This article presents a case study from the perspectives of the patient as well as of various treatment members who saw this patient. The documented statements of the physician of record, a psychiatrist, the staff psychologists and those of Dr. Ernest Zierer and his associate, Edith Zierer, are included. Decisive for the selection of this particular study for Creative Analysis correlation was the fact that it was one of the few supervised continuous case seminars lasting an entire year. The seminar met once a week for one and one half hours and was under the preceptorship of the Hillside Hospital Associate Medical Director.

This seminar had the obvious advantage of providing continuous communications between members of the therapeutic team and the entire psychiatric resident staff. As is often the case in research conducted in a therapeutic setting, important methodological questions can be raised concerning collaborative efforts, for example, the question of the possible influences of independent observations and interpretations by the various team members one upon another. Although the question cannot be resolved here, it is important to note that each of the professional observations and interpretations were recorded prior to each of the conferences. It is from these preconference, independently written reports that this presentation is drawn.

This paper is dedicated to the memory of Ernest Zierer, PhD, the originator of the basic concepts of Creative Analysis pioneering more than 50 years ago. These concepts were subsequently developed and augmented by his collaborator, co-author and often co-therapist, Edith Zierer, ATR. The method has been covered extensively by publications and teaching seminars in this country and abroad. The method was first explored in Europe (The "Zierer School") and in 1943, Hillside Hospital, Glen Oaks, NY was the first mental institution to introduce our diagnostic and therapeutic tool on a hospital-wide basis.

A brief review of the salient features of Creative Analysis precedes the case presentation.

Creative Analysis

Creative Analysis is a specialized psychodiagnostic and therapeutic treatment procedure devised as an aid in treating emotional disorders. In this procedure, painting activity is used to tap conscious, preconscious and unconscious motivations. The theory postulates that colors are not only related to the content of the work, but from an unconsciously created interrelationship described as color "integration" and color "disintegration." The ratio and relative intensity of "integrated" and "disintegrated" paintings are considered reliable indicators of degree of ego integration. The theory also suggests that, via Creative Analysis, integrative deficiencies can be traced...
and color tension control (the equivalent of affect balance control) can be promoted.*

Creative Analysis procedures involve a battery of therapeutic painting tests which are structured but not explicitly directive of the patient's painting activity. The patient may choose to copy his or her own previous work or the work of another, make selections as to motif, color and application, form, style and brushwork. Where the patient is restricted to achromatic rendition, the choice as to motif, style, etc. remains with the patient. The battery of painting tests serves multiple purposes since the experimental conditions replicate past developmental vicissitudes as well as activate current stressful situations. Results of the selective assignment of appropriate tests serve as indices of normal and pathological responses and are, therefore, diagnostic. Similarly, these test constellations offer the patient the opportunity to comprehend these affective reactions and effect change through the development of color tension control which is consistent with his or her intent. This color tension control is equated with affect control and the test instruments simulate everyday situations in which conflict between external demands and internal needs of the individual can occur. For example, in the Reactivation tests, the test structure may simulate developmental obstacles impacting on infantile experiences. The intensity, quality and quantity of integration or disintegration in the finished painting testify to the successful or unsuccessful integration and resolution of conflicts raised by these obstacles. Interferences, which may be the introduction of foreign color particles into the patient's work by the therapist, may be painted out, repaired, isolated or ignored by the patient. This in turn provides clues to the patient's habitual defense and coping mechanisms.

The sequence of test administration is flexible and determined by the therapeutic goals and the patient's immediate needs. Initial diagnosis and later evaluation of the patient's progress are facilitated by an objective record of specific elements in the artwork. This record is called the "Psychogram" (Figure 1). The

---

*Since all statements in this paper regarding the patient's painting activity are based on Creative Analysis findings, and are explored in numerous books, brochures and reviews, and since footnoting them would be too time consuming and cover too much space, it is hoped the enclosed bibliography will serve as a source of information.
"Initial diagnosis and later evaluation of the patient's progress are facilitated by an objective record of specific elements in the artwork."

diagram permits the charting of an "integration graph" which represents the quality and quantity of color integration and disintegration in each painting assignment. The reader is reminded that the integration-disintegration continuum is not based upon content, form, color scheme, style or technique. It is based upon the total particular relationship of colors that is generated by the quality and quantity of personality integration or ego function. Changes induced in color responses in turn promote personality changes. It is only after the integrative-disintegrative discharge has been inferred from the interrelationship or interaction of color particles that de-lusions concerning subject matter, form, themes, individual patterns and style are included in the diagnostic considerations.

The psychograms permit the charting of fluctuations from test to test and the determination of borderline areas of general and specific levels of functioning. While reflecting essential criteria for differential diagnosis, a personality profile also suggests an appropriate course of therapy.

Case Study

The patient in this case was referred for Creative Analysis two months after her hospitalization. The quotes were taken directly from the records and were selected and edited to demonstrate both correlation and conflictual evidence of the independent Creative Analysis findings.

On admission, a psychological profile corroborated the findings of a prehospital psychological evaluation. The treating therapist, a psychiatrist, made the following entries in the record.

"This is the first and only hospitalization of a 25 year old, single Jewish, college graduate and former advertising manager. She was admitted to Hillside Hospital complaining of a series of phobic symptoms with a tendency towards somatic conversion symptoms, commencing at age 15. Family background revealed that the patient is the elder of two sisters. The younger sister is 18 years old and single. The father is a 52 year old postal clerk. The patient's mother had rheumatic fever and had several heart attacks and a number of strokes during the patient's puberty. The mother's long illness began when the patient was fourteen and the mother was almost constantly invalided until she died when the patient was 22½ years of age. Despite these difficulties, she was able to graduate from college, to work successfully in the advertising business in responsible positions, to date, and have a fairly active social life (though tremendously inhibited, frightened and guilty about any sexual activity)."

In the hospital, the patient was treated almost entirely by psychotherapy (including Creative Analysis) and mild sedatives. No tranquilizers or other somatic therapy was required or used. The first month of the patient's hospital stay seems to have been devoted to the accumulation of the developmental history and the history of the patient's illness. This period was used to deal with her adjustments to hospitalization and defining the psychological profile. It was determined from the psychological report that, "there was nothing in the patient's history that could be considered... pathognomic of any more severe psychiatric illness (than psychoneurosis hysteria). However, with a difficulty of such long standing object relationships, the type of depersonalization which she describes, the pervasive anxiety that at times seems to dominate her completely, the possibility of an underlying schizophrenic reaction must, at least for the time being, be kept in mind."

The psychiatrist seeing the patient recorded that their early visits included "vague, hurried references to her fears of homosexuality, her feelings of unworthiness and her confusion of her aggressive, passive conflict with masculine/feminine issues," as well as discussions of dream content and expressed resentment over residential duties such as mopping floors. Early in the third month of hospitalization, the patient was recommended for Creative Analysis.

The patient's attendance in Creative Analysis sessions was regular, but "her daily schedule was erratic or, rather geared to the number and presence of specific participants. Initially, as soon as the painting room became crowded, the patient left unobtrusively. There were no difficulties in the initial test administration; the paintings were made in average time and did not show undue concern regarding tests results. From the outset, the patient worked intensively, completing an average of two projects per day. Her pictures are quite striking, she experiments freely with colors, although much less with shape and form. She seems to feel free to ask questions and to make objections whenever the cor-

"From the outset, the patient worked intensively, completing an average of two projects per day."
relation between a specific test structure and the corresponding "reality situation" is not quite clear to her. Her questioning is never aggressive or negativistic and eventually she succeeds in finding a formulation acceptable to her.

The patient occasionally challenged the therapists' statements concerning unconscious test results, particularly when these results did not correspond to her conscious convictions. Repetitions of such tests at a later date seemed to indicate greater insight. It is a basic premise of Creative Analysis that consistency of integration in a patient's painting cannot occur without personality integration and vice versa. Therefore, such insight or awareness must be internalized before it can be made ego-syntonic. Repetition of such tests serves both educative and therapeutic purposes.

During the first month of Creative Analysis, the patient completed thirty projects. The personality diagram derived from these projects "differed in several important points from the patient's stated self-concept, but corroborated others. The level of the curve does not leave any doubt that we are confronted with a neurotic process. The general impression is that of a severely constricted personality. The single reaction points indicate that many of the patient's problems are rooted in her poor self-esteem. She does not dare to lower her integrative investment even when the project calls for an economy of energy output, for fear of never recovering her energy or else because of a sense of guilt for not functioning at her optimum level."

Other adjustment conflicts occurred. In an example of tests which demonstrate a patient's preparedness to accept a given pattern, inconsistencies arose when she was confronted with the "Copy Project." In this project, the patient is requested to select a reproduction of work of another person which symbolizes an ego-syntonic behavior pattern and to make a copy of that work as best she can. In this instance, the patient's painting showed marked disintegration, indicating a conflict with her selected model and consciously chosen behavioral preferences.

Again, when asked to select "non-aggressive" colors and techniques for a project, she chose previously designated "aggressive" colors and her brush strokes are bold, almost slashing in force, evidencing marked conflict with the assignment. "Hence, on an unconscious level, she rebels against a non-militant approach and, by disintegrating, offers a double repudiation." Integration shows the subsequent resolution of the problem (Figure 2). In a similar assignment, the patient was asked to select and paint with "dull" colors, an assignment which tests the patient's ability to perform adequately under unexciting or dull circumstances. Part of this project was integrated on a low level while the remainder of the painting shows fragmentation. Moreover, the picture gives the impression that she had, at first, succeeded in integrating it, indicating that potentially she could cope with the conflictual situation, but then had rebelliously gone over it with impatient brushstrokes, demonstrating "boring routine is not her forte."

Commenting further, the Zierers' note, "The responses to the reactivation of early developmental vicissitudes are indicative of traumatic experiences on an anal level and during the oedipal period. Initially they showed a predominance of oral character traits, but then anal traits appeared to be more prominent. The superego appears to be stable. Her manner of handling the push colors (those imposed on the patient's work by the therapist in Interference tests) indicates a mechanism of defense, which she calls 'undoing,' as a second rank rationalization. . . . The patient's advocacy of women's sexual emancipation and her repudiation of a double sex standard seems genuine enough. She integrates her concept well in work on this subject of equal rights, her acceptance of marriage, however, is conditional. She disintegrates the family unit depiction with

![Fig. 2](image)

**Constructive Self-Assertiveness:** After repeated failure, the patient succeeded integrating appropriate healthful aggression demonstrating improved inner control.
which she had intended to symbolize marriage (Figure 3).

The immediate therapeutic goal will be to strengthen the patient's self-esteem, to help regulate demands upon herself which may, in turn, facilitate a resolution of her conflicts, and take into consideration projects which facilitate constructive channelizing of aggression and specific adjustment difficulties.

A subsequent psychological examination specifically mentions an IQ score of 129 in the Picture Arrangement subtest which also revealed, "very superior social intelligence, enabling her to sense other people's feelings toward her and react to them easily and appropriately. Her reactions to the unstructured stimuli disclose a constricted, narcissistic, hysterical woman whose emotional development has not kept pace with her intellectual growth. She is extremely immature, is impatient with delay in immediate gratification and has a low threshold for frustration. Her thinking shows only the slightest trace of disorganization, but her affects are extremely regressed, uncontrolled and disclose a potential for anal destructiveness. On the one hand, she evidences a great need to be conforming and conventional, while on the other hand, she discloses rebelliousness and hostility towards authority. Basically, an extremely orally dependent woman, she resists vehemently the role of passivity and submission and strives for an assertive, domineering position in her interpersonal relations."

Perhaps because of the mounting consistencies in reported findings of staff team members, it was decided to present the patient herself at one of the early case seminars. She was quite surprised at the number of staff present and felt that she had not been adequately prepared for so large a group. "That was a dirty trick," she told her doctor later. "It was sneaky. I feel as if I can't trust you. I've always felt afraid to trust anyone. I couldn't trust my other two doctors and I can't trust you." Two days later, she told her psychiatrist, "I get scared, afraid of exposing myself, like a kid afraid of masturbation, afraid of father... always upset about him. He looked so young when we walked together, we looked like boyfriend and girlfriend. I would get a queasy feeling when we walked together. It reminds me of a superstition that I can't remember all of, something about going crazy, something about incest, perhaps that's why I'm always sick like mother, I wanted to be her." She recalled that after her sister was born, "I used to get sick to get attention."

In the Creative Analysis reports, the patient's work pattern showed signs of disruption. She asked for an assignment and then could not find her folder of paintings although it was in plain sight. She began demanding more attention from "the Doctor Professor" (Dr. Zierer). She found her art sessions to be "encouraging and pleasurable," but described her behaviors as protective. "I usually feel the threat of doom of failure about anything that I've attempted, especially if it appears to be successful... the example of this would be my reaction to Creative Analysis. My anxiety becomes so strong that I run out in panic. I feel the need to run away though I realize that the anxiety and fear is coming from within rather than from an outside source. It's much easier not to attempt anything. I must be on my guard in situations where I might succeed. There is the apparent need to feel that I must punish myself for success."

At her request, a compromise solution to an arrangement was agreed upon whereby she might come to the art room early on the condition that she stay at least half an hour after the scheduled group session ended. The patient ended up not taking advantage of the arrangement. She did not start before the scheduled hour and continued to work no matter how crowded the place became. The Zierers commented, "It seemed that receiving this special privilege was more important than the actual use of it."

The patient's response to some of the Creative Analysis assignments

---

**Fig. 3**

*Disintegrated Family: Large fragmented areas isolate rather than integrate the family members.*
brought forth usual conflict statements but with unusual vehemence integration-wise, e.g. regarding flexibility versus habitual commitment patterns. To quote the patient, “I find no stimulus in too much responsibility and, I find it also difficult to modify my behavior or my environment.”

It is a basic premise of Creative Analysis that the test instruments themselves facilitate behavioral awareness and offer an opportunity to explore change in ego-syntonic attitudes. Several projects involve the expression of dichotomies such as painting, side-by-side on the same canvas, in self-determined aggressive and non-aggressive favorite and disliked colors or in the patient’s “own style” and alien self expression. (The test responses were inconsistent, but stabilized subsequently reflecting a more integrated self-concept.) In this patient’s case, those tests which called for an increase or decrease of effort she found to be “the most important and most difficult of all the Creative Analysis projects.” Indeed, regulation of demands on self-discipline seemed to be her most insurmountable challenge.

Nonetheless, during the second month of Creative Analysis, a gradual shift began to take place in the integration within the patient’s art work. At the same time grotesque depictions were replaced by representational forms and the earlier aggressive brush stroke techniques were changed to a less aggressive painting style. The patient repudiated what she had previously called her “non-aggressive abstract style,” initially presented as her own natural style, and created instead what the record describes as “a rather subdued realistic painting as representative of her personality” but with only moderate success on an integrative scale (Figure 4). This implied to the team that the patient was going through a transitional or leveling out process. Definite improvement was demonstrated in several areas, e.g., her ability to function in situations which she regarded as dull, monotonous or routine; her willingness and ability to conform to a given social structure and her tolerance for pressure and frustration.

Stylistic changes are not necessarily indicative of progress, as it was in this case; nor are representation depictions necessarily more indicative of adjustment than are abstract expressions.

In Creative Analysis, the quality and quantity of integration and effective control are the indicators of progress. As the patient began to explore and increase her integrative consistency in alternative styles and techniques of expression, a definite change could be charted.

An example of art therapy indicating behavioral changes contemplated by the patient is demonstrated in the patient’s depictions of marriage and the family unit. In her first version mentioned earlier (Figure 3), the family is isolated and fragmented. In contrast, the integrative responses in subsequent matrimony paintings show a successful working-through process. The patient’s declared color symbols changed also during this period in keeping with her less rigid passive-active feminine-masculine preconceptions.

Shortly thereafter, the patient began to make use of her “off-grounds pass” to get out on weekends. Somatic complaints increased after each of these events. She started a relationship with a male patient who also had an off-grounds pass and they went out together. She began to express some anger with her psychiatrist “over his passive, more silent approach to therapy . . . also angry at restrictions over hand holding in the hospital.” In another psychiatric session, the patient reported a dream in which she “loses all of her teeth.” She had no associations with that dream except the fact of an actual pending dental appointment. This was followed by an association to her in-hospital boyfriend and her father. Her father had come to visit her at the hospital and she repeatedly expressed a desire to have him see the psychiatrist. She mentioned being very angry with her father for losing a coat of hers. The psychiatrist pointed out to her how both of these men are weak and how she seems to be attracted to this type of man.

“... during the second month of Creative Analysis, a gradual shift began to take place in the integration within the patient’s art work.”
The team reported increasing ambivalence towards male authority figures. Within the Creative Analysis setting, she showed marked hostility towards Dr. Zierer whom she accused of bias, while assuming, for the first time, a generally more positive attitude towards Mrs. Zierer.

Over the next three months, the patient completed 27 more projects. Her integrative results reflected a dramatic struggle to find and accept her own ego-syntonic style, technique and color scheme. "The total diagram (168 projects) reflects chronologically and in numerical terms the patient's struggle for an individual style and the recognition and expression of ego-syntonic attitudes and standards of conduct." With this resolution emerged certain motifs. The figures assumed a characteristic posture, seated or standing, of widespread legs. Seated figures were hunched over and the symbol of the clown began to reappear. "It seems significant that the clown (Figure 5) could make its reappearance as it stands for early oedipal disappointments. This does not seem to be a mere coincidence or an artistic whim. The patient's comments indicate that she connected the clown with her memories of when her mother had a stroke. She did not elaborate on this association, but it confirmed our theory that every recurrent theme is the pictorial or symbolic representation of a strongly cathexed idea of an ambivalent nature."

In the originals, the apparently stationary figures of black musicians, another recurrent motif, give the impression of arrested or impending motion. The Zierers' records note that, "the movement, or perhaps rather rhythm, becomes, later on, the most striking element in her paintings; so much so that we were surprised to hear the patient refer to her recurrent subject matter as 'my sitting, still figures' (Figure 6). These often seated, individual or group depictions seem to fairly dance off the page. The sexual implications of the presence of [black] men in dreams has often been emphasized in the literature and patient's recurrent motif of [black] musicians and would bear investigation."

Although the color scheme...

"Her integrative results reflected a dramatic struggle to find and accept her own ego-syntonic style, technique and color scheme."

October 1987, ART THERAPY 119
doesn’t vary much, the patient finally finds in dancing an ego-syntonic and socially acceptable motif for the previously implied impending action. In one painting, two couples were depicted in a jitterbugging stance although the patient had an Apache dance in mind. The record notes that “in an Apache dance, the man pursues the woman, while in jitterbugging — according to an article we read and with which we agree — the man is totally disinterested in wooing, often even indicating that his partner should withdraw, so that he can give himself up more completely to the narcissistic pleasure of his own dance movements. Our theory is that the pictorial representation of a couple dancing may stand for the sexual act. For the patient this previously had a negative connotation resulting from a breakdown under the impact of oedipal traumatia, for which she sought resolution in moral masochism. Now it has become permissible because she is more ready to admit to the active aggressive forces which she equates with masculine strivings.”

The patient’s association of professional success with masculine strivings seemed to inhibit her ability to accept herself as an active sexual partner. “To use the patient’s own words, if she could stop forcing herself to sit still and start ‘doing the doing,’ i.e., by permitting her constructive aggressive tendencies to come to the fore, she could function adequately. In terms of painting, she has overcome whatever the clown motif stands for, and needs to work through the [black] musician theme.”

These concerns are borne out in the patient’s depictions and comments concerning childhood frustration. In several of the Social Conflict projects, the patient depicted children at play. She commented that she had added, “an ostracized child(who) is outside the integrated group and not part of it. In her last Social Conflict project, the patient repeated this motif which she described as (Figure 7) “a child sitting alone in darkness as opposed to the enlightened children playing in the light.” The stated intent here was to depict a group of children in “free discussion about sex, at early ages . . . if sex were discussed more in the home and less in the gutter, there would be fewer frustrations and fewer problems.” Concerning this last painting, the Zierers’ record notes that “it may be significant that in this painting of the subject, she combines her two most recent modes of representation: the hunched over figure (this time the child in darkness) and the dance (performed by children playing in the light).”

Other projects confirm the patient’s ambivalence concerning biological impulses. When asked to depict something representative of her own individuality, the patient painted a woman similar to the one in Figure 4. When asked to paint in an alien style, the patient returned to the abstract style using a forceful, aggressive technique, consistent with her earlier statement of her own personal style. On the basis of this experimental evidence and a number of other experiential exercises, the Zierers speculated, “We feel justified in believing that at one point or another in this patient’s infantile development, the gratification of primitive motor impulses became guilt laden and pleasure in body movement something forbidden. Motor expression, though, remained an active force. Fortunately for the patient, she was able to integrate it and eventually, with successful therapy, she should be capable of using it as a propelling force for optimum integrative investment.”

The patient had become active in her residential cottage administration and involved in the development of a skit to be produced by the residents of the cottage. The patient complained of being an unworthy role model for one of the female patients and also of being misrepresented as a leader, when she was “bending over backwards” not to be one.

The series of reactivation tests were repeated at this stage and showed, for the first time, a beginning acceptance of oedipal frustra-
tion and with it a beginning reconciliation with the female role. The violin picture (Figure 8), an instrument placed in its own living space, represents to the patient the "acceptable self." Thereafter, progress was noted in specific problem areas, e.g., integration in projects dealing with self-determination and decision making. However, there was also evidence of still existing unresolved conflicts.

The patient related her difficulties around the issue of her sister's marriage to homosexuality. "Says she always felt disgusted whenever her mother and sister would kiss her." The patient began exercising and dancing, things she had not done previously. She practiced for her performance in the drama project in which she planned to dance the "Blackbottom." She began to explore sexual foreplay with the boyfriend who was a fellow patient. She also brought more of her pictures done during Creative Analysis sessions to her psychiatrist more often. She was beginning to become more insightful of the psychodynamics underlying her reactions to such things as her boyfriend becoming sick, a new arrival at her residential unit and the possibility of her getting well in the foreseeable future. The psychiatrist notes she "finally says that she thinks she has three more main problems: a) she's afraid of marriage, b) is still jealous of her sister, and c) has guilt over her mother's death. Somehow these all seem related. She is afraid that if she gets married and has a child, the child will alienate her from her husband."

The patient made genuine efforts at reconciliation with her sister, for whom she began expressing sincere warmth. She was quite elated over her own lack of panic and ability to cope with the situation.

The Zierers' notes confirm this progress. "The results of [another test series] point to stronger self-motivation and an increased sense of responsibility for her achievements. We may assume, therefore, that her self-esteem is no longer dependent exclusively on external supplies precisely because it had ceased to be contingent upon aggressive motor behavior. The concept of success is, therefore, no longer unacceptable to her. What she represents in her paintings is ego-syntonic, i.e., her own style of painting integrates successfully. Similarly, there is no longer the need to express restrained motility. The ego-dystonic style is, as often before, an abstraction in aggressive colors and technique. Within the given context, this is indicative of a continued re-integration process in terms of further stabilization of performance."

Progress continued to be evident in the patient's increased ability to shop comfortably in a crowded department store, to enthusiastically enjoy her sister's wedding as well as the fact that she was able to investigate three residential opportunities outside the hospital (one of which was to her liking). Fluctuations evident in Creative Analysis could be correlated to other behavioral areas. For example, the Creative Analysis reports note "an inability to conform successfully with some accepted social patterns." When the patient was

"The patient made genuine efforts at reconciliation with her sister, for whom she began expressing sincere warmth."

Fig. 8: Violin: Image of the patient's accepted self. Within the given text and context (the text structure and the patient's comments) the integrated instrument symbolizes a beginning resolution of oedipal conflicts.
refused off-grounds passes for the expressed purpose of sleeping over at her boyfriend’s house (such leaves were granted for purposes of discharge planning only), the patient became irate and deliberately flaunted the regulations. The Creative Analysis reports note “an inadequate performance in situations necessitating more radical behavior change.” When the patient was scheduled to go home, she could not bring herself to do so and called her father to come and get her. She became angry with herself for calling him and angry at him for coming. Her intention had been to be more independent.

On the other hand, she began painting precisely what constituted her “real” life difficulties. These were pictures of girls standing at bus stops (Figure 9), traveling by train and bus, staying in hotels, walking on the beach, etc. (Figure 10). At this point, a second figure joined the girl in the paintings. A male figure joined the girl in grocery shopping, traveling and staying in a hotel room. Churches (symbolizing intermarriage, according to the patient), theatres and modes of transportation recur as themes. These motifs were all integrated on her current functional level. The Creative Analysis record notes “the shift in defense mechanism seems significant: undoing is almost completely abandoned in favor of identification with the aggressor and rationalization. In summary, judging from the integrative results evident on the graph (168 projects), she should be able to confront independence and what this term symbolizes for her.”

At this time, the patient underwent psychological reexamination. “Significant changes were noted. The Rorschach, HTP drawings and Bender-Gestalt were administered at this time. It is speculated that her imminent discharge from the hospital is arousing enormous anxiety. A response (to one of the cards not previously given) suggests her wish to lose conscious control over her body impulses so that her instinctual cravings may be released from intellectual surveillance. The utilization of space in the Rorschach suggest that a strong stubborn and negative feeling has been stirred up which has a dual implication. On the one hand, it represents ego strength in the sense that the patient can demonstrate assertiveness. On the other hand, it represents a tendency to restructure the environment on highly irrational grounds as well as reflecting a highly oppositional attitude in therapy. In summary, the patient appears to possess sources of ego strength which are keeping her from manifesting any flagrant psychotic behavior.”

On the discharge record, the psychiatrist noted that, “In the course of therapy, it was felt that she had worked through fairly successfully the death of her mother, her strong hysterical identification with her, some of her sibling rivalry and some of her dependence-independence conflicts. She was felt to have been unable to work through or under-

stand her oedipal strivings and her fears concerning them with their relationship to their displacement into other symptoms. She also has not been more than superficially able to explore some of her strong masculine strivings.

Response to Creative Analysis therapeutic testing reveals a strong conflicted individual. However, it also discloses sufficient ego strength enabling her to face her difficulties. The key to her identity crises was seen in her unresolved passive-active male-female confusion. This also accounts for her initial repudiation, of motor expression which she associates with aggression perceived as a masculine attribute.

Summary

The key to this patient’s initial repudiation of motor expression documented in her responses to Creative Analysis therapeutic testing was based upon an association with aggression which was perceived as masculine. Her recurrent motifs and reactivation test results were indicative of: a) an over-indulgence on an oral level; b) severe discipline during the anal period of development (which made gratification of primitive motor impulses unacceptable); and c) traumatic experiences on an oedipal level, the resolution of which had been sought in moral masochism. The patient was able to integrate, to some extent, the reconciliation of feelings of aggression and sexuality through her sessions with her psychiatrist and the Creative Analysis. The socialization with a male as well as her performance in the Blackbottom dance in her cottage facilitated emotional and intellectual insight. The patient’s need to be recognized as a leader even though she resists it (bending over backwards to remain passive), is because leadership, like success, is still threatening to her. There remains an “apparent need to feel that I must punish myself for success... that I must be on guard in situations where I might succeed.”

From the outset, the patient worked very intensively on her recovery, but never admitted to any pleasure in that work. Her fear of success is seen as a fear of loss: the loss of her mother and her father’s favor, as well as a punishment. By punishing herself, by denying herself success, she averts betrayal by an authority figure. She magically avoids the loss of her mother.

Objectively, the patient’s course was marked by a lessening of her anxiety attacks, a widening ability to participate in extramural activities, becoming involved in a heterosensual relationship with greater ease than she had previously known and, finally, to making realistic discharge plans concerning living arrangement, seeking employment and continuing her therapy through a local out-patient facility. On discharge, one year after admission, the prognosis was judged to be good. It was felt that she would be able to maintain herself in her community and continue to reduce her symptomatology while enhancing her adjustments to social and professional demands and personal needs.

603 October 1987, ART THERAPY 125
New! THE PSYCHO-BERINETIC MODEL OF ART THERAPY by Aina O. Nucho. This book begins with a detailed account of the origins and rationale of art therapy, and then focuses on the implementation of the psychocybernetic model, which combines the verbal/analytic and the visual/imagistic symbol systems. The author describes ways to introduce clients to visual forms of expression, the actual "doing" phase, decoding the visual imagery, termination of treatment, and the scope and effectiveness of the model. '87, $34.50

New! VISUAL ARTS AND OLDER PEOPLE: Developing Quality Programs by Pearl Greenberg. This lucid text provides the background and knowledge necessary to understand and appreciate older adults as artists and to develop quality visual art programs. Chapters explore retirement, gallery and museum programs, art for disabled older people, adult learning, art hazards, and art appreciation. Diverse art mediums are covered including collage, drawing and painting, clay and construction, fabric printing, and weaving. '87, $30.25

New! FUNDAMENTALS OF MARKETING THE PRIVATE PSYCHOTHERAPY PRACTICE by Bruce D. Forman and Kadette S. Forman. Devoted solely to concerns of private mental health services, this book discusses the marketing concept, marketing strategies, techniques for analyzing, monitoring, and auditing a private practice, and the marketing mix (place, price, product, and promotion). An entire chapter explores the topic of promotion, including copywriting, layout design, and direct mail advertising. '87, $27.25

EDUCATING THE CREATIVE ARTS THERAPIST: A Profile of the Profession by Shaun McNiff. This comprehensive study explores the interdependence of diverse training traditions, and it reviews the various areas of concentration, such as art or music therapy. Specific competencies and different philosophies are examined, but their commonalities are emphasized. Chapters are also included on an artistic theory of mental health and on supervision and evaluation. '86, $32.75

THE ARTS AND PSYCHOTHERAPY by Shaun McNiff. An integrated approach to all of the arts in psychotherapy is presented in this insightful book. The author examines the distinctive and common qualities of the various expressive arts in relation to psychotherapy. He also draws on the statements of artists to develop a psychology of art that views artistic exploration as psychological research of the highest order. '81, $21.75

THEY COULDN'T TALK AND SO THEY DREW: Children's Styles of Coping and Thinking by Myra F. Levick. In this book, a pioneer and leader in art therapy, describes and illustrates normal and abnormal development of cognitive skills and defense mechanisms through the graphic productions of children between two and ten years old. The range of topics thus examined includes art therapy, defense mechanisms of the ego, psychosexual and cognitive development, and manifestations of defense mechanisms in children's drawings. '83, $38.00

"SELF PORTRAIT" Painting by a young girl in art therapy at Wright State University, Dayton, Ohio

"TREES AND STORM" Painting by a pre-adolescent girl in art therapy at Wright State University, Dayton, Ohio
"Diagnosis and Assessment: Impact on Art Therapy"

Ellen G. Horovitz-Darby, MA, ATR, Coordinator of Creative Art Therapies, Hillside Children’s Center, Rochester, New York.

This article underscores the need for the art therapist to become familiar with and use specific diagnostic assessments particularly “in an age where new legislative law and decreases in federal funding have impacted not only the mental health field but the future of Art Therapy itself...” The format included is based on observations from social workers reports and from psychological assessments, as well as tests that have been refined over the years by Horovitz. Included in this article are references to the H-T-P, the K-F-D, the D-A-P, the Bender Gestalt, the Cognitive Art Therapy Assessment and the Silver Drawing Test. Some examples of completed evaluations are presented to give the reader an idea of the “look” of a completed diagnostic assessment.

Introduction

In 1978, I became active in the New York Art Therapy Association. Part of my work consisted of pouring over new legislative bills and conferring with our legislative assistant. One of the bills that I rewrote was a subsection of Public Law 94-142 entitled “Recreation Therapist (Art, Dance, and Music).” This support amendment was accepted and ratified into law and thus created a civil service line for creative art therapists in New York State. Creative Art therapists could benefit from that law if they were named as a “support service” for a handicapped child.

After eight years a Committee on the Handicapped (C.O.H.) meeting was held in a nearby town (Gananda, N.Y.) and a psychologist who was familiar with my work, referred a child for art therapy services. This referral was made directly on his Individualized Education Plan (I.E.P.). By law, since the “support service” had been recommended, the committee had to provide the services. I was contacted for consultation and assessment purposes. The C.O.H. agreed to transport the child (and family if necessary) for art therapy and to pay for this service.

After completing my diagnostic assessment, the child began treatment. Soon after, I received another referral from the same committee. The school psychologist called and exclaimed that he was not only impressed with the work on the first case but more importantly was astounded by the evaluation process and information which these tests revealed.

In an age where new legislative law and decreases in federal funding have impacted not only the mental health field but the future of Art Therapy itself, it is imperative for Art Therapy to be recognized as a professional field. It is for this very reason that I designed an Art Therapy Diagnostic format described here in.

The Format

Part of the format is based on observations of both social workers’ intake reports and psychological assessments. The format is easy to read both in terms of finding specific data (test results) and determining whether or not the referral is an appropriate modality (Table A).

My agency, Hillside Children’s Center in Rochester, New York, developed a Support Service Referral form (Table B) which is now a precurser to the Art Therapy Diagnostic Assessment. The Quality Assurance Department developed the Support Service Referral form as a manner of expediting not only this service but also other modalities (e.g., psychiatric, psychological). The inclusion of the creative art therapies on this form clearly underscores this agency’s commitment to creative art therapy assessments as professional, clinical tools.

The Tests

In the last few years, I have been refining this procedure, adding and deleting tests when indicated. Originally, the assessment consisted of the House Tree Person (HTP) (both achromatic and chromatic); 2) the Kinetic Family Drawing (KFD); 3) the Draw a Person (DAP); 4) Bender Gestalt Visual Motor Test (B-G); 5) the Cognitive Art Therapy Assessment (CATA); and 6) the Silver Drawing Test of Cognitive and Creative Skills (ST).

(Author’s Note: The CATA was a name I gave to an art therapy evaluation procedure described by Kramer, E. and Schehr, J., 1983. Because I scored the results according to the developmental stages of Lowenfeld and Brittain (1975), I felt the name bespied the procedures.)

My review of Rawley Silver’s test

"Part of the format is based on observations of both social workers’ intake reports and psychological assessments."

October 1987, ART THERAPY 127
(Horovitz, 1985) prompted me to include her battery and measure it against standardized tests (such as the WISC-R) and projective instruments (such as the HTP and KFD). The Silver Test not only yielded similar information but also uncovered invaluable information that was heretofore unknown with both our emotionally-disturbed hearing and deaf population.

Presently, all of the tests are included with two exceptions: 1) the Bender Gestalt (B-G) is scored developmentally and used only on children up to age 10; and 2) the Draw a Person is implemented if more information is required to determine sexual orientation or clarify cognitive and developmental functioning.

Projective analysis of test results (e.g., HTP, KFD, CAT) are stated succinctly and without elaborate descriptors of the work produced. It became clear that a respected clinician need not justify his or her interpretations but rather state them clinically in order to gain acceptance and credence.

A few examples of completed evaluations (minus identifying information such as real names and addresses) are presented at the end to give an idea of a completed diagnostic assessment.

This evaluation is one of many forms designed for our Creative Art Therapies Department. It is hoped that art therapists will continue to develop evaluative tools such as the Silver Test (ST) for inclusion in diagnostic assessments. Perhaps such contributions will convince other mental health professionals of the significance and impact of art therapy not only for treatment but also for diagnostic and assessment purposes.

Author's Note: Since submitting this article for publication, the author now scores the silver Drawing Test (ST) developmentally as well as emotionally when applicable. Also the Bender Gestalt (B-G) is scored for emotional indicators as well as developmentally (again according to the Koppitz system - see reference section). Since this article was accepted for publication, another change has occurred at our agency. Since the Art Therapy Diagnostic Assessment highlights so much information, all deaf/hearing-impaired clients which enter residential treatment are now evaluated for the purpose of yielding information which might not otherwise be available.

3. **BOTTOM PORTION**: Bottom half of the Referral form is completed by the supportive service provider upon receipt and processing of the referral.

**COPIES**: Three (3) copies are made of the completed Referral form.

**DISTRIBUTION**: The copies and original are distributed as follows:

(a) Original is returned to the worker who made the referral ASAP and then filed in the record.
(b) One copy is maintained by the supportive service provider.
(c) One copy is forwarded to the supportive service provider’s supervisor.
(d) One copy is forwarded to the Quality Assurance Unit.

COMPLETE THIS SECTION FOR PSYCHIATRIC EVALUATIONS giving more detailed data for each area.

ART THERAPY DIAGNOSTIC ASSESSMENT

NAME: Adam

ADDRESS:

DOB: 7/12/73  CA: 12.4

PARENTS:

REFERRED BY:

TESTING DATES: 10/10/85, 10/18/85, 10/25/85, 11/15/85
   11/22/85, 11/25/85, 12/6/85, 12/13/85

ADMINISTERED BY: M.E. Keef, AT Intern

Reason for Referral:

Difficulty verbalizing feelings and discussing relevant issues; attention deficit and hyperactivity leading to difficulty focusing on any one activity for more than 3-5 minutes.

Tests Administered:

- House-Tree-Person (Achromatic and Chromatic) (HTP)
- Kinetic Family Drawing (KFD)
- Silver Drawing Test of Cognitive & Creative Skills (ST)
- Bender Gestalt Test of Visual-Motor Perception (BG)
- Cognitive Art Therapy Assessment (CATA)

Behavioral Observations and Impressions:

Although a boy of twelve, Adam appears younger. During the initial testing session Adam was quite curious, asking many questions, and wishing to examine the contents of the cabinet as well as the room next door. Once sitting down to work, he was highly distractible during the testing process. Also, as he was given each new task, he moved first a chair away from myself, then repeatedly further until by the end of the session he was at the opposite end of the room. Upon my asking, he verbalized a difficulty in trusting new people. His manner remained friendly, however, and he stated in a teasing way that he was "testing" me. In the ensuing testing sessions Adam still evidenced curiosity and distractability, but was able to focus quite well on the artwork and necessary clean-up.
Test Results:

- **Cognitive Art Therapy Assessment (CATA):**
  
  **Two-Dimensional**
  Drawing Response -

  Painting Response -

  **Three-Dimensional**
  Clay Response -

  **Developmental Stage**
  Schematic, age 7-9 years
  (Lowenfeld & Brittain)
  (same as above)

  Overall Performance: Lower end of spectrum for schematic stage of
development, age 7-9 years, Lowenfeld & Brittain.

- **Silver Drawing Test (SDT):**

  Predictive Drawing - 8
  Drawing from Observation - 10
  Drawing from Imagination - 6

  Total Score: 24; 9th % for grade 7
  T-Score Conversion: 36.32

- **Bender Gestalt Test of Visual-Motor Perception (BG):**

  Adam scored a 12, which indicates his visual-motor perception to
  be functioning at about age 5½. Werner Halpern, M.D. believes this to indicate
  integration as problematic for Adam, rather than perceptual impairment.

- **House-Tree-Person (HTP):**

  Adam's overall response indicates instability and low self-esteem,
especially the final two drawings of the tree and person, chromatic: given
a selection of colors, Adam chose a pale flesh color, which all but disappears
into the manila-color of the paper. These two drawings are the most minimal
of the set, using only the essential elements to indicate "tree" and "person".
Adam was unduly quiet during this session, appearing depressed. Upon my
inquiring, Adam stated sadly: "Things at home are bad."

- **Kinetic Family Drawing (KFD):**

  Upon being presented with this task, Adam declared that he could
not draw his family. To my question of why he replied: "There's no paper big
efficient." He then chose the smallest paper available, drawing his mother on
one and his sister on another, both as large faces (no bodies), which overwhelm
the page. Adam refused to include himself. These drawings were also done
during the session previously mentioned, when Adam verbalized his depression.
of the state of affairs at home. His use of separate pieces of paper to depict
his mother and his sister, indicates he perceives divisions in the family.
The size of the drawings on the page suggests feelings of being overwhelmed
by them, and of their importance to him. Finally, his refusal to include himself
indicates feelings of isolation from the family, coupled with low self-esteem.

- Cognitive Art Therapy Assessment (CATA):

It is interesting to note that in being given the freedom to create
anything desired, Adam's artwork in all three areas of this task are strongly
related to home. His comments also centered around creating the art work for
his mother, and were indicative of anxiety that it be "good enough".

Especially of interest is Adam's response to the three-dimensional
portion of the CATA. He created a house for his mother out of clay, then painted
it with tempura paints. The finished piece projects an impression of home being
a bleak, unstable place to be.

Summary and Recommendations:

Adam appears to be functioning at the low end of the schematic
stage of development, age 7-9 years, Lowenfeld & Brittain. Associations to
the tests revealed depression regarding his home life, low self-esteem, and
need for acceptance. Since he is able to attend to the art materials, it is
recommended that Adam be seen bi-weekly for individual art therapy. It is
hoped that eventually Adam's family will become involved in family art therapy
to extend the therapeutic process to the family constellation.

Coordinator of
Creative Art Therapy

MEK/jsl
ART THERAPY DIAGNOSTIC ASSESSMENT

NAME: Michael

ADDRESS:

DOB: 5/20/77 CA: 8.6

PARENTS:

REFERRED BY: Paula Gianforti, MSW

TESTING DATES: 10/14/85, 10/21/85, 10/30/85

ADMINISTERED BY: Ellen G. Horovitz-Darby, M.A., ATR, Coordinator of Creative Art Therapies

REASON FOR REFERRAL: Michael was referred by his social worker, Paula Gianforti, MSW, for a variety of reasons including:
(a) functioning below grade level
(b) unsuccessful in traditional verbal psychotherapies
(c) difficulty accepting change
(d) separation anxiety regarding divorce trauma at age 5 years
(e) low frustration tolerance
(f) limited attention span

TESTS ADMINISTERED: House Tree Person (chromatic and achromatic) (HTP)
Kinetic Family Drawing (KFD)
Cognitive Art Therapy Assessment (CATA)
Silver Drawing Test of Cognitive and Creative Skills (ST)

BEHAVIORAL OBSERVATIONS AND IMPRESSIONS:

Initially, Michael was extremely anxious during the testing situation. In the first interview, Michael stated his reasons for attending Art Therapy - "because I don't want them (mother and father) to be divorced." The testing situation revealed Michael as highly distractible, avoidant in posture, excitable and bordering on hyperactive behavior. For example, a few times during the testing sessions, Michael fell off his chair. Later, he purposely bumped into walls. When this worker addressed these actions, his response was, "Do you think they're lonely out there without me?" (Referring to his parents in the waiting room area). It was clear that he felt protective and very responsible for their well-being.

As the testing continued, Michael became more comfortable with this worker (buying her a gift on his second session) and was able to easily verbalize his conflicts.
TESTS RESULTS:

COGNITIVE ART THERAPY ASSESSMENT (CATA)

Two Dimensional
Drawing Response

Painting Response

Three Dimensional
Clay Response

Developmental Stage
Pre-schematic, age 4-7 years (Lowenfeld and Brittain)
Schematic, age 7-9 years (Lowenfeld and Brittain)

Developmental Stage
Schematic, age 7-9 years (Lowenfeld and Brittain)

Overall Performance - lower end of spectrum for schematic stage of development
age 7-9 years, Lowenfeld and Brittain

SILVER DRAWING TEST (SDT)

Predictive Drawing

Drawing from Observation

Drawing from Imagination

SUB-TEST SCORE
10
3
8

Total Score 21 26% for grade 3 T Conversion Score = 43.68

HOUSE TREE PERSON (HTP)

Michael's response on both the achromatic and chromatic subtests of the
House Tree Person were not highly differentiated. Of interest was his response
to the house. He created just a shell which may be indicative of the lack
of substance he feels exists within his home environment. With some prompting,
he was able to create a door. Nevertheless it was overly large, often
reflective of dependent personalities. His difficulty with the Person subtest
revealed poor self-image, feelings of inadequacy, and avoidance of interaction
with others. The Tree subtest reflected inner turmoil and conflict.

KINETIC FAMILY DRAWING (KFD)

Projective analysis of the Kinetic Family Drawing (KFD) revealed Michael's
clear avoidance of family-related issues. His initial response was to spend
much time articulating a house (his father's) yet he added no people. When
this was pointed out, he then added his paternal grandparents and his father
working in the garden, a workman repairing the chimney, his cousin, Patty
outside the home by herself and last added himself looking out on this activity
from inside the house. His need to isolate himself from family interaction was evident as well as his view of his grandparents and father as authoritative parental figures. Mother's absence was obvious and when the worker pointed this out, he placed her inside the kitchen rather than create another family system. Of particular interest is the chimney repairman; perhaps Michael views this worker as someone who can reconstruct the original family constellation and enact his fantasy of a parental reconciliation.

COGNITIVE ART THERAPY ASSESSMENT (CATA) (Projective)

Projective analysis of the CATA was of interest. His drawing revealed scrawling chaotic lines. His emotional response to this graphic association of inner conflict led him to fall off his seat.

The painting, two pieces of paper taped together has a circular rainbow which was later sub-divided to give to each of his parents so neither would feel "hurt". The art therapist's interpretation of the divorce issue followed the completion of the subtest as Michael frantically decided to cut the painting in half.

The clay response yielded similar verbal remarks - Michael became upset when only one creation had been made, again feeling torn between whom he should give the project.

Interpretation of his feelings allowed Michael to reflect his need to save his parents, burden himself with responsibility, and please others. Moreover, Michael was able to verbalize his loyalty conflict around mother's fiancé, Paul, versus his father.

RECOMMENDATIONS AND SUMMARY:

Michael appears to be functioning at the low end of the schematic stage of development, age 7 years, Lower'eld and Brittain. It is clear that he is cognitively arrested due to emotional turmoil, conflict, and unresolved feelings regarding his family constellation.

Since he obviously responds to the Art media and couples the art process with verbal associations to the work produced, individual weekly art therapy is highly recommended. In addition, bi-monthly family art therapy with separate sessions for Mrs. B and her fiancé' Paul, and Mr. B is recommended to expedite resolve of Michael's inner conflict regarding placement within these family systems.

The testing seems to have revealed Michael's need for a self-contained classroom with highly individualized instruction in order to offer him the emotional support which he needs to make cognitive and academic gains.

615
"Art Therapy: The Healing Vision,"

(Videotape Formats: ¼" U-matic, ½" VHS, ½" Beta, Color, 49 minutes, 1986), produced by Menninger Video Productions, Box 829, The Menninger Foundation, Topeka, KS 66601. Information on rental or purchase may be obtained by calling the toll-free number: 1-800-345-6036.

Reviewed by Lewis K. Shupe, Ph.D., ATR, Professor of Art Therapy, Wright State University, Dayton, Ohio.

Advanced publicity on this videotape mentions that the culmination of this production involved a team of art therapists, media designers and video professionals at The Menninger Clinic in over a year’s work. Robert Ault, HLM, ATR, Art Therapist at The Menninger Foundation mentions that he has “long felt the need for a video program that would offer a comprehensive view of the entire art therapy discipline . . . and that [this tape] is intended to fill this gap.”

The video film reviews history and methodology in art therapy and presents a conceptual framework for building techniques that would be appropriate for many levels of therapy work. Using clinical case materials (and, in some cases, the client or patient), this videotape demonstrates how art therapy is applied in at least three treatment settings and with a variety of populations. The tape includes: 1) an interview with Grandma Layton, the by-now-famous Kansas woman whose work documents her recovery from over 40 years of depression; 2) a brief historical review of the relationship of art and healing (including some clinical footage of art therapy in the 1930’s, taken from The Menninger Foundation Archives; 3) the development of a conceptual model of art therapy; and 4) case examples (adult patient, child, group and older persons).

The photography is excellent, the computerized visual graphics are intriguing and an attractive complement to this video providing the viewer with a well organized visual presentation of the content. This includes over-images, unique blending of colors (in some cases, similar to exciting psychedelic-like color changes seen in specialized films) and unique perspectives of people, paintings, media and equipment. Close-ups of paint being daubed on canvas or the child’s fingers manipulating clay are effectively done and photographed with understanding and care.

In the introductory statements by Ault, he points out that art is more than just for amusement or simply as an adjunct for psychotherapy, but that the very nature of art therapy has a life of its own. In reviewing the Layton sequence, he points out some background of the client (“shock treatments, drugs were ineffective [and with the] death of her son, she decided that she had to change her life. She started with contour drawing.”). The paintings are powerful. Layton projects the self-drawing into different situations, and the images evoke a new situational experience. Ault mentions that her depression had vanished after she began drawing, and one can easily see how the art “took over,” and helped to mold and shape meaning into her life. “Her experience illustrates what art therapy is all about,” proclaims Ault, and it seems to be clearly delineated in this video by use of rapid image, close-up shots and client comments.

To the question “How did art therapy develop?” the video illustrates the use of art in healing (through images, rites, ceremonies, symbols, signs, events, “the whims of gods and the dreams of men”). This seems to be a short course in art history, as it moves rapidly from early representational symbols to Baroque, Romanticism, the 1800’s, Impressionism, Abstraction and Expressionism. The examples (i.e., paintings) are well-chosen and photographed impressively. In answering the primary question of this section, Ault points out that psychiatrists in the 19th century began looking at art of disturbed patients and alludes to Prinzhorn, Freud, Jung and to symbolism, sublimation, dreams, images, sub-cultures, with a follow-up of Naumburg and dynamically oriented art therapy. Art education therapy (Lowenfeld) is briefly mentioned, as well as references to rehabilitation, special education and art with the aged person. Kramer (“sublimation”) and Kwiatkowska (“family art therapy”) are included, with a lead-in to the human potential movement with references to art, music, poetry, drama as expressive arts areas with direct relationships to art therapy. Paul W. Pruysen, Ph.D., asks questions...
(and dialogues with the viewer) about interactions, art as therapy, relationships, etc., and implies that we all struggle for answers, that art therapy is an important field for this struggle, and that we should continue in our search for the answers.

