to photograph artwork for our records, is it necessary and ethical for us to do so? Spring writes:

It seems that clinical work done in art therapy sessions...comes under the same rule as other medical records... Each profession has specific materials that are deemed part of the clinical record (i.e., x-rays, photographs of injuries or damage, test results, etc.). What makes art therapists differ in terms of clinical materials and records of the treatment is primarily based on the art product of the patient. (1984, pp. 26–27)

Equating artwork to x-rays or test results is a little different from comparing artwork to blood, tissue, or urine samples. A more accurate analogy would be comparing art done in art therapy sessions to words exchanged in verbal therapy. Psychotherapists who rely solely on talking are not expected to maintain records in the form of audiotapes; rather, they summarize their sessions as written progress notes and paraphrase significant statements as closely as possible. In cases where art therapists are not able or choose not to photograph clients’ artwork, they should be able to describe the art in words (similar to summarizing verbal sessions) and draw facsimiles of the art (analogous to paraphrasing words).

In discussing practical problems with photographing artwork, Malchiodi (1995, p. 2) cites an example of one hypertensive child who goes through a half-hour of computer paper in a session. Although Braveyman (1985, p. 15) writes, “Issues of professional responsibility and potential professional liability often outweigh cost considerations,” does he realize that many art therapists would have to take hundreds of photos/weeks? And with so much photographing and filing to do, would art therapists have time left for the other essential part of record keeping—writing about the artmaking process, making assessments, setting goals? In addition to cost, storage, and time considerations, what about the confidentiality issue of all those thousands of labeled photos getting into the wrong hands?

The discussion about “who owns the artwork” has sensitized art therapists to the importance of keeping careful records, but they should have the discretion to interpret “medical records” in a manner that suits their practice. Malchiodi will probably not photograph that half-ream of scribbles, but art therapists working in areas where there is potential for litigation might photograph whatever artwork they have permission to and record to the best of their ability whatever clients say and do.

To find a disinterested legal opinion about the ownership of art, Susan Spaniol telephoned Iris Burnham, Legal Director of the Bazelon Center for Mental Health Law in Washington, DC, a center founded in response to the Americans With Disabilities Rights Act. Burnham (1995) agreed that AATA should take a position on ownership rather than rely on the judgment of individual professionals, and he also advised negotiating photography of artwork at the beginning of treatment. However, he went on to say:

The possibility of a suit is minimal and the idea that there would be damages awarded is also minimal. If there were a suit, it would be a bizarre law suit, or else a very small part of a larger suit involving something very significant. Photography may not be worth the cost, in addition to its cost in the therapeutic relationship. (1995)

Burnham concluded by declaring, “The law has no answer. The profession should do the right thing and decide that the art belongs to the client.”

How AATA chooses to respond to the question “Who owns the artwork?” can undermine or reaffirm the moral foundations of our work as art therapists. As the professional organization of art therapists, AATA should do the right thing and declare that artwork belongs to the people who created it. Karin Dannecker forwarded catalogue notes from an art exhibition in Denmark honoring the 40th anniversary of the Declaration of Human Rights. Else Bulow (1988), museum director, writes: “No one can take away the imaginative life of others, not the energy of their images. This is the ultimate human right”.

Contributions to Art Therapy Literature: 
A Computer Database Survey

Heather Anne Zeigler, MA, A.T.R., Harrisburg, PA, and 
Ronald Hays, MS, A.T.R., Philadelphia, PA

Abstract

Art therapy literature available on computer databases was 
surveyed to assess the literary activity of registered art therapists 
along with other mental health professionals between the years 
1983 and 1993. Computer databases were selected as the source 
of gathering information because they offer a wide and varied 
audience accessibility to a vast amount of information. 
Information available from the databases is often the first 
encounter persons have with professional literature. Seven com-
puter databases were surveyed for the frequency of entries con-
taining the term art therapy. Findings revealed that twice as 
many articles authored by individuals other than A.T.R.s were 
included in these databases. Implications for the field of art the-
rapy and its practitioners and potential compromises in the deliv-
ery of services are discussed.

Introduction

This paper describes a survey of art therapy articles in order 
to determine the amount, authorship, and source of such articles 
on computer databases. There were no known precedents for 
such a survey assessing the availability of published articles con-
cerning art therapy on computer databases such as CINAHL, 
ERIC, MedLine, and others. Since these databases are widely 
used by researchers in health-related fields, the inclusion of art 
therapy articles has an important impact on the understanding 
and acceptance of the field.

Published research information available on these compu-
ter databases includes the title of the published work, authors’ 
names, journal title, page numbers, date of publication, journal 
issue, key words, and a brief abstract if available. This informa-
tion represents the initial encounter any researcher would have 
with an article.

In order to determine who was writing art therapy articles 
include on computer databases, the investigators considered 
the authors’ credentials and training. An author’s qualifications 
for writing about art therapy may vary depending on his or her 
education in art therapy as well as years of practice and mem-
bership activity in the professional organization. A Registered Art 
Therapist (A.T.R.) as defined by the American Art Therapy 
Association is an individual who has completed an acceptable 
level of education in art therapy, which is approximated with 
competency. Professional membership in AATA suggests the 
employment of a code of ethics and certain standards of practice. 
Given the above issues, assessing the registration status of the 
author at the time of publication was felt to be significant for sev-
eral reasons:

- Differences exist in the level of education, clinical supervised 
  training, and experience in art therapy among A.T.R.s, individ-
  uals working towards registration (students or graduates),
  associate members of AATA who may support and recognize 
  the profession (i.e., psychiatrists, psychologists, social work-
  ers), and individuals who are not members of AATA and may 
  not recognize the profession of art therapy or acknowledge the 
  education and experience needed to practice art therapy or 
  utilize art therapy techniques.

- It would seem that the knowledge base of the practitioners 
  would suggest varying degrees of understanding of art therapy. 
  Such differences could be reflected in art therapy publications 
  written by these different types of practitioners.

- Ethical questions arise when individuals write about a thera-
pic practice in which they may not be qualified, and their 
  writing could have an effect on potential patient care. If infor-
  mation contained in an article is incomplete, misleading, or 
  erroneous, the potential exists for that information to be 
  unknowingly utilized by others who are unaware of errors or 
  misrepresentations of art therapy theory or practice.

Methodology

Initially, the databases were accessed to assess the number 
of articles pertaining to art therapy. Secondly, it was determined 
if the authors of the articles were professional members within 
the field of art therapy, versus other fields. From the outset it was 
evident that there would be many challenges and potential ques-
tions with this methodology. Because no credentials or indicators 
of education or experience were available from the information 
on the databases, membership directories from the American Art 
Therapy Association were utilized. Authors were cross-refer-
cenced in AATA membership directories for registration and/or 
membership.

Seven computer databases were surveyed for the frequency 
of articles in which an explicit reference was made to art therapy 
between the years 1983 and 1993. The survey begins in 1983 
since this was the first year information regarding registered art 
therapists was available.

Utilizing the key phrase art therapy was viewed as the most 
direct means of accessing available articles. Art therapy was 
entered into seven computer databases resulting in the location 
of 543 English language articles and varying definitions and clas-
sifications of art therapy within the databases. Readers desiring
CONTRIBUTIONS TO ART THERAPY LITERATURE

information on standards and criteria for inclusion of material in databases are referred to the various databases since discussion of their standards was not a focus of this research.

The Survey

1. CINAHL 1983–1993. CINAHL is the Cumulative Index to Nursing and Allied Health Literature, designed to meet the needs of nurses and allied health professionals. Articles included in the database come from biomedicine, behavioral sciences, education, management, and other popular literatures. A total of 42 articles appeared in the CINAHL database in which an explicit reference was made to art therapy. CINAHL defines art therapy as: "Facilitation of communication through drawings or other art forms" (CINAHL database, 1983). Art therapy is listed under the subheading of "therapeutics."

2. ERIC 1983–1993. The ERIC database consists of the Resources in Education (RIE) file document citations and the Current Index to Journals in Education (CIJE) file of journal article citations from over 750 professional journals. A total of 16 articles in the ERIC database in the years 1983–1993 contained an explicit reference to art therapy. ERIC defines art therapy as: "The therapeutic use of art forms (painting, sculpting, drawing, etc.) in achieving self-expression and emotional release, usually in a context of remediation or rehabilitation" (ERIC database, 1977). Art therapy is listed under the subheading of "therapy" in ERIC.

3. HEALTH. The HEALTH computer database is produced by the National Library of Medicine and lists publications concerning health care planning, organization, financing, management, manpower, and related subjects beginning in 1974. One-hundred-fifteen articles were listed in this database pertaining to art therapy. Sixty-seven articles between the years 1983–1993 made an explicit reference to art therapy. No definition of art therapy was listed.

4. MedLine. MedLine database covers citations to medical literature from 1966 to the present. A total of 95 articles appeared within the years 1983–1993, with explicit reference to art therapy. No definition of art therapy was listed.

5. PSYCH-LIT. The PSYCH-LIT database includes Psychological Abstracts and Psych Books from 1974 to the present. PSYCH-LIT contains citations and abstracts from journals and books covering the mental health sciences and related disciplines. A total of 766 articles were listed in the PSYCH-LIT database with explicit reference to art therapy. Between 1983 and 1993 a total of 408 articles were listed with an explicit reference to art therapy. PSYCH-LIT defines art therapy as: "Therapy that uses the creative work of clients for emotional expression, sublimation, achievement, and to reveal underlying conflicts" (PSYCH-LIT database, 1973). Art therapy is listed under the subheading "recreational therapy" on the PSYCH-LIT database.

6. SPORT Discus 1975–1993. The SPORT computer database is listed as a comprehensive international database containing sports and fitness literature. Subjects included in the database are sports and fitness-related topics, exercise, medicine, physiology, training, coaching, biomechanics, and psychology. A total of eight articles, published in professional journals, were listed in this database with explicit reference to art therapy. Four articles appeared in the years 1983–1993. No definition of art therapy was listed on SPORT; art therapy was listed under the subheading of "therapy."

7. Wilson Social Sciences Index 1983–1993. The Wilson Social Sciences Index contains articles pertaining to social services and social work. Nine articles were listed with explicit reference to art therapy in the years 1983–1993. No definition of art therapy was noted.

Results

The term art therapy appeared 639 times in the databases surveyed. Eighty-three articles were repeated across the databases one or more times equaling a total of 96 repetitions. Taking these repetitions into account, the databases surveyed contained a total of 543 articles in which the term art therapy was present. Of the 543 articles, a total of 156 were written by or coauthored by registered art therapists. Forty-four articles were written by or coauthored by individuals who gained registration after the article listed was published. Twenty-five articles were written or coauthored by individuals listed as being members of AATA. Three-hundred-eighteen articles were written by individuals not listed as A.T.R.s or as members of AATA. (Please refer to Table 1 and Figures 1, 2, and 3.) Twice as many articles appeared to have been written by nonregistered individuals (see Figure 1).

Several considerations may be made when reviewing the findings:

• Perhaps one of the most important findings is that not every journal pertaining to art therapy and the creative arts therapies was represented on the databases surveyed. Of particular note are the limited entries (21) from Art Therapy, the official journal of the American Art Therapy Association, and the decline in entries found after the year 1986 in the American Journal of Art Therapy.

• The articles on art therapy found in the databases appeared in a wide variety of journals (see Figure 3). Articles referring to art therapy appeared in 96 different journals in the PSYCH-LIT database, 59 in the MedLine database, 32 in the HEALTH database, 25 in the CINAHL database, 12 in the ERIC database, eight in the Wilson Social Science Index database, and two in the SPORT database.

• Of interest is the distribution of art therapy articles in four art therapy publications: American Journal of Art Therapy, Art Therapy: Journal of the American Art Therapy Association, The Arts in Psychotherapy, and Pratt Institute Creative Arts Therapy Review; which lists entries primarily from students in the field of art therapy. Across the databases a strong absence of articles from art therapy journals was apparent. In the CINAHL, MedLine, SPORT, and Wilson Social Science Index databases, no entries were found from the four art therapy publications. Two entries from the American Journal of Art Therapy were listed in the ERIC database. Twenty-two entries in the HEALTH database were also from the American Journal of Art Therapy. The PSYCH-LIT database held the most entries overall (408) and also had entries from the four art therapy journals. One-hundred-fifty-six articles in the PSYCH-LIT database were entries from The Arts in Psychotherapy, 48 articles were listed from the Pratt Institute.

Creative Arts Therapy Review; 40 were listed from the American Journal of Art Therapy; and 21 entries were listed from Art Therapy: Journal of the American Art Therapy Association.

Discussion

Computer databases are vastly becoming the media of choice for researchers, students, professionals, and lay people, offering an enormous amount of information that would be otherwise difficult and time-consuming to compile. The computer databases offer a first "glance" at the literature available on a topic of choice, allowing the researcher to narrow, combine additional variables or areas of interest, or "explode" the topic area to include additional possibilities.

Computer databases may also be valuable to the patient, perhaps indirectly, as a means to gather information on past research and findings, treatment modalities, and related fields that may be applicable to the betterment of a patient's treatment and care. For this reason it is important that what is available on the databases be theoretically correct material, written by authors qualified in the profession about which they are writing. Although the percentage of articles that may contain inaccuracies or erroneous information about art therapy is unknown, "the potential impact can be great if inaccurate information forms the basis for subsequent research or for the treatment of patients" (Katzin & Schuyler, 1989, p. 337). Articles pertaining to the use of art therapy written by authors lacking in art therapy education or supervised clinical training and experience may be those that contain erroneous or dated information.

Given the findings of this survey, the following questions may be raised: Is there an apparent resistance to research, writing, and publishing within the art therapy field? Do writing and computers threaten the fabric of the field? Rubin (1982) felt that including case illustrations in writings, while aiding visualization, may lead to the feared false generalizations that may and do occur as a result of the inability to justify what has occurred during 20 or more sessions into five pages. What occurs in therapy and in the process of creation during therapy is difficult to translate into words, just as artwork cannot be transformed from a spatial matrix (Wadson, 1980) into the linear (verbal communication) without losing vital aspects.
CONTRIBUTIONS TO ART THERAPY LITERATURE

Figure 1 Percentage of Articles By Authorship

A.T.R. = Author was listed as being a Registered Art Therapist (A.T.R.) at the time of publication of the article included in this survey.
A.T.R. POST = Author was listed as being an A.T.R. after the publication year of the article included in this survey.
AATA = Author was listed as being a member, other than A.T.R., of the American Art Therapy Association (AATA) at the time of publication of the article included in this survey.
UNLISTED = Author was NOT listed as being either an A.T.R. or as holding any other membership within the AATA at the time of publication of the article included in this survey.

Figure 2 Number of Articles in Databases By Authorship
This survey has many limitations, including the fact that not every published article about art therapy was accessed, nor was every computer database surveyed. However, the fact remains that the databases surveyed appeared to contain fewer articles written by registered art therapists than by nonart therapists. Also, the limited presence of the journals Art Therapy: Journal of the American Art Therapy Association and American Journal of Art Therapy in the databases surveyed may have serious repercussions on the visibility, spread of knowledge, and growth of art therapy, as well as on potential patient care and treatment. While contributions in these journals and the other creative arts therapy journals provide information regarding research and practice in the field of art therapy, they certainly do not represent the profession to those who use computer searches for articles on art therapy.

Since what is being written about art therapy in more than half of the articles in this survey may not come from registered art therapists, the situation could be potentially problematic. For example, articles from an art therapy journal found in a database would have been reviewed by the authors’ peers, that is “experts” in the field of art therapy. If an article is contained in a nonart therapy journal, then one may question if it has received the same degree of scrutiny regarding its contents and validity.

It is the hope of the authors that the findings and questions raised in this article will serve to increase the awareness and self-questioning not only of those within the field of art therapy, but also of those in related mental health fields, thus encouraging a dialogue which will foster the proliferation of articles that serve to define art therapy and art therapists—who we are and what we can do while keeping the patient’s best interests in mind.

Over 20 years ago Hodnett (1973) wrote about professionalizing and defining the field of art therapy. In her conclusions she stated what she felt the field (in 1973) needed to do—research, research, research! To accomplish this Hodnett saw the need to borrow “rules” from other fields such as aesthetics and experimental psychology, so that experimental and empirical research could be conducted and translated by means of statistical inference. Hodnett’s call in 1973 for more research in the field of art therapy is still relevant today when we might also add the phrase “publish, publish, publish.”

Editor’s Note: This article was condensed from a 1994 Master’s thesis completed by Heather Anne Zeigler in partial fulfillment of the degree of Master of Arts in Creative Arts Therapy from Hahnemann University, Philadelphia, Pennsylvania. Thesis committee members were Ronald Hays, MS, A.T.R., V. Michael Vaccaro, MD, and Beulah Hall, EdD. Further inquiries regarding the complete unedited thesis may be addressed to the Medical College of Pennsylvania and Hahnemann University Library, Philadelphia, Pennsylvania (215)762-7631. The complete title of the thesis as found in the university library is: “Contributions to Art Therapy Literature by Registered Art Therapists and Other Mental Health Professionals: A Computer Database Survey 1983–1993.”

The Dimensions of Service: An Elemental Model for the Application of Art Therapy

Randy M. Vick, MS, A.T.R.-BC, Lemont, IL

Abstract

This article presents the "Dimensions of Service" model as a tool for examining where, how, and why art therapists offer their services. Ten aspects central to art therapy practice (context, nomenclature, realm of need, role, conceptual model, purpose, level of function, length of contact, age range, and groupings) are outlined along with reflections on their potential impact on individual practitioners as well as on the profession as a whole. This model was developed out of the author's experience as an art therapy clinician, administrator, and educator and may be useful both to students entering the field and to professionals reassessing their current career paths and previously held strategies for the delivery of professional services.

Introduction

In conjunction with the 25th anniversary of the American Art Therapy Association, much has been written, spoken, and indeed even painted (Jones, 1995) about the past, present, and future of the field of art therapy. Recent volumes of this journal featured essays by Honorary Life Members and other award winners sharing their visions of art therapy in the 21st century. Consider for a moment however, if a telescope is the best or only tool for viewing such distant images. What could be seen if a magnifying glass or kaleidoscope were used instead?

Over a decade ago, Johnson (1984) challenged the creative arts therapies to focus on three important tasks: "to articulate our unique contributions...to differentiate a wide range of professional roles...[and] to provide the conditions for mature leadership" (p. 209). While his argument was that these developments will be necessary for the establishment of the expressive therapies as independent professions, these same tasks, particularly the first two, are also pertinent for art therapists exploring their personal career path options.

Robbins (1982), also speaking of professional identity, commented on the "intimate interplay between...personal inner development and...professional growth as an art therapist" (p. 1). To this interplay a third aspect might be added: the matura
tion of the profession itself within the larger world of human service professions. These three dynamic and concentric layers—the inner person, the individual practitioner, and the profession as a whole—have a combined influence on the career directions of art therapists.

Growth and development of a profession or of individual practitioners can be as effectively stifled by rigid adherence to outmoded concepts as it can by wild, imprudent change. As any profession matures, it must grapple with the task of balancing stasis and chaos. In searching for such a balance, art therapists revisit questions of definition raised in the earliest days of their emerging profession (Ulman, 1961). How far can the definition of art therapy be stretched before it is rendered meaningless?

The classic models from our literature with their long-term, intensive, insight-oriented thrust (Kramer, 1971; Naumburg, 1987) have much to offer; yet their strict application in the contemporary human services milieu has limited usefulness. Our work must be shaped by the ongoing and thoughtful incorporation of advances made in art therapy and related fields. Ethical, clinical, and legal considerations demand no less than the maintenance of the highest possible level of current professional standards, yet emotional ties to classic models may slow the adoption of more contemporary treatment paradigms. Clinging to a romantic notion of what art therapy "is" can contribute to a series of dis
appointing efforts to fit an ossified template to unyielding circumstances, resulting in frustration and ultimately attrition. The wished for ideal is too often in conflict with the practical reality. Increased competition and shrinking funding in health care do not afford art therapists the option of such self-defeating efforts. Nor is the current human services environment quick to embrace innovations without credible support as to their validity. The challenge to the contemporary art therapist is to merge the best of the historical and current practice paradigms. By skillfully bridging the gap between the wish and reality, increases in both job performance and satisfaction may be achieved.

In this essay I offer an alternative model for examining the manner in which art therapy services are delivered. All too often we begin with a fully formed concept of art therapy and search for an opportunity to employ it. For a new graduate entering the job market or a more experienced professional making a career transition, viable employment possibilities may be too quickly dismissed or overlooked entirely if a single, fixed understanding of art therapy is the only model considered. As the former director of an expressive therapies department in a hospital and now as the faculty coordinator of clinical placements in an training program, it is my responsibility to try to assess how good a "fit" there is between a candidate's skills and interests and the demands of any given position. Yet, regardless of level of experience, a congenial pairing of personality attributes to work circumstances is one of the best determinants of career satisfaction. Perhaps much can be gained by reordering this process and considering first the elemental dimensions of art therapy practice in isolation, allowing a fresh, new image to emerge through their eventual recombination.
Dimensions of Service

The “Dimensions of Service” outlined here are those facets of the profession which shape how art therapists apply their skills and training. This model was developed from the author’s experience as an art therapy clinician, administrator, and educator and may be useful both to students entering the field as well as professionals reassessing their current career paths and previously held strategies for the delivery of professional services. The dimensions are the parameters which give form to art therapy and have the capacity to simultaneously define and limit the scope of our work. These include context, nomenclature, realm of need, role, conceptual model, purpose, length of contact, level of function, age range, and groupings. While these concepts are intertwined in practice, it is helpful to consider them separately for purposes of discussion.

Context

Context refers to the types of settings where art therapists work and encompasses the location, administrative structures, and kinds of services provided therein. The first broad distinction within this dimension is private versus institutional practice. In the purest form the private practitioner works alone outside the physical and administrative walls of human service organizations. The clinician involved in institutional practice is linked via geographic, administrative, financial, and other ties to a larger pool of professionals who share a common treatment mission. Group practices, consultants, contract therapists, and other modern hybrids represent intermediate variations on these two basic themes. Each model has its advantages and disadvantages which, in turn, have their psychological and fiscal impact on practitioners.

Inpatient or outpatient, another broad contextual distinction among programs which have hospital (medical, psychiatric, or rehabilitative) affiliations, means much more than where the patients sleep at night. Each program may serve completely different clientele or the same individuals in different phases of their treatment. Other important distinctions typically involve funding, length of stay, staff size and mix, level of acuity, types of services offered, and so on. Driven by market pressures, hospitals and medical centers are experimenting with so many variants in this area (day hospital, night hospital, partial hospital, day care, day treatment, clinics, surgecenters, 23-hour units, etc.) as to render the old in/out division nearly obsolete.

Institutional affiliation may not necessarily provide information about the actual location of the program. A church-sponsored elder care program may operate out of that church’s basement while a medical center’s hospice may be across town with a wholly separate staff and administration. Schools, long-term and intermediate care facilities, shelters, correctional institutions, residential, and community-based programs offer many opportunities for the provision of art therapy services. The business community (in either the context of staff training and development or Employee Assistance Programs) remains a largely underserved context for our work (Ault, 1986).

Context has the broadest influence on the profession and tends to shape all the other dimensions. The place where art therapists work determines the type of clientele with whom they have contact and most aspects of the services they provide. In addition, it influences who sees art therapists (as well as how they view and provide service to clientele) and creates in the minds of professional peers and the general public an image of who art therapists are and what they do.

Nomenclature

The language used to describe the people with whom we work carries powerful, often hidden messages which can speak volumes about our relationship to them (Spaniol & Cattanoe, 1994). The profession’s strong psychiatric legacy is reflected in the use of the term patient, which carries with it the echoes of the disease model and of helplessness as well as placing the work within the confines of a hospital. Client is considered by many a better, more neutral alternative, but this term too has its detractors. In his 1993 AATA keynote address, James Hillman claimed that in turning to the world of business for this term we stand to sacrifice the implied compassion associated with “patient” care (Hillman, 1993).

Other terms, used directly or left unspoken, typically convey clues about the setting or role of the art therapist. Student can refer to a child in a therapeutic school or a graduate trainee but implies that the work features a strong educational component. Resident and inmate/prisoner both convey a sense of containment but for: very different purposes. Member (used by day treatment programs) and guest (used by some shelters) seem intent upon conveying a warm, cozy sense of belonging while a research participant or subject is kept at a certain anonymous distance.

An art therapy consultant may view a program, institution, or company as his or her client, which may contribute to a certain aloofness or might afford a more effective, system-wide focus. In an era of increasing corporate control of health care, the somewhat awkward notion of customer and the slightly more digestible consumer are often raised accompanied by the concepts of customer satisfaction and profitability. The committee-generated person being served was an effort to offend no one (JCAHO, 1995). It is a product of our politically correct times, neutral by design yet perhaps meaningless by accident.

Language subtly shapes our perceptions of the “other.” In addition to providing information about the context of our work, our style of interaction, job satisfaction, and therapeutic effectiveness may be indirectly impacted by the terminology we use when referring to those individuals we encounter in the course of our workday.

Realm of Need

The realm of need includes the issues or problems to be addressed in our work and can vary greatly. The primary need being addressed through art therapy has always been (and will probably always be) emotional. This psychological landscape is very broad and rolling and greatly influenced by context and philosophy. While one person’s “psychopathology” is another’s “spiritual crisis,” at the core is the world of feelings and the accompanying thoughts and behaviors. One source organizes the realms of need among individuals seeking mental health services into three broad categories:

(M)ental illness (as defined primarily in terms of organic and chemical imbalances which require medication maintenance in conjunction with other therapeutic regimens), problems in living (as defined as the need to acquire skills and learning pertinent to various life
transitions in which they are engaged), and needs of life enhancement (as defined in terms of holistic health and wellness). (Herr & Cramer, 1987, p. 87)

According to a recent AATA membership survey, and true to our historic roots, the majority of art therapists continue to attend to the emotional realms of psychiatric and other mental health populations (LaBrie & Rosa, 1994). With other specialized groups or settings, the emotional concerns can be joined by issues of addiction, family or marital problems, spiritual crisis, business needs, personal growth, or sociocultural pressures. In school settings, educational, developmental, or cognitive goals are emphasized. Rehabilitation programs focus on the physical, psychological, sensory, or developmental limitations and abilities of their clientele. While diagnoses and prognoses vary widely, the physical as well as psychological impact of bodily illness is addressed by art therapists working in medical settings (Malchiodi, 1995).

The concept of realm of need, while related, is not equivalent to population or diagnosis. It transcends these clinical categories to address the human needs behind the labels. As professionals, art therapists must strive to be fully aware of the scope of concerns brought by their clients and to address those which are appropriate to their services. They are ethically bound to refer to other providers those problems which lie beyond the limits of art therapists’ training and experience.

Role

Role encompasses how art therapists, their clients, and their colleagues understand art therapy’s function in the workplace. Included in this complex notion are official and unofficial job titles, clinical duties, work-week responsibilities, and, most importantly, our sense of professional self. Cashell and Miner (1985), in a review of the literature on professional roles, found that role conflict and role ambiguity are common where “there are unclear job responsibilities, inconsistent expectations, an environment of uncertainty and a lack of communication with co-workers” (pp. 93-94). After surveying staff from 12 area creative arts therapies programs, they concluded that lack of role clarity was an important contributing factor to the feelings of stress, burnout, and career dissatisfaction reported by respondents.

In exploring the idea of how we function on the job, Johnson (1985) posed this question:

“If a creative arts therapist spends a whole session talking with the client, is he doing creative arts therapy?” The answer is No if creative arts therapies are defined by our activity, and Yes if they are defined by a more basic principle. (p. 234)

Perhaps the single concept that limits us most is missing the subtle distinction between the tasks art therapists perform and the potential art therapy has. The sensibilities of art therapists are more key to their fully realized roles than are their techniques.

The “artist or therapist” quandary has been an issue of debate for many years in our profession (Ault, 1977). Yet, the realities of the workplace reflect more of a “both/and” rather than an “either/or” stance. The assortment of roles assumed by art therapists can be surprisingly diverse. The functions of artist, teacher, clinician, and healer can coexist harmoniously in the same individual at different points over the course of a career or work week (Lachman-Chapin, Ault, McConeghey, Junge, & Vick, 1992).

Therapeutic role descriptions still remain prominent among our members with 64% of respondents indicating either “Art Therapist” (49%) or “Counselor/Clinician” (15%) as their primary job title in a recent survey. The other categories offered in the survey—“Director” (8%), “Consultant” (2%), “Mental Health” (2%), and “Other” (25%)—may also include individuals for whom the role of therapist is a strong identification (LaBrie & Rosa, 1994). This sample seems to indicate that the tradition of the clinical role (at least in terms of job titles) remains strong. In all likelihood, the identification with the therapist role will and should remain the primary focus of our profession.

The 25% in the “Other” category remains a tantalizing mystery. How many of these members claim among their roles (official and otherwise) “Artist,” “Artist-in-residence” (Allen, 1992), “Teacher/Instructor” (Robbins, 1982), “Mentor” (Johnson, 1993), “Healer” (Arnheim, 1990), or “Supervisor” (Calisch, 1989)? In truth, several of these important roles are almost certainly enacted to some degree by most of the respondents to the survey.

Less commonly considered yet significant roles within the art therapy field are “Theoretician” (Rubin, 1994), “Researcher” (Wadeson, 1992), “Administrator” (Sandel, 1987), “Expert Witness” (Levick, Safran & Levine, 1990), and “Social Activist/Advocate” (Junge, Alvarez, Kellogg & Volker, 1993). These and other nontraditional roles may not represent the initial motivations to enter the field (in fact, may be by necessity “grown into”) but must be cultivated and supported for the ultimate benefit of the profession as a whole. Such primary roles, while rare in the field, are considered standard and legitimate applications in other human service areas. The growth of elder professional “cousins” has been marked by expansions into areas that are not exclusively clinical in nature. In the field of psychology for instance, the “scientist-practitioner model,” where an individual is involved in both research and treatment, can be traced back to the 1940s (Herr & Cramer, 1987, p. 94).

Conceptual Model

What theories or philosophies contribute to the shaping of art therapy training and practice? Of course the work of Freud has left an indelible stamp of our history (Junge, 1994); yet it would seem that today nearly every school of psychological thought has its adherents. Articles illustrating psychoanalytic, Jungian analytic, object relations, self psychology, Adlerian, phenomenology, gestalt, humanism, behaviorism, cognitive, developmental (Rubin, 1987), and existential (Moon, 1990) perspectives appear regularly in the art therapy literature.

Psychological and psychotherapist theories are not the only sources from which art therapists draw conceptual models. Human service fields such as social work, counseling, addictions, education, medicine, neuroscience, cognitive science, nursing, rehabilitation, corrections, holistic healing, therapeutic recreation, occupational therapy, as well as the other creative arts therapies, all have had and can continue to have influence on the profession. Broader reaching areas of study in such disciplines as the arts, sociology, feminism, anthropology, philosophy, ethics, spirituality, and business management all have the potential to inform our theory and practice.
Finally, while sadly still few, there are some conceptual models which, though they build upon existing theories from neighboring fields, can be considered uniquely art therapy models (Lusebrink, 1990). One of the hallmarks of any profession (if it is truly to be called such) is a unique, free-standing body of knowledge which forms the basis of its practice (Herr & Cramer, 1987). Hodnett referred to this substantial base of knowledge as one which “is so vast that no one person could encompass all of it in his lifetime” (1973, p. 108). Art therapy's continued growth depends in large part on the further development of this knowledge base by the thinkers and writers within the discipline and without.

Purpose

The dimension of purpose, which shapes both therapeutic goals and interventions, is at the center of what art therapists do yet remains difficult to concisely define. Embedded in this concept is both the focus to which services are addressed (e.g., illness, personality, behavior, wellness) as well as the intent behind them (e.g., treatment, assessment, support, education, prevention). This dimension explores the question of why we bring art experiences to clients as to what degree these experiences are a means to an end or the end in themselves. Are the processes and products of these experiences to be silently witnessed by the clinician or do they provide material for further discussion and probing? This has been another area of historic debate which has been at times scholarly and, at other times, acrimonious. Yet it is hardly a static issue since each population, group, and individual demands a slightly different approach; and each art therapist must come to a working understanding of the purpose of his or her efforts.

If the classic metaphor of art as “symbolic speech” (Ullman, 1975, p. 4) is to be retained, then it must be remembered that it is a speech which can confuse, clarify, and declare as well as distort, confuse, and obfuscate. In a traditional application, the communicative function of art is used to help uncover issues, resolve conflicts, and explore defenses.

An art therapist working in a briefer, more crisis-oriented manner might encourage the client to use the art to illustrate concerns or practice new methods of problem solving. In another context the concrete qualities of art may be useful for diagnostic, assessment, or research purposes. The focus of groups in a rehabilitation setting might be restoring function and supporting strengths.

It would appear that there is no single, “correct” purpose for art therapy, only options with greater or lesser degrees of appropriateness for different circumstances. The greatest gains can be made through the ongoing refinements, by each therapist, of the therapeutic purposes and approaches best suited to his or her unique population coupled with the support of the successful clinical applications by colleagues working in other contexts.

Length of Contact

The time available to work together with a client is dependent on many factors and varies widely. In many inpatient settings today it is not uncommon to have a single session, whereas in some types of academic, residential, or correctional settings, therapeutic relationships may be built over many years.

This dimension implies more than simple length of stay. A client with a history of chronic mental illness may attend only a few sessions in a short-term setting yet can still be a seasoned veteran of many years duration in the larger mental health system. Such a person is, in effect, the recipient of a kind of disjointed, long-term treatment from a series of providers, including, quite possibly, a number of art therapists. Another variation can be found in systems where the art therapist, viewed as a specialist, provides services in a number of programs within the same system. In a situation such as this, the art therapist may follow the client from inpatient unit to day hospital to partial hospital, while other staff members terminate services as the programmatic boundaries are crossed.

The last three dimensions—level of function, age range, and groupings—refer specifically to aspects of the population served. Here too, as with the previous dimensions, a correct fit should be sought between these qualities of client populations and the temperament of the provider.

Level of Function

This dimension can be thought of as a continuum extending from profound disabilities to high abilities. It is a given that all clients come to therapy because someone (not necessarily the individual seated before us) has perceived some type of deficit.

The concept of level of function implies a certain orientation toward “improvement,” which is often understood as the removal of “problems”; however, the acquisition of new skills, reclamation of old abilities, or the slowing of deteriorative processes all represent improvements in functioning. It would also seem at first that the populations with the greatest limitations would place the greatest demands on the skills and knowledge of the clinician; however, each individual challenges the therapist in different ways.

Age Range

This dimension covers the entire developmental span from very young to very old. At each phase individuals present with certain characteristic patterns of issues and life crises. With emphasis on early childhood intervention as well as the general aging of society, art therapists could very well see a gradual spreading of art therapy services to the outer ends of this continuum.

Groupings

The final aspect of the delivery of art therapy services is the manner in which we group or cluster our clients. The simplest form of this dimension is seeing individuals since, while family, friends, and others may be present in spirit, there is only one person physically in the room with the therapist.

The circumstances quickly become more complex as additional people join sessions. Therapeutic groups can be composed around age, gender, diagnosis, issue, history, or any other circumstance which group members share—even if it is only that they happen to be hospitalized together. Broader interpretations of the concept of group might encompass corporations and the general public. The two most highly specialized types of groups, couples and families, while today much more broadly defined than in the past (Kwiatkowska, 1978), are still shaped by the shared circumstances of their pregroup relationship.
Application

Returning to the three-layered image mentioned earlier, important changes may occur over the course of time. Through life experience, personal growth, perhaps therapy, the inner person has developed. With training, supervision, work experience, continuing education, and so on, the professional self of the practitioner has grown. Simultaneously, as the result of the efforts and contributions of many, the profession itself matures. The individual so described has any number of career options to explore. The Dimensions of Service model can be used as a tool for such explorations by outlining one's current as well as ideal career path along the 10 dimensions defined here.

Conclusion

It is very easy to become overwhelmed when considering the work in a field as complex as art therapy, yet even complex situations can be better understood when examined in manageable portions or looked at with a fresh perspective. The purpose of the Dimensions of Service model is to offer new ways of looking at the profession and to challenge previously held notions.

Just as a magnifying glass allows the viewer a close-up look at the tiny parts of an integrated whole, so too can this model allow us an intimate inspection of the small, perhaps previously unnoticed aspects of our field. Where a kaleidoscope can show the user beautiful and surprising new images with each turn, the structure presented here might allow us to "twist" our previously held notions about the profession and discover an amazing new future we never knew was there.

Amatea, in writing to mental health counselors, outlines five ideas for career development:

(a) viewing jobs as career bridges rather than career steps, (b) attending to the overall context as well as the content of the field, (c) defining ourselves by personal competencies rather than job titles, (d) focusing on possibilities rather than job positions, and (e) developing a collaborative rather than a competitive support network.

(1991, p. 280)

These ideas are very much in harmony with the model presented in this paper and can be of great use to the art therapist considering a career shift. In both models a career is considered to be a dynamic entity which must be viewed within the larger professional landscape. Both recognize the danger inherent in defining a profession based on a single position or job title. And finally, both acknowledge the potential influence the individual practitioner has over the direction his/her career will take.

The systems and strategies for the delivery of human services in this country are undergoing rapid change. With or without art therapists' participation, the circumstances which affect their practice are being altered. We owe it to ourselves, our students, and our clients to be proactive participants in the broadening and deepening of our field. Only through our writing, teaching, workplace experimentation, and collegial support can we together create stronger and perhaps surprising new images of art therapy.

CALL FOR PAPERS

Art Therapy invites submissions to special issues on:

1. Art Therapy with Older Adults

Art Therapy is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to art therapy with older adults. Submissions may focus on, but are not limited to, the use of art expression with the broad spectrum of elderly persons in society: institutionalized elderly persons in nursing homes, hospitals, rehabilitation facilities, and hospices; recipients of in-home health services; elderly persons in senior citizen housing and/or attending senior centers; elderly persons involved in intergenerational programs; and family caregivers coping with aging relatives. The deadline for submission has been extended to August 1, 1996.

2. Art Therapy and Community

Art Therapy is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to the broad topic of art therapy and community. Submissions may focus on, but are not limited to, the following: community-based art therapy programs; open studio approaches that involve community participation; art therapy programs designed to achieve social change within a community; art exhibits developed to educate a community on societal issues; art therapy programs for specific cultural communities or groups; or art therapists as a cultural community. The deadline for submission is September 6, 1996.

3. Art Therapy Research

Art Therapy is seeking full-length articles, brief reports, and viewpoints for a special issue devoted to the topic of art therapy research. Submissions may focus on, but are not limited to, the following: quantitative and qualitative models of art therapy research; research components of art therapy training; critical discussions and explorations of the problems and potentials of art therapy research; art therapy research previously unpublished, particularly outcome studies. The deadline for submission is December 31, 1996.

Please refer to the "Guidelines for Authors" in the journal for specific requirements regarding style and format. Manuscripts that do not adhere to these guidelines will be returned without review. Send submissions to:

Cathy A. Malchiodi, A.T.R., LPAT, LPCC, Editor, Art Therapy

c/o AATA Inc., 1202 Allison Road, Mundelein, IL 60060
Dali to Beuys: Incorporating Art History in Art Therapy Treatment Plans

Abstract

The important role art history can play when integrated within art therapy treatment plans is explored through individual and group case studies with inpatient and elderly populations. These results illustrate the therapeutic value of art therapy sessions that incorporate museum and gallery visits, slide presentations of modern art, and anecdotal information on artists. Clients were observed to have increased self-esteem, greater self-acceptance, increased social awareness, and enhanced creativity.

Introduction

As an art therapist with chronic patients on an inpatient unit and later as an art therapy consultant working with a variety of populations, I became interested in exhibiting clients' art as part of their treatment plans (Alter Muri, 1994). I began to include slide presentations of art from the modern and postmodern periods in my inpatient art therapy groups and, subsequently, in my private practice to explore the therapeutic benefits of integrating museum and gallery visits into art therapy. I found consistently with all the populations with which I worked (including individuals with developmental delays, learning disabilities, affective and mood disturbances, personality disorders, and the elderly) that art history can be integrated successfully into art therapy treatment and can play a valuable role in enhancing self-esteem, sublimation, socialization skills, introspection, and creativity.

I define the process of discussing artists' works, viewing slides, and visiting museums and galleries as art history, as a part of art history rather than art education. In my approach I do not teach techniques or evaluate art products. This is not a new concept. Buoye-Allen (1985) describes an "art lecture group" that viewed slides and discussed the art of former clients along with art by well-known artists. This approach creates a connection between client art and fine art, promotes group cohesion, and clearly increases the understanding of the many ways art can be a medium of psychological integration. According to Silverman (1981), art can be used to stimulate discussions on sensitive issues. Viewing slides or reproductions facilitates the process of rendering unconscious material more conscious.

The following case demonstrates how the use of art history in art therapy treatment increases self-esteem and encourages formulation of a stronger sense of self.

Case #1

Client W is a 19-year-old male with a history of learning disabilities, periods of psychotic episodes, and bouts of depression. He also has had episodes of substance abuse. Client W attended specialized schools for individuals with learning disabilities and behavioral problems. He has been a client on several psychiatric inpatient units.

I first met Client W in a short-term adolescent day treatment program where I was employed as an art therapist. I worked with Client W in individual and group art therapy sessions for a period of 1 year. After Client W left the adolescent program, he was referred to me in private practice for an additional 2 years. From the first time I saw his art hanging on the wall of the adolescent program, I was intrigued by the outpouring of creative energy in his drawings. The choice of imagery and color was striking. His first pieces of art looked very angry and frightening (see Figure 1).
Client W had not created art beyond his assignments in school. As we worked together and his work started to change (see Figure 2), I encouraged Client W to value and continue his interest in creating art. In individual art therapy sessions, I began to show him slides of artists whose work included similar imagery or elements of art (color, composition, form, texture, line, etc.). These artists were Philip Guston, Keith Haring, and Lucas Samaras. After several months, Client W started to work in what one could describe as a more painterly style. His perception of himself also changed from someone who had difficulty in succeeding in life to someone who had a gift for creating art.

At this point I began to incorporate the discussion of theories, artistic styles, and selected anecdotal biographical material of modern artists as a source of inspiration in group art therapy sessions that Client W attended. Other adolescents in the group who lacked motivation seemed to be inspired first by the stories and then by viewing slides of the art. The introduction of art history occurred in the beginning or “warm-up” component of the art therapy group. Miller (1993) validated the use of art history as a warm-up tool and also incorporated art history into the art therapy task. Her work with chronic psychiatric clients in a day hospital program demonstrated that clients who participate in art therapy sessions which included art history enrichment became more involved in the art task and spent more time creating art than clients in a control group. Miller claimed that art history enrichment tasks validated art therapy as an appropriate activity for adults (Miller, 1993).

Included in discussions with the adolescent art therapy groups were cubism, futurism, surrealism, and Dada. These movements in art were interesting to adolescents who felt that society and their families did not understand them. One art therapy task inspired by the Dada movement involved randomly cutting words and pictures from magazines and newspapers to create a collage. Group members could then write poems related to the collage. One client expressed a suicide wish as a result of this process and was able to receive additional clinical intervention.

Client W was also interested in these periods of art. He began to go to the library and take out large books on these artists. In individual sessions, we viewed and discussed slides of art from the Dada, pop, and happenings artists, abstract artists of the 1950s, and conceptual and graffiti artists. Many of these images were inspirational to him. For example, after viewing Dali’s “Soft Construction with Boiled Beans,” he drew (Figure 3) and discussed his issues regarding time and the meaning of life.

Client W’s art often expressed strong emotional statements that he wanted to share with others. His anger pictures showed frightening personal issues that he attempted to understand. Haeseler (1987) strongly urges art therapists not to display artwork with violent imagery and instead to encourage clients to redirect their expression of violent imagery through an understanding of the meaning behind the image. I have found that viewing art slides by artists whose images are not overly violent but contain powerful statements about their attempts to heal traumatic memories can also help clients redirect their own graphic outpouring of violent imagery.

To acknowledge the need to make strong visual statements, I introduced Client W and the adolescent group to two artists, Elizabeth Layton and Joseph Beuys. Both artists created art with strong imagery and were also interested in their messages being heard by society. Anecdotal information regarding Layton stressed her struggle with depression, her ability to use art to work through her own pain, and subsequently, to be able to depict the pain and suffering of others.

Joseph Beuys also used art to come to terms with his experiences. Beuys was a Nazi bomber shot down by the Russians during World War II and rescued by a group of nomadic Tartars who wrapped his body in fat and fur to keep him from freezing (Phillips, 1993). In his art, Beuys utilized honey, fat, and felt to symbolically heal the memory of this traumatic event.

Figure 2 Geometric #1

Figure 3 Eyes on time

Figure 4 The thermos bottle with its lid off
Figure 4 is an example of Client W's art after being exposed to slides and information on these two artists. This drawing depicted a thermos bottle that was open, the lid suspended in mid-air. Client W described this as his "life recovering from being too hot with a tight cover on in order to offer tea to others." This ability to discuss his art was a significant change; as he began to depict realistic objects, it appeared that he was developing the capacity to verbalize repressed feelings. Previously, he had been able only to sublimate these emotions through artmaking.

I experimented with showing this group of clients "Outsider Art," an inspiration from my trip to the Musée de l'Art Brut in Lausanne, Switzerland, and to several galleries in New York. Outsider Art is a term for work created by individuals who have no formal training. Often these individuals create a primitive or naive style of art. Many artists categorized as "outsiders" are artists with psychological problems. The adolescent group, including Client W, was shown reproductions of "Outsider Art." Other adolescents in the group shared Client W's interest in "Outsider Art," but did not identify themselves as artists. Viewing and discussing the art assisted these adolescents to understand that there is no single definition of art. After Client W saw the art, he shared his feeling of hope and inspiration that occurred when viewing the art of individuals who were not trained in art but whose work was currently selling in galleries. In this case, the identification with others who have similar problems can be what Yalom (1975) discussed as universality, a curative factor of group therapy.

During the transitional period in which Client W terminated with the partial hospitalization program and started to see me on an individual basis for art therapy, I recommended that he visit museums and galleries as part of his treatment plan. I also encouraged him to attend current art exhibitions with a friend or family member. Client W was receptive to these ideas and continued to integrate aspects of the art that he viewed into his own work. For example, after observing the work of Kandinsky and Hoffman, Client W's art became more geometrical (see Figure 5). This new ability to work abstractly opened up more avenues of expression and new ways of seeing. At the end of each session, Client W and I put his work up on an easel or wall to view. He discussed the meaning of his art and he titled each piece.

Franklin (1992), Landgarten (1981), and Rubin (1984) all discuss how the process of art therapy can increase self-esteem in adolescents. Museum and gallery trips seemed to have further increased Client W's self-esteem and development of identity. To foster his continued growth, I researched artists who had worked in styles similar to his, one of whom was Jean Michael Basquiat. Basquiat, originally of Haitian-Hispanic decent, had begun to impact the art world with his graffiti poems on the walls of Soho buildings before he died at age 27 from an overdose of heroin. According to Hunter (1992), Basquiat's strongest work is large canvases with rhythmic, improvised slashes of color, abstract signs, and mock-provocative imagery. Through identifying with the struggles of artists, Client W started to view himself as an artist.

After working together for 3 years, I contemplated organizing an art exhibit for Client W. With Client W's permission, I showed his art to several artists and art therapists who felt his work was exciting and showed artistic merit. This preview of his art prevented the potential disappointment of an exhibit being poorly attended or reviewed. I shared my colleagues' comments with Client W and together we planned an art exhibit held at a small gallery. The exhibit was well-attended; Client W sold several drawings and paintings. In addition, a curator of another gallery who attended the show scheduled Client W to have a show at his gallery the following year. After several years of creating art, Client W informed me that he now had an identity as an artist; he no longer saw himself as only a person with problems.

To assist the client in identifying himself as an artist is not the usual goal of an art therapist, but it was extremely important to Client W's identity and sense of self. Franklin's (1992) writing on self-esteem discusses art as a haven where the old self can be confronted and the new self rehearsed. Artmaking provides the possibility for clients to explore how they value themselves by observing what they invest of themselves in the artwork and how they respond to it. The continuum of acceptance and rejection becomes an inseparable feature of all art produced, thus creating repercussions for self-esteem issues (Franklin, 1992). Although the process of art therapy has not been a cure for Client W's bouts of depression and psychosis, it is a tool that he uses to assist him in his process towards psychological equilibrium.

Case #2

The case vignette of Mr. H is another example of the effectiveness of including art history and trips to museums and galleries in treatment. Mr. H, a man in his mid-twenties, had developmental delays and behavioral problems and had been diagnosed as emotionally disturbed. After being institutionalized as a child, he resided in several halfway houses. I worked with him once a week for a period of 5 years. During this period he was transferred to several different residences because of both behavioral problems and relocation of clients from various catchment areas. A recurring symbol in Mr. H's art was the image of a house. He drew many pictures of houses, several of which were empty. In some drawings he and I are depicted in the same house (see Figure 6). His stereotypical imagery seemed to be a metaphor for his experience of having to move from one residence to another. Although schematic representation has a place in the normal artistic development of children, often individuals with developmental delays are unable to progress in their artistic development unless some intervention occurs (Hentley, 1989; Wilson, 1972). However, once the therapist has succeeded in encouraging a client to take a first step in altering his images, further steps can be gradually promoted. For Mr. H, viewing slides of artwork and going to galleries and museums were a catalyst for changing stereotypical imagery.

Figure 5 Geometric #8
At times, creating art increased Mr. H's frustration and impatience with his stage of artistic development. He wanted his landscape pictures to look realistic, and if they were not rendered to perfection, he became disappointed. To encourage and motivate Mr. H to work from the landscape, I brought in books and slides of various artists who used a more painterly and abstract approach in their portrayal of the landscape (e.g., Wolf Kahn and Joan Mitchell). Viewing art encouraged Mr. H to draw landscapes from his memories. He especially enjoyed drawing scenes from the trips that he had taken with other clients to Cape Cod (see Figure 7).

After 2 years of treatment, he developed a sense of trust and rapport. I began to accompany him to museums and gallery shows which were inspiring to Mr. H. He became interested in doing drawings in a style similar to artists that he enjoyed. After attending a retrospective on Monet, Mr. H drew Figure 8. While viewing an exhibit on artists of the Stieglitz group, Mr. H spent long periods of time observing the watercolors of John Marin (see Figure 9). The museum staff, although taken aback at first by Mr. H's appearance, became curious about his love of art. They invited Mr. H to take a stool and create sketches from the artwork that he enjoyed.

Trips to museums and galleries seemed to increase Mr. H's self-esteem, especially when museum guards he once feared as authority figures allowed and encouraged him to draw at the museum. Activities of daily living skills (e.g., learning to take public transportation, handling money, communication, and socialization skills) were also enhanced by his museum and gallery visits. His treatment plan at his residence and at the sheltered workshop where he worked was based on a behavioral model. Staff would not allow Mr. H to go to a museum or gallery unless he attained a certain level of behavior for the week as indicated by the points that he earned on his chart. Going to the museum or gallery became a strong motivation for Mr. H to adopt appropriate social behavior.

Mr. H and I had developed a unique therapeutic relationship. Because I followed him to the different agencies with which he became affiliated, I became one of the few consistent staff members in his life. My sessions with Mr. H emphasized art therapy tasks that focused on decreasing inappropriate displays of anger and increasing verbalization regarding incidents that occurred in his residences. Mr. H was able to direct his anger through the physical quality of the art medium. When Mr. H was beginning to get agitated, he would choose art materials that could produce strong marks, oil pastels and oil bar sticks. On occasion when Mr. H felt that he did not want to create art, we discussed art and artists from books that I brought or books he borrowed from the library. At times I would discuss art from an

Figure 7 Cape Cod

Figure 8 Ode to Monet
"art education approach," which emphasized viewing the elements of art and allowing Mr. H to validate himself as an artist.

**Art History Immersion with Older Adults**

My experience with elderly clients demonstrated the effectiveness of using art history to motivate clients to experiment in art and to be less judgmental of their abilities to render objects realistically. Miller (1983) found that art history enrichment groups reduced clients' anxiety. Showing slides to clients can often motivate individuals who are intimidated by the idea of creating art.

A group of highly functional elderly individuals who lived in a housing project, viewed the art of abstract expressionists such as Mark Rothko, Helen Frankenthaler, Franz Kline, and Jackson Pollock and were encouraged to take risks, create larger works, and "free up." Their artistic productions began to include exploration with large color masses. Viewing the poured and splattered work of the "color field" artists encouraged clients to paint in new ways. One elderly woman had no money for brushes and painted with Q-tips. I took slides of her work, and we sent them to the Q-tip company. To everyone's surprise they sent her a check for $1,000 to use her creations for an advertisement. Another elderly women, Mrs. G, was inspired by hearing the story of Grandma Moses' transformation from housewife to artist. Mrs. G started to paint local scenes (see Figure 10). This enhanced her self-esteem and gave a sense of meaning to her life. Her new identity as a painter assisted her in dealing with some of her physical problems resulting from aging. Eventually she received recognition from the governor of the state for depicting historic images.

Life review is important for the elderly, and museum visits can often serve as a stimulus for reminiscence. Objects displayed in galleries and museums can play an integral role in stimulating verbal and nonverbal expression (Silverman, 1989). Mrs. M was a very quiet woman in her late 80s. She had immigrated from the former Soviet Union as a young girl. At the museum she surprised staff members with her knowledge of the paintings of Kandinsky and Chagall. The scenes portrayed in Chagall's work brought back memories of her youth. In subsequent art therapy sessions, she began to draw pictures that allowed her to start to process issues from her youth.

In working with women in their 50s, I discovered that including slide presentations of women artists who were dealing with changes in their lives fostered a deeper self-acceptance. One client was dealing with the infidelity of her husband and was rarely able to focus on anything else. I remembered a painting by Frida Kahlo entitled "Diego on my Mind" which may have depicted Kahlo's inability to forget about Diego, even when he was having an affair with her sister (Lowe, 1991). After hearing anecdotal
information on Kahlo’s life, including how Diego Rivera, Kahlo’s husband, was well-known for his infidelity, the client was able to put her images down on paper in an artistic style that was more meaningful and powerful than her usual choice of imagery, which was comprised mostly of flowers and kittens.

Conclusion

Art therapists need to acknowledge the power of art history as a tool in treatment. Unfortunately, many art therapists who refer to art history in sessions do so in a clandestine manner because they are afraid of being labeled art educators by their colleagues. Incorporating art history as a tool in treatment may be inappropriate for art therapists who have a limited knowledge base in art history. Cattaneo (1994) suggested that art is not the universal language that we are often taught to believe. However, in conjunction with a thoughtful and thorough assessment of clients’ needs and goals, incorporating art history into art therapy can motivate a wide variety of clients to take greater risks, resulting in art that is often more complete and richer than art produced without the inclusion of art history. The case studies presented offer supporting evidence that art therapy integrated in art therapy treatment plans can enhance self-esteem, socialization skills, self-awareness, expression of repressed issues, and creativity. It can motivate clients to take risks to put meaningful marks down on paper.

Images of the Heart: Archetypal Imagery in Therapeutic Artwork

Abstract

The image of the heart has intrigued philosophers, poets, thinkers, and dreamers across time and cultures. This article explores the image of the heart as it resides in art, myth, literature, and religion. It examines an archetypal art therapy approach to the use of the heart in the artmaking processes of two child clients seen in individual and group art therapy. The historical exploration of the heart is used as a background against which to view personal use of the heart image in art therapy, providing a rich context in which to examine client artwork.

Introduction

When the authors noticed images of the heart becoming prevalent in their own artworks, they were inspired to look closely at the historical and cultural use of the image of the heart. Like other art therapists, both authors are involved in making their own art and in using art to understand personal experiences. The research presented in this paper is a response to hearts occurring initially in both authors’ artwork. In seeking a context for these emerging hearts, they undertook the historical research of the heart’s appearance in art, myth, literature, and religion. This research in turn has informed their understanding of heart imagery emerging in client artwork.

The Archetypal Heart

Everywhere—in love songs, legends, dreams, and art—the heart beats its insistant voice. The heart has spoken since humankind’s earliest abilities to imagine. Eating the heart of the conquered gave power to ancient warriors. Tearing the heart out of a living Aztec hero propelled him into the heavenly realms and left sacred spiritual nourishment to his people. When the heart of the Mayan warrior was ripped from his body, it was placed in a basin held by a stone replica of the demigod, Chac-Mool (May, 1987, p. 27). Mexico City is built on the site of the Aztec capital, Tenochtitlan, which, according to myth, was constructed on the burial site of the heart of the magician and astrologer, Copil. From his heart sprung a sacred Tenochtli, the red prickly pear, upon which stands an eagle clutching in its talons a snake which he cannot succeed in devouring. This occurrence announced that “the glory, the honor, the fame of Mexico Tenochtitlan” (Debroise, 1988, p. 23) would never be destroyed and thus serves as a symbol of strength and survival.

Estes (1992) views the heart as the psychological and physical center of the human being. “In Hindu Tantras, which are instructions from the Gods to humans, the heart is the Anahata chakra, the nerve center that encompasses feeling for another human, feeling for oneself, for one’s own life, and feeling for God. It is the heart that enables us to love as a child loves…” (p. 159). In the story “Skeleton Women,” the heart is imagined as a drum which will “recall the spirits that are concerned with the human heart” (p. 159). Estes suggests that the heart-as-drum metaphor symbolizes the act of “awakening layers of the psyche not much used or seen” (p. 161) through its insistent beating. The heart of the Tin Man on the journey to Oz was once cut away by the enchanted axe; he was left in a timeless place, rusting away until others came to oil and soothe his joints. Of that lonely period he said, “I had time to think that the greatest loss I had known was the loss of my heart” (Baum, 1958, p. 30). Estes (1992) discusses the heart as one of the few organs whose loss one cannot survive.

The heart is one of the few essential organs humans (and animals) must have to live. Remove one kidney, the human lives. Additionally, take both legs, the gallbladder, one lung, one arm, and the spleen; the human lives—not well perhaps, but there is life. Take away certain brain functions and the human still lives. Take the heart, the person is gone instantly. (p. 159)

The Tell-Tale Heart (Poe, 1902) speaks metaphorically to the truth-telling nature of the heart, the heart as the central place of truth. In this riveting tale, the continuous beat of the dead man’s heart drives the murderer to also be the truth-teller. Here, the soon-to-be murderer approaches his future victim but is frightened by the beat of his heart.

And now at the dead hour of the night, amid the dreadful silence of that old house, so strange a noise as this excited me to uncontrollable terror. Yet, for some minutes longer I restrained and stood still. But the beating grew louder, louder! I thought the heart must burst. (pp. 110-111)

In both Eastern and Western medicine, the heart is seen as the body’s center of life energy. Chinese physicians consider the heart to be the ruler of Shen, or Spirit (Kaptchuk, 1986). According to Chinese philosophy, health is a balance of bodily energies, and the individual is seen as a “harmonious landscape,” a painting. Through this landscape, moves the jing, the essence which underlies all organic life, and qi, the quickening of matter into energy. As the storer of Shen, the heart rules the human’s desires to live life. “When Shen loses harmony the individual’s eyes may lack luster and his or her thinking may be riddled” (p. 46). One may lose the essential desire to explore, to create, to live freely, suggesting that perhaps one “has lost heart.”

Westerners tend to view the heart as a pump, pushing blood into the lungs to receive essential oxygen, then pushing the refreshed blood into the circulatory system to oxygenate and
energize each cell of the body. Alongside this scientific view of the heart is the modernized version of Psyche and Eros as it is presented through Valentine's hearts and Cupid's arrows. The stylized Valentine heart repeats itself in quilting patterns, baking forms, stencils, playing cards, and the hearts of Valentine's Day cards announcing love. The Valentine itself can be traced to German and English derivation that transformed the pierced and bleeding heart of the Baroque period Sacred Heart into a symbol of romance (Debouise, 1988). The romantic connotation, though cleansed up, may link back to the heart exchanges between women and Christ (discussed below).

There seems to be a longing for the repetition of the heart in the human search for center and for belonging. Etymologically, the Welsh word for heart is craeld which metaphorically means "centre." The Welsh language distinguishes this center from the bodily organ with "calon, a descendant of Latin caldus 'warm'" (Ayro, 1980, p. 277). No wonder the dispirited soul is drawn to continuously repeat the heart image in its longing for connection with the warmth of the continuously beating human heart.

The Heart of Devotion

In 1988, the Institute of Contemporary Art in Boston organized an exhibition entitled El Corazon Sangrante/The Bleeding Heart. This show centered on the image of the bleeding heart specifically as it has appeared in the art of Mexico; heart images portrayed the physicality of the symbolism of the heart as reflecting the archetype of romance and love as well as the heart as the pulse of life. In the exhibition catalogue of the same title, Debouise (1988), a critic living in Mexico and a curator of the exhibition, explains the medieval origins of the sensuality of the heart as it is portrayed in Mexican art forms.

Debouise describes how medieval Catholicism provided fertile ground to nurture visionary heart exchanges between religious women and Christ. These practices, referred to as the "mysticism of the disgusting" (p. 17), are chronicled in the lives of nuns from the 11th to 17th centuries. Catherine of Siena, Luigarde, and Marguerite-Marie Alacoque, significant women of their times, were empowered by their relationship to the sacred heart of Jesus and the blood flowing from his sacred wound. In these experiences,

the visionary literally penetrates into the interior of Christ's body, whereby occurs a complex mystical operation known as the "Interchange of Hearts" in which the young woman takes the vital organ of the Saviour, and gives to Him her heart in exchange. In other cases, Christ offers the organ directly, without requiring the act of penetration itself. (p. 15)

Each of these three women was subsequently canonized as a saint within the Catholic Church, although the Church later attempted to mitigate the sensual, bodily preoccupation within this image. According to Debouise, this "Cult of the Guts" presented issues of sensuality bordering on the obscene, presenting "a serious problem for the Church" (p. 17). The visions of heart exchanges heralded the "growing tendency to separate the carnal from the spiritual, the body from the soul" (p. 17). This is an important period in the history of the heart image because it is of the "Church"; it is "essentially feminine and folk"; and viewing it as holy or perverse, of saints or of witches, depends on the political outlook of the current culture.

In the art of Spain, Mexico, and southern Italy, images of the heart tend toward extreme realism, lacking the Northern purity of simple heart design. In religious paintings, the heart is presented "as a hunk of meat, as a piece of the guts, as a muscle swollen with blood. Removed from the body without losing any of its vitality, it is something more than mere symbol, it is... endowed with enormous emotional potential" (p. 19).

Baroque art shows the heart ambiguously serving both as container and content, as compact and dense yet simultaneously hollow. The contour of the heart appears as a "skin" and holds the blood of life. Though appearing dense, it also floats, suggesting lightness. Though it appears to pulsate, it has been removed from the body. Exposing the heart in this way exteriorizes the interior. Herein, the heart is revealed as a "vessel for the spiritual" (p. 21) and a "symbol for penance and suffering deemed necessary for true religious feeling" (Teitelbaum, 1988, p. 93).

In Figure 1, the traditional image of the Sacred Heart of Jesus is depicted by a 20th-century nun artist who lived within the spirit of the devotional heart and taught it to her students. As can be seen, this heart is pierced delicately, causing five drops of blood to fall downward. Circling the heart is a brier of thorns representing, for believers, the crown endured by Christ in his act of salvation for humankind. Above the heart burns a fire of love, engulfing the cross of humankind's redemption. The rays of light surrounding the heart signify the love of the Savior for the devoted ones.
Healing the Wounded Heart

A suffering child is perhaps instinctively drawn to the sacrificial heart. The sacrifice of the innocent may be an archetypal memory of children. In ancient times, young children were viewed with deep veneration as sacrificial offerings. Their lives often held greater meaning within the context of ritual and culture than simply as members of a family. Mayan babies born on the equinox were understood to be born especially for sacrifice in early adulthood (Personal communication, Chichen Itza, 1994). Their childhoods prepared them for the honor of sacrifice. During an illness, Emperor Constantine, 3rd-century ruler of all Christendom, "collected a number of children to kill them and bathe in their blood as a healing charm. However, moved by their mothers' tears, the emperor spared the children's lives after all, and the 'saints' restored his health as a reward for this act of mercy" (Walker, 1983, p. 175). Henderson (1968), in Jung's Man and His Symbols, discusses the mystery of human sacrifice. "It is precisely because it is a mystery that it is expressed in a ritual act that, in its symbolism, carries us a long way back into man's history. The ritual has a sorrow about it that is also a kind of joy, an inward acknowledgement that death also leads to a new life" (p. 113).

It is also true that "sacrificing" the heart's natural tendencies is likely to have long-lasting effects on a child's emotions. Florence Cane (1951) observed that if a child avoids painful feelings, her capacity for all feeling may become limited or negated. "The unconscious reaction to these rebuffs is withdrawal. In order to avoid fresh pain, the child avoids all feeling. Thus, the soul retreats, refusing to know or show emotion. The result is a timid or perhaps a closed personality" (p. 93). The fullness of the heart is sacrificed in the avoidance of feeling.

Malchiodi (1990) has documented the frequent appearance of the heart image in the artwork of sexually abused children, especially those who are father-daughter incest victims. She notes that these abused children often show the heart as a stereotypical heart image or that the heart shape is used on clothing. She suggests that the traditional use of the heart in symbolizing love and passion may account for its use in the drawings of sexually abused girls.

We suggest that the heart as depicted in art therapy work be "particularized" (Hillman, 1977) as image rather than generalized as symbol. By this we mean that each heart is specific in its own presentation. It does not represent something else; it presents its own meaning. Working from an archetypal model of art therapy, we facilitate an understanding of that meaning by attending precisely to a client's particular presentation of the heart. This "particularizing" (Hillman, 1977), accomplished partially through the act of precise description of an image, is at the heart of an archetypal, image-focused approach to art therapy.

Case Material S

Heart images dominated the art therapy work of 9-year-old S, who was hospitalized for sexual acting-out, depression, and failing grades in school. She created hearts as she guarded herself from verbally expressing her feelings and as she withdrew from adults.

Reportedly, S's initial sexual abuse was perpetrated by her mother; she had resided in a homeless shelter with her father and brother before being placed in a foster home where she was again reportedly sexually abused, this time by a foster parent. At the time of hospitalization, S was living with her father, brother, stepmother, and stepsiblings. As her treatment progressed, S revealed that her stepmother had also abused her. This revelation raised questions among her therapeutic caretakers. Was this latest account of abuse a figment of the imagination or a fragment of memory that had become confused with person and locale? Should S be put into a group home or returned to her family? At one point her psychiatrist encouraged her to consider the group home as the "best" place, while her psychologist considered a return to the family. Professionals in the clinical system urged S to "tell" her story so that a correct decision as to her placement could be made. However, feeling pressured under the urging and questioning, she withdrew from the array of clinical personnel—the psychiatrist, the psychologist, the group therapist, the art therapist, the nurses, the technical staff, and the teachers. A return to her family attracted her, despite its historical lack of safety. Her feeling of abandonment by the professionals she had come to believe were her trustworthy guardians echoed the loss of faith in her parents and encouraged her to retreat into silence.

S participated in group art therapy and embarked on what seemed to be a promising series of individual art therapy sessions. However, she initiated closure with individual art therapy; in a meeting to explore her desire to terminate, she said, "I don't trust adults anymore. I only trust the other kids." Subsequently, she joined only in group art therapy sessions, surrounding herself with her friends. In the group, she engaged actively with the art materials, painting heart after heart, while sharing little of herself verbally.

In this manner she enacted a theme common to children who have not been nurtured in return for their love. According to Malchiodi (1990), a significant result of sexual abuse trauma in children is their loss of trust in adults: "The person who destroyed that trust was someone who should have been the child's nurturer and protector. The closer the relationship between the child victim and the perpetrator, the greater the likelihood that the child's trust will be severely damaged" (p. 137).

Through her multiple abuses and the subsequent mistrust and withdrawal, the greatest of S's losses may be her heart's ability to feel connection with others. Yet, even in that loss, the heart remains present in her artwork. Her art shows us the journey of her heart. The specific heart images created in group art therapy during this period were unique to S. She made pierced and broken hearts, black hearts, smiling "I love you" hearts, and divided hearts. While these variations on hearts are common to children's drawings, close examination has the potential to reveal a precision and uniqueness to each individual heart. What seems significant in S's case is the timing of her preoccupation with this theme—as she withdrew from adult relationships, her involvement with the image of the heart increased.

In response to S's verbal withdrawal in art therapy group, the authors returned to the literature to facilitate an understanding of her use of this image. There is a striking similarity between S's bleeding heart (Figure 2) and the sacred heart of Figure 1. Both of these hearts have crowns, of a sort, and from both flow a kind of life-blood. In the crowning and the bleeding, both of these
hearts—one a drawing done by a contemporary child and one a traditional symbol painted by a 20th-century nun—symbolically suggest the idea of sacrifice. Without knowledge of the rich cultural meaning of the heart, here specifically the sacrificial heart, we would have a more limited context for understanding S's own depiction of what resembles the traditional sacred heart. S's sacred-heart drawing (Figure 2), includes the protective tangle of color common to her numerous heart drawings; however, more particularly, her image shows an opening in the tangle—there is a space above and below the heart into which may flow a breath of life even as the drops of blood fall.

Experiencing emotion directly seemed threatening to S, as evidenced by her withdrawal from adults and by her unwillingness to tell stories about her hearts. Her actions and drawings demonstrated that a closing off was necessary as she entered a period of waiting with no certainty to her future. It was in this closing off that the emergence of the heart, in its many moods and guises, took place. In working with this child who expressed herself nonverbally, our challenge was to look to the image for clues in the visual qualities of the image—movement of line and color, placement and pattern, and spatial relationships—as echoed through descriptive metaphors. Listening carefully to these metaphors of what is seen in the image can help us hear S's personal rendering of the archetypal image of the heart. Through this "sticking to the image" (Lopez-Pedraza, in Berry, 1982, p. 57), we remain close to S's particular expression, thus preventing a generalized symbol-based interpretation of the work.

Three marker drawings (Figures 3-5) were made very quickly in art therapy during the beginning of S's withdrawal from relationships with adults. In the first drawing (Figure 3), colored lines encircle two pierced hearts, one black, one red. A tangled mass of lines appears to the left of the hearts. The image shows us that when hearts are struck by arrows, what is left is tangled up; one metaphor heard here is that when the heart is struck, what is left is a mess. When the tangle is left, it strings out to encircle the pierced hearts and forms a many-lined floor below. The lining underneath is emphasized by the use of many colors and by the repetition of line. S rapidly drew lines of different colors in this and the two subsequent drawings; her hands flew from one color to the next and the next.

In the second drawing in this series of three (Figure 4), colored lines circle the red and black hearts, encapsulating and separ-
repeatedly emphasized. It is in this ground that the blending of all the colors is contained and in which there is potential for support; in the blending there is a grounding.

Figure 5, S's third drawing in this series, shows a change: The lines that encircle and enclose the hearts also connect them. As hearts are encapsulated by a colored lining, that same lining connects the hearts. The large golden heart, central in this drawing, is surrounded by lines and by reflecting pairs of black and red hearts; what is golden is central. To the left and right, colors circle hearts to form figure eights. Hearts are circled and connected by flowing lines; a multiple lining borders left, right, and underneath the hearts; the blended ground-line holds steady. When hearts are separated by lining, there is a connecting by those same lines. As S separates from adults around her, might there be a connecting with herself that happens through the image of the heart? There is a visible progression: First the lines were a tangled mess; then they became a grounding force, separating the hearts; and finally they circled and connected the hearts. "Only [the image] can tell us about itself" (Hillman, 1977, p. 68). In S's images, her heart's story appears to tell us about being left in a mess and about a separating and a subsequent connecting that is made of the same stuff as the mess.

Case Material J

J, age 10, was another child with a history of abandonment and sexual abuse who often used images of the heart in her art therapy work. Though more verbal than S, J expressed herself through her somatic ills. Malchioli (1990) suggests that children subjected to trauma are likely to have somatic complaints, possibly as a result of stress turned inward. J's existence was continually traumatic as she was moved from foster home to crisis shelter to foster home because of her own family's inability to care for her.

J entered most sessions with a headache or a stomachache. Often she cried from these aches and pains or asked for food to help her feel better. When asked what her aches and pains looked like, J initially produced The Headache Pain and More but Littler Pain. Both of these drawings place the heart in the context of the body. In The Headache Pain (Figure 6), the head is small and pressed against the top of the page; there is little differentiation between the head and the arms and the legs. The body is a large circle with a red-outlined heart in its center. Black markings around and inside the heart emphasize its centrality. Though the picture is titled The Headache Pain, the reddened, marked heart is what is central. When there's a "paine" in the head, the heart is central, reddened, embodied, and emphasized by black marker lines within and around it. Perhaps the prevalence of the pain required that it be known only in the head; yet in being particular to the presentation of the image, it is seen that the "headache pain" may actually be a heartache. Logically, the pain is placed in the head; imaginally, it appears to reside in the body and to be of the heart.

More but Littler Pain (Figure 7) shows a small pencil-drawn head and body in the middle of the page, all its sensory contact with the world cut off through lack of limbs and tightly shut eyes and mouth. The only feature of the body is the heart, "...one of the few essential organs humans...must have to live" (Estes, 1992, p. 159), surrounded by short lines. When there's "more pain," the heart is in the middle of it; and again, the heart is emphasized by dark markings. Other than within the heart, the pain cannot be seen, tasted, smelled, heard, or touched. Even when there is no other way to make contact, the heart is marked and is all there is to the survival of the body.

Later, while J talked, she filled a page with penciled hearts (Figure 8) right side up, upside down, and diagonal. While some of the hearts are like fish, one heart is upside down and darkened. In the lower, left corner is a brainlike mass with three dark hearts inside. There are hearts all over the page and in the head; when crowded in the head or upside down, there's a darkening of the heart. There seems to be continual confusion for J as to whether to place the feeling function in the head or in the heart. The rhythmic repetition of the hearts drawn on this page is rem-

**Discussion of S and J**

The hearts of both of these girls, S and J, required care by the art therapist. As S rushed about, the heart held steady on the page, separated yet connected, tangled yet untangled, changing from one image to the next. As S withdrew from those who wanted her to verbally describe her abuses (in order to determine the best placement possibilities for her), she drew into the sensuous place of her heart, that organ essential to warmth and connection, through artmaking. As those around her struggled to understand her situation, her heart-centered art images continued to emerge at their own pace making their own meaning of messiness, separation, and connection for S.

J's pains were recognizable throughout her body—in her head, stomach, and throat—but in the image, it was the heart that ached and called for attention through its presentation. When things were inexpressible except through somatic ills, then images of the heart appeared in J's artwork. Both Jung and Hillman (Hillman, 1977) discuss the idea of meaning being made clear through image. "As shape emerges, meaning emerges" (p. 75). As art therapists, then, we are in a position to facilitate image-making, thus facilitating the making of personal meaning. We believe that we have the opportunity and the responsibility to do this through an archetypal approach and attitude to art and artmaking because it supports the making of meaning for the client. The meaning emerging from S's work appears to be about the heart's ability to make connections out of the tangled mess even during a period of withdrawal. J's hearts seem to speak to the idea of the heart as central to the survival of her body; her hearts help to locate the pain as a heartache, not just a headache. Both girls, we believe, have used the heart in their imagery to express metaphors of sacrifice, feeling, and connection to a center in times of angst. Clearly, the heart as expressed in their artwork is essential to their survival.