The section titled “How is it used?” is the core of the video. It points out the three elements that are central, according to Ault, to the entire understanding of art therapy: 1) the person; 2) the process; and 3) the product. In his introduction to these three parts, we see a child and adults working in art therapy (examples: a depressed person; a manic person; family pictures). “Information,” says Ault, “must be analyzed within the context of the patient’s life,” and the ensuing sequences attempt to show us the contexts within which the work was done. In the “Person” section (i.e., “Person-Centered Art Therapy”) Ault is shown working with Carrie, a young adult. As she draws, verbalizes and communicates, we have insights of the art therapy process as she moves through the course of treatment. There is appropriate interchange between the patient and therapist relative to the drawings, their meanings to the patient (i.e., in context) and to projections to other content.

In the “Process” section, the viewer is shown examples of art therapists working in different situations. One art therapist works with a deaf child (“acting out behaviors resulting from the death of mother”), and another works with a group on “Bridge Building” with clay, illustrating interaction with the therapist, media and each other. As is stated, this “Process Oriented Therapy” is one of the core foundations in the total view of what art therapy is and how it works.

The “Product” section (“Product-Centered Approach”) emphasizes skill-building, and the importance of a focus on the product with certain approaches, with specific populations, in some sites, and for a particular purpose that is compatible with the goals and objectives that have been identified. An activities director mentions the important social, occupational and recreational aspects of crafts, for example, in a church home for older residents. Brief interviews of residents, and shots of a bazaar where some of the products are for sale, highlight this section.

The summary of the video recalls the “Person, Product, Process” core, and Ault states that “art therapy works because it involves the creative, integrative forces within the psyche.” This video attempts to do a lot within the 49 minutes, and overall, it does it well. Perhaps in an hour tape some aspects (for example, the psycho-educational and developmental content) could have been more fully developed, as they were too lightly touched upon in this tape. However, the producers—and particularly Robert Ault and his colleagues at The Menninger Foundation—have done an excellent job in bringing a “visual” to the art therapist, and to the profession, that is long overdue. Along with the congratulations to all who were involved in the making of this videotape, it is recommended for the viewer who will find it fascinating, aesthetically pleasing and most significantly, of educational importance.

---

**Poetry as Therapy.**

Reviewed by **Josef E. Garai, Ph.D., ATR**, the former founder and chairperson of the Master of Professional Studies degree program in Creative Expressive Arts Therapy at Pratt Institute, from 1968 to 1980. He retired as Professor Emeritus from Pratt Institute in June, 1980. Currently Dr. Garai is an art psychotherapist in private practice in New York City. He has also been a member of the faculty of the New School for Social Research since 1968.

This anthology of poetry therapy proceeds from the assumption that poetry therapy in conjunction with music, rhythm, rhyme and metaphors has been one of the oldest therapeutic means beginning with the Egyptian Book of the Dead through the allegories, fables, and Psalms of the Bible, the Sufi story-tellers, and Milton Erickson's story-inventing method. Morrison points out that the poet heals not only himself or herself, but also his or her readers through identification with the intrapsychic and interpersonal conflicts similar to those described in the poem. Like the expression in drawing, painting, sculpting, imagery, dreams and collages, poetry seeks to restore wholeness to the individual seeking integration of body, mind and spirit.

Poetry provides a spiritual dimension to life and
assists the individual in reconciling inherent polarities such as love and hate, fear and courage, life and death, power and powerlessness, loneliness and connectedness with the world at large. Morrison, as past president of the American Poetry Association and the founder of the American Academy of Poetry Therapy (sponsored by the University of Texas in San Antonio), is eminently qualified to discuss the ramifications of applications of poetry therapy in a variety of clinical and rehabilitative settings. These include prisons, with physically and emotionally handicapped persons, drug and alcohol addicts, prison inmates, holocaust survivors and others.

Particularly valuable for the creative expressive arts therapist are Morris Morrison’s chapter on “Poetry and Therapy,” Frances Louise Henry’s and Phyllis Luckenbach Saywers’ chapter on “The Arts and Healing,” William Sutherland’s chapter on “Where do images come from?,” Marc Kaminsky’s chapter on “Voices from within the process: of writing and reminiscences in old age,” Theresa G. Morrison’s chapter on “Poetry as Therapy with Adolescents,” Gene Bard’s chapter on “Prison Therapy,” and John Whittaker’s chapter on “The Use of Poetry in Psychiatry.”

Art therapists will find in this book a wealth of creative ideas enabling them to combine art therapy with poetry therapy. In my own practice, I have long since combined art and poetry therapy. When I ask individuals to draw with multicolored crayons and model with plasticine clay a recent or a recurrent dream, I also ask them to write a poem related to the dream. In family art therapy I require individuals to draw with crayons portraits of themselves and all the other family members. The poems frequently reveal the innermost thoughts of the family members including misconceptions about one another. The poem one identical twin wrote about his twin brother stated:

I am Johnny and he is Jeff. We are twins and people mistake John for Jeff and Jeff for John. I, Johnny, am always on fire, while Jeff’s coolness greatly admire. I like playing hockey and baseball and making a mess, while Jeff prefers a quiet game of chess.

The metaphors in the poems are powerful incentives toward self-understanding, personal growth, individuation, autonomy and self-actualization. As Morrison points out, when Robert Graves wrote his first book of criticism “On English Poetry,” he stated that poetry was his way of serving his Muse, while looking after his neurosis. Graves advertised poetry as a “form of psychotherapy” for the neuroses of poets and the culture they express and address. Graves assured his readers that a well-chosen anthology of poetry puts the reader in a hypnotic trance; the reader is confronted with an allegorical solution of the problem that has been troubling him or her; one’s unconscious accepts the allegory as applicable to one’s own condition; the emotional crisis is relieved. Graves concludes that such an anthology is a complete dispenser for the more common mental disorders and may be used as much for prevention as for cure.

The book Poetry as Therapy presents an excellent anthology of poems written by people from all walks of life seeking to resolve their problems creatively. The ultimate goal of poetry therapy consists in helping people to live more joyful and creatively productive lives. It is the same goal which we as art therapists share with our fellow professionals.

Some examples of the power of poetry therapy will illustrate further its usefulness. Working with aging people, Martha Rosenfelder wrote:

Growing old to me is a new experience like any other phase of life. Growing old is like visiting a museum; one admires things of the past. Being old is like an evening after a day of work. It is like a beautiful sunset on a rainy day or a vacation without responsibility. Being old is like fall time. Being old is like taking inventory. Being old is preparing for a long trip to the unknown.

Bea Lipsett wrote:

Early morning I sit on my terrace upon the canal. The sun is rising from the East, spreading its iridescent rays upon the calm water. A boat with its churning motor passes slowly by, making the water swirl around. It kicks up the frightened fleeing fish. They find a place of refuge, far from harm. Why, then, can’t I?

In Theresa Morrison’s workshop with handicapped adolescents, Anne, a black girl, who had for years been subject to attacks of asthma and who has also suffered from a severe eczema which she aggravated by compulsive scratching, submitted the following poem:

“Prejudice”

Prejudice is love one bears
His own people
That causes him to spit
On beautiful innocent victims
Of another race.

Prejudice is a force
That prevents people from saying
“Hey, I love you!”

Prejudice is an ache
Surrounding my heart,
Making it feel
About to drop
Into the pit of hell
In the chapter by Nene Sims Glenn on "Reflections of Those Who Survived [the Bataan Death March]," the men found themselves joking at their situation to make it bearable, as in the verses contributed by one survivor:

When they git to talking medals,  
And the battle souvenirs,  
Like the Silver Star and Purple Heart,  
And this here "Croy de Gear" —  
I ain't got no fancy ribbons  
So I feel a little queer;  
But there sure ought to be a medal  
For guys with diarrhea.

My guts is shot all full o' holes,  
Like a bullet drilled me clear  
And blood! I've lost a bucketful  
From this here diarrhea.

But after you lose your innards,  
There ain't nothing else to fear;  
And I bet God has got a medal  
For guys with diarrhea.

Poetry therapy has genuinely brought insights and has come into its own in Morrison's thoughtfully collected anthology.

---

**Ten Paintings**

Reviewed by **Shaun McNiff, Ph.D., ATR.** Dr. McNiff is a Professor of Expressive Therapy and Dean, Institute for the Arts and Human Development at Lesley College, Cambridge, Massachusetts.

I carried D. H. Lawrence’s *Ten Paintings* with me to Switzerland and Sweden where I give training groups in art therapy and dreams each year. The book was intimately connected to the work that we were doing. People in my training groups who looked at *Ten Paintings* all agreed that D. H. Lawrence could have been a member of the group. His pictures embody many of the archetypal themes that group members were dealing with in their art. There were similarities of both content and expressive style. Lawrence’s images are manifestations of what he calls “the great sympathetic centres” in *Fantasia of the Unconscious* and *Psychoanalysis and the Unconscious* (NY, Penguin, 1986).

The art therapy profession has given little attention to what soul art looks like. The profession has been preoccupied with pseudo-scientific standards of graphic analysis which result in the creation of stiff, lifeless and unimaginative images which correspond completely to ... psychological values of the environment in which they were produced. I have found that images which emerge from a soul oriented art therapy environment will express the inner vitality of the psyche. Pictures sometimes come from the “surface” of artistic consciousness as opposed to deeper and yet to be accessed realms of soul. This “deeper” way of working places more emphasis on the feeling to be expressed than the stylistic continuity of forms. Although forms and feelings cannot exist without one another in the arts, soul art focuses on the emergence of emotion and views formal construction as a supportive process. I have personally discovered how the re-engagement of themes from my previous pictures and the formal continuities of my art can be an avoidance to making something “fresh” and related to the immediate context.

*Ten Paintings* is an excellent resource for art therapists who desire to make contact with soul art. It is an elegantly produced, limited edition of thirty-one pages with 10 color plates of the paintings. The presentation of the book does justice to Lawrence’s assertion in the accompanying essay, “Making Paintings,” that “art is a form of delight.” The 10 paintings are so magnificent and expressive of archetypal artistic forms that they merit treatment in a book-length study.

The book makes two important contributions to art therapy:

1. Lawrence’s paintings offer a vivid example, beautifully reproduced by Black Swan Books, of what soul art looks like.

2. The essay “Making Pictures” gives guidance on how to access this type of artistic expression.

D. H. Lawrence started painting at the age of 40 in 1926. He died in 1930.

“A Holy Family,” Lawrence’s first painting, is a contemporary representation of an Italian Renaissance motif. It is a successful picture that must have spurred the artist on. This painting like all of the others in the book is a visual expansion upon the interplay between religion and sexuality that runs throughout all of Lawrence’s writings. He perceived
sexuality as both an expression of, and a mode of approach to, a deeper, more essential religious purpose.

"Fight with an Amazon" is a direct portrayal of Lawrence's sexual subject matter. A nude man and woman in close physical contact are surrounded by vicious dogs, one of which is biting the man's thigh. The woman's hand is also digging into the same thigh. The picture expresses the inseparable themes of sexuality and aggression and Lawrence's preoccupation with darkness and light. The composition is visually forceful. Like other paintings in the book, it gives a sense of fullness because of the way the figures are not completely contained within the borders of the picture. It has strong suggestions of self-portraiture. I am beginning to realize that every artwork is a self-portrait. The extent to which the image succeeds as both a self-portrait and as an embodiment of transpersonal elements will determine its expressive powers. All of the 10 paintings satisfy these criteria.

In "Dancing Sketch" a woman, man and goat dance together. I experience all three figures as part of Lawrence's self-portrait. As in "Fight with an Amazon" he expresses the triad of woman, man and animal. The woman is in the foreground in "Dancing Sketch" as she is within his work as a whole. This picture offers a visual expression of the primal and rhythmic, religious consciousness that he describes in The Plumed Serpent.

"Red Willow Trees" is an illustration of nature as eros and life as passionate fire. "Flight Back into Paradise" has a nude woman pulling away from a fiery industrial complex that she seems tied to with a black cord. Two men in the picture appear to be fighting. This image also corresponds to the novels where woman is connected more to soul and passion whereas man is responsible for the evils of the merchantile world. "Boccacio Story" is a delightful picture of a field worker who is lying on his back and sleeping. He is naked below what appears to be a flowing shirt. A group of nuns are walking through the field painted in pastel colors and they are all staring at him in amazement. The innocent appearance of this image and the other pictures included in this collection show how social attitudes have changed since the 1920's when an exhibition of Lawrence's pictures caused a scandalous uproar in London. He responded to the controversy by saying: "There is something sacred to me about my pictures, and I will not have them burnt, for all the liberty of England."

In a letter to Earl Brewster he wrote:

I stick to what I told you, and put a phallus, a lingam you call it, in each one of my pictures somewhere. And I paint no picture that won't shock people's castrated social spirituality. I do this out of positive belief, that the phallus is a great sacred image: it represents a deep, deep life which is denied in us, and still is denied.

The essay "Making Pictures" and excerpts from Lawrence's letters which are included in the book, present the Laurentian method of painting from the soul. He describes how "the picture happens" and "the struggling comes later" to bring it "to completion."

The knowing eye watches sharp as a needle; but the picture comes clean out of instinct, intuition and sheer physical action.

This philosophy of painting corresponds to what Lawrence said about writing in Fantasia of the Unconscious: "The novels and poems come unwatched out of one's pen." He referred to his writing as "pure passionate experience" that he reflected upon "afterwards."

In "Making Pictures" Lawrence talks about the necessity of putting life into pictures; and painting as delight, exaltation, visual discovery, intense concentration and visionary awareness. As stated again later in Apocalypse, he writes that: "Art is a form of religion, minus the Ten Commandment business, which is sociological. Art is a form of supremely delicate awareness and atonement—meaning atoneness, the state of being at one with the object." He criticizes those who treat art "as if it were a science, which it is not."

He tells us how to draw from the soul in the essay:

The picture must all come out of the artist's inside, awareness of forms and figures. We can call it memory, but it is more than memory. It is the image as it lives in the consciousness, alive like a vision, but unknown. I believe many people have, in their consciousness, living images that would give them the greatest joy to bring out. But they don't know how to go about it. And teaching only hinders them.

And again in an excerpt from a letter to Alfred Stieglitz:

If a picture is to hit deep into the senses, which is its business, it must hit down to the soul and up into the mind—that is, it has to mean something to the co-ordinating soul and the co-ordinating spirit which are central in man's consciousness: and the meaning has to come through direct sense impression.

Anais Nin, an admirer of Lawrence, said that "one art nourishes the other." This is what happens in Ten Paintings. Black Swan Books is providing an important service in publishing this volume. They are also producing a book on the paintings of Lawrence Durrell who together with D. H. Lawrence is one of my greatest sources of artistic and psychological inspiration. These books can help to take art therapy closer to the soul of art.
Statement concerning "Rewriting a Myth"

Frances Fisher Kaplan, DA, ATR, private practice, Morris Plains, New Jersey

The poem entitled "Rewriting a Myth" was catalyzed by a spontaneous drawing that I produced while leading an art therapy group. It holds a twofold significance for me. Creating it helped me more fully appreciate the productive interaction that can exist between words and images—both through the process that brought this particular poem into being and through using the modality of poetry with its almost exclusive reliance on imagery-eliciting words. And it helped me consolidate a more realistic conception of heterosexual relations—one that does not idealize, romanticize, or dehumanize the opposite sex.

REWITING A MYTH

On a sunlit afternoon in May, sitting under the dogwood tree with blossoms like large white butterflies poised for flight, I go searching for the one I call the Dreamer and find her in her rainbow-webbed cave busy with her paints and chalks. Slyly she unwinds for me her latest scroll.

I kneel beside a sun-flecked pool my hand outstretched beckoning the shy creature with a silver horn that drinks from the other side.

Come, I plead, lay your head in my lap. I am no longer a maiden but surely I am still entitled to an enchanted moment.

Come, I will weave you a crown of roses not care if I prick my fingers on the thorns.

Come, I will plait your silken mane with daisies and feed you honey made from orange blossoms.

Slowly the unicorn raises his head and looks at me with pool-blue eyes. He hesitates, puts forth a silver hoof. I hold my breathe, and then—reflected in my eyes he sees a crouching hunter, sunlight glinting on sharpened steel; and with a leap and the flick of a tasseled tail he is gone.

I plunge after him, murmuring, Sweet unicorn, cruel unicorn, sad unicorn, who is tormentor? Who is victim?
The woman snares you and betrays you, you say. She says, I receive you only to be forced to give you up.

Pursuer and pursued, we crash through the forest dimness. Past rock and stump and broken branch. Past secret cave and mossy ancients thrusting high their leafy heads. Until, suddenly, blocking our path is the Old Wise One holding up a much-lined palm. We dare not pass and deprived of patterned purpose, we allow the miracle to happen.

Before me stands, not unicorn, but man, a creature like me—yet not. Across a small emptiness we eye each other warily, afraid of the power we perceive disdainful of the weakness.

Then, recognizing a companion traveler on a journey of uncertain course, of unknown destination, we extend our arms until our finger tips brush.

The scroll is rewound. The sunshine warms the dogwood butterflies who have not yet flown away.

There is still time
to rewrite the myth
to heal the breach between male and female to learn what love is not.
Art Therapist's Portfolio

VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. It also encourages the submission of photographs of art by art therapists with an accompanying statement describing the work's meaningfulness to its creator. Submit black and white glossy photographs and four copies of the written material to: Viewpoints, ART THERAPY, 505 E. Hawley St., Mundelein, IL 60060.

1. "TREE AT NIGHT" Painting by a young girl in art therapy at Wright State University, Dayton, Ohio

2. "SCARY FIGURE" Painting by a young boy in art therapy at Wright State University, Dayton, Ohio

3. "ME AND MY HOUSE" Drawing by a young boy in art therapy at Wright State University, Dayton, Ohio
Plan To Attend

The

AATA '87 Annual Conference

"New Direction In The '80's"

November 4-8, 1987

Pre-Conference - November 4, 1987
Conference - November 5-8, 1987

Sheraton Bal Harbour
Bal Harbour, Florida

Program and Application for Registration will be mailed to all AATA members.
The American Art Therapy Association, Inc.
MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliate publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office.

Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

About Our Cover
A landscape (by memory) of “My House Under Construction” by a deaf/legal blind autistic child of 13 years of age. Drawing with Prismacolor pencils (Art Therapy Program, New Jersey School for the Deaf; submitted by David R. Henley and Cynthia Orsini, Art Therapists).

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

Copyright © 1988 American Art Therapy Association
As we have done in past post-Conference issues of Art Therapy, this issue contains an overview of the recent 18th Annual Conference of the American Art Therapy Association. We have reassembled the entries so that the papers are together, with a similar arrangement for workshops, pre-Conference courses, and the other categories contained in the Conference program. For those of you who did not attend the Conference—and for those of you who did, and would like additional information—a name and address is provided with each Conference overview entry, so that communication can be made easily by the reader who wishes the information.

This issue contains an article by Judith A. Rubin, an honorary life member of the American Art Therapy Association, and an author, teacher and therapist. Her article “Coming of Age: A Subjective Perspective.” is taken from a presentation given at the 1986 (Los Angeles) A.A.T.A. Conference. Rubin moves us through her young childhood (“My love of art... had given my life meaning since early childhood...”) to adolescence and middle adulthood (“My clinical work is a source of stimulation, challenge, and pleasure in helping folks to get better.”). She discusses the ordering of stated priorities and offers suggestions, through her own experience, and for the reader as well as briefly mentioning our own internal struggles and growth as an Association.

At the recent A.A.T.A. Conference in Miami, Florida, one of the general sessions was devoted to the topic “Social Applications of the Arts.” Robert Ault organized and chaired the panel, and the other members were Maxine Junge, Bruce Moon (replacing Patricia Gould) and Gary Barlow. We were asked to “dream about the future,” and be realistic about the present as well as “cite important statistics if necessary, think of a utopian concept, relate to experiences, and, in general, take the content in any direction”—relating, of course, to the overall theme of social applications and/or awareness of the arts. Bob focused on the great American wasteland, business and industry, and the economic structures within our society—and how art therapy “fits into” the present, and the future, and aspects of mental health work. Maxine cited some statistics about the American family that were thought-provoking and disturbing, and discussed the urgency of art therapists taking a political role relative to mental health and the family (“... for the family in America today is in grave danger of dying.”). Bruce shared an audio-visual presentation (“Images of Our Culture and the Effects of Events on Our History”) that was direct, forceful in content and presented with a soft-glove “power punch.” For my part of the panel, I discussed art therapy and education, and focused on three areas—teaching and self-expression; attitudes; and concerns about the future. Many persons suggested that the panel members share the content of the presentation with the readers of Art Therapy, so in a very short turn-around time, we have prepared this four-part article for you. Keep in mind that it has not been completely edited out of the verbal presentation format; therefore, some of the narrative may carry with it the oral presentation flavor. The panel members (authors), however, felt that this direct approach to the article might enhance rather than detract from the basic message and content.

I am pleased to welcome a new “Book Reviews” editor—Aina O. Nucho, Ph.D., ATR, ACSW, associate professor at the University of Maryland School of Social Work and Community Planning. Aina has been an active member for many years in the American Art Therapy Association, and many of you have been “old friends” with her during this time. I am happy to welcome her to this new position, and look forward to working with her in the future. In the meantime, if any of you have a suggestion for a particular book to review, please send your ideas to Aina.

Articles are being received for review fairly regularly now, as well as some submissions for “Viewpoints,” photographs for the cover, and photos of art work that might be used in various places in the journal. Thanks to all of you... your submission will be processed in a timely manner. Keep the articles and other materials coming.

Since Spring is on the distant horizon, my thoughts seemed to have turned to poetry. Maybe these bleak winter days are causing Spring-like thoughts to crop up with regularity [Note: This editorial is being written in late January] although it does seem unusual, perhaps, that as I look out the window to the snow-covered ground, springtime can seem near. Very possibly the motivations came from glancing through the book An Exceptional View of Life. The Easter Seal Story, written and illustrated by handicapped children and edited by Bob Krauss (Norfolk Island, Australia: Island Heritage Limited, 1977). One child wrote the following (taken from a full poem titled “I Like”):

I like writing poems—making them up.
It’s a real neat feeling. I enjoy
taking the time to think of them.
Some are love poems, and some are
just everyday, nice ones. (p. 15)

Also, from an earlier part of the poem:
I like to horseback ride. When the
horse is galloping, I can float
away in my dreams.

The poem included in this issue’s “Viewpoints” was written by Maxine Junge, ATR. Maybe it is your turn to write a poem—to think of Spring, to be thankful, to anticipate, to enjoy, to sense discovery, to “float away in some dreams,” to write some love poems or just everyday ones!

Gary C. Barlow, Ed.D., ATR
Editor, Art Therapy
A.A.T.A. Conference Overview

The 18th annual Conference of the American Art Therapy Association was held in Bal Harbour, Florida, from November 4-8, 1987. The theme was "New Directions in the 80's" and the entire meeting, from the pre-Conference sessions to the closing ceremonies, was a most successful and professionally satisfying one. Special thanks must be given to the Conference Chair, Cay Drachnik, and to the Program Chair, Barbara Sprayregen, and to the many committees that devoted time and energies toward the fruition of this Conference. The persons who were responsible are listed below.

On the following pages is a listing of the presentations, workshops, pre-Conference courses, symposia, and other highlights of the Conference. Included with the presentations are the name and address of a single presenter, or the address of the first person listed in the case of multiple presenters for a session. Information is offered in this format (similar to previous years) so that readers may communicate directly with the primary presenter for any additional information desired on a specific topic. It should be noted that each entry is printed as it appeared in the Conference program, although categories have been grouped together for the reader's convenience. The basic information has not been edited and, therefore, does not reflect any changes that may have occurred at the Conference.

OPENING CEREMONY

“New Directions in the 80’s”
Sandra Graves, PhD, ATR
Mayor Alex Daoud, Miami Beach
Mrs. Martha A. Boden, Executive
Director, Dade County Public Schools

PRE-CONFERENCE COURSES

COURSE #1-The Ulman Assessment Series
Gladys Agell, PhD, ATR, HLM, Director,
Art Therapy Program, Vermont College of
Norwich University, Montpeller, VT 05602
Elinor Ulman, HLM, DAT, ATR Associate Professor,
George Washington University, Washington, DC 20052

COURSE #2-Art Therapy Diagnostics for Adolescents
Maia Gelensky, PhD, ATR
4200 Cathedral Ave. NW
Washington, DC 20016

COURSE #3-Self-Psychology and Art Therapy
Mildred Lachman-Chapin, ATR
903A Waukegan Road, Deerfield, IL 60015

COURSE #4-Systematic Study of Visual Languageing
In Drawings of Primarily Emotional Experiences
Janie Rhyne, PhD, ATR, HLM
1031 E. College, Iowa City, IA 52240

COURSE #5-Theories and Practice of Creativity Development for Creative/Expressive Arts Therapists
Josef E. Garai, PhD, ATR, Professor Emeritus, Pratt Institute
155 W. 68th Street, Apt. 26-A
New York, NY 10023

COURSE #6-Group Art Therapy for Sexually Abused Children
Joan E. Phillips, MA, MS, ATR, 430 S. Lahoma,
Norman, OK 73069
Jobie Sims, MS, ATR

COURSE #7-Diagnostic Prescriptive Approach to Art Therapy: Focus on Chemical Dependence
Diane K. McMillott, MA, ATR
1599 Piedmont Avenue, Atlanta, GA 30324

COURSE #8-Phenomenal and Non-Phenomenal Body Image Tasks in the Treatment of Eating Disorders
Mury Rabin, PhD, ATR
75 Edgars Lane, Hastings on Hudson, NY 10706

COURSE #9-Art Therapy and the Therapeutic Relationship with Elders
Jules C. Weiss, MA, ATR, 1527 Lowerline St.
New Orleans, LA 70118

COURSE #10-The Circle and the Art Therapist
Sandy Geller, MA, ATR, 5 Primrose St., Chevy Chase, MD 20815
Lillian Rhinehart, MA, ATR, MFCC
Paula Englehorn, MA, ATR

OPENING RECEPTION—WINE & CHEESE
Wednesday, November 4, 1987 7:30 PM — 9:00 PM
The Opening Reception will be held in the Grand Ballroom with the Opening of the New Expanded Exhibit Hall. Meet the new ATRs, renew old friendships and make new friends.

CLOSING RECEPTION
Saturday, November 7, 1987 7:00 PM — 9:00 PM
A Closing Reception of all attendees will be held to meet the departing and newly elected board members and to provide social interaction with your peers prior to leaving the conference.

SPECIAL PROGRAMS

EXERCISE PROGRAM—FEELING GREAT
Jules Weiss, MA, ATR, 1527 Lowerline St., New Orleans, LA 70118

FILM PREMIERE—CREATIVE EXPRESSION
Continuous Viewing
Nancy Steinberg, MA, ATR, 103 Park Ridge Circle, Marietta, GA 30068

OPEN STUDIO—
Available to attendees daily

TOURS—
A. Bayside Marketplace
B. South Florida Art Center
C. Vizcaya Tour

EXHIBITING COMPANIES—
A. Brunner Mazel, Inc.
B. Pergamon Journals, Inc.
C. Stern’s Book Service

Art Supplies for Art Studio were partially supported by PYRAMID of Urbana.
MEETINGS

EXECUTIVE BOARD MEETING

EDUCATION AND TRAINING BOARD MEETING

TRANSITIONAL MEETING OF NEW BOARD MEMBERS

EDUCATION MEETING

ASSEMBLY OF AFFILIATE SOCIETIES

March 1988, ART THERAPY 9
"Social Applications of the Arts"

Panel Moderator: Robert E. Ault, MFA, ATR, HLM, Panel Members: Gary C. Barlow, EdD, ATR, Maxine Junge, MSW, LCSW, ATR, Bruce Moon, BS, MACE, ATR.

"Introduction" by Robert E. Ault

Last year I had a discussion with Ed Stygar and others during which I suggested we bring to our annual meetings speakers from outside of our own field. I felt it would help us all to grow to hear a Carl Sagan or a Lee Iacocca, or other scholars or leaders in the fields of anthropology, physics or international relations. I was beginning to grow weary of hearing art therapy hashed and rehashed. I've learned a lot from these speakers over the years but a part of me would like to engage more in the larger arena and explore the connections. For instance wouldn't it be exciting to have a panel to include a creative artist, an arts administrator, a secretary of health or education, and maybe someone from the military or defense department? Maybe a Harvard lawyer could be on the program. I had always found "over dinner" discussions with interesting people very stimulating and growth producing. One exciting thing for me this year has been to have a son enter a microgenetics graduate program and to share his interest and enthusiasm. It has also helped me look at art therapy a little differently. Well, as you know we don't have the budget yet for this, so maybe as a start we have set aside a time to think together about our field and how it relates to non-client populations and contemporary social issues.

It is our hope to stimulate your thinking about a broad view of art therapy and its possible applications to societal needs. Our intent is to share our thoughts and questions, not to attempt a definitive solution. I have asked three distinguished colleagues and friends to participate in this discussion and want to thank each of them for so generously agreeing to do so.

The session will be structured in the following manner. First, I will introduce the topic and how it came to be, then introduce each of our speakers. I will then make some comments, followed by presentations from Gary Barlow, Maxine Junge and Bruce Moon. Patricia Gould was to be a presenter but had to decline for health reasons; Bruce graciously and courageously agreed to step into her place with very short notice.

After the completion of all of our formal remarks, I would like for the panel to each have a brief time to respond to the ideas or thoughts stimulated by the other presentations if they wish. We will then open it up to the floor as time permits for any comments or dialogue that any of you would like to make. Again, we all thank you for being here and allowing us to participate with you.

In this introduction let me introduce myself and the topic together as I believe the two are intertwined and will help to illustrate the reason for, and direction of, this panel. Ten or more years ago at another A.A.T.A. Conference, Shaun McNiff made a presentation on the topic of art therapists that had remained active as producing artists. He included in his presentation art works by himself, Janie Rhynes and myself. It was an issue that many of us in art therapy had struggled with - namely, how do we balance our own creative art-making needs with the demands of academic and clinical life. At Shaun's presentation that day, I made a comment that I was thinking of leaving the field of art therapy and resigning my position at Menninger's (one that I'd held at that time for 16 years). I'd just completed two years of being a primary therapist for seven hospitalized schizophrenic patients and felt completely burned out. Following that meeting several friends suggested that I re-read the book Passages, as I'd just passed my 40th birthday.

Maybe it was a midlife crisis, maybe it was a deeper need to reorder my priorities and the directions of my professional life. I had experienced the process of participating in the creation of the A.A.T.A. and had served in several leadership capacities over the years. This exposure to the larger nations issues certainly impacted on my commitment of being a clinical specialist at one hospital with a handful of difficult patients.

I did reorder my professional life and cut my time in half at the Menninger Foundation, began directing the Master of Science in Art Therapy program at Emporia State University, and opened a private art school. Three other involvements concurrent to this time also altered my view of the field of art therapy. One was to become active in the politics arena including the feminist movement, and getting a better understanding of how as a society we govern ourselves. The second was my appointment by our Governor to the Kansas Arts Commission. Finally, I would include my involvements with Ronald Goodman and Associates, a business communication consulting firm in Des Moines, Iowa.

What I began to discover was that there were great social issues, needs and opportunities for people like you and me to address, bringing to each arena a specialized type of orientation that combines the therapeutic issues of imagery, the creative process and the understanding o
human behavior. I have deeply felt for some years that the arts can have a major role in the salvaging of a world that at times seems to have gone astray and that we as art therapists had a moral responsibility to participate in that process.

Last year I interviewed Dr. Karl Menninger, who at age 93 still works as actively as he did sixty years ago. During the course of that discussion I asked him what he saw as the most pressing problem we were facing today. Without hesitation he answered "The bomb, the bomb, and the bomb. Why would anyone want to incendiarate these books and paintings and these people?" He went on to explain his real fear of nuclear holocaust that would render all our works, regardless of how good we thought they were, as irrelevant.

As we talked that day it reminded me of another answer to the same question I'd heard years before when the (then) President of the American Psychiatric Association was presenting at the Menninger Foundation. Someone asked him what he saw as the greatest danger facing mankind and he answered, "It's not overpopulation, or world famine, or the threat of the nuclear bomb, it's the giving up the Christian virtue of work." How could people maintain a sense of meaningful identity when they no longer did so through their work experience? How do we as a species expend our aggressive energies and keep from doing each other in? Viktor Frankl says "Life is a struggle—living is finding meaning in that struggle." How do we or our children or their children find meaning when we eliminate the struggle? It's a question that has already impacted the art therapy organization complete with the narcissistic demands for stimulation and validation and the pain of insecurity and boredom when these are not present.

The art therapy organization as a whole and as many of its individual members, such as Dr. Joe Gerai, Don Jones, and others, have had a particular sensitivity to these large social issues and have spoken out in their presentations and writings. Our speakers today want to accelerate that process. We are not social scientists, or futurists, but we do share a uniquely humane profession that can, and simply must, assist in the resolution of social conflict and dilemma. I have asked our speakers to present not only their observations of what is now possible, but to include their speculations, their dreams and their fantasies of the directions we could go in the future. I would like to introduce each of them to you, first, and then I will address more specifically my own topic.

The second speaker today is Dr. Gary Barlow, professor and coordinator of the graduate program in Art Therapy at Wright State University in Dayton, Ohio. Two years ago, this program received the prestigious "Academic Challenge" award given by the University and the Ohio Board of Regents. Gary was also the recipient of the Outstanding Faculty Member Award in 1986, and in 1987 was inducted as an "Honorary Advocate" to the National Hall of Fame for Persons with Disabilities. You might know him best as the Editor of our professional journal, Art Therapy. He has also served the A.A.T.A. for many years in a variety of positions, such as the Education Chair and the Research Chair. Gary will be speaking on the relationship of art therapy and education.

The third speaker is Maxine Junge, an art therapist from Los Angeles. Maxine wears several professional hats in her busy life. She is the Associate Director of the Masters program at Loyola Marymount University, is a family therapist, does private practice, and is a good water colorist. She has served the A.A.T.A. in many capacities including her long work on the Education and Training Board, her service as the first clinical representative on the A.A.T.A. Board, etc. Much of her professional life, though, has been focused on art therapy and the family and I've asked her to speak to this.

The final speaker is Bruce Moon, an art therapist at the Harding Hospital in Worthington, Ohio. He is Chief of Adjunctive Therapy for the Child and Adolescent Divisions, and Co-Director of the clinical internship program. Bruce's first education and involvement was with the Methodist Church and he is a minister as well as a good art psychotherapist. He is a frequent speaker and writer, and I appreciate his joining the panel at such short notice.
Part I

“Art Therapy in the Great American Wasteland; Implications for Business and Industry and the Economic Structures of Society”

Robert E. Ault, MFA, ATR, HLM, Director of Art Therapy, Emporia State University, Emporia, Kansas, and Art Therapist at the Menninger Foundation, Topeka, Kansas.

Nine years ago I opened the Ault’s Academy of Art, a small school in Topeka, that provides drawing and painting instruction for both children and adults. There are six classes per week of eight to ten students per class that I teach. About two-thirds of the students are children ages 8 to 15, and one-third are adults ages 16 to 80. Most of my clients are from the middle to upper socioeconomic population in our community. When I began this adventure I actively attempted to make the school a non-therapy oriented business as I was seeking relief from the demands of clinical life. In spite of my wishes to move away from therapy oriented relationships I found quite impossible to move away from the tremendous therapeutic impact the classes seemed to have on the students. I observed about 25 to 30 percent of my clients who came to the school for mental health reasons under the guise of art lessons. What I had stumbled into was what I began to refer to as the “Great American Wasteland,” middle class suburban America. When I use the metaphorical term wasteland, I don’t mean land that is polluted and toxic. I mean land that has not been cultivated properly. These are people that carry tremendous social, political and economic clout, but who personally were suffering greatly from the emptiness of materialism, values of convenience, and a basic narcissistic orientation to life. They worked hard, they paid their taxes, they always voted, and they went through the motions of life without really questioning. Parents were distressed in their lack of understanding why so many of their children experienced school failures, and other forms of acting out such as drug use, drinking, etc., in spite of their favored social position. I was reminded of Frankl’s comments about needing to find meaning in struggle. These were children or adult age children that had been overly indulged and protected.

By using very basic principles of art therapy such as providing a caring, stimulating environment, a structured process of involvement, some counseling, a strong sense of identity with the group and the place, the maximizing of responsibility by the students, the insistence on the proper use of materials, etc., many of these people began to make major changes in their lives. The inherent therapeutic value in the making of art and the ownership of the process came into play. Parents would come to me after a few weeks and say “I don’t know what has happened, but my child is doing better in school than he ever has.” Adults began to report that they had also made significant changes in relationships or in other areas of their lives and were generally feeling better than they had in years. It wasn’t just the taking of art lessons, a many had tried that many times; I was, I believe, the provision of an educational and therapeutic involvement based on solid clinical understandings. It is a potential arena for the professional services of ten thousand art therapists. Topeka is not the only community in America with these needs. I am not recommending art therapy for middle class America, for they would reject it if it was presented as therapy. That term implies the unacceptable label of pathology. These people do not wish to be treated but they are starved for a type of involvement that is both meaningful and therapeutic. The arts have from the beginning of time helped individuals and societies define their being, their relationship and their perception of reality, and can continue to do so in our times.

Serving as an Arts Commissioner was astonished by the lack of public understanding of the arts and the enormous value. The number of people served through the structures of the National Endowment for the Arts and its state agencies is still rather small compared to the total population. Basically, the same people attend the concerts, go to the galleries, or become art consumer. The arts remain essentially, with some exceptions, the goods of upper class America. I believe that be the way it is structured, these class distinctions are maintained. But wh
has that really got to do with art as we as art therapists understand it? The competitive structuring of the arts and the commercial vice it finds itself in has separated it from the mainstream of our population. These folks are, instead, fed a diet of sit-coms, cop shows and Rambo. It distresses me to know the line item in our country’s defense budget for military bands is larger than the National Endowment for the Arts, and that we as a nation will continue to spend more this year on a single B-1 bomber than we will spend on our collective creative, artistic and cultural needs. Art changes people’s perceptions and opens the door to connecting—and it lasts forever. Weapon systems become obsolete almost before they are employed. They also cannot be recycled back into the economy in the form of useful goods.

The past few years, several of us in the A.A.T.A. have been exploring the relationship of art therapy to the world of business. It is another arena for our professional involvement, and is in need of further exploration and research. Social scientists or others who study organizations and organizational behavior have known for years that clinical concepts can be applied to these structures. Businesses or other institutions can, and do, become ill. They sometimes recover and sometimes expire. These ills are often caused not by market problems but by failures of the human relationships working within systems. These breakdowns are often attributed to bad judgment or bad leadership and are most often treated by purging those responsible. You solve the problem by firing people. But what if you look at these structures as family systems, and use family art therapy methods as defined by Kwiatkowska, and others? It can be powerful magic. My experience, to date, with doing this type of work with executives has also been astonishing to me. I have found them often enmeshed in extreme amounts of information and analysis of business factors, yet completely blinded to the role of their own emotions and the impact of these feelings on their judgments. To have someone who uses a less familiar visual mode of communicating and problem solving cut through years of inability to resolve by traditional talking interactions. We know that it works with our patients, and we are now beginning to know that it can work with other non-patient groups. Whether we like it or not, we do have a better mousetrap, but the world is not going to beat a path to our door until we market it.

If one looks at art therapy and business from an economic point of view the figures are staggering. Once Ronald Goodman, the business consultant I mentioned earlier, and myself worked with a group of executives from a company that was about to “go under.” As part of the work, over a day and a half, I had several of the people do a mural together on the theme of reorganizing the company, and gave them 30 minutes to complete the task. That afternoon they did reorganize, shifted several positions, and reordered its structure. When the task was complete, Mr. Goodman stood and said “Congratulations gentlemen, you have just earned a million dollars.” With the changes that followed over the next few months, the company began to dig itself out of a hole and, indeed, his words came true.

There are many other ways for art therapists to interact with business organizations other than treating the system. Dealing with stress reduction, employee burnout, bettering internal communication systems, developing a healthy and aesthetic work environment, developing better methods for evaluations of employees or, in general, working with employee wellness are only a few of the ways that art therapists can work with business. It’s another arena in which art therapists can play a significant role. There are countless other systems throughout our society that this model can also find application to, such as governmental agencies, educational or service agencies, or others. What do we do with all of these possibilities? Joseph Campbell answered it best, I believe, when he said “Go with the bliss.” Trust and follow your instincts in that which is most meaningful and pleasure-giving to you. Let me suggest a few ideas and fantasies.

First, accept a broad concept of art therapy. It is a powerful set of ideas rather than a method, task, or profession. I believe these ideas about imagery and its relationship to thought and feeling are as revolutionary as any put forth by science, religion or political interactions, and they will have their day. I know of no other professional group whose particular expertise is more on target to facilitate these ideas than our own, so scan the whole horizon of possibilities rather than the narrow trail of pathology and treatment.

Second, get involved in non-treatment arenas such as with political activities, local or state arts agencies, or with each other. As my friend Dr. Garai dreams: “Network with each other and get where the action is.” A small number of people can have tremendous impact on governmental agencies if they define their goals and are assertive.

Exploit the visibility of our media. People can understand this much better when they can see it. Demand
that all school systems in America require a credit in the arts for graduation from high school. Pressure your local or state arts agency to support non-competitive arts festivals rather than using exclusively a competitive model. In competition the vast majority loses. It may be alright for football, but not for the arts for it continues to breed elitism and separation for most of our population. We must help with this reintegrated arts into daily life.

Finally, insist that our government put more of its resources into cultural exchanges with other countries, especially those we have hostile relations with. I believe people are basically the same everywhere. They love their children, are concerned for their future, and would rather live in peace than in conflict. As art therapists our business is to make peace in our clients and ourselves and these methods do have deep social implications.

Sigmund Freud said it best in 1939, in a letter to Albert Einstein He states “Anything that creates emotional ties between human beings must inevitably counteract war.... Everything that leads to important shared action creates such common feelings. On them the structure of human society in good measure rests.”

______________________________

Part 2

“Art Therapy and Education”

Gary C. Barlow, EdD, ATR, Professor and Coordinator of Art Therapy, Wright State University, Dayton, Ohio, and Editor, Art Therapy.

In my preparation for this panel, I was asked to give attention to art therapy and education. “How can we impact on concepts and the practice of teaching?” or “Is there a utopic educational process as well as concrete art therapy techniques for the classroom” were initial questions that were considered. In thinking about education and therapy, much content emerged; within this mass of information I chose to be selective not only in specific areas but also in my interpretation of these areas. I hope that this approach and focus will promote even more thought and deliberation among you. The three headings under which my comments are addressed are: 1) Teaching and concerns about self-expression, and what we can do; 2) A focus on attitudes, and what we can do; and 3) Concerns in the future, and what we can do.

Teaching and Concerns About Self-Expression—and what we can do

Education has traditionally focused on linear thinking—the step-by-step cause and effect line that has permeated the school experience with concrete thinking processes. Learning the ABCs, writing the poem in correct grammatical usage and formal constructs, and even in the art class: “To get this, you need to do this.” Through this mode of inquiry and solution, though, the child is able to relate one fact to another or to grasp logical sequences, and he/she shares this world with others.

As skilled as we are, however, in the development of concrete thinking modes, we have been remiss in our affective, global experiencing and in our teaching strategies that proffer effective ways of helping the child or adult to fully partake of this affective learning, experiencing, internalizing and communicating. According to Robert W. Witkin, (1974) speaking of the affective experience in his book The Intelligence of Feeling:

There is a world that exists beyond the individual. . . . The child needs to know about this world, to move in it and manage himself in it. . . . [Part of the world] exists only because the individual exists. It is the world of [one’s] own sensations and feelings. . . . [Part of] the world is of private space and of the solitary object. . . . It implies . . . that the individual is able to relate personally to the world in which he moves. If his existence in the world disturbs his being in ways that fragment him and render his relationships in the world emotionally confused or even meaningless, the he is ill-adapted, and no amount of intellectual grasp of logical or factual relationships will change that. (p. 1)

The “intelligence of feeling” to which Witkin refers is an organized process of subject-reflexive action (pp. 11 f.f.) The creative arts car provide instances of highly developed uses of subject-reflexive action. They relate to the intelligence of feeling as the sciences relate to logical reasoning. Witkin says that the common element in all expressive acts that the teacher is able to detect is the fact that all such acts release sensorial impulse. In abstracting what appears to be the common element in a highly disparate range of activities the teacher easily alights upon the notion of “catharsis.” Self-ex
pression is said to have a cathartic effect in that it is a means for releasing sensate impulse, for discharging tensions, for getting one’s feelings into some sort of external form. This identifying of the common element of self-expressive acts as being the cathartic release engenders a wholly ambivalent attitude, according to Witkin, in teachers with respect to self-expression.

The art therapist and the art teacher (or the elementary teacher, the music, drama and English teacher) can come to some agreement, I suppose, on the first part; that is, that self-expression relates to sensate impulses. The second part—that of creative self-expression as being cathartic—can be a disturbing threat to the teacher. The teacher may view it as both creative, constructive and necessary, on one hand, and as possibly destructive, too independent and anarchical on the other. The teacher is moved by two conflicting impulses, as illustrated by Witkin, when he says “on the one hand to encourage self-expression, and on the other to stifle it.” (p. 34)

The art therapist, then, can be a tremendous resource to the teacher in aspects of: (1) understanding the nature of self-expression, catharsis and abreaction; (2) processing the material; (3) knowing and understanding appropriate modalities and methods for processing; and (4) overall, allaying the fears that might underlie the delivery of self-expression through some forms of media. In this capacity in working with the teacher, the art therapist becomes the teacher or shaper, and the teacher becomes the student or recipient. I believe that we, as art therapists, have a primary responsibility to teach; to share meanings as we understand them; to educate about the human being and personal processes involving emotional, perceptual, intellectual and integrative experiencing; and to talk about and demonstrate our skills relative to the therapeutic process in ways that are unique and important to us. Providing that we have “set the stage” for this, and we move ahead with sensitivity and common sense, we will be able to take a prominent role in the education of educators and other human service and mental health professionals.

The Importance of Attitude—and what we can do

If we were developing a course for the training of art therapists, I should hope that we would consider the purpose(s), then list the understandings, skills and attitudes. The understandings would relate to the cognitive aspects (theories, techniques, perhaps some focus on crisis intervention or family systems, or maybe on different mental health systems and stress management—whatever the purpose of the course was). The skills would refer to the demonstration of strategies, perhaps demonstrated abilities with media or skill in referral techniques. And, in my opinion, the attitudes would be a key factor here, since I do not believe that the art therapist delves enough (i.e., thinks about; processes; practices how to positively support; understands the psychology of attitudinal change; etc.) into what “attitude” means.

Shaun McNiff (1986) states that “If we approach our clients with attitudes of helping images to emerge naturally, we might just help to further the ‘quality’ of what comes forth.” (p. 100) Long, Morse and Newman (1980) devote a section of their book to the teacher and his/her mental health, and to the attitudes of the teacher based on personal history.

One of the most important and least understood aspects of therapeutic management is that it is based on the relationship between the teacher and the pupil as much as on the specific strategies a teacher may use. This is why we say that all significant learning evokes and revolves around the teacher. This relationship is extremely complex because each teacher must struggle with his or her history to get in touch with feelings and conditions that will allow him or her to experience empathy with certain pupils, tolerance toward others, and disgust, anger and rejection toward still others. No teacher has a symptom-free history or the capacity and the skills to work therapeutically with all the pupils assigned to the classroom. The ‘great teacher syndrome’ is an educational fantasy. All teachers carry their history with them, including some unfinished psychological problems, attitudes and prejudices. (pp. 206-207)

Viktor Lowenfeld (1987) alluded to the teacher’s attitude as being vitally important when he discussed personality traits of teachers. Elisabeth Kübler-Ross (1969) writes on attitudes toward the dying process and termination in death. Countless authors imply that attitudinal change is important for improvement in health to occur, and they point out how one’s attitude can influence others, can shape behavior, can promote self-expression, can thwart freedom, can encourage, discourage, provoke fear, illuminate, enhance and mystify. And yet, considering all of these possible conditions or parameters, many of the indexes of books written in our field and other fields do not list “attitude” as a topic specifically addressed—usually only inferentially.

What is it about the creative process—and Witkin’s “intelligence of feeling”—that is important for the art teacher in working with students or the art therapist in working with clients, and what does attitude have to do with it? How do we think,
feel, intuit and project our attitudes and, ultimately, our insights about creative, productive personal activity? What we think and feel, we show and exhibit to others. Graham Greene said "Writing is a form of therapy; sometimes I wonder how all those who do not write, compose or paint can manage to escape the madness, the melancholia, the panic which is inherent in the human condition." (1982)

What are our attitudes... how do we, as individuals, "get into" the creative process, and what do we feel about unbridled, inventive, personal statements that are unhindered by extraneous trivia, and what do we think of this in others... and how can we begin to take part in this process of another's "intelligence of feeling"? I believe that the art therapist holds the unique position of not only fostering creative self-expression within individuals, but also of getting deeper into the understanding of what this creative process is and can be. I am not talking about the issues in the content here, but about the nature of the creative process itself. It is important, however, for the art therapist to understand one's own "intelligence of feeling," and I suggest that the art therapist must continue to be involved in the hard-work aspects of creative production as well as the intellectual stimulation and benefit from the intrinsic qualities within the dialogue of self/media. We must paint, draw, sculpt, weave, write, move, dance or make music. We must not only educate others to the integral values necessary for us to live fully, but we must also learn how to live fully through thoughtful and felt experiences, immersed in media, and with an attitudinal "set" that is conducive to learning, producing and sharing.