**Conclusion**

In this exploration of the heart as symbol, image, and metaphor, the authors searched various literature sources. This exploration into art, myth, literature, and religion then provided a contextual framework for particularizing the heart in the artwork of two female child art therapy clients. Repeatedly, the heart's centrality to the expression of pain and disappointment, as well as to survival, emerged. When there was no other source from which to draw, the heart itself became the source and the image. With no other way to be heard, the heart repeatedly asked to be seen and listened to in its presentation in these clients' artwork.

The art therapists responded to these girls' hearts by attending to the heart of the matter—the image itself—inviting the emergence of meaning through the image, believing that the image has the ability to present its own particular metaphorical meaning. Part of the challenge for the art therapist is waiting out the emergence so the image is allowed to present its own meaning. Through this active inviting and awaiting of the images, noticing precisely how the image changes, the artist's process is attended to through an archetypal approach to art therapy. In caring for each of S's hearts as it emerged, noticing and mirroring, her own process of separation and connection was witnessed and given form. Because the therapist followed J through her somatic ills while simultaneously attending to her heart, J became able to focus on her own pain more precisely—the pain in her heart. By attending to each image with the child, the art therapist held the metaphorical meanings of the images in the process of that child. By viewing these personal images in their own particular presentation against a variety of presentations of the heart in the tradition of the imagination, the personal images and meanings were contained by the archetypal forms of the heart as it has portrayed itself through history.

Brief Reports

Children’s Drawings of the Elderly:
Young Ideas Abandon Old Age Stereotypes

Joseph A. Weber, PhD, Kathy Cooper, MS, RN, and Jenny L. Hesser,
Stillwater, OK

Abstract

Children’s drawings often reveal their attitudes, feelings, and concerns about different issues. Many children have little interaction with the elderly and therefore have a limited conception about old age. A qualitative method of asking children to draw a picture of an old person and then explain or tell a story about the picture is a unique way to unlock the hidden attitudes children may hold. This study concluded that children are abandoning stereotypes related to the attitudes and abilities of older persons. Potential applications for teachers, family therapists, and art therapists are also presented.

Introduction

Bobby, age 9, picked up his crayons and began drawing an active and energetic person who was roller blading with friends in a park. Ten-year-old Sarah spent a lot of time drawing a large face which had a smile from ear-to-ear. Tim, age 8, held up his picture and showed his third-grade class a drawing of a person listening to a “boom box.” The interesting thing about these pictures is that each student had drawn a picture of an elderly person.

A combined third- and fourth-grade class was having a group discussion on aging. The enthusiasm of the students was evident as they shared their ideas of aging and the aging process. Nine-year-old Cindy told the class about her grandmother and showed a picture of grandma riding a bicycle. Cindy emphasized, “My grandma is really hip.”

What is old? How do children view old age? Do children have a clear understanding of what it means to grow old? In reality, people of all ages, including children, have their own conceptualization of age and what it means to grow old (Filmer, 1984; Levin & Trosin, 1992; Sanders, Montgomery, Pittman, & Balkwell, 1984). Some clues may lay in the children’s drawings of the elderly.

When you think of old, what comes to mind? When thinking about an old person, what images do you see? If you drew a picture of old people what would they look like, who would they be with, where would they be, what would they be doing, and how old would they be? These qualitative questions were asked of 104 elementary school students in a Midwestern town. Each student was given a sheet of paper and asked to draw a picture of an old person using a procedure similar to the Draw-A-Person Test (Brown, 1977; Harris, 1963). The children were told to put the age of the person they drew and their own age on the pictures. The students also discussed their pictures with the rest of the class. The pictures were then qualitatively evaluated for the child’s concept of age based on content, activity level, and detail. Traditional quantitative experimental design was not applicable in this exploration.

Children’s Attitudes Toward Age

Children, like adults, have a unique and different understanding of age and what it means to be old. Children see and interact with older adults, elderly relatives, and grandparents on a regular basis. With increases in life expectancy, the U.S. Bureau of Census (1990) projects that the number of elderly people will more than double to 60 or 70 million people in the next 30 years. The fastest growing segment of the U.S. population are those individuals over the age of 85 years. It is very likely that children will interact with healthy, active, older adults and older family members as multigenerational family networks become common (Naisbitt & Aburdene, 1990).

Many of the myths about the elderly are accepted as fact, and over the years, our society has created an image of the feeble, ill tempered, unfriendly, and mentally slow old person (Braithwaite, 1986; Convey, 1988). Some of the most common stereotypes of aging include aspects of poor health, unproductiveness, senility, and unattractiveness (Dychtwald & Flower, 1989).

Children are likely to have a unique perspective on aging which is not influenced by past experiences or prejudiced views. Many studies have reported the notion that children accept the negative stereotypic images of old people and aging as true (Falchikov, 1990; Seefelt, Jantz, Galper & Serock, 1977; Zandi, Mirle, & Jarvis, 1990). It has been suggested that these negative images may reinforce poor attitudes toward and opinions of the elderly. Teachers, however, can help children build positive views of the elderly that will last a lifetime.
Children's Pictures of Old Age

Children's art is a novel way to gain information on children's thought processes about other people. Children's drawings of people can reveal a considerable amount of information about perceptions, concepts, and human dynamics as viewed through their eyes (Maxim, 1980). Through art children can be creative and imaginative as well as use verbal and problem-solving skills when they discuss their pictures with others (Smart & Smart, 1982).

In this study, children were asked to draw a picture of an old person and discuss the picture's characteristics and features. The discussion and information children shared about their pictures gave new insight into the child's concept of old age. The responses and discussion clearly set a tone of curiosity and excitement among the children, while common negative stereotypes and myths of aging were minimized.

The third- and fourth-grade students in this study ranged in age from 8 to 11 years (mean age = 9.1 years) with the classes being almost equally divided by gender (52.1% boys and 47.9% girls). Drawings were grouped into three categories of artwork. Students were likely to draw a picture of an old person which consisted of the following:

- Face—detailed facial characteristics
- Body figure alone—one old person detailed
- Body figure in scene—an old person interacting with other people, pets, objects, and places

Interestingly, most of the children spent a great deal of time drawing an old person within a scene (50%), almost a third (30.8%) drew a body figure alone, while the remaining (19.2%) sketched a face which often filled the entire piece of paper (see Table 1). Pictures often included older people interacting with other people of all ages. Not only were old people socializing with others, but they were very happy. The sketches showed smiles on 64 faces; 31 expressions were neutral; only nine displayed frowns or unhappy looks.

Children had a rather realistic view of what age they considered old. In the pictures drawn, the average age of the old person represented was 87.5 years with a mode of 90.0 years. The range was from 50 to 199 years old. Over half (58.6%) of the children showed an old person as healthy and active with no disabilities, while some of the children drew pictures of old people with mobility aids such as canes, wheelchairs, or walkers. Children took a great deal of time to color their pictures. Clothes, faces, scenery, and background objects were often in bright shades of yellow, green, orange, and blue.

David, age 9, drew a picture which incorporated elements of exercise, enthusiasm, happiness, and togetherness. His picture was a scene of four adult figures, ranging in age from 63 to 100 years (see Figure 1), who were walking, jogging, and rolling (in a wheelchair). David illustrated motion and showed his figures (both men and women) outside on the grass on a sunny day.

Nine-year-old Heather also drew a scene, but unlike David, she illustrated a 99-year-old woman dancing (see Figure 2).

Figure 2 A 99-year-old woman dancing

2353
picture incorporated elements of music, motion, and a variety of musical instruments with the words "rock and roll" coming out of a large horn. In discussing her picture, Heather told the class that this is her grandmother who loves to dance, and, "I'm going to teach her how to skateboard."

All the children who drew figures alone emphasized a front view of the older person. Exactly half of the pictures focused on a mobility aid (a cane or walker), while the other half depicted an old person standing alone. This is illustrated by Travis' (age 9) and Kathy's (age 9) pictures (see Figures 3 and 4). Travis showed a 79-year-old man who was getting ready to go jogging with a 20-pound weight in each hand. In a dialogue with the teacher, Travis mentioned, "I'm going to be this way when I'm old." Kathy drew an 87-year-old woman with a cane. Both of these pictures are representative of all the figures-alone pictures; the figures are standing flat footed, arms stretched outward, and facing forward.

Large detailed faces often told a story of emotion and depicted vivid expression. Of the 32 children who drew faces, a majority (45.8%) emphasized happy, smiling faces with large red lips, rosy cheeks, and brightly colored eyes. This was particularly evident in Tessa's (age 9) picture of a 76-year-old woman (see Figure 5), whom Tessa depicted in a joyful, happy mood. As Tessa held up her picture for the rest of the class to see, she said she gave her older person the name "Clappy Happy." The remaining children who drew face pictures had either a neutral expression (33.3%) or a sad/angry expression (20.8%).

Discussion

In conclusion, we found the results of this study astonishing. The drawings were a simple, interesting, and enjoyable way to obtain children's views on a topic which is sometimes difficult to discuss. The children revealed that they do not hold typical negative beliefs of old people and the aging process, and their drawings were very positive, presenting an energetic look at the elderly. Even when depicting elders with mobility aids, the children used bright colors and full face views, possibly indicating optimism in spite of a minor dependency. This counters the typical view that children negatively stereotype old age and infirmity.

There are many uses for children's drawings of the elderly. Classroom teachers and counselors can use the presented technique to open discussion on intergenerational issues pertinent to students and their older kin. Family therapists can identify children's attitudes from their drawings and discussions and target programs and interventions to strengthen family bonds.
Additionally, art therapists can use this technique to explore children’s views of older relatives and contacts, facilitate discussions of feelings, and identify coping strategies for troubled families.

Editor’s Note: Joseph A. Weber, Ph.D., is an Associate Professor at the Department of Family Relations and Child Development, College of Human Environmental Sciences, Oklahoma State University, Stillwater, OK 74078-0337. Gender Differences and Similarities in the Spatial Ability of Adolescents

Rawley Silver, EdD, A.T.R.-BC, HLM, Sarasota, FL

Abstract

It is generally accepted that males are superior to females in spatial ability. To test this assumption, the Silver Drawing Test (SDT) was administered to students 12 to 15 years old (N = 33 girls, 33 boys) attending public schools in Nebraska, New York, and Pennsylvania. The test instrument included two spatial subtests: Predictive Drawing (ability to predict and represent sequential order, horizontality, and verticality) and Drawing from Observation (ability to perceive and represent left-right, above-below, and front-back relationships). No significant differences in spatial ability were found.

Introduction

Gender differences have been found in the anatomical structure and organization of the human brain. In the female brain, both hemispheres are involved in verbal and visual-spatial abilities as well as in emotional responses (Moir & Jessel, 1992). According to this research, more information is exchanged between hemispheres in the female brain because the corpus callosum (the bundle of nerve fibers linking the hemispheres) is thicker and has more connections. As a result, women may be better able than men to recognize emotional nuances in voice, gesture, and facial expression. Females may deduce more from such information because they have a greater capacity to integrate and cross-relate visual and verbal information. The emotional nuances may also be manifest in art forms because gender differences in the emotional content of drawings have been found in responses to the Drawing from Imagination subtest of the Silver Drawing Test (Silver, 1990, 1992a, 1992b, 1996).

Gender differences have also been found in spatial ability. According to McGee (1979), psychological testing for more than 50 years has concluded that the most persistent individual differences on multifactor tests of psychological functioning is a sex difference in spatial ability, with males consistently excelling. Gaulin and Fitzgerald (1996), studying the behavior of voles, also found male superiority but hypothesized that male voles evolve superior spatial ability only when they are more mobile and have larger home ranges than females. According to Moir and Jessel (1992), male superiority in spatial ability is not only confirmed but also not even in dispute.

Nevertheless, Hunter (1992) found female college students in Australia superior in spatial ability, as reported in her study on individual differences in problem-solving, information-processing, and other skills. Her subjects included 128 women and 65 men, 15 to 53 years old. The men predominated in engineering and construction courses, the women, in office and education courses. Hunter asked her subjects to respond to five tests. In one of the tests, the Silver Drawing Test of Cognitive Skills and Adjustment (Silver, 1990), women showed higher mean scores on visual-spatial relationships than men, performing better on tasks involving the perception of height, width, depth, and to some extent, sequential order. Hunter concluded that her findings were consistent with Silver's theory that cognitive skills evident in verbal conventions can be evident also in visual conventions.

The present study addresses the question of gender differences in spatial ability as measured by the tests used by Hunter. The Drawing from Observation and Predictive Drawing subtests of the Silver Drawing Test (SDT). Subjects were 66 adolescents attending public schools in Nebraska, Pennsylvania, and New York.

Method

Subjects

Subjects included 33 girls and 33 boys, 12 to 15 years old, attending public schools in Nebraska, Pennsylvania, and New York. The SDT was administered by teachers or art therapists who volunteered to help establish the validity and reliability of the test. In Nebraska a classroom teacher administered the SDT to six boys and nine girls, 13 and 14 years old, who comprised half the number of eighth graders in a rural public school. Since this class had previously been divided for periods of music and art, their teacher decided to test all students during the art period (Silver, 1990). In New York the author administered the test to 15 girls and 23 boys, 12 to 14 years old, all the seventh- and eighth-grade students in a public school in an urban, middle-class neighborhood. In Pennsylvania an art therapist tested nine girls and four boys, 14 and 15 years old, all the 10th grade students. Their responses were scored by both the art therapist and the author as part of a study of scorer reliability. Correlations between the two sets of scores ranged between .71 and .81, significant at the .01 level (Silver, 1986). The responses produced in Nebraska and New York were scored by the author.

The SDT Observation Subtest

The aim of this drawing task is to assess the ability to perceive and represent proportions, positions, shapes, and three-dimensional relationships of height, width, and depth. Examinees were asked to draw an arrangement of three cylinders which differ in height and width, and a small rock. Responses are scored on a 5-point scale for level of ability to represent horizontal relationships (left-right), vertical relationships (above-below), and relationships in depth (front-back). Accurate and carefully represented responses score 5 points. Approximately correct but
not carefully represented responses score 4 points. When the relationships of three objects are represented correctly, responses score 3 points; two objects, 2 points. When only one object appears in the correct position, responses score 1 point. When no object is in the correct position or when there is no representation of height or depth, the score is zero.

The SDT Predictive Drawing Subtest

This subtest includes three drawing tasks (see Figure 1). For the first task, respondents are asked to add lines to a row of glasses, showing how the glasses would appear as their contents are gradually consumed. Drawings which show an evenly spaced series of descending horizontal lines with no corrections score 5 points. Drawings with unevenly spaced increments score 4 points. Those with no sequences, incomplete sequences, two sequences, or sequences with erasures or other corrections score zero to 3 points respectively.

The second task requires respondents to draw a line on a bottle half filled with water, showing how the water would look if the bottle were tilted. The third task requires them to draw the way a house would look if moved to a steep mountain slope. These two tasks are adapted from tasks designed by Piaget and Inhelder (1967) for evaluating concepts of horizontality and verticallity. The scoring is based on their observations and rated on the scale of zero to 5 points.

Procedures

In order to compare responses to the Drawing from Observation and Predictive Drawing subtests by 33 girls and 33 boys, mean scores were analyzed using a computation of T-test scores.

Results

No significant gender differences in spatial ability were found, as shown in Table 1. The overall Manova indicated no overall gender differences on spatial measures. Although the girls’ mean scores tended to be stronger in ability to represent depth (front-back relationships), the probability was less than .10 and was not significant. However, it may be significant with a larger number of participants.

Discussion

Although the present study found no significant gender differences in spatial ability, as measured by the Drawing from Observation and Predictive Drawing subtests, Hunter (1992), using the same subtests, found that women excel while other investigators found that males excel. How can these contradictions be explained?

A possible explanation is that some investigators who found male superiority did not use drawing tasks to assess spatial ability. For example, Thomas, Jamison, and Hammer (1973) used a scientific apparatus to present the Piagetian horizontality task. These investigators found that many university women students had not discovered that water remains horizontal regardless of the tilt of its container and did not readily learn the principle through observation. Their report generated much publicity at the time.

In reading the report, I noticed that an illustration of the task seemed to show a subject adjusting the position of bottles mounted on, round, rotatable disks below eye level on a machine. Apparently, a critical clue for discovering horizontality was missing: an external horizontal frame of reference. According to Piaget and Inhelder (1967), horizontality is discovered by noticing parallels, so in their teaching experiments, they presented a jar of water on a table at eye level. “Care was taken to have the level of the water at the height of the child’s eyes, or a little above, so that he [or she] can see the edge of the surface clearly” (p. 381). The Predictive Drawing task provides an external horizontal frame of reference, a line representing the table surface, but apparently the experiment by Thomas et al. (1973) failed to do so, thus discouraging, rather than encouraging, the discovery of horizontality (Silver, 1978).

Although the present study found no significant differences between genders, Hunter found females superior in representing height, width, and depth, and “to some extent” sequential order. Reasons for the different findings may lie in differing cultural backgrounds, sample numbers, and ages of the two groups of examinees. The 66 American adolescents, 12 to 15 years old, had been compared with Hunter’s Australian sample of 65 men and 128 women, 15 to 53 years old.

Further study with responses by American adults may clarify the issue. In addition, a more critical examination of Hunter's thesis would be helpful. Although it is clear that female superiority was found in responses to the Drawing from Observation task, it is not clear what was found regarding the horizontal and vertical concepts revealed in responses to the Predictive Drawing task. Additional information about the methodologies used by Hunter, Thomas et al., and other investigators who examine spatial abilities may shed more light on the conflicting results.

The findings reported or summarized here suggest that nonverbal expression through drawing offers unique opportunities to contribute to the growing body of knowledge about age and gender differences and similarities.

Editor's Note: Rawley Silver, Ed.D. A.T.R., R.I., can be contacted at 700 John Ringling Blvd #1603, Sarasota, FL 34236-1504; home phone (941) 361-7521; work (941) 377-4512 (phone/fax). The author would like to thank Joan Swanson and Robert Volosky, Ph.D. A.T.R., who volunteered to administer the Silver Drawing Test to these adolescents, as well as Madeline Altube, Ph.D., who performed the statistical analyses reported here. Their assistance is greatly appreciated.

Abstract

Every other year for the past 8 years, AATA has surveyed its members to obtain demographics, job and salary information, and areas of specialization. The 1994–1995 membership survey focused additionally on licensure and training issues. In 1994, approximately 4,750 surveys were sent; 2,091 members responded for a 44% return rate. The results of this survey are presented in this article to illuminate the art therapy profession through the responses of its practitioners.

Introduction

"How is AATA going to help art therapists get licensed as art therapists and become covered by insurance companies? This is a primary concern for all art therapists." This comment from the 1995 membership survey echoes the concerns of many art therapists today. One of the purposes of the biennial membership survey is to assess such concerns. By surveying its members, AATA can consolidate information about demographics, job responsibilities, education, and other current licenses. In turn, this information can demonstrate the growing need for licensed art therapists by presenting a clear picture of the art therapy profession.

This most recent membership survey was sent to all AATA members along with the 1995 dues statement. The survey addressed such issues as demographics, education, job titles and tasks, settings and populations, and licensure and further training. Out of approximately 4,750 members surveyed (AATA, 1995), 2,091 responded. The results published in this article reflect only those members who responded to the survey. Results of the three previous surveys appear in Gordon and Manning (1991), LaBrie and Rosa (1994), and Malchiodi and Waller (1989).

Personal Characteristics

Ninety-three percent of the respondents were female; 91% were Caucasian (see Figure 1 for ethnicity figures). The highest percentage of respondents had 6 to 10 years of experience in art therapy, although there was a large range, from a few months to over 20 years (Figure 2). The majority of the respondents, 68%, had either a Master of Arts or Master of Science degree (Figure 3). Responses came from all the states except North Dakota and many countries around the world (Figure 4).

The AATA members who responded were most likely to also
belong to the American Psychological Association, the American Association of Marriage and Family Therapists, the American Counseling Association, the National Art Education Association, or the National Association of Social Workers. About 20% belonged to a state or regional art therapy association. Interestingly, over 100 respondents reported belonging to the California Association of Marriage and Family Therapy (CAMFT), more than twice as many as those members who belong to the American Association of Marriage and Family Therapy (AAMFT).

Job Information

The most commonly reported job title was art therapist, followed by counselor/clinician and art psychotherapist (Figure 5). Many people also wrote in professor or assistant/adjunctive professor, educator or teacher, coordinator, and social worker. Fifty-two percent of the respondents reported working in a psychiatric or mental health setting. Private practice was reported 29% of the time (Figure 6). Chemical dependency, family and youth services, foster care/adoption agencies, in-home family...
therapy or crisis intervention, and community services were frequently written in.

The specialties and populations reported most frequently were adult psychiatric, abused/neglected children, psychotherapy, adolescent psychiatric, families, and sexual abuse. These were consistently chosen for the first through fifth choices. Grief/loss and creativity were often chosen for the fourth and fifth choice. Other specialties or populations were often written in, including behaviorally or emotionally disturbed clients, women's issues, couples, juvenile delinquents, homeless, and ADD/ADHD.

Individual and group therapy were the modalities most commonly indicated by the respondents. See Figure 7 for the full listing. Assessment or evaluation, case management, program/text development, treatment and discharge planning, and writing were also frequently indicated.

Salary Information

The most commonly reported income was between $26,000 and $30,000 per year, although the range was broad. Pay increased predictably as the number of hours worked per week increased. People working between 31 and 40 hours per week reported earning between $26,000 and $30,000 most often. People working over 40 hours per week typically reported earning between $31,000 and $35,000.

Salaries by setting are listed in Figure 8. AATA members working in private practice or higher education most often reported earnings in the higher ranges. Earnings in the lower ranges were reported by therapists working in geriatric or "other" settings. Again, the range was broad enough to make generalizations difficult.

Figure 9 illustrates salary by degree. Respondents with doctoral degrees reported earning the most money while those with bachelor degrees reported earning the least. The lower range is likely to reflect students who were working at unpaid internships at the time of the survey. Of those with master's level degrees, social workers reported earnings in the highest categories most often; those with MFAs reported earnings in the lowest categories most often.

Salaries appear to increase with the art therapist's years of experience. The most commonly reported salary range for those with less than 2 years experience was between $21,000 and $40,000. The most commonly reported salary range for those with more than 20 years experience was over $40,000. Figure 10 shows the relationship between salary and years of experience.

Male art therapists were twice as likely as female art therapists to hold a doctorate. Yet they were three times as likely as
female art therapists to earn over $30,000 a year. This disparity in salary is worth further study.

Registrations and Licenses

In addition to an A.T.R., the most commonly reported license or registration was Marriage, Family and Child Counselor (Figure 11). Other therapists also wrote that they were licensed as a social worker, educator, mental health professional or counselor, or marriage and family therapist. The number of responding A.T.R.s per state is shown in Figure 12.

Thirty-seven percent of the respondents stated that they needed training in addition to their art therapy education to obtain their current jobs. Those who most frequently reported this were behavioral scientists, mental health workers, and counselors/clinicians. Those holding doctoral degrees and MSW degrees were also most likely to report additional training. Hawaiians reported the most additional training, followed by

Figure 10 Salary by Years of Experience

Figure 11 Registration/License

Figure 12 Number of Reported ATRs per State
Oklahomans, Minnesotans, and Californias. Those who reported getting additional training for their jobs were over three times as likely to earn more than $50,000 yearly.

**Longitudinal Trends**

By comparing these results to those obtained from earlier surveys (Gordon & Manning, 1991; La Brie & Rosa, 1994; Malchiodi & Waller, 1989), one can see both growth and consistency in the field of art therapy. AATA membership has grown consistently over the past 8 years. In 1989, Malchiodi and Waller noted a 9% increase in membership over the 1988 statistics. By 1991, membership had grown another 18%. By 1993 and 1995, membership grew 21% and 20%, respectively. Minority membership has grown, as well. African-American membership has increased from 0.6% in 1991 to 1.9% in 1993 to 3.1% in 1995. Hispanic membership has increased from 0.8% in 1991 to 1.4% in 1993 to 1.9% in 1995. Asian-American membership has increased only 0.2% in the past 4 years.

AATA members have remained consistent in their education level, although there has been an increase in doctoral degrees. With a slight decrease, master’s degrees continue to be the most commonly reported degree: 86% in 1989, 82% in 1991, 83% in 1993, and 79% in 1995. Members with doctorates rose to 5% in 1993 and 6% in 1995.

Over the years AATA members have consistently reported adult psychiatric, adolescent psychiatric, and psychotherapy as the most common specialties and populations. In 1991, therapists began frequently reporting sexual abuse as a specialty or population. This has continued to be a common response. In 1989, many respondents indicated addictions as a specialty. However, this has not been reported as frequently since then. Child psychiatric was reported frequently as a population in 1989 but has declined in recent surveys. However, sexual abuse and abused and neglected children increased in the number of responses. For the first time in 1995, family was one of the most frequently indicated specialties.

Each of the previous surveys reported salary information in different formats, thus it is difficult to make comparisons. Nevertheless, salaries appear to have increased since 1989. In 1989, the salary mode was between $20,000 and $25,000. In 1991 the highest mean salary was $37,007 for those in private practice. In 1993 and 1995, the mode salary for those working between 31 and 40 hours per week between $26,000 and $30,000.

**Future Surveys**

The concerns voiced by many AATA members about the 1994–1995 survey, such as lack of clarity and limited ethnicity, have resulted in a changed format for the 1996–1997 survey. Members’ suggestions were taken into consideration when the 1996–1997 survey was written. Continuing feedback from AATA members through biennial surveys is extremely important to create a better understanding of the field of art therapy.

A Place to Stand: Maori Culture-Tradition in a Contemporary Art Studio

Michael Franklin, MA, A.T.R., LSW, Bowling Green, OH

He tohi whakairo Where there is artistic excellence
He mana tangata There is human dignity

Introduction

During a recent sabbatical, I spent 3 months in New Zealand. (Aotearoa is the Maori word for New Zealand, meaning land of the long white cloud.) While there I experienced many events that had an impact on my personal viewpoint of art therapy. The majority of my time was devoted to observing facets of the indigenous Maori culture. Two major settings that allowed these interactions were institutions for higher education (the Polytechnic system) and Vincent's, an open art studio in an urban downtown area. Art-as-therapy, for many reasons to be discussed later, flourished in this studio setting. The purpose of this article is to highlight the unique applications of art-as-therapy observed at each site and to show how Maori culture contributes to the unique imagery in this setting. I conclude with some remarks about our profession that were influenced by this experience.

Maori Culture and the Visual Arts

As a culture, the Maori people are deeply spiritual and connected to preserving tradition and community. They believe that everything possesses a maori (life force) and wairua (spirit) (Doig, 1989, p. 46). Operating with a profound sense of reverence for the forces of nature, honoring ancestral heritage, and preserving their language and art are just a few of the efforts that have allowed the Maori, through years of struggle, to remain a cohesive people in an amalgamated postcolonial age. Although a wide range of cultures is represented in New Zealand (multiple Polynesian, Eastern, and Western peoples), many from the Maori community feel that multiculturalism will remain a well-intentioned myth until such time that a bicultural attitude prevails that honors and accepts the original culture of the Maori. In essence, it is difficult to accept new, multiple groups until the original group is fully embraced. They have worked hard to preserve the richness of their many traditional customs and beliefs, particularly their artistic heritage. This has not always been easy. The challenge of living in postcolonial New Zealand in the 90s often presents complicated issues.

In the past, non-Maori New Zealanders have often minimized the Maori influence on the arts and looked to Europe and other Western sources to shape their aesthetic directions. Currently the pakeha (non-Maori people of fair skin, usually of European, American, or British origin) are strongly considering the indigenous history of the Maori and their profound use of spiritually-invested visual imagery. However, the current age of globalization and the resulting practice of image appropriation have raised many controversial issues. Taking Maori images that have a unique and specific cultural history and using them in one's personal non-Maori art without a true understanding of their purpose is a frequent and disturbing practice. This lack of awareness blatantly demonstrates a trend of cultural insensitivity that flourishes in an atmosphere of image appropriation. The result is believed to be a form of disrespect for what many feel is a matter of intellectual property.

For the Maori, contemporary approaches to art are greeted with a wide range of challenges. Maori elders feared the disintegration of their customs and beliefs as nontraditional influential modes of expression surfaced (Mataira, 1984). Preserving and honoring ancient artistic practices while living and creating art in contemporary society fostered serious questions concerning cultural identity. Noticing these very dynamics, Mead (1984) questioned the assimilation of contemporary art forms as a possible sign of an eroding culture. He observed that:

Maori artists trained in the schools of the pakeha are spearheading a movement to change the face of Maori art more radically than ever before. One does not know whether they innovate with love and understanding, or whether they are about to ignite new fires of destruction (p. 75).

According to Mataira (1984), contemporary Maori artists:

did not feel that they transgressed the mana (prestige, status, authority, psychic force) of past treasures but looked forward to making their work equal to the revered content they were expressing. With that freedom the Maori aesthetic prevailed and traditional elements still made their presence strongly felt, although the journey was now largely a personal and intuitive one (1984, p. 9).

Maintaining and honoring ancestral connections is a major component of Maoridom. The very core of "the Maori psyche revolves around tribal roots, origins, and identity" (Doig, 1989, p. 25).

An oral tradition prevailed before the arrival of the first Europeans. This contributed, in part, to the wide range of exclusively three-dimensional art objects made during this period. The Maori are highly accomplished in carving (bone, wood,
stone) and weaving (flax linen). These art forms were sacred, honored, and cherished professions (Doig, 1989). Art is very much alive since it embodies qualities such as "thi (power), wahi (awe, fear), and mana (excitement, thrill)" (Ibid., p. 45). For the Maori, the significance and beauty of art are not dependent on the integration of formal properties of art, harmonious design, flawless craftsmanship, or originality. Instead, art is beautiful as a result of its thi or power in the way that it can physically affect the viewer to respond spontaneously (Mead, 1984). An artwork, according to Mead, is treated like a person since it stands for ancestors who occupy a significant place in daily life. The Gods spoke through the vehicle of the artist. This person followed specific protocols and tapu (religious or ceremonial restriction) which showed respect for the Gods (Doig, 1989).

Highly accomplished contemporary Maori artists such as Pakariki Harrison are well aware of the constraints or tapu in which traditional carvers participated. For example, food and woman were not allowed around certain carvings, and the carvers were not to engage in sexual contact until the project was finished (Mataira, 1984). Since tapu no longer permeates all of Maori society, artists question how they can honor the practices of the past and allow art made today to reflect contemporary life issues. It is not easy to integrate ancient practices with current shifts in cultural identity. But it does seem that art, with its profound flexibility to bridge past and present, is a likely way to engage in the challenge to define life for the Maori who live in the latter 20th century.

Admittedly, it is difficult to fully grasp the essential role of the arts in the lives of the Maori. I urge the reader to recognize the severe abbreviation that is offered here and the precious heritage that so easily transcends language. This is an exceedingly brief outline of a large subject that encompasses a complicated history of a people. For an in-depth discussion on this subject, see Mead (1984).

The Marae: A Place to Stand

(Many of the ideas discussed here originate with the work of H. Tauroa and P. Tauroa, 1986.)

The marae is the wahi rangatira mana (place of greatest mana), wahi rangatira wairua (place of greatest spirituality), wahi rangatira iwi (place that heightens people's dignity), and wahi rangatira tikanga Maori (place in which Maori customs are given ultimate expression (Tauroa & Tauroa, 1986, p. 17). It is the home of ancestors, family, and the place to stand on mother earth connected to all that a culture could possibly feel. It serves as the central gathering point where tribal affairs can be discussed and experienced (Doig, 1989). For many, the marae offers the urban dweller a sacred place to return, a place of connection where past, present, and future exist simultaneously. The result is an opportunity to reclaim a sense of ancestry, soul, and spirit so easily ignored in 20th century life. These themes are important to understand since Maori culture permeates every remote region of New Zealand society, especially settings where art is created. Realizing that the marae was much more than the physical space it occupied helped me to grasp the quality of transcendence that pervades every aspect of this sacred space to fully "be." A traditional Western sense of place was an inadequate frame of reference by which to try to comprehend the marae.

Arriving at a marae, particularly for pakeha, requires that one be aware of the many protocols for conduct designed to honor the invitation to participate in deeply celebrated customs (Tauroa & Tauroa, 1986). The range of customs are too vast and numerous to describe here in detail. Therefore, a brief description will be offered along with a personal account of what I encountered on one marae.

One of the most revered structures on the marae is the te whare tipuna (ancestral house), also referred to as whare whakairo (carved house), whare nohe (sleeping house), or whare runanga (council house) (Ibid., p. 90). This magnificent carved structure is truly a symbol, containing an endless range of significant themes that are sacred to a people (Figure 1).

Being welcomed onto a marae and entering the meeting house for the first time are profoundly moving experiences. The kai karanga (caller, always a woman) called us to as a form of spiritual welcome, connecting past to present through the first words to be spoken. As I crossed the threshold the penetrating sounds of disarming choral harmonies, for which Polynesian cultures are famous, surrounded and entered me. I felt I was stepping into a holy place, the belly of a people where the spirit of ancestry dwells. Tears came to my eyes as an unknown language and culture embraced me. Access to the spiritual followed as 40 of us pressed noses (hongi), sharing one breath, two feeling as one. I felt safe in this house, contained, held, feeling that I had entered a passageway into the hearts of a people that I knew very little about. Later I learned that the song was welcoming both me and my deceased ancestors, that I was to be treated as part of their community as they cried with me for my loved ones who have passed over. Much that is seen and unseen was alive through song, the word, and the great ancestral space of the meeting house.

Customs continued to unfold throughout the morning, and, in fact, for the entire week, which was the length of my stay. I was spending all of this time in the company of polytechnic college students at their school. The marae was on the school premises, adding a unique dimension to public education. Deeply spiritual themes were embraced throughout the week. All were focused on making art about the Maori creation myth of Papatuanuku (earth mother) and Ranginui (sky father). What was so moving was that the myth was alive in this traditional educational setting. Students were immersed in their own art process to search for the mauri (life force) that is present in myth and kept alive.

Figure 1
through art. Instructors and students alike formed a community as they entered into a dialogue with sacred themes. I observed how the marae acted as the body or vessel for the people. The art process became a way to articulate the range of student experiences and create a record of what was activated by myth. This was a stunning event to observe, revealing that spirituality and academics were not only existing side-by-side, but were integrated into an exceptional learning environment.

The marae and the art it inpired were responsible for the apparent success of this unique cultural and spiritual experience. The inner sanctum inspired by this great cultural refuge is recognized by all as a place where centuries of ritual and custom bridge the dualities of life. Within this space the history of Maori culture is retold through the combination of oral traditions, such as storytelling, and arts, such as carving, weaving, and, more recently, two-dimensional work. Because the history of Maori culture evolved, in part, as the result of these traditions, current life on the marae easily embraces the arts as a way to keep the culture accessible and alive. In fact, culture was much more alive than I ever witnessed in a traditional educational setting. Limitations of space and time seemed to be transcended as ancestors were summoned for guidance, myth activated, and art celebrated to affirm the Maori way of being.

Art as Therapy in New Zealand

As far as my research and sources in New Zealand were able to confirm, there is no formal advanced art therapy education in this country. However, this does not mean that art therapy is not alive and developing spontaneously. One reason it has been forming relates to a cultural and social awareness of the benefits inherent in the artistic process. This awareness has been influenced, in part, by the Maori artistic tradition. Just as in the United States and Europe, the genesis of our profession is surfacing in New Zealand out of an art-as-therapy framework. Artists who know well the importance of the creative process, the capacity of paint to wrap itself around emotion, and the stimulation of a studio atmosphere have been hard at work for years in alternative settings in this country.

Arts Access Programs, a term developed by the Queen Elizabeth II Arts Council of New Zealand, have surfaced as a way to introduce people with little or no exposure to the arts. Usually designed for people with specific needs, these programs attempt to facilitate the integration of the arts into communities such as prisons or psychiatric hospitals (Cooke, 1989). Efforts to institute this policy culminated in the development of programs such as the Creative Expression Unit at Cherry Farm Psychiatric Hospital in Dunedin. Believing that art has the capacity to affect and change behavior, additional settings such as Waikeria Prison developed an 8-week inclusive arts program for inmates in 1988 (Ibid.). Selected artists took up residency at the prison and offered their expertise in areas such as music, mural painting, stone carving, psychodrama, and traditional Maori art forms. It was believed that in this setting, as well as others, the emphasis should be placed on wellness rather than illness (Hodges & Norton, 1991). Artists were selected for professional, technical, and aesthetic achievements in their respective fields. The experience enabled inmates to interact within the prison environment with renewed enthusiasm. Mural painting, for example, allowed the prisoners to re-create their predictable environment within the institutional setting (Cooke, 1989).

As far back as 1870, Edward and Esther Seager realized the value of the arts and created a program at what is now known as Sunnyside Psychiatric Hospital. Over 100 years later a multi-activity arts program was developed at the minimum security section of the hospital known as Stewart Villa (Hodges & Norton, 1991). Six artists, along with staff, participated with more than 60 residents. A study evaluating the feasibility, resident participation, and resident well-being (team building, self-esteem, and expanding worldview) yielded strong support for developing similar programs in facilities around the country.

Vincents

While visiting New Zealand, I was based in Wellington, the capital of the country. This manageable harbor city is surrounded by a hillside. Situated downtown is a wooden, one-story building. Fixed along its exterior is a series of charming plywood paintings, worn like badges of accomplishment. Housed in this structure is a community-based art studio called Vincents. Its green painted frame strongly contrasts with the surrounding vertical office buildings. I could not help but see Vincents as an oasis in the middle of the usual austere urban landscape (Figure 2). The mission statement of Vincents, much like the building's function and physical presence, supports a humanizing environment for "psychiatric survivors":

Vincents is an arts and crafts workshop committed to building a non-threatening, sharing, and supportive environment to the interest of a healthy community. Vincents responds to the needs of participants, in particular, those who are psychiatric survivors.

Initiated in 1985, founding principles focused on maintaining a "culturally safe" setting strongly grounded in the spirit of the Treaty of Waitangi, the "sacred covenant and social contract" of 1840, established between England and the numerous tribes of New Zealand (Doig, 1989, p. 60). Although this treaty was intended to guarantee Maori people equal rights as British citizens, it was usually ignored by the Crown's legal system. Today, however, the treaty is recognized as the "Magna Carta" of the constitutional rights of the Maori people (Ibid., p. 69). Vincents, like many other agencies, strives to uphold these principles by creating a place of mana for Maori and pakeha alike. Elements of
the marae, such as providing a place to stand, and art forms, such as bone carving, are celebrated and encouraged to thrive in this setting. In addition to being culturally sensitive, this open art studio serves those who are usually denied access to the arts due to circumstance or disability. After leaving institutionalized settings, people need community support to make a smooth transition to a previous lifestyle. Vinca tries to welcome everyone, particularly low-income people who are unable to afford similar services elsewhere.

As an art therapist, I was deeply affected by this setting. It was alive, filled with art and creative energy. This thriving studio atmosphere, fully stocked with ceramics equipment and a woodshop, printmaking equipment, painting and drawing facilities, invited endless exploration and dialogue (Figures 3 and 4). It worked because people needed a place to go. It also worked because artmaking, rather than treatment, was pursued. The staff was determined to allow people to focus on their creative interests despite their diagnostic labels.

Professional art tutors were always available to offer personal, cultural, and creative support. When they were not lending technical or emotional guidance, these tutors were encouraged to pursue their own artworks. People attending Vinca rarely appeared intimidated by the artmaking of their tutors. Instead, they seemed to be inspired by watching them manifest the possibilities inherent in a wide range of materials. This studio atmosphere put vision into action. I consider it similar to Edith Kramer’s work (1958, 1971) and recent writings on art therapy, such as Pat Allen’s advocacy for artist-in-residence programs (Allen, 1992). For example, Kramer’s goal of helping young artists create work that “contains and expresses emotionally loaded material” free of direct interpretation from the art therapist closely resembles the intent of the studio atmosphere at Vinca (Kramer, 1971, p. 34). According to Kramer, the working atmosphere should convey that the art therapist “wants neither to impose his ideas nor to elicit any specific information, but that the therapist is there to help him in any way he can to achieve what he wants to do” (Ibid., p. 44).

The “clinicalification syndrome” that Allen describes as using art primarily as a source for diagnosis, discussion, and interpretation was ardently avoided by the tutors at Vinca. However, in several discussions with the director, I affirmed the need for informed knowledge beyond an intuitive understanding of the people who came to Vinca. Many participants struggled with personal issues; they had few places to go and make sense of these challenges. Vinca’s was their niche or refuge where the personal could merge with the visual. The ideal tutor in this setting would be a psychologically/culturally aware, informed artist with an educated understanding of human behavior, particularly the dynamics of establishing a working alliance, and, most importantly, a deep connection to the visual arts. Such a person would be able to protect the sanctuary of art and understand the care necessary to form a relationship with a person who has a turbulent past. Training would include developing art-based skills (Kramer, 1986), developing one’s artist self, and acquiring a wide range of interpersonal skills. Knowledge of psychotherapy would be necessary, although secondary to the goal of helping others receive the benefits of prolonged encounters with creating art.

Being an artist is not always enough. However, approaching artwork with the impulse to cliniify it may defeat the benefits of the art process. Between these approaches exists a hybrid in which art and therapy support, rather than compromise, each other. This fusion of qualities was typical of many of the tutors at Vinca. “Witnessing this studio in action brought a feeling of mourning within me. I felt as if I was observing the origins of art therapy as it began several decades ago in the United States unfold before me. There was a sense of loss as I wondered what had happened to our art-focused beginnings.” Something about Vinca was familiar to me, yet out of reach. Here was a setting where art was therapeutic but for nonclinical reasons. The benefits gained by those attending rested in the flexibility of the art materials, the sanctuary of the art process, celebration of Māori culture, and the opportunity for safe relationships within a working atmosphere. Paradoxically, the tutors were as curious about the way art therapy is practiced overseas as I was about their nonclinical community-based approach. After several hours of discussion we recognized that each had something to offer the other, particularly about ways to integrate art into the lives of people. We recognized that all was not so perfect at Vinca. There were some inherent though understandable problems. Clearly, an art background alone did not offer a sufficient foundation to interact successfully with particular people who attended the studio.
Reflections

Any future development of art therapy in New Zealand will be influenced, in part, by the Maori culture. A bicultural blueprint for living with myth and life is carefully modeled and pursued within contemporary Maori society. Art therapy, in many ways, strives to reintroduce the integrity of these absent connections within the inner world.

My visit to New Zealand allowed me to reconnect with long-held convictions concerning cultural empathy and the richness of an art-as-therapy approach. The studio atmosphere is alive with the benefits reaped from engaging in the creative process. My comments are not calculated to minimize the efforts of those in our field who are doing significant clinical/psychotherapy work and research. As a growing field, it is inevitable that we operate from a variety of ideological viewpoints. However, our challenge has been and is to remain as flexible as the art materials we offer. As art is drained from the graduate curriculum and we expect students to arrive with this training, an imbalance results. We deny ourselves the essence of what we claim to offer for the well-being of others!

I cannot help but wonder about a group of people who often identify themselves as artists and yet feel malnourished in this area. Vincent offers a view of art therapy beginnings and longings. The success of this endeavor highlights what I feel are our mistakes as we move further away from teaching about and working within the art-as-therapy and studio model. The beauty of our work is in the process and materials we offer. The more we provide by way of artmaking, the more we honor our own creative heritage and serve those we encounter.

Author's Note: I wish to thank Rick Lucas, Ross Hemera, Allen Whongi, Lloyd Harwood, and Ray Thorburn for their generous support during this project.

Pioneering in Perth: Art Therapy in Western Australia

Introduction

Although Western Australia covers a third of the Australian continent and almost a million square miles in land mass, more than half of its inhabitants live in its capital city, Perth (Williams, 1995). Considered the "City of Lights" ever since American astronauts captured its bright sparkle in their photographs from space, Perth is now one of the fastest growing cities in Australia (Kelly, 1995). It is also perhaps one of the most beautiful cities in the world and undoubtedly one of the most isolated. Perth is as far from Sydney as Los Angeles is from Chicago, and the distance between the two cities is covered by vast stretches of uninhabitable desert and scrub land (Mikes, 1968). The city itself, however, is lush, situated on the coast of the Indian Ocean and sprawling around the banks of the Swan River. There are scores of picturesque parks carpeted with unique wild flowers which attract thousands of visitors each year.

It was to this city that I went when I left the United States 3 years ago to teach in the first art therapy training course in Australia at the Academy of Performing Arts at Edith Cowan University. Because art therapy is new to Australia, I was invited to come to Edith Cowan to help develop the art therapy program's curriculum and serve as its clinical director.

The Art Therapy Training Program

The program is based on course recommendations of both the American and British Art Therapy Associations. The content of the lectures, seminars, and workshops resembles training programs overseas in that it combines experiential and didactic coursework. The theoretical orientation of the program is based on an integrated model of psychotherapy which seeks to understand how the major theoretical perspectives (i.e., psychodynamic, developmental, humanistic, and cognitive/behavioral) fit together as a whole. Rather than simply being eclectic or subordinating one theoretical approach to another, the program draws from the collective wisdom of multiple perspectives while searching for complementarity and convergence among them. Value is also placed on multicultural awareness—an understanding of how sociocultural factors influence and regulate the expression of human behavior. Viewing psychological problems within their sociocultural context only serves to enhance the integrity and effectiveness of our art therapy interventions, especially in a city like Perth where there is great diversity of race, ethnicity, and culture.

In addition to equipping students with a working understanding of major theoretical concepts and an awareness of the basic constructs of a multicultural orientation, they are encouraged to generate new ideas by combining and transforming concepts in innovative ways. Encouraging a creative approach to theory is one element of the program's general promotion of a creative attitude in all aspects of professional training. The philosophy of the program is reinforced by its placement within the Academy of Performing Arts. Affiliation with the Academy is a source of great inspiration and an acknowledgment of the importance of creative expression for all people, enhancing quality of life for the general public and restoring the quality of life for clinical populations.

Psychosocial Functions of Aboriginal Art and Healing

Since my arrival in Perth, I have been studying the psychosocial functions of Aboriginal art and its healing potential in Aboriginal communities. The majority of Aboriginal communities suffer from a wide range of physical and psychological problems, and their health concerns are best understood in the context of their history of cultural oppression (Hunter, 1993). Terrible devastation resulted from the colonization efforts of the dominant white culture which, in the early history of Australia's settlement, included deliberate genocide and brutal assimilation. These cruel policies robbed Aboriginal people of their cultural identity, religion, language, family life, and land (Ward, 1982). Although social changes in recent years have advanced Aboriginal people in social and political spheres, their communities still face the serious obstacles of widespread poverty, racism, unemployment, lack of education, and increased mortality (Reser, 1991). Inextricably linked to the disintegration of their cultural identity are the widespread problems of depression, delinquency, domestic violence, and substance abuse (Reid & Trompf, 1991). These problems have left many Aboriginal people in a desperate state with a devalued sense of their own cultural identity and potential.

Conventional mental health care services have generally proven ineffective in helping Aboriginal people cope with their troubles because they are often established on worldview principles that conflict with Aboriginal culture (Eckermann, 1992). These services often do not take into account cultural differences in value orientation and communication. Many values implicit in mainstream therapy, such as individualism, independence, assertiveness, and direct expression of feelings, conflict with the Aboriginal emphasis on collectivity, interdependence, control of feelings, and cooperation, where the highest good is perceived as contributing to the fulfillment of community needs. Aboriginal people are understandably suspicious of public health services because they are highly institutionalized and viewed as part of
the white bureaucratic system which was a source of oppression in the past (Anderson, 1988). Another obstacle to the successful delivery of health services is that they are often administered in isolation, separate from an Aboriginal person's community, and do not make use of the person's cultural affiliation and support system. The fact that there are only a very small number of Aboriginal people trained to staff the various public health agencies and institutions within their communities compounds the challenge of successfully delivering public health treatment with sensitivity to cultural differences (Thompson & Payne, 1992). Although there is a recent trend toward recruiting Aboriginal staff and increasing sensitivity of non-Aboriginal health workers, there is still a paucity of effective and relevant public health services available to Aboriginal people.

In their struggle for survival, more and more Aboriginal people are now speaking out against the inadequacy of conventional mental health services in their communities (Fougher, 1995). They complain about European-style approaches to mental health treatment which emphasize medication. Plus, they consider Eurocentric perspectives on their problems to be another form of oppression. They are calling for an indigenous interpretation of therapy which is holistic and community-based, offered in partnership with Aboriginal people. Rather than restricting therapy to typical clinical settings, Aboriginal communities are requesting outreach efforts where therapeutic services can be offered at the grass roots level, as close as possible to where Aboriginal people live. There is also a request for therapeutic services to include a willingness to acknowledge the reality of social oppression and an effort to empower Aboriginal people through fostering cultural awareness and self-esteem. From the Aboriginal point of view, effective therapeutic health care must respect Aboriginal values and strengthen a sense of community and cultural identity to restore Aboriginal dignity.

There is perhaps no better way to meet these aims than by incorporating the arts into the recovery process for Aboriginal people and their communities. Art possesses a power which has proven to be very effective in creating social cohesion and self-respect among Aboriginal people (Caruana, 1993). Being creative has always been an integral part of traditional Aboriginal life, and the arts have played a crucial role in the process of healing (Crumlin & Knight, 1991). Although traditional engagement with art was disrupted through colonization and assimilation in all but the most remote areas of Australia, Aboriginal art continued in less traditional forms, helping many Aboriginal people endure social oppression and reach beyond it by preserving and affirming their creative vitality.

Art holds great promise for opening doors of reconciliation and understanding between Aboriginal and non-Aboriginal people. Although Aboriginal relations with the dominant white culture are strained in practically all areas of contemporary Australian life, the most hopeful signs of mutual respect and equality can be found in the area of art (Sutton, Jones, & Hemming, 1998).

In recent years a greater public recognition of the artistic creativity of Aboriginal people and many Aboriginal artists is evident through exhibits of their work in art galleries of major cities both within and outside of Australia. Aboriginal art is increasingly perceived as an important part of contemporary art practice and considered by some to be Australia's most unique and inspiring art form (Sutton, 1988). The growing awareness and interest in Aboriginal art has strengthened the Aboriginal struggle for survival, especially since many artists receiving public recognition are in the forefront of the national Aboriginal movement for civil rights and cultural renewal.

Given that Aboriginal art has shown great potential for promoting cultural identity and serving as a cross-cultural bridge for reconciliation, it is unfortunate that artmaking has not been integrated into most mainstream mental health strategies for working with indigenous people. It is also unfortunate that there has not been more public support for access to art resources and facilities in Aboriginal communities. However, a small but growing number of unique arts programs are helping to preserve Aboriginal culture and to facilitate the social rehabilitation of Aboriginal people. These programs are set up by Aboriginal and non-Aboriginal artists in collaboration with indigenous communities to reintegrate art into Aboriginal life. In addition to providing an opportunity for creative expression and cultural renewal, these programs are proving to be an important and natural part of the individual and community healing process, helping Aboriginal people find the meaning they need to recover a sense of hope and wholeness.

The reincorporation of the arts into the lives of Aboriginal people is supporting therapeutic and social changes for many who have not been reached by conventional mental health services (Sokil, 1993). This confirms the idea that tending the psychological well-being of Aboriginal people can be very effective if offered as part of a holistic approach intricately linked to creative expression. The artists working in these programs use a model of arts facilitation that respects the Aboriginal worldview and responds to the call for social change. These artists are helping to break down barriers between Aboriginal and non-Aboriginal people and improving race relations as trust and reconciliation grow out of sharing the art experience.

Nalda Searles

One artist who is playing an important part in reintegrating art into Aboriginal communities in Western Australia is Nalda Searles, a non-Aboriginal artist and former psychiatric nurse who, in 1992, was invited by an Aboriginal corporation, Warta Kutju, to implement an art-based project for the Wongutha people who live on the fringes of the remote mining town of Kalgoorlie (Searles, 1994). Most live in conditions of extreme poverty, unemployment, and poor health. A significant number of them are also alcohol and drug dependent, yet are not being cared for or are only marginally cared for by public health agencies. The attitude of local non-Aboriginal people contributes to the distress and alienation of these fringe dwellers since they are considered to be lazy, careless, and irresponsible. Under the influence of oppressive attitudes that question their value and human dignity, many have held a fatalistic view of life that produces a loss of self-respect and a lack of belief in themselves.

It was in this fringe-dweller community that Nalda lived and worked for a 17-month period, funded by a grant to develop an art program that fit the everyday lifestyle of these people, to relieve and soothe their spirits by facilitating pleasurable involvement with art. Her hope was to spark a creative interest and interchange that could promote a positive sense of self-worth and
community esteem. Meeting these people on their own terms meant that Nalda needed to be mobile (i.e., working from a vehicle) and available to work in the natural gathering places of Aboriginal people (e.g., street corners and parks). Offering a variety of art materials, Nalda encouraged many fringe dwellers to engage in artmaking, taking her cues from them as she encouraged development of artistic interest.

As they got to know Nalda, their involvement increased over time until some would paint for hours. Although she offered support and responded to occasional requests for advice about choice of themes and use of materials, Nalda's approach was largely nondirective, encouraging each individual to create whatever he/she wished. The most common subject matter to emerge was landscape painting, which is not surprising since a connection to the landscape is so important in Aboriginal culture. They also created designs based on traditional Aboriginal motifs and narrative scenes based on life events or Aboriginal myths and stories. Their artistic ability was remarkable and their motivation was impressive. As Nalda noted, "They rarely said, 'I can't paint'; they just got on with it, learning through the exploration of the media and from each other." Sometimes more than one person worked on the same art piece, adding new features and parts of a story. Similar to the process of creating traditional Aboriginal art, this collaborative way of working promoted social cohesion and a sense of belonging.

The program was successful in achieving its goal of providing a respite from the depression and suffering in these people's lives. The fringe dwellers expressed great appreciation for the program and a desire to have it continue in the future. Their arts involvement became a source of enormous satisfaction that provided a vital focus for many who before the program had wandered aimlessly with little or nothing meaningful to do. It reinforced a sense of community by unearthing images related to aspects of traditional Aboriginal heritage. The program also led to feelings of pride and accomplishment, especially for those whose artwork was admired by others.

One person whose work was especially admired is an Aboriginal elder, Mary McLean, who, with Nalda's encouragement, developed a unique style of painting. Her dynamic and boldly colored art features scenes of Aboriginal bush life with themes of gathering, preparing, and eating food. Mary's participation in the art program led to her first exhibition in Perth and, more recently, to national and international recognition of her work. Her involvement with the program has transformed Mary's life, and she is now a role model of an artist and a bridge-builder for others in her community.

Although not an art therapist, Nalda's approach was similar to an art therapist's approach because she used art to facilitate contact and communication with people who were psychologically distressed and in extreme need. The art became the means by which she established trust and rapport, providing empathic listening, encouragement, and validation of life struggles. Nalda's former training as a psychiatric nurse served her well in fostering dialogue and a shift in attitude which assisted many of the fringe dwellers to clarify their problems and opportunities for change. It was evident that they had a great need to talk about their difficulties which were naturally communicated as part of their arts involvement.

Midland Park Project

Art therapists have much to learn from this community arts approach which has shown great potential as an avenue for healing Aboriginal communities. The program also offers a hopeful alternative model of therapy in which individual healing is not separated from community life. Inspired by Nalda's work, our art therapy department has become involved in a similar community-based art project modeled on the Kalgoorlie program and developed by artist Philippa O'Brien.

I was invited to meet with Nalda, Philippa, and Aboriginal artist Bob Cameron to collaborate on the planning of a suburban art project for Aboriginal people who congregate in the working-class park of Midland. This town is the center of the largest Aboriginal population in the metropolitan area, a junction point for those who have migrated there from all over the state of Western Australia. Its park is a natural gathering place for many Aboriginal people who, like the Kalgoorlie fringe dwellers, are in a state of extreme need.

The park project will become the focus of one of our art therapy internships and will entail providing the Aboriginal people with a variety of art materials as well as some food, since many are often hungry and undernourished. As was the case in Kalgoorlie, they will be invited and gently encouraged to draw and paint. As a relationship develops, we hope to establish art

Figure 1 The Aboriginals believe that everything in nature is alive and needs to be cared for and nurtured.
therapy sessions that will expand the art process to address both individual and group problems on a deeper level.

Phillippa has already made contact with a few of the people in the park and the responses to the project have been very encouraging. Val Takeo, for example, is an Aboriginal woman whose artwork is quite impressive, considering that she has never painted before. Having lived through the early days of enforced conformity to white ways (perhaps the most dangerous threat to the underpinnings of Aboriginal culture and its continuance), Val realizes the crucial need to preserve aspects of her culture. She uses her art as a form of visual narrative depicting childhood memories, ceremonial activities, and traditional Aboriginal stories. For example, one of her paintings features an image of an Aboriginal creator spirit whose head is painted as part of the earth, indicating his continual presence in the landscape (Figure 1). Above him rises a female earth spirit who is a reminder that everything in nature is alive and needs to be cared for and nurtured by Aboriginal people. In another painting Val depicts an image from an Aboriginal story about Willy Willy, a spirit of a dust storm which travels its angry path carrying the spirits of the dead along with it (Figure 2). Val's art is helping to reclaim her personal past and to revive the collective heritage of her people by visually recording the folklore and life stories that have survived the dark and violent history of Aboriginal oppression. As the park project develops, we hope that Val will continue to recover unknown or forgotten aspects of her culture and through her example inspire others to share experiences that can strengthen Aboriginal identity.

The Psychosocial Function of Art

My research on the psychosocial function of art and its healing potential in Aboriginal communities has confirmed, over and over again, how interlinked arts involvement is to Aboriginal health and cultural survival. It appears that artistic expression promotes healing through touching an integrative life principle in Aboriginal communities where creative involvement becomes the very source of cultural restoration.

The fact that art is so valuable in helping to restore Aboriginal self-esteem and community identity suggests that art therapy holds tremendous promise as a therapeutic method when working with Aboriginal people. Our proficiency in visual communication and expertise in therapeutic process can foster a new level of reflection and understanding for those Aboriginal people with whom we work. To be truly effective in our cross-cultural work with Aboriginal people, however, we must use a broader and more embracing therapeutic approach that affects not only the individual but also the social body of the Aboriginal community as a whole. We must expand the parameters of art therapy practice to support the indigenous values of sharing and affiliation, nourishing the need for connectedness and community bonding. Our Western emphasis on individual and personal achievement must be viewed as culturally relative, and we must not slip into ethnocentric ways of working that diminish the profound importance of interdependency in the social sphere of Aboriginal culture.

Challenging our value assumptions has the additional benefit of encouraging us to consider problems in our own culture from a different vantage point and realize solutions that may be suggested by the Aboriginal way of life. The rootlessness and alienation so characteristic of the Western world are costs that many pay for self-achievement and for conditions that reward competition and independence. In pursuit of that which Western culture has established as the norm, values of generosity and cooperation may be depreciated, leaving us with a restricted sense of our social interdependence. Aboriginal people, with their acute awareness of the interconnectedness of individual human circumstances, remind us that well-being not only means having a healthy mind but a healthy community spirit as well. To cure the ills of our own society may mean finding ways to nurture greater social connectedness and more effective interaction between tending the needs of both the individual and community.

Cross-cultural programs with Aboriginal people also suggest the need for art therapy approaches that are not restricted by conventional therapeutic frameworks and clinical settings. The needs of indigenous people often elude the social welfare system. It is not enough that our work be carried out within the walls of public health agencies. We must form a healing partnership with Aboriginal people through developing art therapy strategies in collaboration with them, reaching out to their communities and making ourselves available to enter their worlds and work among them. This is part of the necessary bridge-building that must exist between indigenous and nonindigenous people if true healing is to occur.

It is my hope that as the Perth art therapy program grows it will attract Aboriginal students who will go on to take a leadership role in developing art therapy in Aboriginal communities. Helping Indigenous people help themselves will make art therapy a more efficacious method of treatment; but, until there are
Aboriginal art therapists to care for their own people, we are left with the challenge of the cross-cultural therapy situation.

Providing effective cross-cultural art therapy treatment for Aboriginal people means adopting therapeutic interventions in a holistic manner that is culturally relevant and supports the deepest needs of Aboriginal people: creativity, community, and empowerment.

I am sure that our work with Aboriginal people will have implications for how art therapy will evolve in Western Australia and will challenge us to further develop culturally sensitive interventions that reflect an appreciation for the uniqueness of the Aboriginal culture and the common humanity we all share.

Earthquake!

Susie Andruk, MA, A.T.R., La Canada, CA

January 17, 1994

At 4:31 on the morning of January 17, in a matter of only 40 seconds, the lives of Southern Californians were changed unexpectedly and abruptly. A 6.8 earthquake rocked the San Fernando Valley. Its effects were felt as far south as San Diego, north to Santa Barbara, and east to Las Vegas, Nevada.

It was an immensely unsettling feeling. My family and I, who live 30 miles from the epicenter, were rattled and rocked in our home. Many things flew through the air, but we did not lose power, and we were able to quickly recover from the initial shock of the quake. However, many others were not so fortunate.

January 18, 1994

I practice art therapy in Northridge, California, the epicenter of the earthquake. I attempted to go to work the day following the earthquake, hoping to find out what had occurred at the hospital. I did not know what to expect, how bad the damage would be, or even if I could get to the hospital by car. I took my usual route but was unable to use the Simi Freeways because of closings due to damage.

I drove the surface streets, attempting to follow the detour, and slowly made my way from the San Gabriel Valley to San Fernando Valley. The drive that usually takes 35 minutes turned out to take well over an hour, as I slowly proceeded from intersection to intersection through detours and signals that were not functioning, allowing only one car at a time to go through an intersection. There were no police to assist in directing traffic. All along the way, streets were buckled, and water gushed out of fire hydrants, down gutters, and into the streets from broken water pipes.

The number of fallen walls increased as I neared the hospital. Concrete block walls in particular appeared to be vulnerable. Piles of bricks and cinderblock were everywhere. The dust filled the air with a strange stickiness; thick and heavy, it created an unusual color in the sky. Stillness and a sense of chaos surrounded me all the way. People wrapped in blankets were in the streets, camping out in make-shift tents. Children in pajamas sat on curbs. Signs hung from trees imploring, "We need food and water." The incredible amount of neediness was extremely overwhelming.

I drove down Roscoe Boulevard through a profusion of traffic. When I caught sight of the hospital, several blocks away, I knew that at least from a distance it was still standing. I hesitated to park on the street because all the curbs and sidewalks were separated and, here too, water was gushing. It seemed that no safe place was available, as I tried to park in a place free of power lines and other dangers such as large trees or block walls that might tumble during the aftershocks.

Crossing the street to the hospital, I found a situation I had never seen. The hospital did not have power or running water, and most of the doors were blocked. Security guards were posted everywhere, directing and cautioning people. The hospital's central driveway had buckled 8 to 10 inches; red tapes marked where people were not allowed to enter. Yellow tapes directed people through areas where they could walk with caution.

Everyone reporting to the hospital was asked to sign in so there would be a record of who was inside in the event that an aftershock caused damage. Before entering the hospital, I looked up at the parking structure, a building reserved for doctors, patients, and high level employees, and saw a vertical crack that went to the top of the five or six story structure.

A row of port-a-potties was outside the hospital in an attempt to maintain sanitation. Signs on all drinking fountains and other areas where once water could be obtained cautioned in English and Spanish not to drink the unsafe water.

Inside the hospital, behind the main entryway, the earthquake had created an 8-inch separation between the floors where two buildings had previously been joined. Plywood was placed over the floor and taped down. The seismic safety inspectors decided that this part of the building, despite this 8-inch separation, was indeed "safe." In the "safe" part of the hospital, light fixtures with squiggling wires dangled from ceilings. Broken glass was strewn beneath each fixture that had burst. People were cleaning up the glass. The hospital CEO had joined them. In blue jeans and holding a drapery, he swept up while thanking employees for making the effort to come to work.

Great walls were cracked and one hospital building was totally inaccessible. Some lights were powered by the hospital generator, but there was no telephone service, giving a real sense of isolation from the outside world.

Gradually, through seemingly endless hallways on designated walkways, I made my way to the building where I worked. The front door had not been deemed usable for pedestrian traffic. Along the stairwells and walks, chunks of concrete were down, leaving bricks, steel reinforcements, and girders exposed. Was it safe to be walking here? A strange, eerie emptiness and quiet filled the hospital, in contrast to both the usual day-to-day hubbub and the horrendous noise that accompanied all this crunching of concrete. Walkways that had been flat were now twisted and askew, visibly off-center, and no longer at right angles. Pieces of thick, vinyl wallpaper once used to hide the imperfections of commercial construction were buckled and bubbled.
Stairwells were the most frightening because of their hollowness and sense of being impenetrable. Water damage from broken pipes was marked with caution signs.

When I finally reached my office, I found two of my coworkers. It was very comforting to see familiar faces. Our office was in a shambles. Enough light from the windows and a generator light in the hall allowed us to see overturned bookshelves and files, broken glass from lamps, vases, picture frames, and mugs. Nearly everything was on the floor. My office was not in particularly bad shape, but directly across the hall the social worker's office had been flooded and smelled of the dank stench of soaking paper. All her patient files were damaged.

Our first job of the day was to clean up the offices. We three who had arrived first were from the most distant locations. Although we had difficulty driving in, we had suffered the least personal damage to our homes. We could account for only about one-half of our co-workers. No one had heard from either department head. Few people came in that day, but, by day's end, we were able to account for all but three department members.

We shared experiences about how we had each fared, our personal experiences with our families, our lack of preparedness, and our inability to give comfort. Children and their fears of returning to school were big issues. Later, we learned that at least three employees had such severe damage that they could not occupy their homes.

After we superficially cleaned the offices, putting things back on shelves, realigning desks, cleaning up glass, and leaving doors open to air the foul-smelling water-damaged areas, we went elsewhere in the hospital to see what was needed. Since there were no phones, we were unable to contact patients and other staff members. We spent some time tending to the child care unit that had been set up within our department in the occupational therapy area, since the usual child care unit had been damaged too severely to be used and children had been moved down to the first floor. Many children were there. They needed attention and a lot of comforting, particularly during the ongoing aftershocks that were very disruptive. Every time the children were calmed, another aftershock occurred. One time causing an enclosed glass display cabinet to drop many glass shelves and ceramic pieces. The noise was horrible, and there weren't enough adults to comfort all the children. The adults were anxious, too, and several put name tags on the children's wrists, for identification, further agitating them.

There was no elevator service. Meals on all five floors needed to be delivered, each carried by hand to very unsettled patients who felt vulnerable because they could not leave the hospital.

January 19, 1994

Two days after the earthquake, telephone service was restored. A crisis intervention team was brought in to debrief mental health workers and help us present crisis intervention to patients, employees, and others who walked in off the streets. When electricity was restored, band-aids were prepared and copied.

The crisis intervention team overwhelmed us with information. In 1 hour they tried to soothe our rattled nerves with hugs and tell us that we could evaluate what we could learn from this experience. I, for one, was not feeling in any state to evaluate the earthquake as a learning experience. The aftershocks were loud and frequent, creating a real sense of lack of safety. The most effective comfort came from peers, people I knew. We took the information from the debriefing and did our best to use it when phoning or dealing with patients.

Patients were extremely glad to hear from us. Their reports were chatty; their well-being varied tremendously. Damage suffered and support systems also varied widely. On Wednesday and Thursday after the earthquake, we were able to contact all but three of our 80 day-treatment patients.

January 20 and After

Gradually, some level of normalcy returned to the hospital. Toilets were returned to use, lights worked, telephones were fully restored, food services were gradually restored. The number of large aftershocks diminished, and patients returned to the program.

Patients exhibited varying degrees of stress. Most commented on the tremendous feeling of helplessness that resulted from the darkness and horrendous noise of the earthquake as the earth crunched together and things came crashing down. Patients told stories about bedroom doors blocked by falling dressers, an inability to get out, refrigerators falling, trapping and separating people in different parts of the house, inability to find people in the dark, cut feet walking on broken glass, flashlights kept by bedside for just such a disaster found inoperable, inability to get any news or power, lost pets, pools with five-foot waves flooding the first floor of apartment buildings. Some, whose building has been red-tagged, were unable to go back to retrieve property. Some left with only the clothes on their backs. The patients, an already somewhat chaotic population, brought a huge number of issues related to loss.

Some of the most chronic patients were able to deal inventively with loss. An amputee confined to a wheelchair was trapped in her bedroom, unable to go anywhere or do anything. She remained calm and waited for help. Another who is blind and accustomed to the dark eased her way, crawling for 4 hours through rubble and disarray to find her way to a door. Another patient who had been staying for a week at a shelter, identified his needs and arrived at the hospital for help in his pajamas, unshowered and unshaved.

The staff was becoming more and more stressed trying to meet other people's needs. Our own needs and levels of tension increased. We were all making an effort to be supportive of each other, but sometimes this was not enough. We agreed on one thing: We needed to be taken care of, too. A higher level of absenteeism followed the earthquake, with staff reporting colds, flus, allergies, and other symptoms.

To deal with my needs during the 3 weeks after the earthquake, I created a series of small collages. They were useful in dealing with the nervousness and edginess I felt going to work at the epicenter each day, the impact of seeing the damage created, and the seemingly endless road winding through two dust-filled valleys between my home and work (see Figures 1 and 2).

Art therapy was also used in groups with patients. Their art, depicting a variety of problems and experiences and evoking conversations, can be divided into four types based on patients'
experiences. First were the disarray issues: the mess, inconvenience, interruption of daily routine. Second were issues of fear, lack of being prepared. Third were safety concerns, and fourth were recuperation and coping techniques related to wanting to leave the area, using FEMA, HUD, and Red Cross services, and other coping experiences.

A 32-year-old man diagnosed with paranoid schizophrenia created a drawing of many overlapping and transparent figures (see Figure 3), representing his highly treasured collection of sculpture that tumbled from a shelf near his bed. The line quality captures the vibration and agitation of the experience and speaks of the escalation of voices he heard after the earthquake. He was able to express his concerns and inability to deal with the mess, the needed cleanup, and feelings of immense loss.

A woman patient in her early twenties drew her apartment (see Figure 4). All the chaos and the vibration of the earthquake are shown. She depicts herself under the sofa bed trying to find a safe place. Lines around the outside edge of the paper represent confinement. She shows the disarray she experienced. On her face she draws her fear. The feebleness of her body suggests the helplessness she experienced.

A man in his late forties and a long-term, chronic patient drew a cracked road (see Figures 5 and 6). He depends on routine and repetition to function effectively from day to day and
often uses the metaphor of a road in his artwork to show where he is in his journey. After the earthquake, the road had an enormous break representing, he said, road damage and the interruption to his life and the chaos produced by this disruption from his regular routine.

Fear was reflected in many drawings and collages. Two were notable because the two women who did them, a 40-year-old woman and a 75-year-old woman, said they had not been afraid and the earthquake had not bothered them. Each said she had not experienced that much damage and that the earthquake was "no big deal." Both stated they enjoyed having people work together. Although it was true that people were rallying to help each other after the quake, neither woman was able to confront the fear she had felt until she drew what she had experienced. The older woman drew two small children on a grassy field. One child says, "I'm so scared," and the other replies, "So am I." The small size of the figures suggests the immensity of the experience and feelings of vulnerability one feels when small and young (see Figure 7).

The younger woman drew an aerial perspective of a room. Two people face each other at a table. They look up as cracks appear above them, and the building is damaged. The distortion of the building and line work strongly suggest anxiety (see Figure 8).
Both patients were able to reassess their initial statements about not being afraid when they considered their artwork and acknowledged that they had experienced much anxiety during the quake. Thus, their healing processes began.

Safety concerns were reflected in many drawings. A 60-year-old man who is large in stature and “indestructible” in affect drew a small house with a leaning, cracked chimney. He titled the drawing “Which Way Will the Chimney Fall?” Safety concerns, especially the desire to stay home coupled with the concern about doing so, are captured in this drawing (see Figure 9).

The theme of wanting to leave the area, as a coping mechanism, was seen in many artworks. Many collage's made from pictures from a collage box, depicted leaving, going on vacation, or getting away. A 75-year-old man captured the essence of this by selecting a picture not of a car, but of a horse and cart. He titled it “I Am Ready to Leave the Area.” This artwork enabled him to discuss his desire to leave the area and how difficult that would be at his age. Issues such as facing the difficulty of selling a home, lowered property values, and the hardship of moving when you are in your mid-seventies, stimulated the entire senior group to discuss their concerns.

On Reflection

The earthquake had an impact on so many, with loss of jobs, loss of homes, disruption in daily living, increase of fear, and loss of control. The surprise of the earthquake made us realize that no matter what we do to prepare, we are really not prepared enough. For our patients, art opened a door for crisis intervention. It facilitated processing of the situation by regular patients, staff, and people coming in for crisis intervention. One woman, the mother of a young child whose school had been condemned, summed up the essence and impact of the earthquake: “Our lives have been changed forever and anyone who doesn’t live in the area cannot really understand.”

Art helped to capture and process the overwhelming experience of dealing with disasters. It has been a valuable tool for me in dealing with my patients and my own issues.
Reviews

Existential Art Therapy: The Canvas Mirror (Second Edition)

Reviewed by Patricia Engle Murphy, PhD, A.T.R., Moscow, ID

Existential Art Therapy is a 200-page book by Bruce Moon which presents a theoretical view of art therapy from an existential perspective. The question of what makes art therapy different from verbal therapies has always been a difficult one because art therapy is not just the use of art in the therapeutic process. Many psychotherapists use art and play in their work. I thank Bruce Moon for writing a book that helps to articulate, from the broader base of existentialism, a theoretical framework from which to debate a role and orientation for art therapists. It is only by looking through the lens of different viewpoints that we refine the parameters of what we, as art therapists, do.

Moon uses vignettes of former patients in an inpatient setting (Harding Hospital) to highlight and clarify his perspective. Moon's examples are quite useful for the new art therapist or student who needs help to understand his theoretical concepts in the therapeutic context. More importantly, he provides students with a way to think about clients that uses a perspective different from the more traditional medical or psychoanalytic model.

Each art therapist must develop her or his own theoretical construct and way of working that suits the therapist and the setting. To do that, it is essential to review and examine as many perspectives as possible. One might disagree or have a slightly different view, but the review process is an important aspect of developing a technique and philosophy that is unique to one's personal style of dealing with clients and a specific work environment.

Art therapists work in many ways and have many orientations, which help give our profession its richness, depth, and diversity. Moon makes it clear that he is not creating a "how to" book but is providing a thoughtful look at his way of working with clients based on many years of experience. Even if readers don't subscribe to all of his perspectives, this book will help them think about what they do and its theoretical foundation.

Below are some of the features that Moon elucidates, which for me identify how he sees his role as an existential art therapist. However, only some of these seem to be directly related to existential philosophy.

First, his three basic principles include:

1. Moon espouses respect and caring for the client based on common exploration, sharing, and understanding. This approach suggests a shift from a more traditional therapeutic relationship in which the balance is more supplantic to the healer. Thus the art therapist shares or shifts the responsibility for healing to a greater extent to the client. Art serves that function in a variety of ways. Moon, for example, does his own art in the therapeutic setting to reinforce equality and shared purpose. In fact, the 21 illustrations in the book are his artwork. I don't believe he is suggesting that all art therapists should do art with their clients, only that we each find a vehicle for communicating respect and mutual sharing to the client. Building trust becomes an essential element of the caring relationship.

2. Moon discusses using metaphor to help the client gain understanding and self-acceptance. Often he creates the metaphor for the client to enhance that process; other times he works with the client's metaphors. He is fortunate to work in a well-equipped and supportive environment which utilizes a team strategy. Many of us don't have such a range of choices in our professional environment, but we can encourage clients, through art, to create metaphors and work with them in the healing process. Moon proposes that the development of metaphor cannot be done in isolation; it creates a storyline that connects one person to another. The process of doing art becomes important as a way to play out the metaphor or tell a story.

3. Moon puts forth the existential view that each person struggles to find the individual meaning of his or her life, and the role of the therapist is to accompany the person on that journey, providing an environment where it is safe to explore those meanings. He emphasizes client choice and responsibility. He writes that: the essential role of the existential art therapist is to walk along as the client journeys toward self-discovery while not imposing individual values or perspectives. This stance is somewhat paradoxical. While Moon suggests that the artist therapist's job is to stand out of the way once the therapeutic environment has been created, all therapists know it is difficult to avoid becoming role models on such issues as integrity and dealing with troublesome emotions. In Moon's case, he also becomes a model for doing art. There is nothing wrong with this, but Moon should acknowledge and address the tendency of clients to look to their therapists as role models despite the best efforts of the therapist not to impose his or her values.

My major disagreement with the book is Chapter XII, where Moon discusses the changing nature of mental illness. He does a good job describing the lack of grounding and rootedness that characterizes much of American culture today and how that absence is reflected in the ways emotional disturbances are exhibited. However, he seems to betray his existential orientation when he describes a theoretical construct of borderline personality disorder.

The following are excerpts from Moon's etiology of borderline personality disorder:
[Until the age of three months the infant is able] through the primitive ego process of splitting to keep his affective experiences of pleasure and rage entirely separate in his consciousness. It is at this stage of beginning object constancy that there is a defect in the development of the borderline. In regard to splitting as a defensive mechanism, what is believed to be most common is the circumstance where the infant's relationship with mother is constrained by the mother's own pathology. These two basic flaws in the infant's developing ego—(1) the retention of splitting as a defense mechanism and (2) the failure to achieve object constancy—provide the basis for the mass of related symptoms that later characterize the borderline patient. They cannot feel anything like normal grief. (pp. 158–161)

Theoretical models in the therapeutic context are useful to the extent that they provide an understanding of the patient's experience and lead to an effective treatment approach. But they offer only one way to conceptualize a circumstance. Although the constructs put forth by Moon may be useful from one perspective, there are other theoretical models from which to create an understanding of borderline personality disorder that are more consistent with an existential view, are not so harsh in their judgments, and look beyond the mother-child relationship and the notion of a flawed or defective developmental process based on the mother's pathology. For example, the model that Moon describes does not take into account the emerging view of childhood trauma as an important feature of many people with borderline personality disorder. In a recent study of 21 patients with definite borderline personality disorder, 81% gave histories of major childhood trauma, including significant physical abuse (71%), sexual abuse (68%), and witnessing serious domestic violence (62%) (Perry, Herman, van der Kolk, & Hoke, 1990). Other studies support this finding, indicating that 70% to 80% of inpatients with borderline personality disorder have experienced prior child abuse (Goodwin, Cheeves, & Connell, 1990). In today's world, omitting the role of the male parent in the development of the child's personality and attachments, particularly where abuse may be present, is naive and sexist. The main point, however, is that an existentialist is not usually so concerned with "object relations" and "alohistoricity," and focuses instead on the client's inability to experience grief and relationships fully and hence to find meaning in life.

The book has some editing errors such as incomplete sentences (p. 47), duplicated paragraphs (p. 45), and incorrect information (i.e., DSM = the diagnostic service manual, p. 74). Since this is a second edition, these errors may be a reflection of rewriting, using parts of the original text and a hasty rereading. I found it distracting and wish it had been edited and proofread more carefully. We should expect a higher standard for our art therapy literature.

Despite these problems, this is a useful book. It helps the art therapist think about his or her orientation and approach. Using his own struggles and paintings as examples, Moon creates an intimacy with his readers. He has some interesting and novel ideas.

Reviewed by Roz Rutstein, MEd, MAAT, A.T.R.-BC, Newfoundland, PA

A Whack on the Side of the Head—a title that might put off some clinicians—is a possible resource for art therapists looking for creative problem-solving material with clinical potential.

Art therapists who look forward to reading books that are understandable and informative and who are willing to venture slightly beyond their discipline may consider Roger von Oech's Creative Whack Pack: Success Edition worth reading. This 1992 revised edition has two parts, a book and a deck of cards. They can be bought separately or as the Success Edition, which includes both.

The back cover informs the reader that the Creative Whack Pack was originally used in creativity seminars with Fortune 500 companies and that the author received his doctorate degree from Stanford University focusing on the history of ideas. The book was not written for clinicians; however, it reminds the reader of those characteristics that make creative actions occur. The author provides clear cognitive explanations along with "puzzles, anecdotes, exercise, metaphors, cartoons, questions, and stories" that activate the creative process. All chapters except the first can be read in any order. The nonlinear option offers suggestions about creative blocks while making simple, clear points as reminders to the reader.

On page 10, the author identifies a block by making the following statement: "Many of us have been taught to think that the best ideas are in someone else's head." He shows how negative "self-talk" of long-standing needs to be countered vigilantly. Von Oech's book could become a tool for clinicians working in acute care settings or working with clients experiencing debilitating depression. The quick, easy, and thought-provoking pages are 4 inches by 7 inches and can be transported easily with art materials without adding significant weight or bulk.

Unlike many resources that are written only for clinicians to read, this one can be recommended to clients with minimal reservation. The Creative Whack Pack deck of 64 cards could be used in any number of directive or partially directive art therapy sessions. It could also be used as a catalyst for between-session activities. Each card has a key phrase that is defined briefly and illustrated in black line drawings of cartoon images by George
Willet. The images could be catalysts for metaphoric comments by depressed clients and offer potential opportunities for shifts in cognitive frames without significant threat either to fragile self-esteem or to expectations for energy investment.

The cards are divided into four suits—explorer, artist, judge, and warrior—each expanding on the different characteristics of its suit with key phrases such as Be dissatisfied, Avoid arrogance, Ask a fool, Slay a dragon, and Check your timing to name a few. Opportunity to use either one or a combination of suits provides the clinician with possibilities for various levels of group process and interaction among group members, as well as material for individual art therapy sessions. As with any resource, clinicians working with self-destructive clients will find some cards suggest creative alternatives that, without clearly defined limits, could become catalysts for self-destructive actions.

There is no bibliography or glossary and no credit to sources of information. Von Oech presents the book more as a parlor game and, in fact, it could easily be and probably has been used that way. Clinicians requiring an inexpensive resource that is not explicitly clinical might consider the book and deck of cards worth purchasing. As pointed out earlier, each can be a catalyst for creative expression, either for the clinician who needs a fresh idea or for the client who is stuck in a self-negating place.

THE REMUDA SYSTEM CAN HELP WOMEN AND ADOLESCENTS SUFFERING WITH EATING DISORDERS

CONTINUUM OF CARE
Adult/adolescent inpatient, adult/adolescent residential, partial care and intensive outpatient treatment sites provide tranquil, specialized settings.

LICENSURE
State licensed, JCAHO accreditation with commendation and CHAMPUS provider.

STAFF
Highly skilled professional staff of licensed psychiatrists, internists, psychologists, RN's, master level therapists and registered dietitians providing individualized programs and lengths of stay.

EXPRESSIVE THERAPIES
Provided as a powerful tool to assist individuals in exploring their identities and problems through the use of their own creativity. Activities include art therapy, music, dance/movement and creative writing.

AFTERCARE TRANSITION
Remuda's Aftercare Coordinator will work with the referring professional prior to the patient's discharge to facilitate her transition back into an outpatient setting as she resumes her day-to-day activities. Most insurance accepted.
Noteworthy

Art to Demystify Breast Cancer:
Healing Legacies

*Healing Legacies* provides access to the normally private dimensions of breast cancer by surveying the artistic works of women and men who have experienced it. This collection helps to demystify breast cancer, for breast cancer is neither one disease nor one experience. Rather it is an event that requires a collection of voices to reveal its many dimensions—the discovery, the treatment, the recovery process, and the emotions.

*The Healing Legacies Arts Registry* was created by the Breast Cancer Action Group (BCAG) in 1993. The registry is a growing and living record for this work. Women and men can enter the registry on an ongoing basis since more people are diagnosed each year. This system also allows exhibition sites the greatest amount of flexibility in choosing subject matter, theme, and quantity of work.

The registry consists of painting, photography, poster art, sculpture, fiber and textile art, ceramics, video, hand-made books, poetry, and performance art. *Healing Legacies* made its debut at the U.S. House of Representatives Cannon Building Rotunda. The collection has had a broad appeal. Past exhibits have been mounted in Ohio and Missouri. In 1996 it is scheduled for New Mexico, Vermont and Alberta, Canada. Through *Healing Legacies* the Breast Cancer Action Group seeks to educate the public, patients, and physicians about the varied experiences people have with breast cancer. To receive information about applying to the registry send a SASE to: BCAG: Healing Legacies, P. O. Box 5605, Burlington, VT 05402.

Art Therapist Works with Palestinian Children

Art therapist and educator, Julie Byers, A.T.R., recently traveled to the West Bank and Gaza Strip to help mental health professionals and children. Byers is currently working on a doctorate at the University of Toronto where she stumbled across the assignment. She was asked by a psychiatrist if she would be willing to do some work for the Near East Cultural and Educational Foundation of Canada (NECEF), with which she was affiliated. The program was funded by the children's bureau of Canada's Ministry of Health and Welfare.

During her first trip last summer, Byers visited six clinics, working not only with children who suffer from posttraumatic stress disorder, but also overworked and traumatized healthcare professionals, helping them to handle caseloads through art therapy. She consulted with these professionals on how they could utilize art with children who have endured violence and political upheaval in their short lives.

Oh God, Why Me??!! Touching the Grief (©1989) Paulette Carr: "When the nightmare confronts you, you want to scream, but can't."

Counseling Center near Jerusalem: Julia Byers (third from the left) with healthcare professionals at art therapy workshop, July 1995.
Keynote Speaker - Jimmy Santiago-Baca

Jimmy Santiago-Baca, poet, author and screenplay writer of Chicano and Apache decent, is recognized as a leading spokesperson for the Hispanic community. His book, Martin and Meditations on the South Valley, received the American Book Award in 1988. In the summer of 1995, Santiago-Baca was one of the featured poets on the Bill Moyers PBS series, Language of Life. His poetry speaks to a vision of change and community transformation through creative expression.

ART THERAPY IN THEORY & PRACTICE

Ed. by Elinor Ulman and Penny Dachingher

"Since its first publication, Art Therapy in Theory and Practice, has been used continually as both a textbook and a resource. Many of the chapters have become indispensable classics which continue to define the field of art therapy.

In this reprint, we re-encounter Elinor Ulman's skill as a writer and editor of great perception and eloquence. Her talent was to bring together the seminal writing of a burgeoning professional field and meld them into an organized, comprehensible body. This book, now available to a new generation of readers, stands as a testament to this art."

RANDY M. VICK, MS, A.T.R.-BC
The School of the Art Institute of Chicago

SUPERVISION and Related Issues: A Handbook for Professionals
by Cathy Malchiodi and Shirley Riley

A long awaited text, this handbook is a highly informative guide to the complexities of supervision in the 90's. Supervisors, educators, and students will find it indispensable not only in the supervisory session, but also in the classroom and in work with clients. An extensive appendix includes ethics and standards of practice, sample forms for use in supervision, laws effecting supervisors and many more references and recourses.

Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of the Art Therapy is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

- Art Therapy: Building Barriers with Native American Clients
- LA '94 Earthquake in the Eyes of Children: Art Therapy with Elementary School Children Who Were Victims of Disaster
- Use of a Drawing Task in the Treatment of Nightmares in Combat-Related PTSD
- Outpatient Art Therapy with Multiple Personality Disorder: A Survey of Current Practice
- Art Therapy at the Crossroads: Arts and Science

Art Therapy is available to AATA Members as part of their membership.

Non-Members may subscribe at the following annual rates:

Individuals: $50.00 (U.S.) - $74.00 (Foreign)
Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:

Members: $12.50 - Non-Members: $23.00

ADDICTIONS
Presenters: Lynn Jones, Holly Feen, and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley, and James Consoli
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The art therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, short and long term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN SCHOOLS
Presenters: Janet Bush, Sarah Hite, and (third presenter to be announced)
This symposium will provide participants with the administrative procedures for implementing art therapy services and programs in schools. Topics will focus on the uses of art therapy in schools; roles and responsibilities of school art therapists; techniques and strategies for working with students; training and preparation of school personnel; and the funding and marketing procedures required for school art therapy programs. Participants will be prepared to transfer techniques and strategies for implementing art therapy services and programs to school settings.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Callanan, and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and consideration of the clinical treatment of three groups of vulnerable aging and case studies.

GRANTS: GOING FOR THE GOLD
Presenters: Frances Anderson, Vija Lusebrink, and Doris Arrington
Successful grant writing in art therapy is, and will continue to be an important survival strategy in the 90’s. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal “in process”.

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchiodi, Julie Epperson, and (third presenter to be announced)
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology and research with children at risk. “Children at risk” are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitations which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short and long term art therapy interventions, effectively assist the child in crisis and appropriately utilize art expression in assessment of current level of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchiodi, Anita Mester, and (third presenter to be announced)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role that art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Themes of imagery from current research by Ackerburg, Simonton, Bach and others will be covered to assist the participants in integrating the use of art expression with physically ill clients will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life threatening illness will be addressed.

adoLESCENT ART THERAPY
Presenters: Kris Sly-Linton and (three other presenters to be announced)
The Adolescent Art Therapy Symposium will cover a wide range of topics designed to address a specific focus area requested by the sponsoring organization. This is a somewhat unique approach to the traditional symposium format but considering the multiplicity of problems regarding the treatment of adolescents today, it was felt this would be a way to make each symposium more pertinent to the intended audience. The four person team headed by Kris Sly-Linton, A.T.R.-BC, was coordinated to include professional art therapists that can provide the expertise required to address the following areas: Special Populations of Adolescents, Program Focus, and Teens and Family Systems.
The American Art Therapy Association

THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board, elected by the membership. AATA has established standards for art therapy education, ethics, and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. AATA’s dedication to continuing education and research is demonstrated through annual national conferences and regional symposia, publications, videos, and awards.

MISSION STATEMENT
The American Art Therapy Association is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing.

Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

ART THERAPY:
DEFINITION OF THE PROFESSION
Art therapy is a human service profession that utilizes art media, images, the creative art process, and patient/client responses to the created products as reflections of an individual’s development, abilities, personality, interests, concerns, and conflicts. Art therapy practice is based on knowledge of human developmental and psychological theories which are implemented in the full spectrum of models of assessment and treatment including educational, psychodynamic, cognitive, transpersonal, and other therapeutic means of reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem.

Art therapy is an effective treatment for the developmentally, medically, educationally, socially, or psychologically impaired; and is practiced in mental heath, rehabilitation, medical, educational, and forensic institutions. Populations of all ages, races, and ethnic backgrounds are served by art therapists in individual, couples, family, and group therapy formats.

Educational, professional, and ethical standards for art therapists are regulated by the American Art Therapy Association. The Art Therapy Credentials Board, Inc. (ATCB), an independent organization, grants post-graduate registration (A.T.R.) after reviewing documentation of completion of graduate education and post-graduate supervised experience. The Registered Art Therapist who successfully completes the written examination administered by the ATCB is qualified as Board Certified (A.T.R.-BC), a credential requiring maintenance through continuing education credits.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the United States. Chapters conduct meetings and activities which promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for chapter members is passed on from the Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:

- Art Therapy: Journal of the American Art Therapy Association (published quarterly).
- AATA Newsletter (published quarterly).
- Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, videos, and the Membership Directory.
- AATA literature, such as Educational Programs List, Art Therapy Media List, Standards of Practice, and guidelines of professional interest.

Services
- Insurance, including professional liability, major medical, life, and disability through Maginnis & Associates.
- Access to national experts in art therapy.

AATA Meetings
- Discounts on registration fees to AATA national conferences and regional symposia.

Nationwide Advocacy
- Governmental Affairs activities including congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payors.
- National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
- Development of Model Job Description and recommendations for licensing standards.
- Development and implementation of national Education Standards for approval of graduate level art therapy programs.
- Development and implementation of nationally recognized Standards of Practice and ethical Standards for Art Therapists.

GENERAL INFORMATION
AATA and ATCB are administratively independent. Membership in AATA and registration (A.T.R.) with the ATCB require separate application and approval. A.T.R. registration applications are available from the ATCB at (312)527-6764.

For new associate, student, and contributing members only, please follow the dates below when submitting membership applications. The membership year is the calendar year 1/1 to 12/31.

Applications received between:
1/1 to 5/31 Full dues payment; membership expires 12/31 of same year.
6/1 to 9/30 Half-year dues plus $5.00 payment; membership expires 12/31 of same year.
10/1 to 12/31 Full dues payment; membership for the remainder of current year and next full year.

CATEGORIES AND FEES
Professional-By application review process only; approved members may vote, hold office, and serve on committees.

- Professional Member-Individuals who have completed educational training in art therapy. Dues are $85.00/year.
- Credentialled Professional Member-Individuals who have been dually approved for Professional Membership by AATA and registration (A.T.R.) by the ATCB. AATA dues are $85.00/year. Annual A.T.R. maintenance fee is billed separately by the ATCB.
- Associate-Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. This category is not open to master’s level art therapy program graduates. Associates may not vote, hold office, or serve on committees. Dues are $85.00/year.
- Student-Individuals who are currently taking full-time course work in art therapy or a related field. A current statement from the institution of learning indicating full-time status and course work content (6 graduate or 12 undergraduate credits) is required. Student members may not vote or hold office, but may serve on the Student Subcommittee of the Education Committee. Dues are $35.00/year.
- Contributing-Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120.00/year.
- Retired-Individuals who, at least 65 years of age and who are no longer practicing. Retired associates receive publications. Retired professionals receive publications and may vote, but may not hold office. Application provided upon request. The maintenance fee is $35.00/year.

☐ Brief Report

☐ Video Review

☐ Book Review

☐ Commentary

Title of Submission

Checklist

☐ Five (5) copies, typewritten on 8 1/2” x 11” white paper with margins of at least one inch.

☐ Black and white photographs (at least 5” x 7”) of original artwork plus four (4) photocopies of each.

☐ Abstract of 100-150 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees, and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature ________________________________ Date _______________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy: Journal of the American Art Therapy Association* uses a blind peer review procedure for articles, brief reports, and viewpoints. Final decisions regarding publication are made by the reviews and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor, and special section editors.

The following are guidelines for submissions. **Submissions that do not conform to these guidelines will be returned to the author without review.**

### Submission Categories

1. **Articles.** Full-length articles may focus on the theory, practice, and research in art therapy or related areas. Articles must include an abstract of approximately 100-150 words summarizing the major point of the article.
2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Brief Reports should include information on the research design, methodology, and results. An abstract of approximately 100-150 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry, or original art may be submitted to this section.
4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office.
5. **Video Reviews.** Reviews of media (videos) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office.
6. **Commentaries.** Brief comments on submissions published in *Art Therapy*: issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

### Other Requirements

1. Send **five (5) clear copies** of each submission to Editor, *Art Therapy: Journal of the American Art Therapy Association*, c/o American Art Therapy Association, Inc., 1202 Allison Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original submissions that are not under consideration by another periodical or publisher are acceptable.
3. Submissions must be typewritten on 8 1/2” x 11” white paper with margins of at least one inch. The body of the paper, references, tables and quotations must be double-spaced.
5. An abstract of 100-150 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles, and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the *Publication Manual of the American Psychological Association* (Fourth Edition) for style of tabular presentations. All tables, charts, or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5” x 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs. Captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions which are addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. **It is the author's responsibility to secure such permissions.** A copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations, and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any submission accepted for publication in *Art Therapy* will go through at least one revision before publication. If authors have prepared their submission on either an IBM, IBM-compatible, or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the submission to the AATA National Office. This will help speed processing, editing, and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations, and materials accompanying their submissions.
STATION OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0742-1565) is published quarterly by the AATA, Inc., 1202 Allison Road, Mundelein, Illinois 60060 U.S.A. Telephone (847)949-6064; FAX (847)566-4580. Non-members may subscribe at the following annual rates: $50 (U.S.) and $74 (Foreign); institutions $77 (U.S.) and $100 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allison Road, Mundelein, Illinois 60060 U.S.A. (847)949-6064. This journal is abstracted in: Resources in Education (ERIC), Art Bibliographies Current Titles, Art Bibliographies Modern, and PsycINFO.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to American Art Therapy Association, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

Introduction to Special Issue on Art Therapy & Education

Cathy A. Malchiodi, MA, ATR, LPAT, LPCC, Editor

Recently, *Art Therapy* put out a call for submissions on art therapy and schools, including applications of art therapy within school settings, and research, ethical, and professional concerns in providing art therapy services within educational milieus. In response to this call, the Journal also received many submissions exploring topics related to art therapy education and training. This issue of *Art Therapy* addresses some of the questions and concerns facing art therapy education in the 90s, including the following: the development of art therapy as a professional field and implications for education and training of art therapists (Feen CALLAGGAN); a survey of educators on the inclusion of art in art therapy education (Wix); and a survey of the salaries and workload of art therapy educators (Wadeson). Three articles consider topics salient to the training of art therapists for work in schools: collaboration among training programs, public school systems, and community mental health agencies (Essex, Frostig, & Hertz); publications useful in training school art therapists (Hite); and an examination of ethical dilemmas in the display of children's art in school settings (Knowles). Also included in this issue is an interview with a prominent art therapy educator, artist, and art therapist, Don Seiden (Vick).

Several important and provocative topics directly related to the health and well-being of the field of art therapy are explored in this issue of the Journal. In "Art Therapy as a Profession: Implications for the Education and Training of Art Therapists," Feen Callaghan compares art therapy’s development as a profession to three related professions: medicine, social work, and psychology. The author explores how these professions evolved, developed curricula reflective of their fields, established professional standards, and eventually created requirements to practice (requirements for competency through educational standards, certification, and/or licensure), while examining the parallel process of art therapy and its development as a profession.

From her investigation of the fields of medicine, social work, and psychology, Feen-Callaghan concludes that art therapists can learn four “lessons” from these fields’ professional development. The first lesson she describes may be one of the most difficult for art therapists to embrace: internal consensus, an agreement among the profession on the criteria for belonging to the profession. For example, Feen-Callaghan specifically notes that art therapists have had difficulty forming a consensus on issues of certification. This lack of internal consensus is also markedly apparent in the variety of models and definitions of art therapy within the profession. This diversity has created difficulties in agreement on standards of practice, ethics, educational requirements, and certification, and has also made it difficult for the professional association to define art therapy’s own unique scope of practice.

Feen-Callaghan also notes that legitimacy, demand, and education are three additional issues that art therapy must address in order to progress as a profession. Legitimacy involves defining the service that one provides, as well as doing so with a level of competence. Feen-Callaghan cites licensure and research as important to attaining legitimacy, noting with regard to the latter that medicine, social work, and psychology have all had to prove themselves through empirical data. Research may be an area of legitimacy that will continue to be problematic for art therapists because of the inherent difficulties of quantifying art expression and creative process and the profession’s resistance and/or lack of inclination to do research within the field.

There also must be a demand for art therapy services. Demand, as noted by Feen-Callaghan, is directly related to legitimacy and recognition. She notes that within social work, psychology, and medicine, the numbers of practitioners and status of the profession increased in relation to the market’s demand for services. In the case of art therapy, clients may see art therapy as a legitimate service and valuable to their treatment, rehabilitation, or recovery, thus creating a demand; unfortunately, art therapy is not always in great demand (or seen as legitimate) by prospective employers (e.g., hospitals, clinics, and other healthcare agencies). Art therapists often must create demand for their services through educating, volunteering, or marketing their skills through workshops and in-services. The profession of art therapy perhaps, however, can take comfort from Feen-Callaghan’s observation that the professions of social work, psychology, and medicine were also not in great demand at the beginning of their development and had to demonstrate their worth to both consumers and employers in similar ways.

Lastly, the author notes that education is a factor in the growth of a profession, particularly flexibility of curricula to train practitioners to meet the changing needs of the job market and society. Whether or not art therapy training is evolving to meet the challenges of healthcare in the 90s is hard to determine. Training programs are currently struggling with difficult decisions about what to include in their curricula, ways to educate students for viable employment, and how to address requirements for licensure in their programs. From her study of other professions, Feen-Callaghan notes that in order for art therapy to grow as a profession, art therapy education should be broadly
Based and be inclusive of current trends in the job market, healthcare, and society.

In relation to the question of what to include in art therapy training, in “The Art of Art Therapy Education: Where is It?” Wix asks the perennial question of “Where is the art in art therapy training?”, a question that has resurfaced within the profession over the last two decades (Ault, 1977; Malchiodi, 1993; Malchiodi, Allen, & Cattaneo, 1991; Malchiodi, Cattaneo, & Allen, 1988). She emphasizes the consequences of the exclusion of artmaking and studio experiences in art therapy training.

I have too often observed the artwork of the art therapy intern, the art therapist, and the patient being left behind in service of the well-trusted and well-known “talking cure.” This leaving behind of a deep dwelling place in art and the imagination leaves behind what I understand to be central to the profession of art therapy. This particular dwelling place is essential, I believe, to the inner landscape of the art therapist.

To attempt to understand how and if art therapy educators included studio art experiences within their training programs, Wix conducted a survey of art therapy educators to see how many included art studio requirements in their curricula, particularly a studio requirement in conjunction with internship. One interesting trend which emerged from Wix’s survey underscored the importance of environment in which art therapy training took place, indicating that training programs housed in art or art-related departments (as opposed to those programs housed in non-arts-related departments such as psychology, education, or health, or independent) were more likely to have studio components in their curricula. This implies that the department or place in which training programs are situated may have an important influence on the availability of space for studio work and may play a significant role in whether or not art is a core component of art therapy training. Wix’s research also brings to question art therapy educators’ responsibilities in providing their students with studio art experiences and the profession’s overall commitment to the importance of art in the training of art therapists.

Both Feen-Calligan and Wix raise provocative questions about the field of art therapy in terms of its direction, evolution, and overall vitality. Feen-Calligan underscores what the profession of art therapy may need to consider in order to continue to grow and meet the ever-changing needs of art therapists in training and individuals in the healthcare system art therapists seek to serve. Wix’s exploration once again raises an important question about the role of art in art therapy training and the ramifications of excluding or eliminating meaningful involvement with artmaking from art therapy curricula. Both authors bring to light some basic issues that the profession must recognize, explore, confront, debate, and resolve in order to continue to remain dynamic and progressive, and to sustain itself into the next century.

Editor’s Note: A special issue focusing specifically on art therapy in schools will follow in the coming months.

Art Therapy is pleased to announce that we are now indexed in CINAHL (Cumulative Index of Nursing & Allied Health Literature), a nursing and allied health database which indexes over 900 medical, nursing, and allied health journals and is utilized as resource for medical literature throughout the world. Researchers can now locate information on articles published in Art Therapy on CD-ROM, magnetic tape, and in print form at libraries and online through the Internet.
Letters to the Editor

As a 34-year-old graduate student in art therapy, with strong roots in the feminist community, I was proud to have the Journal pay attention to these values. I was especially interested in Helene Burt's article, "Beyond Practice: A Postmodern Perspective on Art Therapy Research" (Art Therapy, Vol. 13, No. 1, 1996, pp. 12-19). I would like to further Burt's important message by bringing to light an important contribution to art therapy research informed by feminist theory overlooked by Burt: Maxine Borowsky Junge and Debra Lienesch's article "Our Own Voices: New Paradigms for Art Therapy Research" in The Arts in Psychotherapy (Vol. 20, No. 1, 1993, pp. 61-68).

Burt's ability to integrate the dichotomy among hard and soft research pays credence to the feminist value of supporting differences without "either/or" thinking, moving art therapy away from this linearity in our history. I feel fortunate for the graduate training I receive in which dichotomous thinking is discouraged and where we are supported for integrating a variety of approaches in our identity as art therapists. Research is not separate from our clinical identity, and artmaking is integrated into every clinical class we have.

I went on to read with sadness a letter in the commentaries from a distinguished art therapist who was harsh in her way of correcting another art therapist. It was ironic to me that in this issue exploring feminism, I observed a continuation of the age-old battle of the division of support among women by means of critical name-calling in the face of error. This is what has kept women from achieving power together through the ages. I agree with Burt and Malchiodi that, indeed, we are a profession which has a novelty of feminist consciousness.

However, giving credence to the feminist motto of "the personal is political," my hope is that feminist values will integrate their way into our profession at the base first—how we treat each other as members of the same group—before we begin to apply them at an academic and theoretical level.

Laura Miera
Los Angeles, CA

I applaud Helene Burt for her outstanding article "Beyond Practice: A Postmodern Feminist Perspective on Art Therapy Research" (Art Therapy, Vol. 13, No. 1, 1996, p. 12). It is courageous for any art therapist to reveal the biases in our field, and Ms. Burt's thorough research and witty writing accomplish this superbly.

A few points had strong resonance for me: Ms. Burt's debunking of the objectivity myth, her analysis of relational theory, and her reminder of "the basic principles of feminism—'the personal is political,' choice, and equalization of power" (p. 16). I find that these three principles are teachings for women and men as well. As a man who understands "the political nature of the personal," I realize that my role as an art therapist is to know who I am and be true to myself. I also realize that the way I practice art therapy is my choice, and that it is all right for some to disagree with me. Finally, I cultivate the attitude that I am not better than my clients, in order to "equalize power" during art therapy.

I am deeply moved by the words and images of Isabella. They show art therapy at a level that honors the sacredness of relationship between artwork, client, and therapist. I admire the level of refinement reached by Isabella and her art therapist, but I am not surprised by it because that is what happens when one takes the time, the care, and the attention to do image work.

This article, and others like it, are very significant because they create a more inclusive definition of professionalism in art therapy. Thank you, Isabella, for persevering in bearing witness to the story in your artwork for 15 years, and thank you, Ms. Burt, for sharing your work with your peers.

Martin Perdoux, ATR
Chicago, IL

This is a comment on "Wrestling the Hydra or Can an Art Therapist Find Aesthetic Fulfillment in the Marketplace?" by Harriet Wadeson (Vol. 13, No. 1, 1996, pp. 57-60).

I was impressed by this article, considering the depth of problems, solutions, and choices put forth by the author. However, I was struck by her chagrin at the thought of art therapists becoming "counselors," or "something else."

It seems to me that this is a mute point, since I believe what art therapists do for their clients is indeed counseling. The AATA clearly takes the stand, as expressed in the definition of the profession published in the same issue of Art Therapy: Journal of the American Art Therapy Association as Ms. Wadeson's article, that art therapists will use their professional skills as a means of "reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem." I insist that this is counseling!

According to my dictionary, the definition of counselor is "adviser." Art therapists do give advice! Counseling is defined as "professional guidance of the individual by using psychological methods." We do that also. Counsel (noun) is defined as "advice given as a result of consultation." Surely the art therapist's method of utilizing "patient/client responses to the created products," another part of the official definition of our profession, would have to be termed consultation.

I see no problem with considering an art therapist a counselor—I merely see another example of pickering about profes-
sional terminology. "Art therapy vs. art as therapy" is the first example I encountered when I entered this field 10 years ago; and it still does not make sense to me to argue about terms. We do what we do because we know art works therapeutically in many ways. We are skilled in using created art products to effect change and improve the quality of life for our clients.

These goals are important to many mental health professionals, no matter what their titles may be. If a small group of art therapists cannot get licensing in their state because they cannot afford a lobbyist, but can get licensing under the title of Family and Marriage Counselor, Mental Health Counselor, and so forth, then I believe that is the way to go. After they are licensed, they may continue to do the work we all know has value for so many troubled people—people for whom verbal therapy alone does not work.

Why not add other titles to "art therapist"? We know what we are, as Ms. Wadeson said, and we can always make that clear in any work environment.

It would lighten my heart to see the seasoned professionals in the art therapy field become less involved in semantics and more involved in the practical ways of getting on with our jobs.

Sheila Pite, ATR
Orange, CT

Art Therapy as a Profession: Implications for the Education and Training of Art Therapists

Holly Feen-Calligan, MA, ATR-BC, Detroit, MI

Abstract

The reciprocal relationship between art therapy practice and education has been addressed by Wadeson (1989). Recently, others have speculated about the future of art therapy and art therapy education in light of today’s social, political, and economic climate (see Art Therapy: Journal of the American Art Therapy Association, Vols. 1, 2, 3, 4). This article explores the question, “What should art therapy education comprise in order for our profession to remain vital?” The question is addressed by observing patterns in the development of related professions and professional education. Three professions—medicine, social work, and psychology—are examined. Four lessons for the art therapy profession that seem apparent upon analysis of these professions are outlined. This article attempts to contribute to the discussion of the direction necessary for art therapy education.

Introduction

The 25th anniversary of the American Art Therapy Association (AATA) in 1994 stimulated reflection about the history of our profession and speculation about what the future holds. Jung and Asawa (1994) write that attention to the past can provide important messages for the future, and they note similarities between the development of the professions of art therapy and social work. This article extends the examination of the social work profession by also examining other professions to identify certain patterns of growth occurring whenever new occupational groups form. Attention is given to the development of three professions—social work, medicine, and psychology—because of their similarities to art therapy. Because education is critical to the viability of new professions, the influence of societal changes on art therapy education is elucidated. The article concludes with some thoughts about how art therapy might learn from the experiences of other professions in terms of establishing professional legitimacy and preparing new practitioners.

The Development of Professions

Professions are a phenomenon of the modern world, developing from changing conditions in the larger society (Elliott, 1972; Haskell, 1977; Metzger, 1987). A profession is defined as having a body of knowledge, a degree of autonomy in practice, a service ethic, a procedure to admit new members, self-regulatory power, and frequently a state-supported licensing system (Friedson, 1970; Metzger, 1987). Occupations seeking to establish themselves as professions claim the service they offer is valuable and vital to society (Elliott, 1972). Frequently, there is a sense of calling to a particular profession (Moore, 1970).

Elliott (1972) identified the process through which a profession is born. First, an occupational group is engaged in full-time work on a particular set of problems. A profession emerges as knowledge in a field increases and specialization develops (Ben-David & Collins, 1966; Elliott, 1972). The new professional group outlines its own position and for a time may face competition from overlapping occupations and professions (Ben-David, 1965; Elliott, 1972). A period follows in which the profession attempts to stabilize itself and to maintain a position in society (Wilensky, cited in Elliott, 1972). Training and selection procedures are later formulated, as well as a professional association.

The profession lobbies for public recognition and legal support for its control over entry and modes of practice. The profession then elaborates a formal code of ethics (Wilensky, cited in Elliott, 1972). Elliott (1972) notes that professions having a substantial body of knowledge are better able to convince society of their value. The profession’s responsibility for interpreting that body of knowledge is an important aspect of its autonomy.

Ben-David and Collins (1966) write that the growth of the scientific disciplines can be represented by an S-shaped curve. The ideas necessary for the creation of a new discipline are usually available over a relatively long period of time, in several places, but only a few of the potential beginnings lead to growth. Growth occurs when there is interest in the new idea, when conditions exist for a new role to develop—usually an opportunity for a new occupation—and with the existence of networks making new ideas into cumulative processes. "Ideas beget ideas until the time is ripe for a new and coherent system of thought and research to arise" (p. 451). There follows a spurt of activity until a plateau is actually reached.

The Rise of the Professions of Social Work, Medicine, and Psychology

Professional Social Work

Early social work evolved from charity organizations in the 19th century whose work involved friendly visiting and character reformations of the poor (LaBov, 1965). In the 20th century, problems of social control and economic deprivation intensified due to urbanization and industrialization. The magnitude of the charity workers’ task began to call for greater organization and technical skill than they were able to provide. Charity workers, or caseworkers, as they began to call themselves, believed they had the beginnings of a scientific knowledge base, as well as special-
ized skill acquired by experience and formal education (Lubove, 1965).

Dr. Richard Cabot introduced one of the first casework specialties, medical social work, to Massachusetts General Hospital in 1905. As an outpatient physician, Dr. Cabot had no time to deal with anything but the patient's physical symptoms. He observed that patients could be cured physically but once they returned to poverty, poor food, and filth, illness recurred. Cabot hired social workers to overcome the hospital's isolation from the social roots of the disease and to ensure a full and accurate diagnosis, taking into account the patient's social and environmental situation (Lubove, 1965).

Many of the first social workers were female nurses who were very familiar with hospital routine, physicians, and sickness. Those nurses set about to emphasize casework as their special function, which had as its aim to "release the energies of the individual in the best direction possible" (Lubove, 1965, p. 31). The new casework profession was elevated in status from nursing, for caseworkers or social workers worked in tandem with physicians, not subordinate to them. In the first two decades, medical social work "... depended on the prestige and power of sympathetic physicians and administrators" (Lubove, 1965, p. 30).

In the early days, social workers were confused with occupational therapists, nurses, mental testers, and "neighborliness." Psychiatry strengthened social work's position in the 1920s and more clearly defined its role. Stressing the probability of multiple causation in delinquency and dependency and the need for comprehensive physical, mental, and social examination, psychiatry paralleled social work in the evolution toward differential casework. Psychiatry and social work were developing a theory of the individual as being a product of his or her environment. Medical social work practiced in the hospital provided the proper environment and resources with which to do research. A crucial development between 1880 and 1930 was the emergence of the belief that social work was heading toward a scientific understanding and control of behavior and at the same time clarifying its distinctive social function (Lubove, 1965).

In the early 1900s, the first psychiatric hospitals and psychiatric units in general hospitals were established. Of interest to art therapists was an experiment undertaken at Massachusetts General Hospital in 1907. A teacher of clay modeling, Katherine Burrage, was added to the staff. Her salary was paid by the chief of neurosurgery who hoped her methods would arouse new interests and improve concentration and social consciousness among mental patients (Lubove, 1965).

Training to do medical social work initially consisted of apprenticeship programs in hospitals. The lack of standards in these programs, however, meant that an employer could not assume a minimum competence when hiring a medical social worker. In response, Dr. Cabot initiated a 10-month program at the Boston School of Social Work, which included supervised work at Massachusetts General, school lectures, and conferences. In time, any person desiring to enter hospital social work needed to meet specific educational requirements, as the education of social workers progressed from specialized apprenticeships to professional education in universities.

In 1918 the American Association of Hospital Social Workers (AAHWS) was founded. The purpose of the organization was to insure a minimum standard of competence, to establish a code of conduct, and to avoid unreasonable exclusiveness. In the absence of any state licensing system, the AAHWS could only indirectly control standards of technical competence and inculcate professional norms through its own membership requirements. In 1918 this was difficult given the shortage of social workers and wide variation in hiring practices. Thus, the association was fairly powerless to exclude anyone from doing social work. As time went on, however, the membership requirements were raised. The AAHWS restricted membership to paid workers and encouraged professional education in schools of social work with internships or through approved alternate educational careers. Later, other specialized factions formed their own professional associations, such as the Association of Visiting Teachers and the Psychiatric Social Workers. The American Association of Social Work (AASW) was born in 1921, the first national organization encompassing all the various social work associations (Lubove, 1965).

The emergence of professional organizations paralleled the establishment of professional social work schools. The leadership of one school—The Chicago School of Civics and Philanthropy (later part of the University of Chicago)—seemed to have particular significance to the growth of social work. Professors Edith Abbott and Sophonisba Breckenridge, experts in child welfare and labor legislation, believed social work's future as a profession depended on the school's ability to produce administrators equipped to handle broad problems of legislation and community welfare. Prior to this the emphasis in social work education had been on casework, technique, and field work. Abbott and Breckenridge argued that such training produced technicians but not scientific persons and that an understanding of public welfare administration, social research, law, and social insurance should also be part of the curriculum. In 1932 the Association of Social Workers adopted standards for education. The standards required courses in casework, community organization, group work, social work, public welfare administration, child welfare, problems of labor and industry, social statistics, research, legislation, and the legal aspects of social work (Lubove, 1965).

**Medicine**

Prior to the 19th century the medical profession was a weak and economically minor profession (Starr, 1982). Advancements in science legitimized medicine so that physicians could increasingly deliver what they said they could, thereby strengthening their authority. The power the profession enjoys today originated in the interaction of others on the knowledge, competence, and authority of physicians whose skills were valued and needed by society (Starr, 1982). The development of medicine into a fully-recognized profession was not a smooth progression, however. It involved the interaction of a number of variables including changes in society, medical schools, medical societies, licensure, and protective medical legislation (Freidson, 1970; Starr, 1982).

Societal changes in the 19th century created a market for medicine that had not been in existence previously. At that time the care of the family was left to women who relied on relatives, neighbors, and lay practitioners for remedies and cures in the case of illness. Physicians were called on only in emergencies. With the rise of industry, the increase in employment outside the home, and the decrease in family size, people were not as available as they once were to care for their sick family members.
Industrial society also indirectly cut the cost of medicine. In the past, it was not uncommon for a whole day's work to be lost in search of a physician. When families were able to produce less of what they needed to live and when paved roads were built making travel more feasible, the use of physicians increased. The growth of general hospitals and mental hospitals also served to bolster business for physicians (Starr, 1982).

During the colonial period, apprenticeship served as the principal source for training. Although a certificate of proficiency could be earned by apprenticing, a degree granted authority. The first medical school was chartered in Philadelphia in 1765. After the War of 1812, medical schools quickly grew in number. Typically, the initiative for the medical schools came when a group of doctors approached a local college to offer a medical degree. Physicians felt colleges would lend legitimacy to their enterprise and provide the legal authority to grant degrees. From the college's perspective, the medical school meant added prestige without any investment, since the schools were all self-financed by students' tuition (Starr, 1982).

Despite these efforts, many problems existed in medical education. Originally medical colleges granted bachelor's and doctoral degrees in medicine. However, since the bachelor's degree was sufficient for practice, many students who received the bachelor's degree never returned to complete the doctoral degree. As a result, the bachelor's degree was dropped with only one course for that degree retained as a prerequisite for the doctoral program. Thus, as the degree was elevated, the requirements for entering a medical doctorate program were reduced. Another problem of medical education was that physicians could start their own schools, and many did so, without regard for established medical education standards (Starr, 1982).

Licensure laws calling for the examination of doctors had been in existence since 1760, but for a long time these were ineffective. There were no penalties imposed for practicing without a license. "The collective interest of practicing physicians was to keep entry into the profession restricted, but the particular interest of the doctors involved in medical education and licensing conspired to keep the field open" (Starr, 1982, p. 45). At this time, one could enter the medical profession either through a medical society by virtue of a license, or through a university once having been awarded a diploma. Therefore, neither medical societies nor university medical programs held definite authority. The medical societies had a fundamental problem: If they maintained high standards, their membership would be small; if they opened themselves up to large numbers of practitioners, they would need to sacrifice high standards. Eventually licensing would be granted only to those graduating with a medical doctorate degree, but this was still decades away (Starr, 1982).

In 1846 the American Medical Association was founded to raise and standardize the requirements for the medical degree and to keep unqualified physicians from practicing. Still, sectarian groups in existence advocated nontraditional education and had no interest in standardizing medical education. One strong sectarian group were the homeopathic physicians led by Samuel Hahnemann (1755–1843). Because the philosophical and experimental nature of homeopathy was embraced by much of the public, traditional medical degree programs began adding homeopathic specializations to their curriculum. With time, however, the nontraditional groups lost their strength and, in fact, were strongest when they were needed by the traditionally educated physicians to promote the medical profession as a whole (Starr, 1982).

By the 1880s a licensing movement existed nationwide, reflecting the circumstances of society at that time. The movement applied not only to physicians, but also to any group wishing to seek licensing protection. There was little opposition to licensing, since anyone in a respectable business could qualify to be licensed under the statutes. The primary opposition to licensure in medicine came from within the ranks (Starr, 1982). Much of the opposition had to do with the fear that licensing would impede freedom of research. For example, William James, a respected Harvard physician and professor, argued that Christian Science "mind curers" had the right to experiment with their new modes of therapy (Starr, 1982).

While licensing had the desired effect of limiting the numbers of doctors, the supply still outweighed the demand, and the AMA was unable to effect much change in the area of its original mission, medical education. Therefore, the Council on Medical Education was initiated by the AMA to establish minimum requirements. In time two schools, Harvard and Johns Hopkins, significantly raised their requirements (and their tuition). Other schools followed this lead. Ultimately, an emphasis on research and internship training and higher standards for medical practice stabilized medical education (Starr, 1982).

Psychology

In what will sound familiar to art therapists, the earliest beginnings of psychology are said to reach back to prehistory (Ben-David & Collins, 1966). Explanations of human thought and behavior can be found in every language. In the case of psychology, originally there were two types: speculative philosophy and physiology. During the late 18th and early 19th centuries, Darwin and other evolutionary theorists influenced consideration of the evolution of the mind and the relationship between the mind and the body (Stern, 1965).

A new group among the psychologists emerged primarily in Germany with the work of Wilhelm Wundt and Carl Stumpf. Conditions in Germany allowed for the effective network for communication of new ideas and a commitment to the new field and new roles (Ben-David & Collins, 1966; Stern, 1965). Psychology did not exist as a separate discipline in the United States until after 1870 (Stern, 1965). In this country, the study of the mind remained within a small realm of metaphysics (Stern, 1965).

The growth of psychology in the United States can be largely attributed to its being part of the curriculum at the prestigious educational institution of Harvard. William James was the first to teach psychology at Harvard beginning in 1875, first under the auspices of anatomy and physiology, then under philosophy. As a medical student, William James had spent a year in Germany in 1867, where he had become interested in approaching psychology in a scientific rather than a speculative manner (Stern, 1965). The opportunity to teach psychology came following a Board of Overseers report that Harvard's curriculum did not reflect the new views espoused in Europe at that time.

A highlight of James' tenure at Harvard was his origination of a laboratory in which students could engage in hands-on empirical research. By the fall of 1875 James realized that
experimentation; removal of religious, metaphysical, and logical terminology; and the need for specialists as instructors were the primary requisites for the success of psychology as an independent science" (Stern, 1965, p. 185). In 1878 the first PhD was awarded at Harvard in philosophy and psychology. The years between 1866 and 1890 were tremendous growth years for psychology at Harvard in which many new specialists were added to the faculty, presenting different views on the same subject.

Higher Education and the Professions

As is evident in the previous examples, a critical aspect of the stabilization of a profession is the education of new professionals. Generally, professional education evolved as requirements were added to apprenticeships. During American colonial years, doctors, lawyers, clergymen, and others began accepting several students to train as a group, and eventually the groups became proprietary or professional schools (Brubacher & Rudy, 1958). At first neither the apprenticeship nor the new "professional school" was able to provide all that was required in the way of professional preparation. What seemed lacking was a combination of academic study and practical application. Eventually professional education became the responsibility of higher education. It was felt that preparation through a degree program ensured a level of competence (Brubacher & Rudy, 1958).

Yet the inclusion of professional education in higher education raised another question: What is the purpose of higher education? Should the aim of higher education be the pursuit of truth, as Aristotle, John Henry Newman, and others advocating classical or liberal education would have us think? Or, should higher education be concerned with the preparation of students for their life's work, as those championing vocational education would assert? (Brubacher & Rudy, 1958; Pelikan, 1992). This long-debated philosophical dilemma may shed some light on the question, "What should art therapy education entail?"

Others argue that good professional education is comprised of both theory and practice (Sandalow, 1988; Zuber-Skerritt, 1992). The evolution of psychology, social work, and medicine would seem to support the inclusion of research in the professional curriculum, as well. Moreover, the viability and growth of a profession require not only skilled technicians and researchers, but also an understanding of the larger picture, the interface of the profession with society, as evidenced by social work's eventual need for schools to train administrators equipped to handle problems of legislation and community welfare.

Sandalow (1988) explains, "The proper object of a graduate education...is not merely to equip students for the 8 or 10 or 12 hours a day in which they will be performing in professional roles, but to assist them in developing character traits, intellectual skills, and an understanding of the world that will enrich their lives and enhance their capacity to act as moral beings" (p. 14). Graduate education is disciplinary education. Understanding a discipline entails not only the ability to work with its components but to work independently of them. Intellectual skills and other education are not necessarily brought into graduate study as courses but instead develop as study proceeds. They are developed through a process that is intrinsic to acquiring an understanding of a discipline. Specialized education does not need to be narrow. It depends on the types of questions asked—whether the questions are those of a discipline that has turned inward upon itself or whether they reach outward toward an understanding of the world (Sandalow, 1988).

Levi (cited in Pelikan, 1992) agrees that the professional school must be concerned in a most basic way with the world of learning and the interaction between this world and the world of problems to be solved. For example, Levi states a law school needs to be a part of a university so as not to lose connection with people. Pelikan (1992) added that to qualify as a profession an occupation must involve some tradition of critical philosophical reflection. There also must exist a body of scholarly literature in which such reflection has been developed and debated. The university is possibly the only place in which reflection and debate such as this can be cultivated (Pelikan, 1992).

Art Therapy: The Profession and Education

Early Education

The Morrill Act of 1862 provided federal assistance to the states for education in agriculture and the mechanics arts (Brubacher & Rudy, 1958). Although not specifically mentioning fine arts, it opened many possibilities for experimentation and helped to shift the concept of higher education toward the preparation of professionals. Many "land grant" colleges were founded with departments of music and art and the emphasis on the practice of art (Ackerman, 1973).

The training that was considered appropriate for women in the early 19th century was centered in the arts (Ackerman, 1973). At Oberlin College, for example, women were admitted to a ladies' course in which classes in the arts replaced many of the ancient language requirements. The first art school affiliated with a university was founded at Yale in 1866. Although the art school remained independent from the college and did not offer degrees, it was open to women who comprised the majority of its students. By 1873 coeducational Syracuse awarded degrees in architecture, painting, photography, and engraving. Wellesley established a college of music in 1880, and Newcomb College (New Orleans) founded in 1886 offered a strong arts and crafts curriculum (Ackerman, 1973).

Until the later part of the 19th century the arts were excluded from higher education for men, since they were thought of as being merely ornamental (Ackerman, 1973). The exception was drawing, a subject typically included in engineering and agricultural curricula (Ackerman, 1973). It was not until the Victorian era that the arts in higher education were considered useful or professional (Ackerman, 1973). Junge and Asawa (1994) note that art therapy has been developed almost exclusively by women and view art therapy as a women's movement.

Art education studies in the early 1900s were concerned with the fundamental nature of the art experience, the relationship between art and life, and the impact of art on emotional well-being (McNiff, 1986). These ideas are closely allied with art therapy. However, when art education moved toward standard methods and away from the individual, this propelled the establishment of the art therapy profession (McNiff, 1986).

One view of the history and evolution of art therapy can be found in Junge and Asawa's History of Art Therapy in the United
States (1994). The authors note the emergence of group therapies, the advent of psychoanalysis, the human potential movement, trends in treating mentally ill persons in the community, and the ideas of progressive education and art education as contributing to the development of art therapy.

The first training opportunities in art therapy were offered through apprenticeships (McNiff, 1986). Those who desired to do the work of art therapists aligned themselves with a pioneer in the field. At the beginning of the formation of the American Art Therapy Association (AATA), there were a variety of educational approaches, such as apprenticeships and in-service hospital training that would lead to registration. When the AATA began to require art therapy education for registration, a number of clinical, institute, and academic programs were initiated (Junge & Asawa, 1994).

In 1967, Hahnemann Medical College and Hospital (now Hahnemann University) in Pennsylvania initiated a graduate training program in art therapy leading to a master’s of science degree. The requirements consisted of completion of a 1-year didactic course, a supervised clinical internship, and a thesis project (Levick, Goldman, & Fink, 1967). An earlier graduate program in art therapy was initiated by Dr. Roger White at the University of Louisville; however, that program remained inactive until 1969 (Junge & Asawa, 1994).

At the time of the initiation of the program at Hahnemann, mostly artists were entering the field of art therapy. Myra Levick (1989), founder and director, argued that these artist-students should have a background in psychological theory prior to classes in art therapy techniques. At Hahnemann the psychoanalytic orientation was the basic theoretical construct of the program. Because art therapy was expected to become an integral part of mental health services, Levick felt it was important to think of art therapists as professionals “having the same moral obligations to the people we treat as any professional in the field of mental health” (1978, p. 138).

By the 1970s the AATA had developed guidelines for the education of art therapists that included both didactic courses and practicum experiences and recommended undergraduate work in art and psychology. The master’s degree was the desired entry level into the field, though the AATA did not make this a requirement until much later (Junge & Asawa, 1994). The AATA grants “Approval” or endorses those graduate programs meeting the educational standards outlined by the Association (AATA, 1994). By 1992, 29 Approved master’s degree programs were in place across the country, as well as numerous undergraduate and graduate courses (Baker, 1994).

Issues in the Training of Art Therapists

As a “hybrid profession” (Wadeson, 1989, p. 103) art therapy is impacted by changes in both the art and therapy fields. Changes in society and economics have changed the world of mental health care providers (Wadeson, 1989). Budget reductions are common in health care, insurance plans, and art departments in schools. Services are determined by what insurance companies will pay and often preclude art therapy (Riley, 1980).

Baker (1994) interviewed art therapists about the field’s “growing pains.” Pat Allen (cited in Baker, 1994) notes that due to the jobs that have become available in health care facilities, art therapists have focused on developing clinical skills while their art lags behind. Many art therapists are concerned that the more art therapy looks to the medical model, the further the field strays from the unique qualities art has to offer (Malchiodi, 1994). Miller (cited in Baker, 1994) agrees with the concern that rigid adherence to professionalization may undercut the focus on the artistic, creative side.

Art therapy positions in health care facilities frequently require a license in order for the facility to receive third-party payment for the art therapy service (Baker, 1994). Because there is no license for art therapy in most states, many art therapists have become social workers, licensed professional counselors, or psychologists in order to viably practice art therapy. At the same time, a growing tendency is for such professionals to incorporate art into their work, creating greater tension within art therapy. Many art therapists want to make sure they are known as artists who understand the process patients go through when creating a work and who make interventions via the art that nonartist psychologists couldn’t possibly make (Baker, 1994).

The situation in California exemplifies what is happening in many states today (Wadeson, 1989). Until recently California art therapists could be licensed under the Marriage and Family Counseling Certification (MFCC). After the requirements were tightened a couple of years ago, art therapists could sit for the MFCC exam provided they had taken these classes: Human Growth and Development, Human Sexuality, Psychopathology, Cross Cultural Mores and Values, Theories of MFCC counseling, Professional Ethics and Law, Human Communication, Applied Psychotherapeutic Techniques, Research Methodology, and Psychological Testing (Wadeson, 1989). Although art therapists can practice art therapy without the MFCC, they are not able to find jobs without that credential (Junge, personal communication, November 20, 1994).

Circumstances are similar in Michigan. One graduate art therapy program exists in the state and was founded in 1982. The program at Wayne State University applied for Approval by the American Art Therapy Association in 1993 and was awarded AATA Approval in 1994. In preparation for the AATA Approval process the curriculum was reorganized and revised. This process was rather lengthy, involving obtaining approval from the University’s College of Education, Teacher Education Division, and Curriculum Committee.

Despite the new art therapy curriculum, pressures to change the curriculum again are coming from Michigan art therapists seeking positions in counseling and educational facilities (personal communication, Michigan Association of Art Therapy Executive Board, February 29, 1992). Prior to October 1993, art therapists were eligible to apply for the Licensed Professional Counselor Credential (LPCC), a credential presently recognized by insurance companies for reimbursement of counseling services. Since this date the requirements for the LPCC have been upgraded, requiring equivalent coursework to a master’s degree in counseling. This change prohibits most art therapists from applying for the license if their only graduate coursework has been in art therapy (Michigan Board of Counseling, 4-23-91).

When the art therapy faculty was polled in the summer of 1985 about whether to offer a 60-credit interdisciplinary master’s degree in counseling with an art therapy specialization (including all counseling courses needed for the LPCC), the majority responded, “Yes!” Reasons cited were the availability of jobs,
third-party reimbursement, and strengthening the program’s clinical component. Should this plan be carried out, the 41-credit art therapy master’s degree program (MEd in Art Education, Art Therapy Variant) that presently exists would remain in place; however, continued interest in this program, if the proposed interdisciplinary program is initiated, remains to be seen.

Training shapes a profession, but influences upon the profession shape the type of training that is demanded by the market (Wadeson, 1989). Art therapy education today is struggling with the same questions faced earlier in our history. Should there be a “classical” education in the pursuit of “truth”? Should the education of art therapists consist of courses, regardless of whether they are related to art therapy as it was first practiced, that enable graduates to get jobs? Will the art therapy profession become a subspecialty of counseling or some other mental health profession?

Nancy Hall, past AATA Government Committee Chair, believes that for art therapy to be reimbursable, art therapy training will probably need a curriculum that is in line with that of counseling programs (cited in Baker, 1994). Wadeson (1989) believes the issue of third party payment is likely to encourage training of art therapists as specialists within other health care professions.

The AATA membership voted to initiate a national certification examination which was offered for the first time in November 1994. A certification exam is believed by many to be the next logical step to gain professional recognition, and eventually licensure and third party payment (Baker, 1994). In New Mexico, for example, the Counselor and Therapist Practice Act was signed into law in 1993, establishing the first independent license for art therapists (Baker, 1994). In order to practice art therapy in New Mexico, art therapists will now need to pass the national certification exam. “Reality states that those who are certified and licensed are going to get jobs, and most of us need jobs” (Good cited in Baker, 1994, p. 46). Certification is also thought to protect the public against incompetence.

Lessons from Other Professions

Art therapists may take comfort in the knowledge that as members of a developing profession, they are not alone in their concerns. Social workers likewise felt their profession had become dehumanized and had lost its compassion and enthusiasm (Lubove, 1965). Eduard Lindeman, a social work educator, feared that bureaucratization and professionalization had transformed the social worker from the “embodiment of sentiment” into the “symbol of technique” (cited in Lubove, 1965, p. 85). Although held in fairly high esteem by the public, social workers themselves “envied the lawyers, doctors, and engineers whose professional associations enforced standards of practice and codes of ethics, resulting in ‘images of something ethereal in the public eye’” (Lubove, 1965, p. 128). Like art therapists, social workers felt their salaries weren’t high enough, and that talent was being lost to other professions (Lubove, 1965).

Internal Consensus

The art therapy profession can learn at least four lessons from social work, psychology, and medicine. The first lesson concerns the internal problem of consensus (Starr, 1982). Members in the profession must agree on the criteria for belonging to the profession. Starr (1982) wrote that perhaps the greatest problem with establishing the collective authority of the medical profession in the 19th century arose within the ranks. “Internally divided, it was incapable of mobilizing its members for collective action or of winning over public opinion” (p. 80). Evidence of this discussion in terms of art therapy has arisen with questions concerning what should be on the board certification exam or even questions over the necessity of the exam itself.

Legitimacy

Second, the profession must establish itself as a legitimate one. Art therapists must be able to define the service they provide and to perform the service with competence. That is why research demonstrating the effectiveness of art therapy is so important. Both physicians and social workers had to demonstrate their skills in order for their professions to become recognized and grow. Advances in science contributed to the legitimacy of social work, medicine, and psychology. Social work advanced when it was perceived that the profession was heading toward a scientific understanding and control of behavior (Lubove, 1965). Traditionally educated physicians were respected as authorities, given the new expertise science provided them (Starr, 1982). Psychology developed when the study of the mind was empirically investigated (Stern, 1965). Licensure, once it was finally enacted by the medical profession, contributed to the legitimacy of that profession. To be licensed meant to be competent or legitimate. Medical licensure also strengthened the AMA by requiring participation in the organization (Starr, 1982).

Demand

Related to legitimacy is a third lesson: There must be a demand for the service the profession provides. As Starr (1982) explained, not until there was a market for medical services did the medical profession increase in numbers and status.

Education

The fourth lesson involves education. There is a reciprocal relationship between training and practice (Wadeson, 1989). Training shapes the way the profession will develop. In the United States, the profession of psychology developed in large measure because of the coursework in psychology at Harvard during the middle 1800s. The reformation of social work education to include courses in administration equipped social workers to handle broad problems of legislation and community welfare (Lubove, 1965). Although at present most creative arts therapists identify with clinicians, Johnson (1985) believes they should diversify to be administrators, researchers, lobbyists, and the like, minimizing dependence on other professions for their existence. Sandalow (1988) reminds us that specialized education need not be narrow and should inspire the asking of questions that reach outward toward an understanding of the world.

Art Therapy: The Future

Art therapy pioneers recently responded to the question, “Where will art therapy be as a profession in the next 25 years?”
Many of the pioneers interviewed predict there will be a market for art therapy services, although the market may primarily be in nonmedical settings. Halfway houses and group homes, shelters, AIDS units, and programs for the elderly may be some settings in which a need for art therapy will exist (Kramer, 1994). The impact of change—in health care are difficult to predict, but art therapists will need to be prepared for changes in the pay-for-service by insurance provider system that is now in place (Wadeson, 1994).

To survive in the future art therapy will have to be known by others in health care and education as an essential service (McNiff, 1986; Wadeson, 1994). “Professions that survive with strength and purpose are those that address themselves to the needs of society rather than the more specialized interests of professionals” (McNiff, 1986, p. 42). If art therapists perceive themselves in adjunctive or secondarily roles, they will have this destiny for their profession (McNiff, 1986).

Creative arts therapists need to identify their unique contributions and to articulate the new information art therapy can add to education or health care (Johnson, 1985). What is needed, therefore, is research demonstrating the authority and essential nature of art therapy.

In 1989 Wadeson predicted greater divergence in art therapy training programs. She recommended art therapy educators plan training for the kind of art therapist they will prepare. Training programs may identify themselves along a continuum of clinical, research, or administrative routes. Applicants would be able to acquaint themselves with the different orientations of each and there would be a common ground on which all can maintain balance. McNiff (1987) predicted the next growth area in the profession will be research and scholarship, serving both clinical practice and higher education. “Interdependence among the three essential” (McNiff, 1987, p. 285).

This writer agrees with the sentiments of Johnson (1984) who feels the creative arts therapies have not developed in the 20th century by accident. They are the result of an historical process and serve some function for our culture now. Art therapists must grasp that function and find ways to realize it.

Conclusion

The emergence of the professions in the 19th century corresponded to societal changes. The development of the profession of art therapy followed a pattern of growth similar to other scientific disciplines. The struggles facing art therapy today are not unlike those faced by other professions. Art therapy may learn from several related professions as it strives to establish its legitimacy. In order for art therapy to survive, the profession will need to define its parameters and the service it provides. The service provided by art therapists must be perceived as essential to the needs of society and be rendered with competence. Higher education plays a role in the development of a profession, as professions seek to standardize the preparation of members. Art therapy might be wise to diversify its educational programs to train researchers, administrators, and lobbyists in addition to clinicians.

**CALENDAR OF EVENTS**

**1996**

**OCTOBER**

The International Stress Management Association will conduct ISMA-6 on October 5-8, 1996 in Sydney, Australia in cooperation with several other organizations. For more information, call (619)635-4698, fax (619)635-4669, or e-mail: NOSTRESS@sanac.usiu.edu.

**NOVEMBER**

The Society for Alternative/Complementary Medicine and Wellness in Health Care was created from the powerful and positive experience had by all that attended the National Conference on Alternative/Complementary Medicine in Allied Health Conference last year. This conference will be combined with the National Wellness and Health Promotion Conference to form the 4th National Conference on Alternative/Complementary Medicine and Wellness will be held in the Metro DC area in this Fall. Call (301)236-4614 or fax (301)236-4609 for more information.

The 27th Annual American Art Therapy Association (AATA) 1996 Conference “Many Paths; Multicultural Perspectives in Art Therapy” will be held on November 13-17, 1996 at Adams Mark Hotel in Philadelphia, Pennsylvania. For more information call (847)949-6064.

The National Association for Music Therapy (NAMT) and the American Association for Music Therapy (AAMT) will hold a Joint Conference “Music Therapy: A Tapestry of Many Voices,” on November 16-19, 1996 at the Opryland Hotel in Nashville, Tennessee. Call NAMT at (301)589-3300 for more information.

**FEBRUARY**

The 6th Annual “Emerging Artists Competition” will be held in New York City at Slowinski Gallery’s Mulberry Street exhibition space. The first prize is $1,000.00 and the deadline for submissions is October 30, 1996. Send a SASE for prospectus to Slowinski Gallery, 215 Mulberry Street, New York, New York 10012 or e-mail: slowart@aol.com. For more information call (212)431-1190.
The Art in Art Therapy Education: Where Is It?

Linney Wix, MEd, ATR, LPAT, Albuquerque, NM

Abstract

The meaning and placement of studio components within art therapy education programs are explored in this article. The results of a survey of art therapy educators regarding the inclusion of art studio requirements in conjunction with internship in their educational curricula and the effects of including art in educational programs are discussed. Central to the discussion is the idea of place for art making. Supporting the idea of place, a model studio component for interns in an AATA-approved art therapy education program is discussed with a focus on student responses to participation. The studio as a container for art making and art's potential to heal is examined in the context of nonsupportive educational, organizational, and practical settings.

"It is art which makes life, makes interest, makes importance . . . and I know of no substitute whatever for the force and beauty of its process" (Henry James cited in Stevens, 1951, p. 169).

Introduction

From the documentation of the first year of the Intern Studio Project (Wix, 1995) at the University of New Mexico (UNM) has evolved a second-year study that focuses on a developing body of research designed to study the effects of studio work on the education of art therapy graduate-student interns. The research is based in UNM's ongoing studio for interns.

Although I understand the meaning of research to include the idea of thorough investigation through systematic questioning, I cannot dismiss the etymological connection that " . . . search" denotes "going round in a circle"—for its ultimate source is Latin circus "circle." (Ayto, 1990, pp. 464-465). By the time cercare, "go round" reached Old French as cercier, it had come to mean "examining" or "exploring." (Ayto, 1990, p. 465). My use and understanding of research includes a "going round" in order to gain multiple viewpoints toward an experience, defined by Ayto (1990) as a "condition of having undergone or been affected by a particular event . . . " (p. 213). Hillman's (1975) writings discuss this process of event-deepening to experience as a quality essential to soul-making. Studio research requires multiple perspectives in its very nature of exploring the sensory-laden experience of giving precise form to feeling through the working of art materials with the hands. The studio process is naturally cyclical in its inclusive patterns of making and viewing, immersing and stepping back to see what has been made.

The word study comes from Old French estude, from Latin studium, "eagerness, intense application," hence "application to learning." Studio derives from the same source via Italian and is also connected to hit (Latin taudere), the "application of extreme effort" (Ayto, 1990, p. 507). Based on these etymological roots, I understand the studio to be the home of "application of extreme effort" in artwork. Art derives from "an Indo-European root ar-, which meant 'put things together, join.' Putting things together implies some skill; hence Latin ars, 'skill.'" (Ayto, 1990, p. 37). Thus it makes sense to me that the studio is the place for working with effort and skill to make an image that precisely depicts an emotion, an idea, or a state of mind. When studio serves as the place that houses image-making and when one believes, as Jung did, that image is psyche, then the studio has the potential to house soul-making through the "application of extreme effort" in artmaking.

Background

The Intern Studio (Wix, 1995) at UNM was developed out of the concern that students become too involved with the clinical aspects of art therapy relationships, resulting in art therapy practice that is more of a verbal-psychological model than an arts model. Allen, discussing the pressure to develop a clinical identity, states, " . . . knowing that clinical therapeutic skills may aid their stature in the work place and facing a dearth of genuine art therapy theory, educators usually fall back on trying to convey clinical expertise gleaned from established areas of psychology . . . " (Allen, 1992, p. 24).

The Intern Studio provides a place in which multiple imaginations spawn in fertile ground. McConehgy (1995) states, "When an emotion is not held aesthetically within its image, the image is reduced in quality." Studio is where artists work in the eager, intense application of art skills to form that image which holds the emotion or idea. When the place, physical and psychological, for forming the work is missing, the image, left unformed, is "reduced in quality" (Ibid). Is it possible that the scarcity of art studio requirements amidst the dearth of genuine art therapy theory (Allen, 1992, p. 24) in art therapy education perhaps reduces the quality of the education? If knowing intimately about emotional holding through artmaking is basic to the practice of art therapy, then the educational setting seems an apt place to hone that skill. When studios therein are missing, the emotional holding through artmaking is difficult to realize in academia. McConehgy (1995) continues, stating, "Pay attention requires passion." It seems that the roots of passionate attention-paying to artmaking are naturally found working in the studio. To pay passionate attention to the artwork of clients we first must passionately pay attention to our own artwork.

As an educator, I am concerned about the lack of attention paid to studio as the place to house the "application of extreme effort" required in the making of art in art therapy education programs. I have too often observed the artwork of the art therapy interns, the art therapist, and the patient being left behind in service of the well-trusted and well-known "talking cure." This leav-
The sinking in, the grasping of the idea of art's ability to recreate and to heal, happens through the art therapist's own "recurring opportunities for... personal reexperience" (Robertson, 1963/1982, p. 107) in artmaking. That is, the "how" in doing art therapy has the potential to be handled largely by art therapy interns' and practitioners' immersion in studio art experiences. Of course, this working-on-one's-own-art part of the "how" is only one portion of the art therapist's full education; currently, however, it is the part that is left behind in favor of imparting a particular psychological theory which is rarely image-focused and is often a "hodgepodge of clinical concepts" (Allen, 1992, p. 24).

Residing in the place of artmaking provides insights that can be learned in no way other than the direct experience of making art. How else can one grasp or be grasped by art insights than to set up residence in the place of making? In order to dwell in the place of art insight, more than an experiential exercise designed for use in art therapy coursework is needed. In coursework, the brevity, the boundary issues inherent in sharing psychic material in class, and the subsequent grade upon that work all contribute to the prevention of a deep dwelling. The "effort" is misplaced in experiential exercises; the intent in coursework is usually to learn how to use an exercise either to determine or further a patient's state of mind or health. In a studio context, the "effort" is on one's own artwork—always working toward precise communication of an emotion or idea through image. Thus, the studio component is necessary in art therapy education—to know through one's own experience with making, and image, to know through one's own precise communication, in the studio, the place for "extreme application" in artmaking.

Kramer (1994) urges art therapists to seek part-time (rather than full-time) art therapy positions in order to maintain their own art practices. She insists that as art therapists we must "not lose our identity" and that we "uphold the laws inherent in making art" (pp. 91-92). She states,

"... when it comes to mobilizing this specific creative fervor, this passion, this energy that's in art, I can do an awful lot because it's in me and I can communicate it. I'm very interested in anything a person does that begins to look like art, that begins to look like it's taking shape, taking form, and communicating something, that it's not superficial and it's done with very profound involvement. It's done with passion. That passion has to be in you so that you can stimulate it in others. (McMahan, 1989, p. 112)

Art and image as deep dwelling place seems to be an attitude not held by the American Art Therapy Association (AATA). The AATA Guidelines for Academic, Institute and Clinical Art Therapy Training (1993) state, "Normandy studio art courses are regarded as undergraduate prerequisites rather than as sources of graduate credit" (p. 5). In the revised Education Standards (1995) this statement is eliminated, and it is stated that art therapy education programs "must have regular access to... studio for working with art materials... and to studio art equipment and special supplies" (p. 6). This is the first evidence of the AATA's support for the inclusion of studio opportunities in art therapy education and may be a sign that AATA's attitude is changing. Evidence of art involvement in the form of slides is required neither for professional registration (ATR) nor for Board Certification.
Part I: Educator Survey

The research in process springs from a lesson I learned in my own work as an art therapy educator about the importance of maintaining a nonclassroom studio for the artmaking of art therapy students during their internships. Due to time and energy commitments for internship placements, as well as the clinical expectations of the agency, the intern’s own artwork often receives little attention. Additionally, internship is a lonely time for art therapy interns; they tend to struggle with whether or not they must give up that which initially brought them to the field—art—in order to become art therapists. Working alone, in a private studio, often exacerbates the loneliness experienced at the internship site.

Method

To determine studio opportunities available to interns in educational programs, I surveyed art therapy educators. Because the research originated at UNM, its studio is not included in the research responses. The questionnaire used in this survey asked whether the program is graduate or undergraduate, what degrees are offered, and where the art therapy program is housed in the college or university. Topics covered in the questionnaire included whether or not the program has a studio component for interns and, if so, whether studio is required or elective, and if not, if there is a need for studio. Respondents were then asked for a description of the nature and purpose of their program’s studio component and its effects on interns.

Results

The 59 questionnaires sent out generated a total of 32 responses (Table 1). Of the 24 responding graduate programs, eight indicated that they have a studio requirement in conjunction with internship, while 16 indicated no studio requirement in conjunction with internship (Table 2 is based on 24 graduate program responses). Four of the eight graduate programs responding in the affirmative are AATA-approved, four are not. Of the 16 graduate program questionnaires returned stating that they do not have a studio component, 10 are AATA-approved programs and six are not approved. While four of these 16 respondents stated a need for a studio component for interns, six stated that there is no need for studio in conjunction with internship in their programs. Two of these six discussed the inclusion of experiential exercises in coursework precluding the need for a studio component per se. Four respondents stating that their programs do not offer an intern-related studio stated that their students are required to take from 3 to 12 studio credits not necessarily related to internship during their graduate studies. One respondent in this category discussed her program’s stockroom studio which is available for students to use.

with internship are housed in art or art-related departments. A total of 75% of the responding graduate programs with an intern studio requirement are housed in art or art-related departments. Only one independently housed graduate program indicated a studio component in conjunction with internship; that program is not AATA-approved. Interestingly, of the four responding AATA-approved, independently housed art therapy programs, none contains a studio requirement.

Three art therapy education programs responding in the affirmative described their required studio component as a 1-hour studio built into the internship/field experience courses; one of these studio hours consists of projects, themes, and methods to be utilized with clients, while another consists of artmaking periods in which interns respond to patient art with a focus on the interns’ abilities to use their own art responses to understand patient art and countertransference issues. A studio component described by another responding program includes a materials and methods course focusing on “materials discovery and development” and results in a portfolio presentation at semester’s end. One respondent stated, “Students say they feel more confident in their practicums as a consequence of practicing these techniques (in studio).” Another AATA-approved program offers two art therapy studio courses with a minimum of one required; these courses are designed to develop a repertoire of techniques to be used with patients. This particular program states, “Studio is a vital part of the program.” Two respondents who work in programs offering studio in conjunction with internship also discussed studio requirements not connected with internship.

Only one program requires a studio that is devoted to the art therapy intern’s own art making process. This particular studio distinguishes itself by the intern’s self-determined artistic involvement in contrast to an intern’s response to a patient’s artwork or completion of a project. This mandatory course is required in conjunction with internship. It is described as an opportunity for “students [to] engage in self-directed study within a group studio environment” in which “an in-depth relationship with his or her artmaking is begun.” This program with the self-determined studio component requires a portfolio as part of the candidacy review for upper-level coursework in art therapy. Comments on this studio requirement include this from an on-site supervisor—“The students understand art as the vehicle for change”—and this from an instructional supervisor—“The students’ capacity to explore their art and the creative process as a vehicle for demonstrating mastery is one of the most valued outcomes of [studio involvement] . . . . Fluency in articulating the place of art in [the students’] work is evident in practicum, comprehensive exams and thesis.”

Eight of the 32 total responses were from undergraduate programs, three of which described strong studio components requiring from 24 credit hours of art to “one-third of required coursework in studio.” Six of those eight undergraduate programs are housed in art or art-related departments. One respondent stated that the studio component of the art therapy major at her college “serves to ensure that students have a thorough understanding of artistic principles . . . . and the technical skills necessary to produce art. The studio experience will make the therapist more effective as she will have an in-depth understanding of the methods and materials of the artistic process.”