Concerns in the Future—and what we can do

Perhaps it was Nietzsche who said that the future can—and does—influence the present just as much as the past has influenced the present. What will happen in the future that will affect us as art therapists? What are trends that are already underway? What can we do in educational preparation that will help to "ease us into the future?" With this in mind, I referred to ideas from authors Baruth and Robinson (1987) and their book that included a section on counseling in the 21st century. I believe that their points are important for our consideration as art therapists, and that we should be cognizant of them as we move ahead in our educational planning. I have selected a few from their listing (pp. 375-382), but have edited and combined where necessary. Each, however, reflects content that the authors think will occur in the years just ahead.

1. There will be an increase in gerontological counseling as a professional specialty area, and on career counseling through the life span as well as an emphasis on life span work.

2. There will be emphases on continuing and in-service education and professional development which will receive greater emphasis and will be mandated to receive or retain certification and licensure.

3. There will be an increase in the use of computers and other technological advances in the human services.

4. Another emphasis will be on special groups (minorities, women, one-parent families, intercultural groups, etc.).

5. There will be a focus on preventive activities, accountability, and on the counselor's role as a consultant to parents, teachers and others.

6. An emphasis will be placed on post-masters degree training in specialty areas (such as marriage and family, chemical dependency, and others) and on doctoral level training for persons wishing to enter private practice work in non-school settings, for focused research.

7. Counseling will be provided to greater extent within business and industry, and will become increasingly multidisciplinary, as well as shifting to more private practice, clinics and home delivery. There will not, however, be a shift from services provided by school counselors.

8. There will be an increased emphasis on Holistic models of counseling—approaches that focus on all aspects of the individual (affective, behavioral, cognitive).

9. Group counseling will be utilized to a greater extent because of time-effectiveness and for social considerations.

10. Professional organizations will organize task forces to improve research, and professional alliances will form, more networking will occur, and some specialty groups may consider merging.

Based on these projections for the 21st century in the counseling profession, I would like to raise these "what if" questions for the art therapist and the art therapy profession:

1. What would happen if an art therapist, and an art teacher and a counselor, were considered an integral and necessary team that was hired in a public school system?

2. What would happen if art therapists moved into more proactive roles in issues of mental health delivery of services, and served as a model to which other professionals referred? An example might be art therapy in home delivery services, with a focus on the education, knowledge skills and attitudes relative to this mode of delivery.
3. What would happen if art therapists moved into reactive roles in certain areas, such as research, and focused on work that has been done, then took a proactive stance in the establishment and continuation of a strong national network of research in the human services?

4. What would happen if, through the Education Committee of A.A.T.A. or with other appropriate committees, we identified persons to help us in the increase of the use of computers and other technological advances in art therapy, and came to terms with planning, sharing and communicating about these systems?

5. What should we be doing relative to a greater emphasis on multicultural education and training?

6. What would happen if we moved forward with task forces to share research and educational strategies, and utilized these task forces to build professional alliances with others that could, ultimately, increase our professional and political strength?

7. What would happen if we would consider certain areas of professional preparation that seem to be looming large on the near horizon, such as gerontology, life-span work, and business and industry, and if we would move ahead with concerted educational efforts in these areas?

8. What would happen if we would be able to offer some basic coursework in art therapy to all teachers being trained in diverse fields? This might include fields such as elementary and secondary, music and theatre, but also in other areas of study such as social work, psychology, counseling, rehabilitation, speech pathology and communication, and nursing.

9. Since many institutions (such as mental health centers or nursing home facilities) have educational components, what if we would offer our services in these units—not just with art therapy services, but in various ways that would help in awareness building and with purposeful ventures, such as general arts activities for patients or families, or trips to the art museum or to a performance of a play?

10. In our profession we are subject to accountability and outcomes. What would happen if we would give concerted focus to accountability concerns in art therapy, to a study of how we can build strengths in areas, but also to how we can communicate about our strengths? Could this be an important focus for scheduled professional seminars over the next five years?

Summary

Three areas have been highlighted: 1) Teaching and concerns about self-expression; 2) A focus on attitudes; and 3) Concerns in the future. The philosophical concern dealt with education and linear thinking, the realization that many teachers may consider self-expression as both a blessing and a blight, and that the art therapist can help to break down the fear of self-expression while focusing on the true nature of the “intelligence of feeling.” The second topic, that of attitudes, centered on attitudes in conjunction with understandings and skills. Special emphasis was given to understanding our own attitudes in art therapy while working with children, adolescents and adults, and their formulation of the expression of creative energies within a therapeutic environment. And, finally, the concerns of the future identified many projections as noted by our professional friends, the counselors, who have given us much to think about as we plan for the future.

Whatever we do in training and education for others, as well as continued education for each of us, depends on our commitment to art therapy, on our honest and deep belief that art therapy can be beneficial, on the understanding that we are not the only ones concerned about the human condition, and a realization that we do indeed have something to offer that is long-lasting. But, all-in-all, it depends on each of us individually, and how we view the profession, the process of working with people, and understanding our own levels of comfort as we work with people, media, ideas, concerns and issues.

"Arts with Families"

Maxine Junge, MSW, LCSW, ATR, Associate Director and Assistant Professor of Clinical Art Therapy, Loyola Marymount University, Los Angeles, CA.

I'm pleased that we are thinking together today about this important area of concern.

Many of us in this field, particularly those of my generation, have our roots in the relationship of the arts and social activism. And I would like to suggest to you that the time is now to renew and intensify our commitment to social responsibility as individual art therapists and as a profession.

I like to remember that my first "serious" paper in high school was on Goya, Daumier and Ben Shahn as painters of social protest. In the late 60's and early 70's I ran arts programs in ghetto and barrio areas of San Diego and Los Angeles that were aimed at impacting the educational system and racism and that used the arts for community organizing and empowerment. I believe very strongly in the power of the arts for social change.

My topic today is the family and in preparing for the panel, we were invited to dream a little, to even envision a utopian application of the arts with families. I have been a family art psychotherapist for more than fifteen years and I am convinced about what I do and the effectiveness of using art as diagnosis and treatment. I am particularly interested in art's potential for enhancing family ritual, in a society that is increasingly losing its traditions while still retaining remnants of many that have come to be meaningless. I am fascinated with the relationship between art and playfulness for families that do not know how to play and consider the whole area of humor in its visual forms and uses as providing exciting potential new avenues for exploration. I want to focus with a family on the making of art as genuinely exhilarating and I view creativity and the creative metaphor as an important transforming medium toward new growth and new forms for families. I am interested in art for empowerment of individuals, families, communities, and nations. I could talk to you about those ideas. . .

But I have a problem with this so I am going to take a different slant. I spent a lot of time thinking about this talk and a lot of time attempting to dream. And I found a certain image appearing repeatedly. It became all but inescapable until finally I had to pay attention. The image was of Van Gogh's painting of "The Potato Eaters." I'm sure I don't have to remind you of this dark painting of poverty and isolation. It is so strongly evocative that most of you can probably see it in your mind's eye as I speak.

And "The Potato Eaters" and Van Gogh convinced me that I have to tell you the truth as I see it.

That I don't think talking about art therapy with dysfunctional or normal families, and dreaming about a utopian future is where its at. It's time and time NOW to talk about the urgency of art therapists and the art therapy profession taking an expanded, active role, a political role toward the family, for the family in America today is in grave danger of dying.

In 1985, in his State of the Union address, President Reagan spoke for an "America of wisdom that honors the family, knowing that as the family goes, so goes our civilization."

The reality is much different.

There is a shocking lack of government interest in families. In fact the U.S. remains the only major industrialized nation without family policy. There are no programs of national provision for family allowances, day care for working parents or for health services.

The emphasis in this country is on armaments and defense.

There is a shrinking middle class and the indicators are that more are moving down.

There are 33 million poor and for a family of four the poverty level is now only a little above $10,000. The number of poor Latinos hit an historic high-in 1985.

The facts are:

Major changes and evidence of breakdown in the American family are well documented:

1. Rates of unemployment have intensified especially for young adults and adult black males and Latinos.

2. There has been rapid increase in

"Many of us in this field . . . have our roots in the relationship of the arts and social activism."
female-headed households along with massive cuts in government programs of financial aid.

3. Families below the poverty line have grown in numbers as resources have diminished.

4. The revolution of the women's movement has caused major shifts in women's role with an absence of necessary societal supports, such as effective childcare programs.

The family continues to be taken for granted and is almost a cliche in our society as the essential unit for growth and socialization of children—but it is expected to follow its path with no support in a time of tremendous change.

Some statistics:

1. Only 15% of all American families are headed by two parents. The number of children living with one parent has nearly doubled since 1970.

2. The divorce rate is now stabilizing after twenty years of increase to more than 50% of all marriages. But it is now anticipated that most children will experience the departure and replacement of a parent.

4. Of non-white female-headed households, 70-80% live below the poverty line. More than three times the number of black, single female-headed families lived in poverty in 1984 in comparison with 1981.

5. Almost 40% of all Americans living in poverty are children.

6. Half of the labor force is women and 50% are single and independent of male economic support. Thus we see increasingly the feminization of poverty.

7. As women's involvement in the workforce has increased, men's has decreased, particularly minority men. Rates of unemployment have intensified. This is particularly true for young adult, black males and Latinos. For each 1% increase in unemployment, suicides increase by 320 a year.

8. Half of all mothers with infants under one year old and more than two-thirds of working women with preschool children are working full time. Child care remains woefully inadequate.

9. Child abuse correlates with unemployment, with social isolation, with feelings of worthlessness and powerlessness. Even allowing for more attention paid to abuse these days and more accountability for reporting, in California, for instance, child abuse reports between 1974 and 1983 increased 900%.

10. The homeless, many of whom are families with children, are endemic in our cities and on the increase. One third of the homeless are families.

I don't think I have to say more. You all have personally encountered these problems yourselves in the increasingly horrendous cases we have seen for treatment in clinics and hospitals in the last five years.

The picture is bleak and the plight of families in this country is a systemic problem that requires a major commitment on the part of everyone and at all levels of government to effect systemic change.

All art therapists have had to be social pioneers in our young and striving and innovative field, as we have gone about our business of inventing our profession, of proving our capabilities to others, of creating jobs where none existed before and of working in exciting and creative new endeavors of assessment and treatment and with ever-expanding client populations.

I suggest to you that art therapists can no longer afford to remain in our safe offices dealing with the symptoms and results of such an increasingly destructive system. I urge that we take those skills we have gained as social pioneers into the larger arena.

We are about to enter an election year during which we will choose a President. I challenge you, if you believe in the on-going life of the family, to take your social concern into the political arena, to play an action role to implement and activate the social systems which must offer the necessary support to sustain the family as a social institution or we may watch it die.

And I challenge the American Art Therapy Association to focus on the family as a priority. I propose that it begin by devoting a major part of next year's conference to the family. I suggest that papers be invited and programs created that not only deal with assessment and treatment of pathological family systems, but with prevention and innovative community and larger systems approaches. And I suggest that a section be devoted to debating the art therapist's role as advocate and as social activist within the mental health community and the larger society.

My dream is that in empowering ourselves we can empower others.

And my dream is that sometime in the future as members of families and communities and of this nation—as members of the mental health community and of the art therapy community we will be truly free to dream: to dream of the transformative nature of the creative process and of the sweeping power of expression and social change that lies within the arts themselves. But right now we have much work to do first.

Thank you.
Part 4

“Images of Our Culture and the Effects of Events on Our History”

Bruce Moon, BS, MACE, ATR, Co-Director of Art Therapy
at the Harding Hospital, Worthington, Ohio.

For my segment of this presentation, I want to focus on images of our culture and the effects of significant events from our communal history. I hope that this will be thought-provoking, maybe a little scary, and some fun as well. Additionally, I want to comment on the implications that these images may have for us art therapists.

To frame this, I need to tell you that I am a product of the post-World War II baby boom. I suspect that many of you are too. So, when I talk of our culture, and of art, my experience of both has been colored by the intriguing twists and turns that the world has taken these last three or four decades. [In preparation for showing slides] I’d like to set the stage for what I’m going to say through images and sounds. The intent is to stimulate your memories, feelings and ideas about the world we live in. [Ed. Note: At this point slides were begun, accompanied by an audio tape. This presentation of imagery and sound continued, with some of the following serving as interspersed narrative.]

To continue our looking together I’d like to share with you a brief passage from Dr. Erich Fromm’s prophetic social commentary The Sane Society (1955).

Man today is confronted with the most fundamental choice . . . between robotism (of both the capitalist and communist variety), or Humanistic Communitarian Socialism. Most facts seem to indicate that he is choosing robotism, and that means, in the long run, insanity and destruction. But all these facts are not strong enough to destroy faith in man’s reason.

Thirty odd years have passed since Dr. Fromm issued his warning and his call for transformation. I agree with him . . . that the shadows have lengthened and the voices continue to rise. Let’s listen to a few of the social sounds from the last three or four decades . . . remembering that these are the whispers and screams that we baby boomers have grown up with.

The war to end all wars came to a close
Closely followed by the Korean War
Closely followed by the Vietnam War
A voice cried in the wilderness
I have a dream
Another voice screamed
America, love it or leave it
Shots echoed in the streets of Dallas

Shots echoed in the streets of Memphis
Shots echoed in Los Angeles
Richard Nixon proclaimed that he’s seen
the light at the end of the tunnel
Four guys from England sang, all you need is love
Mayor Daley demanded order in Chicago
Governor Rhodes ordered National Guard troops
onto the Kent State Campus
Draft cards burned
Gloria Steinem gave the world a
new
image of women
Bra’s burned
Jimmy Carter announced
There is a malaise upon the people
If it felt good, we did it
Yuppy became a popular term
We learned to drink Perrier
Ron Reagan gave us the verbal
image
of ‘That Evil Empire’
The bull thundered and the Bears roared
and on, and on, and on.

We baby boomers have all grown up now. And we have heard these voices. And we have gone to see The Big Chill and walked out of the theater depressed or denying. The Big Chill was recently on network television. The Morning After was a Rorschach of sorts for my colleagues and me. All of us had our notions of which character in the movie most reminded us of ourselves. The truly disturbing, denial provoking thing about The Big Chill is its ability to remind us of our naiveté from once upon a time. You know, in 1972 I really did believe that flowers could be more powerful than bullets. I believed that we could change the
world. I was not alone. Let me share with you a segment of a recent letter from David Gallegos, the founder of the Art for Peace Organization, as he reflects on his own journey. “The most frustrating thing that happened was that I was so naive. I was so sure that as an artist I could do something but soon found out that I would face the peace Business. Of all the organizations I approached, not one was interested in working with Art for Peace. This left me shattered...”

Those of us who were active, be it in the civil rights movement or the anti-war movement no doubt understand this shatteredness. And so we have gone to other things in our lives, to professions, and marriages, and baby making, and divorces. We have turned our energies and attentions to the more practical matters of daily life. We haven’t forgotten the specter of nuclear war, we haven’t forgotten the injustices that exist around the globe, we just sort of ran out of gas. The voices were just too loud, too confusing or too quiet; we couldn’t listen anymore.

Some have chosen Fromm’s ‘Robotism,’ while others have immersed themselves in the joys of upward mobility. Perhaps Bob Dylan says it best... “some are mathematicians, some are carpenters’ wives, I don’t know how all this got started, I don’t know what they’re doin’ with their lives.”

One of the hallmarks of our society today is that we don’t value pain very much. A case in point: the new aspirin commercials which feature an irate parent running to the medicine cabinet in a desperate attempt to tolerate her children. We like things to be easy; we like disposable things because they are so easy to live with, easy to use and easy to throw away. We like easy relationships, easy sex, easy fast food, easy abortion, easy divorce, easy entertainment, easy work. We like to take life easy, and we all hope for an easy death.

If you enjoy dark comedy you can’t help but smile at underarm deodorant commercials—particularly the recent ad campaign whose slogan is “never let them see you sweat.” It takes no great psycho-analytical thinking to interpret the common message of both the pain reliever and the deodorant commercials. “Don’t put up with discomfort, and at all costs, don’t let anyone know how you really feel.”

As an art therapist I believe that all things we create are fragments of our own self-portrait. I suspect that this is true for the culture as a whole as well as for the individual. I am not so sure that I like the cultural self-portrait I see being painted around me.

The first sentence in Dr. Scott Peck’s The Road Less Traveled (1978) is straightforward and clear. He says “Life is difficult.” (p.15) When I read it the first time I felt an odd sense of relief. I’d had a vague feeling that something was wrong for a long time. The older I got, the more overwhelming the task of changing the world became and the harder life was. In 1972 it was easy to talk about peace for the whole world—I had no one else to feed and clothe and house back then—and life was much less difficult.

An inevitable consequence of growing up is realizing our own limitations. The Big Chill reminded us that life was not as easy as we thought it would be. By this point, you may be thinking that I am pessimistic or somehow bitter over my (our) innocence lost. On the contrary, I have much hope despite all the evidence of Frommian Robotism I encounter. Regardless of all the aspirin, Tylenol, Advil, Mennen Old Spice, Right Guard, ad infinitum, commercials—there is reason to hope.

In the clinical setting—or laboratory, if you will—I have seen the terribly disturbed and lost find themselves again. I have seen those in excruciating emotional pain cease their running and turn around to face and tame their monsters. I have seen some who once lived only for the pleasures of the moment learn the deep joy of struggle. How? By doing art. The studio, whether it be a music practice room, a dance floor, a stage, or a room filled with empty canvases, is a sanctuary... protecting the virtue of struggle and the value of pain. It is here that attempts are made, failures allowed, mastery accomplished through repetition of process, gratification delayed and occasional successes celebrated. It is in the studio that the present-day artist ties himself or herself to the collective past of all artists before him/her. It is from the sum of all works of art, the tradition, that the artist makes his or her creative leap, thus taking one's place in the vast chain of art history. This history of art, as you all well know, is a saga of struggle. For the process of making art is much like that of giving birth—an act of love and labor and pain, replete with surprises.

Some of you may still want to save the world. I applaud you and wish you well. Others may have come to terms with your own limitations and are content to change little pieces of the world, one patient at a time. Still others, perhaps, just gave up thinking about it. In any case, let me propose that we, as art therapists, can have impact on life and culture by taking every opportunity that we can to remind people that it is okay to hurt, that it is good to struggle and that, indeed, life is difficult. That’s what I believe art is. It’s what I think therapy is. It’s what I feel art therapy is.

Coming of Age: A Subjective Perspective

Judith A. Rubin, PhD, HLM, ATR, Clinical Assistant Professor, Dept. of Psychiatry - University of Pittsburg; Faculty, Pittsburg Psychoanalytic Institute

From a presentation given at the 1986 American Art Therapy Association Conference, the author discusses, with personal insights, the “Coming of Age” of art therapy as a profession. From the author’s early “typecasting” as a child therapist to her present art therapy work in private practice as well as the publication of books and articles in art therapy, she discusses the ordering of priorities, suggestions for the young art therapist (such as years of supervision), the sophistication and expertise needed in order to become a truly mature therapist, as well as the need to be involved with the professional association. Much focus is given to the “Coming of Age” of the association (as well as the therapist) with references to the (understandably expected) struggles associated with growth and development.

The talk on which this paper is based was given at the conference of the American Art Therapy Association, held in November of 1986 in Los Angeles, California. At the time, I shared with the audience my ambivalence about accepting the chairperson’s invitation to talk to the group. The time and energy required to write a paper loomed as large and probably draining, despite the ever-potential narcissistic, exhibitionistic, and otherwise-gratifying pleasures of public presentation. But the primary reason, I think, that I said “Yes” to the chairperson’s invitation to present, and to a friend’s suggestion that I submit a version for publication, is that I feel great affection for and considerable responsibility to the field of art therapy, and to the organization which represents its interests in the world.

Although that may sound a bit pompous, even arrogant, it is quite sincere. And I think it is a sense of responsibility shared by many others who, like me, feel ourselves to be an integral part of this still-young professional family. Perhaps it is analogous to that bond among relatives so familiar to anthropologists and sociologists, who compare the respective thickness of blood and water. But, in addition to genuine feelings of loyalty and a sense of commitment to the members of an association, I believe that my own motives and those of many others are not only personal but even idealistic. For I think many of us feel a sense of responsibility not only to the group, but even more to the discipline—largely because we believe so deeply in what they are both about—because art therapy offers something of true value to the world, something that because of its intrinsic worth deserves to be nurtured and developed. Sharing with the next generation of workers thoughts about my own maturation process and that of the profession seems to me to be part of that responsibility to the field, fueled not so much by dutiful obligation as by passionate commitment.

These rather old-fashioned notions about ideals and values and commitment are as valid and central now as they were in my own “coming-of-age” as an adolescent, that crucial period usually marked as a time of passage into adulthood through pubertal rites and rituals. The idealism of fifty is more temperate than that of fifteen, but no less genuine. In the field of art therapy I found a way of integrating my love of art, which had given my life meaning since early childhood, and my desire to help people in a substantive way. Even though years of classical analysis have helped me to better understand the roots of both areas of interest, this awareness has not—as I once feared—diminished the pleasure derived from continuing work as a clinician who tries to synthesize art and therapy in creative ways, in order to help people to get better and to achieve their potential.

If I were to answer the question of why I feel so disinterested in writing papers these days, I would say that my energies are fully absorbed in the never-diminishing challenge of clinical work. So absorbed, in fact, that I find I have to monitor my tendency to say “Yes” to too many referrals, since they all sound so fascinating. My biggest problem, since leaving the university psychiatric hospital two years ago for full-time private practice, has been learning how to set limits on my apparently-insatiable appetite for challenging cases. Fortunately, my aging body has provided the best braking system, teaching me that, while I might get away with omitting a lunch hour and snacking intermittently, I cannot stretch my alertness beyond a certain number of hours without feeling sleepy and uneasy about my ability to respond to those patients who come at the end of the day. Similarly, my advancing years force me to admit that I can work with only so many preschoolers, and then not too many in a row!

“...art therapy offers something of true value to the world, something that because of its intrinsic worth deserves to be nurtured and developed.”
Fortunately, though originally "typecast" as a child therapist due to my early work at a guidance center, later experience with adults in analytic training and at a psychiatric hospital prepared me to deal with patients of all ages, providing a really delightful balance in my practice. In a recent piece of "mini-research" I discovered that my hypothesized sense of working with all ages was an accurate reflection of the facts. When I sat down and made a list and counted, roughly one-third of my patients turned out to be young children (between 3 and 12), one-third adolescents and young adults, and one-third grownups, at least chronologically. This variety in age level is paralleled by a similar range of diagnostic classifications and degrees of disability, so that the daily contacts are always varied and stimulating.

Beyond the investment of energy in this new enterprise, it is also clear to me that my early need to share with colleagues seems to have gradually modified over time, though it is not entirely absent. At the time of writing this paper (Fall of 1986), I had just sent off the chapters of an edited book on various APPROACHES TO ART THERAPY to a publisher. This recent project was stimulated by a felt need for clarification of different theoretical viewpoints and their application to art therapy, in response to publications, presentations, professionals, and students in learning situations like courses or supervision. The book just before this one, THE ART OF ART THERAPY, was also written in response to what seemed to be confusion about art and/or therapy on the part of many in our field. Like my first book, CHILD ART THERAPY, the second was an attempt to clarify and organize my own thinking about what constitutes good clinical work. All three of these, like most of the papers I have presented and the articles I have written, have been attempts to communicate to other art therapists ... to share ideas which seemed useful, so that others could try them out and assist in the task of evaluation, modification, and elaboration.

But now, despite having vowed never to proof-read another book-length set of galleys, and despite being happily absorbed in a busy practice and continuing to teach and supervise on a voluntary basis in the Department of Psychiatry (University of Pittsburgh), the Creative & Expressive Arts Therapy Program (Western Psychiatric Institute & Clinic), and the Pittsburgh Psychoanalytic Institute ... and, despite having recently formed a nonprofit corporation with my friend and colleague, Ellie Irwin, a drama therapist, called EXPRESSIVE MEDIA, INC., which owns and will some day distribute the films and videotapes we have made ... and despite having a half dozen half-finished films and videotapes I am eager to work on, and at least one major research study I am eager to finish writing up ... despite all of this, which should be enough (and is really more than enough), as soon as I sent the galleys back to the publisher last Fall, ideas for another book started to intrude persistently and insistently on my mind: and I think I may soon succumb to the internal desire to write it.

Whether or not I give in to this impulse now or ever, what is probably significant is that this book would not be for other art therapists or even for other mental health professionals, but for the lay reader, for the educated public. It would have something to do with art and creativity and therapy, and would be an attempt to make all of these less frightening and more accessible to the average person. When I first began to think along these lines, it seemed to have been stimulated largely by my recently intensified activities as a clinician. Though I have always done therapy, and was allowed to practice privately as part of my work in a psychiatry department, I have never done it on such an extensive basis, for so many hours a week, or with such a broad range of patients at any one time. This work, in addition to being fascinating, has impressed upon me the great confusion and fear among most people about psychotherapy; and, when a person is over a certain age, about plunging into the visual arts as an expressive mode, especially when the individual is comfortable and competent with words. But, as noted earlier, I feel almost evangelical about the value of both art and therapy, and my present persistent wish is to present this information in a digestible and appealing way to those who are the consumers of our services—the public.

Actually, the process of forming a non-profit corporation to own my old films reminded me of an earlier investment in reaching parents and teachers through such vehicles, of "selling" them on the broadly therapeutic values of the arts. So it's not a new idea to want to reach the public, but it does represent a shift in my thinking about a target audience for a book, and I am sure, another step in the personal process of "coming of age." And, although I will probably want to share my current experiments in technique and associated notions about theory with both psychoanalysts and art therapists, at some point in time when I feel more clear and certain; there are some things, like presenting at conferences, which used to interest me tremendously, and which have currently lost their luster. I think this phenomenon has to do with other facets of the process of COMING OF AGE; middle age as described by Simone de Beauvoir in her book of that same name, not the blooming of adolescence.

It is true that I used to love to think up and, when possible, to conduct research studies. While I still value such work, I know that I have been dragging my feet for almost two years on writing up the already-completed data analysis of a study on family drawings, and wonder...
why it has fallen so low on my priority list. Similarly, I have been talking for several years with others about doing a study on the effectiveness of art therapy in cases of aphasia. The possibilities of helping people if our hypothesis is correct are substantial, so the interest and potential of this study are more than academic. Still, I have to confess that, while I think it is a fine study which really truly ought to be implemented, I'm really not motivated to spend my energies on anything other than the design, though I know that to get funding more time would be required. And maybe the key word here is the four-letter one that seems limitless when you are young, and all of a sudden appears in all its finiteness as the years go by... TIME. Because there is indeed a limit, and because there is never enough of it, and so one must choose how it is to be spent. And the truth is that at this point in my life, what is most rewarding at the deepest level is doing art therapy and psychoanalysis with a variety of patients, and possibly also writing a book for the layman and finishing some of those old films and tapes...in that order.

In other words, one facet of coming of age is a reordering of priorities—like discovering that activities which used to "turn me on," like research, just don't excite me as much, despite my continuing conviction of their value. I confess that both teaching and supervision are in that category too, despite the fact that I still do quite a bit of both. This year I find myself more interested in the supervision of general residents doing child therapy and teaching courses in psychoanalytic theory to candidates at the institute than in the supervision or teaching of art therapy. But the truth is becoming increasingly apparent to me, that I often feel fatigued and bored in each of these roles; whereas I hardly ever feel bored as a therapist, and fatigued less and less as I learn how to set realistic limits on my time. Doing psychotherapy excites me consistently as no other activity has ever done, and it seems to have become even more challenging the more I have learned and grown as a clinician.

What does all this personal reflection mean for our field? I think that the most startling lesson I seem to be learning is that learning to do effective art therapy is a lifelong task. So, lest my enthusiasm about private practice has stimulated the reader to envision herself in her own studio/office complete with clay and paint and good lighting, let me now add some sobering words of restraint. First, I happen to have had the good fortune to have gotten a PhD in a field which enabled me to qualify to take the nationally administered licensing exam in psychology. Those familiar with it know that the requirements for eligibility to take it are becoming increasingly stringent, and that the examination itself is getting progressively more difficult, as the profession of psychology struggles to keep its hard-won territory for itself in this age of tightening budgets. Even if it were an easy exam to pass—which it is not—it will never be one that those with art therapy training alone could take. Moreover, the likelihood of art therapists becoming licensed providers seems slim at present in most states; though the possibility of credentialing in related fields exists and should be pursued. The reader may well be wondering, since we have registration, why a license matters. In the real world of fees and payment for private practice it matters very much, since it generally makes the difference between insurance coverage and no third-party payment for most carriers. There are, of course, other possible arrangements.

Many practitioners—social workers and others as well as art therapists—work under the supervision of a licensed professional who does the billing. But these arrangements are under increasingly close scrutiny and are often challenged. Although you can practice legally without a license, the patient carries the entire burden of payment, which means that you either treat only rich people, or you are forced to accept a relatively low fee.

But being paid for what you do in the private sector is only a small part of the problem. What is really critical is that you are taking on a very large and serious responsibility when you treat anyone without the protective umbrella of an institution. It is not the cost of the necessary malpractice insurance which poses a serious problem at this point in time for art therapists; that is minor and manageable. What is major and potentially unmanageable is being sufficiently knowledgeable to know: (a) what you are doing, and (b) when you don't know what you are doing. That may sound simple, but it is not. Simply getting regular supervision from a more experienced professional is not enough, though it is probably essential for most people with less than 20 years of supervised experience.

In case you wondered about a misprint, there wasn't one, and I wasn't being humorous, I really meant twenty (20) years. At least, that was true for me. I received supervision on a weekly basis from a professional with more experience than myself from the time I first did art therapy in 1963 through the completion of my psychoanalytic training in 1983, and most often had more than one supervisor at a time(!). Since that time, I have fre-
quently sought consultation with one or more colleagues when I was puzzled about how to handle a case. I also attend two regular study groups, one of which involves ongoing case presentations. In other words, by the time I went into private practice “on my own” I had received thousands of hours of individual supervision on my clinical work. Moreover, I had, by 1985, worked in clinical settings for 22 years—16 of them full-time—with a wide variety of patients individually, in families, and in groups, and had had considerable vicarious clinical experience through hundreds of hours spent supervising others, usually individually and intensively. I would agree that I was probably “over-ripe” and actually “ready” for independent practice somewhat earlier, perhaps even at the time that I took and passed the licensing exam in 1979, and was legally entitled to hang out my shingle in the state of Pennsylvania.

My point is, however, that I believe that private practice in art therapy—as in any other serious form of psychotherapy—should not be undertaken until the practitioner has reached a rather high level of sophistication and expertise. Why? Primarily because of the responsibility for the patient and family which such a role requires, and secondarily, I believe that one also has a responsibility to the profession. For going into independent practice usually means losing the opportunity for your work to be regularly scrutinized and critiqued by those with more experience. And, even if you pay for supervision and attend study groups, you are in a position of greater responsibility—sometimes total—for whatever transpires for patient and family. Insofar as you risk making mistakes due to lack of expertise, you risk hurting not only your client, but also the profession of art therapy, which suffers as much as you from your potentially tarnished reputation. Conversely, if you have the patience and wisdom to work under supervision until your skills and understandings are really well-honed, then you will carry with you into the more public arena of independent practice a sound reputation and the opportunity to enhance the lives of those you treat, as well as the image of the discipline you practice.

That is, in brief, my very subjective perspective on the mid-life “coming of age” in which I am currently absorbed. My first, more adolescent “coming of age” had to do with professional identity, with finding the other swans—as in THE UGLY DUCKLING—with discovering a life’s work that suited so well, that fit my innate capacities and met my deepest longings. Since I happened upon art therapy in my mid-twenties, already married and well into mothering, I remember the intensity of the conflict between fulfilling my maternal/nesting needs and responsibilities, and the pull of this all-absorbing and full-filling work. I “solved” the conflict by working part-time until I could resist the pull of the work no longer, and rationalized that my children were still getting enough of me. In retrospect, I am sorry that I didn’t postpone that shift a few more years, since I now feel that I didn’t get enough of them.

Continuing to use my own experience as a guide, I should like now to look more closely at some possibly common elements in the development and coming of age of an individual art therapist, and then at some developmental themes in the coming of age of both the professional association (AATA) and the discipline itself.

Like many art therapists in pre-association days, I began my work in a state of something akin to professional AUTISM, or at least isolation. Actually, I had discovered the possibility of such work at the invitation of one of my dearest mentors, a child psychologist named Margaret McFarland. She encouraged me to use art with hospitalized schizophrenic children, to share my work with sympathetic colleagues like Fred Rogers and Erik Erikson, and to explore in all my naïveté how to reach these lonely youngsters through the creative process. Like Winnicott’s “good enough mother,” Dr. McFarland provided a warm and supportive “holding environment.” She was available for symbiotic nurturance in the early stages, and later for all of Mahler’s stages of separation-individuation: for hatching and practicing and rapprochement, and the achievement of a kind of libidinal object constancy. I have often turned to her at critical times in my life, grateful for that gleam in her mother-mentor’s eye, so vital to the developing human’s sense of self. I was fortunate to have a father-mentor as well at a later stage of professional growth, a psychoanalyst and child psychiatrist named Marvin Shapiro, who guided my development as a clinician with a loving but always-firm hand, and who helped to point me in the direction of psychoanalytic training, which has been incredibly helpful.

Early on, in these and other relationships, I—like most neophytes—was predominantly ORAL, taking in hungrily and insatiably information, ideas, and experiences in the therapeutic use of art. At a certain point, I had reached a kind of ANAL phase, in that I needed not only to become

“... private practice in art therapy... should not be undertaken until the practitioner has reached a rather high level of sophistication and expertise.”
more separate and independent of my mentors, but also to both hold on to and let go of ideas. And it was then that I think that I got the most pleasure out of the making of creative products, and presenting them to others. This led into a phase of PHALLIC exhibitionism and delight in what I could produce, which I did in profusion: talks, papers, films, presentations, research projects, service programs, and the like. In the middle of writing this paper I had to proof a recently revised curriculam vitae, which has gotten embarrassingly long. I confess that I felt fatigued just reading it, and remembering those years of hyperactivity bordering on mania. I suppose that much of that "INDUSTRY" (à la Erikson) took place during what I might term my professional LATENCY. It was certainly a time of intense involvement in learning and training, including the study of adult and child psychoanalysis at an analytic institute, a doctoral degree at a university, and the writing of my first book.

Engaging with my peer group, I became very involved in work with this association, first as a member of the Nominating Committee, then as Bylaws Chair, then as President Elect and then as President. Six years on the Board; six very busy years of work for AATA, two of them requiring that I officially represent art therapy to the outside world: consulting to the Task Panel on the Arts & Environment of the President's Commission on Mental Health, serving on the Board of the National Committee, Arts for the Handicapped, and planning for a conference hosted by the American Psychiatric Association which led to the birth, eventually, of the coalition of all creative arts therapy associations of which we are now a part—NCATA. These were years of great activity, much of it in relation to AATA and art therapy. While demanding, it was also exciting and exhilarating to participate in and help to guide the maturation of our asso-
ciation and our discipline. I like to think of the latter years of this phase as my professional ADOLESCENCE, not only a time of redefining and refining my personal identity, but also of doing so as a part of the field with which I so strongly identified.

And now I find myself in MIDDLE ADULTHOOD, turning more and more toward clinical work as a source of stimulation, challenge, and pleasure in helping folks to get better. And, for the first time in my professional life, I'm actually getting paid well for what I do. Although money never mattered much to me, not enough to demand an appropriate salary, being a full-time practitioner has required me to charge for my time in a new and more explicit way. I still feel a bit uncomfortable about the whole billing-fee-collecting process, and I wish my math and record-keeping skills were better. But, despite all the discomfort, I also feel excited at being able to do work which is such fun, and so thrilling, and which feels so good when people improve, which they do most of the time, and—on top of that—to be so financially richly rewarded as well. That is like icing on the cake of the pleasure provided by the work itself.

I don't know if I have yet "come of age" in any finished sense. Rather, it feels like my professional development has been a series of "comings" at different ages and stages. I'm even thinking now about the possibility of retiring when my husband does, perhaps in only five years, so that we can do some of the travelling I so enjoy without worrying about leaving patients. When I think of retirement, I think of ending the practice part of my work, and having free time to do lots of other things—like working on films and tapes and books, or accepting the tempting invitations I've had to refuse to teach in some lovely part of the world. I also love doing those other things, and now I don't really have the time. And maybe I would even return to my own painting, the one thing that has felt like a sacrifice during all this professional hyperactivity. I don't honestly know what direction I'll be going in five years from now. But I do suspect that, just as this time of the empty nest at home has stimulated changes for me, so my husband's retirement will do so as well. And, of course, there will be yet another coming of age, this time OLD AGE.

But there, the parallels with art therapy end, because only part of my own journey holds true. Unlike an individual life, the life of a discipline is potentially limitless. It will, I hope, continue to increase in sophistication and depth, as well as in application and scope. It is such a good thing—art therapy—that it deserves to grow. But even good things need good nourishment and care, and practitioners who know what they're doing and what they're talking about in order to make it in this competitive world. Happily, many of the young people I have met, the art therapists of the future, have impressed me with their sincerity and with their "smarts." I think you need both to be a good art therapist, along with a healthy capacity to play and to create—to be in that illusionistic, transitional sphere of patient and therapist, of artist and lover alike.

Thoughts on the Development So Far of Art Therapy and of AATA

In trying to take a wider perspective and reflect on the development so far of our field and our organization, I first came to the conclusion that as a profession, art therapy has grown with impressive speed since it was first born through the pioneering work of such individuals as Mary Huntto in the Midwest at the Menninger Foundation, and Margaret Naumburg in the East at the New York State Psychiatric Institute. The literature, quite meager when I first encountered it as a graduate student in 1957, has literally mushroomed, and has gone from sparse
to substantial in the three intervening decades. Training programs, standards of education and of practice, a code of ethics, all of the necessary components of professionalism—have been developed and mechanisms for their enforcement put in place.

Art therapy is now more often known than unheard of, the reverse of the situation just 23 years ago when I began to do it. And, not only has the field become increasingly more sophisticated, expanding in depth as well as in breadth, it is increasingly well-regarded and respected, also in contrast to the situation a short time ago. I well remember discussions with intelligent people like Joan Erikson, in which it became clear that her opposition to art therapy was based only partly on her concern about losing the healing quality of art by over-analyzing product or process; but also on her experiences of seeing shoddy clinical work done by people who called themselves “art therapists.” While this is still possible, the situation has improved significantly, through the work of this association in developing and enforcing increasingly rigorous standards.

Ironically, while the discipline has traversed its “adolescent passage” fairly smoothly, its disciples—the people who have worked hard to create and sustain the professional association—have often been collectively vulnerable to an adolescent kind of turmoil, with rumblings of unresolved issues at earlier developmental levels. True to what is well known about the dynamics of groups, most people in the association, even those involved in some of the “sturm und drang,” are quite sensible and mature individually.

In our growth and development we have, at times, encountered “tumultuous” events. It seems that we had a hard time giving up splitting as a defense under stress, and were all too ready to label people or groups as all-good or all-bad when tension was high. Perhaps we had not fully resolved what Mahler called the “RAPPROCHEMENT CRISIS.” Maybe that happened because some of our impressive professional parents had a hard time letting our toddler-selves separate when we were ready; or maybe it was because we were unable to handle the overwhelming ambivalence which seems to be an essential part of that process. We also seemed vulnerable to OEDIPAL concerns, in the sense that issues of Inclusion and Exclusion were a frequent source of tension in the group from the inception of the organization. The greatest pain seemed to come from people or groups feeling left out and/or unappreciated. Egos were often bruised or wounded.

Yet somehow, in spite of all this turmoil, we managed to negotiate an organizational LATENCY, a time of intense learning and of hard work on important tasks, both within the group and in relation to the outside world; learning how to deal with political and economic realities, as well as how to better run our household. But, as with those latency-age children needing treatment, we did so at some cost, because of the fixations and regressions born of unresolved conflict. Perhaps the most painful time was the period through which we passed some years ago, which often made me think of Freud’s hypothesis in TOTEM AND TABOO about the need of the children to rebel against the parents, and even in primitive fashion—to attack them.

When Margaret Mead went to Samoa at age 23 to do her famous fieldwork, she wanted to prove that her mentor, Ruth Benedict, was correct about what was then called “cultural determinism.” She found, in COMING OF AGE IN SAMOA, that adolescence there was not turbulent as in the West, but relatively smooth and peaceful, and triumphantly announced that she had proved the theory of those anthropologists who saw development as determined more by nurture than by nature. In 1983, an anthropologist named Derek Freeman from Australia shocked the academic world by publishing a reassessment of Mead’s work, her findings, and her conclusions, titled: MARGARET MEAD IN SAMOA: THE MAKING AND UNMAKING OF AN ANTHROPOLOGICAL MYTH. Some have seen the book as an attack on the Great Mother of cultural anthropology. Freeman, however, did not view Mead as consciously distorting her data, but merely as a victim of her attachments, her biases, and the teasing reports of her young Samoan informants. These adolescent girls told her what she wanted to hear, which she then reported to her teacher, Franz Boas. He also wanted to hear about a “negative instance” of adolescent upheaval, in order to support cultural determinism, in which he and Benedict believed most deeply.

There is an interesting connection, it seems to me, between our painful coming of age in AATA and the Mead-Freeman findings. Because, thank heavens, even during some of the most confusing times, there is also—in Samoan adolescents and in AATA—growth and development. And there have been substantial periods of considerable group cohesion and task-oriented behavior, like the present one. To use Bion’s terms, there were times when we behaved more like a “BASIC ASSUMPTION GROUP” than as a “WORK GROUP,” but at other times we worked together well. Just as there were both genuine harmony and hidden tensions in Mead’s Samoa, our occasional eruptions of passion have represented only a small part of the actual functioning of AATA over the years.

Having spent six years on the AATA Board, I can truthfully state that the energy spent in constructive work was much greater than that spent in destructive rivalries. I speak not only for myself, but for most of the colleagues who served with me during that period and, as far as I can tell, the same overall state of affairs has existed before and since
"... our internal "coming of age" will help us to clarify our identity as a discipline, and will facilitate our ability to be effective in the outside world."

that time. However, while some may argue that conflict is both inevitable and even healthy, I found it frustrating that any of our energy should have been drained in unproductive directions; we really do need all of it, in order to work effectively on the many tasks required for the continued development of both the field and the organization. I confess I have felt especially sad that, because these tensions have so often surfaced at public meetings (at least in the first ten years), the image presented to our professional children—the students and budding practitioners who are the future of the field—has sometimes been a distorted and disturbing one. A significant sign of our organizational "coming of age" has been an increased ability to control and contain our passions in public, to behave with the respect and dignity we owe each other.

There was a time when we would have been good candidates for "association family therapy," had there been such a treatment. Since there did not exist a family therapist who would have wanted to take on a group like ours, we simply had to do it ourselves. So far, the improvement seems to be fairly stable. One of our continuing challenges as an association is to use the discipline we exercise with patients and with colleagues in other fields as we deal with each other. The goal is not to become identical or in any way to deny our differences, but to air them freely, to be secure enough to allow disagreement, debate, and the open exchange of ideas. In this way differences, tensions, and conflicts can be not only expressed but also resolved, as we struggle to integrate and synthesize the rich diversity of individuals who make up the AATA. Hopefully our internal "coming of age" will help us to clarify our identity as a discipline, and will facilitate our ability to be effective in the outside world. Fortunately, like many a family that squabbles at home, we have always been able to behave with greater dignity in public.

On reflection, several psychologically flavored thoughts occurred to me about why our coming of age may have been at times so stormy. First, it may be related to who we are. For we are artists as well as therapists, and share with other creative people that peculiar "flexibility of repression" (Freud) which allows us to "regress in the service of the ego" (Kris). Perhaps that is one of the reasons why we have been more vulnerable to group regressions than seems to be the case with other associations. And maybe it has been more apparent among us for similar reasons: that we, as artists, are freer to express our deepest passions, freer to let them show (while other groups both need and are able to hide them better). For, though it may be true that some of our internal struggles had to do with people and power, they also had to do with passionately held convictions about art therapy. This openness to both regression and expression, while it may be one source of our vulnerability to stress, is also a major source of strength in us as individual therapists, and as joint creators of a professional identity.

We do seem to have passed from an earlier stage of the wholistic incorporation or introjection of mentors to one of more mature, selective identifications. As our own identity as art therapists has developed and become more secure, our earlier chameleon-like need to be the same as more established groups has diminished. We are clearer about who we are, how we are similar to and different from other disciplines. We are becoming more comfortable about what we can contribute, and are less often either grandiose or overly modest. We are more comfortable, in other words, with our potential effectiveness, as well as with our very real limitations.

Similarly, we do seem less prone to seeing issues in black-and-white terms, and more able to view them in shades of gray, to integrate good and bad in regard to ourselves and others and, secondarily, in relation to our varied ideologies and methodologies. And, like the growing child, we have moved from early tendencies to view competition as dangerous and potentially annihilating, to seeing it as stimulating and fruitful, leading to new syntheses and integrations in our thinking and in our work.

Perhaps our rapid expansion has also been a source of vulnerability, as in a youngster whose social and emotional maturity has lagged behind physical and intellectual growth. Some of our awkward periods may have been accentuated by our need, coming as much from outside reality pressures as from internal strivings, to grow up too fast. Though we felt ready, for example, like some adolescents who leave home prematurely, to leave the nest of a management firm, we discovered that we were not really ready for setting up housekeeping quite that independently. We did, of course, as with all crises, learn a great deal from that experience.

As then President Sandra Graves pointed out in her opening remarks for the conference at which this paper was delivered, we know how to be therapists, but we don’t know much at all about being managers or business-persons. Part of our recent maturation as an organization has come from having to painfully acknowledge our limitations in that area, and to accept the fact that we
need to depend on and work with others who know more about such affairs than we do. Perhaps it is akin to my own distaste and incompetence in housekeeping, which long ago led me to work at what I love and pay someone else to do the cleaning. I feel no need or desire to acquire Mrs. Lee’s expertise as a scrubber and duster, any more than I can imagine wanting to be an expert statistician or computer programmer. I much prefer to rely on the expertise of others I can trust in such realms. Perhaps such a model may represent an appropriate state of organizational housekeeping for AATA as well; only time will tell.

Periods of transition in normal development are marked by some degree of upheaval and disorganization, which seem to be necessary components of growth. Similarly, I’m convinced that if there is no resistance (in the unconscious sense) at some point in therapy with a patient of any age, there is also probably not much change going on. It does often get worse before it gets better. So maybe what we’ve been through is expectable and even necessary, and maybe it was an index of some unresolved issues, as I’ve suggested. In either case, there’s no question that it has helped us to “Come of Age.”

One reason I know we are coming of age is that we have experienced some of what Judith Viorst calls NECESSARY LOSSES, like those members who can no longer be with us, whose wisdom and inspiration and guidance we miss mightily. I think of wonderful people like Hanna Kwiatkowska, who, though gone, lives on through her book, FAMILY ART THERAPY AND EVALUATION... or Elsie Mueller, who has been unable to attend our annual reunions for a number of years, but whose sensibility, fairness and balance are also remembered as a model of mature behavior. We have also lost much of our youthful naïveté, as well as some of our earlier grandiosity. People and places and ideas are less often idealized and are viewed more realistically. We no longer need to be rebelliously different from other mental health professionals or slapdash imitative.

But we have not lost our belief in the power of art to speak the language of the soul, or in our ability to “work playfully and play seriously,” as Edith Wallace has urged. Just as I felt rather self-indulgent in so much self-focus at the beginning of this paper, so I now feel equally self-indulgent in being able to share these personal hypotheses with you all. Like many in our field, I feel immensely fortunate to have found art therapy such a wonderful way to do work which is so rewarding. Thank you very much for inviting me to indulge myself in sharing this highly subjective perspective on Coming of Age. I am very excited, as I hope you are, about the years to come. For, if my analysis is at all close to the truth, we should, in the near future, be entering upon our professional PRIME OF LIFE.

MARYLHURST COLLEGE
Graduate Program in
ART THERAPY

A two-year clinical training program leading to a Master of Arts degree in Art Therapy. Flexible scheduling including part-time study is available. Applications for admission in September, 1988 are due in March, 1988.

Learning opportunities are also available for non-admitted students.

Art Therapy Program
Marylhurst College*
Marylhurst, OR 97036
(503) 636-8141, ext. 379

*Marylhurst College is twenty minutes from mid-town Portland, Oregon.

MASTER'S DEGREE PROGRAMS
in Expressive Therapies
and in Creative Arts in
Learning

Offered by the Institute for the Arts
and Human Development
Lesley College Graduate School

Master of Arts in Expressive Therapies
For students interested in the creative modalities of art, music, dance/movement, and drama, presented in a clinical and theoretical framework for a variety of settings.

Master of Education in Creative Arts in
Learning
For students who wish to learn how to integrate the arts for careers in schools, cultural institutions, and human services institutions. Specializations in storytelling and theater studies.

For more information call or write the Institute for the Arts and Human Development, Lesley College Graduate School, 29 Everett Street, Cambridge, MA 02138-2790. (617) 868-9600, ext. 480.

Family Art Psychotherapy: A Clinical Guide and Casebook

Helen B. Landgarten, Brunner/Mazel, 1987, 299 pages, $27.50

Reviewer: Shaun McNiff, PhD ATR. Dr. McNiff is a Professor of Expressive Therapy and Dean, Institute for the Arts and Human Development at Lesley College, Cambridge, Massachusetts.

Helen Landgarten has written a book which makes the most important single contribution to advancing the practice of art therapy with families. The author, grounded in both the practice of art therapy and family therapy, integrates the two naturally. Family art psychotherapy is described so effectively, and with such depth, that it appears to be a discipline unto itself rather than a combination of art and family therapies. Family therapists who read this book will see how art expands the therapeutic process and constantly surprises clients and therapists with its manifestations. Perhaps they will begin to imagine how they might begin to introduce art to their practice. The book will also inspire more art therapists to work with families and expand their psychotherapeutic identities.