### Discussion

Clearly, the “home” of an art therapy program makes a difference in the program’s attitude toward the inclusion of art studio requirements in the curriculum. This is most clearly indicated by programs where there is no studio component: only three (of 16) responding programs without an intern studio component are housed in art or art-related departments (Table 3). This may imply that programs housed in nonarts-related departments do not have studio space available to students; thus, there is no place for “intensive application” when it comes to art. Studios are commonly found in art or art-related departments.

One of the interesting results of the responses from art therapy educators is the variety of definitions of “studio,” ranging from its use in discussing countertransference toward clients and their artwork, to interns’ responses to clients’ work, to develop-

</table>
ment of techniques to be used with clients, to self-directed personal artmaking. This varied definition of studio in art therapy education results in a variety of ways to include studio experiences in the education of art therapists; these range from required studio courses, to elective studio courses, to time set aside for artistic responses to patients' art, to encouraging students to make art at home. When no intern studio was offered, there were additional studio components, not connected with internship, required and elective, within programs.

Simply stated, there are neither guidelines nor requirements for the inclusion of art in art therapy education. Art's inclusion or exclusion appears to be determined by where a program is housed and by the attitude and approach of the educators. The high rate of exclusion of studio opportunities from art therapy education in general (and for interns specifically) indicates a certain lack of commitment on the part of educators to art as the heartbeat of art therapy. Just as an image is diminished in quality when it does not hold the emotion or idea aesthetically, perhaps art therapy education is diminished in quality when it does not hold art at its center. When art is not the heartbeat of art therapy education, it is not the heartbeat of art therapy—possibly indicating a lack of trust in art's ability to heal.

Metaphorically, I hold the tension of dual placement, being in the field and standing at the edge as the fence.

Method

The Intern Studio is a studio option for graduate students in art therapy at UNM. Participants do not receive academic credit for their involvement. They voluntarily attend a regularly scheduled studio that meets for 3 hours weekly on an academic semester schedule. The Intern Studio is designed particularly as a place for art therapy graduate students who are internning to pay attention to their own artmaking.

Interns choosing not to participate in the Intern Studio were surveyed to determine reasons for nonparticipation. Interns choosing to participate were surveyed at the beginning and at the end of a semester's participation to determine the desired effects of studio participation (prestudio) and the actual effects of studio participation (poststudio) on personal artmaking and on attitudes toward and performance in internship.

Results

Of six nonparticipating interns, three stated a time conflict or no available time as the reason for nonparticipation; two stated they work in their own studios; one stated "other" reasons.

Ten Intern Studio participants completed prestudio and poststudio questionnaires (described above) as well as a questionnaire to determine reasons for participation. Figure 1 depicts interns' stated reasons for Intern Studio participation.

Preparticipation. The first question on the preparticipation questionnaire was, "How do you expect Intern Studio participation to affect your own artmaking?" The following quotations are representative responses: "I hope to be inspired by artmaking of others . . . and look forward to the community influence on my artmaking; I want to develop painting skills; I hope to develop a

![Figure 1 Intern Studio Participants: Reasons for Participating](image-url)
deeper relationship with my inner self through my artmaking." "I'm looking forward to making art in a soul-supporting environment." "I want to participate to concentrate on my art to make artmaking a more regular activity to expand my definition of art."

The second question on the preparticipation questionnaire was, "How do you expect Intern Studio to affect your attitudes toward internship and performance in internship?" Again, a summary of intern responses follows: "I expect my work in studio to deepen my connection with clients through connecting more deeply with myself. "I count on studio to provide a place to reflect on internship experience." "I hope to understand through my own art process what I am asking of clients in their artmaking." "I want the studio to provide relaxation and an expressive outlet for internship stresses."

Postparticipation. Postparticipation responses were much more lengthy than preparticipation ones. Having experienced the studio, interns were able to speak at greater length and in greater depth regarding their experiences. On postparticipation questionnaires, all studio participants indicated positive effects of studio participation in their artmaking and on their attitudes toward and performance in internship. A summary of statements made by participating interns regarding the effect of Intern Studio participation on artmaking and internship attitudes and performance follows.

Regarding studio effects on personal artmaking, interns said: "Studio kept me connected to my own art and provided a stronger connection to my clients' processes." "Studio grounded me in my own art life in a way that grounded me in internship." "I recognized that art is the basic ingredient in art therapy." "Studio extended and strengthened ideas that the availability of a wide range of materials can stimulate and deepen art expression." "I was inspired by the work of others and felt supported in artmaking in this soul paradigm." "Studio reafirms what art therapy is about—art." "Studio helped me encourage clients to stay with artmaking through learning to trust my own art process—even when it is difficult." "Without my own ongoing artmaking it was harder to engage clients in their artmaking and easier to slip into verbal processes."

Regarding the effect of studio participation on attitudes toward and performance in internship, interns made the following statements. "Studio strengthened my commitment to art being central to internship. It helped me make internship an artful experience." "Studio gave me time to set aside to do my own art, a great relief, when as an intern, you watch so many others making art and you are helping them." "Being involved in studio facilitated the integration of my artist and therapist selves." "Studio provided an outlet for stress associated with internship through personal artmaking. . . . renewed my strength to continue interning each week . . . increased empathy and compassion for patient processes . . . increased knowledge of materials and methods and my ability to structure intern sessions authentically . . . increased my enthusiasm for my process, group process, and patient process." "Studio enhanced artmaking for me and in turn for my patients. "It made a big difference in trusting art for myself and for clients . . . and improved my ability to focus on patient art process by staying with my own art even when it got hard." "Studio helped me encourage clients to stay with artmaking through learning to trust my own art process. "It improved my ability to facilitate client process through my own first-hand knowing that soul expresses itself through art. "There was a distinct change in my degree of ease with engaging clients in art therapy . . . this is partially due to my firmer stance on centrality of art and imagination made possible by my personal recommitment through studio."

Discussion

From student comments, overall trust in one's artmaking appears to be an issue that is central to facilitating patients' artmaking processes. Intern comments evidence that trust is learned most profoundly through an engagement with one's own artmaking processes. When interns are regularly and deeply involved in making their own art, it appears that they are more likely to trust artmaking for patients and to treat their own ability to facilitate art relationships.

It appears that Intern Studio participation realizes the potential of art in art therapy education. Results imply that the interns' commitment to their own art processes is vital to their commitment to art in internship practice. A further implication is that art is pivotal to art therapy education, to the art therapy intern's well-being, and to the art therapy intern's attitude and performance. An essential ingredient in these implications is the provision of place, physical and psychological, to dwell deeply in artmaking.

Over six semesters the Intern Studio has become very important to interns in UNM's art therapy program. The studio offers participants the first-hand opportunity to learn to trust art through their own involvement in self-directed artmaking.

Conclusion

I believe that the real work of art therapy education is missing when, in the context of art therapy programs, students have not experienced their own commitment to making art in programmatic studios designed for art therapy students. As indicated by student responses to their Intern Studio participation, this type of studio experience tends to deepen both the intern's art and internship experiences, to strengthen connections made with patients and patients' artmaking, to increase empathy toward the patient experience, to provide additional support to students in their internships, and to decrease isolation during internship and artmaking. Perhaps most important, for the individual and for the field of art therapy, the Intern Studio supports and encourages the centralization of art and imagination in the education and practice of the art therapy intern. Art at the center of art therapy education can only make us better art therapists through our intimate experiences with art and the imagination. Studio naturally provides the place for practicing the intense application of artmaking, leading to faith in art and imagination as container and contained, as fence and field in art therapy.

According to educator responses, art is outside the fence in many art therapy programs. While the number of programs providing studio support for students is discouraging, the results from students participating in UNM's Intern Studio are encouraging. Written notes from art therapy educators in programs that offer a studio component suggest similar findings—that their students also thrive and develop "artistic fluency" through studio
participation and that studio requirements are "vital" to their art therapy programs. UNM interns report that their own studio involvement strengthened and supported their relationships in art therapy sessions as well as their abilities to facilitate patient art involvement; they report that the studio "fed" them and that art has been the "silent witness of Self" through studio involvement during their art therapy education.

Through their own "extreme application of effort" in the studio context, participants in the Intern Studio know the joys and the hazards inherent in the territory of artmaking. They know first-hand how artwork reveals the "soul's desperate concerns" (McConelly, 1995). There is a chance that these revelations of the soul through art may prove to be of equal importance to acquiring clinical skills in art therapy education; it may prove that this intimate, first-hand knowledge—gained through direct experience with making art in the studio—is what ultimately provides students with the skills and insights to care for patients as art therapists.

The question continues to loom in my mind: As educators, what is our responsibility for providing students the place, psychologically and physically, for deeply meaningful involvements with artmaking in art therapy education? If educators fail here, they may be destroying their own field by not providing students and themselves with that nourishment found only in making art which is so central to the care they offer others.

Editor's Note: The author wishes to thank participants in the Intern Studio Project who have attended and participated with the fullest of hearts and minds and in so doing have taught me much about the insatiable value of art making for the field of art therapy: Shirley Barnes, Joelle Baum, Katherine Bokinskie, Brenda Bunker, Kim Carter, Virginia Coupe, Trish del Bough, Joe Dvorak, Barbara Falconer, Diana Fosse, Lanni Ann Fredman, Alison Green, Sue Hermes, Maria Hinojo, Jenny Hubbard, Kat Humphrey, Kim Kelly, Threema Leech, Pam Matsuda, Susan McCamey, Gayle Mecca, Lindy Merry, Sandra Mueller, Merle Pokenpaier, Sarbat Ramos, Ransom, Deb Rogers, Tristen Spears, Deb Steele, Janis Timm-Bottos, Ingrid von Brockdorff, Heidi Wolfe, and Yoko Yoshioka.

Abstract

This article describes an intraprofessional collaboration between a graduate program in art therapy and expressive therapies, an urban public school system, and a community mental health agency. It addresses the relationship between the state of society, the state of schools, and the need for community involvement within the schools. The authors examine the important role of art and expressive therapies in providing services to underserved, “at-risk” children in public school settings. It also describes the role of off-site art and expressive therapies’ supervisors in educational settings and the development of a handbook to guide therapist trainees in the supervision process. The final section consists of case vignettes which illustrate the use of art and expressive therapies in public schools.

Introduction

Although there is a significant body of literature on art and expressive therapies within schools, much of it represents work that takes place in specialized settings. There is little in the literature that addresses the development of the role of expressive therapies in the public schools, the integration of the expressive arts into the main school program, and the collaboration among members of an interdisciplinary staff. Many articles explore the benefits of using art and expressive therapies with children with physical handicaps (Herrmann, 1995; Kunkle-Miller, 1990). Other literature examines the similarities and differences between art therapy and therapeutic art education when working with violent imagery drawn by emotionally disturbed adolescents (Graham, 1993).

Some articles address the use of art and expressive therapies with children who, as a result of emotional difficulties, have been referred through the school system to a separate treatment setting for individual or group therapy (Steinhardt, 1993; Zeiger, 1994). In the current climate of dwindling social service resources, referral to inpatient treatment, residential facilities, and mental health agencies has become increasingly difficult. Only those children in the most acute distress can, usually after a prolonged time period, receive time-limited services at these facilities. The result is that greater numbers of more disturbed children remain in the classrooms of the public schools. The art and expressive therapist must explore how these factors shape and define the clinical expressive work to be accomplished in the schools.

The therapist trainees in schools are confronted with the socioeconomic environments in which the children live and are challenged to examine and frame treatment within this larger political context. Literature supports the importance of understanding the social and environmental contexts of school and home for children referred for treatment and also addresses how these factors influence the therapist’s and client’s conceptualization of therapeutic issues and how these perceptions affect the course and outcome of treatment (Case & Dalley, 1990, Franklin, 1990; Gersie, 1995). Gersie, who works in “therapeutic settings located in deprived urban environments” (1995, p. 207), states that when working in this kind of environment, it is the responsibility of the art and expressive therapist not only to help the client express and contain, but also to facilitate the client’s ability to implement change. She also addresses various challenges that can affect the work of art and expressive therapists working in these environments. These include threats of physical violence, confrontation with one’s own and others’ racial prejudice, and “a feeling of impotence generated by the apparent multiplicity of problems . . . awareness of the limits to one’s own capacity to facilitate change” (p. 212).

Dalley (Case & Dalley, 1990) makes similar observations related to school settings and focuses on the necessity to account for social and environmental contexts when treating children. She believes that the therapist should be a collaborative member of the staff, sharing objectives, goals, and problems inherent in working within a school system. She also describes how to define the role of art therapist within the school system and examines how professionals work within a system, although their different disciplines are not governed by the same code of ethics. For example, a frustrated teacher may want information about a child that the therapist trainee considers confidential. It is important to identify how that information can be shared in a way that satisfies the teacher yet protects the integrity of the therapeutic relationship.

Dalley discusses the importance of consistent scheduling and how to facilitate a child’s reintegration into the classroom after therapy sessions and describes how to avoid possible stigmatization by the peers of those children being seen outside of the classroom. She also addresses the potential benefits of removing a disruptive child so as to help diffuse a potentially difficult classroom situation. The change resulting in new group dynamics often enables other students to participate more fully than if the disruptive child had remained the group focus.

Many articles speak to the natural tendencies of children to move between different forms of expression and the use of art therapy to stimulate this transfer. As children learn and develop through the action of play, intermodal work can be most beneficial. Art therapy easily lends into storytelling. Dramatic play can
become spontaneous psychodrama which can be expanded by creating art to illustrate the story being enacted (Cattanach, 1995; Kunkel-Miller, 1990; Steinhardt, 1993).

Art and Expressive Therapies in Public Schools: A Collaboration

The collaboration between Lesley College's Expressive Therapies Program in Cambridge, Massachusetts, Cambridge Public Schools, and Cambridge Youth Guidance Center began in the fall of 1993. The Expressive Therapies Program has a 20-year history of successful training collaborations within private school settings. However, there were very few examples of art and expressive therapies within public school settings. Although collaborations between graduate schools, school systems, and community mental health agencies had been rare in the past, current societal and world changes have precipitated their collaboration.

The severity of problems that children bring into school settings is rising dramatically. Violence, sexual abuse, suicide, substance abuse, poverty, and the decay of family and community structures are just some of the numerous issues affecting children today. While historically the function of schools was solely to educate children, more and more schools are becoming havens for children in distress. Schools are often the only safe, stable, and structured part of a child's life.

Some school systems have recognized children's increasing emotional needs and have adapted their programs to include school-based counseling, family work, psychoeducational groups and activities, and teen health clinics. Other school systems reject the notion that schools should address such a wide range of emotional and social needs and firmly maintain their focus on education alone. The fact remains, however, that schools are being expected to handle students who face very serious, complicated, challenging issues from home and social environments that make it difficult for them to focus and learn in the classroom setting. Depression, truancy, and acting-out behaviors are but a few of the symptoms present in the student who is having difficulty in school. Schools and school professionals are being expected to do more with less money and less resources available to them.

In 1990 a decision by the New J ary Supreme Court emphasized the critical need for public school support and services for poor students and declared New Jersey's Public School Act of 1990 unconstitutional as it applied to poor urban school districts (Abbott v. Burke, 1990).

The fact is that a large part of our society is disintegrating, so large a part that it cannot help but affect the rest. Everyone's future is at stake, and not just the poor. The educational needs of students in poorer urban districts vastly exceed those of others, especially those from richer districts. These needs go beyond educational needs; they include food, clothing and shelter, and extend to lack of close family and community ties and support, and lack of helpful role models. They include the needs that arise from a life led in an environment of violence, poverty, and despair. Urban youth are often isolated from the mainstream of society. . . . The goal is to motivate them, to wipe out their disadvantage as much as a school district can, and to give them an educational opportunity that will enable them to use their innate ability. (Abbott v. Burke as cited in Forsyth and Tallirico, 1993, p. 400)

It is precisely these "at-risk" urban youth who are most in need of counseling services to support their ability to learn in a classroom setting. The inclusion of art and expressive therapies in the Cambridge Public Schools arose out of a need to provide specialized therapeutic services to children who were unlikely to receive them within their communities. Until recently many public schools in Massachusetts were reluctant to house clinical services, preferring to refer students to community mental health agencies for treatment. When students exhibited serious emotional or behavioral problems, they were sent to private therapeutic day schools or residential schools funded by their school district. With the decline of state and federal funds for education and the emphasis on an inclusion model of education (a philosophy advocating all children should be in "regular" classroom settings regardless of their disability), Cambridge, as well as other public schools, has begun to incorporate more school-based services, including expressive therapies.

History and Development of the Training Collaboration

In the first year of the collaboration between Lesley College, Cambridge Public Schools, and Cambridge Youth Guidance Center, eight therapist trainees were placed in the five elementary schools and one comprehensive high school. In 1994 and 1995, 10 therapist trainees were placed in the school system with five additional schools joining the collaboration.

Cambridge is a city of 98,000 people representing a wide range of diverse ethnic and socioeconomic backgrounds. The School Department consists of 14 elementary schools and one comprehensive high school, serving over 8,000 students who speak over 46 languages. This diversity offers a rich training environment for therapist trainees. As the training program with Cambridge Public Schools evolved, it became evident that art and expressive therapies helped to reach students who did not easily respond to traditional talk therapy.

Working with Children in Art Therapy (Case & Dalley, 1990), describes the integration of art therapy into a multicultural school similar in diversity to the Cambridge Public Schools. Explaining the benefits that art therapy can bring to school settings the author writes:

Using the art materials, their (the students') feelings are expressed and contained in the session in a safe and non-threatening way— which for some of the more disturbed children provides an enormous relief. For some of them, the classroom situation sets up the worst areas of conflict and they end up behaving belligerently because of the attention that they crave and have to compete for. The knowledge that at some time in the week they will have an attentive adult to themselves in itself gives a sense of security for that particular child as there is no competition for that time or space. . . . This is one main advantage of having into the school day a space where children can creatively explore their imagination, fantasies, and fears and can be seen as part of their overall learning experience rather than being separate from it (p. 190).

Administration and Structure of the Training Collaboration

The Coordinator of Field Training has administrative responsibility for overseeing the training collaboration with
Cambridge Public Schools. She serves as a liaison between all individuals involved in the collaboration including therapist trainees, site supervisors (mediation specialists), clinical supervisors (Cambridge Youth Guidance Center), off-site art and expressive therapies supervisors, Lesley College faculty, and Cambridge Public School administrators. She is an advocate for the therapist trainees ensuring that they receive quality training and ongoing supervision within the schools to develop their clinical and expressive therapies skills. With on-site and off-site supervisors, she serves as a contact person and mediator to address any issues, problems, or concerns related to training. Twice each year, the Coordinator of Field Training makes site visits to each school to meet with the therapist trainees and their supervisors to assess the collaboration and discuss recommendations for continued improvement.

At the end of the training year, all supervisors are invited to an evaluation meeting at Lesley College which is facilitated by the Coordinator of Field Training. At this meeting a "year in review" is conducted. All participants are involved in an evaluation process to determine the strengths and weaknesses of the year and to develop new goals and strategies for the next year.

The training model with Cambridge Public Schools includes the following criteria.

**Training Responsibilities (weekly)**

- 2-5 hours individual counseling; 3-4 hours group counseling
- 3 hours milieu work
- 2 hours case management; 1 hour administrative work
- 1 hour consultation with teachers, parents, school staff
- 1 hour meeting on "Students at Risk" and Chapter 766, referred students with special needs
- 1 hour (weekly) individual supervision with mediation specialist
- 4 hours (per month) supervision with art or expressive therapist
- 10 hours (per year) supervision with Cambridge Youth Guidance Clinician (for practicum)
- 15 hours (per year) supervision with Cambridge Youth Guidance Clinician (for internship)

**Learning Objectives**

- Develop a multicultural perspective in utilizing arts and expressive therapies with children
- Develop ability to work with children and/or adolescents in individual and group counseling
- Learn to listen and respond appropriately to racial, sexual, social, and ethnic differences
- Develop an understanding of how to effectively utilize the intraprofessional supervision model
- Strengthen ability to set clear, supportive limits and follow through on limit setting
- Learn interview and assessment techniques
- Learn how to write and implement treatment plans geared for the academic setting
- Use process recording notes
- Develop a working relationship with staff members, parents, and outside professionals
- Gain an understanding of how expressive therapies may enhance a child's school experience
- Develop an awareness of transference and countertransference issues
- Establish a professional identity as an expressive therapist working within a school setting

**Intraprofessional Collaborative Supervision Model**

The overall collaboration is administered by the Coordinator of Field Training. Currently there are no art or expressive therapists employed by Cambridge Public Schools. Therefore, an intraprofessional model of supervision was developed to meet the professional state licensing and registration requirements for therapist trainees (Figure 1). In addition to preparing to become registered as art, dance, or music therapists, art and expressive therapists are eligible to become licensed mental health counselors in the state of Massachusetts.

The therapist trainee receives on-site supervision by a mediation specialist (individuals who are certified school counselors, social workers, or psychologists); consultative supervision by a licensed psychologist or social worker from Cambridge Youth Guidance Center (contracted by Cambridge Public Schools); and off-site art, dance, music, or expressive therapies supervision from a registered art or expressive therapist (contracted by Lesley College).

The roles of these professionals are described below.

**Mediation Specialist On-Site Supervisor.** Each therapist trainee is assigned a mediation specialist who is based in the school and is designated as his or her primary on-site supervisor. The primary supervisor provides direction for the therapist trainee's work (assigns cases and groups, helps with scheduling of space, supplies, etc.). The role of the mediation specialist in the school is to create a supportive environment with resources for problem-solving and conflict resolution that are accessible to all.

The mediation specialist provides a minimum of 1 hour of weekly supervision. She or he also co-lead groups with therapist trainees. The mediation specialist is responsible for guiding, mentoring, supporting, and advocating therapist trainees to enable them to function skillfully as school-based therapists within the system.

**Cambridge Youth Guidance Center Supervisor.** The Cambridge Youth Guidance Center (CYGC) provides consultative supervision for therapist trainees in the schools. This supervision by licensed psychologists and social workers enables therapist trainees to meet state licensing requirements. This supervision also explores systems issues, such as how to work in a school setting and how to negotiate school work with teachers and counselors. CYGC supervisors also co-lead groups with therapist trainees and address professional development issues and the ethics and standards of practice of their profession. Building a therapeutic relationship, diagnostic work, framing problems and goals, and supporting fragile children and families are common themes in CYGC supervision.

**Art and Expressive Therapies Supervisor.** The art and expressive therapies off-site supervisor is responsible for providing art and expressive therapies supervision for therapist trainees for a total of 4 hours per month. She or he models, mentors, and instructs therapist trainees on art and expressive therapies assessment tools, techniques, and modalities appropriate for working
Expressive Therapies in Cambridge Public Schools
An Intraprofessional Training Model

Figure 1 An Intraprofessional Training Model

with children in a school setting. The art and expressive therapies supervisor makes site visits each semester to observe therapist trainees utilizing art and expressive therapies with children. Whenever possible, supervisors enable their supervisees to observe them at their place of employment.

The Role of Off-site Art and Expressive Therapies Supervision

In the collaboration between Lesley College and the Cambridge Public Schools, art and expressive therapies supervisors oversee two or three therapist trainees each year at various sites throughout the Cambridge Public School system. One of the most important supervisory responsibilities is bridging the gap between the detached, focused, expressive atmosphere of the college setting and the highly charged, chaotic, and confrontational atmosphere of the large, urban, inner-city public school system. At the same time, off-site art and expressive therapies supervisors and their therapist trainees are challenged to navigate through a system in which the supervisor is an outsider and where art and expressive therapies are an unknown, viewed by some with enthusiasm and by others with suspicion.

The Supervisory Relationship

Off-site art and expressive therapies supervision in the school setting is a complex process for both supervisor and therapist trainee. The clarification of art and expressive therapies in the larger sense illuminates the unique set of issues specific to the off-site supervisory relationship in this setting. Edwards (1993) describes the content of supervision as follows. "As applied to therapeutic work, including the training of art therapists, the word supervision is generally used to describe the process by which therapists receive support and guidance in order to ensure that they are addressing the needs of the client. This encompasses a number of functions concerned with monitoring, developing, and supporting individuals in their therapeutic role" (pp. 216-217).

Supervision is a responsibility and commitment to supporting the growth of another person. Ideally, supervision unfolds at its own pace, parallel to a nondirective treatment model. Two people sit together and discover the content of the work between them. The provision of support and direction occurs within the context of developing a clinical understanding of issues and goals. The off-site art and expressive therapies supervisor must pay special attention to sustaining the relationship even when they are away from the site. "Without an effective and open dialogue with a supervisor, a student will be missing a most enriching part of his or her entire learning process" (Robbins, 1994, p. 20).

An important aspect of supervision is organizing a clear, logical environment from which therapist trainees can clarify expectations, as well as define the parameters of their work. The development of a supervision handbook, which spells out responsibilities and maps out the system, has helped to create the necessary structure. The handbook does not replace the evolving and responsive relationship; rather it is a tool that frees up the supervision hour so that time can be spent examining the more emotionally based issues that arise in the training process. Edwards (1993) cautions that "the training of art therapists should not be approached in a purely academic manner and will, therefore, by its very nature involve students learning about feelings, that is, their own feelings as well as those of their clients"
(p. 221). Supervision must include structured guidance in the therapeutic artistry of the modality and a more nondirective approach that includes exploration of feelings which leads to greater self-awareness. Mollon (as cited in Edwards, 1993) states:

The aim of supervision . . . should not be to teach a technique directly and didactically, but rather to facilitate the therapist trainee's capacity to think about the process of therapy—on the assumption that technique grows out of this understanding. But what kind of thinking is involved here? It is not an active problem-solving kind of activity, but a critical evaluative activity such as is involved in reading a research paper for example, but rather it is best described as a state of mind which is receptive and reflective, one which is open to impressions, perhaps somewhat akin to dreaming. (p. 219)

Supervision in the Educational Setting

The off-site art and expressive therapies supervisor is often viewed by school personnel as infusing a depleted school system with new energy, bringing innovative solutions to old problems, and maintaining optimism in the face of limited budgets and bureaucratic constraints. However, limited availability restricts the off-site supervisor's ability to assist the therapist trainee in his or her journey through a stressed system compromised by overwhelming societal needs and issues. These tensions are at the core of the pioneering effort to establish viable art and expressive therapies programs in the schools.

In the absence of on-site art and expressive therapies supervision and mentoring, therapist trainees must look to the educational milieu for mentoring possibilities in related areas such as conflict resolution groups or, more recently, emotional literacy programs (Goleman, 1995). While these programs open up new directions for the role of art and expressive therapies within the schools, they also rekindle the struggle for the art and expressive therapist to define his or her expertise within the educational setting. The challenge for art and expressive therapists is to join other educators in their efforts to promote children's self-awareness, improvement of peer relations, reduction of self-defeating behaviors, and support of academic performance, while maintaining a therapeutic allegiance to the image and the development of artistic processes. Having an off-site supervisor may actually be an advantage. Located outside of the system, the supervisor is not involved in system politics that often compromise system effectiveness. She or he can retain a clear voice and sense of purpose in envisioning an art and expressive therapies program within the schools. For example, she or he can react effectively when therapist trainees report that teachers view leaving the classroom for art and expressive therapies as a "reward" contingent upon good behavior or assign school work to the therapy hour as part of a behavioral plan. The off-site supervisor can empower the therapist trainee to establish a program that speaks the language of creative arts therapies and holds true to the principles of the trade.

The School Calendar

The school setting, unlike the clinical setting, has a particular calendar that helps to shape certain patterns within a 1-month timeframe. Part of the task of supervision is to help the therapist trainee anticipate the ebbs and flows of the school year according to the school calendar.

September marks the end of summer and the return to academic life, structure, classroom routines and expectations, and focused peer interactions. "Holiday fever" begins by mid-October and continues through January. Anxiety is heightened around the December holidays. December vacation comes with hopes and dreams, real-life limitations, and harsh disappointments. Late winter to early spring marks a period of stabilization, work, and growth. April vacation begins the termination process which unfolds over the final 2 months of school. Accomplishments, increased sunshine, heartfelt yearnings, and sadness can describe this period of time as children prepare to say goodbye to a network of caring and attentive adults.

Patterns in supervision echo the school calendar. Beginnings, middles, and ends occur simultaneously for children, teachers, and support staff, including therapist trainees. The uniqueness of the academic calendar can help a therapist trainee prepare for predictable stressful periods.

The Art and Expressive Therapies Supervision Handbook

A supervision handbook was developed as an instructive tool to help clarify the purpose of art and expressive therapies within the school environment. It supplies therapist trainees with a list of topics to help focus the supervision hour, maximizing the therapist trainee’s learning through structure and organization. The handbook contains forms which help therapist trainees conceptualize treatment. It provides strategies and potential solutions to deep-seated systems problems. The handbook includes various steps for independent program development between weekly supervision meetings and serves as a means to measure and mark weekly accomplishments. The educational nature of the handbook helps to lower therapist trainees’ anxiety levels, thereby allowing them greater freedom to explore and investigate areas of vulnerability in their own process of professional development. The handbook is divided into four parts.

1. Expectations of Therapist Trainees

Art and expressive therapist trainees are expected to work with school personnel in developing a responsive art and expressive therapies program to serve the school's population of at-risk youth as well as make individual referrals of special needs children. Therapist trainees are expected to join educators in a unified commitment toward the cognitive, emotional, social, and creative development of children by establishing clear art and expressive therapies objectives that interact with educational goals. Ethical standards of confidentiality, release forms, maintenance of student portfolios, treatment documentation, and reporting suspected abuse all protect the children in treatment and provide a context for the work.

2. Structural Guidelines

- Weekly Log.—The weekly log provides on-site and off-site supervisors with a quick overview of the therapist trainee's weekly schedule. The log informs supervisors of scheduling issues, the therapist trainee's weekly caseload, overall program delivery and documentation, and patterns of communication and collaboration with teachers and co-leaders.
- Referral Form.—The referral form provides therapist trainees with background information about the children
referred for treatment. Before this form was created, information was often delivered to the therapist trainees in anecdotal fragments. The referral form specifies clinical information upon which a treatment plan may be built, including presenting problems, reason for referral to art or expressive therapies, an overview of the child's personal and family history, description of school performance and peer relationships and recommended treatment goals. The form also helps therapist trainees by identifying a contact person for a quick exchange of pertinent information.

- **Process Notes**—Process notes help therapist trainees conceptualize treatment. The notes encourage them to practice organized and thoughtful reporting and to officially document sessions. They contain behavioral observations such as attendance, attitude, level of involvement, task skills, and transitions to and from group or individual sessions. They also provide a forum to describe the content of each session, the use of imagery, group sociometry, interactions with the therapist trainee, and transference and countertransference issues.

- **Group Protocol**—The group protocol provides a standardized format to describe a range of art therapy services. It indicates the group title, group description, goals, and referral criteria. It forms the basis for the group contract. The group protocol quickly informs teachers about the content of the group, the requirements for membership, and the procedure for referral.

- **Mini-case Presentation Format**—The mini-case presentation format combines the referral form with the process notes, creating an organized context from which to view the students' art. The outline format helps the therapist trainee organize a presentation of the artwork. It stimulates discussion, as therapist trainee and supervisor explore the layers of meaning implicit in the image and the process of its creation.

3. The Importance of Collaboration and Communication

Art and expressive therapists are trained to collaborate with professionals from other disciplines as a member of a treatment team. They learn to approach treatment with an understanding that communication is the basis of good treatment. In a school setting, teachers often work in isolation, creating autonomous classroom experiences for their students. Typically, therapist trainees enter the school setting searching for existing channels of communication only to find themselves in the position of having to create them. Without an on-site art and expressive therapies supervisor to guide them in this process, therapist trainees can feel discouraged and overwhelmed.

The supervision handbook places great emphasis on the therapist trainee's responsibility to maintain ongoing contact with referring teachers. It encourages therapist trainees to seek as well as create opportunities for team involvement.

4. Shared Art and Expressive Therapies and Educational Goals

The viability of placing therapist trainees in the school setting is based on a premise of shared goals. Art and expressive therapies, as practiced in the school setting, further a child's cognitive, emotional, social, and creative development through a unique integration of experience. Educational goals include improving communication and interpersonal skills, increasing awareness through self-expression, increasing self-esteem through mastery, and achieving containment through sublimation. Art and expressive therapies utilize spontaneous experimentation to facilitate a range of task competencies, for example, facility with materials, sequencing skills, concentration. The creative process engages the child with a sense of discovery, risk-taking, and a heightened appreciation of aesthetic sensibilities, while promoting problem-solving strategies. Art and expressive therapies illicit a student's spirit and capacity for self-motivation, provide an outlet leading to tension reduction, and improve group cooperation through collaboration of ideas.

**Case Vignettes**

In the public school, referral for treatment often results from maladaptive behaviors in the classroom or in the society of the school rather than from knowledge of a child's diagnosed emotional problems. As Dalley (Case & Dalley, 1990) explains, "Where art therapy is established in the schools, it can be seen to benefit those children who have particular emotional or behavioral difficulties and whose special needs cannot be met in the classroom" (p. 161). The child often comes for treatment with no known specific history of pathology or indication of the sources of underlying problems. The treatment goals set by school personnel revolve around improving the child's behaviors in order to improve learning. Dalley states, "... the role of art therapy as a central means of working with the child's emotional needs to help the achievement of learning potential is stressed" (p. 161). The challenge for the therapist trainee is to maintain therapeutic integrity within this system and still help meet these goals.

The ultimate goal of the therapeutic encounter in the public schools is to help children improve their educational performance. Edgecombe states the rationale for referring a child to therapy: "... that where a child's ability to profit from educational experience is being interfered with by internalized conflicts, or by distortions in ways of relating ... then individual therapy is required" (as cited in Case & Dalley, 1990, p. 166).

It can be frustrating for both the therapist trainee and off-site art or expressive therapies supervisor to begin to work with a child with little or no clinical history. However, this deficit can provide a powerful training opportunity by allowing the therapist trainee to assess the child through the art and expressive modalities. The following condensed vignettes were chosen to illustrate the work of two therapist trainees who began treatment with varying amounts of background information about their clients. Each vignette is designed to show how art and expressive therapies treatment within a public school setting can address the goals of personal catharsis, behavioral containment, growth of the imagination, and identification of underlying problems within a therapeutic setting, as well as the goals necessary for the child's improved performance within the school setting.

The two cases were chosen to exemplify situations which included a range of identifying information, interventions used, and types of responses. The first case includes substantial background information that informed the therapist trainee's work. After an art assessment, treatment interventions were developed in supervision. Through the expressive metaphors, the child was able to express underlying problems which were affecting his
school performance. The second case describes how the therapist trainee, with no historical data, helped a child use art to verbalize his perception of his interpersonal difficulties with peers. This self-awareness led to improved behavior in all aspects of his school life including the development of improved peer relationships.

Kevin

Kevin is a 6-and-a-half-year-old Haitian male. He is an only child who lives with his parents in a low-income housing project. It is unclear whether his parents are married and how much time the father actually lives with the family. Both parents, who are Haitian, have a high school education. This is a bilingual home in which both Creole and English are spoken. Kevin has been diagnosed with verbal, auditory, language, and motor skill developmental delays. Tests also indicate mild hyperactivity and attention deficits. Kevin was referred for expressive therapy because of difficulties with social interactions with peers and poor physical boundaries; he was either overly affectionate or physically aggressive with classmates. Kevin is currently repeating kindergarten. The goals of the referring classroom teacher were for Kevin to develop better social skills and to receive consistent, positive attention from an adult. When asked by the therapist trainee, during an initial interview, if he knew why he had been referred, Kevin stated he did not know and appeared to be unaware of his academic and social deficiencies.

In the first session, the therapist trainee provided Kevin with paper and craypas and told him he could draw whatever he wished. Kevin drew a picture of what he described as himself standing outside of his house at night (Figure 2). When he presented the drawing in supervision, the therapist trainee described Kevin's difficulty manipulating the craypas. Assessing the artwork she noted the floating quality of the figure and house, the inaccessibility of the house, and the foreboding black sky above the house. The therapist trainee said that Kevin was unable to give her any more information or tell a story about the drawing, stating that her questions were making him tired.

At the beginning of the second session, Kevin described the drawing: "I am going to the park to play. (What are you going to do at the park?) Slide. I can go all by myself. I am not afraid of nothing. (How long do you stay?) Six minutes. Other people want to slide. I go back home to eat dinner, chicken and rice. I am not afraid when it's dark."

Kevin drew again with craypas in the second session. When discussing the process in supervision, the therapist trainee repeated her concern with his difficulty in handling the materials. In assessing the similar elements and content of the drawings, the therapist trainee suggested that the inaccessibility of the house and the huge black sky could indicate family problems.

The possibility of giving Kevin materials that were easier to manipulate and might help expand his metaphoric expression was suggested by the supervisor. For the next session the therapist trainee decided to offer Kevin colored plasticene which he used to make multicolored coils that he called "snakes." He chatted with his therapist trainee while he repeatedly formed these figures and then cut them into pieces. In his own way, Kevin used this session to explore the possibilities of the material and exert control over it.

During ensuing weeks Kevin began to construct elaborate clay and balsa houses (Figure 3). As he developed his constructions, he told evocative stories that seemed to communicate fears about his home environment. He described the house as a vampire's house flanked by snakes. In the front of the house, Kevin put out clay pizza for the vampire to eat. When the therapist trainee asked Kevin about entering the house, he replied that when he was inside the house he would "turn into a ball to be safe from the vampire."

Through art and storytelling Kevin was able to share emotional concerns that probably interfered with his behaviors and performance in school. As treatment continued Kevin began to bring peers to sessions. The treatment goals, appropriate expression of feelings, better peer relations, and improved self-esteem were developed at the beginning of the year and maintained for the duration of the expressive therapy treatment. Behavioral improvements in the classroom were noted throughout the year.

Brent

Brent was a fourth grader referred by his teacher for individual counseling due to low self-esteem, difficulties with social and organizational skills, and poor attention in the classroom. His
history was unknown to the therapist trainee when she began treatment. Most notable to the therapist trainee in the initial stages of treatment was Brent's difficulty in focusing and his tendency to move around the room quickly and frequently. She also noticed that he was quite comfortable using art materials.

An early drawing by Brent (Figure 4) was titled, "Man Hit by Lightning." The therapist trainee and supervisor discussed the emotional content evoked by the few, simple lines drawn by the child. They seemed to reflect the terror felt by this figure. The supervisor encouraged the therapist trainee to explore the lightning metaphor in order to deepen her understanding of Brent's affective experience. For example, the supervisor asked what it might feel like to be struck by lightning? What would a child this age have experienced as a lightning strike? As the relationship between the therapist trainee and Brent developed, he was more willing to discuss his artwork and to respond to encouragement for further exploration of his images. She noticed an improvement in his ability to relax, focus, and concentrate.

Brent began to develop an ability to address emotional issues through his images and discussions about them. Figure 5 is a folded, two-part picture titled, "What Happens When No One Else Is Around." The outside drawing is a contained, precise, pencil sketch of a male face. The inside drawing (Figure 6) shows two figures lightly outlined in pencil. The stomach area of the figure on the right is colored in with orange and red marker. The figure on the left has these same colors spewing toward the other figure from its mouth. Brent described this as a scene of two people getting angry with one another. He said the anger was represented by the colors and noted that the figure holding his anger inside was like him.

This admission led to a discussion about fights in which Brent had been involved and his perception that other children were unwilling to befriend him because of his aggressiveness. He was then able to verbalize his feelings of anger and loneliness because other children teased him. The therapist trainee was able to use this clear disclosure to guide Brent in further exploration of ways to improve his peer relationships.

Although it was a difficult challenge, Brent was able to invite a classmate to a number of counseling sessions after the 10th session. The therapist trainee reported that their interactions were friendly, and Brent demonstrated improved social skills during these sessions. Throughout the year Brent's interactions with others, his organizational and social skills, self-esteem, and overall mood improved notably. He became able to verbalize his strengths and identify areas in need of further examination, including conflict resolution with peers.

Evaluation of the 1994-1995 Training Year

At the end of the 1994-1995 training year, an evaluation was completed including feedback from all participants in the training collaboration. The evaluation highlighted the strengths, weaknesses, and continuing challenges facing the program. What follows are excerpts from the evaluations of therapist trainees, mediation specialists, Cambridge Youth Guidance Center supervisors, and art and expressive therapies supervisors.

Strengths of the Training Program

- The diversity of children (e.g., socioeconomic, ethnic background, and clinical issues)
• Utilization of expressive therapies modalities with individuals, groups, dyads
• Co-leading groups with a variety of professionals
• Opportunity to learn about the public education system and the role of art and expressive therapies within the schools
• Learning how to set clear limits and goals for individual and group work
• Quality supervision. Exposure to experienced mental health professionals with varying backgrounds contributed to a positive learning experience.

Weaknesses of the Training Program
• Need for adequate office space to see children
• Need for adequate assortment of art and expressive therapies media
• Difficulty obtaining information from files regarding past psychological information
• Periodic inconsistent on-site supervision as a result of the necessity for mediation specialists to attend to crisis management
• Need for adequate communication between teachers and therapist trainees
• Need for a comprehensive orientation at the beginning of the school year to cover such issues as mandated reporting in the school system, the role of therapy in schools, release of information procedures, and the intraprofessional supervision model
• Need for inservice training on art and expressive therapies in the schools to better inform school personnel about the field of art and expressive therapies

Strengths and Weaknesses of the Intraprofessional Supervision Model

The following are some direct quotes that represent therapist trainees’ supervision experience.

Student A: The three supervisor model worked well for me. I was able to gain three viewpoints: social work systems, clinical and expressive therapies. They never worked against each other, but all this supervision can be very time-consuming. I was lucky in the sense that all three supervisors were professional, communicative, and very knowledgeable. Having this as a practice student was essential for learning how to use supervision.

Student B: It was very helpful. I found certain issues I could take to only one of the supervisors because the other two might not know about one particular area. Initially, I had some problems in my understanding of how to work with all three, but eventually I found it very rich because each of the supervisors had a different way of viewing a child. I was able to take all the help and hopefully able to synthesize it.

Continuing Challenges Facing the Cambridge Public Schools Collaborative

Lack of operating funds is the biggest obstacle that the training program faces. The cost of supplies, supervision, and overall administration required to run this program successfully must be addressed within the next year if it is to continue. The professionals involved do not want this program to become one of the many projects founded on good intentions, only to fall victim to burnout, unmet goals, and inadequate resources. It is essential that funding sources be secured from grants, corporations, and/or private contributions to adequately oversee this program. Currently the program is being run on the goodwill and strong commitment of the professionals involved.

Why would a group of already overworked professionals be so dedicated to a collaboration where they receive little to no remuneration? (Supervisors are either paid with graduate school course vouchers from Lesley College or a small nominal hourly rate for supervision.) The common thread and commitment which unites the professionals of this collaboration is that each was at one time a school-based counselor or an art and expressive therapist within a school setting. They know firsthand the power, the challenges, and the rewards of the therapeutic relationship developed within a school setting as compared to that of a private practice setting.

It is clear that school-based counseling, including art and expressive therapies, should be available in more schools across the nation. Many children never make it through the door of a private practice office or mental health agency. Lack of money, resistance, fear, or general disorganization may prevent a child from making an office visit at a particular time each week. But the development of a trusting therapeutic relationship, particularly for disenfranchised children or those with histories of trauma, requires more than offering a “safe space” to talk and the assurance of confidentiality. Children need to get a sense of what kind of people their therapists are before they learn to trust them. As a result of visibility and accessibility within schools, these therapeutic alliances are frequently more successful than those in private practice where a child usually sees a therapist only once a week.

Facing Reality, Offering Vision: The Future of Art and Expressive Therapies in the Schools

The authors believe that art and expressive therapies in public schools contribute significantly to meeting the needs of children, communities, and therapist trainees. Now more than any other time in history the severity of the problems that children present in schools clearly demonstrates their overwhelming needs and the community's responsibility to serve them. It is anticipated that in the future, long-term treatment for children is more likely to occur in schools than in any other setting. The literary and clinical evidence that is presented in this article points to art and expressive therapies as preferred treatment modalities which effectively meet the therapeutic needs of public school children. Until the role of the art and expressive therapist within public schools becomes more clearly defined, it is necessary to provide therapist trainees with tools that help structure their learning experience. These include an intraprofessional model of supervision and handbook that represents the tenants of the profession as adapted to educational settings. The work of the children, as illustrated by the case vignettes, is a powerful testament to each one’s ability to use various expressive modalities to
address intrapsychic issues that lead to better school performance and improved learning.

The necessity of a conscious and informed collaboration between art and expressive therapists, educators, and the community is imperative to better meet the needs of school children. The time has come for everyone to take a more active role in the efforts to improve the quality of schools so they can truly educate and nurture children. It is the responsibility of all members of society to prepare children to become whole, healthy, productive, and loving human beings. They will be, after all, the leaders of the 21st century.

An Interview with Don Seiden

Randy M. Vick, MS, ATR-BC, Lemont, IL

Abstract

This article is based on an interview with Don Seiden—artist, educator, and regional pioneer in the field of art therapy practice and training in the Midwest. A personal account of his career path features ground-breaking work with two very different institutions and the training program which grew out of his connections to both. Reflections on historical developments in the field are followed by thoughts on future trends in the profession. Central to the conversation is the theme of the unique perspective artists can bring to the fields of mental health and science by their ability to sort and combine information and bring order out of chaos.

Introduction

Don Seiden is an artist, educator, lecturer, and for the past 32 years has been a quiet pioneer in the field of art therapy in the Chicago area. His primary contributions to the profession have been as the founder of the Illinois Art Therapy Association and Chicago's first graduate art therapy program (at the School of the Art Institute) as well as the first art therapy program at Rush Presbyterian St. Luke's Medical Center. Through his dynamic teaching style, his warm, genuine manner, and above all, his unwavering trust in the power of the creative process in healing, he has served as mentor, role model, and inspiration for a generation of art therapists. Reluctant to travel outside the Midwest, his influence is felt indirectly through graduates practicing across the United States and elsewhere.

The "new" model of the art therapist as artist turning primarily to the studio for conceptual inspiration instead of the clinic has been embraced by Don throughout his career. His one-man exhibit of recent work at Chicago's Enid Oklahoma Gallery in the summer of 1995 provided an opportunity for this discussion of his professional history and thoughts on the future of the field.

Artist’s Statement

In the summer of 1994, I began a series of wall sculptures which were boxes that encased heads. The faces were pressed up against plexiglass. A mixture of the horror of asphyxiation and the humor of distortion collided. About 6 months later I was hospitalized with a severe asthma attack. It was the first occurrence since I was a very young man.

Earlier the same year I had also been working on my altered photographs. The process involved taking 35mm pictures of ordinary images. I would then paint or draw imaginary forms on the prints, a kind of surreal experience. Following this, I rephotographed the finished picture which united the original photo with the additional painting. It was a way for me to comment on

my suspicion that the invisibility of air may hide events and experiences which our normal senses are unable to perceive. I realized that both these art experiences were dealing with the mystery of air—invisible, necessary for life, without which we die.

As an art therapist I have always been fascinated with the human psyche and its complexity. As an art teacher I have respected the need for art in the lives of people. As an artist, my life, my work, my play have all been compressed into the process of making things which describe the adventure of self-exploration. The experience of living for me is described adequately only through my art.

Interview

Q: It's really a nice opportunity to be here at this wonderful show with you and to have the time not only to talk about both this show and your work as an artist but also to reflect and look at some of your pioneering work in the field of art therapy and how it all ties together. Why don't you start out by telling me a little bit about the show.

A: Well, the show is essentially a major change in my life as an artist, I think. Particularly, and certainly, it has ramifications in terms of my role as an art therapist and an art educator. But, as an artist, what has happened here, I think, is that my work has moved away from the materiality of my sculpture. In the past I've worked with materials that were very physical—carving, metal work, and so on—and this show has moved off into another direction entirely. It's more like mind stuff, you know, more conceptual, maybe even more spiritual in terms of my own life. I think that's an important fact.

Q: Is that because of a transition as a person or are you consciously looking to make some changes in your work?

A: Well, I'm rarely conscious (laughter) of myself as a person. I'm less conscious of myself as an artist, but, by that I mean, I think that the work just sort of takes over and becomes what it becomes. But at my age I think that there is another viewpoint that I'm beginning to take in terms of how I view my experience and how I view the world. And that has to do with seeing in places where I've never seen before. Noticing things I've never noticed before. So, I think that what becomes important has not been very important before, and it seems as if some of the ideas around the concept of air represented in this show—airlessness and infinite space—those ideas are now. I'm not sure where they are going to take me in terms of the other aspects of my life, but as an artist that comes first.

Q: One of the key things that strikes me about the show and the work is the idea of being confined or compressed into a small space. That's something that you've dealt with a lot in
AN INTERVIEW WITH DON SEIDEN

Figure 1 "Airless," mixed media 8" x 11"

the show. But when I think back about what I know of your career in the field of art therapy, that hasn’t seemed to have been a problem for you—feeling hemmed in or compressed. It seems like you have expanded into a field and you cross so many boundaries easily. You introduced yourself just a second ago with talking about yourself as an artist and as an art therapist and as an art educator, so those boundaries don’t seem to worry you too much. Were those divisions more or less clearly defined for you, or did you always ignore them early on when you first found yourself in the field?

A: Well, the boundaries were always there in terms of how one achieves a certain kind of recognition or status. I mean, I got a certificate to become an art teacher. I never had to connect that with being an artist. I just made art, and when I became an art therapist, there was no such thing as art therapy; therefore, I invented something that worked for me and later turned into something that now requires that people have certification. So, I think that ultimately the aspect of this that you’re questioning—the lack of boundaries—was there for me. I would do what I felt I wanted to do in the work that I chose. I crossed boundaries that were never there and I created boundaries; that is, I put up fences between things so that other people would know what I was doing.

Q: So you kind of defined your own space. . . .

A: Exactly, I would have to define my own space, and I would have to define it clearly enough for other people to understand it. But basically I’m washed over with art. I mean, art itself is a thing that entered my life and never left, and these other things arose from it.

Q: When you say you got into the field of art therapy or you found yourself in the field, was there a point when you sort of began to use the term or you heard the term and said, “Oh, that seems to be what I’m doing”? How did that come together for you? Do your recall?

A: At the very beginning, when I was interested in art as a way of perceiving and expressing and communicating, the term art therapy was not really something that I thought about. It came into being a little later on, after I’d already begun to work in mental health. I worked in a mental health setting, a number of them as a matter-of-fact, in the area of psychiatry, and I wound up at Rush Presbyterian St. Luke’s Hospital beginning its program in art therapy. But this took a long time. It just sort of developed over years. My entry really was partly because I was interested in where my images were coming from. I wondered about my own art and my own being, and, like most artists, I think I began to wonder where do these things come from? Why would I make this instead of that? So that’s when I got into working with other people through art, and I chose to work with people who are emotionally disturbed—people who are unstable mentally, functioning in very poor ways in their lives, and who wind up in hospitals being treated for various psychiatric disorders—because I felt that that was where these images were most powerful.

Q: That was the origin of images for yourself and where you felt there was a parallel for those people. It’s a kind of a leap to go from a personal exploration about “Where does this come from for me?” to the realization that it could be helpful for someone else.

A: I learned very early how helpful it was for me. I knew that my art was extremely important in keeping me stabilized. My life was not as stable as my art. Art was there all the time when I needed it, and I knew, even though I couldn’t describe it exactly, that making art was a kind of healing process. Understanding my art, trying to understand what it meant in terms of my whole being, was another part. But it was another part that I was trying to understand through other people’s work as well because I knew somehow that the process of making art was very helpful to my psyche and well-being. I assumed it would be the same for other people, and what the work meant in terms of mental health or in terms of one’s emotional stability was something that interested me. So an institution was the best setting for me to work with other people. It became therapy. I started working as an art teacher in an institution, but, you know, the word therapy was a difficult word. It got more difficult when I wanted to start a program at the School of the Art Institute [of Chicago] because the word therapy was, you know, dangerous.

Q: And it’s still a bit frightening in that context. So the hospital brought you in to teach. And at that time, had you been teaching at the School yet?

A: Yes. I had started teaching at the Art Institute approximately the same time. It’s hard to say just when, but the Art
Institute came first and then came the Rush experience. I believe it was 1963 or 1964.

Q: So people at the hospital saw that you had these credentials, let's say, as a teacher of art.

A: Right.

Q: So it became easy for them to bring you in. There must have been some people there who functioned as support or mentors or teachers since there was no training program for you, obviously, since you started your own later.

A: It was so exciting in those days. Number one, the medical establishment had more time to devote to teaching than it seems to do today and more time to work with people. At that time there were a number of people on the staff who were very psychoanalytically oriented, and of course their connection to art was very pure in the sense that psychoanalysis was interested in dreams and art, so we had great conversations, great seminars. It opened up a world for all of us, and I was just reveling in that whole thing. It was beautiful. The psychiatrists, of course, were working on medication at that time too, so there was a lot going on in terms of advances, in terms of how people were treated.

Q: It really was a revolutionary time in mental health from a lot of angles, and it seems like around that time other people, seemingly simultaneously in different parts of the country, were stumbling into this notion of art therapy as well. How do you see yourself in that larger context? It seems so extraordinary that everyone seemed to be coming down that same path or at least similar paths.

A: What seemed to happen here in Chicago was that there were a few scattered people who were working in other institutions, and I had heard about what was happening on the East Coast and little-by-little word would get back to me in the midlands here. I felt like Daniel Boone on the prairies during the time when the American Art Therapy Association was developing. I don’t remember what year it was, but somewhere around 1973 or 1974, I got in contact with AATA and began to get my credentials through them. At that time art therapy was beginning to develop. Also, a few people here in Chicago got together and formed the Illinois Art Therapy Association. I was the charter president of that group, and we were just sort of comparing notes on what we did. We never had much connection to the national organization beyond the letters (ATR) and in a sense trying to get credited. But it was all happening and it was happening without my knowing it until word spread across the country.

Q: But that didn’t seem to hinder you. You didn’t feel like you needed that backing. It sounds like you plowed right in. When you heard about others, it was helpful to kind of put things together, but if they didn’t exist it wouldn’t have stopped you.

A: Oh, no, no because I was very much into what I was doing, totally. As a matter of fact, I felt that some of it was a little hindering because I had to accumulate a lot of my work in order to present to AATA, so at that time it was interruption in some respects. But obviously I knew that this thing was going to grow. I just wanted to be in it at the time it was growing. So it was good. It was good.

Q: And was it around that time too when the program at the School, the training program, began to be discussed?

A: Yes, I was in the sculpture department. I chaired the sculpture department for a few years, and during that time I was getting more and more invested in art therapy and more and more interested in what it was doing for other clients and people with whom I was working. So I opened a connection with the art education department at that time to teach a class called “Art in Psychology.” In that class I brought in people who were in the mental health world—psychiatrists, psychologists, and analysts—alongside artists whom I knew in Chicago. Some of the best artists would come and be paired off with a psychiatrist, and they would just discuss art and what it meant to the artist, and so on. That was a wonderful class and that led me to another class along the same lines and ultimately to the beginning of an art therapy program. It was safe, at that time, to do one class as an experimental class, but as soon as I began to think about a program that would offer some sort of certificate or ultimately a degree, a master’s degree, that was when the trouble started.

The school was interested in the program. Art therapy was just beginning to become known and the faculty was, for the most part, very hostile. The administration saw some possibilities, probably in terms of future students. The faculty was a little scared because the word therapy was an invasion of sorts, in terms of what art meant to a lot of people. There was this whole romantic notion about art and artists where you, in a sense, gave up your life to art. Even though that might involve problems and neuroses, artists used to say, “Don’t take my neuroses away. I’ll lose my art.” But we got started and a year later we had a review and that review was devastating. They brought in people from all over the place to talk about it because it was starting to grab a hold. But we got through the review, and it’s a whole story that I’m not going to go into now, but it was wonderfully stimulating for everybody in the School. I think it was an educational process for all of us. Everybody learned a lot more about the relationship of art to the psyche to the human experience. Whether or not art therapy or making art was a healthy, creative, good thing for people was the subject that was being discussed and probably still is being discussed in some cases. It’s just that it’s a huge thing to talk about.

Q: So what point in time is this? When was the first graduating class?

A: The program began as a graduate level certificate program. Students completed 36 credit hours and received a certificate in art therapy at the graduate level. That was 1979, and in 1981 the master’s program came into being and from then on it was a 2-year program, 60 semester hours of work. Two years produced a student who received a master’s degree, and from then on they would get credentials through the American Art Therapy Association, the ultimate credential being Registered Art Therapist.

Q: And that’s still pretty much the model?

A: Yes.

Q: And then somewhere along the line you went back to your connections at Rush and pulled them into the training pro-
program. How was that finessed because that seems like quite a coup?

A: That was really wonderful. Because the Chair of the Department of Psychiatry at Rush (Jan Fawcett) was a person who was very interested in what I was doing. He would watch what I was doing and I guess he thought of me as a motivator. I mean, I could get depressed people running around and wrapping furniture like Cristo would do. He found this process very interesting and unusual. So we had a very good relationship, and when it came time to develop a program at the school at the time of our review, I was very firm about trying to get people connected to the program who had relevancy in the world of psychiatry because I didn’t have those kinds of credentials. I was an artist who was doing this, you know. And so I needed to get the Rush connection fixed in order for the School of the Art Institute to be happy and comfortable with what we had. So, I talked to the doctor who was in charge, the department chair there, and we got it going in a way that was so crazy. I mean, I met him in the corridor one day and I said, “We need these courses. What are we going to do?” So we sat there and in about 10 minutes we worked out the whole program and Rush’s relationship to it. But it happened 1-2-3. It was just amazing how big things happen.

Q: Well, it must have been percolating at some depth.

A: Oh, yeah, we had started talking about it and, you know, I had talked about it with people at the School. It was all beginning slowly, but when it was finalized, it was done just so incredibly fast. And, then the work started.

Q: So you continued to work at Rush during that time as well?

A: Oh, yeah.

Q: And what other kinds of populations or places have you worked with clinically? You’ve taught all along? There hasn’t been a break in the teaching?

A: No, the teaching was ongoing and the work with other populations was continuing. I mean, I worked with the developmentally disabled, depressed people, and with adults and children. I worked with community problems in various places. Every diagnostic category probably was at one time or another in my life, so it was all ongoing, all intermixed, always me just working—hopefully, bringing art into people’s lives in a new way.

Q: And people were receptive, obviously, because you continued to do that. Now, during that time, did you notice any shifts? I mean, you worked as an educator all along, you worked as a clinician all along in various contexts. And, obviously, you continued your work as an artist all along. Did you notice any shifts in that work over time or the impact of your evolving work as artist in terms of the clinical work? How did you see them interplaying?

A: Well, the artmaking was always at the core of everything I did. Art itself, my experience making art as an artist, was always the kind of furnace that generated the heat for everything else. It was the beginning of the whole thing. But then when I taught and watched how art entered the lives of my students or when I did therapy with people and watched how art was entering into their lives, it would affect my art. It would help to change me, so that it was always a kind of interaction of experience with people and interaction of experience with material and experience with ideas that were constantly being generated from here and from there and from everywhere. My whole life has been a problem of keeping it all together, making sense out of the whole thing because I didn’t have any specific kinds of guidelines for what I did. And I think I have it more together today than probably ever before, but I should hope to by this time—it’s been over 30 years.

Q: Well, when you look at the work in this exhibit, it’s really about combining and sorting various materials and putting them together in an interesting way. It’s really a parallel to your life in so far as not having a rigid boundary or a rigid frame to work within but having a rich environment and sorting out is really central to it all.

A: Absolutely, Sorting it out is probably the phrase to understand how things link up with one another. Something I had heard once, “For people who believe in magic, analogy is the first word,” means that everything is related, everything is next to another, everything is connected. And if you can plug into that powerful source of energy at the right place and the right time, magic will happen. But science, which is what I had always been interested in reading about, and certainly ideas that were present in the world of psychology indicated to me that analogy would be the last word. Things are not analogous until proven to be analogous.

Q: So analogy is the last conclusion?

A: It’s the last conclusion that says, “Oh, yes, this is like that.” So art came somewhere in the middle because I always believed somehow that everything is analogous and I didn’t have any fear about trying to prove this through my art. But whenever I talk to myself about meaning, I always trusted science to be based on a kind of factual truth and so I would have the idea that the analogous situation that I have put forth may not be the real answer for anything but it certainly made art, you know. So I guess sorting it out and working with art—the science, left and right brain, call it what you wish—it was always a fact of trying to bring things together in a way that is comfortable for me.

Q: When you say you trusted science, in terms of what? In terms of a scientific method to later back up or prove what you arrived at more intuitively?

A: Yeah. I think that says it pretty well. I think that art for me has been intuitive. I trust my intuition more and more in terms of making life decisions as I get older and it becomes more important for me to believe in my intuition. But I don’t trust it for everybody else, and I don’t trust it for the world, and I don’t trust it for giving me factual information on what experience is all about. Science gives me that other side that I can sort of look to at least. So I put it together and this business of putting things together is where the sorting out process takes place.

Q: And wonderful things, as we see here, sort of come out of that sorting process. That process could appear a bit unpredictable, but it doesn’t sound like it has been for you.

A: It hasn’t really been unpredictable because it’s a process that sort of flows. You know, in other words, I guess that my process is so important in terms of what kinds of solutions,
what kinds of answers, what sorts of products I come up with. So I do trust the process because it's inclusive. It includes ideas from physics, and from biology, and from psychology certainly, and it helped me to come to some answers.

Q: So, those principles from the sciences are always in play anyway and they are more of the things that you kind of sort through.

A: Yes.

Q: That's interesting. You know, we talked about the development of the program and development of your art. What do you see in terms of larger trends in the sciences, art therapy, education, or art that have had an impact on your work? You talked about psychoanalysis a little earlier. Any other major schools of thought from other areas that have impacted your career?

A: Well, I think that the interest that I have in reading about science and art and how they interact has had an influence. The people who have influenced me in terms of my readings have been John Dewey and Arthur Koestler. People who have a very broad vision of life and put things together from various sources have always been interesting to me in terms of reading. I see that the movement of science and the movement of art and the movement of education have all been gradually expanding, expanding, expanding to be more or less able to accept within the realm of life experience other ideas, newer ideas, that come from different sources.

Multiculturalism, for example, is nothing more than an expansion of our ability to take in and accept. And, you know, as I understand it, evolution itself has to do with growing from the simple to the complex, and we are constantly moving more and more into complexity. Now that requires a different kind of understanding. I mean, if you deal with things on a one-to-one basis, it's pretty simple. You know, this causes that, but you don't have that today. You have cocktail mixtures of medications. You have hundreds of thousands of people congregating in hundreds of thousands of little groups. I mean, the communities that we have to deal with today believe: "I am a person who takes a certain kind of medication... I belong to a group of people who do this... We all buy Chevrolets," or whatever. Not to mention, all the ethnic and cultural groups that we have to deal with. At any rate, how do you grapple with this kind of complexity? That's what's happening. You deal with it like artists deal with it. You have to understand the true nature of diversity and how you bring it back into unity. How do you take more and more and more and make it simpler, more understandable? Technology helps, certainly, and of course, the thing that I think is much more important is that fact that if you understand something about patterns and groupings and relationships, you will be able to deal with it. But I absolutely believe that that's what the trend is. It's towards more and more diversity.

Q: So really forcing us, again, to select and to sort from a richer field and then once those selections and that sorting have been done to really begin to distill ideas down to a usable form.

A: Yes, yes. In order to make things functional, they have to come within the framework of the individual person and that's what's so difficult. You know, because most people can't handle too many ideas at one time. I don't know, maybe it's five or something, but we have to have ways of being able to plug into that kind of immensity. At the same time, the earth is getting smaller and smaller and smaller and there's more and more communication. That's what's happening and how big it's getting. That's how much we have to learn. That's how much is out there waiting to be put into our information carriers.

Q: And so art therapy is like any other field, and the people working in it are faced with that immensity of information, that overwhelming tidal wave of information, and how to sort it out. Do you see for the field any particular trends in growth or danger as we go forward?

A: Looking at the field of art therapy, I see the need for us to begin to think more like artists, not less. To begin to understand that making art is exactly what is required to take all sorts of unconnected things, things that don't look as if they're necessarily related, to have a belief that they are connected and bring them together into some sort of unity and wholeness. Other people don't do that. Science tends to take things apart and find out what makes them tick. But artists are the only people who really take everything and pack it up and put it into this simple form. That's very important because artists are so used to seeing on a grand scale what you know, to looking at the world with all of its stimulation. Think of growing up when your fantasy life was just so vibrant you had to find ways to take all the information and put it into some simple form to be able to understand. That's what artists do best. That's what they're here for, and I think if we as art therapists begin to think that way more and more, we're going to understand why art could be helpful to people. It can simplify life. It could make life more functional, you know, go back to the drawing board and see what it's like and then go out and do it.

Q: But there's that very murky and complex stage when you're sorting through all of the extremes, the hits and pieces first, I think, that can be exciting but also confusing and scary, and I wonder how it is that we can help people with that transition.

A: Well, during the time when people are attempting to sort out their lives, that's when chaos fades and that's why science is so helpful in this. You can utilize a lot of help to simplify the
pieces and the parts and understand how they fit into the whole structure in terms of diagnosis and treatment options. So you get an opportunity to observe what science has done already and will continue to do, to sort out those facts. However, in order to help people pull themselves into a functional unit, science cannot help very well. Science can help people understand the nature of the problem, but it takes the other side of the person to pull it all together and re-create—so the word creativity is extremely important in mental health. I mean, you don’t have healing processes without creativity occurring. Even if it’s a cut, you’re going to get scar tissue. Something new has been added.

Q: So it’s that synthesis that we can provide versus a more analytic, scientific approach?

A: I believe that’s very, very important.

Q: What about the kinds of places that we’ll work? I mean, you started out in a classic kind of context: long-term, impatient, psychiatric, primarily adult, in a psychodynamic, psychoanalytic, medical model.

A: That’s changing dramatically. I don’t see the art therapists leaving that setting totally; however, certainly as the years went on I saw patients who would have been in the hospital for years sometimes come out in 6 weeks. I think time limits have been getting smaller and smaller so that the whole world has speeded up to such a degree that we have to work in much more difficult ways, not only time-wise but also by moving out into the community. Art therapy people are expanding; they’re getting more complicated in their own lives. Art is necessary in life now, much more so than ever before. It’s not so much a commodity. It’s far more of a living vehicle for people to utilize in their lives. I don’t know if I answered that question.

Q: You’re really addressing the idea of moving out of your confined contexts to more integrated contexts within the community.

A: Yes.

Q: And it sounds like, at least, it was hinted that art needs to do that as well, the field of art, to move out of the galleries and into people’s lives in some new ways.

A: Yes, and it is happening in so many interesting ways. I mean, the artist was always on the fringes of society, critiquing it from various points of view. Today, I think that there is a movement that allows the artist to become more a part of things, and art therapists, as people, are smack in the middle of things. I mean, like teachers, they are out there in the trenches working with people directly, using art, and it’s been very helpful. It works beautifully well, and I think all that means is that more and more art therapists will be needed as time goes on, but in different capacities.

Q: And in the capacity not as commentator and not necessarily as the person who dissects and analyzes as scientists have done. So it’s going to be. I would imagine, in that integrating and synthesizing kind of function.

A: I think that’s the main function. I think art tends to bring things together, and I think that will always be the case. There is room and this is something that I personally feel very happy about. There is a space. There is room for an understanding of life experience by looking at the products of art as well as the process being something that helps people to function better. And by that I mean that even many of the great artists who suffered from mental and emotional disorders and some who “died in the line of beauty,” as I like to say, left behind great art which in some respects was the solution to the order out of chaos problem. Art has a history of doing, looking, and understanding how to bring things together and can help people understand how to pull together parts of our life and make them part of something bigger, whole, and significant, and I think that’s an area that we need to understand more fully. It is not interpretation of art, it is more like an understanding of art that helps us to understand how it was accomplished.

Q: So, you’re really talking about an interesting, and I think, underutilized aspect in the therapeutic potential of art. Not a view exclusively to the “making” of art, which is what art therapists traditionally try to get their clients to do in some way, but in terms of a certain therapeutic “viewing” of art in a way that is different than museums do and different from an art historical perspective.

A: Yeah, that to me is an exciting new world that we haven’t done a whole lot with yet. But it’s there waiting for us. Can you imagine how one could enter the formal world of art, the horizontals, the verticals, the circles and the squares, and through that entry understand the dynamics of life experience? That is, can we know what it’s like to be walking that horizontal plane? And having sudden intersections occur? Can you really understand what that might say about life? Can we walk that wavy line and understand what it means to meander as opposed to going from here to there, straight line, goal-orientation? And, how do you mix it up and make it beautiful? It’s done everyday. Artists do it all the time, but we don’t look at art that way very often. We tend to segregate everything.

Q: Even that language is not particularly the language of the therapeutic encounter.

A: No, it isn’t. But I think that we’re missing some language here. I think science needs it. Everything is way too sequential. It’s “follow this after that.” There needs to be, in communicating with clients, much more of the interaction between image and word that allows for some new way of perceiving.

Q: It’s the kind of analogies you mentioned earlier when you talked about magic—the world of magic versus the world of science. I mean, that’s much closer to the world of magic there because you’re dealing with analogy in a more direct way.

A: Yeah. I’ve always thought that I’m on this continuum with magic over here and science over there and art sort of goes like this (back and forth gesture), but I always have felt more comfortable with magic. Except today, there’s a reaching out and I’ve seen it in my contacts with people in the sciences and on a few occasions when I’ve attended and been part of symposia where science and art have come together. There’s a need for one another.

Q: In the cases that I know that you’ve been involved with, it seems like a reaching out on the part of science versus art reaching to science.
Epilogue

I have known Don since my earliest involvement with the Chicago art therapy community after returning from graduate school. This, of course, would come as no surprise to anyone familiar with the Illinois Art Therapy Association, since he is considered locally to be the undisputed godfather of the profession. I have recently come to enjoy a rarer pleasure as a colleague at “The School.” Working and teaching with him have provided me with the opportunity to see a true master at his craft. This experience is both joyful and humbling since the standard he has set is not easily approached. I have already caught myself when faced with a teaching dilemma (and probably will many times again) silently asking myself, “What would Don do now?” He has become, for me, a benchmark of quiet wisdom, creative thinking, soothing sensitivity, and above all, excellence in teaching.

John Dewey (1958), the educator, psychologist, and philosopher, said:

The remaking of the material of experience in the act of expression is not an isolated event confined to the artist and to a person here and there who happens to enjoy the work. In the degree in which art exercises its office, it is also a remaking of the experience of the community in the direction of greater order and unity. (p. 81)

This philosophy is strongly reflected in Don’s work. These acts of expression, the ordering and making sense of experience, are vital contributions that the arts make to society. Viewing art therapy from its broadest vantage point, we can recognize our role in helping to facilitate this process on the individual as well as the societal level. This perspective is the gift Don gives to the field.

Call for Papers for the 10th Art Therapy Association of Florida Conference  
“Art Therapy and the At Risk Population” Spring Conference from May 2-4, 1997

Attention Art Therapists, Creative Art Therapists, Mental Health Professionals, Allied Professionals and Educators: ATAF is seeking papers, presentations, panels, and workshops devoted to understanding the professional issues and guidelines that all art therapists follow. Submissions may focus on any topic or population related to this theme; of particular interest are: issues of confidentiality, issues regarding artwork (i.e.: ownership, permanent records, exhibitions), issues of certification and licensure, and issues of graduate and post graduate training and educational standards. Due October 1, 1996 Qualifying materials needed from each presenter includes: 1) Six copies of Presenter’s Resume 2) Six copies of Completed Call for Papers Application* 3) Six copies of Bibliography for Presentation

*For further information and proposal forms, please write to: Mrs. Peggy Dunn-Snow, ATR-BC, LPAT, 2401 SW 50th Street, Ft. Lauderdale, Florida 33312. Continuing Education Credits for art therapists, nurses, social workers, mental health counselors, and marriage and family therapists are being arranged.
Brief Reports

Are Art Therapy Educators Overworked and Underpaid?

Harriet Wadeson, PhD, ATR-BC, HLM, Evanston, IL

Abstract

Questionnaires were sent to the 22 AATA-approved graduate programs to survey the working conditions of art therapy educators. With few exceptions, the data from the 16 respondents indicate that art therapy educators’ salaries are lower than national university faculty salary averages, that few are tenured, and that course loads are high. It appears that few educational institutions have made strong commitments to their art therapy graduate programs.

Introduction

As I have struggled to increase the funding for the art therapy master’s degree program I direct, amidst shrinking budgets for higher education, I have often felt overworked and underpaid. My annual salary increases have seemed minuscule. Frequently, I have complained to other art therapy educators and have heard their tales of woe. In this frame of mind, I decided to investigate the working conditions of other art therapy educators. Are we really as beleaguered as we seem? Although we frequently discussed course load, administrative responsibilities, rank, and tenure, we were usually too delicate to mention salary. In order to gather that very important information as well, I developed a brief one-page questionnaire that would be filled out anonymously. I sent it to the 22 AATA-approved MA programs. I reasoned that these are established programs, rather than brief experiments, and would therefore give an accurate picture of art therapy in academia. There were 16 responses, approximately a 73% return.

From the information collected, the factors most relevant were the following: (a) number of full-time faculty, (b) course load, (c) salaries, and (d) tenure. These factors seemed the significant determinants of the institutional support given an art therapy educator. (Although faculty rank has symbolic significance, it was not included because salary and tenure are the basics of remuneration and job security.)

Two earlier surveys also collected information on art therapy faculty salaries. Luebrink (1993) received responses from 10 approved art therapy graduate programs. Gordon and Manning (1991) surveyed individual art therapists. Of 1,022 who answered a salary question, 121 were faculty. Nevertheless, it was difficult to interpret the results of these studies because neither study indicated whether salaries were for 9-month or 12-month contracts.

Table 1 shows the responses obtained from each institution in this current study. A monthly salary rate has been added in order to compare 9-, 10-, and 12-month contracts. Information not supplied is signified by “?”

Public vs. Private Institutions

Respondents were queried as to whether their institution was public or private since private institutions tend to pay higher salaries than public colleges and universities. This surmise was borne out in a 1994-1995 faculty salary survey by the American Association of University Professors (AAUP) (Silverman, 1995). AAUP questionnaires were mailed to administrators at approximately 3,000 colleges and universities; responses were received from 2,200, accounting for more than 90% of all U.S. faculty. Although my questionnaire distinguished public and private institutions, it did not specify those that are church-related, where salaries are lower than at public institutions, according to the AAUP survey.

Table 1 indicates that most program director respondents from public institutions are on 9-month contracts, whereas most at private colleges and universities are on 12-month contracts. Contract length is more variable among other art therapy faculty.

Number of Full-Time Faculty

Luebrink (1993) found among 10 approved graduate programs that one had four full-time faculty; three had three full-time faculty; two had two full-time faculty; and four had one full-time faculty. These results are consistent with the results obtained from the 16 programs included in this study: one program has four full-time faculty; four programs have three full-time faculty; five programs have two full-time faculty; and six programs have one full-time faculty.

Anyone who has taught in an art therapy graduate program recognizes that the number of full-time faculty available to handle the many needs of students, programming, practicum sites, AATA approval, and intramural relations makes a significant difference. Among responding institutions, the average number
of full-time faculty is a little less than two (1.93), with six of the 16 programs managing with only one full-time faculty. Although courses may be taught by part-time instructors, for these six the burden of the entire program, including its administration, rests on the shoulders of only one person.