*Family Art Psychotherapy* follows Helen Landgarten's highly regarded *Clinical Art Therapy* (1981) in its vivid descriptive richness of a varied collection of therapeutic experiences. What impresses me most about the book is the absence of personal and theoretical bias. Landgarten is pre-eminent in her pragmatism and commitment to a straightforward practice of art therapy.

After a brief theoretical overview of family therapy models and a demonstration of how to conduct a "family evaluation," the author begins her presentation of comprehensive case materials. The book is essentially composed of seven studies of families which are described with a refreshing absence of jargon. An art assignment, or task-oriented approach, is used in all of the cases. I found that the activities were designed in a way that moved the families into serious dialogue within what appeared to be a limited amount of time. The use of art consistently circumvented the aversions and resistances that can obstruct the therapeutic process. The range of experiences embodied by the cases gives an illuminating description of the problems which confront the contemporary American family together with an indication of the author's professional breadth. Each case is a chapter unto itself: Family Crisis Intervention for a Molested Child; The Family in the Midst of Divorce; Therapy for a Family with an Encopreic Child: Long-Term Treatment; A Single-Parent Household: Issues of Abandonment and Masked Depression; Intact Family with an Acting-Out Adolescent; Three Generation Treatment for a Terminally Ill Grandparent.

The extensive nature of the case materials suggests how art therapists can conduct descriptive research. The chapter reviewing the author's work with an "Intact Family with an Acting-Out Adolescent" chronicles a total of twenty-eight family sessions with two adolescent girls and their parents. Therapy was mandated by a court order resulting from the older daughter's motor vehicle violations. After many disparaging statements expressing his discomfort with, and distrust of, art therapy, the father began to realize that he was "getting his money's worth." After the seventh session, he said: "Who would think that art therapy would help people?" As the therapy progressed, the father and the entire family became serious in their respect for both the therapist and the art therapy process. At the end of the therapy, and as a vehicle of termination, they do successful role plays as art therapists.

The author also presents what she considers to be one of her treatment "failures" in another family's "flight to health." The tone of the book is modest and the value of art therapy with families is established through the continuity of the author's work through a variety of situations.

The theme of "separation and loss" runs throughout each case study while the identification and transformation of these feelings are the subtle, and quietly stated, philosophy of *Family Art Psychotherapy*. Children in the family scenarios are separating from parents in order to become themselves and this process is accompanied by emotional confusion because our society is without passage rites which clarify, express, and validate these changes. In other
situations parents and children are separated from one another through divorce and abandonment and in the book’s last chapter, death is imminent.

In art therapy there is creation in response to loss and this corresponds to the dynamics of healing. The pain of separation motivates the intimacy of the psychotherapeutic process. Separation and loss are close to the essence of artistic action and perhaps this can help us to understand why it is so therapeutically helpful. Art plays out the opposition between connection and independence. The emergence of the self requires isolation and the destruction of old dependencies. The ache of separation and loss deepens awareness. In Psychoanalysis and the Unconscious, D.H. Lawrence described the emergence of individual creativity as a “revolt from connection...the sharp clash of opposition.” He felt that creative transformation cannot take place without “this dual circuit of direct, spontaneous, honest interchange.”

In addition to the book’s articulate commitment to individual families in crisis there is also an unspoken dedication to the institution of the family in what we now see as an epoch of radical change. The family, in a collective sense, suffers from the separation from, and the loss of, its historic continuities. From this destruction and opposition a new culture is emerging. For twenty years at Cedar-Sinai Medical Center in Los Angeles Helen Landgarten has helped families to adjust. Her inspirational practice of family art psychotherapy, documented vividly in this volume, provides us with the clarity and sustenance that will be needed to renew the eternities of family life.

Approaches to Art Therapy: Theory and Technique

Reviewed by Michael Campanelli, Ed D, ATR, Assistant Professor of Art Therapy, Wright State University, Dayton, Ohio 45435.

This book is just what many art therapists have been waiting for. It is a notable effort to collect and describe theories that have been promulgated by distinguished experts in the art therapy field. The text highlights various ways in which art therapy has been conceived and presents each unique art therapy approach as equally feasible for conducting therapy. Each theory is described using its own theoretical terminology, and procedures are delineated with all the specificity that the most pragmatic art therapist might need.

The range of theoretical and clinical information presented in this volume makes it a useful tool for art therapists planning treatment programs, for mental health professionals using art in their work, and for instructors of art therapy. A theory is presented, its concepts examined, and a case example using the specific approach for illustration is given. Because of the skillful integration of illustrated case material into the presentation of each theory, the conceptual underpinnings of the various approaches are persuasively outlined. Therapists with varying amounts of experience will find the book’s format valuable for handbook and reference purposes.

This text is important not only because it provides guidance for using a variety of models for clinical application, but also for its contribution to the continued development of the profession. Diverse orientations are well documented, and the concluding section successfully unifies rather than fragments ideas and practices. The result is the creation of a gestalt of the art therapy field where each theoretical framework is a component of equal merit.

The book is separated into four sections; each contains a series of chapters devoted to broadly defined areas of psychotherapeutic treatment. The first section deals with psychodynamic approaches that include Freudian Psychoanalytic Theory, Jungian Analytical Psychotherapy, and the more contemporary developments in psychoanalytic theory. Each of these is presented as having a direct impact on art therapy theories and practices.

In the first chapter, Rubin gives us some historical perspective on art therapy’s roots, starting with Freud’s insights regarding unconscious communication through dream imagery. The early growth of art therapy as a profession is then traced to Margaret Naumburg’s incorporation of Freudian concepts into the first formal theory of art therapy. This chapter illustrates how the practice of art therapy can serve to bring unconscious conflicts to the surface through spontaneous art expression and free association to the images that emerge.

The next chapter is written by Edith Kramer, who elaborates upon her specific perspective on the value of art therapy (i.e., art as a healing act adjunctive to
the therapeutic process). Featured in this discussion is an in-depth exploration of the role of sublimation in the treatment process, valued for its capacity to reduce instinctual tension and to enhance a sense of social position. Although Kramer has published previously on this topic, it is still fascinating to reread her ideas, particularly the discussion of the processes in lower species that are analogous to sublimation in human behavior. In concert with Kramer’s view is Laurie Wilson’s chapter on the importance of the symbolic process. In Wilson’s view, symbolization has an ability that is fundamental to almost all civilized activity.

The chapters by Arthur Robbins and Mildred Lachman-Chapin are based upon theories emerging from more recent studies of early psychological development. Robbins deals with interpreting art therapy treatment within an object relations frame of reference, recommending the utilization of this framework for specific client populations such as the borderline personality. In Robbins’ view, art serves as a mirror of early internal deficits in relatedness, and art therapy offers a unique way of providing the missing link to complete unfinished object relations.

Self-psychology as promoted by Lachman-Chapin is recommended for the art therapist working with the client who has a narcissistic personality disorder. Lachman-Chapin believes self-psychology to be congruent with an art therapy approach since art can satisfy narcissistic needs and relies on empathy for its appreciation. It should be noted that the chapters of Robbins and Lachman-Chapin, although informative and stimulating, might be ponderous for beginning art therapy students and practitioners not already familiar with the formulae on which the approaches of Robbins and Lachman-Chapin are based.

Espousing the importance of the image as a central focus of treatment are Edith Wallace and Michael Edwards. Both use a Jungian frame of reference in their practice of art therapy. The image in art therapy is viewed by these authors as having a life of its own. This allows the client to have an imaginative dialogue with images where both the therapist and the client link the imagery to archetypical structures inherent within them. Wallace’s discussion of the process of active imagination is particularly helpful in understanding how the art therapist can assist the client in drawing out images from the unconscious.

The section on humanistic approaches to art therapy (as presented by Rose Garlock, Mala Betensky, Janie Rhyne and Joseph Garai) is a striking contrast to the psychodynamic theories in the previous chapters that emphasize the deterministic view of human behavior. The authors in the later chapters focus on the “whole person” and believe that our psychological makeup consists of more than just past experiences. These contributors contend that each of us plays an active part in creating who we are. The emphasis here is on enhancing optimal functioning rather than simply alleviating distress. Each of the authors identifies with a different trend in the human potential movement. Rose Garlock developed a program predicated on the theories of Alfred Adler. Garlock uses Adler’s ideas of a therapeutic social club, with art therapy having a major place in the program structure. She expands the creative potential of each client while simultaneously creating a sense of community. Her model incorporating Adlerian theory into an art therapy prescription for treatment is innovative and useful for application by other art therapists. The Phenomenological Approach (Betensky), the Gestalt Approach (Rhyne), the Humanistic Approach (Garai), have been detailed in other more extensive works. However, Rubin’s linkage of these specific theories has enabled us to see the commonality of thought among them. Drawing upon these approaches, the art therapist helps the client experience himself or herself fully in the here-and-now. As with previous chapters, the case study material assists the reader in visualizing the procedures of each therapeutic model and in understanding its application.

Chapters 12, 13 and 14 are organized around more directive art therapy approaches. Presented in this section is a compilation of many of the concepts emanating from theories that concentrate on the objective assessment of overt behavior. These chapters broaden the range of the art therapy application in addressing the needs of the severely disabled person. In institutional settings, these approaches might be the art therapy treatment of choice, since they are in harmony with the prevailing methodology applied (i.e., the focus on specific behavioral change through the manipulation of a therapeutic situation).

The first chapter in this section (Chapter 12) is by Ellen Roth who combines traditional art therapy techniques with behavior modification principles. Her unique contribution in the implementation of behavior modification through art therapy involves “reality shaping.” Rawley Silver, a second contributor, uses a cognitive approach to art therapy to assess cognitive and creative skills. Silver’s vast experience using assessment techniques that she developed has enabled children with perceptual and learning difficulties to advance beyond a dysfunctional stage. Susan Aach-Feldman and Carol Kunkle-Miller utilize an approach in working with the multiply handicapped, stemming from perspectives that are grounded in developmental principles.
They present specific directions for the adoption of a developmental assessment protocol. Procedurally, their method is well defined and can be easily adapted to a variety of settings. These authors highlight the importance of the art therapist setting goals and evaluating movement towards these goals while considering a wider set of treatable conditions than would ordinarily be taken into account.

The last section of the book is of exceptional value. It presents models of art therapy synthesized from distinctly different styles of thinking and working. This section opens with a chapter by Elinor Ulman who has integrated the orientation of Kramer and that of Naumburg into her own theory of art therapy. Ulman's candor is impressive in discussing her struggles to discover an art therapy perspective that is in tune with her own "authentic self." Echoing Ulman's view is Harriet Wadeson who, in her chapter, offers us a model for devising an eclectic style of working. Believing that personal and professional growth depend upon a creative selection and synthesis of approaches, Wadeson discourages the art therapist from adhering to any single theory. Her case examples guide the reader in intelligent use of a variety of theoretical concepts when employing an eclectic strategy.

In the concluding chapter Rubin leads us further into a consideration of the designing of one's own style of work through theory selection. She covers such important issues as recognizing when a bias towards a theory might be self-serving, concealing the art therapist's own unconscious conflicts, and the pros and cons of mastering one single model and using it well versus the mastery of a variety of models. Also included in this chapter is a survey of the views of many notable art therapists on the nature of theory. The conception of theory that evolves from this survey is one that appears to perceive available styles of therapy as a collective wisdom upon which to build one's own personal theory, combining and transforming concepts from major approaches to create new ones. This chapter is penetrating in helping the reader realize that the principles of theory are not static, but are dynamically interactive with the art therapist's personal characteristic and the variety of clinical circumstances that the art therapist encounters.

Approaches to Art Therapy: Theory and Technique is an impressive body of work reminding us that the art therapy field is a pluralistic one providing a range of art therapy models. Rubin helps us to realize that although each art therapy approach necessarily has its own unique quality, they can be complementary and there can be convergence among these many methods. No doubt, as the art therapy field matures, new methods will be discovered and we will watch the expansion of the synthesis germinated in this book.

"Perpetual Arts Relaxation Tape #2"

This videotape (VHS, 30 minute) is available for purchase or rental. For additional information please write to: Perpetual Arts c/o Mr. Alma Bulkley, 9848 Wimbledon Drive, Sandy, Utah 84092, Telephone: (801) 942-8459.

Reviewed by Michael Campanelli, EdD, ATR, Assistant Professor, Art Therapy, Wright State University, Dayton, Ohio 45435. Judith Miilman, CRC, Manager, Office of Vocational Rehabilitation, 1139 Hylan Blvd., Staten Island, New York 10305.

Watching this video is like gazing at fish in a tank. There is movement in a fluid fashion with an added component of filtered light to give it an illusionary effect. There is no clear static definition of space or form, just frame upon frame of dramatic changes in color—very saturated reds, greens and yellows progressing to softer blends of pastel oranges, pinks and blues.

To accompany the color changes there is electronic music that echoes the fluidity and movement in the visual forms. The music is devoid of traditional harmonic structure, melody and counterpoint. These ambiguous sounds and forms have a calming effect on the viewer. The colors and sounds blend in a pace suitable to contemplation.

The video is 30 minutes long. The text is four quadrants with a continuing variety of color themes. The themes are abstractions containing no narrative or recognizable beginning, middle or end. The "new" structure can be disorienting at first because we are conditioned to expect a linear progression of logical sequences. Once we get past this expectation we are drawn into the moods created by intriguing sights and sounds.
The colors are vivid often resembling a watercolor being painted. The highlights of the images presented are frames that mirror brilliant tones. These tones then fade into soothing reflections that may then be perceived as (perhaps) a sunset, or a seascape, or other content.

There are many possible therapeutic applications for this video. Clearly it could be used as a relaxation technique prior to a session to help clients acclimate themselves to the therapy setting. As a motivational device it could be used by those who have their creativity blocked. Art therapy clients are sometimes unable to allow imagery to naturally emerge in a session; because of the “fluid nature” of the video, forms and shapes one wants to recall may be more accessible. This tape could facilitate the kind of communication the client must engage in to have dialogue with himself or herself and one’s art therapist. In addition, individual segments could be used as part of a projective technique stimulating associations with visual content.

The video could also complement a movement therapy session. For example, the client could be asked to focus on one square of color and physically respond to the variations. The therapist and client could then explore the client’s responses to determine how the color changes parallel the client’s inner world. Using this video with movement would be ideal if projected onto a large screen where the shapes and forms would not only be a stimulus but would create an environmental effect.

Two populations that come to mind in considering clients who could benefit from this video: the child who is autistic, and the child with learning disabilities. An autistic child attracted to visual stimuli might be easily engaged by this video’s content. Exposure to the variety of colors and their changes could serve as a non-threatening introduction to a hands-on art experience. While noticing which segments gather the child’s attention, the therapist could elaborate upon these segments in a selected art activity. Since the video is relaxing, one could use it as a subliminal conditioning tool with the learning disabled child who is hyperactive. With each session, the therapist might gradually slow down the pace, attempting to acclimate the child to a calmer setting.

It is recommended that this video be used judiciously with certain populations. Because of its potential hypnotic effect, therapists should use caution when showing it to severely disturbed clients. The video might also not be appropriate for individuals with seizure disorders. The changes in light and color could stimulate a convulsive attack. Nor would it be suitable for individuals who are visually impaired. One should have visual acuity to benefit wholly from the nature of this video.

This video tape is both stimulating and useful in the form in which it is presented. It serves its purpose as a relaxation device and easily lends itself to adaptations for individualized art therapy treatment programs. The art therapist is encouraged to view the tape and to experience the forms, colors and sounds as they move in-and-out of the immediate space, and to think creatively of the many possible uses of this tape in clinical sessions with individuals and groups. It is a valuable resource for the therapist, both personally and professionally.
"Door at Abiquiu-November 25, 1986"

Maxine Junga MSW, LCSW, ATR, Associate Director and Assistant Professor, Graduate Department of Clinical Art Therapy, Loyola Marymount University, Los Angeles

She thought sometimes
She no longer lived within the confines
doing her own skin
But in some never-never land of betwixt
and between.
Permeable boundaries
Of yes/no, where/why
Being born and dying.

Lately: upon approaching the ends
Of sidewalks, she noticed she could not
Step forward into the street
To cross with the light
Without a palpable wave of panic.

Edges of paper or of feeling
Newly attracted her
And she found herself leaving broad white margins,
Watching
the lines and forms and colors of the evolving image
huddle together in an immaculate
Safe space bounded on all sides by emptiness.

She remembered Georgia O'Keefe's
Obsession with the black door
In the house at Abiquiu
Which she painted again and again for thirty years.
And she thought O'Keefe had also
struggled with the
Beckoning paradox of threshold as
The invisible line between before and after
The knife edge between
relationship and isolation, fullness in the void,
symbol and mystery, known and unknown,
attachment within individuation,
sanity and insanity.

In the prolonged act of noncompletion
there is the promise.
In the prolonged act of noncompletion
there is the beginning.
In the prolonged act of noncompletion
there is the constancy.
In the prolonged act of noncompletion
there is the going on.

Though bound to that doorway,
O'Keefe would not cross over until the
day at age 98 in the warm spring of 1986
When she died.

In November, she awoke one night
After a dreamless, fitful sleep
And came downstairs at two a.m.
To sit at her littered desk amidst
the house's luminous silences and watched
As the black-felt-tip penned words flowed avidly
from her fingers like blood from a secret wound,
They sliced onto the yellow-lined pad.
Were crossed out to start again.
And lines accumulated, one onto the next and the
next until
Moving slowly, slowly, finally, they filled the space
to its ends.
And she found no comfort in the act.
She took two valiums
Round like yellow moons and
Lapsed, into black sleep.

Clarification

In the last issue of Art Therapy, Vol. 4, No. 3, October, 1987, an article was published titled "Diagnosis and Assessment: Impact on Art Therapy," by Ellen G. Horovitz-Darby, MA, ATR. In this article there were references to the Bender Gestalt Test and the House-Tree-Person Test, among others. It has been called to my attention that a clarification should be made relative to the formal tests of each of these (both the Bender Gestalt and the House-Tree-Person)—the formal tests can be administered only by an art therapist who is also licensed in clinical psychology.

THE ART OF PLAY
An Adult's Guide to Reclaiming Imagination and Spontaneity
Third Edition

This book is about playfulness, that particular point in play when imagination and spontaneity begin to add some degree of elaboration, style and originality. Readers will gain a sense of mastery over relaxing, enjoyable and exploratory forms of play, making the enacting of roles with others an especially rewarding and important occupation. An extension of informal, creative dramatics—or what child development specialists call sociodramatic play—adapted for adults, The Art of Play demonstrates how this kind of imaginative, improvised enactment can be a potential source of artistic recreation.

"You have written a fine, original, and important book in The Art of Play. It is, indeed, the best book of its kind principally because it not only makes sense, is clearly and understandably written, but above all is literally a practical handbook in the science and art of play. It is a book that will be immediately helpful to all who read it because at every step of the way you give the underpinning for the practice of play in its many various applications. It is bound to have a wide audience, and will establish itself as a fundamental contribution to the practice of everyday life."

—Ashley Montague

"...most valuable as a broadly based look at theory, benefits and potential uses of sociodramatic play in promoting the growth of both individuals and society."

—Drascope

THE ARTIST AS THERAPIST

Based on the author's thirty-four years as a sculptor, art therapist, psychologist and psychoanalyst, this informative text explores the role of the art therapist in integrating aesthetics and psychodynamics into the therapeutic process. Areas covered include: the use of materials; varying developmental issues in different diagnostic categories; actual clinical cases; the importance of therapists' utilization of their own inner experiences in the development of theories; and the principles of art therapy.

JOURNAL OF POETRY THERAPY
The Interdisciplinary Journal of Practice, Theory, Research, and Education
Sponsored by the National Association for Poetry Therapy
Editor: Nicholas Mazza, Ph.D.

Emerging from the tradition of the arts and psychotherapy, this interdisciplinary journal is devoted to the use of poetry in health, mental health, education and other human service settings. The Journal welcomes a wide variety of scholarly articles that focus on (1) an appreciation and strategic use of language in therapy, (2) poetic approaches involving metaphor and imagery, (3) the use of published poems and lyrics, (4) creative writing, and (5) the incorporation of various literary forms, audiovisual aids, and other bibliotherapeutic materials. Theoretical, historical, clinical, descriptive and evaluative studies will be emphasized.

The scope and special features of this journal include original articles, research and clinical exchange columns, news and notes, news and notes including a column compiling a list of poetic resources to use in practice, book reviews, abstracts of current literature, and original poetry. The Journal of Poetry Therapy is the first periodical designed to meet the needs of the clinician, researcher, educator and professionals concerned with the therapeutic value of poetry, literature, and other related creative arts.

GENERAL MEMBERSHIP INFORMATION:

All classes of membership receive the following: Bylaws, Code of Ethics, Membership Directory, Newsletter, ART THERAPY, Journal of the American Art Therapy Association, discounts on publications, discount on admission to the annual conference, as well as pertinent information about research, insurance, and other matters of interest.

Membership should not be confused with Registration (ATR). Registration is bestowed only by the Professional Standards Committee. For application procedures and information about Professional Membership and Registration, contact the AATA National Office.

Associate Membership shall be open to individuals interested in the therapeutic use of art wishing to support the purposes and objectives of the Association. Associate members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office or serve on a committee.

Annual Dues: $50

Student Membership shall be open to students taking courses in art therapy, art, psychology or who are interested in the field. Student members shall be entitled to receive all official and affiliated publications of the Association and to attend the annual meeting, but shall not have the right to vote or hold office. Student members shall be eligible to serve on the Student Affairs Subcommittee of the Membership Committee. Applications for student membership must be accompanied by a copy of current ID.

Annual Dues: $35

Contributing Membership is open to individuals, organizations, institutions, or foundations which contribute annually to the Association.

Annual Dues: $100

Professional Membership is by application only and is open to individuals who have completed professional training in art therapy and who are or have been engaged in the therapeutic use of art. Professional members are eligible to participate in all activities of the Association and receive all official publications. A professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $75

Credentialed Professional Membership is by application only and is open to individuals who have met the qualifications and been approved for Professional Membership and have been granted Registration (ATR) by the American Art Therapy Association, as set forth in Standards and Procedures for Registration. Professional members are eligible to participate in all activities of the Association and receive all official publications. A Credentialed Professional member shall be eligible to vote and hold office. Contact the AATA National Office for an application.

Annual Dues: $80

“THE FARM” — drawing by a 14 year old gifted child (Wright State University Art Therapy Clinic)

Painting by an adult woman in art therapy. (Wright State University)

Painting by a 57 year old schizophrenic man. (Wright State University)

New! FUNDAMENTALS OF ART THERAPY by Shaun McNiff. Written in a dialogue format, a major portion of this text discusses questions raised by an art therapist in training. Topics examined include the nature of art, animism and art, archetypal imagery in children’s art, theory as creation, diagnostic labels, killing and resurrecting the father, art as dreaming, and eros and image. Throughout the presentation, the author maintains that interpretation is not only fundamental to art therapy but that therapy is itself a process of interpretation. ’88, $34.75

New! THE PSYCHOCYBERNETIC MODEL OF ART THERAPY by Aina O. Nucho. The first half of this book presents a detailed account of the origins and rationale of art therapy. Then it focuses on the actual therapeutic process of the psychocybernetic model which combines the verbal/analytic and the visual/imagistic symbol systems. The author describes ways to introduce clients to visual forms of expression, the actual “doing” phase, decoding the visual imagery, termination of treatment, and the scope and effectiveness of the model. ’87, $34.50

VISUAL ARTS AND OLDER PEOPLE: Developing Quality Programs by Pearl Greenberg. This lucid text provides the background and knowledge necessary to understand and appreciate older adults as artists and to develop quality visual art programs. Chapters explore retirement, gallery and museum programs, art for disabled older people, adult learning, art hazards, and art appreciation. Diverse art mediums are covered including collage, drawing and painting, clay and construction, fabric printing, and weaving. ’87, $30.25

ACTIVITIES FOR CHILDREN IN THERAPY: A Guide for Planning and Facilitating Therapy with Troubled Children by Susan T. Dennison and Connie K. Glassman. More than 200 fun and creative activities are presented for professional use with children between the ages of five and twelve. These ideas cover relationship building and self-disclosure, affective awareness and communication, social skills, school, termination, and follow-up. ’87, $32.75

EDUCATING THE CREATIVE ARTS THERAPIST: A Profile of the Profession by Shaun McNiff. This comprehensive study explores the interdependence of diverse training traditions, and it reviews the various areas of concentration, such as art or music therapy. Specific competencies and different philosophies are examined, but their commonalities are emphasized. Chapters are also included on an artistic theory of mental health and on supervision and evaluation. ’86, $32.75

THE ARTS AND PSYCHOTHERAPY by Shaun McNiff. An integrated approach to all of the arts in psychotherapy is presented in this insightful book. The author examines the distinctive and common qualities of the various expressive arts in relation to psychotherapy. He also draws on the statements of artists to develop a psychology of art that views artistic exploration as psychological research of the highest order. ’81, $21.75

“Adolescence and Family Therapy,” by Shirley Riley, MA, ATR, begins with the statement that “conducting therapy with a family which includes an adolescent child is always a challenge.” Riley identifies these challenges within the sections titled “Treatment Dilemma; Developmental Concerns; Environmental Factors; Assessment; and Setting Goals and Treatment.” Her brief case examples speak directly to some of the problems within this therapeutic context, and point the way to some resolution. The case study “expressions” offers insight for the art therapist who might be working with family art therapy, and especially with those cases that involve the adolescent family factors.

Co-authors Cathy A. Malchiodi, MA, ATR, and Mariagnese K. Cattaneo, PhD, ATR, offer the article titled “Creative Process/Therapeutic Process: Parallels and Interfaces.” As they point out “Art therapists have constantly reexamined the relationship of creativity to therapy and have differing views on that relationship.” Malchiodi and Cattaneo offer insights relative to personal artistic production through the creative process, and the relationship to art therapy and the creative process.

Another article is titled “Art Therapy Assessment of Coping Styles in Severe Asthmatics,” written by Robin Knight Gabriels, MA, ATR. This focuses on a particular condition of which there have been few articles, research or investigation in art therapy literature. As art therapists, we need to pay particular attention to our methods and approaches with persons who have identifiable diseases that have “been around” for long periods of time. What have we done in the past (in some cases we have done very little!) and what might we be doing presently and in the future? What is the current research in the field relative to these particular illnesses? This article helps us to focus on some approaches used by an art therapist.

We are pleased to be receiving an increased number of manuscripts from our professional members and others. However, this increase in numbers does contribute to some delay in publishing one’s article; some of you might have been concerned with this delay. Perhaps it is time once again to briefly review the process. As each article comes into the Editor’s office, a note of correspondence goes to the author informing him/her of the receipt of the article. It is imperative that a style be followed, in the writing of the article, for consistency and practicality of publishing. We have adopted the A.P.A. Manual as our guide (the full title is the Publication Manual of the American Psychological Association, 3rd ed., 1983, with revisions: 1984) published by the A.P.A., Washington, D.C. This informative manual is a total reference guide to publishing, writing, referencing, and the many other specifics involved with getting an article (or book, manuscript, etc.) into print. The reference style is particularly useful for the art therapist/author and should be noted carefully.

If the article is correctly submitted (i.e., A.P.A. style; abstract included; references clear; photographs labeled and in order; illustrations clear and titled; etc.) then the article is ready for review. If these things are not evident, then the article is delayed. For the article ready for review, it is not unusual for it to take a bit of time; full reviews and perhaps minor rewrites that may be suggested do require time for consideration. If there are major corrections needed, then it will take longer. Please remember that the A.A.T.A. publishes its journal three times a year. Therefore, for an article that is received and reviewed, the earliest that it could be published would be, normally, two issues in the future at the minimum; for many, it would require a longer period of time. An exception to this time frame would be invited articles, or perhaps a quicker time period for a thematic issue.

This delay is not uncommon in professional journals that begin to build a solid reputation; although I have received information only from an informal random sample, I would say that the average length of time for the various journals is approximately one year, although one of our sister professions has a waiting period of at least two years (average) or longer. You, however, can help in this manner; be absolutely certain that you follow the formal (“Guidelines for Authors”) found in the journal. This will help tremendously in the entire process.

Speaking of submitting to Art Therapy, how about some of you writing for “Viewpoints”? What issues do you need and wish to express? What ideas do you have regarding philosophical concerns, or methods of delivery, or art therapy assessment, or clinical documentation? Do you have some graphic images that you would like to share, or a poem that is appropriate for our pages? Send them in for consideration. We’d like to hear from you.

As mentioned in our last issue, our new Book Review Editor is Aina O. Nucho, PhD, ATR, ACSW. I’m sure that she would also like to hear from you regarding any new books that you think should be reviewed in Art Therapy. Drop her a note with your suggestions. If we all work together, this journal can only become an even stronger voice for our profession.

For those of you who are heading into a summer vacation, I hope that it is pleasant and enjoyable. For those whose vacation is over, I trust that it was a good one. Let’s all look forward to an exciting autumn, and remember: our Conference is just around the corner! Start “talking it up” and let’s all meet in Chicago in November.

Gary C. Barlow, Ed.D., ATR
Editor, Art Therapy
Adolescence and Family Art Therapy: Treating the "Adolescent Family” with Family Art Therapy

Shirley Riley, MA, ATR, MFCC, Faculty, Loyola Marymount University, and Family Art Therapist, Didi Hirsch Community Mental Health Center, Los Angeles, CA.

Approaches to setting goals for treatment of the family in therapy are discussed relative to the following categories: 1) references to treatment examples; 2) treatment dilemmas; 3) developmental concerns; 4) environmental factors; and 5) assessment. Three case examples (“Art Therapy Expressions”) are included that illustrate art therapy with the family members. The “adolescent family” is discussed with a focus on the delay in development and suggesting a series of interventions pointing the way to healthy functioning in the present and the future.

Introduction

Conducting therapy with a family which includes an adolescent child is always a challenge. With a family of this configuration, the therapist anticipates confronting an additional component of resistance to treatment. This stance is expected since a non-complaint attitude is syntonic with the teen-age developmental process. The expectation is reinforced by the knowledge that all members of a family system are normally resistant to change, since they fear that any modification of their familiar patterns may be a threat to maintaining the family unit. However, even greater difficulties are experienced when we therapists are presented with a troubled family where both teen-ager and parents are functioning on an equal adolescent level.

Treatment Dilemmas

Family treatment is built on the premise that there are techniques that will start a process toward symptom reduction by interrupting malfunctioning patterned behaviors. However, in assessing this “adolescent” family I find more questions than answers when it comes to exact technique and applied family theory.

One treatment approach with parent/child dysfunction is to establish hierarchical boundaries, shore up the adult strengths of the parent, attend to the child subsystem and other structural maneuvers (Minuchin, 1981). With the family wherein the adult has not reached an adult psychological development, we find that these agents of change are not particularly effective. It would be useful to examine how the family art therapist can construct a treatment plan that is tailored to meet the needs of this developmentally delayed family.

Developmental Concerns

To better understand the difficulties involved in treating a family which I will call the “adolescent family,” it is necessary to start by briefly re-examining the basic process of adolescent development.

When puberty thrusts the child toward the next step in physical growth, a simultaneous intrapsychic realignment also becomes effective. This change is called adolescence. In this process the youth must give up attachments to parental figures and their protective position. Adolescents turn their attention to the unexpected, uncomfortable changes they are experiencing physically and in their perceptions of themselves. (Mirkin, Koman, 1985)

Detachment from the primary adults of childhood and the single-minded focus on self is recognized as the “narcissistic stance” of adolescence. (Bios 1962) Particularly in the pre-adolescent and early adolescent child, eleven to fourteen years approximately, the pervasive feeling of emptiness and the constant introspective attention to self, limits the available empathy or interest which may be shared with another person. It is recognized that a move from a strictly narcissistic involvement to the capacity to care for another is one of the essential tasks accomplished during the adolescent developmental period. (Carter, McGoldrick, 1980)

Unfortunately many persons falter on the way to achieving the goal of empathic caring and remain at an earlier emotional stage."

"... many persons falter on the way to achieving the goal of empathic caring and remain at an earlier emotional stage.”
person since the capacity for demonstrating caring feelings for another person has not yet been achieved. (Malquist, C., 1978) Now, if we consider the problem of a psychologically delayed adult becoming a parent, we wonder how will that person be able to give protection and nurturance to a child when he or she is still viewing the world from a narcissistic viewpoint? Younger children of these adolescent-adults fare more or less well during childhood if they maintain rigid defenses and if environmental demands are not excessive. Youngsters are unable to express their unmet needs clearly. However as this same child moves into adolescence, where rebellion and resistance to parental authority is the name of the game, the real struggle begins. We now have a situation where both parent and child are attempting to gain sole attention for themselves, giving little or nothing in the way of empathic understanding to the other. Both child and adult are experiencing emptiness and distress which often is handled through impulsive actions that serve as a distraction from the pain. This unfortunate developmental parallel in parent and adolescent child requires a specific series of therapeutic interventions aimed at encouraging maturation in the adult while simultaneously keeping the adolescent child moving along his or her developmental path as normally as possible. This is easier said than done.

The family system referred to above is reminiscent of the environmental and systemic background of the borderline adolescent which is delineated so eloquently by Masterson (1972). The grave consequences of failure by the adolescent to achieve separation and autonomy is described by him in this manner: “The passage of time presents these unfortunates with inevitable life tasks and thereby faces them with truly a Hobson’s choice: to avoid the challenge of growth, marriage, and parenthood with the consequent loneliness and suffering that this entails or to take on the challenge though emotionally ill-equipped. Should they opt for the latter they receive the additional dividend of becoming an appalled and helpless eyewitness to the repetition of their own unresolved problems in their children.” In these borderline families written about in 1972, the family was often described as headed by an aggressively active mother who resists the child’s desire for individuation in answer to her own needs for fusion, and a passive, distant father who encourages this symbiosis. Masterson and others have, since then, relived the mother of full responsibility for the pathology and modified this dynamic.

There is another very common malfunctioning family system that interferes with child development: the alcoholic or violently abusive family system, where most often the visible pathology is demonstrated by the father. The dependent role in this pattern is taken by the mother.

Many patients recall their own childhood as one where the fathers were either violent or alcoholic or both - a homelife where they were unprotected by mother and triangulated into the parental relationship. These abused children, who are now parents, often engaged in heavy drug or alcohol abuse during their own adolescence which added to their developmental failures. In all the cases described above, it is the adolescent youngster who is delegated by the family to attract attention and gain therapeutic treatment by engaging in various acting out behaviors. (Stierlin, 1979) Once in therapy, I have observed the parent and child expect the therapist to provide quick answers and prompt symptom removal. Contrary to treatment expectations, resistance is not encountered when the family first accepts professional help. It is demonstrated later when the parents feel reluctant to relive painful depressive periods of the past.

When considering an approach to treatment, the configuration in these “adolescent families” that is so fascinating is the mixture of strengths and weaknesses. As in normal adolescent development there exists the overriding component of narcissism, but one can also find idealism, creativity, intellectualization, and other qualities that may be encouraged to achieve a more adult solution to problems. In addition, these families often fall in a grey area of diagnosis. Although they suffer from having borderline or abusive parental backgrounds, they were given just enough caring from some related source to give them a notion of “how it might have been better.” (Winnicott, 1976)

Environmental Factors

These “adolescent families” are frequently headed by a single parent. Traditionally, these clients have separated from a mate, whose behavior reproduced similar stress patterns they had experienced in their family of origin. However, contrary to the notion that this pattern is fated to be reproduced again and again, in many instances the mother or father is cognizant of the repetition and determined not to make the same mistake again. Although the awareness of patterns of the past may be used protectively, it may lead to an additional difficulty for the children. The adult, rather than risk failure, often withdraws from peer-friendships and looks to the adolescent child for companionship. This closeness enhances the diffu-
sion of boundaries between parent and child and promotes symbiosis.

The single parent factor compounds the challenge found in conducting treatment. The therapist cannot piece together strengths of two parents to create a composite executive position from which the adolescent child can either rebel or find protection. Too often the teenager moves into this unfilled role left by the missing parent and is thus deprived of healthy rebellion. The drive to separate continues, but since it is directed against the self (in the substitute parent-role), it turns into self-destructive acting-out behavior.

An additional dilemma in treating these adolescents in family therapy is the realities of the community mental health setting in which they are seeking help. The constriction of time and frequency of treatment must be a serious consideration. Obviously an ideal effective manner of conducting therapy for these developmentally damaged persons is not always possible in a one hour, once a week, short-term contract. Since contact is limited, we must cautiously offer the type of therapy that can be helpful within these restrictions and not attempt to remove defenses or weaken coping mechanisms that are serving a positive function. A systemic/strategic theoretical approach is designed to focus on strengths, reframe behavior and achieve symptom relief within a time limited frame. Therefore, I feel it is the most successful theory to utilize with the families described above. (Riley, 1985)

I will show by case illustrations some of the art therapy techniques to which "adolescent family" seem to have been responsive and which have resulted in a positive outcome for treatment.

Assessment

The presenting picture of the confused, frustrated parent and the defiant, rebellious adolescent is one that is painfully common. The description of the problem that brought them into the clinic does not provide sufficient clues to understand the underlying cause of the behavior. However, if the therapist observes (during the joining phase of the family art therapy), an unusually prolonged competitive struggle being enacted between adult and child, the hypothesis of mutual adolescence should be considered. To explore this possibility further, the art therapist instructs the family to engage in a mutual art task providing an arena for an enactment of the suspected behavior.

Often, the behavior seen by the therapist during a dual drawing demonstrates the diffusion of authority. The parent and teenager vie for attention. They may both draw or refuse to draw, grab for the same color pen, or the parent may defer to the directions given by the child rather than the therapist; these actions together with the messages conveyed in the art product, suggest that there is little adult functioning in this family.

After continued observation, an assessment is made of how the family patterns repeat themselves. If it is established that this is a family where both parent and child are developmentally in adolescence some strategic moves are necessary.

Setting Goals and Treatment

The first goal is to create within the parent an image of competency. This will enable the parent to face the normal trials of raising an adolescent. To accomplish this goal the therapy turns its focus on the parent and momentarily neglects the child and his/her symptoms. If necessary, the counselor invents strengths in the adult's character and, paradoxically, the adolescent will experience relief. Shifting the system will not be an easy achievement, since the family members, (both parent and child) are accustomed to supporting each other in an egalitarian position in the hierarchy. However, the parent gains satisfaction and approval from others by acting more in charge. They will continue to change, and thereby gain narcissistic rewards in an appropriate manner.

Unfortunately there often seems to be such a paucity of ego strength in these individuals, that the therapist must turn to a variety of techniques to achieve the treatment goals. Cloe Mandanes (1981) speaks of how she helps a client to play-act, or pretend, to behave in a proscribed manner. In this case a parent is coached how to pretend to be an efficient and effective adult. Following this experiment in effectiveness, the client will test if the child can perceive the difference between the farce and reality. The hope is to start a feedback loop where, as the parent "pretends" to provide structure for the family, a welcome release from stress will result. With the positive reinforcement of better family function, the behavior is likely to be retained and integrated as part of the "real" self. "Adolescent parents" feel less threatened if they are told that they only have to pretend to be grown up for the short period of their child's adolescence.

In the early stages of treatment, the therapist more openly attends to the parent while still supporting the teenager. The alliance is productive for several reasons: 1) when the therapist aligns with mother and/or father the process leads to the parentified or symptomatic child feeling less needed is free to be a teenager; 2) as freedom to be an adolescent is

“... the art therapist instructs the family to engage in a mutual art task providing an arena for an enactment of the suspected behavior.”
experienced by the youth the need for acting out behavior is reduced; 3) the child actively participates in art therapy but the main attention is deflected from him, thus age appropriate resistance is diminished; 4) it is more difficult to assist a developmentally-delayed adult through the growth process than aid the child who is doing a similar task on time. The results: as the art therapist helps the parent gain maturation, the teenager finds it possible to achieve a more appropriate relationship with the parent.

To further the attainment of individual art therapy productions are suggested which allow the client to observe past patterns of the family of origin and observe if they continue to function in the present. Seeing a parallel between past and present maladaptive relationships provides essential information which leads to the desired change. The therapist when reviewing old behaviors makes use of positive connotation, thereby creating a new reality and transforms present perceptions. By observing his or her problems represented in the art therapy, the client may develop and utilize an ego observer. The skill of monitoring one’s own behavior is one of the major tasks of adolescence, and an important step toward realizing the goal of maturation for the parent and child.

Brief Case Examples

Shamar, a Caucasian 13-year-old, entered treatment with her mother and younger brother, in spite of the fact that she did not feel she had any problems. She was getting satisfactory grades, she ran the family efficiently, directed her mother’s relationships, and parented her younger brother competently. In contrast to Shamar’s grandiose perceptions of herself, the mother, Joanne, was filled with anxieties. She tearfully admitted being unable to set rules, oppose her daughter, or enjoy her boyfriend, because Shamar did not approve. The parents were divorced for eight years; however, the father was very active in the family and intruded at will. Mother complained “he bosses me just as my daughter does.” In spite of the protestations of the teenager that she was an untroubled girl, her behavior belied her words. She prefaced every statement to her mother with the phrase, “now don’t be hurt,” “don’t cry Mother, but . . . .” She then was able to list all her frustrations. Her problems reflected the need for structure in the home, her ambivalence maintaining her overcontrolling role and her desire for relief from adult duties. As the therapy progressed the mother bootlegged many individual sessions, one pretext or another, in order to deal with her own issues. She dwelt on her abusive and critical relationship with her father, whom she feared to this day. She said she wanted to have better relationships with men, to get out from under her ex-husband’s rule and made other complaints that were obviously unfinished business from her own adolescence. Joanne was so fixated on her own needs that she had little time or desire left over for her children.

The therapist found the treatment was particularly difficult for the therapist since the suggestions made by the daughter were very sensible and the contributions from the mother were much less workable. However, it would be destructive to allow this complimentary relationship to continue, because no matter how well the girl performed adult duties she was neglecting her own development.

The family art therapy was very useful in achieving separation and counteracting family member’s enmeshment. The mother and daughter were artistic and were skillful in using the media. Each was able to see the other’s product and absorb both the overt and covert messages. Most importantly the art was often non-verbal, which avoided negative blaming, and provided a new problem-solving device. Joanne gained respect from Shamar when she began to teach art and hold a full-time job. The girl was more cooperative when she realized that the mother had a therapist (a grown-up) to lean on, rather than herself. There was a lively period of treatment when the mother in her own quest for autonomy was extremely distracted. This resulted in the daughter becoming insecure and striking out for attention by getting lower grades. This device succeeded in involving the mother, but in an authoritarian role, which was a positive surprise in this relationship.

As therapy progressed, it became apparent that Shamar’s mother was not going to quickly achieve the adult status that would be most desirable; therefore, the daughter’s contributions to the family were honored by the therapist. Shamar remains a junior partner in the family, a role she plays openly, with structure and limitations set, in the sessions, between the two of them. The young brother of six years, has been given some clear rules about who is the real mother and how much authority the sister has and may use. The chances that this threesome will ever make the ideal family constructed as our paradigm is extremely slim. However, the mother is now able to openly ask for individual sessions and articulate the

“In the early stages of treatment, the therapist more openly attends to the parent while still supporting the teenager.”

46 ART THERAPY, July, 1988
problems she wishes or needs to address. The daughter joins the sessions every third week where the focus changes to family problems. This is the beginning of a realignment of roles to allow both mother and teenager to begin the work of individuation.

Art Therapy Expressions: CASE 1

A brief sampling of the art work done by the mother and daughter discussed above dramatizes the difference in their personalities. The first two figures were drawn in response to the question: what are the family's problems? In Figure 1, Joanne drew a pair of clouds obscuring the sun and producing rain. She related that to their conflicts at home. In Figure 2, Shamar drew a picture of going shopping. The girl responded that she never got enough clothes from her mother and if she did they wouldn't fight. The contrast between the empty, minimal drawing of the mother and the concrete pragmatic statement of the daughter revealed their positions in the relationship. Figures 3, 4, and 5 are drawings done by Shamar on two different occasions while we were discussing the struggle over who would get the privacy of the one bedroom. Shamar first drew herself in pastels, a rather complimentary rendering. In the subsequent session, after some rules had been imposed, she gazed intently at her mother while drawing these two "portraits." She excused the red beard as an "accident" and thought the other woman was "happy." Joanne, a delicate and fragile woman with long, fine, straight hair did not resemble these renditions. However, the quality of anger and the aggressive affect portrayed was extremely confrontive and was shared by both daughter and mother.

Figure 6 shows Joanne's way of dealing with her feelings about her father; feelings which she felt were identical with her emotional state with her ex-husband. She felt burdened by his characteristics of false pride, guilt, conceptions of ugly sex,
her inability to live up to his expectations and, most of all, his violence. She boxed them up and buried them. She felt that the guilt experienced in her present life was derived from this past criticism. Some weeks later she drew a very insightful rendition of the difference between a "fuzzy parent" (on the left of the page) and an "adult parent" (on the right) (Figure 7). I quote her explanation: "the broken pink line means no boundaries, the blue cloud is a dream world that holds back the warmth from the heart, the growth is without roots, and the blue waves show turbulence of emotions. The right drawing has a firm base, calm emotions, growth reaching out and the dreams do not stand in the way of the warmth. The most important feature is the firm but open boundaries." The final drawing, Figure 8, indicates that the process of individuation and maturation is beginning to be realized. The words around a light bulb are: "forming new ideas about what I want from life, creating new relationships, some definite future plans, and a changing family life."

One important aspect of the art in this treatment is the information it supplied which assisted the art therapist in her ongoing assessment of the client's growth and development.

**Art Therapy Expressions: CASE II**

In the second session a hypothesis for treatment was formed by the art therapist, through drawings done by a Latino father and his twelve-year-old son. Over the last two years these two had lived together, went on Father's dates together, and moved together from one unstable living quarters to another. The father and son had the same name and borrowed clothing from each other. The boy's mother had retained custody of a younger sister, but had turned her husband out of the house because of Dad's immaturity and irresponsibility. Bob, Jr., had decided to go with his Dad.

The presenting complaint centered on the son's poor school performance. However, it was clear that Father did not respect the school's concern, but felt he was the one persecuted and humiliated when called to school to speak to the teachers. His distress was aimed at the school and not at the boy. He recalled how he was never successful at school and his father was never around to defend him. Figure 9 and Figure 10 were completed after the clients were asked to show how you
could help with the problem. The father drew a single horse whom he jokingly said was going to escape from the corral; the son suggested that they try to be more “thoughtful, honest, kind, helpful, understanding, and happy.”

Through these two drawings, we can see which person was more aware of the problem and who was going to run away as soon as possible. Treatment focused on helping a man who never grew up, maturate and appropriately support his son. The boy was encouraged to break away from the symbiosis with his father and gain an identity. There was progress until the father moved them away, as was his pattern. It was encouraging that enough change had been made that he followed through with a referral suggestion and continued treatment elsewhere.

Art Therapy Expressions: CASE III

This case was court referred: a black mother and son, the boy age thirteen. He had been taken from the home because of child neglect. The mother, Christi, claimed Jerry was intratably oppositional and never did anything she demanded. The divorced father was in jail because of drug dealing and was completely out of home or family contact. The boy wished to stay at home and said he wanted to learn to control his temper. It became apparent that mother was most interested in her excellent job and wanted Jerry to run the house for her, clean and cook. My perception of this case was that the mother and son acted-out in similar ways with physical violence which is often the behavior that masks adolescent depression. They both had their own forms of temper tantrums and they both ran away from the problems. They each handled the stress in an adolescent manner.

To test how well they could work together, a dual drawing was done. This colorful, solid drawing, Figure 11, gave them great satisfaction and provided them with a pleasurable experience. The empty interior of the house was not interpreted at this time. The tree leaning tenderly on the house and the stop sign were all discussed in length. A positive connotation was used in referring to all images in this significant drawing. The dyad of mother and son rallied strongly after this experience. Work was done with Mother on her parenting skills and a few individual sessions focused on her extremely immature fantasies about being rescued by a “wonderful” man. The termination drawings are presented.
Figure 12 lists Mother’s appraisal before and after therapy. Before, she was “ready to give up trying, also tired of herself and losing control and hitting.” She feels that now she is “happy with her attitude, has a lot of patience, can deal with most things, is no longer hitting and can show him her love.” These improvements were reinforced by the happiness of finding a very solid, successful man to marry, who’s son happened to be her boy’s best friend.

In Figure 13, the teenager pictured the mess his room was in before he came to therapy and himself crying as Mother berated him. Now after therapy he and his mother go horseback riding together. He claimed that these drawings indicated he felt they had moved from sorrow to pleasure. The minimal use of space and cramped imagery suggest a very careful and controlled, perhaps skeptical, expectation of the permanence of this change.

Summary

These three cases had a broad base of commonality. Although the families were widely spread in ethnic backgrounds, they shared similar histories in their extended families. In each case, and with countless more families seen in our outpatient clinic, the parent’s childhood was extremely deprived. Role models, nurturance, and acceptance of who they were as individuals were sadly lacking. These parents passed through the pubertal years without completing adolescent developmental tasks. In particular, the inability to identify appropriate persons of the opposite sex in which to engage in a long term relationship was a shared weakness. Because of their own identity confusions they became parents without a notion of what parenting entailed. They did not learn these skills during their children’s younger years as they were focused on their own unmet adolescent needs. When their children entered into adolescence they forced their parents to struggle with issues of narcissism, identity and autonomy, both within themselves and in their teenaged progeny.

Families attempting to survive these tumultuous times are helped by a family art therapist who is capable of setting realistic goals and adhering to a specialized treatment plan.

The combination of systemic theory and the art therapy modality has
... the inability to identify appropriate persons of the opposite sex in which to engage in a long term relationship was a shared weakness.

Letter to the Editor:

As usual, the Art Therapy journal continues to be well written and full of interesting and informative documentation of the effectiveness of art therapy with numerous populations.