Course Load

Not surprisingly, course load is related to number of full-time faculty. In fact, Table 1 shows that at those six institutions with only one full-time faculty, the program director teaches four to six courses per year. Therefore, in addition to all the administrative responsibilities, these art therapy educators carry full teaching loads. At schools with more than one faculty, the program director is given release time for administrative duties by carrying a smaller course load than other faculty. (Institution K is the exception; here the program director teaches one more course, but he or she is on a 12-month contract and the other faculty are on a 9-month contract.)

Colleges and universities vary in the expected full-time faculty course load, usually ranging from four to eight courses per year as can be seen in the spread among art therapy educators. Further, some respondents cited additional contracts to teach extra courses (Institution N), supervision added to course load rather than being a part of it (Institution A), and coteaching (three out of four courses for the program director of Institution G). Among the respondents, average annual course load is five courses for program directors and almost seven (6.66) for other art therapy faculty (see Table 1).

Salary

Lusebrink (1993) cites salary ranges by rank, but there is no indication of the number of faculty at each rank. Gordon and Manning (1991) break down salary range by percentages, showing a preponderance of low salaries: 20% below $20,000, 27% between $20,000 and $30,000, 22% between $30,000 and $40,000, 16% between $40,000 and $50,000, 3% between $50,000 and $60,000, and 6% over $60,000. As mentioned above, no distinction is made between 9-month and 12-month contracts.

It's difficult to compare salaries of those with 9-month and 12-month contracts. On the one hand, it is assumed that those with full-year responsibilities have an opportunity to make more money than those with a standard 9-month contract. On the other hand, educators who have the summer off may take much needed rest and relaxation and/or have the opportunity to earn

money elsewhere, perhaps teaching in a desirable location for all or part of the summer. The monthly amount entered in Table 1 indicates earnings for the actual time at the institution. Two respondents noted that they earned extra summer salaries (Institution B, $11,000 for administration and teaching one course and Institution D, $9,000 for advising and teaching one course in the summer). Another (Institution G) stated that salary is based on clinical work as well as teaching, so it is difficult to compare salaries from that school with the others. Table 1 shows that at all but one school (Institution K) the program director's salary is higher than that of any other therapy faculty. (Institution J gives the same range for both, so it is not possible to tell.)

The average monthly salary for program directors is $4,393, or the equivalent of $39,533 annually for a 9-month contract. (For those respondents that give a range, the midpoint is used in computing an average. Institution G is not included since salary there is based on clinical work as well.) The average monthly salary for other faculty is $3,991 or $35,915 for 9 months. (For other faculty salaries that show a range, the midpoint is used in averaging if there is only one other faculty; where there are two, the top of the range is used for one and the bottom for the other. Once again Institution G is excluded since salary is based partially on clinical work.)

It is evident from the AAUP survey (Table 2) that the average art therapy program director salary of $39,533 is comparable to an average assistant professor salary at a public institution. When comparing the individual salaries in Table 1 to those in the AAUP survey, it is evident that many program directors and all tenured faculty (nine) are associate and full professors. Nevertheless, all program director salaries at public universities are below the AAUP public university associate professor average of $46,990, based on 9-month contracts. (Institution A's 9-month equivalent is $41,250–$45,000.) At the private institutions excluding Institution G (salary includes clinical work), only Institution F's program director earns more than the AAUP private institution associate professor average of $49,990. Removing Institutions F, G, and possibly J, the 9-month equivalent salaries of program directors at private institutions do not even meet the average of $43,630 for associate professors at church-related schools. (The 9-month equivalent for Institution H is $36,000 and for I is $33,750.) Other full-time faculty earn less than program directors, but since only three institutions give a definite figure, it is not possible to generalize. The data show clearly that with the exception of Institution F, salaries of art therapy educators fall below national averages.

## Tenure

At three of the 16 institutions responding, with six faculty among them, tenure is not available. Of the remaining 28 full-time art therapy faculty among the respondents, only nine are tenured. Eleven are on tenure track. For the remaining six, tenure is available at their institutions, but not for them:

- No Tenure system: 6 faculty
- Tenured: 9 faculty
- Tenure track: 11 faculty
- Nontenure track: 6 faculty

Of the three institutions with no tenure system, one stated that multiple-year contracts are available (Institution P). Although tenure is available at Institution G, the respondent stated that one must be a full professor and that it is very difficult to obtain. One might question the security of the nine art therapy programs with no tenured faculty, five of which also do not have any faculty on tenure track.

## Discussion

In addressing each of the four factors described, the general picture emerges as follows: Of the 16 programs for which there are data, seven operate with only one full-time faculty; 10 program directors carry a full course load of five courses or more annually; all other faculty teach at least five courses annually and some as many as eight; salaries are considerably lower than national averages; and tenure is not available to 12 out of 32 full-time faculty.

It might be postulated that an established, professionally approved clinical training program should have at least the following:

- a minimum of two full-time faculty;
- a program director who is tenured at the rank of associate professor and earning at least the AAUP lowest average of $43,630 for that rank;
- other faculty on tenure track at the assistant professor rank and earning at least the AAUP lowest average for that rank of $35,900;
- release time for the program director to handle administrative responsibilities;
- a maximum annual course load for the program director of no more than four courses; and
- other full-time faculty who each carries an annual course load of no more than six.

Source: American Association of University Professors
When we look at Table 1, it is evident that only Institutions A and F meet these rather minimal standards. Both program directors' course loads are higher than the suggested amount, but they are spread out over 12 months.

The overwhelming conclusion from the data is that art therapy graduate programs are hardly the jewels in the crown of their respective institutions. Looking at the figures for the individual schools in Table 1, most are characterized by either one faculty, no tenure, or low salary. It appears as though most institutions have made only the minimum commitment to their art therapy master's degree programs.

In trying to understand the meaning of these conditions, it is unclear whether this is the price to be paid for being an educator in a not-yet-well-established field or if the implications are more complex. In recent years, at least five graduate programs have closed. Art therapy training programs seem to be expendable. Although a few of the training programs are over 20 years old, the overall picture of art therapy education has a temporary feel, as though the institutions that house them are unsure about giving their continuing support.

Art therapy educators ask a lot of themselves. They are leaders and models. They join the struggle for licensure, in some states just to allow art therapists to practice. They try to embody the best art therapy can be. They inspire their students, fight for training programs, often as a sort of stepchild in the academic family, and do all this while overworked and underpaid.

References
A Reference Library for School Art Therapists

Sarah P. Hite, MS, MSED, ATR-BC, Norfolk, VA

Abstract

Although school art therapists have more clinical training than similar master's level professionals working in schools, art therapists often are not trained in any number of areas essential to success in the educational setting. This paper reviews areas of competence essential to comprehensive school art therapy service delivery and suggests books, journals, and journal articles for use by school art therapists as a resource library. The author suggests art therapy texts as well as references in the areas of assessment in special education, intervention in the school setting, program planning and evaluation, consultation, and research. Utilizing these resources will enhance the effectiveness of those seeking to meet the challenges and urgent needs represented by increasing numbers of students with special education needs.

Introduction

Opportunities for school art therapists are growing because the numbers of children in need of specialized services in school are increasing rapidly. As a result of today's health care crisis, we are seeing more and more disturbed youngsters in schools, who previously might have been seen in clinical settings. Increasing numbers of students are deemed eligible for special education services, and the population of at-risk, behavior-disordered students who do not qualify for special education services is growing daily (Capuzzi & Gross, 1989). Art therapy offers a unique answer to the challenge of these students with special needs because art-based interventions can address all spheres of a child's functioning: cognitive, emotional, social, and physical (Anderson, 1994; Fowler, 1994). Although they have more clinical training than teachers and most school counselors, art therapists are not often trained in a number of areas essential to success in a school setting. Special education settings and alternative schools may be utilized as practicum placements in graduate art therapy training, but few programs offer specific coursework to prepare the graduate for work in schools (J. Bush, personal communication, March 6, 1995). The purpose of this paper is to review areas of competence essential to comprehensive school art therapy service delivery and to suggest books, journals, and journal articles to which the art therapist working in a school setting might refer. This list of reference materials is meant to augment the art therapist's clinical and practice library containing volumes on psychopathology, assessment and diagnosis, ethics and standards of practice, supervision, cross-cultural issues, and safety in the art room.

Art therapists work in school settings under various auspices. They are providers of related services to special education students. They are consultants to school counseling, psychology, or social work departments; child study teams; and curriculum development committees. They are therapeutic art teachers in schools for students with special needs, or they are art teachers whose classrooms are filled with students at risk of dropping out of the educational system. Sometimes art therapists working for community agencies deliver services in school buildings.

Since there are so many models of school art therapy service delivery, no text is sufficiently comprehensive to cover all aspects of the field. Therefore, in addition to select art therapy texts, we can utilize a small collection of reference materials addressing areas of competence school art therapy requires of its practitioners. These areas include assessment, intervention, program planning and evaluation, consultation, and research.

Recommended Art Therapy Texts

The core of the school art therapist's library consists of three books devoted exclusively to art-based interventions in schools. Art for All the Children: Approaches to Art Therapy for Children with Disabilities (Anderson, 1992) covers most aspects of delivering direct art therapy services in special education settings. In addition to a clear overview of the theoretical bases of art therapy and children's art development, the book includes art therapy approaches specific to each category of special education. Excellent chapters covering Individualized Educational Program (IEP) development, adapting the art experience for students with disabilities, and self-concept development through art make this book the theoretical and practical foundation of the school art therapist's library. Anderson's 1994 Art-Centered Education and Therapy for Children with Disabilities, a text intended for undergraduate art, art therapy, and special education students, is also invaluable to the practicing school art therapist. In addition to similar but abbreviated versions of material covered in her earlier book, Anderson includes several chapters about utilizing art to facilitate learning in specific content areas, through integration of art into the special education curriculum.

Henley's Exceptional Children: Exceptional Art: Teaching Art to Special Needs (1992) is the third core school art therapy text. Henley bases his theoretical approach on Lowenfeld's and Kramer's works, and defines the role of the art specialist who works with students with special needs as a therapeutic art educator, placing emphasis on the capacity of the art specialist to function as both teacher and support staff in the special education setting. While this is a book about teaching art, chapters on setting up the art room, adaptations, IEP development, and especially media choice and art tasks for exceptional students make this text essential.
Assessment in Special Education

Hallahan and Kauffman's 1994 *Exceptional Children: Introduction to Special Education* is an excellent resource for understanding categories of exceptionality and the characteristics of students in various categories, as well as history and current trends in special education. A chapter on multicultural and bilingual aspects of educating students with special needs makes this special education text up-to-date. Included in each chapter on exceptionality is a section about transition to adulthood and independent living, which is particularly useful to the school art therapist working with adolescents. The book is illustrated with paintings rendered by artists with impairments, making it uniquely appealing to art therapists. The world of special education moves so swiftly that textbooks often cannot stay entirely current. Even though *Exceptional Children: Introduction to Special Education* is among the newest texts on the market, issues related to inclusion as well as to students who are "Other Health Impaired" are not addressed in this book.

*Exceptional Lives: Special Education in Today's Schools* (Turnbull, Turnbull, Shank, & Leal, 1995) fills in these gaps. This book includes a comprehensive chapter on inclusion and collaboration. These two models of educational reform, inclusion and collaboration, are of relevance to art therapists because art therapists may function as related services providers under either model. This text also includes the most current information on special education public policy and laws and has chapters on the newest categories of exceptionality, Traumatic Brain Injury and Autism.

Intervention

To supplement the school art therapist's clinical skills and ground the treatment approach in an educational setting, two books and three journals are particularly helpful. Capuzzi and Gross' *Youth at Risk: A Resource for Counselors, Teachers and Parents* (1996) introduces the art therapist to concepts and definitions related to the rapidly increasing population of students at risk, those youngsters who do not meet criteria for special education but who are clearly in need of specialized interventions and services. Of particular use to art therapists are the chapters on topics not typically included in most clinical texts: adolescent pregnancy, gang membership, and preventing school dropout. Additionally, information about successful programs that address the educational needs of youth at risk might be useful in planning art therapy interventions with this challenging student population.

*The Mentally Ill Child Grows Up* (Black, 1994) addresses the critical problem of disturbed adolescents' transition from the special education setting to the world of work. Treatment approaches, legal aspects of work related to handicapping conditions, and elements of successful programming are discussed.

The Council for Exceptional Children, an organization devoted to improving the educational outcomes of individuals with exceptionalities, publishes two journals which are useful resources for school art therapists. *Exceptional Children* includes results of rigorous special education research, and *Teaching Exceptional Children*, directed at professionals who work with students with exceptionalities, contains information about classroom strategies that work with exceptional students. The National Dropout Prevention Network is an organization whose mission is to address the educational needs of students at risk; this group's new publication, *The Journal of At-Risk Issues*, explores a range of topics related to alternative education, dropout prevention strategies, and programs that work to improve the educational outlook of students at risk.

Program Planning and Evaluation

Any school art therapy program must include a mechanism for accountability so that consumers such as parents will know that the services they are paying for through tax dollars or tuition are yielding positive results. Individualized Educational Programs for students in special education have evaluation measures built into them, but not all students served by art therapists are special education students. Furthermore, a program of services requires comprehensive accountability and evaluation because documented positive outcomes can provide the rationale for continuing services. As part of public education, school counselors have long been involved in evaluation for this purpose and to ensure that high-quality services which meet specific needs continue. The school counseling text, *Developmental Guidance and Counseling: A Practical Approach* (Myrick, 1987), has a good chapter on accountability which is easily adapted for use in school art therapy programming.

Dade County Public Schools' *Handbook for Therapists* (1994) is the program guide for the Clinical Art Therapy Program in Miami, Florida, which employs more art therapists than any other school system. This manual contains details of every aspect of the Dade County program, including job descriptions, procedures for every job activity from ordering supplies to writing assessments, guidelines for meetings with parents of students, and forms for documentation and recordkeeping. Although specific to Dade County, this is an excellent example of a thoroughly planned, comprehensive program manual and can serve as a model for school art therapy program planning and evaluation in other school systems.

Consultation

Consultation: School Mental Health Professionals as Consultants (Dinkmeyer, Carlson, & Dinkmeyer, 1994) states that consultation in schools involves adults sharing information and ideas, coordinating services, and strategizing about solutions to problems. Usually the problems requiring consultation relate to the adults' inability to meet the educational needs of students. This text, written for school counselors but easily adapted to school art therapy, asserts that consultation offers a "powerful tool to change the school environment and community" (p. 14). Thus, consultation skills are essential for art therapists engaged in persuading school systems about the value of art therapy services and programs. These authors utilize an Adlerian approach to consultation, an approach widely used and understood in schools. The authors define the consultant's role in the school setting and suggest practical techniques and strategies for working with teachers and parents.

Sherman, Shumsky, and Roventree's 1994 *Enlarging the Therapeutic Circle: The Therapist's Guide to Collaborative Therapy with Families and Schools* describes models of consul-
tation and therapeutic collaboration. Although not all school art therapists will be utilizing the family systems model offered here, several chapters prove useful for school art therapists regardless of their theoretical approach. Chapters on the organization of schools and school systems, consultation models, school-based intervention models, and case examples might all be useful for the art therapist working in a school setting.

Art therapy consultation may involve offering education and training to teachers, staff, and administrators regarding an art therapy approach with students with special needs. Lyons and Tropea’s 1987 article, “Creative Arts Therapists as Consultants: Methods and Approaches to Inservice Training in the Special Education Forum,” relates the authors’ experiences as arts consultants to the Arts in Special Education Project in Pennsylvania. Practical suggestions for format, content, and approach to inservice training for special education teachers are provided.

Research

References to guide the school art therapist in research efforts are the final component of the school art therapist’s resource library. Like evaluation measures which show the success of school art therapy programming, research results indicate that art therapy yields significant positive change in students with special needs can justify funding for more services. To augment A Guide to Conducting Art Therapy Research (Wadson, 1992), a text aimed specifically at research in education is useful. Isaac and Michael’s Handbook in Research and Evaluation (1995) succinctly covers all dimensions of educational research, including a section on organizing, classifying, and operationalizing cognitive and affective objectives for research. This section is especially useful for art therapists who must translate more familiar, clinically oriented treatment goals into research objectives stated in educational language.

A Guide to Conducting Art Therapy Research (Wadson, 1992) contains information about seeking grant funding for research. An additional reference specific to schools is Grants for Special Education and Rehabilitation: How to Find and Win Funds for Research, Training and Services (Ferguson, 1993). This handbook provides detailed, step-by-step guidelines for writing grants, glossaries of funding sources for special education, handy charts and outlines, and federal application forms. For school art therapists working with at-risk rather than special education populations, the same author and publisher (Capitol Publications, Inc.) have produced numerous similar sourcebooks.

These are some suggestions: volumes, articles, and journals which, coupled with basic art therapy resources, constitute the knowledge base and address competency areas of school art therapy. Utilizing these resources will enhance the effectiveness of those seeking to meet the challenges and urgent needs represented by increasing numbers of students with special education needs.

Viewpoints

Art Therapists Exhibiting Children’s Art: When, Where, and Why

Leslie P. Knowles, MA, ATR, LMHC, South Dartmouth, MA

As a member of the Editorial Board of Art Therapy, I became increasingly concerned as I reviewed articles for this issue and realized that displaying artwork created by children in art therapy in school settings has become a common practice. Every article I reviewed stated that client artwork was being exhibited in the school and, in a few cases, artwork was hung in school hallways for public viewing. For example, one author wrote about an exhibition of art created by a group of adolescent girls who were in treatment to deal with peer and school difficulties. All the girls had emotional problems and came from a variety of dysfunctional situations. Many had histories of trauma and abuse. The therapist decided to hang body tracings made by these girls during art therapy sessions in the school corridors for students, teachers, and staff to view. The author never mentioned how these emotionally disturbed girls were protected from possible ridicule or overwhelming feelings that can accompany viewing one’s artwork on public display.

After reading these accounts, I experienced a growing tension in the pit of my stomach that seemed to be a signal that something was amiss. I decided to write some of my thoughts to begin a dialogue with other art therapists about children’s rights to confidentiality and the ethics of displaying the artwork they create in art therapy treatment. As a result of my reflections, I question if the American Art Therapy Association has given adequate attention to the potential long-term and damaging effects on a child of exhibiting art done in art therapy for all to see.

Section 3 of the “Ethical Standards for Art Therapists,” published by AATA in 1994 addresses the issue of “Public Use and Reproduction of Patient Art Expression and Therapy Sessions.” All subsections contain a phrase requiring written informed consent from the patient when art therapists display clients’ artwork. For children, informed consent has always involved permission from a parent or guardian. Art therapists are required to obtain written consent to provide treatment. Consent forms for art therapy must include a statement allowing the art therapist to use or display artwork created in a professional setting for the purpose of supervision or education (see Figure 1). Confidentiality is insured and the client is granted the right to revoke his or her consent. When I have presented this form at the onset of treatment, parents and guardians have never failed to provide the requested signatures. By the end of intake, caretakers have entrusted me not only with their child’s mental health treatment, but also with the protection of any artwork created by the child while in my care.

When the artwork leaves the realm of traditional therapeutic parameters, confusion about the child’s rights may blur sound judgment. The motivation to display clients’ art can be strong. Art exhibits have long provided art therapists with a way to inform the public about their work. Art shows can educate teachers, staff, and parents and can provide evidence of the value of art therapy. Children’s imagery is often exciting and provocative, and it frequently cries out to be hung on the wall for others to enjoy. For the child artist, viewing one’s own work on a “gallery” wall is thrilling and may help build positive self-esteem. When art therapists use clients’ art for case presentations, supervision, and education, the boundaries may also become unclear. There is no doubt that viewing and reflecting on children’s art with colleagues and supervisors can be both beneficial and enlightening and can also play a role in safeguarding a child’s rights. However, continued care must be taken in these instances to protect confidentiality as the artwork leaves the therapy room.

In her article, “Confidentiality Reexamined: Negotiating Use of Art by Clients,” Spiniol (1994) carefully examines the idea of negotiating the conditions under which art therapists may utilize their client’s art. She offers a sample release form which “distinguishes between using art for exhibition, publication, presentation, consultation, and education” (p. 71). The guidelines for how clients may allow their art to be used are precise and clear. Although her article is geared toward work with adult clients who have the right to make their own informed decisions about use of their art, I believe that a similar form could be used when negotiating a treatment contract with parents and guardians of children. I would attach a clause to Spaniol’s prototype consent form requiring the art therapist to renegotiate with the client and his or her parent or guardian if she or he decides to display the child’s artwork (see Figure 1). The art therapist must carefully consider the emotional consequences to the child when selecting art for exhibition and should interview the child to explore his/her feelings about having the work shown publicly. The parent or guardian needs information about the negative reactions that their child might have when viewing the artwork on display outside of the therapy session.

Another issue concerns the authenticity of client art and the censorship that may come into play when making art for an exhi-

Figure 1 Susan Spaniol has given the author permission to reprint Figure 2 from "Confidentiality Reexamined: Negotiating Use of Art by Clients" with adaptations for use with children.
bition. The two approaches to gathering a client's art for exhibition are selecting existing images for inclusion or creating new images after the client is informed that a show will take place. Our goal as art therapists is to encourage our clients to use art materials to explore their feelings with spontaneity and authenticity. However, once aesthetics enters the art therapy room, the probability that censorship will take over for both child and therapist increases dramatically. The hope or expectation that the child's art will become the focus of public attention alters the relationship between the client and the artmaking process as well as the relationship between the client and the art therapist, who acquires the additional role of art critic.

In her article, "Censorship or Intervention: But You Said We Could Draw What We Wanted," Haeseler (1987) describes an incident that occurred when adolescents in an inpatient art therapy group created a mural in which they vented their anger at staff. The art therapy intern displayed this piece in the unit lounge. The staff removed the mural because of its "insulting" content, which upset the adolescents because they felt betrayed. The art therapist had told them that they could express their feelings openly and without restraint. Apparently not! How can we expect children to receive the benefits of art therapy if they do not feel free to express themselves spontaneously and authentically without fear of criticism or censorship? Perhaps an alternative solution to displaying the mural would have been hanging it in a more private setting to initiate a dialogue between clients and staff.

An essential component of both individual and group treatment in art therapy is the processing, searching, and storytelling that evolve after image-making. Within the boundaries of an art therapy session, the child is free to talk about the image, explore its meaning with the art therapist, and make changes that feel appropriate. Moving the artwork into school hallways or inviting others into the art therapy room to view the images exposes the child to a wider circle of commentary. Teacher, staff, parents, or peers may discuss the child's art in ways that foster great pride in the child. However, the child may also hear commentary that she or he perceives as negative, hurtful, or offensive. Art hung in school halls is subject to scrutiny by all; the child's protection and confidentiality cannot be insured.

As a therapeutic discipline, art therapists cannot assume that it's "OK" to hang a child's picture on a wall just because it's art. The display of art created in a therapy session for the purpose of furthering a child's progress in treatment—whether in a clinic, school, or hospital—should be handled by the art therapist as she or he would handle treatment notes. Would we transcribe treatment notes from a session and then hang them in public? Of course not! We must answer the question, "Whose needs are being served by showing clients' art?" Most children have alternative opportunities to display their artwork in school settings if they choose to do so. Child clients who display artistic interest, talent, and enjoyment can be encouraged to participate in artmaking in and out of school and outside of therapy. For instance, they may be given opportunities to make art at home or to take art classes in the community. With the child's consent, this artwork would be appropriate for public display.

My supervision of art therapy graduate interns working in schools leads me to suspect that administrators and teachers often exert pressure on art therapists to show art made in their sessions with children. AATA should consider adopting guidelines aimed at protecting the confidentiality of child clients that supplement those written to protect consenting adult clients. These standards would relieve the intern, as well as the seasoned therapist, from making difficult ethical decisions when they are pressured by administrators.

Art therapy programs need to arm their students with a protocol that will be respected and followed and that spells out the organization's regulations on showing child/client art. In addition, it is imperative that all of us who practice art therapy assess our personal attitudes and policies regarding the display of clients' art. The more time I spend working with children who depend on me to protect their feelings, their confidentiality, and their images, the fewer reasons I find to support showing art made in clinical therapy sessions.

My goal in presenting these ideas is to begin an exchange with other art therapists about the rights of children and the need to protect their feelings, confidentiality, and privacy in treatment. Clearly, there is a lack of consensus within the field on the issue of displaying artwork done in art therapy sessions, and children are most at risk for suffering from our lack of clarity. Perhaps reexamining and reevaluating our thoughts about this issue will ensure that we are working from current ideals and principles rather than past premise.

When the Edges Bleed . . .

Harriet Wadeson, PhD, ATR-BC, HLM, Evanston, IL

What is art therapy? This question appears atavistic for a field with a professional association a quarter century old and practitioners with a history that extends even longer. Although in various stages of art therapy’s development, we have continued to define ourselves as a profession with greater or lesser intensity, our present self-reflection appears to be of a different order.

Through most of our development, we have conceptualized art therapy as a discipline of considerable breadth that could encompass many approaches. We have prided ourselves on our inclusiveness. We have had our Freudians, our Jungians, our gestaltists, our art educationists, to name a few (Rubin, 1987). We have had humanists, faith healers, disciples of Native American healing, Buddhists, existentialists, phenomenologists, archetypal psychologists, feminist therapists, and more. And, of course, we have had our very own “art psychotherapists” and “art as therapy-ists.” We have recognized that art therapists work with very diverse populations in various kinds of settings and that ways of working that are appropriate for some might not be for others.

So why ask now, “What is art therapy?” Haven’t we been refining answers to that question throughout the quarter-century of our organized history?

External Pressures

I do not believe the question is atavistic. Something has shifted. What we are negotiating now is not a refinement. We are facing a much clearer polarization where those who are moving to the extremes are themselves asking whether their work is something other than art therapy.

Elsewhere I have written of the current external pressures that are forcing changes in art therapy (Wadeson, 1994). Shrinking health care budgets that has spawned managed care has further necessitated licensure. Most often it is the counseling license art therapists seek (for example, in California, Massachusetts, and Illinois). For most state licenses, requirements include specifically identified counseling courses. In Illinois, art therapists wishing to sit for the counselor exam after 1998 will have to have graduated from an art therapy master’s degree program that identifies itself in the school catalog as training counselors. Parallel to this development are art therapists whose clinical positions have evolved to case management and other responsibilities or who may serve as administrators in sectors other than art or expressive therapy; in other words, art therapists who do little or no art therapy.

Studio Approaches

Against the background of this changing scene, and in some instances because of it, have emerged increasingly vocal art therapists forming a counter-valence of studio-based art therapy. In fact, it was the recent issue of Art Therapy: Journal of the American Art Therapy Association devoted to “Studio Approaches to Art Therapy” (Malchiodi, 1995) that prompted the reflections presented here. In it Allen (1995) asks, “Is the open studio within the purview of art therapy? This remains an open question . . .” (p. 161) and in describing her approach, “We eschew therapy concepts and practices” (p. 166). In the same issue McNiff (1995) poses a similar question, “. . . I often wonder whether it (art therapy) is an appropriate ‘location’ for my practice of soul making” (p. 182) and “Even though the mainstream of the art therapy community appears to be increasingly committed to the sacred function of art, the pressures of clinical regulation . . . and greater mistrust of the imagination may ultimately restrict the free spirits of the studio so that they migrate to other places (than art therapy) more hospitable to the ways of soul” (p. 183).

Borders

Where are the borders, then, that distinguish art therapy at one pole from art and at the other from therapy? What is it about our work that is uniquely art therapy? Certainly art therapists do not hold a patent on the invention of art. As stated over and over in the issue of Art Therapy previously cited (Vol. 12, No. 3), art is for everyone. In his visions of the future, Young (1995) states, “Therapeutic studios will become the dominant form of private practice, in which artists will share their art in a therapeutic way with young people, elderly, handicapped, and ‘normal’ people . . .” (p. 195). It follows, therefore, that this “ultimate medicine” (Young, 1995, quoting McNiff, 1992) is not the province of art therapists alone. People who call themselves psychiatrists, psychologists, social workers, or whatever are as entitled to use this “ultimate medicine” in their work as readily as we do. Some of them may even be artists.

Where is the boundary between art therapists and other therapists? Especially if art therapists are trained and licensed as counselors and may hold positions that entitle work that does not include art, the focus becomes even more blurred. At the other pole, the distinction between art therapy and studio artmaking is even fuzzier. Most of us became art therapists because we found that our own artmaking was “therapeutic.” I cannot number the many graduate school applicants who have responded to my question, “Why do you want to become an art therapist?” with responses about wanting to bring to others the healing their own art has brought to them.

Evolution of Art and Therapy Vectors

The answer appears to me to encompass evolution. As I reflect on my own art therapy career, it seems to parallel art ther-
apy's development in some respects. I entered art therapy because I loved artmaking but knew I did not want to be an artist. I wanted to be a therapist. I believe early art therapists were art people who wanted to work with others in a more personally meaningful way than as art educators. As I began my work at the National Institute of Mental Health, I was entranced. I was fascinated by all I learned, intrigued by psychopathology, amazed by the windows to the inner worlds of my psychotic patients their art opened to me, and gratified by the connections I felt with them. They were not "other." In time the feet of clay of the medical model in which I worked began to emerge from beneath its stately robes. I experimented with alternative modes. I began teaching and found that I enjoyed making art with my students, and new learnings came from working in this way. I loved the creative projects students made in art assignments developed outside class. I inaugurated an Annual Art Therapy Summer Institute at Lake Geneva, Wisconsin. There the learning community I had developed at the university deepened to a sustained learning/artmaking community in a beautiful natural setting away from the demands of other responsibilities.

Similarly, I see art therapy as having moved from an art base to intoxication with the clinical and back to the love of artmaking in the community. A swinging pendulum. But I believe our evolution is more spiral than circular. We will not return to the place where we began. We have come too far.

Definition

The therapy pole seems easier to define. Art therapy is based in art. An art therapist who is not using art in work with clients or is not directing or developing programs utilizing art for therapy is not practicing art therapy. Other mental health professionals who utilize artmaking in work with clients may be practicing art therapy. They are irrelevant to our definition at the present time; future art therapy licensure may restrict art therapy practice to those with art therapy credentials.

Distinctions are more difficult to draw at the art pole. Are quelling bees art therapy? People making art together in some beneficial manner is too loose, too general, too unmeeding of an art therapist to characterize our work. This is not to say that the projects described in Art Therapy: Journal of the American Art Therapy Association are not of significant benefit to their participants. Nor is it to say that art therapists should not continue to work in this way. But I do not believe this work should be called art therapy. Art therapists might be especially adept at this kind of work, but so might artists who work well with others. And, in fact, such is the case in many instances. For example, Art Encounters, an Evanston, Illinois, organization, in addition to sponsoring visits to artists' studios and other art activities, has formed an artmaking group for blind individuals. The group leader does not claim to be an art therapist. I have been part of a drumming/chanting/dancing group led by a Native American medicine man. The experience is not labeled "expressive therapy."

Art therapy should be therapy, not just therapeutic. Anything can be therapeutic—taking a walk, listening to music, watching the sunset. If I write a poem, paint a picture, talk over a problem with a friend, I may achieve greater therapeutic benefit than from attending a session with a therapist. I may experi-

ence catharsis, insight, resolution, transformation, growth. Nevertheless, when we speak of a profession, we must include the professional. An art therapist is one who introduces artmaking for therapy "professionally."

It is not the setting in which we work or the needs of the client with whom we work that determine whether the artmaking opportunities we provide constitute art therapy. It is a question of role. Artists can establish an open studio on a psych ward. Artists can work with drop-ins at a shelter for the homeless. Artists can organize art projects for disadvantaged youth. It is our focus on and commitment to the growth of the individual or the group that distinguishes art therapists from artists working with those in need. It is our knowledge base in human dynamics and art's possibilities for enhancing personal growth that distinguishes us. This differentiation comes clear in an observation made by Henley (1995). He draws attention to the role of the art therapist. He states that the art therapist's "each action or non-action must be supported by a therapeutic assessment which validates the use of interventions" (p. 190). He continues by drawing a distinction between the art therapist and the artist-in-residence in this criticism of Allen's description (1992) of the latter:

... the high-powered, provocative quality of the art (of the art therapy intern/artist-in-residence), ... may have proved unsettling or intimidating to others in the group, perhaps diminishing the motivational or therapeutic effectiveness of the atmosphere." (p. 190)

It would seem then that the art therapy intern was being an artist and, according to Henley, not necessarily being mindful of her responsibilities as an art therapist.

Because art therapists are also artists, some of us may work as artists with an extra sensitivity and understanding of the needs of our clients. Nevertheless, the reality of our own development toward greater professionalism in combination with the external realities of tightening human provider systems (managed care, licensure) mandate definitions of what we provide and how we are qualified to do so. In a service-oriented profession, the bottom line of definition is what is the service and who is qualified to provide it.

In her unique manner of expressing wisdom forthrightly, Janie Rhyme (1995) began to address this issue:

How far can diversity expand within any association before the organization comes apart at the seams? ... Twenty-five years ago art therapists differed and disagreed but there was an accepted vocabulary for discussion of most of our issues. Can we go back and establish that vocabulary? I think not. Can we instead, construct and accept a definition of the art therapists' roles whose boundaries include each of us, from psychanalysts to shamans? I don't see how. (pp. 250-251)

She went on to discuss her own rejection of shamanism and the stance of its practitioners. Although I do not find the same problem in encompassing various theoretical approaches, I do agree with Rhyme that our overinclusiveness is no longer viable. Working with others in ways in which we discard the role of therapists is internally inconsistent. We may call ourselves artists, spiritual facilitators, community organizers, art educators, art resource agents, or whatever, and although these roles may combine with art therapy, if they replace it, we are not working as art therapists.
Conclusion

In sum, the tightening net of accountability and our own increased professionalism mandate a clearer definition of art therapy, especially at the extremes where it borders on being therapy without art or art without therapy. Although some of us may practice in these ways, we should not consider such work art therapy. What we call art therapy must be based in art, and its practitioners must be conducting therapy. I have not, in this discussion, ventured far into the murky realm of just what constitutes therapy and what doesn’t, but, clearly, for a beginning we should not include in art therapy the work of those who themselves describe it as other than therapy. As we continue to evolve what we are now calling “studio approaches to art therapy,” we need to notice our edges in defining ourselves to ourselves, to others, and to those who become students of our practice.

There are dangers if we do not do so. As our edges bleed into being counselors on one side and artists-in-residence on the other, we are in peril that this combination may form a vise in which art therapy as a distinct profession could be squeezed into nothing in the middle. Art therapy may become a subspecialty of counseling. Art as therapy may become a subspecialty of studio art or art education.

Finally, as I struggle to keep my balance on the shifting sands of art therapy today, as I try to make sense of the push-me-pull-you art therapy has become, what appear to be the opposing vectors of art and therapy eventually point me in the same direction. It is clear that we need definition. Lest we become so overinclusive that art therapy holds meaningless distinctions, we need to define what we are not, in order to know more clearly who we are.

Dreams and Memories
67 pp., 16 color illus., $24.95, paper
ISBN 0-9642 424-0
Reviewed by Andrew Yale, MPS, Lewisburg, WV

The last few years have not been the best of times for psychotherapists. Struggling to survive the onslaught of managed care, we look glumly to looming budget cuts and respond naturally enough by focusing increasingly on our professional survival. In such an atmosphere, it’s easy to forget the values that led us to enter the mental health professions. Yet there are moments that remind us. It may be a sudden connection with a patient to whom no connection existed before, or a particular richness that enters the silence to announce that healing is taking place. Or it may be a slim volume of paintings and words that appears unbidden to remind us that the power of the image to heal remains undiminished, no matter how dark the times.

Such a volume is Dreams and Memories in which Joan Sherman, now a successful businesswoman in her sixties, recounts a small portion of her odyssey through 40 years of virulent depression to the psychic integration she now enjoys. That this integration was achieved through art therapy makes the account of particular interest to those engaged in that practice. It also confirms our belief in the inherent healing capacity of aesthetics; for Sherman, over the course of her lifetime, had experienced a variety of modalities with minimal response. Here we have a strong personal testimony to the exceptional efficacy of art, which although perhaps indefinable, can certainly be experienced.

Sherman’s story is told in a series of paintings which she began in 1991 with the encouragement of her therapist. The paintings apparently follow the psyche in its nonlinear, transversal approach to conflict. Thus, before commenting on the artwork, it may be useful to examine a brief chronological account of the events Sherman considers pivotal in her life and illness.

Raised in a cultured middle-class home, Sherman was 19, happily married, and 5 months pregnant when she fell into a severe depression. In a locked ward at Baltimore’s Phipps Clinic, she was subjected to a regimen of barbiturates and physical restraints. Somehow she learned of her physician’s plan for a “therapeutic abortion” should she not respond quickly to treatment. Desperate to save her unborn child, Sherman successfully forced herself to “play sane.” She was released, gave birth to a daughter, began to paint, and struggled intermittently with depression. The birth of her second child triggered a postpartum psychosis which was treated with 21 episodes of electroshock. Then began an ongoing search for a “kind doctor,” which led Sherman through a long series of chemotherapists and social workers. It wasn’t until she met Dr. Paul Lidstrom that she experienced herself responding to therapy. Dr. Lidstrom encouraged her to paint, and with one exception, the paintings in Dreams and Memories were done over a 2-year span while in treatment with him.

The series of paintings begins with the threatening imagery and dull colors of “The Crab Thing” and progresses through a reshaping of the major traumas and triumphs of Sherman’s life. In “Phipps Clinic,” she confronts the feelings left from her first hospitalization which, 40 years after the fact, still evoke recurring nightmares. In “Death of My Mother,” one of the most striking pieces in the book, Sherman molds multiple layers of time and experience into a single, spare, and powerfully composed image which invokes the transtemporal qualities of the psyche. “Just Above Water,” one of the last paintings in the series, suggests an evolution in Sherman’s psychoaesthetics. The composition is loose and simpler than the more densely worked earlier paintings, and the free bold use of line is less constricted. Nonetheless, the work is strongly connected. It projects a new sense of life, with broadening space in the psyche for growth to occur.

Sherman acknowledges her debt to Frieda Kahlo, but to my eye she owes more to such primitives as Ralph Fasanella and Howard Finster. One senses that her personal aesthetic will continue to evolve and become more distinctive. The last paintings in the book give hints of that process beginning.

Dreams and Memories is doubtfully valuable. As a survivor’s account of an often unfeeling health care system, it reinforces our belief in the need for kindness and the healing potentials of art. Completely free of jargon, it is easily understood by people for whom art therapy may also be a lifeline. I have used this book with excellent success to encourage patients to engage in the creative process. By its directness and lack of pretension, this simple account of one woman’s experience inspires an excitement and an engagement with creating that are the healthiest antidotes to the time we are all living through.

Telling Without Talking: Art as a Window into the World of Multiple Personality
314 pp., 173 black & white illus., 21 color illus., $45.00, hard cover. ISBN 0-393-70196-4
Reviewed by Vija B. Lusebrink, PhD, ATR-BC, HLM, Palo Alto, CA
Therapists who have worked with patients with Dissociative Identity Disorder (DID) are often exposed to visual expressions which are remarkably similar in structure and content, such as presentation of multiples within one symbolic image, fragmentation, or changes in style within the same picture. The therapists may also become aware of the repetition or fixed nature of these images in the individual's expression until some breakthrough is achieved in the communication among the alter personalities.

Cohen's and Cox's *Telling Without Talking* focuses on the structure of the visual communications and expressions of DID patients, a specific population which can benefit especially from the therapist's understanding of the structural aspects of the visual language. Often these patients do not have a parallel consciousness among their different personalities, whereas their visual expressions contain messages in structure and content that can benefit the process of therapy and the communication among various dissociated parts of the self. In *Telling Without Talking*, the authors combine in-depth knowledge of how to deal with DID patients, with keen observations of the structure and meaning of the patients' visual expressions.

The main body of the book is based on Cohen's and Cox's conceptualization and classification of the spontaneous visual expressions of DID patients into 10 categories. In this illustrated book, they describe how to create meaning by synthesizing patients' artistic strategies and styles with the content of their visual expression. Therapists working with this difficult population will be pleased to see this wealth of visual information available in book form.

*Telling Without Talking* consists of 13 chapters. The first two cover the major components of visual literacy and briefly introduce the 10 categories. The three levels of determining meaning in artwork—namely the process level, structural level, and content level—are presented schematically. The authors define the parameters of their approach in that their 10-category model addresses meaning derived from the structure of the spontaneous expressions only. In two additional tables they elaborate on the styles and artmaking strategies seen most frequently in each category. The authors also are careful to warn readers about the possible effect on the therapist of the traumatic content of a number of the pictures. The latter warning is well warranted.

The following 10 chapters briefly introduce general concepts related to each category and discuss the structure and meaning of 10 to 12 illustrations in each category. The sequence of categories is: chaos, fragmentation, threat, induction of self-hypnotic process, trance, abduction, switching, and alert pictures. The authors are careful to point out that the visual expressions of DID patients do not necessarily follow this sequence. Twenty-one color illustrations provide a better appreciation of the richness and complexity of the symbolic expression than the black and white pictures in the book. The final chapter is a case study of a DID patient, illustrated with 66 pictures.

"System" pictures represent the different parts of the self and their interrelation. The images illustrate repetitions of forms or multiples of the same object. The main structural elements of system pictures are juxtaposition, sequentiality, and dimensionality. The "chaos" pictures represent the system in disorder, which may be associated with cognitive confusion and physiological arousal. The structure of these pictures reflects movement and force isomorphic to the internal strife among the personalities. Scribbles and portrayals of explosions are the main characteristics of chaos pictures. "Fragmentation" pictures mirror the fractured sense of self as represented through shattered surfaces and disembodied limbs, indicative of the psychological effect of chronic dissociation. These pictures are characterized by the simplicity and boldness of the forms used to communicate the experience. "Barrier" pictures provide dividing lines between the conscious and dissociated components of the self. Naturalistic and expressionistic styles and juxtaposition are most often seen in barrier pictures. "Threat" pictures portray danger from the destructive parts of the self. These pictures are more likely to contain writing than the pictures in other categories, and they are characterized by expressionistic style, juxtaposition, and strong black and red color. "Induction" pictures reflect the self-hypnotic process of creating features such as dots, meandering lines, and spirals in a perseverative manner. These pictures are predominantly monochromatic. "Trance" pictures represent disorienting internal realities through juxtaposition of ostensibly unrelated images, differences in scale, and surrealistic style. "Abraction" pictures revisit the traumatic experiences. According to the authors, these pictures are the most disquieting; due to their portrayals of violent, sexual, and sadistic acts; they are used "to tell without talking." "Switching" pictures are representations of the serial self, whereby the executive control is shifted among the different personalities within the same picture. These expressions can provide the patient with graphic clues about the existence of the alter personalities; for example, they may reflect developmentally different graphic expressions and styles. Switching pictures often display randomness of placement and obliteration of some of the forms. "Alert" pictures tell without talking, thus circumventing the prohibition against talking about the abuse.

The final chapter of the book presents a case study of the DID patient who inspired the professional collaboration between the two authors. The pictures selected from her prolific visual expressions amply illustrate the presence of the 10 categories in one individual's work. The book concludes with a glossary and extensive bibliography on DID. Cross-references to the various artists and their works help the reader observe continuities and discontinuities in the structure of the visual expressions of the 29 patients whose artwork illustrates the 10 categories.

Cohen's and Cox's focus on reading the structural elements of visual expression and their integration with the content "as a pathway into the pictorial communication" (p. 13) define an important aspect of art therapy. The meaning thus arrived at represents a valid dimension in considering any visual and art expression, but, as the authors have shown, especially important with DID patients. The multilevelness of art and symbolic expression allows the patient "to reveal information in a drawing while simultaneously camouflaging it from the viewer or herself" (p. xvii). At the same time, the authors are careful to point out that the multilevelness of symbolism defies a single definition of the meaning of a symbolic image and that an ongoing discussion with the patient about the art process and product is essential to its understanding.

Cohen and Cox explicitly state that their approach does not address therapy with DID patients. As a consequence of its focus
on the element of structure, the book does not emphasize the feelings associated with or expressed through the images. It is interesting to note that attention to the structural and formal elements of visual expression helps distance the viewer from the emotions associated with the image (Lusebrink, 1990). In the case of DID patients, the structural and formal approach may provide a double service for the therapist: first, it may enhance understanding of the expression and the internal state or states of the patient; and second, it may alleviate some of the emotional stress of relating to distressing visual expressions. The emotional distance thus created allows the therapist to be more objective and may prevent some of the countertransference often created by highly charged material.

Telling Without Talking is not an easy book to read because of the emotional impact of the images. The descriptive material also challenges the reader to synthesize concepts and detailed observation, which requires more focused attention than perceiving images globally and listening to a story. The reader will be rewarded, though, with appreciation for the interrelationships of the structure and for revealing details which easily might have escaped the viewer's casual glance. As Cohen and Cox have shown, in working with DID patients the details are often important in integrating the meaning of the images. The authors state that this book is offered "to enhance the competency of those therapists whose client brings spontaneous art into treatment" (p. xix). It is my guess that only a few dedicated therapists without art background will have the patience to read the objective descriptions of the images; as matter of fact, it is also my guess that only a small number of art therapists will take the time to fully benefit from the discussion of the structure and meaning of the images. This does not decrease the value and importance of the information offered because even a cursory survey of the text will help the reader relate to the patient's experience and to the often obscure visual material he or she may create to conceal as well as reveal. However, the synthesis of structure and style with the content provides a transcurrency to the visual expression which may be overlooked by considering process and content alone.

Regarding the integrative approach to the visual expressions, the authors could have elaborated more on the two tables. Table 2-1 reviews styles seen in each category; and Table 2-2 reviews artmaking strategies most frequently seen in each category. After studying the images in the 10 categories, such a discussion would have been useful to reinforce the differences and interrelations among the different categories. Consistent use of the term Dissociative Identity Disorder throughout the text also would be recommended.

Cohen's and Cox's Telling Without Talking is a major contribution to art therapy literature. It reflects excellent scholarship, observational skills, and ability to conceptualize and generalize from complex and diverse visual material. The approach and concepts presented in this book should benefit clinicians and researchers in the field of therapy, especially art therapy.

Soldier's Heart: Survivors' Views of Combat Trauma

Edited by Sarah Hansel, PhD; Ann Stelldie, RN; Grace Zacek, MPH; and Ron Zacek, USMC, Lutherville, MD: The Sidran Press, 1995.

242 pp., 16 black & white Illus., $19.95, paper. ISBN 0-9629164-6-3

Reviewed by Kathleen Lovenbury, MA, Hardwick, MA

"The soul remembers what the heart disavows: being mortally wounded by each soldier who died" (p. 15).

Combat changes the person who fights. Wherever fighting goes, death—actual or threatened—and serious injury are witnessed and experienced. Young men and women, many striving to find themselves and determine their own destinies, have found themselves in a world filled with terror, powerlessness, and revulsion. Soldiers from every civilization have returned from war haunted by fear, pain, and death through nightmares, obsessive review of war experiences, and feelings of anger and depression. This syndrome has gone by many names. The Diagnostic and Statistical Manual of Mental Disorders (DSM-III and DSM-IV) published by the American Psychiatric Association has labeled this condition Post-Traumatic Stress Disorder (PTSD). At various times in history, Combat Fatigue, Shell Shock, and Soldier's Heart were some of the labels assigned to the physical and emotional changes experienced by people returning from war. Hansel (a psychologist and a trauma recovery specialist), Stelldie (a psychiatric and mental health nurse and trauma recovery specialist), R. Zacek (a Marine Vietnam veteran), and G. Zacek (a community mental health coordinator and volunteer in the Vet Outreach program) formed The National Trauma Institute in Baltimore to "advocate for those experiencing stress-related traumas, their families, and clinicians working with these individuals" (p. 7). Soldier's Heart, a collection of pieces addressing combat-induced stress disorder, is the Institute's first project.

Giving form to the unspeakable, expressing feelings and experiences is a basic human need. However, many people who survive traumatic events attempt to deny or forget about these disturbing experiences. Anguish, despair, and fear may continue to affect the survivor's life despite all attempts at denial of the events. The submission process for Soldier's Heart provided "... a means for letting veterans and their families step back from the stress with which they live, take stock of where they are, and articulate their feelings" (p. 7). It is the hope of the Institute that combat trauma survivors and their families "... will benefit from the sense of brotherhood and community they find—that they will see they are not alone and can prevail, and that the wisdom in this collective work will help them find peace" (p. 11).

Trauma undermines the survivors' ability to trust, feel strong emotions, and contain intense memories. Healing can take place with the acceptance, concern, and respect of another person. Relationships are not limited to therapy but can be any relationship "where the veteran feels in charge of the process and can trust the other person enough to risk looking at the traumatic experience, remembering what happened, putting it into con-
text, and filling in any gaps (p. 4). Hanzel et al. clearly indicate that the "... survivor must be able to tolerate arousal and strong distressing emotions" (p. 5). Harmful and helpful responses from those who form healing relationships with the survivor are also presented. Hanzel et al. discuss the "... importance of support for the veteran and family surviving combat trauma" (p. 146). They dispel the illusion that a loving, supportive, and understanding family will heal all veterans and their families.

Soldier's Heart is not a clinical manual for the treatment of PTSD experienced by combat veterans. The book is written for veterans, clinicians, and veteran's spouses, families, and friends. The chapters were selected and organized based on the 200 pieces of work submitted by 70 authors. Some of the work has been edited to provide greater clarity, and only work that reflects the "impact of combat on the veteran's life" (p. 9) is included. Art therapists, however, will find that the editors do not convey the full complexity and richness of using art and poetry as an expression of traumatic experience.

This is a straightforward and readable book. Each chapter begins with a general overview of a symptom or experiences related to PTSD, followed by a collection of powerful poetry, essays, and art. The book concludes with Theater Maps, Military Units, Resources, and a Glossary. A number of excellent books focusing on PTSD, accounts of combat, and treatment are included in the Resource section.

Veteran's essays, poetry, and visual images make it possible for the reader to take part in the ordeals depicted and to experience the horror, the sorrow, the pity, and the unimaginable atrocities that most human beings never encounter. The body of the book is divided into eight themes: Something's Wrong; Isolation: Seeking Help; Despair; Loss, Mourning, and Grieving; Escape; Family and Other Perspectives; and Making Sense of It All. The images, poems, and essays bear witness to the pain, anguish, and loss veterans endure and also the hope they try to maintain. Personal images and writing are interspersed with pieces that express more universal issues. The contributions by veterans of World War II, Korea, and Desert Storm illuminate and characterize the veteran's experiences of healing from PTSD. For this reason this book is useful as a tool for survivors to "find comfort" despite isolation, "recognize their healing journey in the words of others," "find words" for their experiences, "be inspired to use positive coping skills," and to "take hope" (p. 6). It is also a valuable resource for clinicians and the veteran's spouse, family, and friends because it provides a clear understanding of the collective experience of veterans through the eyes of the combat trauma survivors themselves.

This powerful book affected me at multiple levels, as it will surely affect art therapists and others interested in understanding the emotional legacy of trauma and its impact on combat survivors and their families. The potent imagery, poetry, and essays shared by veterans provide an insider's view of the many dimensions of Post Traumatic Stress Disorder, from emerging consciousness, through sorrow and anguish, to acceptance and hope. This is a book that can be read repeatedly without losing its impact.

Dance and Other Expressive Art Therapies: When Words Are Not Enough

268 pp., 6 black & white illus., $18.95, paper ISBN 0415-91229-6 (pbk.)

Reviewed by Carolyn Johnson, MA, ADTR, LMHC, Worcester, MA

Fran Levy has conceived, edited, and contributed to a volume of extraordinary clinical case studies utilizing dance and movement therapy as well as art, music, and drama therapies. The contributors are all experienced dance-movement and/or expressive arts therapists who offer the reader stimulating, articulate, reflective, and moving descriptions and discussions of complex human dilemmas, theories for understanding these dilemmas, and unique methods of interventions. Central to the book's meaningfulness is its emphasis on utilizing multimodal approaches—including dance, drawing, mask-making, costuming, singing, and verbalization—to address the unique needs, strengths, and aesthetic and sensory preferences of the clients.

Though primarily a compilation of dance therapy studies, three chapters include art therapy interventions: Levy's own chapter describing long-term multimodal therapy with a woman struggling with a unique form of "multiplicity"; Lawlor's presentation (among other cases) of a woman working to overcome codependency; and Harvey's description of the multimodal therapy of an adopted, sexually abused child. The book is divided into two sections, the first dealing with adults and the second with children. Chapters in the first part include work with multiple personality disorder (MPD) clients, battered women, borderline patients, chemical addiction, codependency, anxiety, and geriatrics. In the second part, chapters focus on work with children who are blind from birth, sexually abused, at risk for attachment disorders, autistic, and learning-disabled.

Levy's book provides example after example of the saliency of the arts to therapy, especially when joined with the empathy and openness shared by so many of the book's contributors. Each author presents case material—background information, theory, and case progress notes—as well as the author's reflections on his or her own work. It is these reflections which, for me, provide the most compelling reading. The therapists share the struggles of their own creative process—their doubts, vulnerabilities, and "mistakes" while doing therapy. In Duggan's report of her work with learning-disabled inner-city adolescents, for example, she describes her difficulties in finding the right "structure" to contain the exuberant and often unchanneled energy of the adolescents. She writes openly about her failed attempts to impose some containing order (and the kids and her own subsequent frustration) until the moment when she recognized, quite surprisingly, the need for the very simplest of dynamic structures. Her description of her own creative process as a therapist parallels many of the dynamics of a successful therapeutic process—conflict, the
search for meaning and order, struggle, and eventually, understanding. This relationship between creativity and healing is understood by most creative arts therapists to be the central basis for our work. But the chapters in Levy's book provide, for non-creative arts therapists as well, powerfully convincing examples of the potency of including the arts in the therapeutic process.

In the introduction Levy identifies three themes that are woven into the fabric of the case presentations: 1) trust and empathy as the key ingredient for establishing a working therapeutic alliance, 2) the integration of art forms to address specific needs and developmental issues, and 3) the primacy of symbol and metaphor in the expressive arts therapies. The first theme, that of establishing a safe, therapeutic container which inevitably includes the therapist's empathic response to the client, is central to all psychotherapies. But the other two themes are particularly characteristic of the expressive arts therapies and are well described in the book's chapters. In Lawlor's chapter, "Confronting Co-Dependency," she relates these two themes by noting that the "... multimodal approach sets the stage for symbolic confrontation between different aspects of the individual's self and between the self and others" (p. 111). The use of symbolic action, images, sound, and play provides the metaphorical equivalents of feelings and for many clients offers opportunities for the safe expression and communication of difficult feelings and experiences. In her introduction, Levy reiterates Robert Landy's contention that "through projective techniques creative arts therapists allow for an aesthetic distance from core emotions while still encouraging genuine self-expression" (p. 3). Each author, regardless of whether he or she uses multiple modalities, discusses the importance of introducing clinical interventions that are responsive to the developmental needs and aesthetic and sensory preferences of the clients. The rationale for the use of directed versus nondirected interventions, the use of props, materials, and choice of music, for example, are sensitively described.

Art therapy interventions are utilized in the above-mentioned three chapters as part of thoughtfully directed therapeutic processes. In Levy's chapter "Nameless: A Case of Multiplicity," the use of body movement and verbalization were perceived by both the client and the therapist as much too threatening in the initial stages of treatment. Levy recognized the usefulness of drawing as an intermediary modality (all six black and white figures in the volume are included in this chapter) and provides detailed descriptions of the process in which the drawings emerged, and of the theoretical framework for understanding them. Levy utilizes the work of, and is mentored by, Dr. Sidney Levy, a psychologist, psychoanalyst, and Professor Emeritus from New York University who developed the Levy Animal Drawing Story test (LADS) in the 1940s.

Lawlor's chapter, "Confronting Co-Dependency: A Psychodramatic Movement Therapy Approach," includes a study of a woman client, an author and illustrator of children's books, who was encouraged by the therapist to construct a series of masks representing her feelings. The masks became the focal point and inspiration for a sequence of powerful, metaphorical dances which included the rage and intense sadness the woman was struggling with at the time. Utilizing the more familiar visual medium helped her to deepen her understanding of her feelings and make possible the further, less familiar exploration of her experience through movement and drama.

Harvey, in "Sandra: The Case of an Adopted Sexually Abused Child," introduced drawing into early sessions with Sandra and her adopted mother in an attempt to identify dysfunctional patterns of nonverbal communication between the two and to increase his understanding of Sandra's self-concept. Drawing became a regular component of ongoing family therapy in this fascinating case.

There is much in this volume relevant to art therapists, despite the fact that only three of the 16 chapters specifically include art therapy interventions. As expressive arts therapists, we are trained to attend to the relationship between the dynamics of feelings and expression and the dynamics of artistic form. It is this relationship between feeling and form that distinguishes creative arts therapies from verbal approaches and lends potency and integrity to our work. It is this relationship that transcends the boundaries of specific art forms. Space, time, texture, color, line, and rhythm are the common denominators of all the arts. As a creative arts therapist, I find the multimodal approach to be both familiar and challenging and, perhaps most importantly, particularly attuned to the uniqueness of each of our clients. Levy's book lends credence to this approach and adds richness to the expressive therapy literature.

Video Review

Drawing from the Fire

Produced and directed by Chris Holmes, Stanford University, Department of Communication, 1993.

VHS 16mm, 23 minutes, color. Purchase only: $39.95 from Chris Holmes Productions, 310 Esplanade, #65, Pacifica, CA 94044, E-mail: mycroft@svpal.org

Reviewed by Lizabeth Flanagan, MA, ATR, Ardmore, PA

All at once we are drawn in and horrified by this video's initial scenes borrowed from a local news broadcast. The subject is the 1991 wildfire which spread, resisted containment, and finally destroyed much of Oakland Hills, a community in the hills of Oakland, California. Statistics reveal the horrible aftermath: 10,000 people evacuated, 3,800 homes burned, 150 people injured, and 25 killed.

But as much as the opening scenes of "Drawing from the Fire" depict trauma and devastation, it is also clear by the film's end that it is even more about hope. We are introduced to school personnel, therapists, children, and their parents who turn our attention to the growth that takes place when individuals are challenged by disastrous circumstances.

The video profiles the work of Pediatricare, a nonprofit organization offered as an outside service because of the widely felt devastation. Kristen Mendenhall is the featured art therapist who works with the children and parents of Hillcrest as part of this service. She describes the benefits of the school-based art
therapy groups that provided the children with a way to express thoughts and feelings related to the trauma. Creative drawing was used to "deepen into their feelings," which allowed for safe exploration. She also presents the programs as both a time- and cost-effective measure. The parents did not have time to seek out other professionals and its availability within the school as part of a daily program made treatment more accessible.

Next we see Mendenhall conduct a group session in which the children are encouraged to process their physical as well as emotional reactions. The shots of the children eagerly sharing their experiences underscore her previously-stated rationale that a child may not possess the verbal acuity needed to process aspects of his or her world and so may find art expression much more comfortable and suited to the immediate need of working through trauma. Even for those unwilling to verbalize, creating a drawing still reassures that they are participating members who benefit and ultimately internalize success.

One boy comments on his physiological reaction to the fire: "My knees are registering 10 on the Richter scale and I felt like someone was riding a bicycle in my stomach." Questions are raised by children who wonder why their house burned down while across the street others did not. There are misconceptions and anger expressed by a girl who thinks her friend's house was saved because "she knows all these firemen" and therefore was given priority over her neighbors. A school staff member comments later in the film that some children internalized guilt, believing the fire was a direct result of their misbehavior.

Following the group, Mendenhall goes on to relate how she noted progress in the artwork of a 6-year-old boy. Her comments are not too technical nor do they gloss over the intent and result of the therapeutic art process. She shows us changes from a chaotic and helpless evacuation scene to a drawing in which the boy is able to isolate the intensity of his anxiety and terror inside the outline of certain rescue figures. Her final comments sound somewhat trite and fail to recognize the underlying dynamic implications. In referring to the boy's ability to graphically contain and finally master his fear she states, "I thought it was cute," and "his crying stopped and he felt a lot better." Nevertheless, Mendenhall's direct approach coupled with the visual aid of the drawings make it possible for even an untrained eye to grasp her interpretive information. The images can speak to a large audience because the video is not as concerned with detailed clinical discussion as it is with providing a service to a community in need. Mendenhall also comments on how important it was for the school staff to understand how the intervention was helping. A discussion between teachers, social workers, and therapists allows us to see the unity and common goals of the various professionals. They are also given an opportunity to discuss their feelings and concerns as well as their observations of the children.

Two segments deal more directly with parents and individual families. We are told about a support group specifically for families. One family is filmed walking through the ruins of what was once their home. A boy kicks a soccer ball against an exposed concrete wall while his baby sister climbs a leveled stairway. The mother talks about finances and insurance issues and asks, "Can it be home again?"

The Oakland Museum of Children's Art is involved in the program by sponsoring a tile project in the school. Museum staff worked with the children to create individual tiles to be mounted together on a wall. Mendenhall speaks of the symbolic role of the fiery kiln and how it imparts strength and permanence to each tile. The tiles are used as a backdrop to the closing credits, strengthening a sense of hope.

At the end of the video, we are left with the image of a mother and son, the primary bond, as they talk about their struggle. The image solidified a sense of commitment. The boy talks with a certain maturity about how this experience has changed him: "You learn from what's happened to you." He is the same boy who had shared first in the art therapy group.

The film does not offer an original viewpoint to the profession of art therapy due to the nature of the topic explored: an extreme and catastrophic situation that demands visceral rather than cerebral exploration. There is little time for delineation of theoretical theses and schools of thought. In this respect the video's function as a teaching tool within art therapy study and practice seems limited.

For those interested in school and community-based programs, clinicians, and the larger community, this video is certainly a good service to the field. As proposed in the accompanying notes, it intends to be helpful to other communities that may require the services of trained professionals in the aftermath of tragedy or natural disasters by relating the story of one such community. It presents one powerful rationale for using outside services: They are not directly affected by the tragedy and are better able to function by objectively focusing on the immediate needs of the community.

Despite its subject, the video maintains a fresh, immediate quality. The editing and direction result in a fluid offering of evocative imagery. We are challenged as viewers to work together—just as this Oakland community did—to feel, think, and process the devastation on different levels. The music, credits, and sound contribute to the high quality of this film, telling a compelling story that will be inspiring for any viewer.

What this film definitely can do for the art therapist is renew his or her convictions about the healing power of creativity and just how versatile our skills are, whether in the context of the conventional health care setting or in response to disasters of greater proportion.
SUPERVISION
and Related Issues:
A Handbook for Professionals
by Cathy Malchiodi and Shirley Riley

A long awaited text, this handbook is a highly informative guide to the complexities of supervision in the 90's. Supervisors, educators, and students will find it indispensable not only in the supervisory session, but also in the classroom and in work with clients. An extensive appendix includes ethics and standards of practice, sample forms for use in supervision, laws effecting supervisors and many more references and resources.

ART THERAPY
IN THEORY & PRACTICE

Ed. by Elinor Ulman and Penny Dachinger

"Since its first publication, Art Therapy in Theory and Practice, has been used continually as both a textbook and a resource. Many of the chapters have become indespensible classics which continue to define the field of art therapy.

In this reprint, we re-encounter Elinor Ulman's skill as a writer and editor of great perception and eloquence. Her talent was to bring together the seminal writing of a burgeoning professional field and meld them into an organized, comprehensible body. This book, now available to a new generation of readers, stands as a testament to this art."  RANDY M. VICK, MS, A.T.R.-BC

ADDITIONS
Presidents: Lynn Jones, Holly Feen-Calligan, and Katie Webb
Participants will receive the latest information on the use of art therapy in the treatment of addiction and dual diagnosis. Art therapists will be able to identify specific non-verbal approaches for working through resistance and denial in the treatment of substance abusers. Counselors will be able to identify specific ways in which to coordinate treatment efforts with art therapists in their facilities.

FAMILY ART THERAPY
Presenters: Mari Fleming, Shirley Riley, and James Consoll
The objectives of this symposium are to provide the participants with an overview of how art therapy provides families an enriched vocabulary to assist them in solving family problems. The therapy gives a "voice" to all age levels and offers a non-threatening vehicle to aid in communication restructuring the family system. The intensive workshop will offer ways to combine family theories with art expressions and examine assessment methods, and short- and long-term treatment. Participants will engage in experiential opportunities to experience how art therapy is applicable in their own professional setting. Every effort will be made to offer the most current trends in family therapy and art therapy application.

ART THERAPY IN SCHOOLS
Presenters: Janet Bush, Sarah Hite, and (third presenter to be announced)
This symposium will provide participants with the administrative procedures for implementing art therapy services and programs in schools. Topics will focus on the uses of art therapy in schools; the roles and responsibilities of school art therapists; techniques and strategies for working with students; training and preparation of school personnel; and the funding and marketing procedures required for school art therapy programs. Participants will be prepared to transfer techniques and strategies for implementing art therapy services and programs to school settings.

ART THERAPY WITH THE OLDER ADULT
Presenters: Larry Barnfield, Bernadette Callanan, and Judith Wald
The symposium will cover general views on aging, relevant facts and new research, the role of art therapy with elders, and settings in which art therapists practice and the special advantages of art therapy with the aging. It will cover the goals of treatment, treatment issues, and the clinical treatment of three groups of vulnerable aging and case studies.

GRANTS: GOING FOR THE GOLD
Presenters: Frances Anderson, Vija Lusebrink, and Doris Arrington
Successful grant writing in art therapy is, and will continue to be, an important survival strategy in the 90's. Many model art therapy projects funded by grants will be discussed. The entire grant writing and granting process from identification of funding sources (public and private), to proposal development, submission, and implementation will be covered. Technical assistance will be available to participants who already have a grant idea or proposal "in process."

ART THERAPY WITH CHILDREN AT RISK
Presenters: Cathy Malchioli, Julie Epperson, and (third presenter to be announced)
This symposium proposes to fill the need for advanced art therapy training focusing on theory, interventions, methodology, and research with children at risk. "Children at risk" are defined as those who are directly affected by family violence, physical and sexual abuse, neglect, homelessness, and various disabilities such as attention deficit hyperactivity disorder, learning problems, and physical limitation which put them at further risk for abuse and neglect. Emphasis will be on how the clinician can develop both short- and long-term art therapy interventions, effectively assist the child in crisis, and appropriately utilize art expression in assessment of current levels of psychological functioning.

ART AND MEDICINE
Presenters: Cathy Malchioli, Anita Mester, and (third presenter to be announced)
The symposium will focus on the unique dimensions of art therapy within a medical context with people who have experienced life-threatening chronic illness, particularly cancer and HIV. The special role of the art expression plays in the assessment and evaluation of both the somatic and psychological status of the individual will be discussed, supported by the current research of both art therapists and clinicians in related fields. Special emphasis will be on paradigms for the use of art therapy within the context of psychoneuroimmunology and mind/body healing. Theories of imagery from current research by Achterburg, Simonot, Bach, and others will be covered to assist the participants in integrating the use of art expression with physically ill clients, and will be presented so that participants acquire an understanding of the practical aspects of adapting art therapy to specific disease conditions. Lastly, emotional and transpersonal issues of grief and loss which are intrinsic to the experience of physical life-threatening illness will be addressed.

ADOLESCENT ART THERAPY
Presenters: Kris Sly-Linton, Patty Isles, and (two other presenters to be announced)
The Adolescent Art Therapy Symposium will cover a wide range of topics designed to address a specific focus area requested by the sponsoring organization. This is a somewhat unique approach to the traditional symposia format but considering the multiplicity of problems regarding the treatment of adolescents today, it was felt this would be a way to make each symposium more pertinent to the intended audience. The four person team, headed by Kris Sly-Linton, was coordinated to include professional art therapists that can provide the expertise required to address the following areas: Special Populations of Adolescents, Program Focus, and Teens and Family Systems.
Keynote Speaker • Jimmy Santiago-Baca

Jimmy Santiago-Baca, poet, author and screenplay writer of Chicano and Apache decent, is recognized as a leading spokesperson for the Hispanic community. His book, Martin and Meditations on the South Valley, received the American Book Award in 1988. In the summer of 1995, Santiago-Baca was one of the featured poets on the Bill Moyers PBS series, Language of Life. His poetry speaks to a vision of change and community transformation through creative expression.
Art Therapy, the official journal of the American Art Therapy Association, is a quarterly journal for professionals and students who are interested in the use of art in the fields of mental health, psychotherapy and human development. The purpose of Art Therapy is to advance the understanding of how visual art functions in the treatment, education, development, and enrichment of people. Art Therapy publishes refereed articles, including illustrations, by art therapists, psychologists, family therapists, and others that reflect the latest advances in theory, research, professional issues, and practice. An emphasis is placed on the use of visual arts in therapy, but articles in related disciplines of interest are considered for publication. Art Therapy is an important source for news and summaries of national conferences, book reviews, media, and commentaries.

Recent articles published in Art Therapy:

- Art Therapy: Bridging Barriers with Native American Clients
- LA '94 Earthquake in the Eyes of Children: Art Therapy with Elementary School Children Who Were Victims of Disaster
- Use of a Drawing Task in the Treatment of Nightmares in Combat-Related PTSD
- Outpatient Art Therapy with Multiple Personality Disorder: A Survey of Current Practice
- Art Therapy at the Crossroads: Arts and Science

Art Therapy is available to AATA members as part of their membership.

Non-members may subscribe at the following annual rates:
- Individuals: $50.00 (U.S.) - $74.00 (Foreign)
- Institutions: $77.00 (U.S.) - $100.00 (Foreign)

Single copies are available at:
- Members: $12.50 - Non-Members: $23.00

Make checks or money orders payable to AATA in U.S. funds and return with this order form to:

THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-for-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board, elected by the membership. AATA has established standards for art therapy education, ethics, and practice: AATA committees actively work on governmental affairs, clinical issues, and professional development. AATA's dedication to continuing education and research is demonstrated through annual national conferences and regional symposia, publications, videos, and awards.

MISSION STATEMENT
The American Art Therapy Association is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing.

Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

ART THERAPY:
DEFINITION OF THE PROFESSION
Art therapy is a human service profession that utilizes art media, images, the creative art process, and patient/client responses to the created products as reflections of an individual's development, abilities, personality, interests, concerns, and conflicts. Art therapy practice is based on knowledge of human developmental and psychological theories which are implemented in the full spectrum of models of assessment and treatment including educational, psychodynamic, cognitive, transpersonal, and other therapeutic means of reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem.

Art therapy is an effective treatment for the developmentally, medically, educationally, socially, or psychologically impaired; and is practiced in mental health, rehabilitation, medical, educational, and forensic institutions. Populations of all ages, races, and ethnic backgrounds are served by art therapists in individual, couples, family, and group therapy formats.

Educational, professional, and ethical standards for art therapists are regulated by the American Art Therapy Association. The Art Therapy Credentials Board, Inc. (ATCB), an independent organization, grants post graduate Registration (ATR) after reviewing documentation of completion of graduate education and post graduate supervised experience. The Registered Art Therapist who successfully completes the written examination administered by the ATCB is qualified as Board Certified (ATR-BC), a credential requiring maintenance through continuing education credits.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the United States. Chapters conduct meetings and activities which promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for chapter members is passed on from the Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:

Publications
- Art Therapy: Journal of the American Art Therapy Association (published quarterly).
- AATA Newsletter (published quarterly).
- Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, videos, and the Membership Directory.
- AATA literature, such as Educational Program List, Art Therapy Media List, Standards of Practice, and mailings of professional interest.

Services
- Insurance, including professional liability, major medical, life, and disability through Maginnis & Associates.
- Access to national experts in art therapy.

AATA Meetings
- Discounts on registration fees to AATA national conferences and regional symposia.

Nationwide Advocacy
- Governmental affairs activities including congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third party payers.
- National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
- Development of Model Job Description and recommendations for licensing standards.
- Development and implementation of national Education Standards for approval of graduate level art therapy programs.
- Development and implementation of nationally recognized Standards of Practice and Ethical Standards for Art Therapists.

GENERAL INFORMATION
AATA and ATCB are administratively independent. Membership in AATA and Registration (ATR) with the ATCB require separate application and approval. ATR registration applications are available from the ATCB at (312)527-6764.

For new Associate, Student, and Contributing members only, please follow the dates below when submitting membership applications. The membership year is the calendar year 1/1 to 12/31.

Applications received between:
- 1/1 to 5/31
- Full dues payment; membership expires 12/31 of same year.
- 6/1 to 9/30
- Half-year dues plus $5.00 payment; membership expires 12/31 of same year.
- 10/1 to 12/31
- Full dues payment; membership for the remainder of current year and next full year.

CATEGORIES AND FEES
Professional-By application review process only; approved members may vote, hold office, and serve on committees.

- Professional Member-Individuals who have completed graduate level educational training in art therapy. Dues are $85.00/year.
- Credentialled Professional Members-Individuals who have been dually approved for Professional membership by AATA and Registration (ATR) by the ATCB. Dues are $85.00/year. Annual ATR maintenance fee is billed separately by the ATCB.

Associate-Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. This category is not open to Master's level art therapy program graduates. Associates may not vote, hold office, or serve on committees. Dues are $85.00/year.

Student-Individuals who are currently taking full-time course work in art therapy or a related field. A current statement from the institution of learning indicating full-time status and course work content (6 graduate or 12 undergraduate credits) is required. Student members may not vote or hold office, but may serve on the Student Subcommitte of the Education Committee. Dues are $35.00/year.

Contributing-Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $120.00/year.

Retired-Individuals who are at least 65 years of age and who are no longer practicing. Retired Associates receive publications. Retired Professionals receive publications and may vote, but may not hold office. Application provided upon request. The service fee is $35.00/year.

Checklist

☐ Five (5) copies, typewritten on 8 1/2" x 11" white paper with margins of at least one inch.

☐ Black and white photographs (at least 5" x 7") of original artwork plus four (4) photocopies of each.

☐ Abstract of 100-150 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees, and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information.
   (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature_________________________________________ Date__________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 USA.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. *Art Therapy: Journal of the American Art Therapy Association* uses a blind peer review procedure for articles, brief reports, and viewpoints. Final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor, and special section editors.

The following are guidelines for submissions. **Submissions that do not conform to these guidelines will be returned to the author without review.**

**Submission Categories**

1. **Articles.** Full-length articles may focus on the theory, practice, and research in art therapy or related areas. Articles must include an abstract of approximately 100-150 words summarizing the major point of the article.

2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Brief Reports should include information on the research design, methodology, and results. An abstract of approximately 100-150 words should also be included.

3. **Viewpoints.** Short articles focusing on personal experiences, poetry, or original art may be submitted to this section.

4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office.

5. **Video Reviews.** Reviews of media (videos) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office.

6. **Commentaries.** Brief comments on submissions published in *Art Therapy*; issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each submission to Editor, *Art Therapy: Journal of the American Art Therapy Association*, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.

2. Only original submissions that are not under consideration by another, periodical or publisher are acceptable.

3. Submissions must be typewritten on 8 1/2” x 11” white paper with margins of at least one inch. The body of the paper, references, tables and quotations must be double-spaced.

5. An abstract of 100-150 words must be included with full-length articles and brief reports.

6. Please avoid footnotes wherever possible.

7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles, and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.

8. Use tables sparingly and type them on separate pages. Refer to the *Publication Manual of the American Psychological Association* (Fourth Edition) for style of tabular presentations. All tables, charts, or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.