The article in the October, 1987, issue “Creative Analysis Involving Multidisciplinary Evaluations of a Case Study,” by Edith Zierer, ATR, documents her work nicely. Nevertheless, I would suggest that articles written by her should also mention the use of involving the clients/patients in written problem statements. Oftentimes, the fact that the statements are written is overlooked in articles. Having studied under Edith for three years, and having also assisted her in some of her documentation for one summer, I probably should have picked up on this sooner. Why do I make such a request? Mainly, because my approach involves having clients utilize all their senses with the art therapy process, i.e., thinking and visualizing, drawing, writing, and reading aloud are combined with problem statements, free association, and projective imagery. Edith deserves credit for my incorporating written assignments. Also, the art of incorporating written assignments as part of art therapy [is sometimes] questioned and challenged [by others]. Of course, with some populations, statements cannot be written and the approach [must be] modified.

Thank you,

Pearl Spodick, ATR
Creative Process/Therapeutic Process: Parallels and Interfaces

Cathy A. Malchiodi, MA, ATR, Art Therapy Program, Department of Art, University of Utah, Salt Lake City, Utah. Mariagnese K. Cattaneo, PhD, ATR, Expressive Therapies Program, Institute of the Arts, Lesley College, Cambridge, MA.

This paper explores the similarities and connections between the creative process and the therapeutic process and their relationship to art therapy. Because of the nature of art therapy, the focus on the creative process is emphasized more so than in verbal therapies. Art therapists have constantly reexamined the relationship of creativity to therapy and have differing views on that relationship. Some believe the level of creativity is indicative of the degree of sublimation achieved; others connect creativity with the discovery of insights. Because creativity plays a central role in art therapy, it is a theoretical area that art therapists should continue to investigate.

In order to examine the exchange and interplay between the creative process and the therapeutic process, the authors will discuss their personal creative processes as visual artists. How each creates visual imagery will be related and paralleled to the role creativity plays in art therapy and the therapeutic process.

Introduction

There are numerous theories and definitions of creativity. A number of psychologists have written diverse and convergent opinions on the subject (Kris, 1952; Arieti, 1976; Rossman, 1931; Osborn, 1953, to name a few). Others (Lowenfeld, 1939; Read, 1940; Schaffer-Simmern, 1948) have made significant contributions to both the theory and practice of developing creativity in the arts. Florence Cane (1951) explored and outlined conditions she believed to be necessary for creative self-expression in visual art. Through the collective research of these investigators and others, the original concept of creativity, that of an elusive gift belonging to a special few, has undergone an important change. It is now seen as a capacity common to all people. Perhaps not everyone is capable of becoming an artist in the truest sense, but everyone can be creative in some way.

On some level creativity is involved in all therapeutic relationships. Because of the nature of art therapy, the expression and understanding of the self through visual art, the focus on the creative process is accentuated more so than in verbal therapies. As art therapists we are constantly reexamining the interrelation of the creative process with the therapeutic process and have developed divergent views on the dynamics of that interrelationship. Some art therapists believe that the quality of art production and the level of creativity indicates the degree of sublimation achieved (Kramer, 1971). Wadeson (1980) believes that creativity is involved in each art production, no matter how minimal the visual expression, and that important insights can be achieved and psychic changes can occur through the creative process within the therapeutic alliance.

Creativity not only plays an important part in the making of visual art, but is key to the development of a successful and productive therapeutic relationship with the client. Each therapeutic intervention and interaction is a creative act, one that arises from the art therapist's experiences not only with art and psychology, but also from personal experience with the creative process. Rubin (1982) points out that what many art therapists need is permission and support to use the creative parts of themselves in their work with others. Art therapists must understand that in order to be effective in therapeutic interventions they must learn to use their creativity in therapy. This applies not only to the understanding of the process of creative art-making, but also in how to tap inner creative resources to provide support and treatment to clientele. The therapist's creativity, as well as the client's, encompasses the entire art psychotherapy process (Wadeson, 1980).

The authors of this paper explore the possibilities for parallels and interfaces of creativity and therapy. Each has utilized her personal experiences with creating visual art as focus for making connections between creativity and therapy. How each approaches the creative process is paralleled with the role creativity plays in art therapy and the therapeutic process. Cattaneo examines the aspect of the creative process

"Creativity not only plays an important part in the making of visual art, but is key to the development of a therapeutic relationship with the client."
known as the encounter and its place in art therapy. Malchiodi discusses the concept of destruction as intrinsic to creativity and explores its possible connections with psychological reconstruction during the course of therapy.

Cattaneo:

The stages of the creative process and the therapeutic process are similar and interface with each other. As art therapists we have the capability to consciously use this interface for fostering self-awareness and psychological health in our clients.

Rollo May (1975) identifies a component of both the creative and therapeutic processes called the encounter. In both creativity and therapy there is encounter—the encounter with the vision, the issue, the obstacle, the core of the problem, etc. This encounter, however, cannot be forced. We cannot force ourselves or others to be creative. We cannot force ourselves or others to have insights. But we can give ourselves, we can commit ourselves to the encounter. Writer Alice Walker (1983) talks about one of her encounters in an essay “Writing The Color Purple”:

“I was hiking through the woods with my sister Ruth, talking about a lover’s triangle of which we both knew. She said, ‘And you know, one day the wife asked The Other Woman for a pair of drawers.’ Instantly the missing piece of the story I was mentally writing about — two women who felt married to the same man — fell into place.” Walker’s experience illustrates how during the encounter the unconscious breaks through opposition into the conscious mind.

Henri Poincare (1952), a French mathematician, describes an encounter resulting in a mathematical insight. He says the most striking aspect of the encounter, what he terms as illumination, was the suddenness and vividness of the illumination and that the insight came with certainty and brevity. He goes on to characterize this illumination by an intensity of awareness and heightened consciousness. The insight to some extent occurs in opposition to what one clings to consciously.

Poincare also states that the time before the encounter or illumination is important. Poincare describes this time before as a time of hard and conscious work and that time of rest and relaxation is very essential for the illumination. May (1975) says that to experience an insight from the unconscious we need to be able to give ourselves to solitude. May Sarton (p. 26, 1973) in “Journal of a Solitude” states, “It is never a waste of time to lie down and rest even for a couple of hours. It is then that images float up and then I plan my work.”

These authors share the view that after the encounter or illumination a second period of hard work follows. As a visual artist and art therapist, I have experienced many times the moment of the encounter, the time prior to it and the time after, both in

Fig. 1 “Forest Hanging I” by M. Cattaneo (1981); cheesecloth and acrylic, 61" × 90".
personal creative work and my work as a therapist. A particularly vivid experience I had with the moment of encounter occurred in the process of creating the work I call “Forest Hanging” (Figure 1).

As an artist, I mostly work with fibers and wood. I incorporate within my work environment both nature and natural light with all its variations. A few years ago I spent the summer in an artists’ community in the country. My intended project was to make a white, grey and black hanging in a size larger than I normally was used to working. I had prepared myself for this work, made a whole series of sketches and written an extensive proposal.

Prior to going to this artists’ community I was teaching in Switzerland. I was on my way back to the U.S., sitting in the plane and waiting to take off. Suddenly I got a very clear image of a very large and many-layered red hanging, hanging in the middle of the woods. There was no way I could overlook it. This moment of encounter with the image was so vivid that I can still feel the excitement of it.

During the seven hours of flight I started to draw, to make sketches of it. The image did not let go of me. Upon arrival in the U.S. I put the proposed plan aside and I never completed it. I started immediately working on the red hanging. It was a time of hard work and perseverance where the mastery of the craft was fully needed.

After more than a month of work I finished the piece. That evening I hung it on the wall of my loft. It not only filled the whole wall, but covered some of the floor as well. It was finally finished and it was exactly like the vision I had. I had already determined the place where it would hang in the forest and had set a date to show it there.

I began to realize that this piece of work only had a strong meaning as a piece of art, but also the image itself was asking me for a deeper understanding of its meaning. There was something in its presence that haunted me. It made me feel extremely uncomfortable and there was an urge to take it off the wall, even to destroy it.

I did not take it down or destroy it, but I started to intellectualize its meaning. I connected the hanging to my cultural heritage. It reflected the reclaiming of the tools and techniques I had once learned and despised. The cutting of the material and the mixing of the paint were like cooking, the dying of the pieces of cloth, dipping them into the paint and hanging them up were like washing clothes and hanging them on the line. I had also ironed the pieces and sewed them together, two additional tasks related to housekeeping.

That evening in my journal I wrote: “I see wash hanging on a clothesline in the sun, moved by the wind. How many pieces of laundry have women hung or laid out to dry? In school I learned to hang up laundry: never wear together with dish towels, all the pieces neatly grouped according to item, always keeping the visual aspect in mind and thinking ‘bout the neighbors. A chaotic washline would reveal a chaotic and bad housewife.”

Washing
Washwomen women washing theirs and other people’s clothes in the river
in the communal washhouses fed by spring water
the washhouses where the women of the villages met where they were with each other
sharing news gossips
laughing singing
crying
fighting

a place which was not for men.
Washwoman, a negative word for a woman who likes gossiping.
Washwoman during the French Revolution.
Washwoman, the lowest class of citizens the lowest servants
Washwomen washing white the stains of the rich.

With this work I show respect for the work women have done for centuries. It is a homage to what I despised for many years. It is a homage to the unknown woman, to the woman who silently did wash which was needed to be done, who lived and survived and died...

These intellectualized connections were at the time helpful. I did not destroy the piece, but I gained respect for it as a homage to women. I was able to hang the piece in the forest and show it to the public. The piece had gained a life of its own.

It was only sometime later that I found the courage to explore and leap into the unknown in the search of a deeper meaning. And as the image had come as an unexpected encounter, bypassing the original plan, so came the encounter with its meaning. In the end, it was the size, visibility and red color of the piece that stood out clearly. My work had previously been mostly white, small in size and subtle. They were pieces of art that one could overlook. This piece was clearly visible and the viewer was confronted with it. The piece had to do with my becoming visible and present, something that made me feel very uncomfortable, something that was not appropriate for a woman in my culture. The image had to do with becoming visible and the obstacles that got in the way.
as I moved in the world, as I presented myself to it, I had reached an inner readiness to bypass the intellectual explanation and go a step further in the search. My unconscious was able to break through in opposition to the conscious belief.

As art therapists we deal with the encounter twice in the art therapy process. The first is the encounter with the image, the second is the encounter with its meaning. We all know that a premature intellectualization of the image can lead to the wrong path or direction. Sometimes this is a dead end street or a detour. But we also know that clients often take or choose those detours because they are not ready for the encounter. This longer path might be needed as preparation for the encounter with the deeper meaning. It is here where the creativity of the art therapist, the art therapist's understanding of the creative and therapeutic process helps the client to avoid dead end streets and leads the client to the path that brings encounter and breakthrough.

As May (1975) said, we cannot force creativity, we cannot force each other to have insights, but we are committed to search and go the path that leads to the psychological readiness for the encounter and insight.

**Malchiodi:**

Pablo Picasso once remarked that every act of creation is first of all an act of destruction. Rollo May (1975) characterizes the breakthrough of creative insights in a similar fashion. He has stated that when a creative insight occurs it breaks through into your consciousness against what you have been trying to think rationally. It breaks through in opposition to the conscious belief to which you have been clinging. In the process it may destroy what you previously believed to be true. According to May (1985), "In all creativity, we destroy and rebuild the world, and at the same time we inevitably rebuild and reform ourselves."

![Fig. 2 “Vessel” by C. Malchiodi (1987); collage and pencil, 12” × 16”](image)

![Fig. 3 “An Angry Fear” (1987); collage and pencil, 12” × 16”](image)

Elliot Eisner (1966) defined creativity in terms of an act of destruction he called boundary breaking. Boundary breaking is described by Eisner as the rejection of accepted assumptions. The individual recognizes limitations in present ways of thinking or ways of looking at things and proceeds to develop new premises. In the process old beliefs are destroyed to allow for new ideas to emerge.

As an art therapist and a visual artist, I have observed in my work with clients and in my own art process the act of destruction as a component of creativity. I have also witnessed in my clients and myself how this element of destruction can be the beginning of therapeutic reconstruction and integration. A powerful experience with the act of destruction occurred recently in a series of collage/mixed media pieces I created called “Continuum” (Figures 2-7).

As a theme for this series, I chose a basket I had woven many years before while spending a summer in the Sierra Nevada mountains of California. The basket suddenly seemed to hold a renewed attraction for me in terms of its soft, subtle colors and cylindrical shape. Because it was created from wool and alpaca, it could be molded into various shapes and forms, something I had not considered until this time.

At the time I was working with photos and xeroxed images, combining them with drawing and painting. I decided to xerox a couple of dozen images of the basket, each resulting in a slightly different image because of the way the basket could be molded and shaped on the copier. I then took these images and began to spontaneously tear them into smaller components until I had reduced each one into forms unrecognizable as the original basket.

I began to work with the shapes that had emerged from my destruction. At first I became frustrated, wondering to myself if there was any hope of really working with these shapes in some productive way. Then I began to manipulate, play, rework and reconstruct the shapes. I even continued to tear the pieces while I moved about the chaos of shapes I had created, absorbed in the process and the intrigue of these unknown images.

Hours passed by unnoticed. Visual imagery began to emerge and...
Each image I created seemed more powerful than the next. Each one also seemed to encourage the next one to come forth. Each took on a distinct personality even though it was formed out of components from the same image. The sequence appeared to have a connection, to be part of a continuum, to have aspects that related to each other in some way.

When I finished the final image (Figure 7), I felt a sense of relief and completion. I felt as though it took the place of the original image, the basket, in some sense. But an understanding of the forms themselves was not within my reach, only the sense of comfort and peace.

It was many months before I would fully understand the meaning of the series. I was halfway around the world when the answers began to emerge. I was in Beijing, in a stone courtyard of a school at which I was teaching. It was the time of the midday meal and the cooks were busy in the cookhouse preparing food for the teachers and students. Each day the cooks brought out a wooden cart into the center of the courtyard. In this cart were several large baskets filled with freshly baked bread, covered with cloths to keep the bread warm until mealtime. We would file past the cart, each taking a piece of steaming bread from the baskets.

In my journal that night I wrote, among other things, about my impressions of the cooks and the baskets of bread. I noted how the cooks waited as we passed by, looking to us for acceptance of what they had to offer us in their baskets that day. Cooks who never spoke, only waited for reaction to what their baskets held today. I also wrote about the baskets—a symbol of nurturance, receptivity, openness, acceptance. They are silent vessels, objects to be filled and emptied, perfectly formed, yet vulnerable.

When I arrived back home I began to make clearer connections between my basket image and those that I saw in Beijing. My destruction of my basket and its reconstruction into new forms revealed more fully some turmoil I had been experiencing in my own life in recent months. In an attempt to deal with the situation instead of confronting it head on, I had remained silent and worked harder, feeling that if I were perfect that I would be safe. I became an overachiever in reaction to my situation, to compensate for the loss of self-esteem I was experiencing. I filled my own personal vessel (the basket) with pain, confusion, frustration and self-doubt.

The act of destroying the basket image was my first step toward liberation and separation. The images that resulted from the chaos of the destruction represented steps to un-

"We tend to view destruction as a negative action when indeed it is often a necessary prelude to reconstruction and creation."
angry, but simultaneously fearful of the consequences of revealing my feelings. “Guardian” (Figure 5) became an inner resource to me, a benevolent watchful being within myself who possessed a quiet strength and was accepted for who she was. The final piece of the series, “Transcendence” (Figure 7), represented exhilaration and wholeness, a feeling of clearer understanding, integration as well as separation of myself from an unhealthy situation. In retrospect, the entire series incorporated powerful aspects of my inner experience—the fear, the frustration, the anger, the vulnerability, the inner resources, the separation, and, ultimately, the understanding.

There are some interesting parallels related to this theme of destruction in both the creative process and therapeutic process. We tend to view destruction as a negative action when indeed it is often a necessary prelude to reconstruction and creation. In therapy, a client often may have to destroy old belief systems in order to experience growth just as an artist may destroy old forms in order to construct new, more creative ones. In my case, destruction of an old form brought such results; in my visual work, I was able to realize new imagery and in my psyche, new understanding and self-awareness.

In the examination of my own personal process as a visual artist, I also have observed two components characteristic of the destruction/creation process—insight and imagination. Insight, of course, is an important aspect of therapy. As an art therapist, one hopes to enable the client through visual expression to achieve insights about oneself and one's world. Such insights may include discoveries about behavior, motivations, fantasy and the unconscious. In comparison, in the making of visual art, insight can also be utilized to reconstruct new forms from that which has been destroyed.

Along with insight a second component may also come into play—that of imagination. According to May (1975), imagination involves the ability to consider diverse possibilities, to be able to take chances and risks and dispose of old ideas. Thus imagination may help the individual to generate new ideas out of those discarded or destroyed. Imagination is an important tool in the process of art therapy in which the individual may be able to reorganize or alter accepted thought patterns and perspectives through visual modalities. In my own situation, my imagining new forms from the old ones led not only to the creation of new images, but also the emergence of new perceptions and self-understanding.

Conclusion

There are several important parallels and connections between the creative process and the therapeutic process to consider. The image in both the artist's studio and the art therapy session may come as an unexpected encounter and its meaning may not be immediately apparent. This observation by both authors needs further exploration and raises questions about the time factor required to achieve insights about images during therapy. The encounter with the creativity and the encounter with meaning seem to be separate events connected by an internal process variable in the dimension of time. Immediate meaning is often not apparent and can be misinterpreted, a possible delay to progress and growth.

As a component of creativity, destruction of old images can be key to new ones emerging. The element of destruction can exist in the creative process when old forms are destroyed and new ones result from the chaos. In therapy, this destruction can be essential to creating new understanding and awareness. It is an aspect of art therapy which should be given closer examination because of the power of visual destruction and visual reconstruction.
“Imagination is an important tool in the process of art therapy in which the individual may be able to reorganize or alter accepted thought patterns and perspectives through visual modalities.”

of perspectives, perceptions and emotions. It is this as well as the encounter with process and meaning which closely connect creativity and therapy. It is obvious that the use of the art process in therapy enhances this connection by providing a visible channel for the encounter, the insight and the reconstruction.

Master’s Degree Programs in Expressive Therapies and in Creative Arts in Learning

Offered by the Institute for the Arts and Human Development
Lesley College Graduate School

Master of Arts in Expressive Therapies
For students interested in the creative modalities of art, music, dance/movement, and drama, presented in a clinical and theoretical framework for a variety of settings.

Master of Education in Creative Arts in Learning
For students who wish to learn how to integrate the arts for careers in schools, cultural institutions, and human services institutions. Specializations in storytelling and theater studies.

For more information call or write the Institute for the Arts and Human Development, Lesley College Graduate School, 29 Everett Street, Cambridge, MA 02138-2790. (617) 868-9600, ext. 480.

58 ART THERAPY, July, 1988
Art Therapy Assessment of Coping Styles in Severe Asthmatics

Robin Knight Gabriels, MA, ATR, National Jewish Center for Immunology and Respiratory Medicine, Denver, CO.

"Art Therapy Assessment of Coping Styles in Severe Asthmatics" presents a definition of asthma as a psychophysilogic disorder, and provides an introduction to an art therapy technique designed to assess the perceptions asthmatic children have of their illness, and their coping styles.

Four cases are briefly presented demonstrating how this procedure can enhance treatment and highlight psychological factors pertinent to this population.

A comparison of the coping styles and grieving stages is made between terminally ill and chronically ill patients. Other issues specific to asthmatic children are identified in order to compare patients' coping styles.

In conclusion, the use of art therapy is presented as a means of identifying ability to cope with illness in a pediatric asthmatic population. Art therapy can have certain advantages over more traditional therapeutic modalities in this situation.

Introduction

The patients presented in this article were treated on the Pediatric Psychophysilogic Unit at National Jewish Center for Immunology and Respiratory Medicine which is a 24-bed, medical/psychiatric unit where hospitalization averages about three months. Intensive psychologic and family treatment is provided for children ages seven to seventeen. The patients on this unit primarily have asthma or, in some cases other chronic diseases, accompanied by significant psychosocial problems.

The term psychophysilogic refers to disorders in which there is a significant interaction between physiologic and psychologic components in the clinical picture, with varying degrees of weighing of each component. (Prugh, 1983, p. 337)

It is important when working with these children to have an understanding of asthma and its pathophysiology. During an asthma attack, the small airways of the lungs, or bronchioles, become obstructed by bronchospasms. The muscles around the bronchioles squeeze these tubes so that there is minimal airflow allowed through them. Simultaneously, an increase in production of mucus within the bronchi causes the lining of the tubes to get puffy. The result is a decrease in the amount of airflow in and out of the lungs brought about by an "increased responsiveness of the trachea and bronchi to various stimuli" (Mrazek, 1985, p. 17). In most cases, asthma is controlled by a variety of classes of medications. Unfortunately, many have noxious or uncomfortable side effects.

Most of the patients on the Psychophysilogic Unit are regarded by the clinicians and researchers as "high-risk" asthmatics (Strunk, 1985). This means that they have significant medical, psychologial and psychosocial problems which are associated with a greater risk of death from their asthma.

Mathis (1981), in his article, discusses three ways in which psychological factors can affect the course of asthma. Emotional factors can precipitate an acute asthma attack, can exacerbate pre-existing asthma, and can impede preventative home care. Psychological stimuli which may precipitate asthma include emotional reactivity to excitement or stress, anxiety, fear, laughter, crying, expressed or suppressed anger and resentment. Conversely, changes in respiration can stimulate emotional reactions. For example, a child may become fearful and panic when experiencing a change in respiration; this, in turn, may heighten or exacerbate the respiratory change. Mathis also identifies the ways psychological factors directly influence asthma management. Illness may come to serve many of the child's unmet needs for parental nurturance. The illness may also serve unconscious needs of others. For example, parents may focus their total attention and energy on the child's illness to avoid dealing with their own marital problems. Medical noncompliance, the failure of the asthmatic child and/or parents to take preventive steps to decrease the risk of an attack, is also in this category. Noncompliance may be a result of psychological conflict, resistance to authority, unconscious death wishes, maladaptive coping styles, poorly developed self-care habits, or conflicting values (Mathis, 1981).

The Technique and Rationale

Many of the patients on the pediatric psychophysilogic unit have a
great deal of difficulty verbalizing their feelings, both generally and specifically concerning illness. They also have difficulties revealing their serious psychosocial problems which often contribute to a deterioration of their asthma when they are in the home environment. For these reasons these patients are referred to art therapy for further evaluation and treatment. There are no standard tests or assessment procedures currently utilized at the hospital which deal specifically with assessing how children cope with and perceive their asthma. The art therapy diagnostic technique introduced in this article was designed to address this problem.

Patients are seen in individual art therapy and are instructed to draw three pictures about their asthma. They can choose from a variety of art materials (paint markers, crayons, chalk, and colored pencils). In the first picture, they are asked to depict what it feels like to have an asthma attack or wheeze. Next, they are asked to draw a "helpful/good" environment, either real or imaginary, in which they would not have to worry about having asthma attacks. Finally, they are asked to depict a "harmful/bad" environment, either real or imaginary, in which they would be plagued by asthma attacks. Following each task, they are encouraged in a helpful and non-threatening way to discuss their pictures. Patient reactions to these tasks are often enlightening and reveal many of their fears, concerns, psychological and psychosocial problems. These pictures are then utilized to improve coping skills by: 1) increasing the patients’ awareness of their feelings and concerns related to their asthma; 2) making them more aware of their illness and its impact on their lives; and 3) teaching appropriate self-care and illness management techniques.

The following case examples describe the application of the technique and its usefulness in revealing the perceptions the children have of their illness and what they view as helpful and harmful.

CASE I

Carl was a 7-year old male, admitted a second time to National Jewish Center. During his first admission, he was found to have a severe psychological component to his asthma. This was evidenced by his increased wheezing as discharge from the hospital approached, which was especially intense during his mother’s week-long stay prior to discharge.

Carl, his mother, and his four older siblings were abused by Carl’s father. Carl’s mother was unable to protect him from physical harm. In addition, Carl’s father did not support medical treatment, but insisted on an organic, natural food approach to treat Carl’s asthma. Conflicts between the parents led to their inattention to his medical and psychological needs and interfered with his receiving help when he experienced problems with his asthma. Carl was very reactive to this stress that occurred within his family.

Following Carl’s first admission, he was put in a foster home for one and a half years where he did well and was responsive to structure and limit setting. During this placement, Carl’s mother divorced her husband and was given custody of Carl’s four older siblings. Carl then returned to live with his mother, siblings, and mother’s new boyfriend. Almost immediately following his return, Carl began having problems with his asthma which led to several re-hospitalizations and a respiratory arrest. Carl’s mother initiated the second hospitalization to National Jewish Center because of her fears of Carl’s worsening asthma and her difficulties controlling his illness.

Fig. 1

Carl’s return to the family had heightened his anxieties and indicated that further therapy would be necessary to facilitate a better transition home. It was also identified that Carl’s medical problems were exacerbated by his mothers’ inability to properly judge and manage the severity of his illness.

Carl was referred to art therapy to help him modulate and express his feelings and anxieties. Carl was asked to complete the asthma pictures during one of his initial individual art therapy sessions. In his first picture (Figure 1), he described what it was like for him to have an asthma attack by drawing his shoulders “hunched up.” He drew question marks to indicate his feeling of not knowing what to do when he had an asthma attack. This picture encouraged him to talk about a past asthma attack when he was alone at home and began to wheeze.

Carl related having feelings of fear and discomfort during that time.

In Carl’s second picture of a good environment (Figure 2), he depicted himself standing in a large house
with “lots of open spaces” so he could breathe. He stated that in his picture, his mother was at the store, but that he would not have to worry about anyone else caring or not caring for him because he would know how to take care of himself. Carl’s comments about his picture reflected his mistrust of caretakers and of their ability to care for him. Carl had the unrealistic expectation that he could take full responsibility for his self-care at the age of seven.

Last, Carl depicted a bad environment (Figure 3). In this picture, he drew himself (right) and his mother (left) trapped in a vault-like place where there were no windows, no doors, and no air. He stated that his mother was happy but that he was very scared and sad. Carl was unable to discuss this picture further, and reacted to the powerful content of this drawing by regressing to finger paint. This picture reflected Carl’s perception of his mother’s inability to identify or manage his asthma.

As therapy progressed, Carl was more successful at tolerating affective experiences, at using art to vent angry feelings related to his environmental changes, and at identifying issues that caused him much anxiety. Carl also was better able to recognize and accept that other adults could help him with his self-care.

CASE II

Jamie was a 15-year-old, steroid-dependent, asthmatic girl. She was referred to the unit with a primary complaint of moderate to severe asthma which was becoming increasingly difficult to control. The referring doctor and her parents both suspected that emotional factors, including Jamie’s oppositional behavior and stress within the home, were exacerbating her asthma. There was a concern that Jamie was frequently noncompliant with her medical regimen and was inconsistent in her self-care. Jamie was also allergic to most pets, yet there were two dogs, a cat and a ferret in the home.

The parents’ lack of understanding of Jamie’s asthma was problematic. Jamie’s mother tended to overprotect her. Yet she was adamant about keeping pets in the home despite Jamie’s severe allergy to animals, causing exacerbation of her asthma. Jamie’s father also did not take Jamie’s asthma seriously, and was not protective enough of Jamie.

Further, Jamie had significant difficulties individuating from her parents, taking responsibility for her own self-care, and maintaining a stable sense of herself. She refused to take her medications in order to get her parents to do things for her. Her oppositional behavior, particularly medical noncompliance, put her at risk of dying from her asthma.

Jamie was referred to art therapy for further assessment and treatment of: 1) poor self-image; 2) poor understanding of the significance of her asthma; and 3) intense ambivalence about individuating from her parents. Jamie was willing to complete the “asthma” pictures. However, her verbal descriptions of these pictures were minimal and lacked emotion. In her first picture (Figure 4), she drew herself trapped under water and unable to breathe. This picture revealed much more of Jamie’s anxiety, pain, and fear about her asthma than she was able to verbalize.

“Patient reactions to these tasks are often enlightening and reveal many of their fears, concerns, psychological and psychosocial problems.”
Jamie depicted a good environment for her asthma (Figure 5) where she was protected from harmful environmental asthma triggers by living in a balloon. She drew herself in a balloon with someone else holding the balloon. It was significant that she presented herself as helpless, relinquishing the responsibilities for her asthma self-care to someone else. In addition, the picture reflected her anxieties of separation from caretakers, fearing that she may be unable to care for herself and her asthma.

In her third picture, Jamie represented a bad environment (Figure 6) by drawing herself alone on a hill surrounded by asthma triggers: grasses, humidity, and emotions. She stated that in the picture, she was holding a snake which caused her to feel anxious, and this exacerbated her asthma. The picture again reflected her feelings of anxiety related to being left alone to care for herself and her asthma, and her fear that she would be unable to do this. Additionally, Jamie's figure drawings in all three pictures appeared to be of neuter gender which reflected a tenuous self image.

These pictures were used therapeutically to help Jamie become conscious of her anxieties and fears associated with her asthma self-care. These pictures were also shared with Jamie's father in order to: 1) make him more sensitive to Jamie's anxieties about her asthma; 2) encourage him to begin to take Jamie's asthma more seriously; and 3) take interest in helping Jamie make appropriate self-care decisions.

CASE III

Mike was a 13-year old male referred to the unit for evaluation due to concerns about the effects of family stress on his asthma and his medical noncompliance. Mike was the only child remaining at home after his 21-year old brother and 19-year old sister moved out to attend college.

Mike developed asthma at the age of 11 and the following year experienced a respiratory arrest and hypoxic seizure. Approximately six months after Mike's diagnosis, his mother was diagnosed as having asthma, and required several hospitalizations and emergency room visits. During the two years prior to Mike's diagnosis of asthma, the family experienced a number of stresses. Both parents worked and Mike's father had experienced increased stress in his job, requiring him to work longer hours. In addition, Mike's mother had begun a second business. Mike's mother also reported increased marital difficulties characterized by her husband's drinking, anger, and increased time away from home. It was also difficult for the family to handle the emancipation of their two older children. Mike's parents appeared to have limited coping skills in handling the stresses and responded by withdrawing, avoiding activities, and drinking. These unresolved issues seemed to have interfered with their providing mutual support and effective parenting for Mike.

Further, Mike's parents did not provide adequate supervision of his asthma and expected Mike to take almost total responsibility for his asthma care. Mike had reported being afraid to tell his parents when he was having trouble with his asthma. He perceived that they would not know how to respond because of their emotional reactions (e.g., fearing that his father would become anxious and his mother would have an asthma attack).

Mike had experienced social and academic difficulties and related depressive symptoms which appeared to have been a consequence of his emotional difficulties accepting his asthma.

Mike was referred to art therapy to evaluate his self-image and methods of coping with his asthma. Mike willingly completed the asthma pictures, but spent an excessive amount of time drawing the details in his pictures. He made statements about feeling that everything had to be drawn perfectly. This reflected his very compulsive and perfectionistic
style as well as an extreme concern about what others think.

In Mike's first picture (Figure 7) he drew himself helplessly tied up and standing on a "treadmill going nowhere." He explained that the tight bonds constricted his ability to move and breathe. This, he said, was similar to how it felt to have an asthma attack. Mike stated that in this picture no one understood or wanted to help him, including doctors and family members, so he would inevitably drop into the tunnel. The "tunnel to nowhere" may have been a metaphor for dying, but Mike could not acknowledge this. This picture and his verbal explanations clearly reflected a sense of hopelessness, helplessness and depression. Mike's perception of himself as a doomed victim was also suggested.

Mike's second picture about a good environment (Figure 8) was also worrisome. He drew himself huddled in the corner of an empty room with his only comfort being a lantern. Mike stated that in this picture he was in a room devoid of asthma and allergy triggers, and away from people and stress. He expressed his wish to be in total control of his asthma management, so he would not have to rely on others. The emptiness of the picture reflected a sense of isolation and perhaps depression. His comments of wanting to care for his asthma by himself and to withdraw from people suggested his inability to allow others to help. This perception may have been related to the fact that his parents had difficulties helping Mike appropriately care for his asthma.

Mike's last picture (Figure 9) of a bad environment also suggested a theme of mistrust of others. Mike explained that the eyes in his picture represented people hiding behind a "wall of bushes." He added that these people did not understand him or his asthma, they were not to be trusted, and they were trying to figure him out. Mike stated that in this picture he was alone, out in the open, and on "unstable ground." This was perhaps suggestive of his own feelings of vulnerability and mistrust of the therapist as well as others. Mike stated that the treadmill from the first picture (Figure 7) was "looming in the distance." (left hand side of this picture) and represented for the impending doom of his having another asthma attack. Again, Mike's perception of himself as a vulnerable, helpless victim was clearly portrayed. Also represented was the paranoid ideation that people were out to harm him, and not to be trusted.

These pictures were helpful in identifying Mike's perceptions of himself as a helpless victim who had asthma and his extreme mistrust of the ability of others to help him. The art therapist informed the multidisciplinary treatment team of Mike's perceptions. This helped the team
members to determine appropriate ways to work with Mike as well as to set appropriate self-care goals for him. Progress was made in helping Mike to learn how to care for his asthma, and he began to feel more confident and less helpless in his asthma management. In addition, while in art therapy, Mike began to feel more comfortable trusting in a therapeutic relationship when he experienced having someone else understand his asthma-related fears.

CASE IV

Dana was a 16-year old female who had multiple hospitalizations for her severe asthma. Her asthma was poorly controlled, and she suffered life-threatening attacks despite maximal medical management. Dana was extremely achievement oriented and perfectionistic. She relied heavily on intellectualization, and she had a strong need for control.

Dana was referred to art therapy to assess her use of this media in helping her cope with her anxieties associated with her severe illness. Dana was initially hesitant about completing the asthma pictures because she said she was so tired of doctors and nurses always asking her to explain her asthma symptoms in detail. Dana was finally willing to do the asthma pictures when it was presented to her as a means of explaining her opinions and feelings about her illness.

Dana explained in her first picture (Figure 10) what it felt like to have an asthma attack. She drew her lungs being “squeezed by a monster’s hands.” She explained that the monster was her asthma, and that it was so big because it was impossible to understand or control. It was pointed out to Dana that she had drawn her lungs so big that the rest of her body could not be included. Dana stated that she felt like just “a pair of lungs walking around” and that she was nothing because her lungs were the only part of her that received attention from people. This picture, and Dana’s comments, reflected Dana’s feelings of emptiness, powerlessness, and helplessness over her asthma. This picture, and Dana’s comments, also reflected identity problems. Her asthma overshadowed any possibility for her to establish a sense of herself beyond being a severe asthmatic. There was a real hopelessness about her perception of her asthma as a monster, that could not even be fully imagined or controlled.

Dana’s drawing of a “good” environment for her asthma (Figure 11) was of herself living underwater with fish. She commented that fish were lucky because they “never had to breathe,” they could just get air from their gills without effort. Dana stated that she would like to have gills so she would not have to work to breathe. Her picture reflected a retreat from people rather than viewing them as helpful. Her comments about not wanting to work to breathe suggested depression and
perhaps a wish not to live with her asthma.

In Dana's final picture of a bad environment (Figure 12), she depicted herself as extremely small and standing inside a gigantic cigarette box. There was a lighted match which "is about to light the cigarettes." Cigarette smoke had, in the past, triggered life-threatening asthma attacks. Themes of impending doom, depression, and hopelessness were clearly identifiable in this picture and in her verbal descriptions. The gigantic cigarettes and lighted match reflected much anxiety. Her facial features in the drawing did not portray any particular emotion such as distress or fear which suggested her own feelings of apathy regarding her will to live.

Dana had a very difficult time tolerating any further discussion of these pictures after she finished them. She was eager to end the session which indicated her anxiety revealing her depressed and hopeless feelings.

Dana's work in art therapy focused on her gaining a sense of mastery and control over the art work itself, and, at the same time, working with potentially frustrating and less controllable materials such as finger paint. As therapy progressed, she began to make pictures of comfortable environments in which to relax, but also made provisions for her illness self-care. This was much more realistic and reflected more acceptance of her illness than her original drawing (Figure 11).

Discussion

Several themes were identified by the technique introduced in this article. In general, these children expressed an overwhelming sense of helplessness and lack of control over their illness, feelings of fear and anxiety associated with their illness, and passivity in dealing with their illness. Recurrent themes specific to asthma were feelings of being suffocated, squeezed, trapped and vulnerable.

For the purpose of identifying various coping styles, it is helpful to look at the grieving stages identified by Elizabeth Kubler-Ross in her book, On Death and Dying. Kubler-Ross (1969) noted five stages of grieving in the terminally ill: denial, anger, bargaining, depression, and acceptance. These stages of grief are also observed in the coping styles of chronically-ill asthmatic patients. Asthmatic children must cope with a
life of chronic illness. Severe asthmatics must also face the possibility of death. Children who deny the severity of their illness may purposely refuse or forget to take vital medications, or they may continuously expose themselves to harmful allergens. This was true in Cases I, II, and III. Another example is the children who are seriously depressed about having asthma. They may become suicidal and act this out, either by taking an excess of medications or by not taking their medications at all.

Specifically, among the four cases discussed in this article, depression was a common manner of coping that was clearly revealed through the patients' drawings and comments. In every case, the patients presented themselves as helpless and overpowered by their illness. Their depression incapacitated their abilities to successfully manage their asthma.

Closely related to depressive themes, though not referenced in the cases presented, was a sense of helplessness, of giving up, and a wish to die which was indicated in other patients' drawings about their asthma. Figures 13 and 14 were both drawn by a 14-year old, suicidal male patient in response to tasks one and two of the technique. This patient described wheezing in Figure 13 as feeling like he was choking and going to die. Figure 14 was a picture of "heaven," which was identified as the only helpful, good place for him and his asthma. He exhibited his severe depression and suicidal ideations by drawing himself with a noose around his neck (Figure 13) and depicting "heaven" as a place where he wanted to be.

Children who are extremely angry at the idea of having to live with and adjust to their illness may react like those who deny their illness. They may avoid taking vital medications and expose themselves to harmful allergens. This is extremely self-destructive because it puts them at risk for having severe asthma attacks. Figure 15 was a drawing done by a 14-year old, male patient who was extremely angry at having asthma. In this picture, he aggressively...

"... stages of grief are also observed in the coping styles of chronically-ill asthmatic patients."
scrawled over his drawing of himself. This self-destruction in his picture was reflective of his self-destructive behaviors at home of not taking his asthma medications.

The stage of bargaining has not been identified in severe asthmatic children. This is perhaps due to the fact that these patients still maintain some level of control over the course of their illness versus terminally ill patients.

Acceptance of illness was clearly demonstrated in Figure 16, drawn by a 12-year-old male. In this picture, the patient attempted to depict a good environment for himself and asthma. This patient shared that he enjoyed diving because this was something he could do well. He also added that swimming helped him to relax when he wheezed. The child's picture and comments reflected his ability to maintain a positive sense of himself despite his illness, and not allow his asthma to incapacitate him.

In order to assess children's coping styles using the technique introduced in this article, the therapist must go through a series of steps. First, the therapist needs to examine all of the elements including art work, verbal associations, and psychological and medical history in order to make appropriate conclusions about patients' coping styles. Second, the therapist needs to consider several general issues regarding coping abilities and determine how they are expressed in the patient's art work and comments. These issues include: 1) self-esteem and body-image; 2) adequate self-care knowledge; 3) compliance with medical treatment; 4) ability to function reasonably well despite illness; and 5) ability to express affect.

It is important that the therapist notes what children depict as harmful to themselves and their illness, such as unhelpful people and environmental and emotional triggers. This may provide further information about children's perceptions of their home environment.

Art therapy has proven to be an effective medium, complementary and sometimes supplementary, to more traditional modes of therapy. Art therapy allows verbally defended children and adolescents to reveal serious concerns and problems unconsciously through their drawings, which can then help to focus the therapeutic process.

Art is a less customary communicative vehicle for most people, and therefore is less amenable to control. Unexpected things may burst forth in a picture or sculpture, sometimes totally contrary to the intention of its creator... Unexpected recognition often forms the leading edge of insight, learning, and growth. (Wadeson, 1980, p. 10)

Many of the patients on the Psychophysiological Unit have great difficulty expressing affect. They express themselves maladaptively through somatization and/or through harming themselves or others. Art therapy provides an appropriate outlet for these patients to express and vent their feelings, some of which include: intense fear, anger, lack of control, aggressive impulses, and depression. "The art object allows the individual, while separating from the feelings, to recognize their existence. If all goes well, the feelings become owned and integrated as a part of the self." (Wadeson, 1980, p. 10)

When patients utilize a great deal of denial, art therapy has particular value. The pictures or sculptures done in art therapy provide a perma-
Art therapy has proven to be an effective medium, complementary and sometimes supplementary, to more traditional modes of therapy."

The technique presented in this article facilitates patients' abilities to express feelings about chronic illness and its effect on their lives. The art work allows patients to distance themselves from painful affect, giving them a chance, metaphorically, to separate themselves from their illness, "... the painted image can cope with the expression of the infinite and the oblique in ways that language cannot." (Dalley, 1984, p. 132)

This technique has only been used with asthmatic children and adolescents, ages 7 to 17, but may be of benefit to adults. This technique could be modified to be used with patients who have other chronic illnesses.

Further research is needed to make this art therapy technique a more standardized measurement of coping with chronic illness. At present, work is proceeding to develop a system of objective, standardized scoring for this technique.

August Walla

Reviewed by: Roland Fischer, PhD, University of Basel, Switzerland, was formerly a research professor with the Department of Psychiatry of The Ohio State University, and a researcher at The Maryland Psychiatric Research Center. Honorary member of the Biofeedback Society of America, and the International Society for Psychopathology and Artistic Expression (including the German-speaking Society for Psychopathology and Artistic Expression). His bio-philosophical papers are translated and published in English, French, Spanish, Japanese and Arabic.

After Pinel, who (1795) in Paris initiated the liberation of the mentally ill—by removing the chains from his asylum inmates—Prinzhorn (named Prinz Wunderhorn in Hermann Hesse’s Steppenwolf), in 1922, added a revolutionary momentum to the process of liberation by publishing his Artistry of the Mentally Ill, comparing the bizarre works of the patients with the art objects of children and aboriginals. Most shockingly, striking parallels were shown between the art of mental patients and the art of the avant garde of the day, the German Expressionists. But the selective rehabilitation of the gifted but unrecognized artist among mental patients, that is, the rehabilitation of such patients qua artists, was left to Leo Navratil, Austrian psychiatrist (MD, and PhD), who devoted his entire professional life (1959-1986) to this task in the State Hospital for Psychiatry and Neurology at Klosterneuburg-Gugging, near Vienna. In 1981 Navratil could (literally) see the culmination of his career, his Magnum Opus, the House of Artists, a two-storey building on the premises of the Hospital, adjacent to a forest, a pavilion with studios for those creative patients who are at work with their rehabilitation as painters and writers. August Walla is one of them, attested by the 300 fantastic (mostly colored) illustrations of Navratil’s monograph under review. Although the text is in German, the illustrations speak for themselves, and do so in all languages. Walla, diagnosed as schizophrenic from his early youth on, signs and sells his most original and decorative paintings, which are unburdened from the constraints of conventional art. Accordingly, Walla does not consider himself an artist (“I paint only to please him”—i.e. Navratil), he asserts. Nevertheless, this artist malgre lui is eager to treat himself through art. This kind of art therapy is an iconic reshuffling of one’s autobiogra-phy, a pictorial process of cognitive self-organization. It may be considered as a creative state that proceeds on a level of arousal that is intermediate between the low arousal level of daily routine and that of schizophrenic hyperarousal. Creativity, in this sense, is another spontaneously organizing process that can also be observed in atoms, molecules, biological cells, organisms and societies; it operates in games and governs the circulation of money, the formation of words from letters, and the creation of galaxies from clusters of nebulae.

But what is a work of art? It’s both a “narrative home” and a symptom of the human condition (in the Freudian sense), epitomizing the unity of the psyche’s four poles: the wish and its Superego, the Ego and its Reality. Hence we may ask the (therapeutic) question: What kind of an artist is induced by the work of art? Anne Lister (1791-1840) in her diary replies: “I generally feel relief from unburdening my mind on paper.” But a work of art is also “an object that is produced by an artist as an embodiment of his emotions or feelings and evokes those emotions and feelings in an observer of the object” (Tolstoy, 1896). “Significant form” on the other hand is the one quality common to all works of visual art, posits Bell (1913), whereas Dickie (1974) contends that an object is a work of art if and only if some member of the art world has conferred the status “work of art” on the object. Apparently, whether an object is a work of art is purely a matter of historically changing convention. In our pluralistic days there is a “framed art,” the child of galleries, museums, experts, art schools and art dealers, an art that is cut off from its magical, mythological, political and therapeutic roots (Thévoz). And there is an “art brut,” that is, “raw art” (Dubreffet), and Walla belongs to this “school without school.” This is a wild,
traditionless, highly symbolic art with an individual mythology and very personal defense system. But common to both “framed art” as well as “art brut” is that they display, according to Navratil, three trends for patterning (Gestaltstendenzien): the trend to physiognomize, to formalize, and to symbolize. What kind of people are artists? The Wittkovs trace “the scholarly and popular belief that artists . . . form a race apart from the rest of mankind,” and maintain that “the ‘otherness’ of artists is widely accepted by the general public,” who believe that artists are, and always have been, egocentric and temperamental outsiders: neurotic, rebellious, sensitive and intuitive individuals, unreliable and licentious, extravagant and obsessed by their own work (in short, altogether difficult to live with). No wonder that few parents want their child to become an artist. Walla, and his fellow artist-patients, fit easily into this deviant category.

Walla, born 1936, in Klosterneuburg, was a problem-child. He could not succeed in school, and never learned a profession. Most of the time he lived with his mother and was only occasionally (and for short periods) in psychiatric treatment. His art is during these (drug-assisted) intervals rather plain. Since 1983 he lives in the House of Artists (the Wallalla of Walla), in Gugging, visiting regularly his 92-year-old mother at a nearby geriatric ward. Walla moves in this world of ours like a sleepwalker, covering large canvases and any available surface (inside and outside of the House) with his Gods and Devils, his ornaments and symbols. The figures of this personal religion and self-styled mythology are the pillars of his magical-mythical world: a narrative home in a universe of fiction. Although influenced by Austrian Catholicism, the religion of his upbringing, Walla’s Gods and Devils are very personal projections and identifications. So is his symbolism that utilizes the military emblems of the coming and going Nazi- and Russian-occupying forces. The swastika in Walla’s paintings, for example, has no political significance but stands for his feminine gender identity, which, so he pretends, was surgically altered by the Russians to make him a communist “‘double-boy.’” Walla’s writings—on walls, postcards, trees, and all kinds of surfaces—are executed in a calligraphic-ornamental style of his own, emphatically drawing each separate letter and thus amplifying the semiotic aura of these word-icons. In general, it is the connotation of words that overshadows their denotative meaning. The affective logic of higher states of arousal radiates from these hyperphrenic “writings on the wall” reflecting an inner dialogue. These multi-colored and often large-sized combinations of writing-and-painting emanate a childlike innocence of hypnotic persuasion. These are manneristic texts with their own system of signs.

Indeed, the entire manneristic universe of Walla is perfused with signs.

In contrast to Museums, the cemeteries of “framed art,” “an art that is solemnly buried—exhibited for socially approved worship, Navratil’s House of Artists is a very lively place, indeed. The ongoing creative performance of its more than a dozen artists-in-residence (painters, poets and writers) may be observed in statu nascendi. In retrospect, it could be argued that the Zeitgeist favored and indirectly supported Navratil’s relentless efforts to rehabilitate his artist-patients. His era witnessed two new and contrasting phenomena: schizophrenia hyperarousal has been lowered through tranquilizers in practically all mental patients of the Western world, while the relatively low arousal levels of normal daily routine were raised in millions of people taking LSD, psilocybin, mescaline, cocaine, and related psychoactive drugs. In a parallel development one could observe an exchange of creative traits against bizarre symptoms between professional artists and mental patients, with the result that patients are nowadays regarded as less sick and more creative (they paint and write in mental hospital settings, healing themselves through art therapy), while artists are more and more looked upon as potential patients who seem to create art in order to stay (relatively) sane and avoid hospitalization. The formerly sharp dividing line between hyperphrenics and “normophrenics” (an expression coined by A. Bader, Lausanne) becomes increasingly blurred, and Navratil’s campaign of rehabilitation did both profit from as well as contribute to this development.

But the proof of the pudding is in the eating. Walla’s art work is selling well, and so does the artistic output of the other artists in residence. Hauser’s “Naked woman with hat” was auctioned at Christie’s, in London, for 35,000 DM. All residents do pretty well; all are owners of a personal TV set. They are visited, filmed, and can be seen all over Europe on the TV. The West-German weekly, Der Spiegel, featured a five-page article on Walla and his art (in the January 25, 1988 issue), and the permanent Walla collection of the Museum of Modern Art, in Vienna, is to be shown in Switzerland, Heidelberg and Berlin.

The House of Artists is the only Art Academy in the world that is located on the campus of a State Mental Hospital. Navratil, who has published dozens of fascinating books (in German) on the relation of schizophrenia to art, literature, and poetry, was able to create a permanent institution that rehabilitates the artist suffering from his own creative sensibility. We can only repeat the same words of salute and praise which were once said of William James: “What a real person he is.”

The Psychocybernetic Model of Art Therapy
Aina O. Nucho, PhD, ATR, ACSW. Charles C. Thomas, Springfield, IL: 248 pp, $34.50

Reviewed by: Connie E. Naitove, ATR; reprinted from the NECCT Newsletter (Vol. 12, #4) with the author and publisher's permission.

The Psychocybernetic Model of Art Therapy . . . is one of the most important books to be published in the field of expressive therapies, period! Not only does the text carefully explain the background and significance of Nucho's psychocybernetic model, but it does so with clarity, organization and thoroughness. In fact the entire volume is a model of clarity. The first quarter of the book discusses the theoretical foundations of Nucho's concepts involving cybernetics, systems theory, images and symbolization. This is followed by one of the best descriptions of the historical and theoretical foundations of art therapy to be found in print. Nucho then draws the two factors neatly together and, in the second half of the book, explicates, with a series of illustrated descriptions, her psychocybernetic art therapy process. The book concludes with the results of scientific clinical studies designed to ascertain the validity of this approach. This is followed by some illustrated "Case Vignettes" which read like any other projective descriptions of client art work, are not clearly tied to the psychocybernetic theory and could easily have been omitted.

It should be understood that this is NOT a run-of-the-mill art therapy text. Nucho is refreshing in the depth of her research and her choice of references. Indeed, the theories and concepts explored and referenced lend themselves to other arts and therapeutic approaches.

It should also be said that this is NOT a simple book! The very title makes it clear that neither the theories nor the vocabulary are all that familiar or self-explanatory. Nor is this a book wherein the reader can pick out isolated chapters or segments to read and come away with any degree of understanding of the meaning and significance of the psychocybernetic model of art therapy. For best understanding, the book should be read in toto, from beginning to end. It is an ideal text for the classroom, since each segment could be followed by discussion and the opportunity to become comfortable and fluent in the language and concepts.

Many knotty issues are classified within the text, from the role of the therapist as a facilitator (p. 20), to therapeutic significance of such activities as sports and crafts. "It may be therapeutic just as gardening or splitting wood may be therapeutic in that it may help a person feel more effective and worth while. But it has very little to do with the information sorting and processing endeavors which are the core of the psychocybernetic model of helping." (p. 79) Also, Nucho displays a rather refreshing sense of optimism concerning the last half of the 20th century and rapidly encroaching 21st. She regards the "explosion of thinking and practice in the field of human behavior" in a light of philosophical renaissance and anticipates "radical development of new knowledge in the neurosciences and in behavior . . ." which will enable art therapy, per se, and the expressive therapies in general "to play a strategic part in the healing arts (and, we suspect, in education as well) for future generations."
Passion in Art: Miracle Department

Harriet Wadeson, PhD, ATR

Expect the unexpected: in art; in life. Living with passion, making art with passion, makes all the difference.

Kyle was born two months premature, deformed and brain-damaged. Skull x-rays indicated abnormal brain development with one hemisphere smaller than the other. Electrocardiogram showed asymmetrical brain activity. An initial eye examination revealed no evidence of vision, but later tests amended the diagnosis to legal blindness. Repeated intelligence tests at the National Institutes of Health during the first years of life scored Kyle mentally retarded. At 18 months the Director of the Diagnostic and Evaluation Center for Handicapped Children at Johns Hopkins University Hospital gave Kyle the definitive prognosis of “never reaching beyond an eight-year-old level.”

Figure 1 is one of Kyle’s early representations of himself drawn when he had first turned five. He had started talking only a few months earlier. Note the eyes, an accurate portrayal of Kyle’s one normal looking eye (in fact the retina was damaged) and the slit where his other eye never developed. The figure is well-developed for a child of Kyle’s age, and the hands each have five fingers even though Kyle could not count at this time.

More exceptional is Figure 2, Kyle’s representation of a cement mixer drawn a year earlier when he had just turned four. He was passionately interested in vehicles at that time — trains, buses, trucks, helicopters, all of which he drew repeatedly. For a “normal” child of four, this drawing would show advanced development. For a blind, retarded child, Kyle’s drawing ability was remarkable.

At age eight Kyle’s passion was the piano which he had taught himself to play, Figure 3. Like all his drawings, this one shows exceptional accuracy of detail and spatial relationships. Kyle never drew from a model; his memory was a remarkable visual catalog of unusual exactitude for objects, scenes, and events from both the recent and distant past.

Now Kyle is grown, and despite a lifetime of rejection by his father and his peers, he continues to live his life with passion. The focus of this supposedly blind young man continues to be visual expression, now in the form of photography. Figure 4 is my photograph of a color enlargement he shot, developed and printed, of me getting ready to take him out to dinner. My dress is a vivid red color that he has captured as accurately as the more subtle flesh tones. Though it has taken him longer than most kids, this boy who “would never reach beyond an eight-year-old level” is about to graduate from college. Though his visual impairment is considerable, he has bicycled hundreds of miles on trips throughout New England and Nova Scotia (another passion: he builds bikes). His university purchases his photographs of campus life for their publicity brochures.

What are we to make of this passion for living and creating that grows against all odds? Certainly Kyle connects to the world and takes it in through his
limited vision and unique intelligence. But beyond that is his visual re-creation of his world, from the fascinating vehicles that passed his house in earliest memories to the complexities of life at a large university that engage him now. Creating has been a consistent driving passion in his life. It is an integral part of the person he is.

What is the nourishment from within and without that will not let creativity die even under the most unlikely conditions? How is it that one person retains a vital passionate link to the life around him while another with similar hardships would wither and withdraw? Perhaps we are left with only our wonder at the miracles we witness and our gratitude that we may partake of them.

MEMBERSHIP APPLICATION

GENERAL MEMBERSHIP INFORMATION:

1. The membership year is the calendar year January 1st through December 31st.

2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application.

   Applications received between:
   - January 1st and May 31st: Full dues payment
   - June 1st and September 30th: Half year dues plus $5.00 payment
   - October 1st and December 31st: Full dues payment
   - Membership will expire December 31st of the same year.

3. Professional Member applicants must meet criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval. Contact the AATA office for Professional Membership application packet and criteria.

4. AATA Membership and AATA Registration (ATR) should not be confused. Each has a separate application procedure. Registration is bestowed only by the Standards Committee. Contact the AATA office for Registration application packet and information.

5. Benefits of AATA membership:
   - Membership Directory & Bylaws
   - Subscription to ART THERAPY, the Journal of the AATA
   - Quarterly AATA Newsletter
   - Discounts on publications, Annual Conference fees and pre-conference courses
   - Availability of group insurance
   - Special mailings of professional interest

6. National AATA membership is required for Chapter membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES:

PROFESSIONAL - by application only; such members may vote, hold office and serve on committees

   Credentialled Professional Member:
   - Individuals who have been dually approved for Professional Membership AND Registration (ATR) by the AATA. Dues are $80 yr

   Active Professional Member:
   - Individuals who have completed professional training in art therapy (education). Dues are $75 yr

CONTRIBUTING - Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 yr

ASSOCIATE - Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 yr.

STUDENT - Individuals who do not meet the qualifications of Professional Membership and are currently taking courses in art therapy or related fields. Requires a current statement or letter from the institution of learning indicating:
   - Fulltime status: 6 graduate semester units or 12 undergraduate semester units or equivalent
   - Coursework content

Make checks payable to AATA

Art Therapist's Portfolio

VIEWPOINTS provides a forum for sharing ideas and graphics about issues facing art therapists. It also encourages the submission of photographs of art by art therapists with an accompanying statement describing the work's meaningfulness to its creator. Submit black and white glossy photographs and four copies of the written material to: Viewpoints, ART THERAPY, 505 E. Hawley St., Mundelein, IL 60060.

"Jellystone Covered Bridge" - painting by a 75 year old woman in a nursing home. (Wright State University)

Painting by an 8 year old learning disabled child. (Wright State University Art Therapy Clinic)

CHARLES C THOMAS • PUBLISHER

New! FUNDAMENTALS OF ART THERAPY by Shaun McNiff. Written in a dialogue format, a major portion of this text discusses questions raised by an art therapist in training. Topics examined include the nature of art, animism and art, archetypal imagery in children's art, theory as creation, diagnostic labels, killing and resurrecting the father, art as dreaming, and eros and image. Throughout the presentation, the author maintains that interpretation is not only fundamental to art therapy but that therapy is itself a process of interpretation. '88, $34.75

New! ACTIVITIES FOR ADOLESCENTS IN THERAPY: A Handbook of Facilitating Guidelines and Planning Ideas for Group Therapy with Troubled Adolescents by Susan T. Dennison. This excellent resource manual contains over 100 new and effective therapeutic activities. These interventions have been designed to attract adolescents to therapy and to elicit their full participation once involved. Specific guidelines for their use, timing, and rational are provided through a group therapy practice model and an assessment guide. '88, $32.75

THE PSYCHOBIOCHEMICAL MODEL OF ART THERAPY by Aina O. Nucho. The first half of this book presents a detailed account of the origins and rationale of art therapy. Then it focuses on the actual therapeutic process of the psychocibernetic model which combines the verbal/analytic and the visuallimagistic symbol systems. The author describes ways to introduce clients to visual forms of expression, the actual "doing" phase, decoding the visual imagery, termination of treatment, and the scope and effectiveness of the model. '87, $34.50

VISUAL ARTS AND OLDER PEOPLE: Developing Quality Programs by Pearl Greenberg. This lucid text provides the background and knowledge necessary to understand and appreciate older adults as artists and to develop quality visual art programs. Chapters explore retirement, gallery and museum programs, adult learning, working with disabled older people, art appreciation, and diverse art mediums. '87, $30.25

EDUCATING THE CREATIVE ARTS THERAPIST by Shaun McNiff. As the first in-depth study of higher education in the arts therapies, this book is essential to all those involved at the more than 200 schools that offer related courses and programs. The author discusses diverse training traditions, areas of concentration, competences, philosophies, and supervision and evaluation. '86, $32.75

THE ARTS AND PSYCHOTHERAPY by Shaun McNiff. An integrated approach to all of the arts in psychotherapy is presented in this insightful book. The author examines the distinctive and common qualities of the various expressive arts in relation to psychotherapy. He also draws on the statements of artists to develop a psychology of art that views artistic exploration as psychological research of the highest order. '81, $21.75

About Our Cover

"Where I Live"—a drawing and crayon-resist painting by a 9 year old girl in the Wright State University Art Therapy Clinic.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.
Within the past few years artists, craftpersons and other professionals who work with art materials have been warned about the dangers of working with certain toxic materials over extended periods of time and with improper measures taken relative to safety factors. A book worth our consideration for more information is titled *Health Hazards Manual for Artists* (3rd revised and augmented edition) by Michael McCann, Ph.D., C.I.H., and published in 1985 by Nick Lyons Books, 31 West 21st Street, New York, NY 10010. The book is divided into three primary sections. Part One, “How Art Materials Affect You,” focuses on risk factors, effects of art materials on the body, and has separate chapters on solvents and aerosol sprays, acids and alkalis. Part Two, “Hazards of Various Media,” has many details on painting; ceramics; stone, plaster, clay and wax; sculpture; photography; and numerous other media and processes. Especially enlightening is the chapter on “Children and Art Materials,” and the author states that “... children are at much higher risk physiologically than adults from exposure to toxic materials. Children and teenagers are still growing and have a more rapid metabolism than adults. As a result, they are more likely to absorb toxic materials into their bodies.” (pp. 62-63). Part Three, “Safety in the Studio,” covers various aspects of materials and their use, including substitution of safer materials; ventilation; storage and handling of materials; fire prevention; protective equipment; and how to get help. Much of the information is geared specifically to the public school room or the artist’s studio; however, with very little adjustment, the art therapist can certainly glean ideas and understandings of the hazards of materials that we use in the clinical setting, and we can begin to comprehend the seriousness of taking a long and hard look at the materials we use and how we use them. There are many books and pamphlets listed in the references, as well as other helps that should be of interest to us.

One of the articles included in this issue is by Maxine Junge, ATR, and titled “An Inquiry Into Women and Creativity Including Two Case Studies of the Artists Frida Kahlo and Diane Arbus.” An introduction, including personal references and special meaning to the author, is followed by a working definition of creativity. Next, intensive focus is given to Frida Kahlo, a painter born in Mexico City in the early 1900’s, and Diane Arbus, a well-known photographer who was born in New York City in the 1920’s. The vignettes and examples are compelling and serve as a foundation for understanding these two artists, as well as relating in a clinical way to their backgrounds, the environment within which each produced their art, and the art work itself.

Barbara Wittels Witlin, ATR, and Roy Augusthy, MD, are the co-authors of “Comparison of Art Psychotherapy and Discharge Diagnoses of Diagnostic Unit Patients.” The article focuses on art psychotherapy diagnoses as they are correlated with psychiatric discharge diagnoses on Axis I (of the DSM-III, 1980) with a patient population of 97. With their discussion of the findings pertaining to agreement, disagreement and other stated criteria or categories, suggestions are made for further research. Two psychiatric evaluations are briefly given, with assessment and discussion on each.

“One Inner Guide,” by Vija B. Lusebrink, ATR, elaborates on the concept that “has universal manifestations in images in the fairy tales, myths, and religions of different cultures” (see abstract). These images, as Lusebrink points out, emerge during physical or mental stress but also can be activated with stabilization and reinforcement occurring. Included in this article are the following general categories: the understanding of the Inner Guide; images in folklore and art, and in dreams and active imagination; emergence of the image in mental illness; active imagination in healing, including the need for visual expression as well as verbal description; and summary with concluding discussion.

Although this editorial is being written prior to the A.A.T.A. Conference in Chicago, by the time you read it the Conference will be history. Let me offer, in advance, my thanks to all of the many people who worked diligently to make the Conference a success. In addition, for those of you who presented papers, panels, forums, workshops and other offerings, you are encouraged to submit to this journal for publication consideration. Check in this—or other—issues for the proper format. Why not send the article in before you forget?

PART I: THE PERSONAL

“You are original and creative”
—Fortune from a Chinese fortune cookie

About the Process: By Way of an Introduction

I have been thinking about this article since I stood in the sculpture garden of Barbara Hepworth’s house in St. Ives on the Cornwall coast of England. Hepworth’s garden is connected to the house and studio in which she lived and worked for twenty-five years and in which she died in a fire in 1974. The house was given to the Tate Museum and is now open to the public. Hepworth’s work in reproductions seems physically huge and monumental because of its simplicity and abstractness of shape and form and perhaps because of the viewer’s associations to her classmate, the other pre-eminent (and monumental) British sculptor of this century, Henry Moore.

In actuality, standing in her garden of no more than thirty-feet square, I was struck by the intimate scale of Hepworth’s work and of her environment—almost a miniature, silent and “secret garden” distinctly disengaged from the world behind its high enclosing white walls. To a Californian used to the openness and accessibility of space of the coastal areas, there was the temptation to define the scale of Hepworth’s miniature British world as so personal as to be “female.” Visiting someone’s house we feel we can know them in some essential inner way and as I wandered mostly alone in the house and garden on that bright fall afternoon, I felt intensely connected to Hepworth and moved by her creative vision and by the visible signs and symbols of the daily life she had led. Also possibly hovering about my consciousness that day, was the matron saint of women and creativity, Virginia Woolf, who had lived, worked and died by suicide just a few blocks away in the house high on the hill overlooking the St. Ives harbor.

Since early adolescence, when I came forcefully in touch with my own powers of creativity in the visual arts and the potential ability of the creative process to aid in the development of my own identity and consolidation of a personality, I have read about the process and products of creativity with dissatisfaction. Most of what I read seemed to offer little explanation, information, nor finally to pierce the essential mystery. For my generation, “creativity” became an all but meaningless catchword with any potential for capturing its qualities and essence apparently lost in the inability of words to describe such elusiveness. Besides, as a visual artist obsessed with the power of imagery, I felt a profound mistrust for mere words.

An early and precious memory is of accompanying my father on one of his weekend painting trips. Sometimes we would drive to downtown Los Angeles and on Broadway or Main Street stop to paint from the car. The sweetness of that memory of our special shared closeness of the creative process remains a precious treasure and, I’m sure, a continuing touchstone of definition in my life. Barbara Hepworth speaks also of car trips with her father as a powerful impetus to creativity:

All my early memories are of forms and shapes and textures. Moving through and over the West Riding landscape with my father in the car, the hills were sculptures; the roads defined the form. Above all, there was the sensation of moving physically over the contours of fullnesses and concavities, through hollows and over peaks—feeling, touching, seeing through mind and hand and eye. The sensation has never left me . . . perhaps what one wants to say is formed in childhood and the rest of one’s life is spent in trying to say it . . . (Bowness, 1977).

“An early and precious memory is of accompanying my father on one of his weekend painting trips.”
The birth of great and recognized women artists throughout history has been used as a truism to explain the lack of recognized women artists and their supposed inadequate creativity in all but the realm of home and hearth—the creativity of anatomy. Gratefully, times have changed somewhat. At least to many today, the fact that a woman who attempts to be an artist historically suffered, and continues to suffer, deeply ambivalent parental and cultural messages which as introjected psychologically can be injurious and crippling is, thankfully, no longer news. Given the powerful cultural edicts, we must marvel at the strength of the need for creative expression that it could continue to exist, even against the overwhelming tides, in some women’s lives. We must be thankful that there are more open opportunities, awareness and support today.

There is a series of books in which women talk about their lives and work. (Examples of this genre are Rudick and Daniels, 1977, Gilbert and Moore, 1981 and Miller and Swensen, 1981.) Brewster Ghiselin’s classic work The Creative Process surveyed thirty-eight (living and dead) of the . . . world’s outstanding men and women [and] reveal how they actually begin and complete creative work in such fields as art, literature and science . . . a fascinating analysis of how new ideas are born and developed (Ghiselin, 1952).

Out of the thirty-eight, four were women—three writers and a dancer. Unfortunately, more recent “integrated” compendiums have not significantly altered this typical non-representation and women artist’s stories remain “ghettoized” in books and art histories specifically about women, by women, and, I suspect, read primarily by other women who are rightfully hungry for models. Further, we are still at the necessary stage of the documentation of creative women’s lives (judge by the increasing numbers of biographies), but we have not really reached the time when we have much in the way of satisfactory theory. It is my belief that no matter how much in ill-repute Freud may be currently held, his notions about the sources, motivations, and transformative energy of creativity and that the creative urge is ultimately akin to psychopathology, for better or worse, still pervade current thinking about art and artists and thus warrant a fresh look. Secondly, psychoanalytic methods have provided us with important tools with which to understand the artistic personality and its vicissitudes. Additionally, I am an art psychotherapist and therefore believe that all art is a reflection of the artist, of her environment and of the relationship between them. As an art psychotherapist, I had long been interested in Georgia O’Keefe and what I perceived as the projected visualization in her artwork of a midlife crisis of dependency/independence. Thus, I thought it would be interesting to look into the lives and art work of two other visual artists, the photographer Diane Arbus and the Mexican painter, Frida Kahlo and within an undeniably psychoanalytic (though not strictly Freudian) perspective, explore questions about the genesis, meaning, and uses of creativity in their personalities and lives. Recently, I happened across a journal article by a psychotherapist called “The Woman Artist: A Struggle for Self-Realization” (Cohen, 1983). This article presented an original conceptual framework in which to place the struggles of the woman artist and seemed to me to provide an interesting piece of thinking about these particular problems.

Finally I felt these diverse elements could come together to provide a useful way to proceed that might lead to the asking of provocative questions. Thus the following section presents a working definition of creativity and briefly describes some basic ideas about the subject as it might pertain to women. In the last section of the paper, Arbus and Kahlo will be used as case studies for an inquiry into the role of creativity in their lives and personality development.

PART II: THE THEORETICAL

A Working Definition of Creativity

Although the word “creativity” is used with an easy familiarity suggestive of universal understanding (cf. the fortune cookie quote at the beginning of this paper), and has been defined from a variety of perspectives such as the psychological, the historic, the aesthetic and the behavioral, in reality it is not easy to arrive at a generally accepted definition. Webster’s Ninth New Collegiate Dictionary states: “Creativity—the quality of being creative” and “Creative” as “marked by the ability or power to create.” It is indeed easier to talk about characteristics of the creative process. McWhinney suggests that there are at least four recognizable and alternative forms of creativity and that there should be specifically differential training for their use (McWhinney, 1985). Creativity is the domain of human beings, and (stories of chimpanzees making paintings notwithstanding) it differentiates us from the animals. We have evidence of its continuing existence even in the most extreme and devastating situations such as the Nazi concentration camps where in the face of an unbearable reality we are reminded of the best that is human. Ariet (1976) cites the importance of distinguishing creativity from spontaneity and originality
which are the feelings, ideas and images emerging from unconscious processes, experienced and sometimes acted upon, but which remain relatively unchanged and untransformed. He goes on to describe creativity as “a desirable enlargement of human experience”:

“A creative work” establishes an additional bond between the work and human existence... [and] thus may be seen to have a dual role: at the same time as it enlarges the universe by adding or uncovering new dimensions, it also enlarges the universe and expands man... It is committed not just to the visible... but to the invisible as well... A new painting, poem, scientific achievement, or philosophical understanding increases the number of islands of the visible in the ocean of the unknown (Arieti, 1976, pps. 4 & 5).

Distinguishing between “ordinary” and great creativity, Arieti postulates a “magic” synthesis from which the new, the unexpected, and the desirable emerge” (Arieti, 1976, p. 13). For the purposes of this article, Arieti’s definition is accepted in its delineation of creativity as arising out of the “raw matter” of the interrelationship between the person and the context, and through a special transformation something new is created which is positive and which expands the relationship between the person and the environment.

Ideas on Women and Creativity

The idea of the innate inferiority of women as creative beings has been mentioned previously in this paper. It is an idea held for centuries and still believed by many. Patriarchal society in which the woman was relegated to the functions of motherhood and home, often as “property” to father or husband, perpetuated the notion that women: had no inclination toward creativity. Later, psychoanalytic theory suggested that the motivation to create in women is typically (and “normally”) sublimated into the “creation” of children. Neo Freudian Karen Horney, discussing men’s contributions to the arts, states:

“Patriarchal society... perpetuated the notion that women had no inclination toward creativity.”

... Is it not the tremendous strength in men of the impulse to create work in every field precisely due to their feeling of playing a small part in the creation of living being, which constantly impels them to an overcompensation in achievements? (Horney quoted in Cohen, 1983).

Although Horney favorably (if unconvincingly) reframes men’s creativity as a kind of “womb envy,” she substantially holds to traditional psychoanalytic thinking about women and their corresponding unsatisfactory sublimation process:

... There is much to be said in favor of the view that women work off their penis envy less successfully than men, from a cultural point of view. We know that in the most favorable case this envy (penis) is transmuted into the desire for a husband and child and probably by this envy transmutation it forfeits the greater part of its power as an incentive to sublimation (Horney quoted in Cohen, 1983).

Researchers, basing their models on the prevailing patriarchal assumptions evolved interpretations to support their assumptions. Cattel early in the century statistically studied men of science in this country (1903, 1906). In an article published in 1910, he noted that between 1903 and 1910, women in science had not increased in number nor improved their standing. Thus he concluded that

There does not appear to be any social prejudice against women engaged in scientific work, and it is difficult to avoid the conclusions that there is an innate sexual disqualification (Cattel quoted in Arieti, 1976, p. 317).

Cattel’s misguided interpretation of data in which the effects of the social milieu are not even seen and thus the only explanation is biological inheritance is not untypical.

Cora Sutton Castle in 1913, followed Cattel’s method and made a list of 868 eminent women (including politicians, mothers, mistresses and rulers) through twenty-six centuries and from forty-two countries. She noted a marked tendency for eminent women to acquire prominence in the same field as their fathers and that they had not been particularly successful as wives. Castle could not seem to decide whether the small numbers meant that women are innately inferior or had a lack of opportunity. She did not recognize that the fact that two-thirds of the women on her list lived in the last two centuries should have shown that environment influences statistics.

Tamar Cohen in her persuasive article “The Woman Artist: Struggle for Self-Realization” essentially grounded in Humanistic personality theory, postulates a conceptual framework based on a developmental model. Cohen, a psychotherapist who has treated artists in her practice, points out an essential theme emerging from recent psychological studies of the creative process: the artist’s strong urge to create—both as a means of self expression and as a continuing marker of experience. Cohen quotes Miriam Shapiro, a well-known contemporary feminist artist:

As a child, as an adolescent, as a college student, I was remarkably simple-minded. I cared most about

December 1988, ART THERAPY

81

716
being an artist, about making my art . . . When I look back on the years of excessive self-doubt, I wonder how I was able to make my paintings. In part, I managed to paint because I had the desire, as strong as the desire for food or sex, to push through to make an image that signified (Shapiro quoted in Cohen, 1983).

It was exactly this urge to create, to witness, to mark and to last, which compelled the artists of the concentration camps. Cohen argues that it is this strong creative urge itself which “throws the woman artist into conflicts as she tries to actualize the artistic core of herself.” She suggests that the woman artist, like other women initially internalizes the myths about “woman’s role.” As she struggles with her feelings about a perceived and/or actual role definition of wife and mother, her creative gifts and urges can become additional burden for her and even a threat to her evolving personality.

Cohen conceives of the woman artist’s process as occurring in a three-stage progression during which specific conflicts are dealt with and in which each stage is characterized by the attitude the woman artist shows toward her creative work. In the first stage, the conflict is avoided either by accepting her social role or by consciously or unconsciously avoiding it. The artist Judy Chicago describes the latter position:

I felt convinced that the only way to make any progress in the art world was to stay unmarried, without children, live in a large loft, and present myself in such a way that I would HAVE to be taken seriously (Chicago quoted in Cohen, 1983).

In either case, the woman artist must repress or deny her needs and straddle the fence of ambivalence. In the second stage, the conflict is displaced. A commitment to the work, Cohen writes, may “touch off a core of uncertainty which, perhaps, has to do with her sense of womanhood.” Pervasive questions about the value of her work and feelings of self-doubt often hinder the woman artist’s ability to work productively. Her lack of productivity leads to further doubting and Cohen suggests that “a typical outcome now is the unsteadiness of the woman’s commitment to her artistic work.” At this stage the woman may talk of “other demands” which take her away from her art. In the third stage of resolution, the woman artist begins to consciously, if painfully, confront both her commitment to her work and her emotional needs:

Gaining a new sense of inner confidence, she also seems to be able to respond more positively to the needs of the important others in her life . . . the woman artist is not free of stresses, but she approaches solutions in a fresh and unrestricted manner. As she experiences a deep sense of fulfillment regarding her artistic work, she also feels the inevitable pain which comes with growing (Cohen, 1983).

The woman artist in this stage can work productively and adds personal and meaning to her art. She may begin to exhibit her work opening herself to criticism. “Much like a mother who has to accept and treat her child as a separate entity,” Cohen states, “the woman artist allows separateness from her “final product” (Cohen, 1983). Finally, Cohen suggests a social action role for the woman artist:

Communicating through her art, the woman artist can transmit her inner reality, her lived experiences, and thus help in removing the prejudices and social obstacles with which she herself has had to struggle (Cohen, 1983).

PART III: CASE STUDIES OF TWO VISUAL ARTISTS, FRIDA KAHLO AND DIANE ARBUS

Introduction

This section is composed of case studies of two visual artists, Frida Kahlo, the Mexican painter, and Diane Arbus, the American photographer. These artists were chosen basically because their work is of interest to me. Additionally, there exist recent, well-documented and complete biographies of the two. An assumption is that artistic creativity springs from and is innately related to the artist’s life and that the artist’s creativity profoundly influences roads taken and choices made in the artist’s life. Further, the cultural, social and psychological milieu of the times are integrally intertwined with the artist and her life. Clearly, this is not in any way a comparative look at men and women. Also, the two women artists will not be formally compared although there will be some attempt to highlight what may be important congruencies within their “stories.” Each case study will include, first, the basic sources used and a description of the outlines of the artist’s life. Next, discussion will be centered around cultural, social and psychological questions designed to elicit information within an essentially psychodynamic framework to provide an in-depth exploration of the origins and uses of creativity in these women’s lives and work and in the development of their personalities.
Frida Kahlo

Source

The information for this study is taken from Hayden Herrera's 1983 book about Kahlo, *Frida: A Biography of Frida Kahlo*. Herrera's book includes excerpts from Bertram Wolfe's 1963 biography of Kahlo's husband, the Mexican muralist Diego Rivera, *The Fabulous Life of Diego Rivera* and quotations from Rivera's *My Art, My Life*.

Description of Frida Kahlo's Life

Less than one year before her death in 1954 at the age of forty-seven, Frida Kahlo's paintings were presented in a one-woman exhibition. This was her first major exhibit in her native land of Mexico. Kahlo was born on July 6, 1907 in Mexico City the third daughter of Guillermo and Matilde Kahlo. Her father was a German Jewish atheist who had immigrated to Mexico at the age of 19. He had been a promising scholar in Germany but suffered brain injury in a fall and thereafter experienced epileptic seizures. Kahlo's mother was attractive, uneducated and a pious Catholic. At the time of Frida's birth, her father was a successful photographer who had just been commissioned to record Mexico's architecture. It was said that she inherited from him her eyebrow that connected across her nose and her intensity of gaze. After Frida's birth, her mother became ill and she was suckled by a wet nurse, an Indian woman.

The Mexican revolution broke out when Kahlo was three years old. Her father lost much of his livelihood which had been supplied by the government and became depressed and distant. At age six, Frida developed polio. She spent nine months in her room during which time she invented an imaginary friend. She emerged from the polio with a withered right leg which was to bother her both physically and emotionally all her life and which she covered with the long skirts of Mexican folk costumes that became her trademark and her mask. After her illness, because of her leg, she was teased and left out by her peers. She became solitary and an "introverted creature." In a family photograph taken shortly after she recovered from polio, Frida stands alone and separate from the family and in paintings of herself as a child, she tends to portray herself as separate.

At the age of 15, Frida attended the best educational institution in Mexico, the National Preparatory School. The school and the students who went there during the climate of change of those years would become the new intellectual leaders of professional and national life. There, at the age of 15, so the story goes, Frida first met the famous muralist Diego Rivera who was painting a mural at the school. Rivera was 36 years old when Frida became infatuated with him. She said: "My ambition is to have a child by Diego Rivera." She married him seven years later against her parents' wishes.

At the age of eighteen, she experienced an accident which would transform her life. Herrera writes "Frida's life from 1925 on was a grueling battle against slow decay." She was riding on a bus that was hit by a streetcar. Among her other injuries, her spine was broken in three places, her right leg was crushed and an iron rod went through her at the level of her pelvis. She would never be able to have children and would endure thirty-two operations on her spine and foot. After the accident, neither of her parents came to the hospital. Frida said: "My mother was speechless for a month because of the impression it made on her... it made my father so sad that he became ill." During her long recovery she began to paint—at first portraits of her friends and of herself. She stated: "I paint myself because I am so often alone... because I am the subject I know best."

After her recuperation, she took her artwork to show to Rivera who was painting frescoes at the Ministry of Education. In spite of Rivera's continuing liaisons with other women, their attraction grew and they were married in 1929. She was twenty-two. He was a famous forty-one-year-old Communist artist. Shortly after, she became pregnant, but had a therapeutic abortion, the first of more abortions and three miscarriages. They spent four years in the United States where Rivera had mural commissions but returned to Mexico because of Frida's urging. They continued their tempestuous marriage, were divorced for two years and then remarried. Although she always remained emotionally tied to Rivera and in fact took care of his bills and correspondence during the divorce, she had periodic love affairs with both women and men. Leon Trotsky and Isamu Noguchi the sculptor were two of the men.

Although she focused her life on Rivera and caring for his needs and played down her own career as an artist, she continued her development and was discovered and appreciated (wrongly) as one of them, by the Surrealists in the late 1930's. Through the years, she endured multiple operations which included many incrustations in torso-length plaster casts and she continued painting. She died in 1954. Although from entries in her written and drawn diary there is a hint that she committed suicide, the cause of her death is listed as "pulmonary embolism."

"[Kahlo and Arbus] were chosen basically because their work is of interest to me."
Frida Kahlo's paintings are a kind of autobiography of memory and reality. They are physically small, surrealistic and formal in style. Although content—predominantly self portraits—is often bloody, violent and masochistic, the paintings' connection to Mexican primitive folklore and their binding of emotionality through restrained "hard edged" formal qualities provide the viewer with a welcome aesthetic distance. The artwork's overall concern with women, family, the land, suffering and death are both uniquely Kahlo's and also seem ultimately rooted in the paradoxical nature of Mexican culture and of the role of the Mexican woman during Kahlo's lifetime.

The Roots of Creativity in Frida Kahlo's Early Life

There appear to be three central themes that provide clues to the sources of Kahlo's artistic creativity and productiveness. They are: early family dynamics and Frida's attachment to her father, her illness with polio at age six, and the role of illness in the family dynamics and the development of Kahlo's personality.

THE ROOTS

Family Dynamics and Frida's Attachment to Her Father

Kahlo's mother was an uneducated—she did not know how to read or write—and religious woman who became ill after the birth of her third daughter resulting in Frida being nursed by a wet nurse. We can speculate a period, perhaps a lengthy period, of post-partum depression. Although she taught her daughters housewifely skills, it is known that Frida was largely cared for by older sisters. At midlife, Frida's mother began suffering from "seizures" or "attacks" that resembled those of her husband's epileptic seizures. Frida's father, a successful photographer until the Mexican revolution, was a man of silences. He was distant, withdrawn, and suffered more-or-less monthly "attacks of vertigo." During the revolution he lost much of his ability to make a good livelihood through photography and withdrew emotionally and more. In spite of his depressive nature, Guillermo Kahlo was the most attached to Frida of anyone in the family and encouraged her intellectual adventurousness. She was known to resemble him physically and he said: "Frida is the most intelligent of my daughters. She is the most like me." He lent her books from his library and encouraged her to share his passion for nature. He was an amateur watercolor painter and she would accompany him on his trips, collecting stones and leaves to bring home and observe under a microscope. Of their relationship, Herrera writes:

When she was old enough, her father shared with her his interest in Mexican archaeology and art and taught her to use a camera and to develop, retouch and color photographs... her father's fastidiousness, his concern for minute surface detail would later appear in her own paintings... the stiff formality of her father's portraits affected her approach to portraiture... Frida once said that her paintings were like the photographs that her father did for calendar illustrations, only instead of painting outer reality, she painted the calendars that were inside her head.

Eleven years after her father's death and two years before her own, she painted his portrait from a photograph he took of himself. In the painting, Frida painted "magnified cells containing dark nuclei afloat in a swarm of small dark marks that suggest sperm" (Herrera, 1983). It may be speculated that this imagery may reflect her looking through the microscope after collecting trips with her father, her profound and sexual attachment to her father and perhaps her sense of him as a source of primal energy. The inscription in the painting reflects both Kahlo's love and her use of him as a model for her own life of artwork created in spite of illness and suffering and of the rightness of social causes:

I painted my father, Wilhelm Kahlo, of Hungarian-German origin, artist-photographer by profession, in character generous, intelligent and fine, valiant because he suffered for sixty years with epilepsy, but he never stopped working and he fought against Hitler... .

There are other examples in art history of women artists who were encouraged by artist fathers and there has been some recent research to suggest that achievement in women may be dependent in part on their relationships with their fathers. Tintoretto's daughter, Marietta Robusti, was one woman artist with an artist father and Diane Arbus is another.

Kahlo's Illness with Polio at Age Six

Her nine months spent convalescing in her room, at a period when the intelligent and normally active child would have spent time with peers and expanding her world resulted in a loneliness and a withdrawal into her own imagination. She invented an imaginary friend who was happy, understanding and physically agile and free:

...I breathed vapor onto one of the first panes. I let out a breath and with a finger I drew a "door"... full of great joy and urgency, I went out in my imagination, through this "door"... down into the interior of the earth where my "imaginary friend" was always waiting for me... I was happy.

Frida's illness connected her even more strongly to her father and his experience of illness. Afterwards she was ashamed of her withered right leg and overcompensated by becoming a daring tomboy. Also, some of her descriptions of her treatments during that time echo the fascination with the details of sickness and suffering which would be a predomi-
nant theme in the imagery of her paintings.

**Illness and the Family Dynamics and Its Role in Kahlo's Personality Development**

Because of Guillermo Kahlo's epileptic episodes, this was a family intimately familiar with illness. Hererra describes:

[When Frida's father had an attack] As a small child, she was hustled out of the way ... she would lie in bed in fright ... He became for her a "kind of fearful mystery, for whom I also had pity."

When Frida was older, she would accompany her father on photography trips to be there to help. She learned to help him with his attacks in the street and also to make sure his camera equipment wasn't stolen. In addition, there were Frida's mother's illnesses, probably depressions, her own bout with polio and her later devastating accident at age eighteen.

Kahlo's early life engendered an "up close" relationship to illness and its ramifications that would continue throughout her life. Her fascination with its clinical details was an ongoing fact of her life and art. Illness' use to bring the secondary gains of attention and specialness would be an essential of her relationship to Diego Rivera—her illnesses often had the power to attract him back to her when she had no other means. That she was hypochondriacal is also well-known. She had immense physical problems but there is a real question as to whether she actually physically required her thirty-two operations or whether she had come to need illness and surgery as a way to be in the world. We can speculate that as a young child she must have been rendered terrified, insecure and vulnerable by her parents' illnesses and by her own. In her evolving personality, this resulted in a clinical attraction as a means of mastering and controlling her fears.

It is interesting that she intended to pursue medical school and, had the accident not occurred, probably would have. (According to psychoanalytic theory, to be a doctor is (sometimes) a defense mechanism against one's own feelings of vulnerability.) Later, when Frida began to paint, she would find another way to cope with these same profound feelings within the form and content of her artwork.

**Frida Kahlo's Artwork: Her Creative Vision and Its Relationship to Her Life**

In order to discuss this issue, I have chosen to briefly analyze one painting "The Broken Column" painted in 1944 soon after one of her surgeries. (See plate XXVIII, Herreras, 1983)

In her artwork Kahlo consciously portrayed her autobiography. In this painting she is confined in an "apparatus" such as many she was made to wear to allow spinal healing. Here, in a jagged, bloody opening in the body, a crevice resembling an earthquake fissure, one can see a broken Greek column. Nails pierce flesh and tears fall from eyes. The orthopedic corset is both prison and necessary support. Without it, the body would fall apart. Within its rigid structures, Frida's breasts are contrastingly delicate and vulnerable. The figure is set alone in a barren landscape with cuts and crevices which provides a metaphor for the broken body. At the horizon, there is a strip of ocean—the possibility of comfort—but it is too far away to reach.

Both Kahlo's suffering and her strength which are recurrent and dominant themes in her work are evident in this painting. The subject matter is of almost unbearable anguish and yet the formal stylization gives a sense of solidity and permanence and also provides enough distance so that the viewer can bear to look. The figure, though wrenching apart and in a stance of enforced passivity stands upright and strong.

The face is turned slightly to the side. Suffering is signaled by the tears on the cheeks, but the face is masklike and impassive and the eyes connect directly with the viewer. In spite of wounds and tears, there is a sense of dignity and stoicism. Colors are muted except in the flesh which appears distinctly alive and enduring. Shapes are solid, almost classically balanced and in their dimensionality imply durability. The painting is both a poignant cry for attention and an heroic example of survival.

Kahlo is the most personal of painters. She never attempted any subject without intense meaning for her and they were all filtered through the lens of the self and of the imagination of a confined invalid. She was an exhibitionist of her feelings in a stylized, theatrical form. "The girl whose ambition was to study medicine," Herreras says, "turned to painting as a form of psychological surgery."

**Interplay Between Conflicts Engendered by Women's Social Role and the Creative Urge**

Frida Kahlo virtually up until the last years of her life presented herself as a semi-serious painter. This, in part, was a pose that enabled her to keep her painting strictly for her own uses and not submit to the suggestions and criticisms inherent in exhibits and sales. Diego Rivera created large public paintings. Hers were small and private (and non-competitive with his).

Since her school-girl days when she had first met Rivera, she put his needs first and adapted herself to them. Rivera's biographer Bertram Wolfe wrote:

To him she came first after his painting and after his dramatizing of his life as a succession of legends, but to her he occupied first place, even before her art.

In her wedding portrait with Diego, Frida paints him as the great artist with palette and brushes, the tools
of his trade. She is the adoring wife. His head is turned away from her; her head leans toward his shoulder.

Having met Rivera when she took her paintings to him and made him a mentor before she made him her husband, Kahlo recognized that being Diego’s wife was a full-time job. Through much of her life, she painted only sporadically at times completing only one or two works a year. She kept the house, cooked what he liked and tried to anticipate his needs. When he was working on a mural she would usually carry his lunch to him in a basket, stopping to do this even when she was engaged in her own painting. In her sorrows, she did not immediately turn to her artwork for solace but to her “house-wifely” pleasures:

We could not have a child and I cried inosubably but I distracted myself by cooking, dusting the house, sometimes by painting, and every day going to accompany Diego on the scaffold. It gave him great pleasure when I arrived with the midday meal in a basket covered with flowers.

In 1932 the two were in Detroit while Diego worked on commissioned murals. There a newspaper article was written about Frida under the title “Wife of the Master Mural Painter Gleefully Dabbles in Works of Art,” indicative of her general attitude toward her work (and also of the writer’s attitude toward women).

Kahlo’s abortions, miscarriages and inability to have children are both indirectly and directly reflected in her art. After one of her early miscarriages, she painted a picture of her own birth. She was fond of dolls, pets and others’ children and recognized them as the substitutes they were. “Me and My Doll,” and her self portraits with monkeys are examples. “My Nurse and I,” “The Deceased Dimas” and “They Asked for Planes and Only Got Straw Wings” show her sorrow at her childlessness and in her nostalgia for her lost childhood, how she identi-

fies herself with the child she could not have.

Another interesting element of Frida’s adherence to a female role was her interest in clothes and how she looked. Once again, in her life and her art, clothes as costume, as theater, as metaphor and as mask, are of essential importance. She covered her leg, withered from polio, with long skirts and was fond of wearing native Mexican costumes both because they covered and because they represented her solidarity with folkloric Mexico. Once she separated from Rivera and cut off her long hair (which he loved). She painted herself with short hair, in a man’s suit with her shorn hair lying around her on the ground, as if she were divesting herself of her sexuality. Her clothes reflected a kind of visual language of her inner self. Herrera sees Kahlo’s costuming as both a mask and a frame which defined the wearer’s identity and provided a boundary to distract from inner pain.

The question of the female role expectations conflicting with the urge for creative self-expression is an especially interesting one with Kahlo. We may speculate that if she had been able to bear and raise children and had a more easy time with Rivera, she might have been satisfied to displace her creative urges onto her career and her children. We may wonder if she had not been so physically restricted, often isolated and in an essentially female, ambivalently wished for yet despised dependency, would she have needed so desperately to have expressed her sense of herself as a functioning, separate, enduring and imagining human being? We can guess that a woman of Kahlo’s intelligence, vibrancy and creativity would have needed to find some way toward visual expression. But these are, of course, essentially unanswerable questions. What we can know is that Frida herself, in her writings, expressed both sides of the conflict. On the one hand, she denigrated her work. In 1935, in a letter to a friend, Frida wrote:

I have painted about twelve paintings; all small and unimportant with the same personal subjects that only appeal to myself and nobody else . . . . I sent four of them to a gallery which is a small and rotten place, but the only one which admits any kind of stuff.

And when someone bought a picture she would say she felt sorry for him:

For that price they could buy something better . . . it must be because he’s in love with me.

Expressing the other side of her ambivalence, she wrote:

As you can observe, I have painted. Which is already something since I have spent my life up until now loving Diego and being a good for nothing with respect to work.

Frida Kahlo, herself, perhaps best spoke to the issue when she wrote:

Since the accident changed my path, and many other things, I was not permitted to fulfill the desires which the world considers normal, and nothing seemed more natural than to paint what had not been fulfilled . . . . my paintings are . . . . the most frank expression of myself . . . . with the conviction that before anything else I want to give myself pleasure and then that I want to be able to earn my living with my craft . . . . many lives would not be enough to paint the way I would wish and all that I would like.

The Psychological Significance of Kahlo’s Art to Her Personality

As a young girl Frida Kahlo’s intellectual pursuits and her observation of nature had been encouraged by her close relationship with her artist father. Polio at age six and her nine-month convalescence had plunged her into the transcending pleasures of her imagination. Throughout her childhood she faced and coped with the mystery and un-
predictability of her father's epilepsy and her mother's depression. During the period of her invalidism after the terrible bus accident at age eighteen, she began to paint which provided her with the pleasures of the creative process, enabled her to continue interpersonal relationships through her portraits, kept her company, and finally brought her to Diego Rivera.

All her life, Kahlo would associate suffering with creativity and physical suffering was intimately connected to psychological suffering. In her artwork physical suffering would express deep psychical wounds and both would be presented unflinchingly—with dignity, control, almost objectivity. She wrote that her inability to "fulfill the desires which the world considers normal" led her to painting. "They thought I was a Surrealist," she said, "but I wasn't. I never painted dreams. I painted my own reality." Painting provided her with the tools to tame, for awhile, that difficult inner reality and outer circumstances. In her artwork, Kahlo could escape into the healing potential of the imagination and express her pain in a visual catharsis. Her paintings were small, personal, symbolic, primitive in style, controlled in form and color and in their careful brush strokes reminiscent of the photographic retouching techniques taught to her as a youngster by her father. To paint at all probably contained for Kahlo the comforting memory of her father's attentiveness and encouragement. But it was in her use of form that she would forcefully and symbolically control and contain her pain, bind overwhelming feelings, ward off terrible vulnerability and fears of death and provide herself the sense of psychic distance that enabled her to survive. Kahlo's particular brand of primitivism conceals and reveals—the small scale, fantasy, and bright color distance the viewer and artist from the intensely painful content. Kahlo's art is a metaphorical representation of two important aspects of Kahlo's personality: her almost clinical fascination with and attraction to pain, indeed her pleasure in pain; and her dignity and courage in the face of it.

There is no question that for Kahlo, her art was healing. "I believe that by working I will forget the sorrows and I will be able to be a little happier" Kahlo wrote. When she was confined to bed much of the time, often encased in orthopedic devices, she could paint when she could do nothing else. When she was required to lie immobile and passive, through painting she could regain the active stance and the independence of creative choice. She could slip out of the bondage of her physical self and escape through the open windows of her vital imagination. Indeed, one can wonder if without painting she would have been able to survive at all.

Sources

Much of the biographical material in this study is based on Patricia Bosworth's Diane Arbus published in 1984. An additional source is: Diane Arbus (1972), an Aperture monograph edited by Doon Arbus (Diane's daughter) and Marvin Israel which includes reproductions of Arbus' photographs and quotations from some of Arbus' interviews, writings and text from tape recordings made at a series of photography classes she taught in 1971. The photographs discussed in this article were taken from this book. Also used for source material is Diane Arbus' Magazine Work which Doon Arbus and Marvin Israel published in 1984. This is a chronological presentation of the work Arbus did for magazine publication between 1960 and 1971.

Diane Arbus

Description of Diane Arbus' Life

Diane Arbus (pronounced Dee-ann) was born in New York City March 14, 1923. She was the middle child and the first girl of a privileged Jewish family. Her father, David Nemerov, owned a Fifth Avenue department store called Russek's. Her mother was beautiful and distant and the care of the children was left primarily in the hands of nannies. The family milieu was one of separateness and silences within the privileged but protected environment of the very rich. Diane and her older brother Howard Nemerov developed an exceptionally close relationship. As young children they were recognized as gifted, imaginative and of a special intelligence. Howard grew up to become a well-known American poet. Diane attended the Ethical Culture and Fieldston schools in New York. During her school years she showed talent in painting and had a particular interest in the work of George Grosz, a painter of grotesques. She met and fell in love with Allan Arbus at the age of fourteen. He was working in her father's store. She wanted to marry him right away but her family insisted she wait. Against their wishes she married Arbus in 1941 when she turned eighteen a month after her high school graduation. Just before this, in her senior year at school, she had denounced all her paintings as "no good" and stated that all she wanted was to become Mrs. Allan Arbus. Despite their wealth, Diane received no money from her parents after her marriage. She was, however, sometimes invited to come down to Russek's and pick out clothes. At times, particu-
larly in her later years alone, making a living was a major problem.

In 1943, during World War II, Allan joined the Signal Corps and Diane followed him until he was shipped to Burma. During his war years, Allan learned photography which he later taught to Diane. With Allan away, Diane moved back with her parents. She discovered she was pregnant and her daughter Doon was born in 1945. Diane refused to let her mother or sister accompany her to the hospital as she said she didn’t want anyone close to her there. She believed she had to be alone to truly experience something.

When Allan came home, the two became fashion photographers. Diane’s father gave them their first account photographing fashions and furs for newspaper ads, and for the next ten years or so they worked very closely, symbiotically, together turning out photographs for newspapers and most major fashion magazines in the United States. Usually he took the pictures and she attended to the model’s clothes, the props, etc. For Diane, the marriage and her role as a housewife and mother were the important things. Nevertheless, in the postwar era of the “housewife heroine,” she remained a working woman. Instead of a fashion photographer, Allan longed to be an actor. In 1954, their second baby, another daughter, was born.

In the 1950’s the photojournalism of Life magazine was dominant and in 1955 there was a huge exhibit of photography at the Museum of Modern Art which was organized by Edward Steichen—“The Family of Man.” The overall concept of the show was a romantic, benevolent view of humanity. In contrast to this more sentimental approach, in 1956, when her Grandmother died, Diane took photographs of her in her coffin.

Diane suffered from recurrent depressions where she experienced extreme lassitude. It was said that she could sit for hours silently staring. In 1957, Diane and Allan dissolved their professional partnership and began to do things independently of each other. Allan would continue to run the photography business and Diane would take photographs or work as she wished. It was hoped that the new arrangement would help alleviate Diane’s depressions. But they became estranged. Also in 1957, Arbus’ father sold his business and, with his wife, moved to New York where he set up painting full time and exhibiting his paintings.