9. Photographs must be at least 5” x 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs. Captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.

10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions which are addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. **It is the author’s responsibility to secure such permissions.** A copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.

11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations, and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.

12. It is expected that any submission accepted for publication in *Art Therapy* will go through at least one revision before publication. If authors have prepared their submission on either an IBM, IBM-compatible, or Macintosh computer, upon acceptance, they can send a 3.5” diskette containing an electronic copy of the submission to the AATA National Office. This will help speed processing, editing, and publication.

**Note:** Authors bear full responsibility for the accuracy of all references, quotations, and materials accompanying their submissions.
STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 0741-1856) is published quarterly by the AATA, Inc., 1202 Altonson Road, Mundelein, Illinois 60060 U.S.A. Telephone (847)599-6064, FAX (847)566-4580. Non-members may subscribe at the following annual rates: $50 (U.S.) and $74 (Foreign); institutions $77 (U.S.) and $100 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Altonson Road, Mundelein, Illinois 60060 U.S.A. (847)599-6064.

This journal is abstracted in: Resources in Education (ERIC), Art Bibliographies Current Titles, Art Bibliographies Modern, and PsycINFO.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to American Art Therapy Association, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

MISSION STATEMENT: The American Art Therapy Association, Inc. (AATA) is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing. Its mission is to serve its members and the general public by providing standards of professional competence, developing and promoting knowledge in, and of, the field of art therapy.

About the Cover: “Kachina-Spirit Guide,” 9” x 12”, is a one-of-a-kind print (monoprint) by Sally Brucker, MSW, ATR, Tokoma Park, MD. It is part of a series called “Kachinas.” The image of the guide came in a dream and, for Brucker, symbolizes the presence of the “third eye” or “spirit” present in the therapeutic space when what has been heretofore hidden, emerges. The figure of Kachina is borrowed from Native American culture which honors the power of the spirit to heal and guide others. At the end of therapy, Sally often gives her clients a small reproduction of this print as a way to honor their spirit and continuing journey.
Art Therapists in Cyberspace

Cathy A. Malchiodi, MA, ATR, LPAT, LPCC, Editor

Cyberspace is a familiar catch-all phrase for the infinite world of computer networks that include the Internet and the World Wide Web. The Internet or "the Net" is the mother of all computer networks and was originally developed for communication purposes by the US Department of Defense in the 1960s. Eventually, businesses, institutions, and the general public connected to the Internet, with the number of people using the Net skyrocketing in the 90s.

The World Wide Web (aka WWW or the Web) is generally considered to be the most popular spot of the Internet, an area in which individuals, organizations, institutions, and businesses have developed sites commonly known as Web pages. It is commonplace these days to hear someone speaking about his or her personal Web page, to notice more "www" addresses appearing on business cards and advertisements, and to encounter numerous Web sites during cyberspace travel. Currently, the AATA, several chapters, creative arts therapies associations, the National Creative Arts Therapies Association (NCATA), and a few enterprising art therapists have developed Web pages. The AATA Web page (www.arttherapy.org) has been up for more than a year and is currently devoted to governmental affairs and to providing the names of Board and Committee Chairs. Since mostly students travel the Internet, hopefully the AATA will include additional resources, more detailed information on membership, professional opportunities, education, and publications on its Web site in the near future.

Although the Internet and the Web have become popular ways to communicate, cyberspace may not be the most frequently used form of communication between art therapists. However, given its popularity and versatility, it is still one that every art therapist ought to experience at least once. Some believe that cyberspace is the ultimate form of networking with other art therapists. For example, Danny Sofer's Web page (http://www.sofer.com/art-therapy/) notes the following:

The Web offers many things that existing forms of communication—newsletters, magazines, conferences, meetings—offer, but it also offers many advantages: it is cheap; it is global; it is collaborative; it is democratic; it creates fast feedback loops, and it's becoming increasingly ubiquitous.

While the Internet and the WWW offer many opportunities for art therapists wishing to communicate with others both within and outside of the field, it is not always clear what the actual advantages are. For instance, it is difficult to say that online communications are "cheap": in reality, the cost of using the Internet or online services that are necessary to surf the Net or browse the Web is quite variable. For students and educators at universities, luckily there is generally no cost or a very nominal fee for access to the Internet and the Web. But for the average art therapist, access through a home computer is the most likely way to get to the Internet or browse the Web. This requires a considerable amount of capital, including a computer with adequate capacity to run an online program, and a way to get online (e.g., a service such as America Online, Compuserve, or other company for a monthly fee of anywhere from $10 per month and up). Getting online also requires a modem and may require a separate phone line if you want to keep your main home or office line free to receive calls while online. If one really wants to fully experience cyberspace, manuals and magazine subscriptions to publications such as NetGuide may also be necessary.

Going online also requires that you have considerable free time to spend staring at your computer screen. Unfortunately, most online users have slow access speeds—in other words, they have modems that transmit data at 9600 bits per second or less. There are modems that transmit information at 14,400 bps (bits per second) and 28,800 bps, and some people at universities have direct cable access which can transmit data at very high speeds. Most art therapists who have a modem are likely to have one with a slower access speed which often means that online travel is sluggish and visiting Web pages which have many graphics to download can be extremely frustrating.

One clear advantage of online communication is the ability to be interactive with other art therapists and professionals, even around the world. Once one is online there are a variety of ways to communicate with other individuals and groups. The most popular way is probably e-mail electronic mail. This is a direct form of communication similar to leaving a message on someone's voice answering machine, except that e-mail messages are sent as text and deposited at the address or mail box of the recipient. An amusing part of electronic mail is the use of online monikers; in most cases you are able to choose your online name and some art therapists have been quite inventive with their choices. I have interacted with a Mr. crayon, Larkstar, Cyanotype, BlueHer671, GOLIVE IT, CrowMother, Mystickion, PLAYMIKE, and PurpleArt, to name a few. There are some people I only remember by their cyberspace names, forgetting or, in some cases, never knowing their "Earth" names at all.

In the area of speed and convenience, communication via cyberspace, versus phone communication or snail mail, has many advantages. I now take for granted that I will receive e-mails each week from throughout the US, will regularly find notes from colleagues in Europe, Asia, and South America, and will be able to send a communication to someone on the other side of the world in seconds. For example, cyberspace has made it possible and easy to work on a manuscript with another art therapist in Scotland, to get information on what Asian art therapists are doing, and talk with a publisher in Brazil, all from my home computer.
There are also possibilities for public communication online through bulletin boards (places where you can post messages for everyone who visits the site to read) and live online chats (areas where many people can meet online at a given time and type in responses on screen, a kind of "text" conversation). My initial response to online chats and bulletin boards was positive, imagining them as places for discussion and possibly even peer supervision (Malchiodi, 1996). However, after three years of observing both chats and bulletin boards, it seems that they are more useful as support groups for art therapists rather than ways to debate or discuss professional issues. The majority of entries on bulletin boards and folders are questions about where to obtain training, where to find work, and what to do with various client populations. Perhaps this is the nature of cyberspace itself: since one cannot see who one is talking to in online forums and bulletin boards, body language and facial cues are not available as visual references. Misunderstandings and misinterpretations of messages frequently occur, often resulting in ruffled feathers and hurt feelings. Also, since what is entered onto a bulletin board or chat forum is permanent, many art therapists may be reluctant to submit an opinion that others will be able to read.

Both bulletin boards and online chats seem to go through phases where people are very active in the discussions to times when no one seems to be interested. For example, in 1994 and 1995, the Creative Arts Therapies folder in the Better Health & Medical Network of America Online (AOL) was very active, while currently it rarely receives new entries. Similarly, the Creative Arts Therapist's online chat on AOL were once well-attended, while the current chats attract little participation. Perhaps that will change as more art therapists come online.

On the other hand, an Internet forum created by Barbara Levy, called CATCHAT (http://plaza.interport.net/catch/), is a very active bulletin board for creative arts therapists, professional colleagues, and those interested in art, music, dance, and drama therapy. I visited the art therapy section while writing this editorial and at that time it had daily entries, although these entries are generally questions about training programs, or job opportunities (where do I find a job?). For the season professional there is little advanced material, however, these computer forums for art therapists are helpful for students or novice therapists who are asking basic questions and looking for information on how and where art therapists practice.

When participating in either bulletin boards or live chat sessions there are some important factors to consider. For example, the chat host or discussion leader is not necessarily a qualified professional in the field or topic. I have attended quite a few chat sessions on America Online (AOL) in various healthcare sections and have found the qualifications of the chat hosts to be uneven at best. AOL does not necessarily pick the most qualified people for the job; according to Ellyn Silverson, co-coordinator of the Better Health & Medical Network's AOL, qualifications seem to have little to do with selection of discussion leaders.

The qualifications for facilitating group meetings in the Better Health & Medical Network are not based on clinical expertise, board certification, or any other medical credentials. Although a facilitator may have a clinical background, their clinical profession is not a qualification for facilitating a group meeting in the Better Health & Medical Network. As you know, our group meetings are not intended for the provision of diagnostic or therapeutic recommendation. Our selection of facilitators for start-up group meetings in the Better Health & Medical Network is based on numerous factors, but health care background is not one of them—online communication.

This lack of quality control is not limited to live online chats. Web pages are generally not subject to any critical review; whoever creates them may use them to present select information, generate business, or promote oneself or one's services, just as one would create an advertisement for a newspaper or a highway billboard. What you may read on a Web page is not necessarily the truth or the best information, and is only as accurate as the person who wrote or compiled it.

There is indeed a democracy involved in the Internet as Sofer noted; no one controls or owns the Net or what goes onto it. The downside of the situation is no one controls what information is placed in cyberspace, thus quality control is almost nonexistent. However, the upside is cyberspace does allow for free expression of thoughts and ideas, a welcome concept in this day and age.

There are numerous pros and cons of venturing into cyberspace and it certainly may not be for every art therapist. Cybertravel is intriguing, but it does take patience and a lot of time, even with the fastest modem or direct cable access. Like many individuals, I was initially excited about the Net and the Web, but I eventually found that I did not have the time to devote to wandering through it. E-mail—like snail mail, phone messages, and faxes—has become one more item that I have to attend to and respond to on a regular basis. Live online chats, which interested me at the outset, now seem to be a tedious way of communicating with others and have the missing element of hearing a voice or seeing a face. Bulletin boards are great for those who are exploring the field of art therapy, but for the advanced professional offer little new in the way of helpful information. Also, there is currently so much information on the Net and the Web that one would need to be either retired from active practice or unemployed to pursue reading even a fraction of it.

However, would I give up traveling cyberspace? No, I would not. I enjoy the ability to quickly communicate with people around the world, an impossible notion only a few years ago. I also have come to take for granted that I can search the Web for research data in areas such as Medline and ERIC from the comfort of my home office. Most of all, I like the idea of being able to travel through "space" that is still largely uncharted and often uncharted, somewhat like the field of art therapy. Perhaps this is one characteristic that makes cyberspace attractive to those art therapists who want to boldly go where few have gone before.

Reference

Editor's Note: Another interesting art therapy Web page is one constructed by Petra Hansen. Art Therapy in Canada http://www.mic.org-phansen/index.html. Hansen has compiled a series of hub biographies that are well worth a visit if you are conducting a literature search or simply browsing the Web for information on art therapy.
The Use of Art Therapy as a Predictor of Relapse in Chemical Dependency Treatment

Sara Brizdle Dickman, MS, ATR, Jonathan E. Dunn, MD, PhD, and Abraham W. Wolf, PhD, Cleveland, OH

Abstract

This pilot study evaluated the hypothesis that relapse in patients treated for chemical dependency could be predicted by evaluating artwork completed during the active treatment phase. A retrospective study, based on 5 years' observation, was carried out at a large county hospital. A rating manual was developed identifying 11 items as potential indicators of relapse. Two independent art therapists rated 30 sets of four assigned drawings. Three of the 11 items were found more likely to be present in the drawings of patients who relapsed within 3 months after treatment. These included: 1. the presence of a drawing of psychoactive substances or drug paraphernalia; 2. the lack of either a figure representing the self or any articulated or detailed figure in a drawing; and 3. the use of an abstract or geometric drawing style on at least 66% of the picture.

Introduction

Chemical dependency continues to be a major problem in healthcare today. According to estimates, it costs the United States as much as $163.5 billion annually (Hogan, 1993). This cost includes not only treatment but also “the productivity losses caused by premature death and inability to perform usual activities, and costs related to crime, destruction of property and other losses” (Hogan, 1993, p. 14). Relapse rates tend to fall within the range of 45% to 60% (Hoffman & Miller, 1994). Predictors to identify patients at high risk for relapse could be very useful in the formulation and execution of an individual's treatment plan.

This study sought to determine if items drawn in therapist-directed art therapy tasks could be used as effective predictors of relapse during treatment for chemical dependency. Previous work using art therapy with chemically dependent individuals has focused on assessment and the use of a variety of different treatment approaches. Allen (1985) described the integration and application of art therapy into a hospital inpatient detoxification treatment program. She noted that patients seemed to gain insight through artmaking and that many patients found their defenses challenged, which was the overall goal of the program. Foulke and Keller (1976) wrote about the art experience of addict rehabilitation in a setting where the goal was to facilitate tolerance and integration of affective experience under conditions of full ego control. Spring (1985) identified a symbolic language in the art of chemically dependent, sexually abused women. For some of these women, drawing provided authentic relief from pain during the session; and for others it provided a model for achieving a sense of control. Albert-Pulcro (1980) used an analytical approach when he encouraged narcissistic transference and used it as a focus for treatment. Cox and Price (1990) used incident drawings to help adolescents translate inner experiences into art expressions and break through to feelings of self that had been lost through substance use. Julliard (1994) used art therapy combined with role-playing, to increase chemically dependent patients' belief in Step 1 of the 12-step program. Each of these authors anecdotally found art therapy beneficial during the treatment and recovery from chemical use.

The retrospective study described in this article used art therapy in the treatment of substance abuse in a different way. In this study, art was looked at as a possible predictor of future behavior, particularly relapse. The treatment team at the county hospital, including a psychiatrist, a psychologist, counselors, residents, medical students, and the art therapist, hypothesized that patients' drawings might contain predictors of these patients at high risk for relapse. Based on 7 years of providing art therapy services to this population, the art therapist and the psychiatrist decided to retrospectively examine patient artwork to see if they could identify items predictive of relapse.

History

The research site, a 74-bed, nationally recognized county hospital located in Cleveland, Ohio, provides a full range of both inpatient and outpatient, general and tertiary healthcare. In 1976 a Center for Alcohol and Chemical Dependency was established. Under the aegis of the Department of Psychiatry, this program treats adult patients ranging between 20 and 45 years of age. After an initial evaluation, treatment consists of a 3-week outpatient program. The program utilizes a comprehensive therapeutic approach to help resolve the physical, social, and emotional needs that accompany chemical dependency. Individual and group counseling, Alcoholics and Narcotics Anonymous, family care, and an aftercare program are included.

Art therapy was added to this treatment plan approximately 10 years ago. At the outset the goal of the program was to provide patients with an avenue for personal expression beyond the traditional verbal one, with a focus on encouraging expression of feelings about their addiction, treatment, and recovery. This approach was implemented successfully for several years. However, in 1991 after consultation with the medical director there was a decision to shift the direction of the art therapy program so that art expressions began to be used to assess and evaluate patient progress in the recovery program. New patients as well as readmissions were required to attend four, twice-weekly...
art therapy group sessions which lasted up to 2 hours each. At these sessions, after an initial warm-up exercise, they were given one of the following four sequential drawing tasks: (1) How do you feel about being in recovery? (2) What makes you angry? (3) What is the most difficult part of recovery for you? (4) How do you plan to continue your recovery after you leave this hospital treatment program? These questions were developed specifically to evaluate patient compliance and attitude toward treatment and become part of the standardized data for evaluation as this current study evolved. Drawing materials consisted of 12" x 15" paper (white or colored) and markers or oil pastels.

Methodology

After observing and processing the artwork of chemically dependent patients for several years, the treatment team realized that certain items were appearing frequently in the drawings. The presence of these items was noted not only by the art therapist but also by the psychiatrists and counselors working in the program. Discussion about these recurring themes, styles, and symbols generated the research efforts of this study.

Eleven items were identified as potential predictors of relapse. A rating manual was developed by the authors to define and rate examples of those 11 items (Table 1). Two art therapists not currently working with a chemically dependent population were trained to identify the 11 items. They scored each item positive if present, negative if not present, and not applicable. Each drawing was rated on a separate score sheet and each rater scored 50 sets of the sequential drawing tasks described previously.

Fifty sets of drawings by 50 patients who finished the program in 1992 or 1993 and for whom follow-up data were available were selected. The sample population had the following characteristics: the mean age was 35.6 years; 10.3% of the patients were females; 69% were Caucasian; 43% were single, 37% were divorced or separated, and 20% were married or cohabitating; the mean level of education was 11.6 years (.1 SD); 55% had a high school degree or greater, but less than 5% had obtained a 4-year college degree; 62% had previously participated in some form of chemical dependency treatment. Of this group of patients, 23 had relapsed and 27 had abstained for 3 months after leaving the program. The posttreatment follow-up data were collected by telephone interview as part of the program's regular follow-up work.

Subjects who relapsed were compared to abstainers on each of the 11 addiction indicators. A positive score on each addiction indicator was scored and summed for drawings 1 through 4 for that indicator. Therefore, scores for each indicator ranged from 0 to 4. Because of their restricted range, the summed scores for cases who relapsed were compared to those who abstained using the Chi-Square statistic. Results of the Chi-Square analyses for each indicator are reported at the .10 and .05 level of probability. All data were analyzed and reported separately for Rater 1 and Rater 2.

Results

Table 2 reports the comparison of subjects who relapsed and who abstained after 3 months for each of the 11 items. Values in this table represent the proportion of subjects who received a positive score on any of the four drawings. For both Rater 1 and Rater 2, subjects who relapsed were scored as having a greater proportion of positive items on all four drawings with one exception (Item 7, Progression to Left). Chi-Square analyses of the proportion of cumulative items indicated suggestive (p < .10) and significant (p < .05) results for both raters on Item 2 (Presence), Item 5 (Lack of Self), and Item 10 (Abstract). The interrater reliability (.90) average was 96.4%. Table 3: Forty-five percent of the sample (23/50) relapsed 3 months after treatment.

Discussion

Statistical outcomes bore out the hypothesis because three of the items (2, 5, and 10) appeared to be indicators of future relapse. Nevertheless, each of the 11 items offers the following interesting data.

Item 1: Stereotypical Drawing—Figure 1: This item was included in the study because it was theorized that nonideational, highly idiosyncratic, highly idealized drawing responses such as rainbows, hearts, and flowers, and smiling/frowning faces represented either a lack of personal investment in or a resistance to the recovery process. This was a difficult item to document, and it did not prove to be statistically significant. The raters had problems identifying and agreeing on this item, as the stereotypic concept appears to be a highly individualized one. The rating manual definition and examples were unable to clarify this and it was

decided to review each of the drawings where there was a question regarding stereotype. This review accounts for the 100% IRR score on this item.

Item 2: Presence of Psychoactive Substances or Paraphernalia of Use (Figure 2). This item appeared to be most significantly related to relapse with a probability rate less than .05. Subjects who relapsed within 3 months drew substances almost twice as often as those who did not. As Table 2 indicates, 53% of relapsing patients included some substances in their work, compared with 48% of recovering patients. It appears that patients fixated on alcohol and chemicals drew them more often and were more likely to relapse than those who did not include them in the four assigned drawing tasks. This item, therefore, may provide a valuable visual cue in the assessment of patient treatment. Counselors and art therapists who recognize this chemical presence in the artwork as a red flag indicating relapse might factor this into their patient evaluation and treatment planning, using the drawings in discussions with patients.

Item 3: Placement of Substances Near a Human (Figure 3) and Item 4: Enlarged Scale of Psychoactive Substances (Figure 4). The data for Item 3 and Item 4 reflect a wide numerical range between recoverers and those who relapsed, with the higher score belonging to those who relapsed (Table 2). Item 4 had an average range of approximately 25 points between those who relapsed and those who did not, a good indication that when a substance is drawn proportionally
large—that is, large in proportion to the rest of the items in the drawing or to the paper itself, the patient is at risk for relapse.

**Item 5: Lack of Inclusion of a Human Figure Representing or Identifying the Patient** (Figure 5) or **Lack of Any Articulated Figure** (Figure 6). This item received a statistically significant rater $p$ score of approximately .05 for one rater and a near significant $p$ score of .10 for the other rater. Table 2 documents the importance of this item, with the highest percentage of relapsing patients, 100% in the case of one rater, drawing pictures devoid of human figures. Although abstainers also scored high on this item, relapsing patients all scored higher. The importance of the human figure has been well documented in the field of art therapy and psychology (Machover, 1949; Hammer, 1955). Conversely, the lack of the human figure or an unarticulated stick figure may make a statement also. It might reflect denial, which is an important stage of recovery, or a lack of personal commitment to or investment in the recovery process. This absence of a human figure or lack of detail on a figure might also reflect a resistance to participation in the art therapy process, which often translates into a resistance to treatment itself. This item was difficult to rate and, after much discussion, the definition was refined to say that any detail on the figure—more than a dot for the eyes, nose, and mouth—was counted as an articulated or detailed figure, e.g., hair, a hand, or foot, etc.

**Item 6: Steps** (Figure 7). Recovery usually includes a 12-step program. Item 6 was an attempt to identify stairs with steps from that program and to look for stairs that did not appear to be integrated into the drawing (accessible or nonfunctional) as predictors of relapse. Individuals who relapsed often drew stairs that appeared to be floating or were too large/unreachable for a figure to climb.

**Item 7: Spatial Progression Towards the Left** (Figure 8). This item was an attempt to apply the theory that the left side of the page represents an individual's past (Ogden, 1977). Therefore, a progression in this direction might indicate a behavioral return to past use, that is, relapse. However, the data on both Items 6 and 7 were unable to sustain this hypothesis, and for these two items, patients who relapsed did not score higher than nonrelapsing patients (Table 2).

**Item 8: Dichotomous Thinking** (Figure 9). Initially, this dichotomous drawing appeared to reflect statistical significance between relapsing cases and nonrelapsing cases, with a $p$ of .02 based on an initial $N$ of 38. Dichotomized, “black and white” thinking is often found in addicted individuals, who may have an inability to see the middle range of “grays.” This would translate into a behavioral inability to moderate chemical use. When the $N$ was expanded to 50, however, the $p$ value changed to .35. Nevertheless, those who relapsed scored higher on this item, with a point difference of 15 from those who did not relapse (Table 2). This item was also difficult for the raters to score.
requiring frequent review, and this accounts for the higher IRR (Table 3).

**Item 9: Presence of Water** (Figure 10). This item did not prove to be statistically significant in this study, appearing only 20 times (10% ) and equally divided between relapses and abstainers. This does not appear to support the findings of Devine (1970) in her investigation of the paintings of alcoholic men where 27% included water in their paintings. In this study both drug users and women were included. This composition of the study sample, along with the directed nature of the task and the use of dry media rather than paint, may have contributed to the results. Flowing paint itself may be more conducive to images of water. In her study, Devine also found boats were “the most popular theme of all.” However, in this group of 200 assigned drawings, only one boat was drawn. Albert-Palco (1976) found water to be a prevalent theme: “Water is commonly regarded as a sym-
hol of regression. Alcoholism is traditionally seen as a similar regression, the need to dissolve one’s consciousness in the comfort of liquid escape. Perhaps the directed nature of drawing tasks such as those in this study may have influenced the choice of symbols.

**Item 10: Abstract or Geometric Style**. Figure 11. This item using an abstract or geometric style over at least 66% of the picture approached statistical significance for Rater 1 and was statistically significant for Rater 2 with a p value just at the .05 mark. These drawings appeared to be exactly what their name implies, that is, abstractions. When patients elect an abstract drawing style, they may be avoiding the difficult realities of treatment, preferring the amorphous lack of realistic detail found in abstract designs. This also may indicate that they are unable or unused to dealing with boundaries or to making clear statements and or are afraid to take the risk of exposing themselves on paper. The use of abstraction may be a visual expression of the paranoia often associated with chemical dependency. “Will this be used against me?” Until a patient is able to get beyond this fear of honest expression, either on paper or verbally, relapse is likely.

**Item 11: Despair or Helplessness**. Figure 12. This item was found by one rater more often in the drawings of relapsed patients (Table 2). This rater scored those who relapsed 15% more likely to draw despair than those who did not relapse. Conversely, the second rater found a higher percentage of abstainers for this item. Where despair was depicted with dark colors, clouds, or rain, but some help was present as a potential end to the despair, the drawing was not rated as positive for despair.

**Conclusions**

Art therapy has been used in the treatment of chemical dependency for over 25 years. Its application varies according to the philosophy and staff of the specific treatment program. Emphasis on visual expression, whether for insight, assessment, or evaluation, utilizes the special qualities art therapy offers a population familiar with verbal therapy and expression.

This retrospective study hypothesized that art therapy might be used as a predictor of future behavior regarding relapse. It consisted of a four-part structured drawing exercise carried out as part of a treatment and evaluation process in an outpatient chemical dependency program at a large county hospital. Eleven specific indicators were selected for analysis from an assigned drawing experience. Statistical outcomes substantiated the hypothesis because three of the 11 items rated appeared to be indicators of future relapse. Those items were the presence of psychoactive substances or paraphernalia in a drawing, the lack of a figure representing the patient or of any articulated or detailed human figure, and a picture drawn entirely or predominantly 66% in an abstract or geometric style. These three items were noted more often in the drawings of patients who relapsed within 3 months after treatment.

A rating manual was developed for this study which is available for use by other investigators. Initial testing indicated the manual was relatively easy to use and assisted in rater objectivity. The hypothesis generated by this retrospective study should be tested prospectively both in the research setting and in other settings. The authors suggest that results should be compared with follow-up data after 1 year. Further analyses of the drawings of patients who dropped out of the program before completing treatment may offer additional data in the prediction of relapse.

In this study, the outcome was defined as a dichotomous, unidimensional indicator; that is, the individual either remained abstinent or relapsed. Clearly this approach misses individuals who may have used chemical substances on only one or two occasions, learned from their relapse, and changed their behavior. In this study, the single outcome indicator was used for practical reasons since the data were already being collected for other purposes. Further studies might allow for such behaviors, as well as look at data 6 months or a year after treatment, to compare the results.

Children of the Stones: Art Therapy Interventions in the West Bank

Julia Gentleman Byers, EdD, ATR, Montreal, Canada

Abstract

This article reports on art therapy interventions with children, families, and mental health workers, who were experiencing Post Traumatic Stress Disorder syndrome as a result of the military conflicts in the West Bank and Gaza. Through references to mental health literature regarding art therapy with individuals in war zones, the psychological effects of war and violence on children and their families are identified. The author describes art therapy in six mental health clinics. The artwork from participants in group workshops helped to open lines of communication among people enduring attempts at reconstruction and rehabilitation of their society. The article ends by describing follow-up plans to promote empathic dialogue among mental health workers in the different cultures.

Introduction

In March 1995 I was invited to participate in the Partnership for Children project which was funded by the Children's Bureau of the Ministry of Health of Canada. Dr. Farid Olan, Associate Principal of Seneca-at-York College and Associate President of the Near East Cultural and Educational Foundation of Canada (NECEF), and Dr. Jim Graft, philosophy professor at the University of Toronto and President of NECEF, provided this opportunity to facilitate art therapy training and interventions in the West Bank and Gaza. This unique project allowed a Canadian mental health team to interact with children, families, and mental health workers experiencing post traumatic stress disorders.

The NECEF's aim was to introduce a new approach for reconstruction and rehabilitation in war-ravaged societies by addressing the psychological and emotional trauma of children and their families affected by the combat. Before the Intifada conflict and violence, there were no community mental health services available in the area. During the past 7 years, mental health clinics and special services have been established, partly by international relief organizations, in the occupied territories.

Review of the Literature

The psychoanalytic exploration of children in traumatic situations such as war and separation began with the pioneering work of Anna Freud during World War II (1973) and Bowlby (1951). As identified by Apfel and Simon (1993), "The value of psychoanalytic/psychodynamic perspectives in research on children in war necessitates a design of research protocols which includes questionnaires, semistructured interviews, open-ended interviews, or expressive therapies, such as drawing and drama" (p. 176).
equipped or temporarily deny the importance of validating the children’s struggles because their own hardships are too extreme.

Cicchetti and Izley (1981) find that these human factors can be either transient or enduring. Vulnerability, challenges, and protective issues recur in multiple dimensions of family life and need constant monitoring. Because art materials are non-threatening families can be encouraged to express their dilemmas for the sake of the children’s welfare. Ellingon (1991) notes that many clients treated with conventional therapies are likely to suffer from existential conditions rooted in life experiences, rather than from psychological conditions. So that children do not become developmentally delayed, preventive, secondary, or tertiary symptoms need to be treated as soon as possible. The art process fosters the experience of struggling to establish equilibrium between polarities of emotions. People gain a sense of freedom in their choice to express colors and art media. As Ellingon (1991) emphasizes, “Choice is the key word—choosing is freedom in action” (p. 7).

Whether the individual is a child, an adolescent, a parent, or an adult mental health worker suffering from burnout, expressing the existential dilemma of war or violence can be extremely empowering when life events leave the impoverished community feeling helpless. The anxiety of nihilism is redirected by developing self-identity, concern for one’s fellow beings, and national pride, while respecting other cultures. Art as communication, therapy, or psychotherapy offers a recontextualized role of validating traumatized people’s experiences in a meaningful and healing way.

Emotional Effects

The children referred to in the title of this article represent those who have experienced the multidimensional aspects of surviving war and living in an occupied territory. Although adults use guns and other sophisticated weaponry to fight the ongoing religious and political conflicts in the Near East, it has been observed and documented that children have expressed their frustration and discontent by throwing stones. In ancient times, wars were fought with stones and clubs; this archaic return may represent the “sameness” of historic years of conflict and primitive emotional responses. In attempting to master and control their hostile environment, the children’s actions have received reinforcement from their peers and indirectly from family members.

Even though the trauma of an active war has passed since the Intifada and the Gulf War, the Palestinian and Israeli people live in an environment of constant potential danger. For example, on July 3, 1995, while I was working in the West Bank, activists in the street of Ramallah demonstrated their rage at the Israeli authorities who had kept their friends and family members imprisoned for lengthy periods of time because of alleged war-related crimes.

People on the West Bank and Gaza are enduring another aspect of the recreation and reconstruction of their war-ravaged society—not only the traumas of death, torture, and physical and mental damage that is apparent in the faces seen in mental health clinics, but also the “sleepers” or dormant effects similar to those of children of divorced parents (Wallenstein & Blakesley, 1989). Symptoms such as night terrors, withdrawal, or acting-out behavior appear 5, 10, or more years after the trauma are actually experienced. Secondary symptoms, seemingly not related to the initial trauma, such as domestic violence, learning disabilities, and psychologically delayed child development, begin to surface during this same time frame. Children with adolescent siblings witness unrest in their families. Children born subsequent to the Intifada years experience the loss of significant family members through death and imprisonment. As Garbarino and Kostelnly (1993) note:

Danger is a judgment about the social meaning of risk and an authorization for effective and moral response. Subjective danger is the phenomenological construction of liability to injury or evil consequences while objective danger is an empirical determination regarding the probability of liability being translated into injury. (p. 29)

As previously documented, during the Intifada, Palestinian children developed a “bravery” when combating Israeli soldiers and showed a reckless disregard for their own safety. During the author’s brief encounter with the people of the West Bank and Gaza, the confusion regarding objective and subjective dangers people experienced was noted. The people felt safe when they should have been afraid, or felt endangered when in fact there was negligible risk. Of particular developmental interest is whether or not the expression of danger results in psychological disruption.

Between acute and chronic danger, one might classify the atmosphere in the clinics as one of ongoing traumatic stress. The mental health workers are in a constant state of insecurity, with frequent threats of being laid off and having extremely low remuneration for their services. The curfew restrictions, check points, and armed border crossings are constant reminders to everyone of the highly volatile environment. Taxis and private cars are licensed in orange, blue, or green representing the degree of restriction of passage between the demographic areas of the clinics.

The multilevel effects of chronic danger are felt by everyone in the West Bank. As articulated by Dr. N. Hashoun of the Child and Family Clinic in Bethlehem, everyone has been affected by Post Traumatic Stress Disorder relative to his or her direct and indirect experience (personal communication, 1995). Palestinian children are at risk of emotional withdrawal that may be socially adaptive in the short term but a source of danger to the next generation (Losel & Bliesener, 1990). When political ideology reflects communal violent conflict, the ability for empathy is decreased, which can lead to identification with the aggressor. As Erickson (1976), p. 238—describes: “The major problem for adults and children alike is that the fears haunting them are prompted not only by the memory of past terrors but by a wholly realistic assessment of present dangers.” Studies show that after World War II, the level of emotional upset displayed by the adults in a child’s life, not the war situation itself, was the most important factor in predicting the child’s prognosis.

Studies of Palestinian children after the start of the Intifada reported an increase in children’s complaints of sleep disturbance and depression (Baker, 1990; Dr. Shafiq Masdala, 1989). Acting Director of the Palestinian Counseling Center documented the reactions of Palestinian children to the Gulf War. He observed a variety of manifestations of the children’s anxieties, including the fear of sirens with panic attacks when the sirens were on, emesis, especially when the sirens were on; fear of
wearing gas masks: rumors of mass graves prepared by the Israelis for the Palestinians; and rumors of mass expulsion of the Palestinians by the Israelis. He also noted correlated concerns of the Palestinian men bothered by feelings of helplessness, being unable to protect the children. Through researching the dreams of these children, Masalha concluded that sociopolitical conditions which existed prior to the outbreak of the war increased the children's anxiety. The children became passive after having been active participants in the struggles for the 3 years prior to the war. Since little or no mental health services were available at the time of the Intifada, the population was not equipped to deal with the psychological traumas associated with tortures, deaths, and the loss of basic needs.

Mental health workers in this area needed to learn to be cognizant of monitoring their own emotional states in response to Post Traumatic Stress Disorder and the psychological effects of danger. Their current caseloads represent a diversity of symptomatic complaints that reflect the "sleepers" effects of children's traumas. As Johnson (1987) observed, diagnosis of post traumatic stress responses from childhood physical war trauma has been problematic due to the profound denial and dissociation at the time of the trauma. Fortunately, or unfortunately, in times of occupations the degree to which adults acknowledge and handle the stresses tends to impact the long-term ability of children to integrate the experience constructively.

The following observations from the different clinics are presented as examples of brief art therapy interventions with follow-up recommendations.

The Near East Cultural and Educational Foundation (NECEF)

As identified in the NECEF project's funding proposal, reconstruction and rehabilitation demand a multifaceted, multilayered mental health program. The project emphasizes establishing empathic bridges among children of different backgrounds "so that they may come to see that, despite variations in living conditions, children everywhere have common fears, hopes and aspirations."

The project proposed that paraprofessionals, i.e., art therapists, give seminars to mental health professionals in the West Bank and Gaza on techniques and issues in counseling. The content was to focus on the relevant needs of children who had been traumatized by violence and the effects of violence on their families, inter-personal relationships, and social/community structures. As an art therapist, I was also expected to consult with teachers and community workers involved with groups of children participating in an Art Exchange/Kids-to-Kids Program. This subsidiary program provided an opportunity for Palestinian and Canadian children to express and exchange their concepts of "self" and "community." Canadian children were chosen from a variety of backgrounds, including children from two native communities in the Northwest Territories, two schools in British Columbia, and schools in Edmonton, Windsor, Hamilton, and Toronto with an Arabic-language program. Rima Said, an Arabic-speaking art therapist, and others helped establish the pairing of Canadian children with peers in the West Bank and Gaza.

Between June 21st and July 8th, 1985, I conducted art therapy training and crisis intervention sessions at six clinics in the West Bank and Gaza: the Palestinian Counseling Center in Ramallah, the Gaza Community Mental Health Program, the Khan Younis Clinic in Gaza, the Child and Family Clinic in Bethlehem, the Medecins sans Frontieres' Child and Family Clinic in Jenin, and the Child and Family Guidance Training for Mental Health Clinic in Bethlehem. In this article my work at four of the six clinics is described.

Initially, I facilitated a 4-day workshop at the Palestinian Counseling Center on using art therapy to treat people experiencing post traumatic stress disorders. In Gaza I worked with Dr. Sameh Hassan, a child and family psychiatrist, facilitating team-work through art therapy in organizations in the Gaza Community Mental Health Program. In Jenin, through the Medecins sans Frontieres Association, I was asked to emphasize art therapy with adolescent populations. In Bethlehem, at the Child and Family Guidance Training Clinic, I focused on direct interventions with 50 children, ages 4 to 15, whose symptoms included: autism, elective mutism, hyperactivity, withdrawal behavior, and overt post traumatic stress disorder symptoms. Together with the clinical psychologist, the director of the clinic (a psychiatrist), the social worker, and special education therapist, I provided the children with therapeutic art materials, a new experience for many.

Ramallah

Understandably, mental health workers in the West Bank and Gaza were displaying symptoms of professional burn-out and stress. Due to travel restrictions, consultations between professionals were rare. Many clinicians felt isolated and relied on international training groups to provide ongoing supervision and training. Many of the workers had families struggling to survive with the uncertainty of employment.

The initial goal of the art therapy workshop at the Palestinian Counseling Center was to provide the workers with an increased awareness of the process of utilizing art materials. By becoming sensitive to their own symbolic use of art materials and decoding approaches, participants were able to observe each others' perspectives. Through processing their own individual responses to the art workshop experience, they could readily apply theoretical and practical concepts of therapeutic intuition with the children in their caseloads. Many psychologists who had problematic case issues of resistance or hopelessness were interested in better understanding and interpreting the art productions. They also needed validation for the extremely demanding role of being a parental figure in the therapeutic communities as well as in the larger community struggling to rebuild.

The workshop began with the aid of translators although many spoke English by encouraging the participants to introduce themselves by making spontaneous symbols that represented either parts of their experiences or personalitie. The initial directive was to address the issue of identity in the self and others. Since participants came from five different agencies, the importance of establishing meaningful contact with each other was facilitated.

One psychologist depicted his identity by drawing the Palestinian flag. Beneath the flag, he placed the name of the clinic that employed him and talked about the tensions he felt at the
clinic. On the side he drew his family, with a border around them and two trees, a pointed-tipped tree in the center and a quickly drawn red tree below. He reflected that the poverty of his human figures revealed his recent struggles trying to obtain advanced degrees while caring for his young children. He drew a sun above, which expressed his hope for a better future.

During the afternoon session, I encouraged participants to build empathic responses to each other through imagery. First, I asked all participants to paint spontaneously. After completing their free pictures, they exchanged their images and I instructed them to share with each other nonverbally. Then, I asked them to make another painting representing what they thought the original picture needed or was missing. Next, these two images were discussed.

One participant added a frame around the painting because the image looked as if it needed containment. The river spilling over and the turbulent atmosphere of the landscape seemed to need a protective boundary. This participant was able to recognize that what she gave the other person was indeed what she herself needed to structure her own overwhelming environment. She also depicted her clients as birds, a symbol of freedom. Through this experience she was able to express her crisis, receive support, and develop coping skills.

Another group member chose to partially frame the other’s abstract forms, not to impose another structure but to work with the flexibility of the lines. Symbolically, this person also acknowledged a desire not to invade others. Although a critic had added a background or frame to the picture, she was the easiest solution in empathically complementing an image. It was striking how these two participants used the notions of borders in a symbolic and productive way.

On the second day I introduced plasticine, with its elastic and dimensional qualities, as a communication tool. Through processing the joint productions, discussions focused on reviewing the timing and pacing of the therapeutic process, decoding the metaphors, and recognizing the multiple levels of interpretation. Participants in one of the small groups were able to work through a very conflictual misunderstanding with their art. One mental health worker had created a physically disabled child in green plasticine sitting in a white wheelchair. She felt frustrated and angry about her client’s disability, which was caused by the war. It was hard for her to separate her feelings about her client from her feelings about the civil unrest. The other participant thought the plasticine figure was lonely, so she provided a large companion. In response, the first mental health worker felt misunderstood. She felt intimidated by the size and shape of the “helper.” The interaction allowed the participants to acknowledge how easy it is to assume each other’s needs in the service of goodwill.

At the end of the day, participants requested consultation on specific cases. I chose to supervise these through role-playing actual therapist/client sessions which included countertransference responses. A special education counselor requested role-playing a situation in which an early adolescent child was resistant to therapy. The presenting problem included an overprotective mother who complained that her daughter was too shy. This revealed a common Palestinian theme in the undifferentiated mother/daughter relationship. The therapist role-played the client who was desperately attempting to define her own space in the separation/individuation process. What became evident to the observing participants was the need to constantly lead the client. All reflected on their own tendencies to want to control the session in the countertransference response of similarly protecting the child from the unpredictably dangerous environment in which they live.

On the third day, I focused on crisis intervention tools for the therapists. Through the spontaneous use of multimedia and found objects, participants explored the use of directive and nondirective activities to evoke the projected client’s associations and expressions. Wire was repeatedly chosen for images which drew associations to the barbed wire fences that surrounded many of the refugee camps, prisons, and checkpoint borders between Israel and Palestinian territory. Participants explored the versatility of the medium by building lines of communication. Feelings of pain, frustration, and hope were expressed.

A group mural brought closure to the workshop. What was remarkable in the collective image was that one of the quieter participants showed leadership in choosing the underlying structural form for the picture. The notion of understanding group dynamic processes was still a new concept for these workers. In a fleshlike tone, this new leader drew a painted hill-like base on which others spontaneously elaborated. This gesture tended to divide the picture. Some people coped by defining their contributed space in a hidden way, or in a gesture to combine common elements as one image. The group observed the two competing suns that were drawn in the top corners. They concluded that the different textures of the painted suns expressed the paradoxes of danger and warmth they felt in relation to local authority figures. They identified different chaotically drawn parts of the image as corresponding to different defenses used to cope with their clients.

BETHLEHEM

Many children in Bethlehem could not go to school for years due to the occupation. In 1995 Dr. Hashem, a psychologist at the Bethlehem Clinic, observed that of the 500 children experiencing Post Traumatic Stress Disorder, many lacked any therapeutic or positive, community opportunities over the summer months. No movies, theaters, or parks were available to the children. For children in abusive homes, or homes broken by the loss of family members, providing a summer camp served as an “illusion” of normalcy.

Although the director expected 15 children to come to the clinic for the summer camp, 30 arrived, ranging in age from 4 to 15. The children were divided into two groups, 5 years old and younger, and older than 8 years. The clinic’s facilities were very small, so we spontaneously converted individual interview rooms into activity rooms. Since art materials were very new to thechildren (some had never held a paintbrush or had the opportunity to create in plasticine), they were eager to use the supplies. Surprisingly, there was very little acting-out behavior. The children appeared eager and focused on the new experience.

The younger children were very reluctant to be spontaneous with the range of supplies they were offered. The older children were quicker to use the materials and share their ideas. By placing four mural papers on the wall, the children from both groups were given about 15 minutes to illustrate what was important to them in the collective image. A 14-year-old began by painting his
fantasy of being on a boat, even though there are no lakes in Jerusalem and the nearest water area is either the Dead Sea or the Mediterranean Sea. Another child drew a line creating a space between the water and the land. On the land, there were many sparse trees and many suns. The children’s depiction of birds as symbols of freedom was most prominent. The chaotic nature of the birds in flight seemed to represent the symbolic constriction of not being able to fly away because others were in the way.

Post Traumatic Stress Disorder in children frequently manifests itself as hyperalertness, constricted affect, and sleep disturbances. The “sleepers”’ onset seems to develop when news of a recent uprising occurs in local areas. As previously stated, it is how the adults respond to the events or carry on with daily activities that determines adaptive or maladaptive responses in children. Again, through depicting fences, borders, and barriers, these children express a need for safety as containment rather than confinement.

Jenin

 Médecins sans Frontières (MSF), a French team of doctors and paraprofessionals, was sent to Jenin to assist in creating a mental health clinic. Their purpose was to assist, supervise, and train local health workers to develop an ongoing clinic to meet the needs of the population of Jenin. The most recent influx to the clinic were children entering the turbulent phase of adolescence. With no community services (sports, arts, or music facilities), the team worried how the adolescents would make use of their free time. The propensity for males to identify with the aggressor and utilize violence was becoming an increasing social problem, especially for adolescents from dysfunctional family systems. Night curfews were still frequent when outbursts arose. The team created a “greenhouse” space within the clinic as a place where adolescents would feel safe and free from the unstable environment. The team actively sought multimedia suggestions on how to “transform” the space. Bolstered by adolescent psychological theories, they looked for the opportunity to exchange creative therapeutic strategies in dealing with the onslaught of the impending social crisis.

With an emphasis on adolescent group art therapy, I facilitated a 1-day workshop with the psychiatrist, two social workers, a special education counselor, a psychologist, a psychologist, a translator, and the driver of the team’s car. Themes focused on the recollections of the trials and tribulations of their own adolescence and how these related to their clients’ issues and concerns. Several creative artworks were shared in promoting awareness of the therapeutic strengths with the complementary team approach. Participants were able to acknowledge an awareness of their own experiences with adolescents and how they were countertransferentially responding to their clients.

Bethlehem Child and Family Guidance Training Clinic

Dr. Y. Hasboun, director of the Bethlehem Clinic, had recently begun a 6-month training program for mental health workers. Since art therapy was a new modality, she requested a seminar on the application of art therapy with family therapy. Following a seminar on general systems theory by Dr. S. Hassan, I facilitated a hands-on experience of family dynamics. As in systems theory, the basic assumption is that the “identified patient” is part of a larger biological system that interacts with the whole. A ball of string was passed to different participants so that eventually all were linked together like lines of communications within a family. By pulling tight, releasing tension, and letting go, participants experienced a hands-on experience illustrating that families are always in the process of change.

The group was then divided into two families, with four observers and one therapist, to role-play imagined family dynamics through art therapy. As developed by Landgarten (1980), the directive was to draw two murals. The first drawing was nonverbal, followed by another with verbal interaction. The families were instructed to title the artwork. One mural depicted issues of estrangement that surfaced during the discussion of the family dynamics. This drawing revealed the dominance of the father figure in the family, who had been imprisoned for 7 years for war-related activities. His face was maimed from the torture he endured in prison. To reintegrate into the family, he attempted to control his family members by defining the theme of the picture. The quiet son drew red people in prison next to the hot sun. The mother also used red, creating a fence and attempting to add some flowers to an imagined house. The daughter drew the gray areas of the home, soldiers fighting, and prison bars within the prison in attempts to support her father’s cause.

The father completed the picture by adding the gun which was supposed to break the hand-cuffs of the Israeli soldiers. He then took the red pen and wrote the title: “The Palestinian Present Situation.” The daughter took on the role of attempting to show the father how he was overbearing and hurting the family members. The mother aligned with her quiet son, almost afraid to risk confrontation with her emotionally labile husband. As observed in similar family dynamics, when a discordant marital relationship exists, parents develop a fusion with a child for needed support and comfort. Although this pseudo-family, presents an organized system through the orderliness of the image, the content reveals barriers to communication. Continued discussions focused on strategic interventions to help the family members realign and reintegrate into an effective family system.

Summary

Dr. Eyad El Sarraj, psychiatrist and director of the Gaza Community Mental Health Program, argues that children of the stones are not made of stone, and psychological problems are born from a seemingly hopeless situation (personal communication, 1995). In 1993, a survey of 2,779 children found that 92.5% were exposed to tear gas, 42% were beaten, 55% witnessed beatings, 4.5% had broken bones, 56% were exposed to night raids, and 19% were detained for short periods of time. Through international aid and intervention, the statistics of traumatized children are decreasing, although the “sleepers”’ effect of the traumatic events and the multiple stresses on the families is being identified in increasing numbers.

To continue to support the efforts of the mental health workers and to encourage empathic bridges between international children, the Kids-to-Kids Program is currently being brought together in a book and exhibition. A further development is the inclusion of an interactive CD-ROM produced by
Lila Pine, an independent artist. Drawings from native and immigrant Canadians will be available for bicultural exchange through a WEB site. The children, utilizing the new technology, will be able to interact by reaching to each other's symbolic messages and empathizing with each other's life situations. As a source of empowerment for the children, their families, and the mental health teams, this interactive technology promotes the therapeutic use of moral, cultural, and family development. The emphasis of the CD-ROM is to develop a greater understanding of global peace through acknowledging, validating, and celebrating cultural differences while emphasizing the similarities within all humanity.

I returned to the West Bank and Gaza in June 1996. Currently negotiations are being planned to facilitate exchanges between Israeli and Palestinian mental health workers to develop additional treatment strategies. Israeli and Palestinian children need assistance to make sense of the violence they have experienced. All children fear separation, loss, death, pain, and abandonment. Supportive significant relationships, open communication, and a sense of hope and confidence are human rights for all people. It is the global efforts of many which will offer hope for the next generation. As Wadeson (1990) stated, “Life, Meaning, Creativity, Art. In the largest sense, they are all one” (p. 3).

Editor’s Note: The author would like to take this opportunity to acknowledge Bita Ault, ATR, HLM for his encouragement and assistance in editing this article. Much appreciation is given to Huma Sakhi and who voluntarily and spontaneously served as translator for the NECEF team for some of the art therapy workshops. The opportunity to work with Dr. Graff and Dr. Hassan on the NECEF team was invaluable. The human encounter and privilege of meeting all participants and colleagues on the trip will long be remembered.

Abstract

The structure of art as a symbolic system is composed of three dimensions: observer, process and product. In this paper, each dimension is described, discussed and its application to art therapy illustrated through presentation of a case study of a 12-year-old boy suffering from a progressive neurological disorder. It is argued that the structural aspects of art are integral to art therapy and facilitate the discussion and understanding of the function and method of art therapy.

Introduction

"Every art form involves communication on the part of one person or subject to another by means of a symbolic object that the first subject has created, and that the second is able in some way to understand, react to, or appreciate" (Gardner, 1973, p. 30). This article is concerned with the structural and functional aspects of art as a symbolic system. It is argued that these structural aspects of art are integral to art therapy and facilitate the discussion and understanding of the principles involved in art therapy.

To understand how art functions, it is necessary to distinguish among the three dimensions that are inherent to its structure: the observer who perceives the artwork, the process by which the artwork comes into existence, and the product which is the work of art itself (Weber, 1958). This conceptual framework establishes an external reference for what is involved in viewing, understanding, and responding to art in general and to clients' artwork in particular. These concepts also facilitate the discussion and understanding of the functions and methods of art therapy.

A brief description of process, product, and observer follows in order to provide a theoretical framework for the discussion of these dimensions in art therapy. A case study of a 12-year-old boy with tubular sclerosis, a progressive neurological disorder, is used to present these theoretical dimensions in the clinical practice of art therapy.

The Observer—It's All in the Eye of the Beholder

An artwork, functioning as a symbol designed to communicate, can only fulfill its function when viewed and experienced by another person. The observer's response is a result of what is experienced while viewing the drawing (Dewey, 1934). "It's all in the eye of the beholder" means that different people have different experiences and responses to what they see when they view and experience works of art. Through past experience, accumulated knowledge, expectation based on context cues, current state of mind, and projection, the observer supplements the sensory information received in looking at works of art (Arneheim, 1974; Dewey, 1934; Gombrich, 1960; Winner, 1982).

"Not only how but what it (the eye) sees is regulated by need and prejudice" (Goodman, 1968, p. 7). Just as the art object is created by a unique individual at a particular point in time from a background of experiences that define who that person is (Shahn, 1957), so too the viewer of the object is a unique individual at a specific time with a personal background that comes to bear on the experience of the moment (Dewey, 1934). According to Gombrich (1960), the more abstract the picture, the richer the inference the observer must make in order to complete the viewing process.

When art is produced in a therapeutic situation, the therapist responds as both a facilitator of the artwork as well as an observer as described above. However, the response to the product must be therapeutically motivated, involving awareness of one's reaction to what one sees and perceives, and using that self-awareness to relate to the needs of the client and the work at hand. The response fosters the therapeutic relationship and forms the basis on which the therapeutic interaction is built.

The Process—Actions Speak Louder Than Words

Artwork is motivated and determined by certain forces in the artist as well as by external stimuli that affect his/her world view (Kivnick & Erikson, 1993; Weber, 1958). The artistic process requires simultaneous physical, emotional, and intellectual involvement in order to balance the internal and external forces that impinge on the artist. In choosing to draw and constrained by the medium, the artist embarks on a process, on a course of action over time to achieve a self-determined goal.

When we speak of process in art therapy we speak of the client's activity, the involvement in a creative pursuit. The therapist's perception and response to the client's activity as well as the response to the final product of this activity as described above is also an aspect of this process. Process also refers to the interaction between the client and therapist as they perform their respective roles in the relationship, often referred to as the therapeutic process.

In outlining his notion of the psychology of creation, Weber (1958) relies on introspective and unconscious processes suggested in psychoanalytic accounts of the creative process. With regard to professional and successful artists, Weber (1958) writes that to create is to approximate a memory or situation from childhood that is usually forgotten. A childhood situation or event manifests itself, in general, unconsciously in a work or group of works of art as a "theme."
Weber (1958) distinguishes between two types of themes, which he calls personal and transpersonal. Personal themes are derived from the artist's individual experience based on the earliest discovery of the world. Transpersonal themes relate to the common aspects of experience, which relate to many people.

In art therapy the client is encouraged to create personal themes that are formulated out of the client's own, individual, unique experience in order to give that experience a concrete form. In making it concrete, the experience becomes accessible to both client and therapist. These personal themes have significance only to oneself unlike, using Weber's terminology, great art, which features transpersonal themes that have meaning to many people. The opportunity for clients to create personal themes in art therapy allows them to organize their own unique experience and awareness through art, just as transpersonal themes in the most powerful of symbolic objects serve to organize cultures.

Process also relates to the therapist's observing the individual in action as opposed to relying solely on verbal descriptions regarding the client's behavior, psychodynamics, strengths, and weaknesses. How does the client deal with success, failure, solving problems encountered along the process of creation, and finding problems to solve which engage one in the creative process? In opposition to the psychoanalytic perspective, some writers view the creative process as the urge to solve problems (Arnheim, 1962; Dewey, 1934) while others view it as the urge to find problems (Getzels & Csikszentmihalyi, 1976).

Arnheim (1962) writes that visual thinking—a conscious, rational, intellectual process—is central to the artist's way of working where constant decisions have to be made as problems arise in the creation of a work of art. The creative process, he writes, is a series of deliberate, conscious, logical choices made on the basis of the need to communicate a particular meaning and organizing its presentation through a specific medium requiring formal considerations. Getzels and Csikszentmihalyi (1976) agree that artists continually confront problems which must be solved in order for their work to progress. They extend this argument by proposing that creativity involves not only the ability to solve problems but also the motivation to discover challenging problems.

Csikszentmihalyi (1993) outlines how the evolutionary process has built a preference for complexity into the human nervous system. He writes that just as we experience pleasure when we do things that are necessary for survival, like eating and procreating, we also experience enjoyment when we are occupied in projects that stretch our skills and allow us to recognize and master new challenges. The feelings that are generated from the experience of mastering difficult challenges, that require using one's personal skills to their limits are called flow (Csikszentmihalyi, 1993). Some of the characteristics of flow are concentration, absorption, deep involvement, joy, and a sense of accomplishment.

Flow is an experience that can occur only when one is actively involved in doing something. Csikszentmihalyi (1993) mentions that activities like mountain climbing, writing poetry, painting a picture, even developing and implementing a program to feed and educate poor children can cause flow to occur. Neither talking nor thinking about flow can cause its occurrence; the activity is essential, in the pursuit and experience of the process of creativity.

In art therapy an attempt is made to provide the client with flow-like experiences. Flow-like experiences rely on doing, not solely on talking. Experiences are "flow" when they foster well-being, self-expression, self-understanding, and even motivation to find and solve more challenging problems. Art therapy also provides the client with the ability to provide these experiences for himself/herself outside of the therapeutic session (Uman, 1961).

The Product—A Picture Is Worth a Thousand Words

The product exists and stands between the observer and the artist (Gardner, 1973; Langer, 1942; Weber, 1958). Like a novel with its linguistic structure, a drawing through its visual structure contains information and knowledge within itself. Through its physical existence—the product—the art object embodies meaning and knowledge in its own right.

The object's concrete form is determined by the message that the artist is attempting to convey, by the materials the artist chooses to use, and by the artist's skill in making his idea, thought, and/or feeling visible. As the artist Ben Shahn (1957) writes in describing the "biography" of a painting, "It is the wholeness of thinking and feeling within an individual; it is partly his time and place; it is partly his childhood or even his adult fears and pleasures, and it is very greatly his thinking." (p. 51). The recombination and new formulation of these ingredients in the art object embody a separate, independent, and unique existence from the work's production as well as from its producer.

As discussed earlier, the work of art, the symbolic object designed to communicate, functions only when it is seen and responded to by another. The work of art can only convey knowledge, meaning, and understanding when it is perceived. As the adage indicates, it would take a thousand words to describe the totality of: the artist's intention, the meaning embodied in the work of art, the experience generated in viewing the work of art, as well as understanding the meaning of the viewer's experience in consciousness. Yet, still, all these words would not describe the picture adequately. The work of art speaks for and of itself in its own unique way.

Summary

As an observer the therapist perceives the client, the therapeutic process in progress, the client's artwork as well as the client's work of art. The process of art therapy is documented by, and reflected in, the client's art and the transformations of form and content within it, over time, due to the influence of the therapeutic relationship. The product of art therapy, generally considered the client's art, is broadened in this theoretical framework to include the accumulated work from all the sessions, both the works of art and the work of healing that go hand in hand in art therapy.

Observer, process, and product are interconnected and interrelated dimensions of the total art experience. Their conceptual delineation facilitates a discussion of processes and experiences that are continuous. These three integral and integrated aspects of art provide a theoretical framework which leads to greater understanding of art therapy issues and practice. The remainder of this article presents a case study of art thera-
py with a 12-year-old boy suffering from a progressive neurological disorder in order to demonstrate the application of this theoretical framework to clinical work.

Case Study

The Therapist as Observer

Jon suffered from tubular sclerosis, a congenital disease characterized by benign slow-growing tumors of glandular origin which cause lesions in major body organs, such as the heart, kidney, liver, spleen, lungs, and nervous system, resulting in progressive mental retardation and sometimes epilepsy (Adams, 1989). Tubular sclerosis is typified by a slow deterioration of mental functioning causing intellectual deficiency. It may be accompanied by behavioral and affective disorders resulting in what may be loosely classified as a primary type of psychosis (Adams, 1989). Jon had the characteristic reddish butterfly pattern of spots on his cheeks and over the bridge of his nose that is a typical symptom associated with this disease. He did not exhibit any seizure activity, which often accompanies this disorder, and he was not receiving any anticonvulsant medication.

In Grade 1, when the effects of Jon's disease were still minimal, his teacher wrote in a report that he appeared to be a very frightened boy who desperately wanted help. She wrote that he could not read and that he was most apprehensive when he was learning to read. At the age of 7 years and 8 months, he did not know his birthday or his address.

Progressive deterioration from the disease affected Jon's behavior and thinking. Six years later, at the age of 12, Jon repeatedly attacked younger children in the schoolyard. When reprimanded by the principal, he attacked the principal and was transferred from the adapted Educable Mentally Handicapped Program to a special learning class where his behavior could be monitored and controlled.

Jon's parents were angry at his teachers for their lack of understanding while the teachers thought Jon's parents did not properly control his aggressive behavior. In the meantime, Jon continued to be in class, as he had for 6 years, displaying remarkable stamina in facing academic work for which he was progressively more and more uninvited over the 6 years. His IQ had dropped more than 30 points to an approximate IQ of 75 at the time of referral.

Jon presented himself as a wary, defensive, and withdrawn preadolescent. He was sensitive to his environment and responded intuitively and impulsively rather than critically. For example, in response to the principal's attempts to confront and control his wild behavior, Jon lashed out aggressively, punching and kicking as well as cursing and yelling. He seemed insecure and threatened when being criticized or when feeling defensive. During a meeting with his father, teachers, principal, and therapist, Jon could not answer questions asked of him; he looked confused, scared, and belligerent. He could not tolerate all the questions nor reflect on situations that occurred and in which his impulsive and violent actions were inappropriate. At the meeting, Jon responded nonverbally, his face frozen in a scowl as if to "say" the questions were stupid.

Jon used environmental clues to help him orient to his surroundings. When asked what day of the week it was, Jon could give the correct answer by looking at the name listed on the blackboard for lunch duty as a different person was assigned on different days of the week. He fabricated alternative scenarios or denied situations in which he acted impulsively and aggressively. Jon denied breaking things when he became angry, saying he "goes to his room and listens to music."

Jon was aware of his limitations and expended a great deal of energy covering up his inadequacies and trying to seem "normal." He swaggered when he walked, he talked tough and "cool" but could not continue the pretense beyond these superficial mannerisms. In the privacy and security of the art therapy sessions, he was willing to learn the name of his illness as well as to answer whether he felt physically good or bad at that particular time. He stated repeatedly that he did not like the "work" at school and that there was "too much." He said that he enjoyed putting things together with his hands and had successfully held a newspaper route for 2 months with support from his father. Jon's father reported that Jon was able to make and serve breakfast as well as take care of all his physical needs.

Jon was referred for art therapy to assess his psychological condition and to provide him with an educational experience that did not rely exclusively on verbal communication. This assessment would provide input into the development of realistic educational goals and into the determination of effective future treatment.

The role of the art therapist as an observer begins with the description of the client and the formulation of the goals of therapy based on the compiled information. Writing a case study from the art therapist's perspective is in itself the observer's point of view. In the role of observer, the art therapist's response to the client and his art (both the activity and the final product) is based on educated sense perceptions at a particular point in time supplemented by knowledge gained from personal and professional experience.

Process of Therapy as Documented by Jon's Drawings

Jon attended 12, 1-hour art therapy sessions conducted twice weekly for 6 weeks. The sessions were held in the special learning center in an inner-city school. Each picture, each symbolic object made up of combined symbols, represents Jon's ongoing communication with the art therapist. Unable to put his thoughts, feelings, or ideas into words, Jon made use of the time and space provided him to convey meaning through concrete realization. The therapist's availability and response to Jon's changing images formed the dialogue that is embodied in the sequence of pictures.

Jon was silent and apprehensive during the first few sessions. Over time as he became accustomed to the therapist, the format of the sessions, and the expectations of drawing pictures and reflecting on them, he relaxed and worked in a focused and involved manner. Jon completed over 30 pictures, call pencil drawings on white paper, except for one crayon drawing over the course of the therapy.

Jon was always polite, allowing the therapist to enter the room first. He brought chairs to the table in preparation for work. He was compliant and agreeable, working very hard to be liked and accepted. Jon rarely initiated conversation and did not verbally volunteer information about himself. He answered most questions with, "I don't know," "It depends," and "It does not.
matter.” In general, Jon’s affect was reserved and withdrawn, occasionally responding to humor with a sideways smile.

Jon drew in a slow, methodical, and purposeful manner. He presented concrete objects and environments which he differentiated and organized on the page as they came to his mind, one object leading to the next. Jon’s drawings and responses to them were reminiscent of drawings and responses made by children younger than his chronological age.

The major repetitive themes of Jon’s drawings centered around life in the wilderness, wild animals, explosions, the threat of fire, and human figure drawings of a boy in various situations. “The Boy” was drawn in the first session depicting a front view of a smallish male figure listening to his boom box and standing next to a basketball and hoop. The pierced earring with its cross, the three peace signs on the figure’s necklace and pants, the above-mentioned props, and the muscles on the boy’s arms relate an attempt to portray a good image. The startled expression on the figure’s face and the upraised arms create a contrasting mood of surprise and/or fear in the drawing (Figure 1).

Two of the many drawings with the human figure in them find the ‘Boy’ in front of a burning building (Figure 2) and scoring a goal in hockey (Figure 3).

These pictures were given titles by Jon. They are “Put It Out” (Figure 2) and “The Breakaway Boy” (Figure 3). They indi-
cate a progressive change in content from a preoccupation with external danger to positive images of internal control and wishful aspirations of success. These drawings also show a progressive change in form. There is variation in detail, complexity, integration, realism, and involvement in terms of time spent on producing the drawing. Both content and form were determined by how Jon felt, what he was thinking about, as well as what was going on in the session at the time that he drew the picture.

"The Great Adventure" (Figure 4), one of Jon's first expressive pictures (titled by him), depicted a bear hiding in a mountain cave looking scared, "weird," and somewhat ugly. A helicopter with a net and a search light projecting out from the bottom were drawn hovering in the air above and to the left of the mountain.

Jon said that the net under the helicopter was to capture the fierce bear. When asked what was his favorite part of the picture, Jon indicated the mountain climbers, seen as tiny stick figures in the bottom left-hand corner. He said his least favorite part was that the bear might be harmed in the pilot's attempt to save him. In describing the part that he liked best in his pictures, he would often describe the situation being depicted (the representational content) rather than the way it was drawn (stylistic form), as in this case or in Figure 2, in which he said that his favorite part was that "they are putting out the fire."

"The Great Adventure" (Figure 4), "The Runaway Bear" (Figure 5), and "The Hiding Bear" (Figure 6) form a series that show the transformations of the bear image in Jon's drawings. From a primitive shape with four straight lines for legs in "The Great Adventure" (Figure 4), the bear figure becomes differentiated, with paws, claws, teeth, and fur in the "Runaway Bear" (Figure 5).

The bear in "Runaway Bear" (Figure 5) is active. Unlike its depiction in the other two drawings (Figure 4 and Figure 6), here the bear is stealing honey from the house drawn in the upper left-hand corner of the page just under the sun. Finally, "The Hiding Bear" (Figure 6) depicts a cub, looking directly out at the viewer, with a fallen tree behind him. The fallen tree is depicted as two long horizontal lines with short crooked lines radiating off them at a 90 degree angle. These lines come out of the bear's ears and look as if they go through the bear cub's head, rather than behind it.

"The Bomber" (Figure 7) and "The Unstoppable Fire" (Figure 8) depict two of Jon's many openly hostile and aggressive themes. "The Bomber," flying right and staying straight, has two bombs on the wings, a pilot with a machine gun shooting down an enemy plane as well as a gunner under the plane. Another gun is drawn on the side of the plane with "NASA" on the tail and identification marks drawn near the nose at the front of the aircraft.
"The Unstoppable Fire" was a crayon drawing which depicts two mountains, a lake, a sun, a rabbit burrow in the bottom, left-hand corner of the page with two rabbit ears sticking out and arrow-shaped trees dotted on the mountainside and in the valley. The fire surrounds the house drawn near the mountain peak on the right side of the page. Black smoke covers the house, the black chimney, and the top, right-hand corner of the page. There are a great number of details in the image: raindrops, birds and one bat litter the sky above the trees; a river flows in the valley between the two mountains, leading to a lake covering the bottom half of the page; in the lake there is an octopus, a sunken ship, and a clam.

Figure 9, "Owl, Fish, Bear, Zebra, Skunk, Pig, Leopard," and "Leave the Wild Alone!" (Figure 10), produced near the end of the art therapy sessions, indicate the interaction and result of the therapeutic relationship that had been established during the previous sessions. In allowing Jon to freely express himself in his artwork, accepting him unconditionally and nonjudgmentally, supporting and gently guiding his drawing development, a feeling of trust, mutual respect, and collaboration had been developed, mostly nonverbally.

These two pictures represent the struggle and successful structuring of Jon's images to create an integrated, coherent, and meaningful whole. Both Figures 9 and 10 required great effort in terms of motivation, cooperation, and concentration on Jon's part. "Owl, Fish, Bear, Zebra, Skunk, Pig, Leopard" (Figure 9) shows three concentric circles delineating areas for fish in the inner circle, trees in the middle circle, and different animals in the outer circle. Each animal is identified by distinguishing marks and is drawn in a simple, primitive manner that is sensitive, integrated, and delicate.

Jon found the circle too complex a form within which to structure his symbols on the page and took the suggestion that he use the rectangular page boundaries to help him organize and frame his next drawing, "Leave the Wild Alone!" (Figure 10) was drawn in response. It shows seven deliberately delineated rectangular components, representing trees overloaded with acorns on the bottom to his ever-present sun with jagged rays, stereotyped birds, and puffy clouds at the very top of the page. There is a row of tents with a campfire protectively enclosed by rocks above the tree section; drawn in the next row is an underwater scene with a school of fish; then repeated images of an owl and a rabbit occupy center page as representations of wildlife. Next are four snow-covered mountains, each with a little circle on it depicting a cave similar in form to the cave drawn in Figure 4, and at the top a city scene with repeated images of a building similar in form to the burning building depicted in Figure 2), traffic lights, and a car. Jon was pleased and proud of this picture. He gave the title in the form of the imperative, "Leave the Wild Alone!" directing the viewer and conveying a clear meaning, as opposed to describing the content of the picture as he had previously done.

Finally, in comparing Jon's drawings of a house, there is a visible difference between "The New House" (Figure 11, drawn at the first session) and "Jump Up" (Figure 12, drawn at the last session). In "The New House," a bird's-eye view is used to depict different rooms incorporating top and side views for objects in each room. Prominently displayed is a center rug with a boat floating on concentric circles. The sun is placed incongruously at
the bottom, right-hand corner of the page possibly indicating disorientation caused by anxiety felt at the first meeting.

In "Jump Up," his last picture, Jon used a more conventional view of a house with flowers, deck, tire swing, tree, and trampoline in the yard with a small stick figure floating above the trampoline. As he became relaxed during the sessions, he was able to use more space on the page and placed the sun, more appropriately, in the top, left-hand corner of the page. The reworking of the roof area and deteriorating pattern of shingles have been thought to indicate organic disorder (Jolles, 1971) and could, in those terms, indicate Jon's valiant effort to overcome his limitations.

The transformation in the form and content of Jon's artwork during the course of therapy embodies and represents the therapeutic process. Each picture stands between Jon and the art therapist and captures at a particular point in time a communication which prompts a response, resulting in the next picture, another communication from Jon to the therapist and a response, thereby embodying the dialogue, the ongoing interaction between client and therapist. The art activity provided Jon with the opportunity and the tools to organize his thoughts, feelings, and ideas in concrete terms by drawing what he wanted in his own way. Once drawn, the picture could present him with those very thoughts, feelings, and ideas as well as enable him to share them with the therapist and, subsequently, his parents and teachers. Jon's artwork changed from day to day and from picture to picture depending on what was going on around him, how he was feeling physically that day, and what he wanted to convey about himself to the therapist.

Jon portrayed many outdoor and camping activities in his artwork. Camping was a family activity that Jon enjoyed and through which he developed many strengths. By these drawings he was able to communicate to his parents that their guidance and support were essential to him. These drawings also revealed
another side of his personality. In class Jon was belligerent, aggressive, and uncooperative while attempting to cover up his inability to do assignments in reading, writing, and arithmetic. In his artwork he portrayed a sensitive, gentle, and intuitive side of his character, specifically in relation to wild animals and preserving the wilderness, an aspect of his personality which had not been apparent to his teachers previously.

Jon was productive, competent, self-directed, and self-controlled during the art sessions. During the 6-week period that he was involved in the artwork, he had no violent outbursts. The school personnel and his parents began to collaborate at this time, which prevented Jon’s manipulative antics. Jon experienced success in that he was pleased with the results and progress of his efforts; Jon experienced acceptance as he was allowed to function at his own level and was supported by the therapist for all aspects of his work and involvement. Jon experienced relatedness with another person as he was given undivided attention, respect, and honest feedback. Jon experienced growth as he saw the change and development in his drawn forms and was proud of the final result.

Product—The Art Book and the Outcome of Therapy

All of Jon’s drawings were dated and mounted on colored paper with printed titles and the pages numbered and compiled into an art book for him. On the last day of the art therapy sessions, Jon created the front cover of his art book by drawing the letters of his name on a background of flame-colored lines and colors. He also pasted a Certificate of Merit, given to him at the last session, into his art book.

He turned the pages of his art book and looked over the 30 pictures he had drawn. Flipping through the pages, at times Jon stared intently at a drawing, and at times he passed by one quickly. He went back and forth, in no particular order looking first here and then there. The work of art captured and documented, like a visual diary, the time spent and served as a reminder of the progress made in art therapy. The art book portrayed his mountains, helicopters, planes, human figure drawing; a boy listening to music, a boy playing at sports, a bear at one time wild, another time a hiding cub, a sunken ship, a great adventure; the art book portrayed his ideas and his work. The art book also portrayed his development and his involvement. The concrete expression of thought and feeling, of time and meaning enabled Jon to reveal and revisit past experience at his leisure and convenience.

Conclusion of Case Study

The goal of therapy to help the client change behaviors that were maladaptive and destructive within the limits of his physical illness and emotional disabilities was achieved by providing Jon with the opportunity to discover and experience adaptive and creative behaviors available to him. The art activity engaged in a time and place removed from the everyday with an objective outsider, not parent, teacher, or peer, allowed Jon—since he was in a new situation—an observer, a process, and a product with which to discover and experience new behaviors and responses within himself.

Jon’s drawings were constructions of perceptions of his environment integrated with internal sensations that were communicated to the therapist in the form of pictorial responses. He was proud of the result of his efforts which became visible and tangible to him through the art product. Jon experienced success, relatedness, and self-control. These experiences as well as the self-awareness gained from these experiences were embodied in his art book.

The unique usefulness of art therapy rests in the synthesis of art with the treatment of psychological disorder. Art therapy makes the art experience available to all individuals; inherent in the art experience is observing art, producing art, and keeping objects of art in one’s possession. As illustrated in this case study, understanding these dimensions within the theoretical framework of observer, process, and product, their interrelationships and their distinct and combined functions, enables the art therapist to better discuss, describe, and, in turn, understand the work of art therapy.

Mandala Drawing: Facilitating Creative Growth in Children with ADD or ADHD

Valerie Smitheman-Brown, MA, ATR-BC, Lutherville, MD, and Robin P. Church, EdD, Baltimore, MD

Abstract

Using a single-subject, multiple-baseline research design, this study investigates the creative growth and behavioral changes precipitated by the work done in art therapy through the employment of the mandala as an active centering device with children who have been diagnosed with Attention-Deficit Disorder (ADD) or Attention-Deficit Hyperactivity Disorder (ADHD), accompanied by a history of impulsivity. During specified intervals of treatment, a drawing was requested. "Draw a person picking an apple from a tree," and rated according to the guidelines of the Formal Elements Art Therapy Scale (FEATS). Through examination of the drawings and objective findings of this scale, it appears that a visual measurement of creative growth was achieved. Preliminary findings indicate that the mandala exercise has the effect of increasing attentional abilities and decreasing impulsive behaviors over time, allowing for better decision making, completion of task, general growth in developmental level, and an interest in personal aesthetics.

Introduction

Children who have a history of Attention-Deficit Disorder (ADD) or Attention-Deficit Hyperactivity Disorder (ADHD) accompanied by impulsivity exhibit those behaviors in most situations, including art therapy sessions. By introducing the drawing of a mandala at the beginning of each session as an active centering device, it is expected that there will be evidence of an increase in attention span and a decrease in impulsive behaviors. Along with this behavioral adjustment, an improvement in the individual creative developmental level according to Lowenfeld's criteria is anticipated.

The choice of the mandala is related to the work of Jung (1972), R. Kellogg (1989), and J. Kellogg (1975, 1984). All concurred that the use of the mandala is an experience that often creates a calming and relaxing effect on the artist. Jung began painting mandalas in 1916 and regarded the form as "corresponding to the microcosmic nature of the psyche" (1965, p. 196).

Rhoda Kellogg's work describes the mandala as the first emergent form in creative expression after the scribble stage. The ability to draw a circle appears to be crucial to pictorial development (Kellogg, 1969). According to the extensive work of Jean Kellogg, mandalas offer a channel for creativity and provide maps of inner growth. The mandala form presents a structural device on which to concentrate and can be approached as a drawing of ongoing process (Kellogg, 1978, 1984).

Literature Review

A literature review reveals that ADD and ADHD appear to be the most researched areas of childhood behavior. In these common disorders of childhood, an individual exhibits significant problems with attention span, impulse control, and motor activity level relative to similar-age peers. In tracing the history of this disorder, Barkley states, "The prevailing view of ADHD at the close of the decade of the 1970s concluded that hyperactivity was not the only or the most important behavioral deficit seen in hyperactive children: poor attention span and impulse control were seen as equally if not more important in explaining their problem" (1990, p. 20). The diagnostic criteria in the DSM II (1968) emphasized distractibility and impulsivity as defining factors and the Diagnostic Statistical Manual III (DSM III) (1980) erected subtypes based on the absence or presence of hyperactivity. It was diagnostically important to differentiate between the behavioral traits characteristic of hyperactivity versus aggression in order to prescribe efficient treatment. The DSM III-R (1987) made two important revisions: (1) the need to establish the symptoms as being developmentally inappropriate for the child's mental age, and (2) the coexistence of an affective disorder no longer excluded the diagnosis. The most recent diagnostic criteria cited in DSM IV (1994) divide symptoms into two major categories—attention and hyperactivity-impulsivity. When evaluating symptomology criteria regarding the degree to which it is maladaptive and inconsistent with developmental level should be considered.

Barkley states that "The decade of the 1980s closed with most professionals viewing ADD or ADHD as developmentally handicapping conditions that are generally chronic in nature, having a strong biological or hereditary predisposition, and having a significant negative impact on academic and social outcomes for many children" (1990, p. 39). It has long been accepted that children with ADHD are more likely to have specific cognitive processing deficits than other children. School underachievement is rampant in this population. Behaviors associated with ADD and ADHD prevent a child from achieving his/her potential, result-
ing in a lack of ability to cue themselves internally, critical to the control and organization of behavior.

Research done on the impulsive behaviors of children diagnosed with ADD or ADHD points to the need to facilitate relaxation and centering in order to offer them the opportunity to attend to task and achieve growth potential. Barkley notes that ADHD children display fewer behavioral problems with tasks that are novel or unfamiliar (1990, p. 214). In quoting research done by Zentall, Barkley supports the fact that ADHD children are more likely to pay attention to colorful or highly individually stimulating materials compared to "normal children." Tasks requiring an active, motoric response as opposed to a passive response may also help hyperactive children channel their behaviors.

A recent study by Epperson and Valum (1992) points to the value of art therapy with ADHD children due to the unique nature of the artmaking process. Expressive qualities evident in art products are thought to serve as a record of behaviors at the time the child was involved in the process. Motor movement, attention, and degree of impulsivity are thought to be reflected in line quality, use of material, degree of organization, integration, and completeness evident in the resulting artwork. The creative process provides a record of the child's emotional/behavioral status with the creation of a permanent product. While Epperson and Valum's study primarily investigated children's art to examine if changes in imagery were evident and could be explained by variation in medication dosages, it also considered how changes in the art might correspond with overt behavioral changes. The investigation indicated that stimulant medication can have a significant influence on expressive qualities. In addition, the data from art products corresponded in a positive manner to data obtained from a behavioral assessment measure (Epperson & Valum, 1992).

Methodology

The multiple baseline across individuals' designs following a model described by Kazdin (1982) was chosen for this research project for the following reasons: it allows for continuous assessment of effects of the intervention on performance over time; the descriptive function of the baseline phase can act as a basis of predicting the level of performance if the intervention is not provided; it has the ability to incorporate a larger sampling; and there is no need to use reversal or experimental techniques to demonstrate the effects of the intervention.

This study assessed the functional relationship between treatment strategy and behavior change by introducing the intervention to different baselines at different points in time. The baseline targeted attention span and impulsivity across eight students and four control subjects. Once the intervention was introduced to attempt to alter the particular behaviors, it was not withdrawn as in the standard single-subject ABAAB designs which will temporarily withdraw the intervention to prove the hypothesis. After behavioral baseline was established, two students and one control were introduced to the intervention immediately. Two additional students and one control were added each 30 days thereafter.

As a practical and visual measurement of change, this study used a drawing task, "Draw a person picking an apple from a tree," suggested in Lowenfeld (1947, 1956) and developed more completely as a diagnostic tool by Gatt (1990, 1993) using the Formal Elements Art Therapy Scale (FEATS). The FEATS was developed to describe global variables in the artwork of adult psychiatric patients. This scale was chosen because it is both objective and consistent. The FEATS rates the following pictorial variables: prominence of color, color fit, energy, use of space, integration, logic, realism, problem-solving, developmental level, details of objects and environment, line quality, depiction of person, perseveration, and rotation. Each variable is measured on an ordinal scale with five defined points (Gatt & Talone, in press).

The FEATS was originally designed for adults. To use this study with children, it was determined that four elements of the scale applied: integration, problem-solving, developmental level, and details of objects and environment. As the FEATS may not be familiar to readers, the exact wording of the rating manual and a copy of the ordinal scale for the four elements chosen are noted in Appendix I and II.

Subjects

The population chosen for this study consisted of eight student subjects and four control subjects, ages 10-13, attending an Intensity V school. Intensity V is a level of education designed to meet the needs of children with severe emotional and developmental issues and maintain the least restrictive environment for learning. Each student and control subject had carried a diagnosis of ADD or ADHD for more than 1 year and had a documented, ongoing history of impulsive behaviors.

Procedure

Baseline data were gathered from historical and observable patterns of behavior, use of the Child Behavioral Checklist (Achenbach, 1979), general artwork produced before the intervention, and the repeated drawing task, "Draw a person picking an apple from a tree," also produced prior to the introduction of the intervention. Ongoing behavioral data were charted through direct observation. The intervention was considered to begin during the art therapy session in which the mandala drawing was first introduced.

The student was presented with a piece of 12" x 16" white paper, on which a circle 10", in diameter had been drawn in pencil and a box of 4B Holbein oil pastels. The student was informed that beginning with the present session, he/she will be creating a free-choice circular drawing for the first 5 minutes as a means of relaxing before beginning other artwork. The student was instructed to begin in the center of the circle and draw whatever he/she wished. At the conclusion of the mandala exercise, the student was given free choice of artwork and art medium for the remainder of the session. The 5-minute time was a minimum; the mandala could, of course, be continued as long as the student wished to work. This method of organizing the beginning of each art therapy session was consistent over the research period once the intervention was introduced.

Throughout the course of the research, the control group had access to nondirective art therapy techniques and were not introduced to the mandala exercise. Every 2 months all the students were requested to repeat the task, "Draw a person picking
an apple from a tree. For this drawing the student was offered 12" x 18" white drawing paper and a set of 12 "Mr. Sketch" washable, nontoxic markers. All repeatable drawings were rated according to the Formal Elements Art Therapy Scale (FEATS) by three independent raters. The author obtained a prepublication copy of the FEATS rating manual, and each rater was trained in the areas of the scale considered applicable to children prior to viewing the artwork. The raters were blind to the subjects and the hypothesis. Two studies are presented in this article as an illustration of the changes observed in developmental level and the behavioral adjustments indicated by the use of the mandala.

**Case Study #001**

Student #001 is a 13-year-old female with a DSM III-R diagnosis of Attention-Deficit Hyperactivity Disorder, Elective Mutism, and Mild Mental Retardation, r/o Post Traumatic Stress Disorder. Her history shows significant attentional difficulties and impulsive behaviors from birth, intensified after 8 years of age and coinciding with the commencement of elective mutism. This student completed 20 mandala drawings and five repeatable drawings administered in 2-month intervals, during the course of the intervention. In comparing these drawings, it should be noted that this student was not previously known to have drawn a full human figure.

Figure 1 shows the preintervention drawing. The drawing was executed in less than a minute. The student drew only a face and impulsively used all the colors available for each part of the hair. The apple and tree are designated by words. While it might be possible to recognize the apple, the tree is severely rotated and was considered unrecognizable. Although the images are in close proximity, there is no apparent interaction.

In Figure 2 (drawn 2 months later), the student exhibits a full body schema. The arms appear to be single lines drawn in red reaching towards the apple. Again, the apple is recognizable. The tree drawing now has what appears to be a square trunk. Of note is the attempt at integration between the images. The most striking difference in Figure 3 is the tree drawing. Although this tree is still somewhat chaotic, it contains fruit, leaves, and a sticklike trunk or branch system which are all recognizable and colored appropriately. The image of the person displays some possible distinction between body parts noted by the use of red for the head and yellow for the balance of the body. Interaction and energy are suggested in the arms reaching up towards the tree. The student normally chose to communicate by writing, and the words seen in the drawing describe the change in hairstyle.

Figure 4 includes the addition of a groundline and sun, perhaps indicating a recognition of the environment. The tree is grounded, and the leaves and apples are in proper position. The person may be jumping up to get the apple, indicative of energy. The arm is bent and drawn along the trunk line of the tree touching the apple. The postintervention drawing, Figure 5, is a scene that could be said to be both integrated and environmental. Color is appropriate throughout the drawing, and images are filled in to indicate volume. The body schema differentiates among head, body, and facial features by the use of color. Energy is depicted in the person jumping and reaching for the apple.

The cognition of this student has been described by educators and psychologists as scattered, indicating widely variable
abilities. This can be seen particularly in the developmental level of her figure drawings. Using Lawenfeld's criteria, steady progress in developmental level can be noted in the five repeatable drawings. Comparison of the pre- and postintervention drawings exhibits her ability to attend to detail and produce a more integrated drawing and include more environmental details in her work as she gained strength in her ability to focus and control impulsive behaviors.

**Case Study #002**

Student #002 is a 10-year-old boy diagnosed with Attention-Deficit Hyperactivity Disorder, Separation Anxiety Disorder, and Post-Traumatic Stress Disorder. There was a history of attentional difficulties and impulsivity apparent since the age of 4 when abandoned by his primary caregiver. The student completed 16 mandala drawings and four repeatable drawings administered every 2 months.

The preintervention repeatable drawing, Figure 6, can be said to exhibit impulsivity in line quality and branch connections. The apples appear to be drawn without regard to their actual placement on the tree. Color prominence and problem-solving are minimal. The content of the image is fantasy based with the depiction of what are described as elves flying in the tree to pick apples.

Described by the student as a “dinosaur picking an apple from a tree,” the image in Figure 7 continues the fantasy element. The tree is filled in with color giving a sense of volume, the apples are more organized, and the work is color appropriate. The student displays possible anxiety in the line quality of the dinosaur and impulsivity in the overlay of the sun on the back of the animal. While still not totally reality-oriented in the depiction of a giant picking an apple from a tree seen in Figure 8, the figure appears to be progressively more humanoid. The balance of the drawing shows an integrated environment, including sun, skyline, clouds, and groundline. The tree, leaves, and apples are organized and object-color appropriate. All of the images shown depict volume and solidity.

In the postintervention repeatable drawing, Figure 9, the most dramatic change noted is the departure from fantasy seen in the images of two human figures, one climbing a ladder to pick the apple and one holding a basket of apples. The figures are not well defined, but can be identified as human and are sized appropriately compared to the tree. The student displayed his problem-solving capability by adding the ladder, thus imaging an appropriate response to the challenge of the task. Groundline
Conclusions

This study investigated the development and behavioral changes precipitated by the work done in art therapy through employment of the mandala as a centering exercise with children who have been diagnosed with ADD or ADHD accompanied by a history of impulsivity. It was hypothesized that incorporation of an active centering technique in the form of a mandala drawing at the start of each art therapy session would foster increased attentional capabilities and effectively decrease impulsive tendencies during the session. The overall creative expression of the child was used as an additional support for the hypothesis. By examination of the repeatable drawing task, "Draw a person picking an apple from a tree," rated on four scales following the guidelines of the FEATS, a visual measurement of change was recorded.

The findings indicate that the mandala exercise had the effect of increasing attentional abilities and decreasing impulsive behaviors over time, allowing for better decision making, completion of task, expression of growth in developmental level, and an interest in personal aesthetics. Four areas of the FEATS ratings deemed particularly applicable to the population were chosen for investigation: integration, problem-solving, developmental level, and details of objects and environment. These categories were chosen to emphasize the concrete nature of the visual expression and assist other professionals to explore the use of the formal elements of art as a tool for understanding change and growth on other levels.

Analysis of the ratings in these four areas examined in the preintervention and postintervention drawings by the subject group reveals an average increase of 35% in integration, a 38% increase in problem-solving attempts, a 37% increase in awareness of details of objects and environment, and a 22% increase in the ratings of the developmental level (Figure 10A-D). Within the control group, three of the four subjects made no perceivable advance in the categories tested. One student made significant progress throughout the research, perhaps due to the introduction of art therapy in general (Figure 11A-D).

The Baseline/Performance Data Over Time for the two cases presented in this study chart the targeted behaviors of attention span and impulsivity (Figure 12). This was accomplished through prechecklists/postchecklists completed by the teachers and direct observation throughout the course of the intervention. Each student shows a gradual improvement in attention capability and decrease in impulsive behaviors that correlate to the visual improvement in creative developmental level over time. This appears to indicate that the use of the mandala drawing to facilitate active focusing allows the student to exhibit a more age-appropriate developmental level.

A comparison of the Baseline/Performance Data Over Time between student and control subject groups showed an increase in attention span and a decrease of impulsive behaviors in all subjects. The student group, however, improved attention span after introduction of the intervention by an average of 23% while the increase in attentional span observed in the control group averaged a bit less than 10%. A decrease in impulsivity of 24% was observed in the student group and a decrease of 12% within the control group.

The diagnosis of ADD or ADHD accompanied by a history of impulsivity was the only criteria for choosing subjects for this research. According to the outcome of this research, it appears that a wide range of additional Axis I and Axis II issues are not a factor in the application of this intervention. Inherent differences in the cognitive strength of each student appear to have no adverse effect on the work, although it may take a bit longer to observe change for the lower functioning student. Some variables which may have influenced the student's progress during the research should be considered. The students involved had been in this placement for a year or more, the length of exposure to the structured setting should be considered. All of the students were medicated to address their handicapping conditions. Medications and dosages were not a controllable variable for this research. Art therapy was a new modality, and the individual

attention could have encouraged the possibility of an increase in expression of developmental level.

The results of this study indicate that the intervention has some promising results. The project, begun during the 1994-1995 school year, is being researched on a continuing and expanded basis at this facility. The use of mandala drawings as an active focusing tool is being piloted during the 1995-1996 school year in a classroom setting prior to several different academic subjects and several different age groups. The goal of the research is to observe the effects of the intervention in a demand situation such as the classroom. Investigation will focus on the translation of the increase in attentional capabilities and the decrease in impulsivity as it relates to academic performance. A matching study conducted in another facility and additional research using this technique are encouraged.

*by Linda Gantt, PhD, ATR-BC, HLM*

#### Scale #5 — Integration

Look at the overall balance and relationship of the elements to each other. If the picture is not at all integrated and seems to have no overall composition, mark 1. If there is some attempt at making a relationship between two or more of the elements, mark 3. If the composition is well-integrated and well-balanced, mark 5.

#### Scale #8 — Problem-Solving

How effective is the solution for getting the apple off of the tree? If the person cannot get the apple, the picture would be rated 1. If the person has the apple in hand but it is not apparent how he/she got it, rate the picture 2. If the person is on a rock, box, or ladder (or on some other reasonable type of support) but is not reaching for the apple, mark 3. Rate the picture 4 if the person is on a ladder or rock or other reasonable type of support, or on the ground reaching for the apple but not able to grasp it. Solutions which rate a 5 would be showing the person on a ladder or rock (or on some other reasonable type of support) or standing on the ground with the apple actually in hand (that is, in the process of picking the apple as the directions for the picture state).

If the person seems to have picked the apple but the solution is not reasonable (such as a small branch with the apple on it coming straight out of the middle of the trunk), mark it 3.

#### Scale #9 — Developmental Level

Keep in mind Lewinsohn's developmental levels. Scribbles would be rated 1. Those with circular or rectangular shapes for the person's body and no attempt to portray realistic proportions or relationships of objects would be marked between 1 and 2. Drawings like those of 4 to 6-year-olds would be rated 2. Latency age drawings with a baseline and objects lined up on it would be rated 3. Adolescent drawings (with overlapping of objects and with realistic sizes for each object in relation to the others) would be rated 4. “Adult” drawings (those which show some artistic sophistication) would be rated 5.

#### Scale #10 — Details of Objects and Environment

How many extra items are there in the drawings? If there is nothing but a person, a tree and/or an apple and these items are drawn simply with little detail (e.g., a single line for the tree trunk and a rounded form for the top), rate the drawing 1. If a horizon line is added or there is some suggestion of grass, rate it 2. If there is a horizon line and one or two additional details, mark 3. If there are many additional details such as flowers, clouds, a sun, or other trees, rate it a 4. If there are abundant and inventive details such as fences, other trees, and special clothing details (e.g., a pattern on a shirt), rate the picture 5.

Revised October 1993
Brief Reports

The Amusement Park Technique in the Treatment of Dually Diagnosed, Psychiatric Inpatients

Kathy D. Hrenko, MCAT, ATR, and Robert Willis, LSW, CAC, Warminster, PA

Abstract

This article examines a specific art therapy task in the treatment of dually diagnosed, psychiatric inpatients. The amusement park technique is a nonthreatening, unique way to engage patients in the therapeutic process. It provides important diagnostic and prognostic information to the art therapist. This article identifies common imagery created and demonstrates how the artwork serves to identify the psychodynamic concerns of the mentally ill substance abuser. Connections are examined relating patients' choice of image, psychiatric diagnosis, and drug of choice.

Introduction

Amidst the current atmosphere of managed healthcare systems and proposed reforms, the impact on inpatient treatment has led to shorter and shorter lengths of stay. The challenge for healthcare professionals is to rapidly evaluate and stabilize patients. Collins and Uhman (1995) report, "What's emerging under managed care is a new mental health model: short-term treatment of immediate problems that emerge at different points in a person's life cycle, rather than long-term treatment for underlying problems that aren't readily apparent" (p. 163). Therapists must search for techniques and interventions which will quickly engage the patient and reveal important diagnostic information.

This article explores the use of the amusement park technique in group art psychotherapy with dually diagnosed patients. This particular technique has been utilized for the past 5 years as part of an art therapy program in a 40-bed inpatient psychiatric center which functions within a milieu therapy model that includes individual sessions with a psychiatrist, traditional group therapy, art therapy, recreation therapy, substance abuse groups, and a variety of psychosocial educational sessions. Patients immediately begin a busy schedule of back-to-back therapy sessions. What a relief it must be for patients who are in crisis to enter a group where they are asked to represent their lives in the form of an amusement park ride or event.

The amusement park technique had frequently been used with the center's adolescent population as a way to understand their interests. When faced with a particularly resistant, young adult community, this technique was used in an effort to engage the patients. The results were quite interesting and very different from the responses of the adolescents. While the adolescents tended to approach the task in a more concrete manner drawing rides they enjoyed, the adults were able to make selections that demonstrated their life struggles. This paper will explore some of the reasons why this technique may be appealing and therapeutic for dually diagnosed patients in general.

The Attraction of the Amusement Park Technique

The amusement park theme has been used most effectively with a higher functioning population. These patients are generally not overtly psychotic and have undergone at least a partial detoxification process. The art therapy session runs for approximately 1 hour and often contains 10 to 15 patients ages 18 and above. The patients sit around tables covered with white mural paper and can choose from a variety of drawing materials. They are instructed to draw an amusement park ride, booth, or event which represents their life. Following the completion of the tasks, patients are given an opportunity to talk about their artwork and share with the group how the image they created relates to their lives.

Research into the dynamics of drug dependence and dual diagnosis shed further light on the possible conscious and unconscious attractions to the amusement park theme. Richards (1983) notes several commonly accepted theories on dual diagnosis. Among these are the "escape hypothesis of addiction" that individuals use psychoactive substances to avoid certain feelings and thoughts, and the self-medication hypothesis of drug use that individuals use drugs because of their positive effects on the symptoms of psychopathology. (p. 38). He also discusses the "stimulus control hypothesis of addiction" that individuals use drugs to increase, decrease, and modulate the level of impinging environmental and internal stimulation. (p. 38). Richards indicates that each of these theories is relevant in dual diagnosis treatment.

The amusement park theme may provide similar functions to the self-medication phenomenon or the escape hypothesis. Albert-Puleo (1980) states, "Drug abuse can be viewed as a maladaptive way of handling feelings by retreat into euphoric states." (p. 43) A carnival ride or trip to the amusement park for...
depressed patients may be a perfect opportunity for relief from their overwhelming unhappiness. A similar relief also may come from substances as Plicic 1973 noted... One of the most common indicators of depression is a growing dependence on alcohol, sleeping medications, and other drugs that may promote momentary relief, at least from the surface anxiety and lack of energy associated with the underlying depression" (p. 97).

Schoenborn and Horn's 1983 study on negative moods defined as depression, loneliness, restlessness, boredom, and upset; found that men who experienced these affective states were three times as likely to be heavy drinkers than those who reported no negative moods (p. 1). The amusement park and its rides may produce effects of relief similar to those brought about by drug or alcohol use.

Through an analysis of dreams, Whitmont 1980 provides another point of view regarding substance use which seems directly relevant to the superficial, thrilling aspects of an amusement park.

One might assume that most drug addicts and alcoholics are misguided "seekers of the spirit"—alcohol has been called 'spirits rura'. They are compelled to seek a form of the spirit to be found in the world of Dionysus, the god of revelry through the light from below, from the earth rather than from the heavens, and who signifies necessity to find life and meaning in theasticities and terrors, in the beauties and agonies of this concrete world; not merely in the remote, abstract spirit realm as it is commonly understood. (p. 227)

Patients often comment on the attraction to certain rides despite their fears. Similarly, addictive patients will discuss their continual use of substances despite negative consequences or feelings experienced.

Krystal and Raskin 1979 explore "altered states of consciousness," which was originally defined by Ludwig 1966. They correlate these altered states to personality functioning and the need for drugs. Characteristics such as sensory deprivation, overstimulation, as well as ecstatic, hypnotic, and toxic states may serve to defend against unpleasant or undesirable effect. Amusement park rides produce similar effects of overstimulation by light, speed, sound, sensory deprivation by darkness, and even hypnotic-like states on repetitive rides. Rides may also provide disorientation that is brief and controlled. Krystal and Raskin 1979 state: "Being freed from the task of orientation to reality is especially likely to be exhilarating when disorientation is temporary and controlled. Disorientation may be used defensively as a block against confrontation or for carrying out a dangerous impulse" (p. 79). The feelings and sensations the amusement park provides are what mentally ill addicts are looking for in their drugs to respond to the symptoms of their mental illness.

Ride Selections as They Relate to Diagnosis and Drugs of Choice

The relationship of the subject to his or her choice of ride seems to be similar to the relationship of the symptoms and the drugs of choice. Upon closer examination of particular ride selections, patients were able to describe the way in which their drawings represented their lives. This often included the intimate connections between their psychiatric and their drugs of choice. While every mood contains a variety of rides, booths, and events, common symbols emerged. Although quan-

Figure 1 My life is a roller coaster!

Figure 2 The ride from hell, speeding out of control, without a seatbelt.
of control, without a seat belt." She further explained that the lack of a seat belt represented the loss of family support she experienced due to her alcohol abuse. The patient drew herself moving backwards on the ride, which may be indicative of her lack of engagement in treatment. She was discharged at her own request soon after she drew this picture. The patient returned to the hospital in less than a week following an alcoholic binge.

The Therapeutic Value of the Amusement Park Technique

Patients find common connections to their peers in the amusement park mural. The symbolism may serve to connect people with different diagnoses, but similar life paths. Frieze (1975) writes, "Researchers are aware of the resemblance of acute alcoholic episodes to manic-depressive moodswings" p. 114. When both patients draw roller coasters - Figues 1 and 2 - they begin to see that although their problems may be individual, they feel support in knowing they are not alone in their struggle. Patients find a variety of amusement park events which lend themselves to self-expression. These have included the abovementioned rides as well as clowns, water slides, hot-air balloons, food stands, games of chance, and even "freak shows." Further examination of these images suggests similar relationships between the patients' substance abuse and their psychiatric illness. One thing remains clear: Each selection seems to have very relevant and personal meaning to the patient.

When verbally processing the mural, patients appear to easily relate to one another's drawings and life situations especially when several roller coasters, ferris wheels, and mere-go-rounds have been drawn. Patients find common bonds when discussing this ride called life. Yalom (1975) in his study of curative factors in group therapy discusses this concept of universality.

In the therapy group, especially in the early stages, the disconfirmation of their feelings of uniqueness is a powerful source of relief. As sharing other members disclose concerns similar to their own, patients report feeling more in touch with the world and describe the process as "coming to the human race experience." Simply put the phenomenon finds experience in the ride "we're all in the same boat" p. 8

The amusement park technique appears to offer a non-threatening avenue for patients to express their feelings. This is especially helpful to the mentally ill addict. Albert Puleo (1980) writes, "Drug addicts unaccustomed to tolerating emotions, let alone talking about them, are initially threatened at the prospect of verbalizing feelings. Art expression thus provides a safe step toward the eventual goal of verbal discharge."

The artwork also serves as a concrete way for substance abusers to connect their drug use with affect. Patients use their artwork as a means of self-expression of pain; at the same time patients receive support from fellow group members. Figure 3 represents a roller coaster on fire. It was drawn by a 32-year-old man diagnosed with Major Depression and Alcohol and Drug Dependence. The patient explained to the group that he had not felt anything for 20 years because whenever any feelings arose he would use substances. When the group confronted the patient on the possible anger expressed by the fire, he agreed that it represented years of "rage." He also explained that the higher he gets the more he gets burned but he just keeps getting high. He told the group that although the ride - which symbolized his alcohol and drug use - was extremely dangerous, that was part of the appeal or "thrill" for him.

Patients often share their feelings of being overwhelmed, frustrated, or hopeless about not being able to get off the ride. For some patients stopping the ride or reaching the end of the line may indicate suicidality. Figure 4 was drawn by a 35-year-old male suffering from Major Depression and Alcohol Dependence. He related his life of depression, drinking, and bouts with suicidal feelings to the train wheel. He explained to the group that he just wanted to get off the ride and go to another part of the park where he could live happily with his children. The patient represented himself at the bottom of the train wheel with little hope of ever getting off the ride. However, the patient explained to the group that when he began feeling suicidal, he had voluntarily admitted himself to the hospital hoping to develop some new coping skills.

This technique frequently elicits discussions about feelings of powerlessness—that someone or something is controlling the ride. For those involved in 12-step programs such as Narcotics Anonymous (1982), this experience provides a visual way of looking at the first step which states, "We admitted we were power-
less over our addiction, that our lives had become unmanageable” (p. 19). This idea is supported by Potocki and Nicholas-Wilder (1989) who write, “Art and movement interventions are one way of interpreting the Twelve Steps and practicing their applications” (p. 103).

Another therapeutic aspect of the amusement park theme evolves from the patients’ perceptions and verbalizations about where they are located on the ride. As previously shown by Figure 2, the location or direction in which the patient is moving can have prognostic value. For example in Figure 3, a 37-year-old male with Major Depression and Alcohol Abuse (not active) reported being at one point at the bottom of the ferris wheel at the time of admission, but during group several days later, he was feeling hopeful. The patient had shared his aftercare plan with the group including continuing therapy for his depression and active participation in Alcoholics Anonymous meetings to maintain his sobriety. The patient now saw himself as moving uphill.

Patients perceiving themselves at different points on the ride may be valuable in the treatment process. Yalom (1975) writes about “instillation of hope,” which occurs when patients have contact with others who have improved and are able to share how they have successfully coped with their problems. The artwork serves as visual reinforcement that patients can see themselves at better points in their lives. Yalom’s theory on altruism or the importance of giving in therapy also is reflected in this task. One alternative technique which can be utilized to promote instillation of hope and altruism is for patients to be instructed to provide suggestions for how peers can get off their rides or deal with their problems by relating their past successes. In a group where the patients are cohesive and comfortable with one another, patients can even draw solutions (for themselves or others), finding ways to deal with their rides and symbolically ending the negative cycles. Interesting discussions can also be stimulated by asking questions about which rides or booths group members would like to visit and why.

Conclusion

The amusement park technique has proven to be a valuable and creative intervention in the treatment of psychiatric patients, especially those struggling with addictions. As Farrell and Joseph (1991) warn, “Preparing to manage continuing increases in utilization of psychiatric emergency services, particularly in a climate of increasing fiscal constraint, will demand the most creative use of all potential resources at our disposal” (p. 137). Potentially, this technique can provide valuable diagnostic and prognostic information. It seems to quickly engage patients, even those demonstrating resistance to therapy. The group mural also provides therapeutic value both in the process and in the imagery created. Although this article focused on an inpatient, adult psychiatric population, the same technique has been utilized successfully with detoxification and adolescent psychiatry units. The amusement park technique, though simple in presentation, offers promise and versatility in its applications to individual, group, and family art psychotherapy.

Painting as Language for a Stroke Patient

Shulamit Carmi, BA, and Tonni Mashiah, MD, Gadera, Israel

Abstract

Stroke patients experience physical, emotional, and social difficulties during various stages of the rehabilitation process. Use of painting as a means of self-expression can help by providing an outlet for the release of emotions that the patient can no longer hold inside. A series of paintings by X., a stroke patient, offers a clear demonstration of the artistic process as a vehicle for airing feelings of anger, yearning, loneliness, and the desire to make contact. As the only Arab patient in a Jewish hospital, X. used symbols that developed out of his experience of a culture that was foreign to him. His paintings offer a striking example of the integrative role that art can play in the recognition and organization of the internal conflicts experienced by the patient.

Introduction

Stroke patients, especially those who become hemiplegic, suffer from a disturbed sense of body image, which in turn can threaten their emotional stability. This is often aggravated by stroke-produced speech impairment affecting communication at times when self-reliance is lost and the patient is dependent on others. Therefore, the treatment of the psychological and social needs of the elderly stroke patient poses a great challenge to the rehabilitation team and requires cooperation between its members and the patient. It is surprising to find that art therapy has rarely been applied to the rehabilitative treatment of stroke patients, as evidenced by the scant literature on the subject (Arbit & Lee, 1986; Weinberg, 1985). This is especially odd since in patients with chronic, disabling, or even terminal diseases, art is a valuable tool both diagnostically and therapeutically (Rosin, Matz, & Carmi, 1977).

The diagnostic, emotional, and rehabilitative value of art therapy with stroke patients was stressed by Field (1976), who also discussed the recovery of physically impaired limbs and bodies. The focus of treatment is on helping the individual gain maximum autonomy within the boundaries of his or her disabilities. Furthermore, the artwork itself helps to reveal the patient’s manipulative abilities as well as his or her emotional state and self-image. These factors can be indicative of the patient’s diagnosis and prognosis.

The Patient

X., male, age 57, divorced father of four, carpenter by profession, had a stroke with a right hemiplegia and with a slight motor impairment of speech dysarthria. His cognitive state was good; however, in addition to the stroke, his emotional state was confounded by several factors. A dominant issue was his national and religious identity. He was born and had lived in Akko, an enclosed fishing port on the Mediterranean famous for its Crusader fortifications and buildings, with a mixed Jewish and Arabic population. X.'s mother was Jewish and his father was Arabic. Since Jewish religion is matrilineal and Moslem religion is patrilineal, X. is considered Jewish by Jews, whereas by Islamic laws, he is a Moslem. X. was raised and educated as an Arab, his wife and children were Arabs, and he had spent most of his life in Arab society. Suddenly he found himself in this hospital as the only Arab patient among Jewish patients and staff.

Another problem was his family life. Several years ago, he divorced his wife, quarreled with his children, and was forced to leave Akko. He relocated to Jaffa, another picturesque biblical port (from here Jonah escaped to meet the whale) near Tel-Aviv, also with a large, mixed Jewish-Arab population. In his new home he suffered the stroke. During his stay no family member ever visited him. A third issue that added to his confusion was his eviction, a consequence of failure to pay his rent, so that during hospitalization he became homeless.

The Paintings

During his hospitalization and rehabilitation, X. was a prolific painter. Through his paintings, he confronted his memories and feelings and this provided him with a way to rehabilitate his hurt self.

When he first came to the therapy room in his wheelchair and saw the painting materials on the table, he informed us that he was a painter and had painted in his childhood. For this reason we suggested he return to painting and he agreed immediately. Since that day X. came daily, on his own initiative, to the therapy room and spent many hours painting with his nondominant left hand. Having considered himself a painter, his self-perception had now changed. He always had subjects to paint; therefore, it was decided not to intervene in his work. He was reluctant to answer questions and spoke very sparingly.

X.'s paintings can be divided into four main groups, each reflecting his experiences during one particular stage of his hospital stay. They relate the issues and emotions with which he was grappling: his background and national identity, loneliness and the desire to make contact, anger and conflicts, and yearning for home and independence. These topics are discussed in the chronological order in which they affected X.

Background and the Issue of National Identity

X.'s first paintings were disorganized: stains of paint separated by empty white spaces, which attested to the difficulty he experienced in controlling the paintbrush in his left hand. His
control of the brush improved quickly, and through his paintings, N. began to tell the story of his life.

In Figure 1, he painted Akko, the city where he was born. The city wall, a public garden, boats with Israeli flags, and, in his words, doves of peace. In Figure 2, we see his present place of residence, Jaffa, with the clock tower that is the symbol of the city. The clock is always painted in yellow, the color of hope according to N., as time carries a promise. In this picture we see the first allusion to the issue of "home," an issue that was to occupy him a great deal during the long months of creativity ahead. There is a traffic light and a crosswalk in the background, and a table and chairs set up in the middle of the street. The inference is clear—he has no home. In another picture, he paints a table under the sky, set for the Passover Seder.

As the only Arab in the hospital, N. felt that he was different and perhaps felt somewhat discriminated against. To be "different" may mean simply to be different from others in some way. Sometimes both sides recognize the difference, and this recognition can affect the way they relate to each other. Now that he was hospitalized, he was completely dependent on Jews. He adopted Jewish religious phrases such as "Baruch Hashem, Bless God," and "He-catzar Hashem, So help me God," and tried very hard to win the favor of his benefactors.

One of his paintings shows a patient wearing a back splint cap, as worn by observant Jews. The logo of Kupat Holim, the Israeli Sick Fund, is visible on the blanket. There is a nurse standing at the head of the bed, her posture lordly and masterful. This is the first hint of the conflicts that have developed between N. and the nurses during his hospitalization and of arguments that have infuriated him, which he mentioned in the therapy room. These were clearly expressed in his paintings.

Loneliness and the Desire to Make Contact

As N.'s physical state improved, he asked the social worker whether he could marry again. Figure 3 is an example of his paintings during this stage, characterized by the presence of a phallic-shaped tree surrounded by a river which flowed in a breastlike curve. In Figure 4, we can see that loneliness preoccupied his thoughts. The painting shows a lonely horse without a rider, retreating from the handle that prevents him from reaching home. As a symbol, the horse symbolizes his struggle with loneliness.

Cooper 1992, p. 130: The horse serves as a mount for kings, noblemen, and warriors. N.'s horse, however, with its tail tucked, startled, somewhat withdrawn expression is not the proud mount of a king. This horse may represent the fear of shrinking manhood and N.'s lack of confidence in his sexual function.
Another painting shows a yard with a swing and a little swimming pool. We noted the absence of people in the picture and asked him about it. His irritated response was, "They aren't necessary."

During this stage, X. dealt with feelings of loneliness and abandonment. Although he spoke negatively about his family, his separation from them during the period of his hospitalization contributed to his loneliness. Grappling with these themes made the integration of the damaged self possible.

**Anger and Conflicts**

X.'s condition continued to improve, he progressed from using a wheelchair to walking supported with a tripod cane. He walked around the ward and listened in on conversations among the nurses; a pastime that led to a number of misunderstandings. He painted Figure 5 following an argument he had with a member of the staff. When asked what the painting portrayed, X. answered, "It is an eagle preying on a hare. A strong, powerful animal attacks a small and weak one."

Figure 6 shows his progress toward independence. . . . In the picture we see him walking, supported by a cane, on the arm of a pale and ugly nurse. The nurse, who is supposed to be supporting him, falls down—she is unreliable. A clock is painted in the center of the painting—sign of passing time; see also Figure 2). The images are surrounded by a sawtooth frame.

The process for "working through" trauma includes eliminating the sense of denial, venting of fear, release of rage against the bodily assault, and mourning where loss is involved (Landgarten, 1981, p. 335). X. was dealing with the changes in his body image, namely his restricted mobility and impaired speech. Following an argument X. said, "A nurse should be like an angel to the patient." Figure 7 portrays the nurses' station. The ward is painted in pale-gray colors, in contrast to the bright colors that characterize most of his paintings. (It is noteworthy that he uses these pale colors every time he painted the ward.) The nurses, again portrayed as ugly and pale, are falling in the background. The most conspicuous object in the painting is the telephone—a tool of communication and the link with the outside world, and a plant in a pot. X. paints plants and flowers, which are sometimes symbols of death and resurrection and of the force of life (Cooper, 1975). Another painting depicts the ward's dining room and the nurse aide who serves the food. The attendant has been painted with great care—she is wearing a yellow smock and her expression is friendly. Although she stands next to the trolley, she serves no food; the wagon is closed. There are no patients in the dining room.
Yearning for Home and Independence

As his condition continued to improve, his yearnings for home and for independence grew stronger. At this stage, N. painted pictures of “beautiful houses.” Discussing Figure 8 he said, “This is not my house. It belongs to rich people. I will not have a house like this.” The houses are large and fenced in, the gates are locked shut, and sometimes there are large animals standing guard. These houses are reminiscent of villas of wealthy Arabs, with the courtyards enclosed by high walls. Everything is locked and sealed; there is no way for N. to enter.

In mythological paintings, two imaginary beasts are sometimes depicted guarding the Tree of Life or other riches (Cooper, 1978). N.'s treasure is the house, but it is inaccessible to him, being protected by the monsters. Following the series of large villas come rows of small, pleasant colorful houses in a variety of settings, including gardens and fields (Figure 9). N. has acknowledged that he would like living in one of these houses, but these houses are also closed. There is a wonderful light shining through the closed windows. The passage to these houses is convoluted and fraught with obstacles; in most cases there is no path leading to the door. Despite these apparently negative aspects, the paintings are optimistic. Vegetation and birds abound, and there are ducks and boats in the water.

As the time of N.'s discharge neared, difficulties arose which delayed his leaving the hospital. He painted three very poignant paintings in which he showed his home moving off into the distance until it disappeared, until finally there was no house at all. After these paintings came a series of pictures of strange, unreal houses set among stones and tree trunks.

On the day N. happily reported that his discharge was imminent, he painted himself leaving the hospital, leaning on a tripod cane. A nurse, standing erect, is embracing him. The hospital, with barred windows like a jail, is painted in yellow, the color that symbolized hope for N. He and the nurse step out of the building and step out of the painting as well (Figure 10). The next painting (Figure 11) was painted after some time had passed. N. was still in the hospital, but informed me that he would be leaving soon. The painting shows a man loading suitcases onto a wagon harnessed to a horse. “Who is the man?” I asked. N. replied, “Someone in the village.” The horse is about to pass a bridge to a new life. The river is an obstacle but at the same time a source of life and appears in many of N.'s paintings.

After his discharge from the hospital, N. moved to an Arab neighborhood in Jaffa and returned to the Arab community. His house was decorated with Arabic verse, and he lived in harmony with his new neighbors. The first picture he painted in his new home was of a large boat. There was an important new detail added to the picture—a bridge from the boat to the shore. The wandering boat traveler is now safely upon land. In the foreground, on the shore, there is a house. It is the same house that appeared in his earlier paintings, with the light shining through the windows.

Conclusion

During his stay in the hospital, N. painted approximately 50 pictures. While his paintings dealt with a variety of different issues, the ‘home’ motif was the thread that ran through all of his work. From his earliest creations to the last picture he painted before leaving the hospital, Yaretzky, Lif-Kinachi, and Levinson (1994) describe group work in art therapy with “The Home” as the central theme in the life of hospitalized persons. This is especially true if “home” is not necessarily the place to which the patient will return.
The emotional state of the stroke patient, whose motor speech impediment hampers communication, can be deduced from analyzing the elements in the paintings. The motifs in N.‘s pictures are characteristic of paintings by other patients in a similar physical condition. What made N. unique was the continuity in his paintings. This progression turned painting into a language that replaced speech to serve as a means for spontaneous expression. The painting became an integral part of the process of his rehabilitation and return to the community.

Art Therapy: Journal of the American Art Therapy Association invites submissions to a special issue on:

ART THERAPY WITH PEOPLE WITH SEVERE MENTAL ILLNESS

Art Therapy is seeking full-length articles, brief reports, viewpoints, book reviews, and video reviews for a special issue devoted to art therapy with people with serious psychiatric disabilities, including schizophrenia and the mood disorders of manic depression and major depression. Submissions may focus on, but are not limited to, the use of art expression in settings such as psychiatric hospitals, day treatment, community programs, club houses, and client-run organizations. In addition to art therapeutic applications, articles may address related issues such as the relationship between creativity and mental illness, and the relevance of art therapy to disability culture, advocacy, and the concept of recovery.

Deadline for submission is August 1, 1997. Please refer to the “Guidelines for Submissions” at the end of this journal for specific requirements regarding style and format. Submissions that do not adhere to these guidelines will be returned to authors without review. Please send submissions to: AATA Journal, Attn: Susan Spaniol/Associate Editor, 1202 Allanson Road, Mundelein, Illinois 60060.
Considerations for the Treatment of Children with Gender Identity Disorder

Audrey E. Bergin, MA, ATR, and Mary Ann Niclas, LCSW-C, Timonium, MD

Introduction

The treatment of children with Gender Identity Disorder is laden with extremely important ethical and moral considerations. As therapists, we understand that any treatment of behavior outside the bounds of a culture's expectations must be approached with caution and with a thorough understanding of the culture in which it occurs. However, this diagnosis, because it is additionally burdened by society's gender expectations and by one's own gender and resultant expectations, requires even more care. It is of paramount importance that we clarify our own biases and expectations of gender-based behavior before attempting treatment of children with Gender Identity Disorder. The children deserve no less.

Cultural Considerations of Gender

Gender-typed behavior, as all behavior deemed appropriate or inappropriate, is defined by culture. Therefore, it cannot be universally described and attempts to do so have failed (Luria & Jacklin, 1983). Since norms are set by each culture, they grow and evolve with the culture. Our culture's approach to gender-based behavior has evolved to the point of a question rather than an answer: What is gender-appropriate or gender-normal behavior? And, so far, we have been unable to quantify an answer.

Work by Luria and Jacklin (1983) showed that only a minority of the grade school children studied were behaving the way society expects, based on their gender. This clearly illustrates that our expectations of appropriate behavior of boys versus that of girls is based on stereotypes and not on reality. However, it must be noted that stereotypes create cultural expectations—they put pressure on children to conform and they put pressure on adults to define divergent behaviors not as harmlessly different but as potentially harmful or aberrant.

A rather extreme example of cultural gender-based differences is described in Herald's (1987) study of the semen-eating cultures of New Guinea, such as Sambia. In these cultures, prepubescent boys are housed with older men. The boy's male partner repeatedly feed them semen through the act of fellatio. They believe that the semen has growth-giving powers necessary for a boy to become a man. Once fully grown, the young man leaves the house ready for a heterosexual marriage. "These cultures lack any word for homosexuality..." (Luria & Jacklin, 1983, p. 547).

This ritual is considered a normal, healthy, and necessary route to manhood within its culture. In our culture it would be considered deviant and abusive. This clearly illustrates that normal sexual and gendered behavior is defined by culture, not by biology. So too is the diagnosis of Gender Identity Disorder.

However, it is not just culture which defines, as well as impedes, this diagnosis and treatment. It is our individual gender and expectations as well. Unlike other aspects of a client's personal therapeutic issues, such as a history of abuse, socioeconomic status, marital status, race, and religion, gender cannot be filtered out of a pool of available therapists. There are no androgynous therapists who could truly treat gender-related issues objectively.

In addition, in our culture male traits have dictated what is considered the norm and it is on this foundation that the diagnostic criteria of Gender Identity Disorder is based. Travis (1982) discusses research in the field of psychology which describes differences between men and women. She describes the liberal point of view that men value their work ethic more than women, implying that there is something wrong with women. Travis asks why it is not stated that men overvalue their work compared to women. According to Luria and Jacklin (1963), Western philosophies tend to polarize differences, giving one side positive value and the other side negative value. There is an unspoken message which accompanies our culture that categorizes differences into polarities of good and bad, superior and inferior, normal and abnormal, and when we make a diagnosis we go through the same process. Rather than accept deviations from the norm, we tend to classify them as unhealthy. Due to the combination of cultural expectations and individual biases, the diagnosis and treatment of Gender Identity Disorder is fraught with pitfalls.

The Question of Treatment

Imagine that you, as a small boy, find yourself daydreaming not about sexual liaisons with girls, but about the opportunity to cuddle with another boy. Pretend that you have no real interest in the opposite gender but find members of your own fascinating. Then try to imagine what would happen were you to communicate this interest to your peers. Their disgust and aversion would create in you a pro-
found shame in the immediate situation because of the sudden
impeachment to mutuality and shame at yourself for being wrong,
defective, disgusting. (Nathanson, 1982, p. 298)

This scenario illuminates the high price society extracts
from individuals who deviate from gender expectations. As ther-
apists, it is our job not to add to that price unwittingly. That is
why a careful and thorough evaluation of our biases is critical to
successfully deal with gender issues. Our individual comfort
level with our own sexuality and the clarity we bring to our own
definitions of maleness and femaleness ultimately determine
how that child is viewed and assessed. That, in turn, drives how
the child is diagnosed, which, in turn, drives the treatment plan.

Even the diagnostic criteria can work against our best efforts
for objectivity. They are heavily reliant on individual inter-
pretation (e.g., "... strong and persistent preferences...",
"... intense desire...", "... persistent discomfort...", etc.).
There are simply no quantifiable measurements for children
with Gender Identity Disorder. Therefore, careful consideration
needs to be given to the diagnostic criteria. In addition, clinici-
s' biases will also determine the degree of masculinity or
femininity associated with the identified behavior. Since ob-
jective measures appear to be lacking, and cultural and individual
factors will influence how one defines normal or abnormal, it is
particularly important for the therapist to assess the source and
nature of the behavior defined as problematic.

The hurdles to an appropriate diagnosis are awesome. An-
Objective, quantifiable measurements are unavailable. Cultural
and individual factors greatly influence our ideas of normal and
abnormal. But there are practices that can help the therapist
overcome those barriers. A thorough assessment of the source,
nature, and the context of the behavior helps us better approach
and design appropriate treatment.

The following considerations help map out the scope of the
behavior, its possible stimuli, and its larger context (Rotheram-
Borus & Gwadz, 1993):

- Evaluate the number and types of current and prior sexual
  behaviors of the child.
- Take a thorough history of any sexual behavior problems.
- Consider possible motivations for the sexual behaviors.
  Are other children involved? If so, what is the client's
  relationship to the other children? Is bribery, trickery,
  or any type of coercion used? How does the other child(ren)
  feel regarding the sexual behavior of the child
  being assessed?
- Review the developmental history of the child. Is there
  emotional or physical abuse or neglect? Is there sexual
  abuse?
- Assess the child's school behavior peer relations, behavior
  at home and out-of-home activities (day care, recrea-
tional programs and so forth).
- Focus on the collective family history as well as individual
  history. Specific areas to explore are emotional, physical,
  or sexual abuse, psychiatric disorders, divorces,
  incarcerations, and sexual battering.
- Evaluate the emotional and sexual climate in the home.

In addition, it is imperative to assess the child's perception
of gender differences and the meaning he or she associates with
those differences. For example, does a girl really want to be a

Table 1
Diagnostic Criteria for Gender Identity Disorder

A. A strong and persistent cross-gender identification (not
merely a desire for any perceived cultural advantages of
being the other sex)

In children, the disturbance is manifested by four (or more)
of the following:
1. repeatedly stated desire to be, or insistence that he or
she is, the other sex
2. in boys, preference for cross-dressing or simulating
female attire; in girls, insistence on wearing only
stereotypical masculine clothing
3. strong and persistent preferences for cross-sex roles in
make-believe play or persistent fantasies of being the
other sex
4. intense desire to participate in the stereotypical games
and pastimes of the other sex
5. strong preference of playmates of the other sex

In adolescents and adults, the disturbance is manifested by
symptoms such as the stated desire to be the other sex,
desire to live or be treated as the other sex, or the convic-
tion that he or she has the typical feelings and reactions of
the other sex.

B. Persistent discomfort with his or her sex or sense of inap-
priateness in the gender role of that sex

In children, the disturbances manifested by any of the fol-
lowing: boys, assertion that his penis or testes are disgusting
or will disappear or assertion that it would be better not to
have a penis, or aversion toward rough-and-tumble play and
rejection of male stereotypical toys, games, and activities;
in girls, rejection or urinating in a sitting position, assertion
that she has of will grow a penis, or rejection of wearing
breasts or menstruating, remarked aversion toward nor-
matve feminine clothing.

In adolescents and adults, the disturbance is manifested by
symptoms such as preoccupation with getting rid of prima-
ry and secondary sex characteristics (e.g., request for hor-
mones, surgery, or other procedures to physically alter sex
characteristics to simulate the other sex) or belief that he
or she was born the wrong sex.

C. The disturbance is not concurrent with a physical intersex
condition.

D. The disturbance causes clinically significant distress or
impairment in social, occupational, or other important
areas of functioning.

Code based on current age:

- 302.6 Gender Identity Disorder in Children
- 302.85 Gender Identity Disorder in Adolescents or
  Adults

Specify if (for sexually mature individuals):
Sexually Attracted to Males
Sexually Attracted to Females
Sexually Attracted to Both
Sexually Attracted to Neither

boy, or does she desire the societal or familial privileges associated with being a boy?

The therapist must carefully consider the goals of treatment. Clearly one would like to alleviate underlying psychopathology and reduce the child's social ostracism. Examination of one's biases and prejudices is most important at this juncture. If the function of therapy is to help others listen and respond to their true selves, then working to suppress a genuine sexual orientation is not ethical, moral, or therapeutic. How can one be "wrong, defective or disgusting" for being honest with oneself?

When treatment begins, we suggest it take place on two different levels: family therapy to address marital conflict or parental psychopathology, and psychotherapy for the child. Meyer and Solmer (1983) state that children who present with Gender Identity Disorder &'up tomatology'... very often serve as the vehicle through which parents express their own problems with self-image or sexuality' (p. 161). In fact, Stoller (1972) offers the idea that Gender Identity Disorder is a disturbance that rests not with the individual child but with interpersonal family dynamics.

The second part of treatment is psychotherapy for the child. This process is difficult to quantify; however, case studies written in a qualitative or descriptive fashion give the impression that children benefit from the therapy ("Gender Identity Disorder and Early Object Loss"). Art therapy and play therapy are recommended modes of treatment because of their symbolic, metaphorical, and nonthreatening nature. Using these modalities, children are able to work through possible issues of abuse or family tension and conflict, all of which may be the underlying dynamics behind Gender Identity Disorder. The following case studies illustrate these concepts.

Case Study 1: Clyde

Clyde is a 10-year-old boy being treated in a residential treatment center for children who are severely emotionally disturbed and dangerous to themselves and others. He is the youngest child of Ms. Morrison. His only brother, Fred, is 16. Clyde was referred for treatment after numerous hospitalizations for aggressive and sexualized behavior as well as suicidal ideation and gestures. Clyde was 3 years old when his parents separated; both he and his brother continued to live with their mother. According to Clyde's mother, Mr. Morrison was a violent alcoholic and drug abuser. During their years together, Mr. Morrison was reportedly physically, emotionally, and sexually abusive to his wife. Ms. Morrison alluded to being sexually abused as a child by a family member. Her anger at this and at her husband was still fresh; she openly stated that she hated men and feared her son would grow up to be like their father. Clyde had limited contact with his father. The treatment team suspected that Ms. Morrison used Clyde's numerous hospitalizations in part to hide him from his father since she believed her husband had sexually abused him. In the past, when Mr. Morrison visited Clyde in the hospital, Ms. Morrison removed him from treatment immediately. She also moved her home and refused to provide her new address to staff since she did not want Clyde's father to know where they were living. Ms. Morrison told the staff that if Mr. Morrison ever exercised his legal rights to visit Clyde, she would remove Clyde from the facility.

Clyde's treatment consisted of individual art therapy and milieu, group, and family therapies. His working diagnosis was Major Depressive Episode with features of Gender Identity Disorder also noted. During the initial family therapy session, Clyde curled up in a fetal position on his mother's lap and babbled baby talk. This was acceptable to Ms. Morrison and even welcomed by her. Fred did not participate in the family sessions. As therapy proceeded, Ms. Morrison revealed that Clyde was dressing in feminine clothing, talking in a girlish voice, and saying that he wanted to be a girl. Although staff never observed any of this behavior, Clyde did admit that he "... would do anything to get [his] mother's attention." The treatment team suspected that Ms. Morrison's active hatred of men, coupled with Clyde's strong desire for her attention, encouraged Clyde's feminine behavior. In addition, his behavior was reinforced by Ms. Morrison's videotaping him when he behaved like a girl. Ms. Morrison said the videotaping was to prove to mental health professionals that Clyde was gender identity disordered. It was the treatment team's opinion that Clyde's need for his mother's attention at almost any cost and the resulting enamishment of the two were the source of Clyde's feminine behavior. 

Clyde and Ms. Morrison attended weekly family therapy. Initially, the therapist worked to assist Ms. Morrison in encouraging Clyde's age-appropriate behavior, in setting limits on unacceptable behavior, and in developing her own outside interests and friendships as a way of decreasing enamishment between the two. With support from the family therapist, Ms. Morrison was able to set limits on Clyde's infantile and aggressive behaviors. Also, with that support, she joined a local church group. Soon after, Clyde's talk decreased, as did his destructive and sexualized behaviors.

Clyde began individual art therapy concurrent with his family therapy. (The art therapist and the family therapist were different clinicians.) Early in his individual treatment, Clyde drew several family pictures (Figure 1). In these pictures he depicted himself and his mother wearing similar clothing, which appears to be a dress. His older brother is clearly differentiated by his clothing: he is wearing a T-shirt and shorts. A quick analysis of the picture would possibly indicate features of Gender Identity Disorder. However, given the family history and the dynamics of their interactions, it seems to be reflective of Clyde's enamishment with his mother. It may also suggest Ms. Morrison's projective identification on Clyde due to her past experiences, which may have deepened Clyde's sense of enamishment.

During spontaneous sand tray play, Clyde repeatedly expressed a sense of conflict which seemed symbolic of his family's conflict. For example, Clyde placed a large dragon in the center of the sand tray, dividing it into two sides. The animals that lived on either side were unable to move from one side of the tray to the other because the dragon would attack them if they tried. Similar themes of conflict were seen in his artwork as well.

Since conflict related to family seemed to be a repetitive theme, Clyde was prompted to create a story with pictures about a family of birds. He was given the scenario of a mother bird and two baby birds who were young and could not fly well. The mother bird was worried about the babies and did not want them to fly far because of all the terrible things that could happen to them.

What follows is Clyde's completion of the scenario.
Once upon a time, there was a tree with three little birds in it. Figure 2: One bird was the mother and she had two baby birds. As the babies got older, they began to explore the rest of the tree. Figure 3: The mother bird used to worry about them because she knew there were cats around. The mother bird had a way to protect the babies from cats. She knew of a nearby bush where she could move the babies in order to hide from the cat. Every day the mother bird sees the cat, and knows it is coming. The mother bird tells the babies, and they all fly to the bush. Figure 4: The baby birds are scared. Eventually, the cat quietly climbs up the tree, then suddenly jumps out and grabs one of the baby birds. The baby bird starts flapping its wings as fast as it could. It gets free from the cat and flew away. When the cat has the baby bird, the mother comes out and starts pecking at the cat. Figure 5: They all get safely back to their nest. The three birds get together and build a watchtower (Figure 6). The watchtower had everything they need. Overhead, a bird patrol flies. The family can call anytime there is a cat nearby. Then the bird patrol takes the cat away. Sometimes the cat comes back, but the family can always call the bird patrol again. Eventually, the cat learns to stay away from the tree. And the bird family lives happily ever after.
TREATMENT OF CHILDREN WITH GENDER IDENTITY DISORDER

Clyde’s story gives a clear picture of his perception of the family dynamics. One could interpret the mother bird’s behavior as a metaphor for his own mother’s behavior, and her fears concerning Clyde’s father. The artwork allowed Clyde to begin experiencing his feelings about his family situation. As a result, his presenting behavior problems decreased significantly over his 3-month stay, and he was discharged home, continuing treatment in outpatient therapy.

Case Study 2: Joe

Joe is a 12-year-old boy being treated in the same residential facility as Clyde. Joe has one younger sister, age 7. Joe’s sister lived with a family friend. The children were not able to live with their parents due to the parents’ own difficulties. Joe was referred for suicidal ideation, running away, making false abuse allegations, and fighting. In addition, Joe exhibited sexualized behavior such as voyeurism, cross-dressing, and what is typically defined as “feminine behaviors and body language.”

Many of Joe’s behaviors quickly stabilized upon entering the facility. During his 9-month stay, no suicidal ideation was observed, and there were no episodes of running away or severe aggression. His behaviors were mainly manipulative and characteristic of a boy struggling with gender issues. For example, Joe borrowed a female friend’s lipstick and used it secretly. He was also intrigued by a popular female vocalist and had a shrine to her in his room (Figure 7). He emulated her movements and make-up style and desired her wealth and popularity. He attempted to do this privately. He formed a GAY Club with some of the younger boys on his unit and tried to keep it hidden from staff. Lastly, Joe fantasized that a male staff member would kiss him on the cheek.

Joe participated in weekly individual and group therapy and monthly family therapy meetings with his mother. In his individual therapy, he was initially very guarded and tried to keep conversations on a superficial level. When this failed, Joe attempted to shift the focus onto the therapist. As Joe began to trust the therapist, he started questioning the changes in his body. Joe and the therapist reviewed books to answer his questions. The books presented the material with a heterosexual orientation. Joe was told that although the book presented boys liking girls and vice versa, some boys like boys and some girls like girls, and that was acceptable. At first Joe questioned the normality of boys liking boys. Given time and reassurance, he was able to accept this possibility. A few weeks later he decided to tell his mother that he was gay. After this, Joe seemed very comfortable with his homosexuality, and the focus of his therapy shifted to helping him cope with society’s reactions. The manipativeness around the behaviors described earlier gradually subsided. Joe’s mannerisms became more overt. This was seen as a healthy sign because less energy was going into deception and was instead channeled into self-acceptance.

Conclusion

There has been much controversy surrounding the diagnosis of children with Gender Identity Disorder. Perhaps this diagnosis has become a replacement diagnosis for that of homosociality, which was removed from the Diagnostic and Statistical Manual in the 1980s. Indeed, even within the homosocial community there is disagreement about “whether this is a problem of sociology or biology or even if it is a problem” (Luria & Jacklin, 1983, p. 552). This debate is on-going in the mental health arena as well.

We have presented a critique of childhood gender-typed behavior and the diagnosis of Gender Identity Disorder itself. Given this, it is our opinion that responsible clinical behavior requires assessing and treating possible underlying causes, such as sexual abuse or family dynamics, when presented with a child who shows possible signs of Gender Identity Disorder. Not to do so could be a violation of one of the basic tenants of ethical treatment—client self-determination. If, on the other hand, the long-term goal of treatment is to prevent homosexuality, the morality of the treatment must be called into question.

The Absent Father: Gender Identity Considerations for Art Therapists Working with Adolescent Boys

Martha P. Haeseler, MA, ATR-BC, Guilford, CT

Discussion

The poet Robert Bly (1990) writes, "Twenty to thirty percent of boys now live in houses with no adult male present" (p. 186). For art therapists who work with inner-city adolescent boys, this statistic often reaches 100%. Bly says that in contemporary society, the image of the male, and the father, is debased and that in the absence of male mentorship boys grow up "soft" (Ibid., p. 4), emotionally numb, and ashamed. Bly says boys need to get in touch with the "Wild Man...the positive side of male sexuality" (Ibid., p. 223), to develop their resolve, spontaneity, Kingly and Warrior qualities, and their ability to grieve. According to the psychoanalyst Peter Blos (1962), masculine gender identity formation depends on an identification with the same-sex parent. "Nothing can be accomplished without...[the boy's] having come to terms with the father, or rather, with his image or object representation" (Ibid., pp. 156-157). It is interesting that both poet and psychoanalyst, writing 28 years apart, emphasize the importance of the father or male mentor in a boy's life. Additionally, current research has identified that boys from father-absent homes show greater feminine role identification (Kodandaram, 1991), delinquency, mental disorders, poor academic performance (Lewis, 1991), reduction in cognitive and linguistic abilities (Tarantino & Zorichini, 1989), and poor self-esteem (Harper & Ryder, 1986).

What is masculinity? Some define it as "any quality that is felt by its possessor to be masculine" (Stoller, 1955, p. 11). To one teenage boy, long hair is masculine; to another, no hair is masculine. Others (Blos, 1999, pp. 5-6) define masculinity as culturally, more than individually, determined. Bakoff (1959) writes that given the variations in child-rearing in our culture, "a variety of male human sexual behavior...[should be considered] normative" (p. 25). Masculinity is associated with gender identity, but separate from sexual preference; a male homosexual may be conventionally masculine.

Are there masculine and feminine characteristics in art? In 1963, Erikson noticed that young boys built towers out of blocks while girls built containers and houses, thereby recapitulating their anatomy (p. 106). Despite subsequent feminist influences on child-rearing practices, and despite the changing roles of men and women since 1963, some gender differences are still easily observable in child art (Silver, 1992; Silver, 1993) and play (Cilligan, 1993, pp. 9-11) (Figure 2). Is the creative process in men partly propelled by a wish to give birth to a baby? (Blos, 1962, p. 63). Can we see the art process itself as embodying both feminine and masculine characteristics—empathy and expressivity combined with forceful action? Do we not all contain the masculine and feminine within us, the animus and anima?
In classical psychoanalytic thinking, when the boy enters the oedipal stage he still identifies with the active phallic mother and turns his libido toward father, wishing to have a baby by him (Blos, 1962, p. 26). This is called the negative oedipal stage (Figure 3). The positive oedipal stage begins when he turns his libido towards mother and competes with father. He then represses these desires, partly due to castration anxiety, accepts the reality principle, forms the superego, and begins an identification with father that is the basis of the ego ideal and helps consolidate the masculine identity. Blos (ibid.) writes that if the oedipal stage is not resolved in this way the boy remains in submission to the phallic mother, who is both desired and feared. The absence of the father during the oedipal stage can hamper the boy’s ability to gain a foothold in the reality principle as well as in masculinity. (Max’s chief complaint on admission was “reality frightens me.”)

Gender identity is thought to be established in most cases in early childhood (Rakoff, 1989). However, as the boy enters adolescence these conflicts around attachment, identification, and sexuality (Figures 2 and 3) are revived, offering him another chance to rework them in a way that results in a gender identity and sexuality that is congruent with sense of self. Rakoff (1989)

Figure 2 Adolescent boys often draw thinly disguised phaluses: “My Thumb.”

How is masculinity developed? Biologically, “the ‘resting state’ of tissue is female” (Stoller, 1955, p. 74) unless given a hormonal push in utero by androgens to differentiate into maleness. In the psychoanalytic model, the boy baby, when in symbiosis with the mother, identifies with her. Stoller (1955) writes that “for masculinity to develop, each infant must erect intrapsychic barriers that ward off the desire to maintain the blissful sense of being one with mother” (p. 182). These protective barriers contain “fear of female anatomy, envy and resultant derision of women, fear of entering their bodies, fear of intimacy, fear of manifesting feminine attributes...” (p. 182) as characteristics of what we have come to know as homophobia. Many writers emphasize the importance of the father as “a vital part of the separation-individuation process” (Blos, 1959, p. 11). Stoller (1955) writes that the pre-oedipal father “serves as a shield to protect the child against impulses the mother might have to prolong the mother-infant symbiosis... serves as mother’s main support. ...later directly modifies behavior by reward and punishment... [and] serves as a model... for identification” (p. 40). Mahler, Pine and Bergman (1975) write that “identification with the father or possibly with an older brother facilitates a rather early beginning of the boy’s gender identity” (p. 215). The child’s relationship with the father is more in accordance with reality because it is not overlaid with a history of symbiotic attachment, as is the relationship with the mother. Bouchard (1955) stresses the importance of the pre-oedipal father in helping the child develop autonomous ego functioning.

Figure 3 Max drew this just after mother’s lover left the family. Max pointed out that the skeleton giving “stillborn” birth is itself a baby holding a rattle. Note the fetuses in the corners. “My mother didn’t like this picture.”
writes. “The father in most societies is the bridge from the domain of intimacy, emotional bonding, sexuality—the locus of our ‘clothed’ experiences—to the public culture of duty, the performance principle, the life of political mankind—our clothed experiences” (p. 30). By writes that boys must first bond with women, then separate, then bond with men and separate: “...boys need a second birth, this time a birth from men” (p. 16). Bly writes of object hunger for the same-sex parent in adolescence (p. 91). By writes of ‘father-hunger’ (p. 94) which women cannot feed.

What if there is no man in the boy’s life? Eames (1959) writes, “It is the intensification of the oedipal and pre-oedipal tie to the mother that makes adolescence so turbulent in father-absent situations. The need aggressively to break away from both the sexual and the dependent attachments that have not been adequately mitigated by a close connection with the father, one that might prepare the boy adequately for his masculine role” (p. 24). Max said, before discharge, “I guess I’m tied to my mother’s apron strings. That’s why I’ve always liked to take off to fantasy places in my mind.” Bly writes that the central theme of male preadolescence is ‘castration anxiety in relation to the phallic mother’ (p. 64). Figures 4 and 5. The image of the witch, the vengeful woman warrior, the fearsome goddess Kali, is ubiquitous in mythology, literature, and the artwork of adolescent boys. Figures 6, 7, and 8. By writes that “the possessive side of the Great Mother will start its imprisonment” (1990, p. 157) (Figure 9) unless men call the boy’s away. The oedipal victor is a Pyrrhic

the home, a teacher or even a gang leader. For father-absent
boys, a same-sex therapist is often recommended (Moberly,
1986).

Can a female art therapist help these father-absent boys? Is
she a second-choice therapist, less effective than a man. Not
necessarily. I think a woman can be effective in treating these
clients if she is aware of their special needs.

Most importantly, she can be sensitive to the boy’s need to
establish clear boundaries in the therapeutic alliance. She is care-
ful lest her caretaking instincts feed the fear of merging. Much
has been written about the need for the art therapist to provide
a nurturing holding environment, a maternal matrix within which
the client can begin to separate/individualize (Lachman-Chapin,
1987; Robbins, 1987). However, as Gilligan writes, “Since mas-
culinity is defined through separation while femininity is defined
through attachment, male gender identity is threatened by inti-
macy…” (1982, p. 5) and these boys easily become lost in that
empathic sea. Figures 10 and 11, portraits of an art therapy
intern drawn only partly in two, suggest how frightening the artist
perceived his attachment to her. (See also Figure 12.) Blox
(1982) writes that “the therapist’s aim is to replace infantile shar-
ing and merging by identification, or… to replace the search for
external sources of self-esteem, by the discovery of one’s own
resourcefulness” (p. 228). Transference becomes quickly evident
in working with these clients, manifesting itself either as a yearn-
ing to return to the symbiotic union, or more commonly, as

**Figure 7** Max. She has no weapons but “the horned
monster protects her.”

**Figure 8** As Max works on drawing a realistic female
face and body, the monster/male face seems to be fading away. However, the
woman in the bottom becomes masked and then a monster face emerges from her.

**Figure 9** The 16-year-old artist said, “This is a fantasy
pleasure chamber. The woman on the huge
video is inciting the people to dance faster
and faster and they are having so much fun
they don’t notice that they are beginning to
bleed and die.”
Figure 10 By a 14-year-old. Portrait of the art therapy intern.

Figure 11 By a 14-year-old. Portrait of the art therapy intern.

Figure 12 By a 14-year-old. "The nurses are out to get me with their hatchets."

Figure 13 Max: The central portion of this last work reads, "Long ago I wandered through my mind in the land of fairy tales and stories, lost in happiness (sic). I knew no fears. Innocence and love was all I knew. Was an illusion." The sun is coming up over the sleeping village as Max makes a turn from fantasy to reality.

The growing ability to see the art therapist as a real other, separate from himself, introduces into the symbiotic relationship what Ogden (1986) calls "threeness" and helps the boy individuate. He can then identify with the considerable resourcefulness and risk taking that artmaking requires and with the public role of the artist. The artmaking itself can represent a move from the enclosed intimate world to the clothed public world of action, the performance principle," and reality Figure 14.

Chasseguet Snger writes that "the mother's responsibility is to bring the child to project his ego ideal onto successive and ever more advanced models" (1984, p. 28), encouraging him to admire this father rather than devalue him. The art therapist, alert to these issues, can help the boy celebrate his maleness.

1 As I can make my strengths and talents known to adolescents they can identify with the attributes I possess while clearly seeing me as separate from themselves. They can become comfort
This may mean providing materials for large constructions, or stone carving, for example. However, Rukoff (1989) writes, "Should the therapist share the implicit assumption that a valid masculinity is to be expressed only as a fully heterosexual sexual orientation, then the uncertain, troubled adolescent will undoubtedly be given invalidating messages rather than the support and education he requires" (p. 29).

Art therapists who empower these clients as artists can help them gain a foothold in their preferred style of masculine identity and provide the means with which they can express dynamic issues such as father-hunger and fear of the phallic woman, get in touch with grief and anger, search for gender identity and the "male face," discover the Warrior’s resolve and spontaneity, and create the Wild Man.

Tim

Fifteen-year-old Tim, hospitalized for a suicide attempt, had come to a standstill, giving up his usual love of sports to sit on his bed and stare into space. Although his parents divorced when he was 5 and his father moved out, Tim had maintained a close relationship with him until 2 years ago when Tim and his mother moved to the United States from their native Caribbean island. Tim had not seen his father since. In Tim’s first art therapy group he drew himself "a half a person; that’s how I feel" (Figure 14).

Other artwork illustrates issues of father hunger (Figure 15), gender identity and sexuality (Figures 16 and 17), and fear of and anger at women (Figure 18). When his father arrived to
Figure 18 Tim: "Those are my mother's hands tearing my world apart."

take him back to his island home, Tim drew Figure 19, his first picture in color.

A Mother's Journey of Healing: When a Child Changes Gender

Linda Milligan, MPS, ATR, Voorhees, NJ

As an art therapist working in a juvenile prison, I often find myself reflecting on imprisonment and its many forms: physical, emotional, and or spiritual. After some contemplation, I found myself working on a very detailed drawing in dots with pen and ink. This was a very soothing process and, as the image took shape, I discovered I was creating a fable. The artwork, “Martin’s Fable,” Figure 1, is a picture of a woodland nymph trapped inside a bubble. Although she has many fine woodland treasures that could make her happy and healthy, she longed to be outside her bubble. One day a magician came, gently wrapping his wing around her. They flew away; she went from darkness to light.

As I studied the finished picture, I was struck by the similarity between the fable and my son’s life. Although “Martin’s Fable” is a recent picture, it stirred a desire to reexamine art that I created years ago as I struggled to understand an extraordinary event in my child’s life and to heal my pain from loss. Like the recent message of “Martin’s Fable,” this brief article is a reflection of my earlier journey from darkness to light.

Eight years ago my oldest child, at the age of 20, began the exploration of deep feelings later diagnosed as Gender Identity Disorder DSM IV, 1994. This resulted in a female-to-male gender change. It is not in the scope of this article to explore the cause or ramifications of transgender disorders. Rather, it is to look at how a book of art helped a mother integrate this change. Looking back, I remember that my own feelings closely followed a pattern described by Kübler-Ross in On Death and Dying 1969: denial and isolation, anger, bargaining, depression, and acceptance. However, as I look over my art, I see three primary stages: stage I, consisting of denial, isolation, and bargaining; stage II, anger and depression; and stage III, acceptance and hope.

The first stage began when I learned of my daughter’s deep feelings, and her need to explore the possibility of gender dysphoria. My thoughts and reactions were vague and very intellectual. I hoped the situation would resolve itself so I chose not to deal with it, talking little about it to family and friends. I did a good deal of denying, isolating, and bargaining with God, hoping that another reason would be found to explain her profound feelings. I did not make art during this period, as my denial led me to believe I had no pain to express.

The second stage began when changes in my daughter became obvious, dressing as a male and using a new name, Martin. It was at this point that I turned to my art to express my feelings, which were mostly pain and anger. Figure 2. I created a collage to express what I knew and didn’t know. I knew I had lost my daughter, but did not know what it meant to have a son. I felt that my memories of my child would fade away, and that she had been torn from the very center of my being. For the next year or so I struggled with sadness over this change. Figure 3 and anger, because I had no say in this event. Figure 4. I feared that I and others would not understand, and barrie could come to my child. Figure 5.

I struggled with a great deal of confusion as I sifted through my understanding of gender, sexual orientation, and their impact on happy, healthy relationships. Figures 6 to 10. My sadness and anger were also based on my feelings of failure and rejection: failure that I did not accept this change instantly, and feeling that my attempts to comfort my child were being rejected. I believe my anguish was my self-imposed prison of expectations. At the core of those expectations was the belief that if I could be more than the “good enough” mother Winnicott, 1971, I would not lose my child.

Figure 1 Martin's Fable, pen and ink, 18” × 12”

Figure 2 Untitled, collage, 18” × 12”
Over time, anger, depression, fear, and confusion developed into a patchwork quilt. My artwork was done on 18" x 24" paper with tempera paint. The paint was thick, with lots of movement and many deep colors. I found myself exploring the feel of the paint, pushing it about as I pushed about my new and old beliefs about people and things I loved. My images contained people, sometimes naked, and at other times color and design were imposed on the bodies to express conflict. The conflict centered on these questions: Are we what we see or are we what we feel? Is our "being" visible or invisible? Can our bodies be our prisons?

The concept of imprisonment is expressed throughout my art with thick borders or blocks of color around the people, and lines of color separating sections. At times, the content is circus themes, playful, and humorous (Figure 6). This paralleled how I sometimes spoke to friends about this change. I often found myself mixing male and female names and pronouns as I reflected on past and present events. I found humor a saving grace as it eased my pain and helped to put others at ease. The playfulness of the images helped me feel safe as I looked at the intense feelings expressed. The playful subjects minimized the sense of being imprisoned in time and place.

The flying trapeze artists symbolize the courage of change.
physical or emotional, and the need for those feelings to be seen and acknowledged. Change is the process of traveling from pain and darkness, through fear, to a new understanding and light.

My art brought release and much comfort. Sometimes the paintings were done quickly, like sketches—intuition and energy pouring out. At other times I painted colorful dots over and over, creating pleasing patterns which helped me to feel connected to my daughter. Later, instead of dots, I used glitter to soften the strong feelings. The glitter had a way of falling off the painting and turning up in unexpected places, reminding me of my son. Those small pieces of glitter, and the brief moments when found, helped to integrate the larger event into my life.