In 1959, Diane studied with Lisette Model who became her mentor and her artistic role model and offered her a kind of mother-daughter relationship. Model took pictures which were considered revolutionary at the time in terms of their size (16 x 20 prints) and their subject matter—drunks, beggars, ordinary people and the ugly—which she called “extremes” and “exaggerations.” Model encouraged Arbus to pursue her own work and to photograph what she had been previously afraid to confront—ugliness, loneliness, freaks and oddities. She began to prowl the city at all hours searching out subjects. She was devastated over the breakup of her marriage.

In 1963, Arbus’ father died and she photographed him dead. He had been the first to encourage her talent. During the 1960’s she continued to obsessively pursue her photography “of the forbidden” and struggled with the demands of her life as a single mother while enduring continuing depressive episodes and hepatitis. She was treated by psychotherapists and took antidepressant medication which seemed to do little to ease her depressions. She published some of her work in magazines such as Esquire, but much of it was considered too bizarre and confrontive for the mass media. She received two Guggenheim fellowships and in 1967 her photographs were exhibited at the Museum of Modern Art in a show called “New Documents” representing three photographers. Her work was gaining her much recognition which she didn’t enjoy.

By the late sixties, both daughters were increasingly away from the house and Diane was increasingly alone. In 1969 she and Allan were finally divorced and he remarried and left New York for Hollywood to pursue a career as an actor. Diane photographed and participated in “be-ins” and peace marches and took portraits of feminists for the London Sunday Times. Although she was recognized as an artist she still couldn’t make a living as a photographer. In 1971 she taught photography and took pictures of retarded people which she was dissatisfied with. She told friends she didn’t think she could go on. Diane Arbus committed suicide on July 26, 1971. In 1972 she became the first American photographer to be exhibited at the Venice Biennale.

Roots of Creativity in Diane Arbus’ Early Life

The impetus for virtually all the themes in Diane Arbus’ compelling photography can be found in her early life and particularly her family’s dynamics. In fact, her work can be seen as a direct result of those dynamics and a kind of obsessive repetition compulsion of early feelings and patterns of behavior. What Arbus could not work through in her early years, she attempted to master first through her controlled life as Allan’s “perfect wife” and her daughters’ mother. As those demands fell away, increasingly in her artwork in spite of continuous terror, she plunged into the out-of-control, dark excessive world of her sexual and aggressive impulses that was both dangerous and exciting. It finally killed her. That she could not resolve and integrate these conflictual urges resulted in her multiple depressions. For many years she carried her cameras with her at all times and acknowledged them as a “shield” against danger. A camera and the creative process became for
Diane Arbus a transitional safety zone against harm. She said:

... There's a kind of power thing about the camera. I mean everyone knows you've got some edge. You're carrying some slight magic which does something to them. It fixes them in some way... I have this funny thing which is that I'm never afraid when I'm looking in the ground glass. This person could be approaching with a gun or something like that and I'd have my eyes glued to the finder and it wasn't like I was really vulnerable.

Finally, she claimed that photography "no longer worked" for her and she killed herself. There is evidence to suggest that even as a child, Arbus displayed schizoid characteristics. She was extremely sensitive and emotional, moody and uncommunicative and would lapse into remote silences which intimidated her parents. Her adulthood probably contained numerous schizophrenic episodes. But if her creative process contained within it the seeds of her destruction, it was clearly for Diane a courageous attempt at mastery and survival. If in the end her art failed her, it should nevertheless not be construed as merely visual pathology. For in her photographs, Diane Arbus transcends confrontation with the dark night of the soul to give a sense of meaning to that profound experience that resides in the depths of all of us.

The Dynamics of the Nemerov Family

According to Diane's sister, the Nemerov family was one "of silences." Diane's beautiful mother Gertrude was not affectionate toward nor attentive with her children. Diane thought she cultivated a "air of supreme indifference" and "never stopped looking in the mirror." (Years later, Diane would repeat this pattern in her photographs when she could not help looking into "the mirror" of herself and others.) Her father, the businessman, was gone most of the time and also showed little warmth or interest in his children. For the first seven years of her life, Diane was brought up by a nanny who was cool and undemonstrative who almost never left her alone. In her privileged, overprotected, Arbus developed many fears, and from an early age a sense of "unreality." She said:

I was confirmed in a sense of unreality. All I could feel was unreality... One of the things I suffered from as a kid was I never felt adversity... and the sense of being immune was, ludicrous as it seems, a painful one.

Recounting her sense of isolation, she told a friend of an experience in summer camp: All her friends had been bitten by leeches and she wasn't. "Not even leeches bite me," she cried. It was this sense of isolation and unreality that later caused Diane to search out and confront any experience that could make her feel. She was preoccupied with anything physical, including her menstrual cycle and its blood, because it was the physical that could make her believe she was alive.

The lack of an adequate bonding relationship with a parent caused Diane and her older brother Howard to cling to each other and they developed a symbiotic relationship. They were both gifted, intelligent and noncommunicative except with each other. At times they would refuse to talk with anyone but each other. Their younger sister Renee was supposed to be the normal one. Howard who would become a well-known poet was all intellect, Diane all emotion. The symbiotic qualities of this relationship would be repeated in Diane's life with Allan Arbus and with her daughter Doon. The exchange of secrets would characterize much of her art. Her struggles to understand and cope with her feelings about attachment and separation and the challenge of establishing a separate identity would be a central theme of her life and would be played out, most particularly, in her photographic obsession with twins.

Diane's Relationship with Her Father

In spite of his lack of interest generally in his children, Diane was her father's favorite child and through her ambivalent attachment to him, she gained some sense of the energy of the outside world. Although he was not home much, Diane would often be taken to visit him at his store. He was a businessman fascinated by drama and excess. Even when he was having financial problems, he spent lavishly to provide the visual accoutrements—the mask of wealth and excitement. His sexuality and sensual nature were openly acknowledged. He said that he wanted his store to be one where men could buy expensive presents for their mistresses and the fact that he had mistresses himself was apparently accepted by his wife.

And he dreamed of becoming an artist. When he went to Europe to see the fashion collections, he always took a sketchbook along. When he sold his store in 1957 and retired, he moved with Gertrude to Florida and became a full-time painter, exhibiting regularly and selling his work. His messages to Diane about artistic achievement when she was young were characteristically ambivalent. He encouraged her but dismissed her art as a hobby. Her real goal, he said, was "to live under the wing of a man."

According to psychoanalytic theory, the adolescent reworks the unfinished tasks of the earlier Oedipal stage. At age fourteen, the height of her threatening sexual feelings for her father, Diane "safely" fell in love with Allan Arbus and thereafter for almost twenty years, displaced her incestuous wishes and her needs for intimacy onto her relationship with him. Ironically, at eighteen, when she married Allan, Diane believed
she was creating an independent life for herself.

**The Compulsion to Confront the "Forbidden"**

With her extraordinary sensitivity, Diane must have been aware of hidden nuances underneath the surface. It was this awareness which allowed her to feel the pain of her isolation as a child and her sense of separateness. Within the unspoken subtexts of the Neomerov family, she lived in ambiguity. For a young child, the mystery beneath the mask that cannot be spoken about becomes something full of terror—bad and evil and forbidden. The unexpressed rage and sexual impulses go underground, become projected onto the world causing it to seem a fearful place. Her biographer Patricia Bosworth writes:

Diane said [to the novelist John A. Williams] that she was always frightened, no matter what she did—she lived with fear and overcoming fear every day of her life.

This "forbidden" side of Diane was not able to be completely denied or repressed although she tried. In 1957 she studied photography with Lisette Model. The first photos she brought in, according to Model, were "little balloons flying in the clouds—fragile and wispy." She told Model that she couldn't photograph because "what I want to photograph is evil." Model told Arbus: "Evil or not if you don't photograph what you are compelled to photograph, then you'll never photograph." With Model's encouragement, she began photographing people and places that she had been afraid to confront: She went to Coney Island, the Wax Museum, traveling circus, photographed tattooed people and became obsessed with freaks.

Gazing at the human skeleton or the bearded lady, she was reminded of a dark, unnatural, hidden self. As a little girl she had been forbidden to look at anything "abnormal": the albino with his flat pink eyes, the harelipped baby, the woman swollen with fat from some mysterious glandular disease. Forbidden to look, Diane had stared all the more and developed an intense sympathy for any human oddity.

**Diane Arbus' Photography and Its Relationship to Her Life**

Arbus' portrait of identical twins will be examined. (See first reference, Arbus, D. and Israel, M.) Two little girls about eight years old stand awkwardly together in front of a white cement wall. They wear smoked dresses. They have dark hair and bangs. One twin has a faint smile. The other holds her lips tightly together with strain. They look directly at the viewer with light eyes. Their faces are framed by identical white headbands held on with two identical bobby pins and by their dresses' jagged white collars. On their legs are white lace stockings with patterns that are not identical, as if their mother had run out of "steam." They stand on a brick walk which is splattered with white paint spots from the wall.

This is anything but a relaxed, pleasant portrait of two innocent children. The psychological complexity of the photograph makes the viewer feel that she has never really seen twins before (or, for that matter, children before). One twin stands slightly in front of the other. The effect is of Siamese twins or of a multiple ink blot made from folded paper. They are mirror images and yet different—two parts of a whole—and their intimacy and inseparability is palatable. They share secrets between them that no one can know. The viewer is drawn into the intensity of their relationship to each other and to the photographer. The feeling is of accidentally stumbling on something hidden; one cannot look away. Arbus said she never arranged her subjects, but simply arranged herself. "I can't seem to do anything that I want," she said. "Except be a spy . . . I've captured people who will never look that way again . . . ."

The subject matter of the photograph of young children is innocent enough. But the frontality, objectivity and confrontive quality of the form along with the stark black and white shapes seem almost shocking. The white headbands, collars, cuffs and stockings seem to this writer reminiscent of the orthopaedic corset in Kahlo's "The Broken Column." They structure, support, and cruelly imprison. The effect is of control and order and quiet. However, the dissimilar stockings on the girls and the accidental drops of white paint on the bricks hint at an underlying psychic chaos. The artwork of Arbus and Kahlo are not unlike each other, but Kahlo's primitive style provides the viewer with some distance with which to observe horrible suffering. In its theatricality and exhibitionism, one cannot forget that it is Kahlo, specifically, who suffers. The "super" realism of Arbus' work and its psychological complexity along with the realistic immediacy of the photographic image reveals the more universal dark side of human nature and intensely involves the viewer. The artist is not in the forefront but an intrinsic part. This photograph alters and enlarges our view forever. Arbus' is a dual artistic vision arising out of the splitting in her own personality between the masking normality of surface and the hidden underlying terror. (This can be equated to a coexisting super-ego and id without the mediating integration of the ego.) This photograph like much of her work, reveals the abnormal in the normal. Arbus said of it: "I thought how ordinary is a charming pair of twins. In some societies twins are taboo, an aberration."

**Interplay Between Conflicts Engendered by Women's Social Role and the Creative Urge**

Diane Arbus grew up in the years before World War II when the
women of her mother’s privileged class centered their lives around their husbands. They ran their homes, took care of their husband’s needs and in their spare time shopped, played bridge or engaged in charitable endeavors. In spite of Diane’s restless, creative spirit she always envisioned her life attached, like a twin, to a man. At age fourteen, when she fell in love with Allan Arbus, she thought she had found the crucial relationship to define her life and that they would love each other forever echoing the romantic notions of the times. He was her mentor, her teacher, her reason for being. She called him “Swami” and he called her “girl.” As in her relationship with her brother Howard, Diane was all emotion and she used Allan’s cool perfectionistic control as a balance wheel. In marrying Allan, she hoped to achieve a life independent of her family and by marrying (even Allan, whom her parents opposed) she could win her father’s approval and enjoy the pleasures of being the “good girl.” She was brought up to please. But that she recognized the inherent ambivalent nature of her position is revealed in a school essay she wrote on Medea. She described:

the deep selfish slowness of woman who closes her eyes to everything, including the restlessness of woman whose dreams then become a defense against awareness. Such women were like sleepwalkers... a woman wants to be one thing... and then she is told to be another. If she doesn’t fulfill her destiny, should she hate herself? I don’t think so.

Along with the felt ambivalence she might have been describing her own remoteness and depressive episodes, defining them as a defense against creativity. Certainly, she attempted to close her eyes to awareness. Soon after this she began to say she hated painting and that it had been a huge pretense to think of herself as a “great sad artist.” One of her friends later suggested that

“Diane was simply scared stiff of her talent. It terrified her because it set her so apart.”

After marriage, Arbus concentrated on being Allan’s wife. During the war years, while he was away, she moved back in with her family where she was treated as a little girl and told how to dress. When her daughter was born in 1945, she refused to allow her mother or sister to accompany her to the hospital. Bosworth writes that she was “terrified of being alone, but she believed she had to be alone to really experience something, only then would it really count.” But when she brought her daughter home, her mother had hired a nurse and insisted that the baby be bottle fed. Diane and Allan continued to regularly attend Friday night dinners at the Nemerovs’. Many years later Diane explained to Newsweek why she didn’t start taking photographs seriously until she was thirty-eight years old:

Because a woman spends the first block of her life looking for a husband and learning to be a wife and mother, just trying to get those roles down pat; you don’t have time to play another role.

Nevertheless, in the postwar era of the housewife as the essence of femininity and normality, Diane was a working wife and must have felt constantly torn. One of her colleagues said:

[Conflict] was the subtext of our lives. At the office we’d be making decisions, taking creative responsibility for things. At home we were susceptible and passive and dependent on our men. It was confusing.

In the late fifties when Arbus began to finally explore the parameters of the artistic vision that would consume her in just more than ten years, she was thirty-eight years old. Her marriage had recently broken up, her parents had retired and moved to Florida and she struggled to sustain the life of a single mother. She could no longer escape or sublimate the challenge of establishing an independent life for herself. It terrified her and she endured severe depressions. Arbus’ descent “into the depths” of the physically and psychologically dangerous world of her art must be seen as an attempt to conquer her fears and save herself. Arbus said “I was terrified most of the time.” Bosworth writes:

But terror aroused her and made her feel. It shattered her listlessness, her depression. Conquering her fears helped her develop the courage she felt her mother had failed to teach her... Part of her motivation [for photographing freaks] was freaks frightened her. She wanted to get so scared that her heart would pound and sweat would pop out on her brow, and then she would conquer her fear and stay for hours...

For Diane Arbus, the conflict between her expected female role and her creative urge always existed and to achieve a balance was, for her, an impossibility. But in a very real sense the demands of her life as a wife and mother must be viewed as a positive personality dynamic. They did not make her happy, but they provided her with structure, order and the comfort of close relationships thus aided in the survival of a fragile personality. For, at mid-life, during the experimental permissiveness of the decade of the sixties, as the roles of daughter, wife and mother fell away from her, and Arbus explored the depths of her creativity, she plunged into the abyss of chaos, unbridled sexuality and loneliness that would finally engulf her life.

The Psychological Significance of Arbus’ Art to Her Personality

Diane Arbus’ identity as an artist existed from an early age. Even as a child, her talents and giftedness explained and excused her strange, remote behavior. In an artist much “weirdness” is acceptable. She was
special and she knew it and felt insulated from others, and those around her knew it too. In adolescence, her strong urges and sensitivities were sublimated into her art and her relationships. Through the artistic imagination she could begin to explore the forbidden territories that existed outside the limits of safety and thus herself still remain safe. For the fearful personality, her art would provide a counter-phobic and socially acceptable means to attempt to master her fears. Later, she would speak of her attraction for freaks in this way:

Most people go through life dreading they'll have a traumatic experience. Freaks were born with their trauma and they've passed their test in life.

For the isolated, protected youngster, through her imagination she could prick her finger, smell the blood and know that she existed. And the feelings could be expressed and contained on paper and canvas and thus garner for Arbus a measure of control.

There is an important question here that has been alluded to before. We must ask whether in the little more than ten years of her individual work, Arbus' creativity was, overall, of positive benefit to her fragile personality. In the opinion of this writer, it was not: As Arbus' creative urgency loosened the ego's frail constraints and plunged her deeper and deeper into her unconscious processes, her personality shattered.

That her photography offered her a structured medium with a great deal of technique through which to express and experience the hidden parts of herself was certainly helpful. "The process itself has a kind of exactitude... It's a little bit cold, a little bit harsh," Arbus said. It also provided her a psychologically "safe" way, through her camera as transitional object of interacting with the world. One is led to wonder whether what we observe in the work is the cathartic and thus helpful reflection of Arbus' underlying aggressive hostility. After being photographed by her, Norman Mailer said: "Giving a camera to Diane Arbus is like giving a hand grenade to a baby." It is this writer's view that what we see in the photographs is not rage, but an unflinchingly honest, objective reporting of a very private reality. Hers is a vision of a reality seen without sentimentality or judgment or scorn. Her subjects look directly at her and, unlike most people, she could not bear to look away. It is this act of direct, human cooperation—in relationship—that gives the works their dignity.

On the negative side, her work increasingly drove her into psychologically dangerous territory. Her affinities to the freaks and oddities she was obsessed with reminded her of her own "freakishness" that was previously held in check. Further, a drawing or a photograph of difficult material has an intensely confrontive impact of its own that is hard to ignore. Words, once spoken, can float away dissipating their impact. Written words can be closed off within the covers of a book. Language is a symbolic representation of a distinctly distant reality. Visual images, on the other hand, speak directly to our most essential psychological and unconscious processes and often spring from the deepest parts of the self. Visual imagery such as Arbus is permanent over time and continues to demand attention. With them, one cannot hide or deny or distance within socially acceptable "civilized" conventions. That primitive people thought that the camera was able to steal the soul from the person and capture it in the image was for good reason. If Arbus' form had been words, she might have been able to adequately distance. As it was, I would suggest that she became increasingly mired in a circular process from which finally, there was no escape: The more she photographed, the more she confronted her own forbidden self. And the product of her creative process, the immediacy of the confrontive imagery of her photographs, as she worked on the pictures in the darkroom, looked at them, thought about them and showed them to others, constantly caused her to return to the deepest, most hidden and painful parts of herself. This circularity poses an interesting dilemma for a psychotherapist, for in Arbus' life and creative work, there is implied the possibility of choice between the preservation of life and of her essential creative vision. Could she have retained both? It is my hypothesis that in order to preserve the integrity and survival of her personality (and of her life) a psychotherapist treating Arbus would have needed to discourage her unique, obsessional subject matter and help her displace and sublimate her primary process material into a structured, cognitive framework and an overall more distant, secondary process orientation. Additionally, she might have helped Arbus achieve a less chaotic social environment perhaps out of the stresses of New York City, with its anti-traditional, promiscuous and acting-out art world of the 1960's. Indeed, the doing of photography might have been discouraged altogether. If this could have been accomplished (and it is a big "if"), Arbus' life might have been saved. But without her artistic identity and creative artistry could she have survived at all? If Frida Kahlo's paintings helped her cope with her difficult reality and possibly lengthened her life, so it may be possible that Diane Arbus' photographs offered her the same succor from despair, at least for a time. Through her increasing periods of depression, she roused herself to photograph and thus continued on. Arbus said "I feel like an explorer," and if her relentless explorations devastated her in the end, she left a legacy of meaning which will endure. She changed the direction of photography in the United States and those who look upon her pictures never see the
world, nor our hidden selves, in the same way again.

The artist works within the ambiguous and treacherous territories between the self and the world and there, makes meaning. Out of what is known and what cannot be known a whole new thing is created which, when we experience it, transforms our understanding of our selves and of the essential nature of reality. Arbus' creative power to make meaning is what the fictional painter Guéy Jimson, in Joyce Cary's *The Horse's Mouth* is talking about when asked why he became an artist. He describes walking by a shop window in London and catching a glimpse of a Cezanne painting. "Cezanne," Jimson says, "skinned my eyes for me." Diane Arbus said:

I do feel I have some slight corner on something about the quality of things ... [i]t's a little embarrassing to me, but I really believe there are things which nobody would see unless I photographed them.

Ultimately, we can only be grateful that through her creative vision, Diane Arbus helps us to see.

Comparison of Art Psychotherapy and Discharge Diagnoses of Diagnostic Unit Patients

Barbara Wittels Witlin, MS, ATR, Past-Senior Art Psychotherapist, Fairmount Institute, Philadelphia, PA and Roy Augusthy, MD, Director Diagnostic Unit, Fairmount Institute

This paper correlates art psychotherapy diagnoses with psychiatric discharge diagnoses on Axis I according to the Diagnostic and Statistical Manual of Mental Disorders III, (1980). Total patient population (N = 97) was evaluated by one art psychotherapist and one psychiatrist on the diagnostic/evaluation unit: Fairmount Institute, Philadelphia, PA. Based on chart data frequency and percentage of agreement is: affective (N = 48) 40, (83.3%); schizophrenia spectrum (N = 27) 20, (74.1%); organic (N = 15) 10, (66.6%); personality disorders (N = 5) 5, (100%); others (N = 2) 0, (0%). In total population (N = 97), diagnostic agreement is 75 (77.3%).

This model for future efficacy studies may indicate relative accuracy of art therapy testing in different diagnostic groups. It also suggests future comparisons of efficacy/cost-effectiveness of art with other diagnostic testing. Evaluation of drawings indicates possible usage of art for differentiating between groups of schizophrenics showing brain atrophy on CAT and PET scans, and schizophrenics without detectable brain changes.

Introduction

This study was done retrospectively, covering a two-and-a-half year period, using two sources of information:

1) The discharge diagnosis by the psychiatric director on a psychiatric diagnostic unit.

2) The art psychotherapist’s diagnosis of these same patients.

The site is a private psychiatric hospital, The Fairmount Institute in Philadelphia, Pennsylvania. In this setting a number of diagnostic tools are used, including psychiatric interviews, a psychosocial assessment, meetings with the patient’s family, a physical examination with follow-up consultations if necessary, psychological testing and laboratory procedures. These are all used to supplement impressions gathered during daily clinical observation.

Art psychotherapy assessments are carried out by a master’s degree level art therapist with sufficient internship to qualify for A.T.R. (art therapy registration). Assessments are done without prior information from charts or other written or verbal information.

A literature search shows no previous systematic attempts to correlate art psychotherapy diagnosis with DSM III discharge diagnosis. Also absent from the literature are statistically significant efficacy studies correlating art therapy with psychiatric diagnosis or assessment. A single study such as this, using one art psychotherapist and one psychiatrist with chart information, is not rigorous enough to meet the standards for statistical significance. The research is intended as a basis for heuristic exploration and replication.

The two areas explored are:

1) An examination of the frequency of concurrence of art psychotherapy diagnostic assessments with psychiatric diagnosis.

2) Identification of strengths and weaknesses in art psychotherapy for diagnostic purposes.

A Review of the Literature

Two authors, Ulman (1976) and Kwiatowska (1978), have published a suggested series of drawing tests for diagnosis. Elements of both of these tests are widely used in art therapy testing.

Arieti (1974), Amos (1982), Weiner (1966), and many others have written descriptive literature on pathological art. Dax (1965), Plokker (1965), and Wadeson (1980) have presented statistically significant diagnostic studies, especially distinguishing characteristics of depressed patients' drawings from other psychiatric classifications. Authors are not always in complete agreement on classifications distinguishing one diagnostic group from another.

In his review of findings in neuropsychology, Goldstein (1984) using the Halstead-Reitan test battery, found “many chronic schizophrenics perform in a manner indistinguishable from that of patients with chronic brain disorders,” with regard to cognitive deficits. The present study suggests that art evaluation is useful in determin-
Methods

Tests administered:
Patients are referred from the diagnostic unit for art psychotherapy assessment if definitive diagnosis is in question and total range of available testing is indicated. Patients, seen individually, are requested to do four drawings:

1) A specific place (real or imaginary).

2) A kinetic family drawing (members of the family doing things), (Burns and Kaufman, 1972).

3) A body of water, (Wittels, 1982).

4) Free choice of subject.

Materials provided are 12” by 18” drawing paper and a box of 12 assorted colored pencils. Based on the patient’s response to task No. 1, “draw a place,” the remaining tasks may be modified.

A patient’s inability to concentrate may necessitate reducing the entire test to the simple task of drawing a house, a tree and a person. A grossly confused patient may be asked to do only an organicity screening involving conceptualizing and copying simple shapes.

Data collection: Sample size N = 97, is the total population of patients given discharge diagnoses by the co-author and evaluated by the author. The number of days between art evaluation and discharge diagnosis is usually seven, but ranges from one to ten.

To preclude advanced knowledge of cases or familiarity with the co-author’s diagnostic style, charts are not seen and cases are not discussed. The art psychotherapist does not attend case conferences, nor is she the recipient of written or verbal reports before or after the art therapy evaluation. The physician has access to art evaluation as well as test results from other disciplines. However, the amount of psychiatric observation and multidiscipline-generated information limits the influence of art psychotherapy evaluation on the determination of final diagnosis.

Two cases, selected by the psychiatrist and the art therapist are presented to illustrate the art evaluation process.

Results

Cases are classified as follows: affective disorders; schizophrenia spectrum; organic; and other, depending on discharge diagnosis. Schizophrenia spectrum is defined to include schizophrenia; schizotypal personality; schizoid personality; and borderline personality disorder. (Wender, 1977)

Results are classified into two categories: agreement and disagreement. Agreement is defined as agreement between art therapy diagnosis and discharge diagnosis on Axis I, except when there is disagreement about the existence of borderline, schizoid or schizotypal personality disorder on Axis II.

Table I classifies cases according to the psychiatrist’s discharge diagnosis. Agreement or disagreement refers to the art psychotherapist’s evaluation.

In the affective disorders group, there is 100% concurrence in the diagnosis of the seven manic cases. In depressed cases 33 out of 41 or 80.5% show agreement.

The affective disagreement group includes six cases which are perceived in a similar way by both evaluators, but which do not match exactly on Axis I. They show agreement in most diagnostic features, but differ in emphasis or degree.

One affective case in the disagreement group agrees on Axis I, but disagrees about the existence of borderline personality on Axis II. The eighth case is diagnosed depressed with paranoia by the physician, schizophrenic by the art therapist. Four of the eight disagreeing cases involve heavy drug abuse.

In the schizophrenic agreement group 20 out of 27 or 74.1% agree. In the disagreement group, three show the same two possible diagnoses, but disagree about which is the “best choice.” Four cases show the same components, but are not identical on Axis I (two of these agree on the presence of organic dysfunction on Axis III). The seventh case is inconclusive to both physician and art psychotherapist.

In the organic group, 10 out of 15 or 66.6% agree. All five disagree-

*Other than those classified within Schizophrenia Spectrum
mements are toxic psychoses misdiagnosed schizophrenia by the art psychotherapist.

All 5 cases in the personality disorder group were in agreement.

The two disagreements comprising the "other" category are inconclusive to both psychiatrist and art psychotherapist.

Two cases, illustrative of the art assessment process are also examples of an unforeseen result, i.e., possible ability of an art psychotherapist to differentiate between subtypes of schizophrenia. Both cases are diagnosed chronic schizophrenia by physician and art psychotherapist. One shows organic impairment and the other does not.

**CASE No. 1:**

**Psychiatric Evaluation**

Mr. X. was a casually dressed, 26-year-old single white male, admitted because of severe agitation and extreme social isolation. He had become physically assaultive to his parents and had threatened to kill them. He had spent a great deal of time alone in his room, at times laughing and shouting. Psychiatric history dated back to the age of 15.

The patient was superficially cooperative. His speech was rather monotonous, with significant looseness of association. Thought process was very disorganized and contained bizarre sexual content. There was evidence of paranoid and grandiose delusions, ideas of reference and auditory and visual hallucinations. He was oriented in all three spheres and there was no evidence of organicity or gross intellectual impairment. Insight was very superficial and judgment impaired.

**Art Assessment**

Mr. X. did three drawings: a place, his family "doing something" and a body of water. The works were skillfully executed and showed good perceptual-motor skills with no evidence of organicity.

The first drawing (a place) was a mountainous, other-worldly landscape with a phallic shaped windmill. The picture was not extremely bizarre and drawing skills were excellent. The mood was barren and empty. Sharp, strangely disconnected blades around the windmill suggested the defensiveness of paranoia.

The second drawing (the family) was more bizarre. The father wore earmuffs, according to the patient, to shut out "the voices." The mother was a tiny figure pushing a vacuum cleaner inside the father's head. The patient portrayed himself as Christ being crucified by his sister. Verbalizations made while creating this drawing were tangential and bizarre.

The third drawing (a body of water) was a well with a stone wall and a bucket that could not be lowered. There was no background and the poverty of detail suggested thought blocking following the decompensation seen in the second drawing. Each of the drawings showed characteristically schizophrenic splits into two separate drawing styles or spatial division into unrelated and disconnected components.

**CASE No. 2:**

**Psychiatric Evaluation**

Mr. Y. was a 21-year-old, single white male, a first psychiatric admis-
sion because of auditory and visual hallucinations and extreme paranoia. He was highly delusional, feeling that somebody had placed a metal plate in his stomach and this plate controlled his mind and body, making him feel weak. The patient had refused to eat for fear that food might cause the metal plate to explode and had refused to go outside because he saw people who were "radiated." He had refused to bathe and had slept with knives next to him, seriously considering cutting open his stomach with a knife to get rid of the plate.

These symptoms were of one year's duration, but he had received no psychiatric help. There was no history of substance abuse. The patient had sustained a head injury one year prior to admission.

Mr. Y. was a disheveled, poorly groomed, thin white male, suspicious, guarded, and rather uncooperative. His speech was underproductive, with considerable looseness of association. There was evidence of auditory and visual hallucinations. The patient denied suicidal or homicidal feelings, but his mood was angry and his affect was blunted. He was well oriented to person, but not to place and time. There was no evidence of intellectual impairment. His insight was extremely poor and judgment was grossly impaired.

Art Assessment

The drawings of Mr. Y. showed qualities which are characteristic of both organic and/or some schizophrenic drawings, i.e. over-simplification, distortion, lack of affect, concreteness and perseveration, disturbed lines and incompleteness.

"The works (of Mr. X.) were skillfully executed and showed good perceptual-motor skills with no evidence of organicity."

The first drawing showed the patient with the metal plate he believed to be inside his body. The second drawing showed the patient's concept of himself after the desired surgical removal of the plate. The figures are simple, amorphous shapes. The drawing of the patient after surgery shows an enormous phallic-shaped left arm. This is consistent with sexual identity confusion and magical ideas of changing his sex by removing the offending plate.

The family drawing shows perseverative repetition of geometric bodies without tops on the heads. There is no graphic indication of relatedness within the family.

The fourth drawing of a house shows perceptual distortions and lacking essential details. Two windows above the door reinforced with double lines suggest paranoid eyes. The complete lack of affect and systematic delusions portrayed point to chronic schizophrenia rather than organicity as a primary diagnosis.

Discussion

Clinically, both cases described clearly met DSM III criteria for schizophrenia, upon admission and discharge. In spite of the clinical similarity in psychiatric evaluations, the drawings in case No. 2 showed a

"(Mr. Y) was well oriented to person, but not to place and time."
likeness to drawings by patients with organic brain disorders, while drawings in case No. 1 did not.

Frequent difficulty distinguishing between organicity and schizophrenia is not unique to art evaluation, and is found in psychological and neuropsychological testing as well. Still, art is highly sensitive to perceptual difficulties caused by organicity.

CAT scans, PET scans and metabolism scans show a certain percentage of schizophrenics have clearly defined atrophic type brain changes (Gonzalez, Grossman, Masden, 1985). Case No. 2 could belong to that subgroup of schizophrenics which shows atrophic brain dysfunction. Clinically, it is difficult to distinguish between the two groups. Further studies, including psychological and neurological testing, CAT and PET scans may clarify whether a patient such as case No. 1 belongs to the subgroup of schizophrenics without any noticeable brain changes, while patient No. 2 is a schizophrenic with identifiable brain atrophy. Such a study is strongly recommended.

In our own sample, the overall agreement of art psychotherapy testing with discharge diagnosis at 77.3% indicates its usefulness as a diagnostic procedure. Its value is enhanced by low cost and quick results. (An average art evaluation requires a total of about three hours, including interview, study of drawings, and write-up.)

The area showing the highest percentage of agreement, 83.3%, is the affective disorders. This is explainable by the unique quality of the drawings which do not usually overlap with other diagnostic categories, if there are no additional serious mental problems to cloud the issue.

Schizophrenia spectrum disorders showed 74.1% agreement. This category showed the following difficulties in art evaluation:

(1) Deciding placement on the schizophrenia spectrum.

(2) Pinpointing the predominant problem in cases with schizophrenic as well as depressive symptoms. For example: schizophrenia with depression, versus depression with schizoid or borderline personality.

(3) Overlap with organicity.

Psychiatric diagnosis and art evaluation showed 100% agreement in personality disorders other than those in the schizophrenia spectrum, but sample size, (N=5) was insufficient to warrant any conclusions.

When no psychosis is present, drawings show great sensitivity to organic impairment. However, with the tools available, art evaluation is not helpful in our study distinguishing toxic psychosis from schizophrenia. Here again, sample size is too small for conclusive findings.

Notes
Barbara Wittels Witlin, M.S., ATR is the senior art psychotherapist of the Fairmount Institute in Philadelphia. Roy Augusthy M.D. is the director of the Diagnostic and Education Unit of the Fairmount Institute.

Requests for reprints should be sent to: Barbara Wittels Witlin, M.S., 102 Seven Oaks Road, Summerville, NC 29483.

Deepest thanks to Hal Rosen, M.D. for his invaluable help and encouragement in preparing this manuscript. Special thanks to Roy Witlin, M.Ed., my mentor and inspiration.

Inner Guide

Vija B. Lusebrink, PhD, ATR, Associate Professor Expressive Therapies, University of Louisville, Louisville, KY 40292

The concept of inner guide has universal manifestations in images in the fairy tales, myths, and religions of different cultures. Jung explored this concept intuitively first as a child, later through his method of active imagination.

The most common images of inner guide are protective animals and beings, safe and special places, and light and sound images. The image of an inner guide may change over a period of time, representing different levels of depth of the experience. At times an image of the inner guide may be rejected by the individual as inconsequential because it does not correspond with the individual's expectations.

The images of inner guide emerge in times of great physical or mental stress providing for the individual an inner wisdom and healing. These images also can be activated in a relaxed and receptive state through guided daydreams. The visual expressions of the visual stabilizes the images and reinforce their structural and affective aspects.

Inner Guide as the Wise Helper and Healer

We may have had experiences of making difficult decisions or facing dilemmas in which there seemed to be no way out. We may toss and turn in sleep, we may perseverate thinking about it during daytime, and just as we are ready to give it up, something "clicks." A small voice inside us or some observation suddenly sheds a light on the problem, and we know the way to go.

Jung (von Frantz, 1968) considered that wisdom came from deep and at the same time from transpersonal dimensions of the psyche, namely the Self. In this transpersonal dimension the Self is defined as the organizing center and the totality of the psyche, of which the ego constitutes only a small part (von Frantz, 1968; Edinger, 1973). The Self manifests itself spontaneously in times of extreme stress, when the individual is forced to give up his/her ego position. At these times the totality of the inner psyche becomes an inner companion, and an inner guiding factor. The stress precipitating the experience of and the guidance by the Self can be either physical, such as an illness, or catastrophic occurrences in the external environment. The stress can also be emotional or intrapsychic. A manifestation of intrapsychic stress may be the result of the alienation from the Self, which is experienced as a loss of meaning in life (Edinger, 1973).

The connecting link to the Self most often is manifested as a symbolic image. The multidimensional nature of symbolic images link the biological system with the spiritual, transpersonal dimension. The subsequent expression of the symbolic image through art media, music, dance, or stories gives the image a body.

Inner Guide in Jung's Experience

Jung (1963) in his Memories, Dreams, Reflections tells of several instances of his encounter with the inner guide. Jung's first experience was when he was about ten years old. During this time his parents were considering separation. Being a sensitive child who spent a large amount of time by himself, Jung reacted strongly to this stress by having anxiety dreams and visions. To subdue his anxiety, Jung carved a little mannequin, to whom he gave an oblong blackish stone, and hid both of them in a safe and secret place. In doing so Jung experienced a feeling of safeness and an absence of the inner torment he had before. Each time when the situation at home became difficult to bear, he would think of his little mannequin and stone; he would also place little scrolls of paper written in his own language with the mannequin. The meaning of his actions did not concern Jung at that particular time. This experience lasted for about a year and it marked the end of his childhood.

Both the image of the mannequin and the stone emerged for Jung after many years, when Jung discovered the image of his stone was similar to that of the soul-stones of primitive tribes, and the little mannequin similar to the representation of a god of the ancient world as seen in the image of a little mannequin reading from a scroll to Aesklepios of Telephorus, Greece. Jung carved similar figures later in his life without any remembrance of his childhood ex-

This paper was presented at the 17th Annual AATA Conference in Los Angeles, November, 1986.

“A small voice inside us or some observation suddenly sheds light on the problem, and we know the way to go.”
The connecting link to the Self most often is manifested as a symbolic image.

The most common forms of representation of the Self are through the images of stones, animals and mandalas. Images of light and the place of emergence, like a pool of water, are related to Self, as are special places marked by the knowledge that one has to “stand there.” For example, in the biblical story of Jacob’s dream he fell asleep using a stone for his pillow, and God’s voice in the dream told him to mark that place: “The land where thy liest, I give to you and your seed.” Angels in the form of guardian angels may be another manifestation of the Self. Stones have been invested with holiness and special powers by primitives. We still gather stones; could this reflect our reaching for the unchanging part of ourselves? Precious stones are used as symbols of Self, as are the images of flowers such as the lotus or rose.

The images of animals and birds as helpers and as representatives of a higher Self are abound in mythology, as well as ancient religions. In the biblical story of Elijah in the wilderness, he is fed by the ravens. Wilderness or desert often stand for the psychic stress or alienation (Edinger, 1973). In folklore the inner helper appears often as an animal representing the instinctual, intuitive, innate wisdom. Examples of these helpers are present in the fairy tale of Cinderella or in the Russian tale of the hunchbacked horse. In the Russian story, the hunchbacked horse helps Ivan, similar to Cinderella, to undertake tasks which seem to be impossible; to catch the pig with the golden bristles and silver tusks; and to get the beautiful Tsarina from a faraway land. The little hunchbacked horse saves Ivan’s life when Ivan has to jump in a kettle of boiling water. Ivan emerges from this ordeal beautiful and strong and marries the Tsarina. This story is of a particular interest to us in that the little hunchbacked horse is not “perfect” in that he has a hunchback. This impairment is similar to Jung’s guide Philemon, who had a lame foot. Many times the inner guide appears to be insignificant, a stranger, or have a defect; namely, it may have a quality for which he or she is rejected at first.

Mandalas are the structural devices of centering leading to the inner core. Jung (1963) drew mandalas for about ten years during the time of his inner turmoil and search in his adult life. This period of his life culminated in the “Liverpool dream” in which the center of a city was marked by a small pool with an island in the middle. The island, despite the surrounding darkness was blazed with sunlight, and on it stood a single tree, a magnolia with reddish blossoms. The tree appeared to be in sunlight and at the same time to be the source of light. For Jung the dream had a sense of a finality of a goal, and this was for him the first inkling of his personal myth, giving an objective view on what had filled Jung’s search for many years. Jung’s (1963) “Liverpool dream” combines the elements of place, water, light and a flowering plant as demarking the desired place to be. After the dream Jung gave up painting mandalas. The dialogue with the image in the form of painting helped Jung to contact this inner source.

Mandalas as centering and healing devices have been used in different cultures, especially by American Indians and the Tibetan Buddhists. The Navaho sandpaintings (Olin, 1972) have as a center a “place of emergence” which in their my-
"Mandalas are the structural devices of centering leading to the inner core."

...ology leads to evolution to a higher plane. Many of the Tibetan Buddhist tankas have the image of Buddha in their center, which is then contemplated and visualized by the individuals to discover their own Buddha nature. The individual, though, has to first confront his own shortcomings and mortal sins in the form of monster images before he or she can reach the Buddha nature. Similarly, in Kioto, Japan, the worshipper has to go past the threatening giant guardian sculptures before he or she can enter the inner shrine of Buddha (Campbell, 1974).

Images of the Inner Guide in Dreams and Active Imagination

In everyday life the Self as an inner guide appears most often in dreams. In women's dreams the inner guide may appear in a human form as a superwoman, such as a priestess, sorceress, earth mother, goddess of nature or love. In men's dreams the Self as an inner guide may be encountered in the image of a guardian, wise man, or spirit of the nature (von Frantz, 1968). A voice making pronouncements in dreams can also be a manifestation of an inner guide.

According to the Jungian thought, the Self is a psychic reality, everpresent and not limited in time. As an archetype the Self can be expressed only through a symbol or image. A conscious connection can be established with the archetypal images through the method of active imagination (Jung, 1960, 1969). This approach presupposes a passive acceptance of the flow of imagery combined with active participation in the imagery. In active imagination, the images seem to have a life of their own, and their symbolic flow develops according to its own logic. Jung (1969) cautions against interrupting the flow of events with conscious thoughts.

Giving the symbolic image a form and voice, and establishing a dialogue with it is an important part in enhancing the contact with the Self. The technique of active imagination is an excellent way to establish such a dialogue between what Singer (1973) calls the "I" and the "Non-I." According to Singer (1973) the use of imagination performs the work of the transcendent function to establish a conscious dialogue between the unconscious and the ego through the objectification in images. Painting and drawing of the images produce a further clarification of them. Thus, dream images which do not seem to yield any meaning of the dream for the dreamer may be called upon in a wake state and actively confronted. Singer (1973) points out that in this process "the conscious side states its position vis-à-vis the dream, or asks the question that the dream has covered. It then suspends all critical judgment and allows the unconscious an equal opportunity to express itself. Often words will come, or ideas, which have meaning, and to which the ego may respond" (p. 362).

A transformation of the personality may take place if the process of active imagination is seriously undertaken. At the same time active imagination may become too fascinating for the individual and may pull him/her toward the unconscious. For this reason active imagination is recommended primarily for individuals with a well defended ego. Series of spontaneous paintings may be regarded as active imagination in process (Lyddiatt, 1971). The act of painting is a reality-directed activity and brings out, in most cases, the integrative aspect of a structure present in the visual expression.

A guided daydream (Leuner, 1978, 1984) uses the principle of active imagination combined with the structure provided by the therapist who presents verbally to the client in a relaxed state a sequence of scenes and actions with a symbolic meaning. The client's images, in turn, become the source for further exploration via active imagination. For example, the sequence of going in a cave and encountering a wise man or woman there with whom the individual establishes a dialogue represents a semistructured way of establishing an inner dialogue with the Self. Going up the mountain and entering a temple on the mountain top is another guided imagery sequence which often leads spontaneously to the encounter with some aspect of the inner Self. Descent and ascent in guided imagery correspond to reaching down in the unconscious layers of the psyche or reaching up towards a spiritual aspiration. If the guided daydream contains some reference to obstacles to be encountered on the way towards the goal, either in ascent or descent, these obstacles provide a point of deeper involvement for the client than just casually following the therapist's instructions. Once overcome, the obstacles may become incorporated in the image representing the self. Thus the transcendence of obstacles in a guided daydream contributes to the emergence of a transcendent function.

The following examples illustrate the transformation of images during...
ascent and descent. In a sequence representing the ascent of a mountain the individual’s ascent at first was blocked by a fallen tree log. The image of the tree log became incorporated in a temple on the top of the mountain. The temple was made of logs arranged in octagonal form and in the middle of it was a book of wisdom. In another sequence representing descent into a cave the obstacle was introduced by the therapist in the form of a dragon as an archetypal symbol for the lower, undeveloped aspects of a personality. By actively overcoming the dragon in the guided daydream one individual reached a temple-like structure with a mandala-like stained glass window. In both examples overcoming the obstacles resulted in images representing the Self.

Emergence of the Image of Inner Guide in Mental Illness

The image of an inner guide may spontaneously emerge in mental illness, especially in severe illnesses such as psychosis, acute schizophrenia (Perry, 1962), and multiple personality disorder (Allison, 1974, 1980). In psychosis and acute schizophrenia the inner guide or a representation of the Self usually appears in the image of a wise old man or a woman, which is then stated in the terms of corresponding present day personalities, such as Einstein. The image of Virgin Mary may be an inner guide for a woman. The structure of a mandala also often is present in the visual expressions of these patients.

A schizophrenic patient reflected, in his spontaneous paintings, the emergence and transformation of the image of inner guide. At first the patient identified with the ward physician who had a Freudian orientation. Then an inner image slowly emerged which was “older and wiser” than a specific staff person. After reintegration the patient shared with me his feelings experienced during a trip to a special place where he had felt inner peace and healing. The image of light emerged for him as if coming from the outer space. This sequence of emergent images exemplifies reaching the inner core during acute psychosis, and the subsequent distancing from it.

Another acute schizophrenic who was decompensating presented a collage in the form of a mandala, with the structuring and centering of images. Creating the collage provided him with a way to integrate the pressing images, and over a period of time he constructed this collage on the walls of his room. This mandala-like structure, including the image of Einstein as the old wise man provided the client with his own inner structure and guided him towards his subsequent reintegration.

In the multiple personality disorder the inner guide or the inner self represents a deeper unifying personality within the individual. This inner guide or integrative part of the individual establishes a dialogue with the dominant personality to work towards the best interests of the individual.

Allison (1974) in discussing a case of multiple personality, describes her three personalities: a dominant repressed and depressed personality; an aggressive and impulsive personality; and a dependent and submissive personality lacking self-confidence. Eventually the different personalities were integrated with the help of the fourth one who knew what the other personalities were doing and was able to help the main personality to deal with the other personalities and to integrate them. The fourth personality was one who had started as an imaginary playmate when the patient was three years old. Allison (1974) designates this integrative part as the inner guide. In the therapy sessions this part knew how the main personality was feeling and how she could be best helped; it had strength and could encourage strength in the dominant personality. In the case where the inner guide personality did not know the answer directly, she would be able to convey it through automatic writing. Allison reports working with five other multiple personalities, all of whom had such an integrative part as inner guide. According to Allison (1974), this phenomenon is the manifestation of a higher part of the personality which is a derivative of the soul, a part called the Inner Self, the Real Self, the Self” (p. 30). The healing and the integration of the multiple personality can take place only when all the parts of the personality decide to subordinate themselves to the direction taken by the inner guide.

Allison (1974) describes the requirements for the therapist working with the inner guide of the patient: the patient must have a complete trust in the therapist, who must call on the inner guide to come out, unless it is an emergency and the guide will contact the therapist; the therapist must be also in touch with his or her own inner guide who is in communication with the patient’s inner guide.

In a case where I, as co-therapist, worked with a multiple personality, the client experienced the emergence of a new and integrative part. Nevertheless, the split-off parts were insistent on their existences, and the grief of letting the other personalities go was strong, since the other parts were experienced as dying. The
main personality was portrayed in mourning. Dealing with the grief becomes an integral part of the integrative process and in this case the feelings of grief were experienced by the emerging healthier part. Ultimately this client died of a drug overdose.

Active Imagination and Inner Guide in Healing

The image of inner guide can be used in enhancing healing (Bresler & Trubo, 1979; Korn & Johnson, 1983) by obtaining the advice for the patient from his/her own unconscious through a guided daydream. In contacting the inner guide it is important to establish a safe place and to have an open and nonjudgmental attitude (Bresler & Trubo, 1979; Korn & Johnson, 1983). In using imagery in healing the presentation of a sequence of scenes usually starts with a meadow. The client is asked to imagine the emergence of a being from the woods as a way of establishing a possible contact with the inner guide. The client is encouraged to establish eye and verbal contact with the guide as well as set up a place for further meetings. In this approach the inner guide may often emerge as a light or an animal. This sequence allows the patients to establish a contact with the intuitive part of himself/herself, representing the transcendent function, and ultimately the wisdom of the Self. The sequence reinforces a safe meeting place with the inner guide where future meetings can take place. The spontaneous emergence of the inner guide in this context should be accepted uncritically, since the spontaneous images have the greatest healing power. The imagery becomes an important source of support and enhancement of well-being especially in chronic illnesses.

In trying to contact the inner guide the individual may initially encounter difficulties for the individual in the form of threatening images or closed-off areas. Opposites may be present before the appearance of a unified image, or the images may be just a vague landscape in which one has to find the right direction. The individual may not take the image of the inner guide seriously at first, or may be disappointed that the emergent image does not correspond to his/her own expectations and may change the image accordingly.

The following is an example of the special but everyday quality of the image of inner guide. A woman in her fifties complained of continuous migraine headaches. She was a very responsible person, taking care of everybody's needs in her family including her father who had heart troubles and her mother who was terminally ill with cancer. The woman took part in a group dealing with behavioral approaches in the treatment of migraine headaches.

In the guided daydream of inner guide an image emerged of her deceased little dog who had been a great joy and comfort to her in the past. The woman herself enjoyed the daydream, but was not quite sure of the significance of it. A few months later she had a dream where the little dog wanted to get her out of the house and to play with her. This was an inner wisdom for the woman, whose headaches had reappeared as her dying mother required an inordinate amount of her time and effort.

The therapist has to establish for any client not only safe and relaxed conditions to experience the imagery, but also needs to provide a receptive attitude towards the spontaneously emerging images and attach importance to them. The client may not be able to do these things in the beginning of the treatment. The therapist also reinforces continued contact with the inner guide.

Art Expressions of Inner Guide

The act of giving the image a body through visual expression—or through movement, or any other modality—in addition to the verbal description is an important part of making the contact with the inner guide or wisdom. The visual expression of the healing action and healing agents is similarly important (Achterberg & Lawlis, 1980, 1984). The visual expression may present a structure for the inner guide and the healing process which may be overlooked in the verbalization. Also, the visual images, in turn, are more readily incorporated in dreams and thus speak to the whole organism more readily than the verbal modality which may be more defended. The visual expression of a threatening image may serve as a point of exploration or desensitization regarding the threatening aspects. Vague images may be explored through different media in defining the ambiguous aspects of them. The visual portrayal of opposite images, followed by a third, often helps to synthesize both aspects in a form which transcends the previous split into opposites.