I did not always understand the images, or why I needed to create so many, but they poured out rapidly and with little planning. The images presented in this brief article are just a small portion of the dozens painted.

I believe that acceptance (stage III) began in my art and in my heart before I realized it intellectually. I remember an uneasiness while I painted “The Spell” (Figure 7), yet I felt a deep connection with each figure, male, female, old, and young. We all have many aspects of ourselves, and the journey of life is to understand how they fit together. The egg and tree of life are symbols of a new life, my son. This was followed by a very pregnant form, sharing of news (Figure 9) and the appearance of hearts on the mother and child (Figure 10).

Acceptance is a dance of gains and losses. As I got closer to a full acceptance I began using soft pastels. The sadness I felt was softer, more manageable, and inside me (Figure 13). It no longer felt overwhelming. I also felt a soft connectedness with my child (Figure 12). I began exploring the relationship of being a mother to a son.

Acceptance is further expressed in Figure 13, done in tissue collage. It is a soft impressionistic landscape with myself off to the right side. I am peacefully watching. What is out in front is not clear but is workable. This was the last image in a series begun 2 years ear-
lier. At that point I had come full circle, a mother watching her child go from childhood to manhood, and I knew I embraced this new person... my son.

In the picture, “Martin’s Fable,” the magpie helps the woodland nymph escape from the bubble by traveling with her from darkness to light. My child traveled a similar path, changing the physical outer self to match the spiritual inner self. Likewise, my art helped me travel through the grief process. I escaped the spiritual prison of isolation, anger, judgmentalism, and self-imposed expectations, and moved towards an acceptance of the process of growth and self-fulfillment.

My journey of acceptance was much like a spiral staircase, slowly taking me upward from darkness to light. Each time I reexamined a question, my understanding moved to a higher level—a level that was clearer and softer. Art allowed creativity to solve my inner struggles by adding distance without denying pain. It permitted an exploration of outcomes, preventing me from getting locked into one view during the process of change. It gave voice when I had no words to explain the questions I was trying to understand and answer.

My healing took time. At first I believed my grief related to the loss of my daughter. I came to understand it as my fear of losing a relationship due to a belief system which prevented me from seeing my child as a whole being. Artmaking helped me to safely explore the importance of gender, body shape, and sexual orientation in our relationship. These are complex issues not given to quick, easy answers. I have come to accept this change and embrace my son with all my heart. I know Martin is a much happier, more fulfilled person as a male, and our relationship continues to be unique, as it was before the change.

Art Beyond Humanism: Non-Western Influences on an Art Therapist’s Practice

Martin Perdoux, MAAT, ATR, Chicago, IL

In this article, I present the viewpoint that the doctrine of humanism limits my practice of art therapy. In Merriam Webster’s Collegiate Dictionary (10th ed.), the traditional Western definition of humanism is “a doctrine, attitude, or way of life centered on human interests or values; especially: a philosophy that usually rejects supernaturalism and stresses an individual’s dignity and worth and capacity for self-realization through reason” (1993, p. 561). Whether we recognize it or not, most of us art therapists were born and raised in a Western Eurocentric culture, and our thoughts and actions are shaped by the philosophy of humanism. It is, as the dictionary reminds us, our “way of life” (1993, p. 561), and it is a matter of responsibility to be aware of it. Please note that I am not writing about humanistic therapy, but the all-encompassing attitude of humanism that underlies all forms of therapy, including art therapy, and all forms of Western thought and action. Making art on my own or alongside other people reminds me that humanism, the way of life within which art therapy developed, has limitations that are worth examining.

It is very hard to see something so vast when you are standing in the middle of it, and the only reason I saw the influence of humanism is that I stepped outside it when I had the good fortune to live for 10 years among the Kumeyaay, a southern California Indian tribe. The Kumeyaay language does not separate the world into the natural and supernatural, as English does, and this has encouraged its users to resist European humanism. The Kumeyaay find no “magic” in what European descendants would perceive as “supernatural”; for the Kumeyaay, anything that exists is necessarily alive, intelligent, and self-aware. Paula Gunn Allen explains that “many non-Indians believe that human beings possess the only intelligence in phenomenal existence, often in a form of existence” (1992, p. 60). By contrast, “The Indian assumes that this awareness is a natural by-product of existence itself” (ibid.).

Historically, the movement of humanism is “associated with the Renaissance, with its emphasis on secular studies (the humanities), a conscious return to classical ideals and forms, and a rejection of medi eval religious authority”; modern usage often indicates a “respect for scientific knowledge” (The Concise Columbia Encyclopedia, 1983, p. 393). In order to understand how humanism brought about this kind of thought, we must look back to the beginning of Western civilization, to the fall of Adam. Ken Wilber retraces the evolution of scientific knowledge from the initial drawing of boundaries by Adam, which “merely classified... and were useful only in description, definition, naming, and so on” (1979, p. 32). As a matter of fact: Wilber remarks, “Hebrew tradition has it that the fruit of the Tree of Knowledge actually harbored knowledge not of good and evil but of the useful and the useless — that is, technological knowledge” (pp. 31, 32). The descendants of Adam continued drawing metaboundaries to count, and then to measure, what Adam had named. Algebra allowed 17th century scientists “to search out abstract relations between those measurements, which could be expressed in theories, laws, and principles,” laws that “seemed, in some sense, to ‘govern’ or ‘control’ all the things and events marked off with the very first type of boundaries: Adam could name the planets: Pythagoras could count them; but Newton could tell you how much they weighed” (pp. 34, 35). With each new boundary came “more generalized knowledge, and hence more power” (ibid.).

This world of classical boundaries was shattered around 1925 when quantum physics established that the ultimate reality of subatomic particles did not fit the old physical laws and could not even be located. The Heisenberg uncertainty principle established that subatomic particles could not be located because they had no boundaries; therefore, all knowledge based on the laws of physics became null and void. As Wilber states, “The crucial item is that the physicists now know that these boundaries are pretend and make-believe, and that the basic constituents themselves remain no-boundary” (p. 35). Unfortunately for the world, the rest of the Western technocracy did not recognize the full significance of the quantum physics revolution, either because they were not aware of advances in physics or more likely because they did not want to relinquish the sense of control over nature that came with the old classical system of physical laws. “This is difficult for most of us to grasp, for we are still very much under the spell of Adam’s original sin, and so we cling to boundaries as to life itself” (p. 41). This comment from Wilber also explains the difficulty in understanding and letting go of humanism.

If quantum physics has succeeded in forming a worldview that is essentially identical to the Kumeyaay’s, why does the rest of the scientific community continue to grasp at the straws of old classical physics, clinging to outdated scientific knowledge, and living a life principally ruled by the ideals of humanism? This question is particularly pressing when one understands that the sense of alienation, fragmentation, and conflict many people experience is due to the act of drawing a boundary itself. “Because when you establish a boundary so as to gain control over something, the same thing you separate and alienate yourself from that which you attempt to control” (p. 32). The quantum physics revolution is also important for art therapy because the realization that all things are connected in “a richly textured field” (p. 42) changed the scientist’s role from observer to participant (p. 40). If art therapy wants to be part of scientific knowledge it must as well be a part of the most current scientific knowledge. For example, it follows that the art therapist should be a full participant in the artistic process, rather than an observer.
In this article, I use the term self as the answer to the question, Who am I? Wilber explains the process of answering that question:

What you are actually doing, whether you know it or not, is drawing a mental line or boundary across the whole field of your experience, and everything on the inside of that boundary you are feeling or calling your "self," while everything outside that boundary you feel to be "not-self." 1979, p. 4

I also mention the phrase flexible self, which according to Wilber's definition of self is derived from the ability to redraw the boundary line between self and not-self, thereby including more or less of the universe within that boundary. The ability to empathically identify with other humans and other species is proportional to how inclusive the boundary is. Once again, humanism can limit the flexibility of the boundaries we draw because it centers on human interests, and because it does not believe in nonhuman intelligence and self-awareness. In other worlds, humanism can be said to stiffen the self, and its emphasis on reason dictates that we ought not to waste time learning to relate to the "inanimate" world. This means quite literally that the most intelligent, dynamic, and interesting part of the world is absent from our perception of it.

The doctrine of humanism may be followed with well-meaning intentions, but it often results in anthropocentrism, or an anthropologist Ralph Metzner 1992 refers to it, "Human chauvinism, or speciesism" (p. 4). Humanism does indeed invite humans to relate to each other, but that capacity is greatly reduced by the inability to relate to the rest of the universe. Most art therapists would agree that the increased capacity to put themselves in their clients' shoes is crucial to their successful practice. Some have even written books showing that it is in their best interest to acknowledge the intelligence that manifests itself through animals. Allen, 1995; McNiff, 1992: 1 believe that the limits of the humanist attitude are an underlying cause of our relational problems, and that they must be transcended.

Throughout my art therapy practice, I have not only become aware of the importance of having a well-defined and flexible self, but I have also realized that art therapy requires strength and flexibility in an area that is related to the self: the artist's self. This realization has led me to distinguish the terms role and style, which I use as follows: Whereas I favor the nondirective style of the open studio, I assert my role as a leader. The strength and flexibility of my artist's self is of paramount importance in asserting my role as a leader since I prefer to create my own artwork alongside clients in order to be a full participant. I have never felt that my own artistic process permanently intimidates clients. In fact, I find that my participation gradually encourages people to create within the noncompetitive arena of the art studio. This requires that I maintain a certain level of genuine creative activity. This also requires awareness of personal issues addressed by my own art so I can differentiate them from my clients' concerns.

This approach leads me to define my role as helping clients develop their artist's self by "pulling them into my wake," so to speak. The terms artist-in-residence or artist-as-therapist may define my role most accurately, although they are not usually used for someone who works in an institution for people with chronic or acute mental illness. I have so far succeeded in cultivating the artist-in-residence role through slide presentations of my own artwork. This casual group format has been tremendously helpful, especially when the facilities were short of what I call an art studio. Still, the most helpful factor in my ability to cultivate my role as a leader in groups or individual art therapy has been the attitude I refined while I lived for 10 years in a community where thoughts were not shaped by humanism. There, I learned to respect and relate; I began to understand my place in the world and among fellow human beings in a new way. In other words, my self became more flexible.

A flexible self can benefit any human being, provided he or she has a defined self in the first place. Individuals who suffer from mental illness can be characterized as people who did not have the chance to define themselves, or people who lost the self they knew. It is my experience that the definition of an artist-self among people whose self is not well-defined is not only helpful but it may fill a vacuum. It may be that the artist-self provides a self-definition that people with mental illness may lack.

Should this formulation seem disconcertingly simple or even simplistic, understand that it is not ordinary in terms of its value. Outpatient clients kept coming back for more when they were not required to do so. Many demonstrated a level of practice and devotion in their art that would shame most art students. Their motives were certainly not financial; rather, it was simply that they defined themselves in terms of their art. Their art was a controllable field of experience (perhaps the only one in their life through which they could draw a boundary, finally creating an answer to the question, Who am I?"

The subjective experience of mental illness, of not knowing where one's self starts and ends, is undoubtedly terrifying, but it does allow a noticeable capacity to empathically identify with other lifeforms. That ability was demonstrated to me by many clients I saw at the Thresholds, a psychosocial clubhouse for adults with chronic mental illness.

During a weekly group that led to the bimonthly publication of The Missing Place, the literary and arts magazine of Chicago's mental health community for which I was the Editor-in-Chief, a 30-year-old man I will call Mike empathically identified with another species. Imagining he was a cheetah, he painted its running silhouette and attached it to a poem about the wild animal. The humor and wit of the poem suggest the pleasure Mike must have felt while writing and painting:

I yawn. I blink. I stretch.
I roll and shake the leaves off my back.
I meander through the bush.
I freeze; I catch a gazelle in my eyes.
I stalk silently.
With a burst of lightning speed, I race toward the gazelle...
I leap and dig my blunt front claws into its eyeballs.
It falls.
It pants under me and I rest on it for twenty minutes until I have the strength to bite it to death.

Traces of Mike's restless personality and bipolar disorder peer through the wide-eyed portrait of the animal; he even called it "a psychotic cheetah." The caption Mike wrote under the cheetah's portrait also reads like an autobiography: "An endangered specie[sic], the cheetah is the fastest land mammal alive in the African bush." The man has merged with the animal, creating a hybrid. Mike has chosen an animal that is restless and explosive by nature. When he so completely identified with the cheetah, Mike's explosive temper and manic restlessness suddenly became adaptive traits. For the few minutes when Mike drew and wrote, all of his symptoms became useful qualities.
This case vignette illustrates that although an undefined self is not to be wished on anyone, it may allow a similar quality of empathy that a well-defined and flexible self would allow. This client was able to empathically identify with an animal in a way that could be said to be therapeutic in two ways. First, Mike safely explored a new temporary identity as a cheetah in his artwork, and he experienced empathy with the animal, giving it qualities usually reserved for humans. Mike’s exercise, however transitory, seemed to dissolve the boundary between man and animal, moving him away from the alienation of his inner self. Second, for the first time since the onset of his illness, Mike was able to see his symptoms in a positive light. For someone whose symptoms are a tremendous source of frustration and anger, this reframing is nothing short of a revelation. This therapeutic identification with another lifeform could not have happened if Mike had not been encouraged to define his artist-self through years of artmaking at The Threshold.

Beyond its practical applications in art therapy treatment, this relationship between the artist-self and the self also helps explain the romantic conception of art, the creative process, and its fascination with psychopathology. This view of the artist-self indicates that the romantic concept of art may in fact hold some truth: that an undefined self exists for a boundary that can be explored and defined appropriately during the gradual emergence of an artist-self. The romantic view of the artistic process points to important coping possibilities, which so many case studies illustrate; however, romanticism also individuates art and artists from everyday life. John MacGregor (1989) points out that “extreme individuality is an essential component of the Romantic artist and his work,” and that such an artist is “the visionary who alone could see realities invisible to others” (pp. 71, 72).

Everything in Western culture, even art school, teaches us that the creative process should be reserved for a few gifted or diseased ones. Hermetic boundaries have been drawn to isolate art-like behaviors into well-guarded bastions. “Art remains an elitist activity, made and, more important, consecrated by the few” (Dissanyake, 1998, p. 183). Contrast this idea of art “separated from primary lived experience” and the quality of life I experienced among the Kumeyaay, where “virtually everyone was a participant in and appreciator of art” (Thid.), and you understand the value of art beyond humanism. Until the artist-self is validated by a culture that would integrate it into the commonplace of everyday life, the status quo will remain.

I believe in a definition of art therapy as a field that can integrate art into day-to-day life and dissolve the boundary between art, life, and consciousness. With this definition, therapy becomes the qualifier, and art therapy is really the “therapy of art.” Art therapy is a definition inside of another, inside of another, inside of another. The most inclusive one, the therapy of art, may be the most important one to defend. When art is integrated in everyday life, everything becomes an art (thus the phrase “the art of . . . ,”), everyone can be an artist, and everyday life becomes a practice. Life becomes a work of art. The benefits of the creative process, including therapeutic ones, are distributed throughout everyday life and available to all who participate.

At present, art therapists have the opportunity to play an important part in the reintegration of art into everyday life. Art therapists can encourage people to define their artist-self. In the case of persons with mental illness, it could be the first step of self of self they have experienced. In the case of the world at large, especially the Western world, it can help in a more subtle but no less essential way: Art therapists can, against all reason, offer a way to learn to perceive the world as a whole, intelligent, and dynamic place, a way to taste life beyond humanism.

Call for Papers for the 10th Art Therapy Association of Florida Conference
“Art Therapy and the At Risk Population” Spring Conference from May 2-4, 1997

Attention Art Therapists, Creative Art Therapists, Mental Health Professionals, Allied Professionals and Educators: ATAF is seeking papers, presentations, panels, and workshops devoted to understanding the professional issues and guidelines that all art therapists follow. Submissions may focus on any topic or population related to this theme; of particular interest are: issues of confidentiality, issues regarding artwork (i.e.: ownership, permanent records, exhibitions), issues of certification and licensure, and issues of graduate and post graduate training and educational standards. Due October 1, 1996. Qualifying materials needed from each presenter include: 1) six copies of Presenter’s Resume; 2) six copies of Completed Call for Papers Application*; 3) six copies of Bibliography for Presentation.

*For further information and proposal forms, please write to: Mrs. Peggy Dunn-Snow, ATR-BC, LPAT, 2401 SW 50th Street, Ft. Lauderdale, Florida 33312. Continuing Education Credits for art therapists, nurses, social workers, mental health counselors, and marriage and family therapists are being arranged.
Reauthoring the Dominant Narrative of our Profession

Shirley Riley, ATR, MFCT, Los Angeles, CA

Introduction

This is the appropriate time in the evolution of the profession of art therapy to re-create our image and explore a new model of our profession responsive to the postmodern mental health climate. To that end, I would like to take the reader on a fantasy trip and hypothesize what it would be like to move the birth of our occupation forward in time, from the 1950s to the present. After looking at art therapy from this visionary viewpoint, I will offer the reader a sobering look at today’s mental health concerns and how they seem to be influencing our clinical practice. The conclusion will incorporate both vision and reality, suggesting how we can move beyond our current concepts of art therapy to re-create a psychotherapeutic service that is both aesthetic and pragmatic. We can enter the postmodern society of mental health providers.

The Time Capsule

If art therapy was conceived in the 1990s, do you think it would be born burdened by the paradoxical question: is art therapy “art as therapy or therapeutic art”? Or is that familiar struggle just an outworn expression of the age of the Fifties, when the traditional analytical view of therapy was “either this way or nothing,” rather than, “this way and many more”? I would like to think that this issue, which has been conflicted in the past, would seem pointless, limiting, and diverting attention away from the quality of therapy that we have to offer.

In the postmodern climate of competition that dominates our world of mental health services, I suspect there would be room for all our philosophies under the master umbrella of creativity. We would focus our talents on presenting art therapy as a method of treatment that most successfully gives access to the silent, visual knowing part of our intellect that is often neglected in the process of verbal therapy (Tomin, 1990). We would assume that creativity is not limited solely to a relationship with the art, and accept a broader definition of creativity that includes how we and our clients can find more successful ways to live in today’s social system. I think that the founders of the art therapy profession of the postmodern world would be seen as pragmatically aesthetic or, if you prefer, aesthetically pragmatic, offering the best of all possible worlds.

Our imaginary “founding parents” would be able to explain to other professionals that we conduct therapy in many ways and we follow many theoretical schema. In addition, we are also aware that with the introduction of a visible vocabulary created by the clients, the art therapy will modify theory to make it more personally responsive to each client. The aesthetics of choosing the right theory to “fit” the client’s needs turns the therapy into a re-constructed search for a new aspect of the problem-saturated situation. When the client is involved in re-creating his or her view of life, through artwork and reflections on art, the client embraces actions which lead to a “unique outcome” (White & Epston, 1990).

The well-trained art therapist, born in today’s world, has a broad knowledge of psychological theories but is not totally committed to any singular belief system. The art of the therapy comes by watching and encouraging the client to find images behind images, uncovering meta messages that surface through the image. Clients may discover how they were taught to accept their discomforting world view as an immutable “truth,” their only alternative. It takes no stretch of the imagination to remember the terrible “truths” that some clients have endured. Through their graphic illustrations, clients can develop a new understanding of their trauma and how their hard-fought-for defenses were necessary to make living tolerable in a painful world.

In this postmodern art therapy world I am proposing, art therapists would agree that within every setting offering psychological help, and with every population served, it is necessary for the therapist to wear specialized lenses when viewing clients’ needs. For example, it is obvious that we cannot wear inpatient lenses for viewing outpatient treatment (Hoffman, 1990). With each clinical situation only an individualized, unique treatment approach is the “right” way to conduct art therapy. This would eliminate the unnecessary struggle over whether there is greater benefit from a studio art experience, contrasted to a more structured clinical art therapy treatment plan, or conflict over behavioral art therapy treatment: the structure limits creativity versus the spontaneous use of art in adult growth groups. There would be acceptance that the same art therapist may become a “different” therapist at different times, in response to different needs of the client. That is to say, the therapist changes his or her approach to conform to the therapeutic needs of the person in treatment. It is not “difference” that is in question; it is rigidity that should be censored.

Consideration of the overwhelming social pressure of our time in history would be built into our system of therapy. There would be no division between case management and “real” therapy. No one would question that the client is a whole person and what is needed in one aspect of his or her life cannot be divided from the rest. The therapist would move quickly to alleviate, within the scope of his or her powers, physical traumas from the client’s world, such as abuse, and to provide needed social services and health care information. After these issues are attended to, the client would be less troubled and better able to deal with relationships and intrapsychic problems. It would never occur to our newly invented postmodern art therapist that she or he was in danger of losing her or his identity because social work services were needed immediately, rather than art therapy. It is
Reauthoring the Dominant Narrative of Our Profession

Basic good sense to acknowledge that in extreme crisis the client is focused on survival rather than therapy. Art therapists have no reason to feel threatened; they know art therapy exists because, all through time, people have made art and learned through the experience. There are many clinicians who are so visually oriented that they cannot "see" the art therapists; for these counselors it is impossible not to "see" therapy as well as hear and speak it.

In harmony with the ever-changing circumstances of the postmodern world, art therapists would continue to bring their viewpoint to the public—a synthesis of theory and imagination, of silent and verbal communication. As we embrace the challenge of explaining our profession, we would make it clear to allied professionals that we are not solely an adjunctive methodology. We can equally achieve therapeutic goals and provide complete mental health services as primary therapists, restricted only by the limitations imposed by state licensing laws.

Reality and the Impact of Social Concerns

With this model of the newly created art therapist in mind, let us come back to the here-and-now and see if we are willing to re-create ourselves to fit today's challenges.

For example, it has been documented that children reveal their troubles through the concrete language of art (Malchiodi, 1990; Rubin, 1978). However, if a child's artwork leads to information regarding discrimination at school, the art therapist is obligated to lay aside the art materials and investigate the system that may be unaware of a traumatic situation that should be addressed. A second example might be a family unable to problem-solve their interpersonal difficulties. When five or six people are living in one room and rotating the use of the bed and floor space, drawing the pressures of cramped quarters and lack of privacy is not enough to reduce their stress. The art therapist may need to accompany the family to a social agency to reinforce and support the coping strategies they have worked on in therapy. She may also need to assist clients as they follow through and encounter the social service worker and housing authorities. Therapy no longer fits the 50-minute format within the confines of the therapist's office. Even the rigid format of California's Medi-Cal system allows coverage for the therapist to engage in some external mental health activities that will lead to higher functioning for the client. In private practice, these undertakings would probably be covered by the client; however, in my experience, these extra services are more often required for clients that are in a clinic setting.

There are countless other similar crisis situations that could be mentioned. If there was space to do so, who of us likes to do these managerial tasks? I venture to say very few. Like it or not, we should take heed that if we choose not to enter the fray of social services and managed care systems, we will lose the position of primary therapist to other clinicians who are less aesthetic and more pragmatic. Calling oneself a therapist indicates that we have accepted the role of advocate for our clients and must do what we can in that role.

Not every clinic setting asks the art therapist for social agency involvement in combination with the art therapy, but many do. I worked in an outpatient agency for many years practicing art therapy and I was expected to be the therapist in charge of the family's complete treatment plan. This included therapy, case management, referrals for psychiatric consultations and testing, and school follow-ups. I wrote Medial progress notes with DSM diagnoses, which require that one member of the family be identified as the I.P. I did this, although it was against my beliefs about family systems. My cooperation was needed to help the clinic keep its doors open: my paperwork produced state revenue. However, when the door to my room closed, I conducted "my" therapy without external restrictions. My treatment team knew my approach and were consulted clinically, as needed. Privately, I think it made me a little crazy to record in one manner and practice therapy in another, but I never noticed that it had an effect on the families. I found a way to focus on the family's need for treatment and translate it into language that satisfied stipulations but still gave me the freedom to provide the therapeutic services that my clients required.

In contrast to the long-term, purely psychological treatment plan approach, I have come to believe that we must assist clients on many levels whenever there is a risk of losing vital support systems that give their life dignity. In addition, we must realize that therapy is moving away from the individual session dealing only with intrapsychic difficulties. Most therapists are faced with dealing with the complications of real world challenges: the pregnant teen-ager, the client ill with cancer or AIDS, the homeless, with their multiple problems: the drug-abusing youth or adult. We cannot limit our services to just the hospital, clinic, or therapeutic school. Outpatient clients go home. Hospitalized patients need aftercare; children have to deal with their peers, gangs, and their parents when school is over. The clients have to accept the advantages and disadvantages of short-term therapy, and so do we.

There are many forms of short-term therapies that are widely used by HMO providers, clinics, hospitals, and persons in private practice. To name a few of these therapies we can point to the following: solution-focused therapy (de Shazer, 1988; Friedman, 1993; O'Hanlon & Weiner-Davis, 1987); problem-solving therapy (Hales, 1976); and the MRI brief therapy group in Palo Alto (Fisch, Weiklund, & Segal, 1982). The proponents of these approaches feel that the success of therapy has little to do with the time involved in treatment, and clients are generally happy to achieve their goals as promptly as possible. Some clinicians feel that the populations that are not benefiting from these brief therapies are those professionals who deal with more severely damaged clients, such as clients with schizophrenic disorders, severely abused clients, those with dissociative disorders or borderline personality disorder, and other chronically distressed persons. Their care has often been shifted to day treatment centers where the objectives and goals are developed to fit their needs. These patients receive medical therapy through the use of prescribed drugs and complementary psychotherapy to evaluate the changes sought through medication. The psychiatrist handles the medication and sets the treatment goals but often does not spend much time with the patient. As we look at the changing mental health scene, it becomes apparent that along with the people we serve, we are not only art therapists, we are also members of a society in transition and must develop our skills to meet the prevailing demands of the times.
Where are we going?

I am confident that a large majority of our graduate programs are offering an adequate, background in psychological theory, practice, and principles of art therapy. My question is: "Are they educating students to join the mainstream of today's mental health care system? Are our students being taught how to join managed care (or whatever will replace health insurance in the future) in order to survive?" If the next generation of art therapists does not endure, neither will the profession. If there is no place in the job market for art therapy, how can we ply our trade? I do not particularly like this limiting change, but I feel that our first responsibility is to our students and their future. We can teach our students and trainees the pragmatics of providing treatment, as well as the aesthetics of conducting therapy. I am sure that the dominantly creative character of the persons in our field will make them better "problem solvers." It takes imagination and visualization to find new ways "to beat the system" and not compromise on the quality of treatment that brings comfort to our clients. What is often overlooked is that creativity also brings satisfaction to the creator, no matter where it springs. There are many ways to be artful and therapeutic in the world of managed care. We have a broad palette of approaches in the art therapy room; we must not be afraid to step outside that room into the hassle of our mental health environment. It is not as though we have a choice.

Theories and Treatment

In the current literature and personal reflections of many of the foremost thinkers in the field of family therapy, the field with which I am most acquainted, there is a major shift in the focus of theories and personal involvement of the therapist. There is a thrust to bring the many approaches to treatment under a broad encompassing theory, not discarding but including the variety of belief systems that have developed in this field. Breul (Schwartz, Kume-Karrer, 1982). Perhaps we should do the same.

Theorists are offering more comprehensive approaches to treatment: many of these theories emphasize language and restoring history: Anderson & Goodishian, 1985; co-creating therapy with clients Hoffmann, 1993; using a reflecting team to deconstruct the session (Thorn, 1985); and externalizing the problem, viewing it as an entity separate from the individual White & Epstein, 1990. All these approaches are ways of conducting therapy that share the goal of depathologizing the client or family. This attitude takes a wide perspective of the problem, admits the involvement of the therapist, and offers relief in an effective and shorter time frame. These changes may have come about partially in response to the economic pressures from society, but they are theoretically sound and operate from a base of respected systemic thinking.

I think we have to make similar shifts in our thinking. Why not go past the issue of how we do art therapy? There are many roads to success, and there is no question that what we do is useful. We do not have to contrive an entirely new formula for art therapy; we only have to work together to find an aesthetic pragmatic explanation of our expertise for those who question it. We can preserve the skills we have and add others that we know we need to survive. We can remain the same and be different simultaneously: we loose nothing.

A recent issue of the journal Networker, 1993 devoted attention to the necessity of bringing a variety of skills to the field of mental health that we might ordinarily avoid. A practice consultant is quoted:

Many therapists are great clinicians, but terrible business people. Temperamental artists in a profession that is changing from being an art to an industry. These changes create a lot of cognitive dissonance. Some clinicians must learn to change and learn to explain themselves to the business community. ... But for others, altering themselves to fit the pattern of consumer capitalism cuts too close to the marrow of their personal identity. Some even leave the field rather than make these compromises. (Lawless, 1995, p. 24)

Turning Theory into Political Practice

Over my 20 years of practice and supervising, I have seen many students and colleagues establish their own identities in the mental health field. Their successes went further than substantiating their skills as therapists and demonstrating how the addition of art made for improved treatment. They demonstrated that they could write excellent case progress notes, consistent with state standards; support a child in a school IEP; individual education plan; fight the county worker for justice for a client, argue with a divorce lawyer in defense of a native woman client, work with a family in denial of the demise of their son with AIDS, and accept the role of activist for the good of the clients. The hands-on willingness of these men and women art therapists to encounter the mental health system in every aspect, has radically reeducated the local community in Southern California. Both consumers and providers have a new understanding of the capabilities of the art therapist which has transcended the sometimes stereotyped and misunderstood view of our place in the mental health system.

What has caused me distress and left me puzzled is that these very persons were not always embraced and accepted by our own art therapy community. There appears to be a notion that they are degraded because they are not "really" doing art therapy. I think we should adopt some of the wisdom of social workers. They have no problem with their identity; they just stay together and gain more power every year. If they lack expertise in an area of service, they raise another specialty for social work! I think we should do the same. In truth, we are doing that very thing and should take pride in all the workplace infiltrated by art therapists and remedial to meet their own creative standards.

In the same vein of enhancing our survival skills, another question can be posed: Why not get some some sort of allied license until our own comes along? Why not boast that we can expand our educational programs to include information demanded by the state licensing boards and still not dilute the art therapy core of every course? Why not be comfortable with who we are, and know that we can use the current available licenses, such as MFT or counseling to keep ourselves alive? There are many good reasons why art therapists should continue to work together both clinically and politically with allied professions without the fear of danger or compromise.
There is a theoretical concept that may be very useful to further the move toward an altered vision of art therapy. This way of thinking is called social constructionism, which has been incorporated into modern-day individual and family psychotherapy, both by psychiatrists and psychotherapists (Anderson & Goolishian, 1989). A fundamental concept they propose is that we all have invented a basic reality of the events of our life based on the prevailing myths and belief systems we have been taught. However, in dialogue with another we can learn to see aspects of our history that have been disregarded. This dialogue opens the possibility for a new interpretation of our story and creates the potential for a new and more positive ending to the dominant narrative. This concept has been called “re-authoring a life script” (White, 1990).

This concept could be used to reauthor the current invented reality of what an art therapist is and what she or he can and cannot do. A fresh dialogue could free us to move on and embrace and balance all aspects of our work with clients and ultimately with ourselves. What we believe in becomes our truth, and since truth has many facets, we can invent a reality that takes advantage of the challenge presented by today’s society. The historical “founding parents” of our profession established our identity in the face of disbelief from many professionals. However, they took the encouragement they received from others and held on to their own convictions. They believed in the positive qualities that art therapy could bring to our professional identity. We can do it best by recognizing that although change is threatening, it also offers new opportunities to redefine our profession and continue to offer our unique talents to clients and the profession of mental health.

*Editor’s Note: This manuscript was first offered in a slightly altered form as the keynote address at the Buckeye Art Therapy Conference. 1985, Columbus, Ohio.

Artistic Production as a Diagnostic Approach to Illness

Yvonne, Pepin-Wakefield, PhD, Port Townsend, WA

The idea that art can be used as a diagnostic tool and may also aid the diagnostic work of medical practitioners is based on my personal experiences and on themes that emerged in my doctoral research. These themes are:

1. Drawing enhances cognition, enabling people to focus more intensely on an object and that object’s relation to relevant situations.
2. Combined visual and abstract modes of thinking permit people to see implicit, but intellectually unrealized structure in a problem-solving situation (Pepin-Wakefield, 1993).

These themes suggest the following:
1. Anatomically based drawings may be useful in the diagnosis of certain physical pathologies.
2. A combination of abstract and visual modes of thinking may aid a client’s cognitive understanding and verbal description of physiological processes, which may in turn aid diagnosis.

My original foray into the therapeutic nature of spontaneous drawings began during my adolescence. At age 13, drawing became a way for me to identify and alleviate conscious and unconscious feelings related to the deaths of my parents. Over the years, I drew hundreds of drawings of “Little People,” characters that became containers for the transmission of a plethora of emotions (Figure 1).

Years later, just as I used spontaneous drawings to identify and release psychic pain, I used similar creative processes to express and identify physical pathologies. Viewed retrospectively, I believe some of the early drawings which abstractly portray psychological distress may also indicate the origins of physical disease manifested later in adulthood. The following visual examples, I believe, support my contention that artistic production can be an effective diagnostic tool which may give the primary care provider a direct link to uncensored nonverbal messages involved in artmaking and provide direct access to emotional and physical memory associated with illness.

A simple line drawing reflects the origins of my foray into using art to express and diagnose physical pathologies (Figure 2). Drawn in 1977, the image depicts severe pain in my bronchial area. Doctors treated the symptoms with antibiotics, but the discomfort persisted. One night, when the pain was unusually intense, I used a black felt-tipped marker to make a line drawing of the distressed area. The next night the pain was rendered more distinctively through a pencil drawing (Figure 3). As the pain persisted, my drawings of it evolved to include color. In Figure 4, I enclosed abstract versions of lungs, trachea, and bronchial tubes within circles. Then, using a red crayon, I shaded in the portions which felt afflicted. Intuitively sensing that the color green was soothing, I used that color crayon to shade in and around the areas of pain.

Over subsequent weeks I made a series of drawings which represented the afflicted bronchial region, each time discovering through the process of drawing, and later by incorporating some form of a green media, that the pain would subside. I frequently referred to anatomy and physiology books to pinpoint the location and strengthen the accuracy of the drawings. Eventually, I would discover that the discomfort in my upper respiratory tract was caused by an allergy to a form of vegetation growing around my studio. By then I discovered I was able to control the pain by “drawing it out,” identifying the afflicted regions by imagining them in abstract but anatomically referenced drawings and adding healing color.

What began as an unconscious expression evolved into a conscious inquiry into the range of ways color is used in healing practices. My informal research led me to publications (Anderson, 1975; Clark, 1975; Ouseley, 1949) chronicling the historical uses of color in healing. My discoveries were supported by studies that indicated the color green has been used to lower blood pressure and dilate capillaries. Additional research suggested that each color has a definite wavelength, carries a dif-
ferent frequency and impact force, and can affect muscular, mental, and nervous activity. Increasingly I began to cross-reference my intuitional drawings with the study of anatomy and physiology to describe other physical symptoms.

The following examples illustrate how I have used a range of media to heighten my abilities to visually express and identify physical ills. This methodology of using artwork to understand physical pathologies represents a phenomenological approach by examining the multiple realities of underlying forms and patterns to describe the phenomena of human consciousness. Unlike other methodologies, phenomenology cannot be reduced to hard and fast rules, yet the reduction of phenomena can be bracketed and studied.

Based on my success in “drawing out” discomfort, I began to reconcile persistent pain in my upper left temporal region, intuitively expressing it as the color red and bringing in the color green to south the area (Figure 5). Throughout the next 10 years, cranial imaging would spontaneously crop up in my drawings, especially during times I was working through emotional issues and junctures.

Nearly 20 years after these first drawings were made, I would discover their hermeneutical associations when I was diagnosed as having temporomandibular joint disorder TMJ, a group of conditions involving injury or dysfunction occurring in the temporomandibular joints, jaw tissues, muscles, tendons and ligaments involved in jaw movement.

A major theme occurring throughout the “Little People” drawings, the first drawings I used to represent psychological pain, depicted trauma to the head, which was continually being pierced by objects or severed from the body (Figure 1). Over the years, this suffering became more anatomically rendered, indicating perhaps the development of TMJ (Figure 6).

If it is accepted that long-term physical pain produces secondary psychological suffering, can long-term psychological pain produce secondary physical pain? Could it be that my TMJ was the result of continuing emotional distress, maintaining a “still upper lip,” “gritting my teeth”? To hear my adolescent years of isolation and dissociation, Figures 6 and 7 - Is it possible that these early drawings reflected the origins of a physical condition that only decades later would become diagnosed?

Another example of my personal use of art and its potential use as a medical diagnostic tool is found in a body of my early
paintings and drawings, numbering in the hundreds, which increasingly reflected abstracted intrauterine imagery (Figure 8). As with the other drawings, these works of art were created spontaneously.

Many of these intrauterine images were recorded in Japanese accordion books which I used as visual diaries. In a Japanese accordion book, all the pages are attached to the others and fold in or out between two covers. The books range from 6 to 11 inches in size, and fold out in lengths from 4 to 15 feet long, allowing imagery and compositions to merge. The books' format, like human physiology, a continuous web of organic interplay, depicts interconnected imagery flowing from one point into another.

From 1975 to 1981, I used a range of media in the Japanese accordion books and my paintings to create surreal, abstract, realistic, and metaphorical images and symbols of intrauterine forms. During this time I consulted doctors about pain in my left abdominal region, only to be left with a bill for an undiagnosed
and often debilitating discomfort. One time I took some of these drawings to a doctor who looked at them, asked a few questions, and speculated that I had endometriosis, a condition characterized by the abnormal occurrence of functional endometrial tissue outside of the uterus (Figure 9). The next day I underwent a laparoscopy and the doctor's conjecture was verified. Since first experiencing symptoms of endometriosis and beginning a series of abstract womblike artwork, the disease had spread and created numerous internal adhesions. Had I shown these drawings to a receptive doctor earlier, I may have been spared years of suffering and subsequent major surgery.

The Swiss physician and chemist Paracelsus generally believed the spirit can prevail over matter and subsequently manifest disease or health in the physical body. He also believed that the spirit is the master, imagination is the tool, and the body is a plastic material. In my case, imagination was the tool I used to document a visual history of pain and to help control both psychological and physical pain.

In a longitudinal study of artwork it could be possible to discover recurring themes, colors, and images that could help identify a disease or a particular stage in the development of a disease. Artwork used in the context of health care could, I believe, expedite diagnostic work. In addition, such a tool could be useful in working with children, people who are mentally and verbally impaired, and non-English speaking patients. This method of visual diagnosis could provide people with a sense of responsibility and ownership of their bodies and at the same time provide medical practitioners with a simple and cost-effective diagnostic tool.

Dreaming and Waking in Russia

Sally Brucker, MSW, ATR, Washington, DC

Introduction

Last winter I had a dream that literally took me places I had never dreamed of going. Like a foreign traveler, I allowed myself to go to unfamiliar places, trusting that if I ceased looking for "something" I would find what I was seeking. And it reminded me once again that when we are mindful of the connection between our waking and dreaming selves, we can experience moments of understanding and self-awareness not otherwise possible. While there are many theories and schools of thought pertaining to dreamwork, within the context of this article I will refer to Gestalt (Perls, 1969), Lucid Dreaming (LaBerge, 1983), and the "If this were my dream" technique (Ullman, 1979). The following is the story of my dreaming process and, as such, it moves between dreaming and waking states. I will begin with the dreaming state where, when my eyes were closed, it all began.

Dream of My Grandmother

While preparing for an art exhibition called "Dream Maps," I decided to keep a dream journal. I recorded the following dream in January, 1985:

I am in an unknown country. Almost immediately, I see the tiny figures of my maternal grandmother, Jenny, standing in the center of a hall in a large, ornate, and somewhat gaudy art museum. She is dressed like a poor Russian peasant (which she once was) and is looking slightly forlorn. Although she has been dead for over 20 years, I sense that I am standing in her old-age home. I look around and notice a group of young toddlers rehearsing a play. They consist of men and women dressed in lavish period costumes, laughing nervously and drinking from enormous gold goblets. I realize it is they who are responsible for caring for my grandmother, and since they are clearly neglecting her, I become incensed. I stomp over to them demanding, "Why aren't you taking better care of my gran?" They laugh, pour me a glass of wine, and say, "Relax, Sally. Your gran is fine."

Since, in my work as a psychotherapist, I am accustomed to working regularly with dreams, my initial inclination was to delve into my own. But since I am also aware of the internal havoc dreamwork can wreak, I had decided to postpone working on my own dreams.

Waking

In March, 1985, my exhibit, "Dream Maps," was shown in a gallery in Washington, DC. It consisted of abstract monoprints and handmade dream journals relating to the process of dreaming. The "dream maps" were intended, like dreams, to give the observer the experience of traveling through an unknown landscape. They were also concerned with how light and image emerge in dreams and then become fragmented when the dreamer awakens. From the fragments, the dreamer, like the traveler, holds a map containing residues of form and feeling from which meaning must be deciphered. A woman from the Association for the Study of Dreams (ASD) attended the show and invited me to New York to take part in an art exhibit in conjunction with the ASD annual conference. I eagerly accepted and signed up for several sessions on dream interpretation including "Lucid Dreaming."

Lucid dreaming has been defined as the phenomenon of dreaming while being fully conscious that you are dreaming (LaBerge, 1985). During a lucid dreaming session, we were asked to go back into a dream that needed further work and, in a semidream state, to continue or to change aspects of the dream. I went back into my gran's dream, but this time I approached my grandmother and asked her if she was indeed all right. She, in turn, smiled an angelic, ethereal smile and responded, "My dear, I am fine. Stop worrying so much about me, about the young people. Take time to visit this beautiful museum."

On awakening from our lucid dreams, we were asked to help create a "dream play" from our lucid dream so the group could help the dreamer elucidate further meaning. To my amazement, my dream was chosen! The actors volunteered and, as their director, I chose the cast and staged each scene. After an enthusiastic 10-minute rehearsal, the dream play began. The audience utilized the technique developed by Montague Ullman (1979) called "If this were my dream." Instead of offering a direct interpretation, their role was to help me (the dreamer) understand the dream by imagining that the dream was theirs. The statement "If this were my dream" was utilized as a way of doing this. I was then free to accept or reject any such statements. Through observing this process of my dream coming to life and through hearing the nonjudgmental comments made by others, I came to realize that my grandmother was telling me to stop worrying so much. Instead of focusing on the caretaking responsibilities of my now elderly mother and family, I should instead focus on myself. "Go to Russia and visit the Hermitage!" she suddenly seemed to be saying. I was both grateful and perplexed.

When I returned home, I opened my mail and found an announcement of a conference on Creativity and Psychotherapy in all places, St. Petersburg, Russia! By now, fully captivated by the call of my dream, I submitted a proposal for a workshop called "Drawing Your Dream Map." It was accepted and, with no hesitation, I decided to attend. What in the world, I wondered, are they dreaming about over there?

The Conference in St. Petersburg

This city of 5 million that stretches along the Neva River has often been called the Venice of Russia. Ornate former palaces and stately buildings painted in bright hues of ochre, azure, peach, and lime evoked a mood of nostalgia and delight. The
newly painted Hermitage stretched endlessly and beckoned brightly. Would I find my Granny there? I wondered. We were there at the time of the white nights, which create a mystical, dreamlike atmosphere in the evening. We strolled and watched the towers, statues, and buildings gleam against the river and canals. In stark contrast, by daylight, we saw the city’s grime, the poor conditions of many people, the former prison for those who opposed Stalin’s policies, and the unforgettable memorial for those who died in the horrific siege of Leningrad in 1942 and 1943.

The official title of the conference was “Exploration of Creativity, Third International Conference on The Creative Arts in Psychotherapy, Education, and Medicine, Nursing, and Human Relations.” It extended for a period of 9 days, 6 days in St. Petersburg and 3 days in Vilnius, Lithuania. Co-sponsors were Cross-Cultural Consultants of Milford, New Jersey and the Harmony Institute of St. Petersburg, Russia.

The Harmony Institute for psychotherapy and counseling was established in 1988 as the first comprehensive treatment and (more recently) training center in humanistically oriented psychotherapy. Its relatively small staff of 40 mans a crisis hotline for the city and provides crisis intervention and ongoing treatment, including expressive arts therapy, to individuals and families.

Participants in the conference included over 40 persons from the U.S. and Europe, representing a cross-section of disciplines. Over 120 Russian professionals and students attended the 4-day conference in St. Petersburg. More than 40 presentations of papers and workshops were made including, “Creative Confrontation in Psychotherapy,” “The Effective Role of Expressive Communication in Work with School Age Children,” and “Life Story: Art Therapy Analysis.”

The Open Window—Natasha’s Dream

Natasha, a 29-year-old music therapist from Moscow, had the following dream while on a pleasurable vacation:

Scene One—I am in a beautiful place inside a lovely cottage. The sun is shining and the grass is green. There is not a cloud in the sky. The window is open and I can see clearly outside. I feel relaxed and comfortable.

Scene Two—The day turns cloudy and the window appears, but now there is a curtain flapping madly in the wind. The sun disappears. There is no grass. I am frightened.

Disturbed and puzzled by her dream, Natasha asked, “Why would I dream this?” She then made a brief sketch of her dream and, using the gestalt therapy technique of identifying with each element of the dream, the first person, stated, “I am a window. I am opened, receiving warm sun and light. I am a curtain flapping, covering the window.” As she went deeper into this image, Natasha was struck by her fascination with the curtain, seeing it as the central element of her dream. Working further with this image and watching others enact her dream, Natasha realized how much she protected herself from acknowledging and expressing deeply felt pain and fear. The sunny house with no curtain was seen as mirroring her outer self. The curtained window, she thought, represented her defense against looking more deeply at her “clouds, storms, or shadow self.”

I was amazed at the similarity between Natasha’s dream and some of many of the women I see in my practice in Washington, DC. These defenses usually surface as they are about to enter the deeper work of therapy, where they must confront their fears, impulses, and deeper unconscious concerns. This dream poignantly conveyed the ambivalence of that moment. The vacation setting became a metaphor for Natasha’s wish to delay the hard work ahead of her. A statement by one of the three men in the workshop, “I would hate to depend on the wind to determine which way I would go,” and the women’s sighs and laughter echo the different gender perceptions I hear quite often during the couples therapy sessions I lead. At this point, I began to day-

2540
dream. Does Natasha’s dream reflect the “dark side” of the Russian soul that appears in so many Russian novels I have read, or still yet, the ephemeral hold the Russian people feel they have on the soon promise of Perestroika? As for Natasha, she appeared both exhilarated and exhausted.

The Coffee Cup and The Flower—Dmitri’s Dream

In this seemingly simple, short dream, there appears a cup of black coffee with a flower sitting next to it. In relaying his dream, Dmitri, a young man of 30, posed Plato’s eternal question to the group, “Is the glass half empty or half full?” The group responded with more questions: “Stirred or unstirred?” “Asleep or awake?” Those who enacted this dream felt frustrated. They longed to stir the coffee, to drink it, to smell the flower, to create a romance from the image. For, unlike Dmitri, they were well past their adolescence. As for him, the image would remain as it appeared in his dream, a philosophical question, poised on the brink of change. It is evident that Dmitri could not take this image any further and that for him, it was enough. I could not help wondering though, will the cup be half empty or half full for him? Just that morning, Marina, my language interpreter, had commented to me that she was worried about the immediate future of her 19-year-old daughter who has just returned after a year in a university in the United States. “She was better off there,” she confessed. “Here she will be marginalized. She must decide on a profession. There will be no room for the youthful explorations she experienced last year.” What will happen to Dmitri’s dreams?” I wondered.

Waking Thoughts

Both Natasha’s and Dmitri’s dreams touch upon the risks of life changes and choices. To enter the eye of the storm for Natasha meant that she would not feel safe, although she already knew that the flimsy curtain in her dream would not adequately protect her. The tension between the universal wish for childlike innocence and safety, and the drive towards self-knowledge was clearly one message contained in her dream.

In Dmitri’s dream one might view the cup of coffee as a kind of wake-up call to adulthood, romance, sexuality, or action—a call away from childhood which, understandably, he approaches with uncertainty. My “granny” dream can be seen as another call to action, to look at my past and to move forward. In order to do so, I must make choices for myself not always based on what is good for others. The human urge to delay or defend loss, a necessary precursor to change, is a recurrent and universal theme in psychotherapy as well as political and social change.

Dream Catcher

I know so little about the daily lives of the men and women in the workshop, yet for one day, we shared the intimate space of our dreams. Their humanity, humor, and spirit touched me deeply. Even more than that, it reassured me. One poignant moment I will never forget occurred on a day I decided to go off on my own. Due to the panic of cabs near our hotel, I dashed off with what little time I had and literally jumped on a trolley car. Initially feeling quite proud of myself and, not worried that I spoke no Russian, I sat enjoying the sights, reasoning myself that all the trolleys eventually headed towards central St. Petersburg. This trolley, however, began making several turns away from the center of town and soon I found myself in an unknown, exceedingly dreary, and increasingly frightening part of town. Encountering a steady stream of souther and unfamiliar faces, I began to panic! By now, at least 40 pairs of unfriendly eyes were upon me and the center of town seemed impossibly far away. This was beginning to feel like one of those endless and frustrating really bad dreams saved only by the realization that it is “only a dream”. Just when it seemed I would be riding around St. Petersburg forever, the trolley finally turned and a friendly pair of eyes met mine, inquiring if she could help. Irina, a beautiful young architect who spoke fluent English, got off the trolley with me, helped me onto another, and rode with me to my destination. When she left me, I told her she was my “angel” and that I would like to give her a gift. I reached into my briefcase and there it was—not something I usually carry with me. I handed Irina my small Native American dream catcher that I had brought to show my workshop participants. “Please take this,” I said. She smiled as I told her the story of the dream catcher and of my own dream of coming to Russia. We embraced, parted, and I turned to enter another dreamlike space, the enchanting “Summer Garden.”

In 1906, my grandfather Sam, AWOI, from the Russia army jumped a ship, dreaming of America. Soon after he was settled, he sent for my Grandmother Benny. In 1965, I hopped a plane with my backpack and briefcase in tote, dreaming of Jenny. When I finally made it to the Hermitage, I could have sworn I saw her there, smiling her ethereal smile and teaching me more about dreaming than I could have ever learned elsewhere.

Creativity and Madness:
Psychological Studies of
Art and Artists

Edited by Barry M. Panter, MD, PhD, Mary Lou
Panter, RN, Evelyn Virshup, PhD, ATR, and
Bernard Virshup, MD
299 pp., 65 black & white illus., $24.95, hard
cover. ISBN 0-9641185-1-3
Reviewed by Martha P. Haeseler, MA, ATR-BC,
Guilford, CT

People are always interested in the lives of famous artists, musicians, and writers and curious about what makes them tick: what psychological, physical, and societal forces have influenced them to create and have inspired the nature of their work. This book, written by mental health professionals, addresses such speculations in a series of psychoanalytically oriented essays.

My main criticism of this book is that the title, Creativity and Madness, implies a link between artmaking and psychological/mental instability and distress. This link is supported by the following quotes from the preface and introduction: “The material artists use for their art comes from the primitive levels of their inner lives. . . . To remain in touch with that primitive self is to be on the fine line between sanity and madness. . . . [Artists] use the conflicts and torments as elements of the creative process” (Panter et al., 1995, p. xi). “We think that emotional suffering, and the struggle against it, is found in most great artists” (Panter et al., 1995, p. xvii). Some authors emphasize that the psychological problems of artists fuel their work. Edward Minuch is quoted as saying, “I want to keep these sufferings—being without them would ruin my art” (Panter et al., 1995, p. 81). Marcel Proust said, “Everything great in the world is created by neurotics” (Panter et al., 1995, p. 15). And indeed, this book describes many tormented lives, descents into madness, suicides.

Ever since Cesare Lombros wrote that “geniuses should be diagnosed as suffering from a degenerative psychosis” (MacGregor, 1980, p. 941), questions have been raised such as those in this book: “Are creative artists mad?” (Panter et al., 1995, p. xvi) and “Must the artist suffer?” (Panter et al., 1995, p. xvii). These questions are worth asking. However, emphasizing a connection between art and madness only serves to perpetuate the stereotype that one has to be crazy to make art, which contrasts with a basic tenet of art therapy: that creativity lies within all people. I fully subscribe to psychological theories that attribute part of the impulse toward artmaking to efforts to repair early traumas, to restore losses, and to repair early narcissistic injuries. However, these experiences are universal to humankind and do not necessarily produce mental illness or great artists. And use of the word defect in the following quote, “Many creative persons suffer a structural defect, often related to early object loss, which may be temporarily healed by the artistic productions” (Garber, citing Klingerman, in Panter et al., p. 204) may be psychoanalytically applicable but nevertheless implies that there is something wrong with creative people. “Madness”—psychosis, schizophrenia, or bipolar disorder—can certainly be related to stress and trauma, but it is also a malfunction of brain chemistry, a physical illness with biological and genetic antecedents. Some people with psychotic illness can sustain a high level of functioning and quality of life, as does Kay Redfield Jamison (1995), whereas others become overwhelmed by the struggle to stay connected to reality and other people.

How do we explain the relatively high incidence of psychotic illness among famous artists, writers, and musicians? Perhaps their drive to create is nature’s response to the incipient illness as it is experienced by these talented people. In the face of loss of self and reality they turn to artmaking to marshal all their resources to heal themselves. To order the disordered, to express their pain, and to reestablish their selves. Art therapists often see this drive to create in their psychotic clients. If there is a connection between creativity and madness, I would argue that it is because many people who are “mad” make art to maintain a connection to the world and themselves, not because people who are creative are “mad.” Furthermore, there are many sane artists (some of whom are art therapists) and many psychotic people who are not artists.

If this were a book about psychotic artists the title would fit. However, the book also describes the wonderfully resilient lives of Michelangelo, Elizabeth Layton, and Pieter Breugel the Elder, and some authors describe the “reparative, and even life-saving” (Berman, in Panter et al., p. 60) function of artmaking, especially for people in distress. All of the authors are respectful to the artists and some provide a thorough overview of the work of leading theorists who have written about the psychology of artists. Many of the authors provide a complete picture of the artist’s social, political, and artistic milieu and discuss how the artwork relates to both inner and outer necessities. Some briefly mention possible genetic factors contributing to the artists’ psychological distress. The authors who state that they themselves are artists, writers, and musicians seem to have the most sensitive understanding of the artistic process. For example, Mallin (Panter, et al.) points out that the poverty and rejection often experienced by artists, “with swings between depression and elation, can predispose a person to being cast by society as mentally ill” (p. 112). In a psychological study of art and artists, I would wish to see more discussion of the ideas of Dissanayake (1994) about the importance of art and ritual in meeting fundamental needs of societies and individuals, the ideas of Prinzhorn (1922) about
REVIEWS

humankind’s innate impulses to make art, and the ideas of Kramer (1971)—that in the sublimation process people attain their highest level of functioning.

In the preface, Panter writes that the book ‘is intended for both the lay person interested in psychology, art, and the creative process, as well as the mental “cauldron professional”’ (p. xii). As a result, there is an admirable attempt to explain complex psychological theories in simple language, including a glossary defining art and psychology terms that may be unfamiliar to a lay reader. However, in some articles this simplification seems to have inclined the authors to emphasize a single explanation for artists’ distress, which seems reductionistic in the light of the complexity of the subject. For example, Bond (Panter et al., 1995), writing of Virginia Woolf, includes much interesting detail about her upbringing and discusses her development in terms of Phyllis Greenacre’s seminal thoughts about the development of genius. The author reviews Margaret Mahler’s stages of separation and individuation, argues that Woolf never attained psychological separation from her mother, and correlates the rapprochement subphase with bipolar disorder: ‘The manic condition, then, is a desperate compromise: between the attempt to avoid further regression to the symbiotic state of dissolution of self, and the frantic urge to ward off a painful reality’ (p. 235). The arguments are compelling and well-illustrated with excerpts from Woolf’s writing. However, discussion of Woolf’s psychological development should at least acknowledge her strongly ambivalent relationship with her father, with whom she identified (Panter, 1987), and who himself often collapsed in ‘fits of the horrors’ (Bell, 1972, p. 39). Mention should also be made of her sexual molestation by her half brother, George Duckworth, when she was 6, and again after her mother’s death when she was 13, a few months preceding her first psychotic episode (Bell, 1972). These violations may well have contributed to the development of her symptoms of anxiety, anorexia, and dissociative states.

Attention to a few technical details would have improved the professional presentation of the book. For example, there is no illustration list giving sources of the art reproductions, there are many quotations given without reference, and there are also many typos and errors, for example, Kavanah, in Panter et al. (1995) gives Picasso’s birth date as 1851, then writes “in 1931, when Picasso was 40...” (p. 226).

In sum, the book transcends its name. It is evident in reading this book that art is not only about torment and madness. The motivations for and products of the artmaking process are as wide-ranging and deep as life itself and include light as well as dark, joy as well as pain, sanity as well as madness, love as well as death.

Literacy Through the Book Arts

155 pp., 39 black & white illus., 52 figures, 87 diagrams, $18.95 cloth. ISBN 0-435-08766-5

Reviewed by Leslie K. Knowles, MA, ATR, LMHC, South Dartmouth, MA

Literacy Through the Book Arts is the second in a series of books by author Paul Johnson (A Book of One’s Own is the first) in which he examines the multiple possibilities found in the form of book art. Although teachers and parents are the intended audience for the book's message of what children are capable of achieving using words, illustration, and design, art therapists will find the book useful in their clinical practices and personal art expression.

The book is divided into four parts with an introduction, conclusion, and an appendix that includes suppliers of book art materials and equipment in both the U.S. and the U.K. Johnson uses simple, easy-to-follow instructions, supported throughout the book with diagrams and examples of children's work. He clearly illustrates how many of the book forms can be made from a single sheet of paper.

Part 1 of the book is a rather lengthy, historic overview of book art and a discussion of language in its written and visual form. Chapter 3, titled "The Psychology of the Fold," peaks my interest as Johnson begins to examine the appeal of the book format both historically and today. The folding of a single piece of paper can create a three-dimensional environment that is able to change its shape while remaining the same form. "The fold is an invitation into something tantalizingly magical. We enter a book through a fold; without it there is no way in, and once in, no way out without it" (p. 35). He discusses the "image-making plasticity" of the folded piece of paper and the three-dimensional appeal of the format, which "begs to be energized with communicating symbols" (p. 35).

In this chapter, Johnson begins his discussion of the two basic approaches to book art that he details in Parts Two and Three: the concertina (or accordion) book and the origami book. By the time I finished this section, which includes wonderful illustrations and diagrams, I was ready to start folding.

Part Two has three chapters that detail the potentials of the concertina format. In its simplest form, the concertina is a rectangular piece of paper folded four times to create a free-standing horizontal book that has eight possible pages. Johnson describes numerous approaches to creating a concertina book and illustrates his discussion with books written by children.
Conversations about the book are included, both in this chapter and in other sections of the book, in a question/answer format. The children are encouraged to talk about source material, writing style, and illustrations. The author shares work done by both individual children and small group collaborations, discussing the benefits of both approaches.

I was intrigued by the enormous range of books that are introduced and illustrated, from the simple four-fold, eight-page book, to the imaginative “top-cut” book, to the detailed, intricate “pop-up” book, to the extended form that includes the work of multiple artists. The variations appear to be endless.

Part Three explores the “origami continuum.” As explained by Johnson, “The only structural difference between a concertina book and an origami book is a cut across the central panels of the landscape horizontal” (p. 105). While the pages of the concertina book can be turned in the conventional reading manner, it is without a central, pivotal spine. Johnson explains that the absence of a spine is contrary to our traditional expectations of how a book should appear. The origami book looks like a real book with a spine and a front and back cover; all clearly defined. The author discusses the potential this book form has to influence cognition and creative action.

The final section of the book discusses in detail the materials needed for book art. This section may be redundant for most art therapists who have a prior understanding of art materials. There is also a section on displaying books and evaluating finished work that is applicable to educational but not clinical settings.

As stated earlier, this book is intended for use by teachers and parents whose children are exposed to this holistic approach to learning in school. Although the teachers are instructed to incorporate bookmaking into their classroom curricula, much of the work is continued, expanded, or completed at home where parents are encouraged to both assist and participate with their children in the process. As an art form that has both creative and therapeutic potentials, bookmaking for use in a clinical practice has possibility and merit. As I read the book, I imagined numerous clients and groups that would benefit from the structure that book art can provide. The idea of personal storytelling through the book form has value, as does metaphorical storytelling. The relative simplicity or complexity of bookmaking can be adapted to the needs of each population. While reading Johnson’s descriptions of his work with 4-year-olds. I could imagine applying the same structure to a geriatric group involved in life review.

Books can bring up the notion of the “happy ending.” For clients who have difficulty envisioning a new way of life, the process of creating a book with a positive outcome could assist them in visualizing change and growth. In my work with children who are victims of abuse and adolescent sex offenders, I see many ways to utilize the book format—from the keeping and sharing of secrets, to the development of pragmatic ways to keep self and others safe. As part of a group session, bookmaking could be used in a variety of ways to create trust, cooperation, and group identity.

Used as a part of any therapy session, this format would require an active role by the therapist. Many clients would need help planning, cutting, and writing, but the process could be both productive and healing. Johnson includes illustrations of books that are precut along the top edge by the teacher into forms that stimulate the children, as well as books that are cut as part of the story developed by the child.

This form of artmaking is also quite inexpensive and requires a minimum of effort looking materials. The author’s recommended paper, cutting utensils, and art materials are basic and easy to acquire. All can be adapted for use with a variety of client populations. Johnson encourages the children, whenever possible, to be allowed to cut the book forms themselves. Obviously, the sharp craft cutters recommended for much of this work would be inappropriate for many clients, but scissors would be an adequate replacement.

**Literacy in the Book Arts** is a book that art therapists will appreciate, especially those interested in a holistic approach that enables clients to benefit from the combined use of the word and the image. Johnson encourages his readers to become book artists themselves, a notion that I would endorse. Since reading the book, I have become a novice bookmaker and have found it to be an enjoyable variation on the journals I have kept for years. Johnson concludes his book a bit dramatically, but in the same spirit of enthusiasm found throughout the book:

For those who have come to know the image and the meaning of the book form and felt its magnetic attraction, life can never be the same again. May all of us, through our own books, seek out a form of expression that is more purely and essentially our own. p. 153

THE REMUDA SYSTEM CAN HELP WOMEN AND ADOLESCENTS SUFFERING WITH EATING DISORDERS

CONTINUUM OF CARE
Adult/adolescent inpatient, adult/adolescent residential, partial care and intensive outpatient treatment sites provide tranquil, specialized settings.

LICENSURE
State licensed. JCAHO accreditation with commendation and CHAMPUS provider.

STAFF
Highly skilled professional staff of licensed psychiatrists, internists, psychologists, RN's, master level therapists and registered dietitians providing individualized programs and lengths of stay.

A COMPREHENSIVE PROGRAM
We treat the whole person with individualized programs designed to meet medical, nutritional and psychological needs, blending these components with a non-denominational Christian perspective.

EXPRESSIVE THERAPIES
Provided as a powerful tool to assist individuals in exploring their identities and problems through the use of their own creativity. Activities include art therapy, music, dance/movement and creative writing.

AFTERCARE TRANSITION
Remuda’s Aftercare Coordinator will work with the referring professional prior to the patient’s discharge to facilitate her transition back into an outpatient setting as she resumes her day-to-day activities.

Helping Traumatized Children Find Relief From the Terror of their Trauma

I Feel Better Now! is . . .

- An eight session group program for children 6 - 12 years old.

- Deals with violent and non-violent trauma including incidents including murder, suicide, witness to violent or non-violent yet traumatic incidents, death by fire, drowning, car crashes, other unexpected losses, environmental traumas, forced separation from parents, divorce.

- Field tested in schools and agencies with 150 traumatized children.

- The group process is based upon an educational model of teaching, exploring, guiding, normalizing, and the reframing of experiences. Feelings are addressed in order to be normalized, not analyzed.

Complete Kit Includes:

- Leader Guide
- Children's Workbook
- Video Tape
- Puppets
- Koosh ball
- Resource Book
- Annotated bibliography
- Parent handouts
- Sample letters
- Identification of differences between trauma & grief reactions

Selected items can be purchased separately.

What the experts have said about I Feel Better Now! ...

"I will be using this program again and again!" Lynn Hunt, Clinical Social Worker

"...most beneficial and needed program for traumatized children." Jan Hinion, MA, LPC, Psychologist

"...invaluable in helping children verbalize their painful losses." Donna Groth, MSW, School Social Worker

"Well organized, easy to follow, easy to implement, wonderful materials." Audrey Bause, M.Ed, Elementary Counselor

"...definitely helps traumatized children in a concrete and supportive way." Peggy Schneider, MA, Elementary Counselor

"Extremely versatile and adaptable to the different kinds of trauma that children experience." Lynne Krajcik, ASCW, Clinical Therapist

"...wonderful opportunity for children to resolve issues they have had to bury within themselves." Doris Paule, M.Ed, Elementary Counselor

55TH ANNUAL
PSYCHODRAMA CONFERENCE
February 20th - 24th, 1997
New York City

Where The Action Is:
Psychodrama, Expressive Arts,
Group Psychotherapy

The American Society of Group Psychotherapy and Psychodrama invites you to join us at the Holiday Inn Crowne Plaza in NYC for our 55th Annual Psychodrama Conference: "Where the Action Is" February 20th - 24th, 1997. We will be exploring the widespread use of action methods in various disciplines. Included in the program will be:

- Pre and Post Conference Training Institutes in Psychodrama, Transactional Analysis, and Group Psychotherapy
- Workshop Workshops in Psychodrama, Playback Theater, Drama, Dance/Movement, Music, Art and Poetry Therapy
- Presentations and Post Conference Training Institute on Psychodrama and Psychodrama Analysis
- Workshops Using Action Methods with Families, Couples, Adolescents, Eating Disorders, Post Traumatic Stress Disorder, Trauma, Dissociation, Education, etc.
- KEYNOTE SPEAKERS: JESSIE A. VAN DER KOLK M.D., Associate Professor of Psychiatry at Harvard University, Chief, Eric Lindeman Trauma Center, Mass General Hospital, Author of "The Body Keeps the Score" and "Limbic Life: How the Body Sees and Thinks"

Join us in the Heart of the New York City Theater District for an exciting, spontaneous and creative event!

SUPERVISION
and Related Issues:
A Handbook for Professionals
by Cathy Malchiodi and Shirley Riley

A long awaited text, this handbook is a highly informative guide to the complexities of supervision in the 90’s. Supervisors, educators, and students will find it indispensable not only in the supervisory session, but also in the classroom and in work with clients. An extensive appendix includes ethics and standards of practice, sample forms for use in supervision, laws effecting supervisors and many more references and resources.

Paper $27.95

ART THERAPY
IN THEORY & PRACTICE

"Since its first publication, Art Therapy in Theory and Practice, has been used continually as both a textbook and a resource. Many of the chapters have become indispensable classics which continue to define the field of art therapy.

In this reprint, we re-encounter Elinor Ulman’s skill as a writer and editor of great perception and eloquence. Her talent was to bring together the seminal writing of a burgeoning professional field and meld them into an organized, comprehensible body. This book, now available to a new generation of readers, stands as a testament to this art.”  RANDY M. VICK, MS, A.T.R.-BC

MAKE CHECKS PAYABLE TO AATA.
THE ORGANIZATION
The American Art Therapy Association, Inc. (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 4,750 professionals and students. It is governed and directed by a nine-member Board, elected by the membership. AATA has established standards for art therapy education, ethics, and practice: AATA committees actively work on governmental affairs, clinical issues, and professional development. AATA’s dedication to continuing education and research is demonstrated through annual national conferences and regional symposia, publications, videos, and awards.

MISSION STATEMENT
The American Art Therapy Association is an organization of professionals dedicated to the belief that the creative process involved in the making of art is healing and life enhancing.

Its mission is to serve its members and the general public by providing standards of professional competence, and developing and promoting knowledge in, and of, the field of art therapy.

ART THERAPY: DEFINITION OF THE PROFESSION
Art therapy is a human service profession that utilizes art media, images, the creative art process, and patient/client responses to the created products as reflections of an individual’s development, abilities, personality, interests, concerns, and conflicts. Art therapy practice is based on knowledge of human developmental and psychological theories which are implemented in the full spectrum of models of assessment and treatment including educational, psychodynamic, cognitive, transpersonal, and other therapeutic means of reconciling emotional conflicts, fostering self-awareness, developing social skills, managing behavior, solving problems, reducing anxiety, aiding reality orientation, and increasing self-esteem.

Art therapy is an effective treatment for the developmentally, medically, educationally, socially, or psychologically impaired; and is practiced in mental health, rehabilitation, medical, educational, and forensic institutions. Populations of all ages, races, and ethnic backgrounds are served by art therapists in individual, couples, family, and group therapy formats.

Educational, professional, and ethical standards for art therapists are regulated by the American Art Therapy Association. The Art Therapy Credentials Board, Inc. (ATCB), an independent organization, grants post graduate Registration (ATR) after reviewing documentation of completion of graduate education and post graduate supervised experience. The Registered Art Therapist who successfully completes the written examination administered by the ATCB is qualified as Board Certified (ATR-BC), a credential requiring maintenance through continuing education credits.

CHAPTERS
Affiliated chapters of the AATA have been established throughout the United States. Chapters conduct meetings and activities which promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network for people working toward common goals. Information and support for chapter members is passed on from the Assembly of Affiliate Chapters to the local level.

You must be a national member to become a chapter member. Information on locating the chapter nearest you is available from the AATA National Office.

MEMBER BENEFITS
All members receive:
Publications
- Art Therapy: Journal of the American Art Therapy Association (published quarterly).
- AATA Newsletter (published quarterly).
- Substantial discounts on AATA publications, such as Annual Conference Proceedings, other professional journals, videos, and the Membership Directory.
- AATA literature, such as Educational Program List, Art Therapy Media List, Standards of Practice, and mailings of professional interest.

Services
- Insurance, including professional liability, major medical, life, and disability through Magazines & Associates.
- Access to national experts in art therapy.

AATA Meeting
- Discounts on registration fees to AATA national conferences and regional symposia.

Nationwide Advocacy
- Governmental affairs activities including congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third party payers.
- National liaison with related professional organizations for recognition and promotion of art therapy.

Professional Standards
- Development of Model Job Description and recommendations for licensing standards.
- Development and implementation of national Education Standards for approval of graduate level art therapy programs.
- Development and implementation of nationally recognized Standards of Practice and Ethical Standards for Art Therapists.

GENERAL INFORMATION
AATA and ATCB are administratively independent. Membership in AATA and Registration (ATR) with the ATCB require separate application and approval. ATR registration applications are available from the ATCB at (312) 527-6764.

For new Associate, Student, and Contributing members only, please follow the dates below when submitting membership applications. The membership year is the calendar year 1/1 to 12/31.

Applications received between:
1/1 to 5/31
Full dues payment; membership expires 12/31 of same year.
6/1 to 9/30
Half-year dues plus $5.00 payment; membership expires 12/31 of same year.
10/1 to 12/31
Full dues payment; membership for the remainder of current year and next full year.

CATEGORIES AND FEES
Professional-By application review process only; approved members may vote, hold office, and serve on committees.

- Professional Member-Individuals who have completed graduate level educational training in art therapy. Dues are $100.00/year.
- Credentialled Professional Member-Individuals who have been dually approved for Professional membership by AATA and Registration (ATR) by the ATCB. AATA dues are $100.00/year. Annual ATR maintenance fee is billed separately by the ATCB.
- Associate-Individuals interested in the therapeutic use of art who support the purposes and objectives of AATA. This category is not open to Master’s level art therapy program graduates. Associates may not vote, hold office, or serve on committees. Dues are $100.00/year.
- Student-Individuals who are currently taking full-time course work in art therapy or a related field. A current statement from the institution of learning indicating full-time status and course work content (6 graduate or 12 undergraduate credits) is required. Student members may not vote or hold office, but may serve on the Student Subcommittee of the Education Committee. Dues are $45.00/year.
- Contributing-Individual organizations, institutions, or foundations which contribute annually to AATA. Such members may not vote, hold office, or serve on committees. Dues are $150.00/year.

Retired-Individuals who are at least 65 years of age and who are no longer practicing. Retired Associates receive publications. Retired Professionals receive publications and may vote, but may not hold office. Application provided upon request. The service fee is $50.00/year.

_______________________________________________________________________________

Checklist

☐ Five (5) copies, typewritten on 8 1/2” x 11” white paper with margins of at least one inch.

☐ Black and white photographs (at least 5” x 7”) of original artwork plus four (4) photocopies of each.

☐ Abstract of 100-150 words (for articles and brief reports only).

☐ Detachable cover sheet with author(s) name(s), affiliation, degrees, and credentials.

☐ Appropriate release forms obtained for use of client art expressions and client information.
  (You do not need to send these with your submission, but you must have them on file.)

☐ This Attention Authors form.

Author’s Signature________________________________ Date_______________________

Please send completed form with submission to: Editor, Art Therapy: Journal of the American Art Therapy Association, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 USA.
GUIDELINES FOR SUBMISSIONS

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy: Journal of the American Art Therapy Association uses a blind peer review procedure for articles, brief reports, and viewpoints. Final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor, and special section editors.

The following are guidelines for submissions. Submissions that do not conform to these guidelines will be returned to the author without review.

Submission Categories

1. Articles. Full-length articles may focus on the theory, practice, and research in art therapy or related areas. Articles must include an abstract of approximately 100-150 words summarizing the major point of the article.
2. Brief Reports. Short articles which focus on the results of research are appropriate for this section. Brief Reports should include information on the research design, methodology, and results. An abstract of approximately 100-150 words should also be included.
3. Viewpoints. Short articles focusing on personal experiences, poetry, or original art may be submitted to this section.
4. Book Reviews. Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office.
5. Video Reviews. Reviews of media (videos) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office.
6. Commentaries. Brief comments on submissions published in Art Therapy: issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

Other Requirements

1. Send five (5) clear copies of each submission to Editor, Art Therapy: Journal of the American Art Therapy Association, c/o American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.
2. Only original submissions that are not under consideration by another periodical or publisher are acceptable.
3. Submissions must be typewritten on 8 1/2” x 11” white paper with margins of at least one inch. The body of the paper, references, tables, and quotations must be double-spaced.
5. An abstract of 100-150 words must be included with full-length articles and brief reports.
6. Please avoid footnotes wherever possible.
7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors’ names, positions, titles, and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.
8. Use tables sparingly and type them on separate pages. Refer to the Publication Manual of the American Psychological Association (Fourth Edition) for style of tabular presentations. All tables, charts, or diagrams must be legible and able to withstand reduction. Include originals and four (4) photocopies.
9. Photographs must be at least 5” x 7” and black and white glossy prints, preferably with high contrast. Photocopies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs. Captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc. Include four (4) sets of photocopies of original photographs.
10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions which are addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author’s responsibility to secure such permissions. A copy of the copyright holder’s written permission must be provided to the Editor immediately upon acceptance of the article for publication.
11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations, and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.
12. It is expected that any submission accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their submission on either an IBM, IBM-compatible, or Macintosh computer, upon acceptance, they can send a 3.5” diskette containing an electronic copy of the submission to the AATA National Office. This will help speed processing, editing, and publication.

Note: Authors bear full responsibility for the accuracy of all references, quotations, and materials accompanying their submissions.