The following are different examples of the images of inner guide drawn after the presentation of a guided imagery of encountering the inner guide in a safe place.

The images can be divided into several general categories. The first category represents social compliance coupled with resistance, or rejection of the emerging images. The inner guide may be initially represented as God or wise man, but upon further probing these images may reveal compliance with expectations, while the spontaneous images may be rejected as inappropriate, as for example a cartoon frog or a little creature (Figure 1). Exploration of these images and feelings associated
with them as well as the expectations of the individual becomes an important part of the process of reaching the inner core.

The spontaneous images of inner guide or special place can be divided in the following four main categories: protective being; safe and special place; light (Figure 2) or positive sound images; and animal image as the inner guide (Figure 3). Often these different elements are combined in one image or a scene. Similarly to the helpers in myths and fairy tales the image of the inner guide may undergo transformations upon repeated experiences representing different levels of the inner experience. The acceptance of the spontaneous images is important in the transformations. The dialogue with the inner guide may reveal the importance of these transformations for the individual. Rejecting the earliest image or interpreting it on the wrong level as a result of ego inflation or delusion of grandeur may result in harm instead of insight (Miller, 1977). Working with healing images places a responsibility on the individual, but this responsibility may be interpreted as the individual's ability to respond to the images. For individuals with masochistic and self-blaming tendencies the individuals are advised to look for strengths, resources, and solutions within themselves. Exploration of the sensations, feelings, and the images associated with the symptom are important preparatory steps for asking advice from the inner guide. In the dialogue the insights gained

Fig. 1  Inner guide as a little creature in the closet.

Fig. 2  Inner guide as a light.

Fig. 3  Inner guide as a lion.
from this exploration are shared with the inner guide, as are the needs of the symptom which may have many layers. Turning the insight and advice into a practical action is another important step in the process of using the image of inner guide in healing (Rossman & Remen, 1982).

Summary and Conclusions

Inner guide represents a wisdom coming from deep, and at the same time transpersonal aspects of the psyche, namely the Self in Jungian thought. This aspect emerges in time when the individual undergoes extreme stress either physically or emotionally. Jung’s experience with his inner guide Philémon serves as a template for the concept of inner guide. The images of inner guides, especially in the form of helpful animals, abound in folklore and mythology.

Inner guide may emerge in dreams providing the individual with much needed guidance in times of stress. Jung’s concept of active imagination is one way to facilitate the individual’s experience of the image of an inner guide. Guided imagery also may facilitate the emergence of inner guide. Several examples of the spontaneous manifestation of the inner guide in mental illness, as well as the images of it emerging in guided daydreams, illustrate the different aspects of the inner guide.

"CREATIVE EXPRESSION"

Written and Directed by: Leslie Wright, RMT
          Nancy Steinberg, MA, ATR
Producer Pat O'Sullivan
Produced and Edited at: New Age Sight and Sound
          Ridgview Institute
          Atlanta, Georgia

This video is attractively presented. The color quality vivid and the musical selections intriguing. The body of the tape is comprised of seven segments. Each is composed of a series of still frames which incorporate a script interwoven with visual images and written definitions. A musical score is integrated into the fifteen-minute presentation. Typically, a word that refers to a psychological state is flashed on the screen, briefly defined, and then followed by a series of approximately ten images and a specific musical passage chosen to illustrate that psychological state. Featured are segments devoted to the following: loneliness, anger, denial, depression, confusion, guilt and insight.

A strength of the video is its style of presentation and format. The opening narration effectively illuminates the terrain to be covered and arouses interest in the "visual and auditory" presentation. We are informed that we will witness "the process...of interpretation of art and music and the feelings conveyed." The video's content is methodically arranged in digestible portions of information, which follow one another in a regular sequence. This regularity provides a predictable frame of reference for the viewer.

Another positive aspect about this video is that the creators assert the validity of applying music as well as the visual arts in therapy. Art Therapists, immersed in the world of visual imagery, sometimes need to be reminded of the value of other expressive therapies. Here, an Art Therapist and a Music Therapist collaborate, pooling from both modalities to endorse the importance of creative expression. Endeavors such as this benefit both the Art and Music Therapy fields since this complementary effort gives us a more complete understanding of the affective domain as it is communicated through two different sensory dimensions.

While viewing the video important concerns basic to the theory and practice of Art Therapy begin to surface. Crucial issues are inadvertently exposed centering around the video's significant weaknesses. The first crucial concern regards the definition and classification of psychological phenomena. In communicating about their work, Art Therapists need to be clear in identifying the psychological states of their clients. This means being able to accurately define and distinguish between concepts such as emotions, defense mechanisms and cognitive processes. This video fails to differentiate between such concepts and erroneously classifies them, e.g. denial is referred to as an emotion rather than a defense mechanism. Obviously this is not a trivial flaw since the soundness of a therapist's work depends upon his/her ability to perceive the client's condition with the utmost precision. Furthermore, a therapist's accurate understanding and usage of psychological terminology is imperative if we are to dialogue effectively with fellow mental health professionals. Effective communication becomes even more problematic when our terminology fails to denote the full meaning of the concepts we use. Here again, the video falls short of our expectations. For example, insight is defined as "a personal awareness of how positive changes can influence the course of one's behavior." This definition is incomplete because it fails to include the notion that an awareness of negative relationships can also be part of the insight process.

A second important issue evoked while viewing this video regards the classification of art work into discrete categories. This is an issue of long standing significance in the field of Art Therapy. Categorization gives us some frame of reference to make sense of the barrage of images we encounter in visual form. On the one hand, categorization enables accu-
rate diagnosis/prognosis, and predictive validity is established. On the other hand, there is the danger of relying on a fixed formula that reifies Art Therapy phenomenon. In the video this problem is brought to mind since the visual examples of various psychological states might be construed as prototypes for how these states are or should be expressed. Classifying art therapy work in this manner also implies that an art work expresses a singular emotion. This notion is misleading since any one piece of art may be an expression of multiple thoughts and feelings. This kind of classification is problematic, particularly in the case of the non-art therapy viewer and the neophyte Art Therapist where there may be a tendency to latch on to simplistic notions in the interpretation of art work.

What might help the viewer from inferring a simple relationship between the categories and the represented motifs would be a statement at the beginning of the video, such as: “The selection of images chosen by no means exhausts the potential range of images that might be elicited in the expression of any single emotion. Further, it is conceded that a variety of feelings may be expressed in a single piece of art work. The images you will see were selected by the therapist, solicited from various populations, in response to specific directions that focus on the expression of particular emotions.” Such a statement would reference the art work within some context and caution the viewer against broad generalizations about art therapy expression and interpretation.

While viewing this video, the issue of classification ascends to dominance because of yet another problem. The viewer is not given enough information to understand why some of the art work is placed in a given category. There are several ambiguous shapes and forms included in categories for no apparent reason. In addition to ambiguity there is confusion created by the occurrence of similar motifs found in more than one category. For example, to illustrate the visual expression of anger, there are several drawings in this segment which portray figures with an emphasis on their mouths and teeth. We are led to believe that such a motif is a graphic clue to interpret anger. Yet we find the very same motif included in the two other categories of denial and depression. The use of the same motif for different categories diminishes the significance of what has been set up as a valid marker for coding a psychological state.

One final problem with the video concerns how music is used in the presentation of Art Therapy material. As stated earlier, the collaborative efforts of art and music therapists are laudable. However, such efforts are not without certain hazards that might impede the delivery of a cogent message. The criticism about the combined use of art and music in this video relates to the contrast between the professional quality of the music coupled with the clinical quality of the art work. The validity of underscoring the images with classical music is questionable. The musical pieces chosen are powerful and have an established universal appeal not on par with the chosen art work. There is a danger of manipulating the viewer into seeing the images in a contrived way, set up by the imposition of the tone and mood of the musical score. The added provocation of music seems to make the art work conformable to a context which may distort the original meanings and intents of the clients. While musical elaboration may enhance a presentation of art therapy ideas, such an intervention must be applied with critical attention to the possible effects of muting or exaggerating the voice of the client.

Although “Creative Expression” contains significant flaws, it is an attractive video which can be used as an instructional tool for Art Therapists. It is important to keep in mind, however, that the most important lessons we can learn from this video may not be those it intends to instruct us about. It stimulates questions about the approaches we employ to interpret art work and brings to mind the weighty responsibility Art Therapists have in clearly communicating about our field. It is therefore recommended that this video be used prudently with full awareness of its shortcomings. The use of video to disseminate art therapy information is relatively new. Hopefully, “Creative Expression” can serve as a base from which future videos can depart, using the content here for elaboration and improvement.

"Art Therapists"

Jules C. Weiss, MA, ATR, Art Therapist and Consultant in private practice, and the Director of an Older Adult Wellness Program at the Lee Circle YMCA in New Orleans, LA. Mr. Weiss is author of Expressive Therapy with Elders and the Disabled: Touching the Heart of Life, and the Wellness Program for Older Adults published by Haworth Press.

In the moment, through the arts, we call forth a primal relationship.

A relationship which engages the spirit in expression and acknowledgment of the soul. A creative task which invites a deeper and more intimate experience of the self and the life of the individual.

The pen and brush, movement and sound are the wheels and sacraments of the journey. Authentic expressions of the core. Experiences, which illuminate our life.

We are the leaders and we are the witnesses in the authentic, individualistic experience and empowerment.

Artists, helping others to find and master the art of their being.

People ask themselves in the midst of a complicated, computerized, televised age, "Who am I and where should I place my attention?"

Searching for a path of happiness and fulfillment, they question how to find and take hold of their inner life.

How to face the moment?

We hold a responsibility that reflects the life task of man: to be a guide in the journey to know oneself; to help individuals create in the wisdom of the self; and to enable people to learn, develop, and share in the well-being of this world.

We are the new priests, accompanied by meaningful, vibrant rituals and rites which inspire the inner life to blossom.

We are the new artists.

Poem—Amy M. Speltz, ATR, Minnesota

As I sit here on my bed
Visions of blood fill my head
Hoping and praying to soon be dead
The razor blade will slit my wrist
Trembling in my other fist
Droplets of blood hit my sheet
As a pool of blood forms at my feet
The razor blade goes through my vein
As suicidal thoughts go through my brain
Cutting cutting cutting in deep
Waiting for my peaceful sleep
There’s a knock at my door

As I cut a little bit more
A whispering voice “Are you okay?”
As I think “Go away”
I hear them coming through my door
Wait what’s happening I hear no more
My head is light and beginning to soar
As I feel them close the door
And as the van begins to speed
They can no longer fill my need
And as my head begins to spin
I realize in suicide there is no way to win

Written by Trina and Holly, two teenagers who have dealt with suicide. January 1988

108 ART THERAPY, December 1988
Don't wait to hear 'Guilty as Charged' to discover that Professional Liability Insurance is a Professional Necessity.

Don't be lulled into a sense of security by a few years of "no incidents." Keep the facts in mind continuously:

Fact #1. A suit for malpractice, whether justified or not, might destroy your career and future security. And it does happen...often.

Fact #2. Trying to forecast a court decision is playing "Russian roulette." Courts may not be familiar with 'appropriate medical practices.'

Fact #3. You can be involved in a malpractice suit even if you were not directly involved in an incident.

Fact #4. If a suit is filed against you, you must be defended, even if the charges are unfounded. And legal fees, alone, can be destructive.

PROFESSIONAL LIABILITY POLICIES ARE NOT ALL ALIKE!

Insurance companies which underwrite Professional Liability policies vary widely in coverages, premium rates and claims handling. There are three major areas of difference:

For almost 40 years, Maginnis and Associates, Inc. has been designing and administering Professional Liability Insurance programs for allied health professionals.

Backed by the experience, continuous annual growth and daily exposure within the constantly-changing field of insurance, we sincerely believe that the Professional Liability plan we provide is the best presently available.

Get the details now! Complete and mail the coupon at right for additional information about all the AATA-sponsored insurance plans.

a. Coverage Limits. Means the dollar amounts of per-occurrence protection and the aggregate total-per-year protection. Look for top dollars!

b. Premium Rates. Compare this feature carefully. The best insurance buy is the policy that offers the highest coverage limits at the lowest annual premium rate.

c. Don't overlook the "Experience Factor." The best liability programs combine reliable "Old Line" insurance companies with a well-seasoned Administrator.

The interdisciplinary journal devoted to the creative arts as healing arts.

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Assistant Clinical Professor, Department of Psychiatry,
Yale University; Clinical Psychologist, Veterans
Administration Medical Center, West Spring Street,
West Haven, CT 06515, USA

Dedicated to scholarship in the creative arts therapies,
THE ARTS IN PSYCHOTHERAPY presents innovative
research in artistic inquiry and expression, and its
use in the treatment of mental disorders.
THE ARTS IN PSYCHOTHERAPY is a quarterly,
international journal for professionals in the fields
of mental health and education. The journal
publishes articles (including illustrations) by art,
dance/movement music, poetry and drama
psychotherapists, as well as psychiatrists and
psychologists, that reflect the theory and practice of
these disciplines. There are no restrictions on
philosophical orientation or application.

SPECIAL RATES AVAILABLE FOR MEMBERS
OF QUALIFYING SOCIETIES!
Members of qualifying societies can receive a discount on
one-year Professional subscriptions the THE ARTS IN
PSYCHOTHERAPY. Please write for further information.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is
to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and
strives to present a broad spectrum of ideas in therapy, practice, and research.

Volume 6, Number 1
April 1989
The recent 19th annual A.A.T.A. Conference is history and reports have suggested that it was an exciting and profitable series of meetings. Although it is early, I am already looking forward to next year’s conference.

This issue of Art Therapy includes (as in the past) an overview of the recent Conference. For those of you who wish additional information on papers, panels, etc., you should consult your A.A.T.A. Directory and jot a note to the presenter(s) for the information that you desire. I am sure that any presenter would enjoy hearing from members not only for the requests, but also for a “pat on the back” regarding the presentation.

Also in this issue are two professionally important and timely articles. “The Effects of Art Therapy Experiences on Rigidity, Body Concept and Mental Maturity in Graphic Thinking of Adolescents with Mental Retardation” is by Sirkku Sky Hiltunen, EdD, RDT, ATR, a primary art and drama therapist at The Art and Drama Therapy Institute in Washington, D.C. Dr. Hiltunen presents a study that “… focuses on the decreasing of rigidity and consequent enhancement of receptive/expressive cognitive functioning in order to clear the channel of and prepare the groundwork for communication of thoughts and ideas in the further therapeutic intervention.” (ref: abstract)

Another study, “Art for Institutionalized Elderly,” by Wendy Weiss, MFA, Donna E. Schafer, PhD, and Forrest J. Berghorn, PhD, presents an eight-week textile art education intervention, encouraging skill development and the application to fabric painting. Results show significant improvement in some areas, and point out the need for expanded work with this older population—particularly in selected art areas that encompass some skill development.

My sincere congratulations to two members of the American Art Therapy Association who received well-deserved honors at the recent Conference. First, Don Jones, ATR—a worthy recipient of the Honorary Life Member designation—has proven to be a long-standing, sincere friend of art therapy through his clinical training, work in the field, and commitment to the profession. As a “founding father” of A.A.T.A. he certainly deserves this honor, and joins the ranks of others who hold this recognition.

Second, Lewis K. Shupe, PhD, ATR, the recipient of the first Distinguished Service Award presented by A.A.T.A., is deserving of this honor. Certainly, Lew has given of his time and energies in many ways to the Association and to the professional field, and he has also built many long-lasting friendships through his professionalism, support and forward-looking views of clinical and academic preparation.

Responses from both Don and Lew are in this issue, as is the presentation given by our A.A.T.A. president, Cay Drachnik, in the opening ceremony of the Conference. It is a thought-provoking statement that charges the reader to think not only about “where we are,” but “where we should be” as we move ahead toward the year 2000.

In this issue the reader will find a letter to the editor from Barry Cohen, relating specifically to a recently published article (re: Comparison of Art Psychotherapy and Discharge Diagnoses of Diagnostic Unit Patients, by Witlin and Augusthy, Dec., 1988, Vol. 5, No. 3). His letter requests the inclusion of additional bibliographic references, and I am pleased to transmit this information to the readers of Art Therapy. It is important to convey your thoughts, suggestions and clarifications on published materials as well as ideas for future issues. The “letter to the editor” format is a relatively easy way for the readership to be heard. Thanks to Barry for his letter, and I look forward to other communications as the need arises.

We are receiving an increasing number of submissions for “Viewpoints” and I encourage even more. We will publish accepted entries as they “fit” into each issue. How about some art work from members for this section?

For anyone wishing to have a book reviewed, write to Aina O. Nucho, PhD, ATR, the Book Review Editor of this journal. If you have come across a new book that you think should be shared with our readers, please drop a note to Aina. She will be happy to follow through with the suggestion.

Have a pleasant summer!

Gary C. Barlow, EdD, ATR
Editor, Art Therapy
Letter to the Editor

Dr. Gary Barlow, Editor
Art Therapy
505 E. Hawley Street
Mundelein, Illinois 60060

Dear Gary:

I am writing in reference to the article “Comparison of Art Psychotherapy and Discharge Diagnoses of Diagnostic Unit Patients” (Wittlin and Augusthy, December 1988). Such a study is long overdue, and the authors’ contribution is to be heartily commended.

I wish to point out that the literature review was not quite complete. The authors bemoan the absence of literature statistically correlating art therapy with psychiatric diagnosis.

Actually, “The Diagnostic Drawing Series: A Systematic Approach to Art Therapy Evaluation and Research” won the 1983 AATA Research Assistance Grant for organizing a national study to do precisely that. Presented at least once each year at the national conference since 1983, this study correlates DSM III diagnoses with structural characteristics of a standardized three picture series using statistical analysis.

The paper was published in English in the Spring 1988 issue of Arts in Psychotherapy journal, which was devoted to assessment in the creative arts therapies. Prior to that, it was published in Holland’s journal Psychologie (April, 1986). Two major college psychology textbooks cited and illustrated the DDS (Wade and Tavris, 1987); and Benjamin, et al., 19879). These were in addition to the illustrated article published in the American Psychological Association Monitor (April, 1985). These publications were noted in the AATA Newsletter research column published in the Fall of 1988.

The authors espouse the scholarly approaches of literature review and replication but have themselves failed to address pre-existing work in the field. I am aware of the lengthy lead time for publishing journals which may overlap the appearance of contemporaneous and relevant papers. This collaborative work, however, has been a well-publicized aspect of art therapy research since 1983. In the final analysis, the responsibility for scholarly accuracy must rest with the journal editor.

Thank you.

Sincerely,
Barry M. Cohen, ATR
Director, Expressive Therapies
Mount Vernon Hospital

AATA Conference Overview

The 19th annual Conference of the American Art Therapy Association — with the theme "Professionalism in Practice" — was held at the Palmer House, Chicago, Illinois, from November 16-20, 1988. The entire Conference was successful, with members and guests coming away with renewed vigor and professional satisfaction. Special thanks must be offered to the Conference Chair, Linda Gantt, and to the Program Chair, Patricia Isis, as well as the many committee members who devoted time and energies in the preparation and follow-through of the meeting.

On the following pages is a listing of the numerous papers, workshops, pre-Conference courses, symposia, panels and other highlights of the Conference. This information is offered (similar to previous years) so that readers may communicate with the presenter(s) for additional information desired on a specific topic. Refer to your AATA Membership Directory, 1988, for addresses, or write to the AATA Office if an address is not listed in the Directory. It should be noted that each entry is printed as it appeared in the Conference program, although specific categories have been grouped together for the reader's convenience. The basic information has not been edited and, therefore, does not reflect any last minute changes that may have occurred at the Conference.

Art for Institutionalized Elderly

Wendy Weiss, MFA, Assistant Professor, Department of Textiles, Clothing and Design, University of Nebraska, Lincoln, Nebraska
Donna E. Schafer, PhD, Assistant Professor, Gerontology Programs, San Francisco State University, San Francisco, California
Forrest J. Berghorn, PhD, Professor, Associate Director, Gerontology Center, University of Kansas, Lawrence, Kansas

Abstract

Institutionalized elderly often lack stimulating and creative activity. An eight-week textile art education intervention introduced an activity that encouraged learning new skills and applying them in an individual and creative manner to fabric painting.

To evaluate the intervention’s effectiveness, data were gathered from two interview schedules; one administered to nursing home staff, the other to residents. The sample of forty-nine residents, twenty-six of whom participated in art classes, was drawn from three nursing homes in Lawrence, Kansas.

Results indicate social interaction improved significantly and the quality of art work produced by the majority of participants improved over the course of instruction.

The study suggests that arts programming in nursing homes contributes to social well-being and provides opportunities for learning new forms of creative expression.

The objectives of most nursing home activity programs are to maintain a resident’s physical functioning, self-care behaviors, motor skills, mental alertness and social skills. What distinguishes a creative activity from activities such as a group craft project or classroom reality orientation is that in a creative activity the results are always varied. Each participant brings his or her ideas to the activity and is encouraged to use them. Hence, the products will never, and should never, be the same. Creative visual expression is a non-verbal form of communication, making it appropriate for individuals who are experiencing losses in their ability to communicate verbally, as well as personal losses through illness, death of loved ones, loss of lifestyle, and other changes related to aging and institutionalization.

Literature Review

The body of literature on developing art programs for institutionalized elderly is relatively small. Most articles describe specific programs or cases with which art therapists have been involved. Others discuss benefits older people can gain from participating in a creative activity and offer advice for assisting them in achieving the benefits of creative expression.

Harrison (1980) describes an outreach art program she established as a preventive psychological intervention for a community mental health center. Weber (1981) describes a folk art program with day care center and nutrition site participants. Dewdney (1973) pioneered in the development of art therapy programs or exercises for institutionalized elderly. She identifies three levels of functional ability and places emphasis on encouraging students in a constructive atmosphere, at each level, to reinforce the value of both the artists and their work. Wald (1983) describes the use of art therapy to diagnose, evaluate, and treat victims of Alzheimer’s disease.

Aspell (1976) states the benefits of art education for blind elderly, including flexibility, independence, originality, individuality and sensitivity. According to Aspell, the constant need to make decisions while creating a work of art fosters independence. Developing problem-solving skills and organizing ideas in new ways inherent in artistic activity, promotes flexibility and originality. Additional benefits, Aspell contends, are increased manual dexterity and social interaction. Zeiger (1976) developed an art therapy program based on Robert Butler’s (1963) work on the life review. She found that severely impaired residents’ drawings of significant past experiences facilitated discussion of repressed memories and resulted in increases in social interaction and clearer perceptions of surrounding activity.

Alpaugh, et al. (1976) suggest that older individuals tend to be more cautious and less willing to take risks than younger people. Consequently, they advise that “older adults will need encouragement to experiment with unusual alternatives...” the optimal learning situation for older adults is one in which difficulties are minimized and anxiety is alleviated through supportive instructions.” (p. 35) Crosson (1976) suggests techniques to encourage spontaneity in geriatric patients, including placing a depressed or resistant student next to an active, motivated one; guiding the hand of

“The body of literature on developing art programs for institutionalized elderly is relatively small.”
a patient to overcome hesitation; using magazine illustrations to inspire subject matter; and exhibiting finished art work and inviting student comment to help relationships develop among patients. Essays in Weisberg and Wilder’s collection (1985) address the question of how to encourage elderly participants to communicate with others in the disciplines of music, art, dance, creative writing, photography, and drama. The authors/artists discuss ways to encourage decision making, social interaction, and learning new skills—ingredients essential to the creative process.

The existing literature is useful in providing information about the types of projects artists have used with the elderly population, often with particular groups such as Alzheimer’s patients, those living in both institutional and non-institutional settings, and blind elderly. Taken together, it is clear that artists have introduced a full range of visual arts activities to older students, including acrylic painting, collage, drawing, textile arts, ceramics, as well as other expressive arts such as creative writing, music, and drama.

However, with few exceptions (e.g., Clark and Osgood’s, 1985, study of creative drama programs for the elderly), the literature has lacked systematic analysis of the impact of arts programming on elderly students. This lack of systematic evaluation, coupled with the variations in the elderly student groups reported in the literature, makes it difficult to determine which teaching methods are most suitable for given groups, what benefits are most likely to occur and for whom, whether or not there is a carry-over of benefits from an art intervention to the daily lives of elderly students, and whether or not a group of older students are able to improve their capacity for artistic expression. A lack of systematic information not only inhibits us from making our programs more effective, but also prevents us from demonstrating convincingly that creative programs are a good financial investment for those interested in the social and emotional health and well-being of older people.

The textile art program for nursing home residents we conducted, and its evaluation, are presented in the following two sections. In designing the program, we incorporated many of the teaching techniques suggested in the literature. From the literature we formed the hypothesis that participants in our program, relative to a control group, would show statistically significant gains in self-esteem and social interaction as a result of participation. We also hypothesized that program participants would improve, as rated by two independent judges, in their use of elements of artistic composition over the course of the art education program.

The Program

Over a seven-month period from October 1985 to May 1986, residents from three nursing homes participated in textile arts classes offered by the Parks and Recreation Department of Lawrence, Kansas. This special program was funded jointly by the Kansas Arts Commission’s “Artist in Education Program,” the Community Development Block Grant Program, the participating nursing homes, and the City of Lawrence. Activity directors at all five Lawrence nursing homes were invited to participate in the program. They received a letter introducing the creative and research aspects of the program and were given the option to select either an eight-week session that met once per week (costing $100) or three times per week (costing $200). They were told supplies would be provided. In follow-up calls, it was made clear that if the nursing home was interested in the program but could not pay for it,
Fig. 2. These four paintings by the same individual were done in sequence from left to right. The student's initial line and shape paintings developed into a body of paintings based on the student's recollection of the buildings on the farm where she grew up.

special arrangements could be made. Two of the five homes declined to participate, one opted for classes three times per week and two requested one class per week. All three participating institutions paid the requested fee. One of these facilities is operated by the county; the other two are privately owned. All have fewer than 100 beds. Classes were scheduled to meet for one hour, with one half-hour allowed both before and after class for set up and clean up.

Class content was similar for all three classes. The class meeting three times per week included a greater variety of exercises on the material covered in all sessions. The three classes followed the same general sequence of design material, with some variation based on the dynamics of each group. Weiss was the instructor for each class. Over the eight-week period, students progressed from painting lines on paper, to color mixing, to painting shapes, to painting on fabric. The students then selected one or more of their fabric paintings to make into a pillow.

The activity room at two of the nursing homes, and the dining room of the third, served as classrooms. Approximately eight to twelve students per session participated. In general, they were reasonably mentally alert, although some were marginally so. All were sufficiently ambulatory to leave their rooms, but some needed assistance. Most had some disabling condition, ranging from slight visual impairment to severe physical impairment. Students had been informed that the class was part of a research project and that regular attendance would be helpful; however, students were not required to come to class and could drop out any time. The work areas at each home were similar, with everyone sitting together at one table. Before class, Weiss set the table with water jars for cleaning brushes and clear plastic cups containing tempe a paint or fabric paint, depending on the day's project. Students sharing paints from cups facilitated clean up and, more importantly, created an opportunity to interact with each other when in need of a particular color. The palette Weiss used included primary colors, and sometimes black and white. To obtain a full spectrum of color, one may use primary red, fushia red, turquoise blue, primary blue, golden yellow, and lemon yellow. Students learned to mix whatever colors they needed.

In the first group sessions, students explored different ways to paint a line using tempera paint on paper. Usually, the first paintings were monochromatic, based on a selection from the primary colors. For students who hesitated to start, Weiss provided verbal directions and a demonstration of all the steps required to handle a paint brush (i.e., picking up and holding the brush, dipping it in the water jar, saturating the brush in the desired color, wiping excess paint off the brush, and making the first mark). Because most students had never painted before, this instruction was basic to introducing the painting process. As much experimentation as possible was encouraged, taking into consideration the limitations of individual students. Weiss suggested students paint a crooked or wavy line, from one side of the paper to the other. Failure to paint a straight line immediately can be discouraging to students with conditions that make it difficult to handle the brush in a steady manner. Students begin to see compositions developing and the first hurdle of trying something new is generally overcome in the line painting session. In design terms, the first assignment makes sense because line is one of the tools used in developing a composition. Students naturally start organizing their marks after a few efforts, even if the instructor says nothing about composition.

The second stage of instruction can either be mark making, shape or color mixing. Weiss introduced color mixing because students were already asking how to obtain specific colors. Color can be approached in many ways. However, for this proj-
"After . . . four weeks of classes, students began to paint on fabric."

ect, students were asked to make color stripe paintings. They selected an initial primary color and gradually added another primary, painting a stripe of each color gradation. Some continued to add a third color. A few students were able to grasp the subtlety of the problem and others needed extensive assistance throughout the process. Some students interpreted the idea of painting stripes as painting wavy lines or shapes, using color gradations.

The color mixing problem allows the student to see how to create secondary colors (orange, green, and violet) from the primary colors (red, yellow, and blue). They discover that mixing all three primaries yield various hues of brown. The instructor can reinforce the knowledge acquired in these sessions, especially when a student asks how to mix a color. One can refer to an example of the desired color and ask the student to name the colors from which it is made or ask the student to guess or try the experiment again. As with any learning experience, the sense of discovery and accomplishment is vital to making new information meaningful.

An exercise using cut-out shapes followed the color mixing exercise. Students were asked to name shapes, cut them out for themselves or for each other, and develop compositions using them. They could either trace around the cut shapes or try to draw them, as in a still life. It is useful to provide examples of other artists' work to help reinforce and legitimize what one is teaching. Wald (1983) introduces collage exercises with a lecture on the history of collage. She says this elevates what some students consider a childish task to a mature level. Henri Matisse is a good example since he continued to produce art until he died, devising methods to overcome his losses due to age and illness. Students respond to the bright colors and shapes of the paper cut-outs of Matisse's later years. Sonia Delauney is another artist whose use of bold shapes and colors appeal to beginning older students.

After the first four weeks of classes, students began to paint on fabric. If some individuals needed extra feedback to get started, Weiss provided direction. The art instructor must differentiate between "learned helplessness" (Selig, 1975) and true functional inability to execute a task. It is important to attempt to determine how much an individual can manage on his/her own, and, when help is needed, to look for ways to assist that will allow the individual to work as independently as possible. At the conclusion of each session, participants were invited to describe and explain to other group members the work(s) they produced during that session and comment on the success of, or extent to which they were pleased with, their efforts. Other participants had the opportunity to comment on the work(s) being shown.

During the seventh week, each student selected a fabric painting he/she wanted to make into a pillow. Although many residents were excellent hand sewers and some were interested in using a sewing machine, time limitations dictated that the instructor heat-set (by ironing) the fabric paint and stitch fabric backs to the pillow between classes. The instructor left an opening in which the students could insert stuffing during the last class meeting. This last session generally turned into a group effort, with more mobile individuals helping those with restricted movement and sewers stitching and closing the gaps for non-sewers. Communal sewing projects, such as stitching the binding on a group-painted quilt project, are an excellent way to stimulate conversation among participants.

When students are able to execute all the work on a project, they identify more with the finished product and gain a greater sense of accomplishment. Consequently, in projects that activity directors provide for residents, and longer term projects with artists, we recommend that students participate as fully as possible in the finishing work, such as ironing the painted textile pieces to heat set them and hand-stitching the entire pillow or object. This recommendation is consistent with recommendations of other investigators working with institutionalized populations (e.g., Schafer, et al., 1986; Langer and Rodin, 1976; Morganti, et al., 1980; Harel and Noelker, 1982; Saul and Saul, 1974; Fontana, 1977) who suggest that full participation, decision making and control over events/activities among nursing home residents are quite important if residents are to benefit.

Evaluation

Participants

Nursing home staff members in each of the three participating facilities were asked to identify ten to twelve residents whom they felt were mentally and physically capable of participating in art classes. Included in the evaluation are all residents identified by staff meeting these criteria and those who agreed to participate and sign an informed-consent form. Information was gathered on forty-nine residents. All were evaluated by nursing home staff members. Twenty-six participated in art classes, thirteen of whom were pre- and post-tested and thirteen of whom were post-tested only to control for test-retest effects. Eight residents were pre-tested but dropped out of the program or were, for various reasons such as ill health or hospitalization, unavailable for post-testing. Eleven residents identi-
fied by staff as potential participants chose not to participate or were unable to do so. Four residents, who were assigned to a no-treatment control group, were pre- and post-tested but did not participate in art classes. Of the forty-nine residents included in the study, twelve (24.5%) were male and thirty-seven (75.5%) female. Forty-seven residents were white. Residents’ ages ranged from 60 to 96 years (M = 79.4; SD = 9.7). Residents had completed an average of 10.5 years of schooling (SD = 2.8). Length of stay in a nursing home ranged from one month to six years, with the largest number of residents living in a nursing home for twelve months (M = 15.7; SD = 18.6).

**Measures**

Two interview schedules were developed for this study. One was given to nursing home activity directors and included background information about residents’ health conditions, whether or not they had participated in the decision to move into the nursing home, how frequently they received visitors, and how frequently they participated in the nursing homes’ activities. The other instrument was administered to residents and forms the basis for pre- and post-test results of the art program’s effectiveness.

Nine variables in the resident questionnaire are demographic or background variables. These, like the variables in the activity director evaluations, are considered to be independent; that is, not likely to be affected by participation in art classes. The principal function of this set of variables is to test for compositional differences among those in the participant, attrition, and control groups. They include sex, race, age, prior residence, schooling, tenure in the nursing home, marital status, previous occupation, and value orientations (preference for independence, family interaction, friendship formation, or community involvement).

Three dependent variables are included in the resident questionnaire to test the effectiveness of participating in art classes. One is an attitudinal measure; two are behavioral. The attitudinal measure is a ten-item self-esteem scale developed by Rosenberg (1965). Scoring procedures have varied in different studies using this measure (Brettspraak and George, 1982). In the present study, a value of 0, 1, or 2 is assigned for each item depending on whether a respondent agrees, is not sure, or disagrees with a statement. Responses are recoded so that a “2” is assigned for the high self-esteem response. The additive scale ranges from 0 to 20. The mean score for pre-tested residents is 14.9 (SD = 3.6).

One behavioral variable is the number of other residents in the nursing home a subject reported knowing by name (range 0–11, M = 2.8, SD = 3.4). A second behavioral variable was created to reflect the nature of a person’s interaction with the facility’s other residents. Responses were coded to reflect the degree of spontaneous activities initiated by the resident (range 1–3, M = 1.9, SD = .9).

Finally, four art works were randomly selected from among the class projects of each participant. The date the work was produced was concealed. Two experienced judges using a five-point scale independently evaluated the degree to which each work reflected a judicious use of the elements of composition (line, color, shape, space) and an overall assessment of the success of the work.

An average score was computed for each work from the two evaluations. A variable was then created that measured the extent to which each participant improved in the use of composition elements over the sequence of four works. If each successive work by a participant was judged more favorably than the one that preceded it, a value of 3 was assigned. If two works were judged better than those that preceded them, a value of 2 was assigned. If at least one work was judged more favorably than a preceding work, a value of 1 was assigned. A value of 0 was assigned if no improvement in successive efforts was noted. Thus, the range of the art work improvement variable is 0 to 3 (M = 1.27; SD = .72).

**Statistical Procedures**

One-way analysis of variance was used to compare resident pre-test results for art class participants who were pre- and post-tested with the pre-test scores for attrition group members on dependent variables and selected background characteristics. One-way analysis of variance was also used to detect differences, if any, in the background variables constituting the activity director evaluations for art class participants, attrition group members, potential participants identified by activity directors who did not participate, and control group members. Following the one-way analysis of variance, the Newman-Kuels post-hoc test with studentized range statistic was computed to identify group means that were significantly different. The purpose of these analyses was to determine whether there were compositional differences among the various groups in the study.

One-way analysis of variance was used to compare post-test scores on the dependent variables for art class participants who were pre- and post-tested with post-test scores for art class participants who were post-tested only. The purpose of this analysis was to determine whether or not there were test-retest effects among those participants who were pre- and post-tested.

Finally, a T-test of group means was used to compare the pre- and post-test mean scores on dependent variables for the participant group that was pre- and post-tested with the mean scores on dependent vari-
ables for the control group. The purpose of this analysis was to determine whether or not participation in the art classes brought about significant improvement in self-esteem, the number of people known, and interaction quality relative to people who did not participate.

Results

Group Composition

A comparison of pre-test scores for art class participants who were pre- and post-tested with members of the attrition group revealed two significant differences. The pre-test mean score for art class participants on the self-esteem measure (M = 16.5) was significantly higher than the pre-test mean (M = 12.0) for members of the attrition group (F Ratio = 8.8; P = .009). That is, those residents who participated in art classes and were pre- and post-tested had, at the outset, higher self-esteem than those who were pre-tested but dropped out of the classes or were, for whatever reason, unavailable for post-testing.

Second, a significant difference in gender existed between the participant and attrition groups. The participant group mean score (M = 1.8) was significantly higher than the mean (M = 1.4) for the attrition group (F Ratio = 5.9; P = .03). Since a value of 1 was assigned to males and 2 to females, these results indicate that females were disproportionately participants while males were more likely to be drop-outs. Other variables in this analysis that were not significantly different between the two groups are the following: age, schooling, tenure in the facility, value orientations, number of people known to the respondent, and interaction quality.

An analysis of the evaluations activity directors completed on the forty-nine individuals in the study revealed two significant differences among groups. Those individuals (N = 11) who were identified as potential participants by the activity directors but chose not to participate or did not do so were judged to have significantly more difficulty walking than members of all other groups (P = .003). Individuals in this group also were significantly less likely to participate in nursing home activities (M = 3.00) than those residents (N = 13) who participated in art classes and were post-tested only (M = 4.08; P = .02). Other variables in this analysis that did not significantly differ by group are the following: tenure in the facility, frequency of outside visitors, participation in the decision to enter the nursing home, hearing problems, vision problems, reading problems, bowel or bladder problems, stroke, senile dementia or confusion. Thus, the individuals in the non-participant group in this study are less frequent participants in other activities, which may be related to their mobility impairments.

Taken together, these results suggest that drop-outs and non-participants in the art classes were somewhat more frail, both psychologically and physically, and less active than those who completed the program. While not surprising, this finding does underscore the difficulties that activity directors experience in providing group activities for more vulnerable residents and the problem they have in involving male residents in nursing home activities.

Test-Retest Effects

The twenty-six participants in art classes were divided into two groups of thirteen. One group was pre- and post-tested, while the other was post-tested only. A comparison of post-test scores on the dependent variables (self-esteem, number of people known to the respondent, interaction quality, and improvement on art work) revealed no significant differences between the two groups. Therefore, the experience one group had of answering the same questionnaire items previously apparently had no effect. Consequently, pre- and post-test scores for participants can be compared with greater confidence that results reflect the impact of the art class experience, rather than practice in test-taking.

Impact of Art Classes on Dependent Variables

A comparison of pre- and post-test means on the dependent variables for those participants who were pre- and post-tested appears in Table 1.

Table 1. Pre- and Post-Test Means for Dependent Variables

</table>

*Statistically significant difference

While all post-test means are somewhat higher than the corresponding pre-test means, only interaction quality is significantly higher statistically on the post-test. That is, following participation in art classes, residents were significantly more likely to interact with other residents and spontaneously initiate conversations or activities with them. It should be recalled that residents in the participant group had significantly higher self-esteem on the pre-test than residents in the attrition group. It is possible, therefore, that the lack of significant improvement from pre- to post-test in self-esteem reflects a ceiling effect. That is, there may not have been much room for improvement in the self-esteem of participating individuals whose self-esteem, relative to their peers, was already high prior to participation.

Pre- and post-test means on the dependent variables were also compared for control group members, of whom there were only four remaining at the end of the study period. No significant differences were found.
Impact of Art Classes on Artistic Composition

Table 2 summarizes the mean score for the twenty-six art class participants on successive projects as rated by the judges.

Table II. Group Means on Successive Artistic Works

<table>

</tr>
</tbody>
</table>

The increase in mean scores through the third work, though slight numerically, suggests that art class participants did improve in their ability to successfully use elements of composition in the projects they produced in class. It is not clear why the group mean score for the fourth is slightly below the mean for the third work. It is possible that participants may have reached a plateau in their mastery of composition elements. Table 3 demonstrates that a majority of participants did improve, at least somewhat, in their use of composition elements in their art work.

</tr>
</tbody>
</table>

Only three individuals failed to improve at all over the course of class instruction. At the other extreme, only one person improved substantially. The majority of individuals had at least one work that was judged more favorably than a preceding one, and eight participants had two works that were evaluated more favorably than those that preceded them.

Since it was beyond the scope of this study to compare the artistic progress of a group of nursing home residents with a group of non-institutionalized elderly, or with people in other age groups receiving similar instruction, it is not possible to determine whether the amount of improvement demonstrated by this group is impressive or unexceptional. However, it is certainly reasonable to suggest that most nursing home residents are capable of learning some new skills, and that they improved in their use of elements of artistic composition as a result of the instruction they received in this program.

Discussion

To summarize, the principal findings of this study are: that the majority of art-class participants improved, at least somewhat, in their use of elements of artistic composition; that taking part in art education classes brought about a significant increase in the quality of participants’ interaction with other nursing home residents; and that self-esteem was not affected by participation in the classes.

These findings must be considered in light of the size of the sample being discussed. Although the sample included forty-nine persons, some sub-groups became quite small because of attrition. Small sub-sample size is a common problem among studies undertaken in nursing homes for several reasons. First, one can expect a high attrition rate when studying frail institutionalized elderly. Also, most nursing home interventions, if they are to be effective, must limit the number of persons in any group session. Finally, to secure a large sample an investigator must have the time and resources to involve a great many nursing homes, since each will have a small number of potential participants.

Art-class participants had relatively high self-esteem scores at the beginning of the intervention; this may explain the lack of significant change over the intervention period. Because of the selection criteria, those eligible for the art classes were in better physical and mental condition than the balance of nursing home residents. Moreover, it was found that those completing the program had significantly higher self-esteem than those who dropped out. We would suggest that the self-esteem of art-class participants reflects their assessment of themselves in relation to other nursing home residents. Such a comparison would reveal that, even with their own physical problems, they were better off than most of their peers.

Given the significant change that occurred in “interaction quality,” another explanation for the stability of “self-esteem” is possible. If one considers benefits to be gained from participating in a therapeutic intervention in terms of either attitudinal or behavioral outcomes, it may be that some interventions are likely to affect one category more than the other. In the present instance in which participants created at least one tangible artwork per session, it was found that the one dependent variable significantly affected by the intervention was behavioral, the extent to which participants initiated interaction with other residents outside the class. By contrast, Berghorn and Schafer (1987), in a study of...

"...most nursing home residents are capable of learning some new skills. . . ."
reminiscence groups in nursing homes (an entirely verbal activity), found that the reminiscing experience had a substantially greater effect on the attitudes of participants than on their actual behavior. Further, their study underscores the need for research that compares the characteristics of those persons who benefit from a given intervention with the characteristics of those who do not benefit. The findings of the present study suggest that, in addition, future research on therapeutic activities should consider the relation between the type of intervention and the type of benefit, if any, achieved.

"... most nursing home interventions, if they are to be effective, must limit the number of persons in any group session."

The Effects of Art/Drama Therapy Experiences on Rigidity, Body Concept and Mental Maturity in Graphic Thinking of Adolescents with Mental Retardation

Sirkku Sky Hiltunen, EdD, RDT, ATR, Primary Art and Drama Therapist, The Art and Drama Therapy Institute, Inc. (ADTI), 6045 16th Street, NW, Room 215, Washington, DC 20011

Abstract

Subaverage and rigid cognition is the primary dysfunction in mental retardation. This study focuses on the decreasing of rigidity and consequent enhancement of receptive/expressive cognitive functioning in order to clear the channel of and prepare the groundwork for communication of thoughts and ideas in the further therapeutic intervention. Only this cognitively-oriented preparatory phase was the focus of this article. An art and drama therapy program was designed for 21 Mentally Retarded (MR) students at the Kennedy Institute, a private special education facility, in Washington, DC. For this study, an art and drama therapy curriculum using Piaget’s theoretical framework of cognitive development was implemented. The curriculum was designed to bombard the cognition of MR participants through graphic, movement, visual and auditory thinking as alternative modalities for verbal thinking. Drawings were assessed regarding body concept, rigidity, and mental maturity to determine the effects of the Art and Drama Therapy Program on participants’ graphic thinking. Data show movement from rigidity in graphic thinking toward flexibility. Statistical analysis in general suggested that the subjects had reached the oscillatory stage, fluctuating between rigid and flexible responses. The author conjectures that longer art and drama therapy intervention might firmly establish the acquired new flexible responses. Significant differences in body concept in graphic thinking were observed. This suggests that the art and drama therapy experiences improved students’ conceptual knowledge of the body. Some improvement in mental maturity was also measured in Female Figure and Self 2 drawings.

Background

Cognition, thinking, and intelligence are often used synonymously. Furth and Wachs (1972) developed a curriculum that categorized cognitive processes as movement, visual, auditory, graphic, logical thinking, and social thinking. These researchers suggest that cognition can be enhanced by games that use various thinking modalities. Their suggestion relies on the Piagetian premise that cognition is not limited to logical thinking, but intelligence can also operate through sensory perception (visual, auditory, kinesthetic).

For this study, cognition and intelligence are synonymous. Furthermore, cognition is defined in its widest Piagetian sense as an ability to obtain, retain, and apply knowledge in a developmentally significant manner. The knowledge may be received or expressed visually, verbally, graphically, through imagery, or through movement, drama, or other sensory-motor media.

Inhelder (1968) refers to “viscosity” and “fixation,” Webster to “repetitiveness” and “inflexibility,” and Stellern et al. (1976) to “rigidity” and “perseveration” when discussing the ideational or visual-motor repetition of the same response, which manifests deficits in the adaptive performance of the MR population. This study did not focus on the affective etiology of rigidity, for the subjects of this study were not dually diagnosed, but primarily diagnosed as mentally retarded.

The lack of body awareness and body concept among the MR population is pointed out by Lowenfeld (1957), Crawford (1962), Weininger et al. (1972), and Wilson (1977).

Piagetian psychology acknowledges thinking as manifested through movement. The interrelationship of cognition and movement or movement and graphic expression is reported in Webb and Koller (1979), Cane (1951), Ulman (1965), Lachman (1973), and Fino (1979).

Silver (1975a, 1975b, 1976, 1977) studied the connection between cognition and art production (graphic thinking). She developed a cognitive rating scale, which is based on Piagetian assumptions. The scale is the basis for Form III of this study.

According to Bettelheim (1977), the simplification of fairy tale characters makes it easier for a child to acquire concepts needed to understand reality.

Overview

Mental Retardation can not be classified as an illness, the pathology
of which could be identified and for which medication and cure could be provided. DSM III (1980) states that the essential features of MR are (1) significantly subaverage general intellectual functioning; (2) resultant or associated impairments in adaptive behavior; and (3) onset before age 18.

For this study, an Art and Drama Therapy curriculum using Piaget’s theoretical framework of cognitive development was designed to address the problems of delayed cognitive development (mental maturity), rigidity (perseveration), and lack of body concept. The objective of the therapeutic intervention was to “bombard” the cognition of MR participants through multiple media (drawing, painting, mask making, movement, pantomime, mask pantomime, and fairy tale imagery) to elicit more flexible responses in both graphic and movement expressions, to enhance body concept, and to enhance mental maturity. Graphic responses were measured to assess change in the subjects. Fairy tales were presented to participants verbally to elicit mental imagery. Because images in the fairy tales mediate the information holistically, the MR participants did not have to understand every word. Fairy tale characters personify a concept in a straightforward manner. The character is either clever or stupid, beautiful or ugly, strong or weak. Thus, the characters can enhance the comprehension of each component concept. The translation and transmission of mental imagery into graphic form, movement, drama, or verbal expressions of the participants provided measurable/observable data for the assessment of this cognitive process.

The effects of the art and drama therapy intervention on the graphic thinking regarding body concept, rigidity, and mental maturity of the MR participants were assessed through their drawings (Silver Cognitive Evaluation Scales, Harris HFD test, and Bender Gestalt test).

“The objective of the . . . intervention was to ‘bombard’ the cognition of . . . participants through multiple media. . . .”

Subjects

The 21 students, whose parents had given permission for participation, in this study were the total population of two junior high school classes at the Kennedy Institute, a private special education facility in Washington, D.C. Subjects ranged in age from 13 to 20 years. Eleven (11) subjects were males and ten (10) females.

Nineteen of the participating students were in the IQ range of 50-70, classified as Mild Mental Retardation. One student had an IQ of 40, classified as Moderate Mental Retardation, and another of an IQ of 84, corresponding to Borderline Mental Retardation (DSM III, 1980).

Procedure

The 21 students were divided into groups of five or six. Each group participated in three sessions weekly for a total of 29 sessions, conducted over the 15-week period in the school’s art therapy room. Three weeks were not actively programmed because of the Easter holiday and several field trips. The participation rate was high. Of the 29 possible sessions, the average number of sessions attended was 25.7; one student could participate in only 17 sessions, and one other missed 8 sessions.

Mask Pantomime Therapy Curriculum

The Art/Drama Therapy intervention lasted from the 15th of March to the 10th of June. The pre- and post-tests (Harris and Bender) were administered and scored by an outside school psychologist during the weeks prior to and following the intervention. The psychologist also scored additional self drawings, which had been administered by the researcher after the MR students participated in self-body confrontations and body-parts naming in front of a mirror during Units I and VII.

The pre- and post-body-concept checklist was also used for the assessment. Rater 1 (the researcher) and Rater 2 (a developmental psychologist) evaluated pre, intermediate, and post drawings (Silver’s rating scales) to assess cognitive changes.

“Fairy tales were presented to participants verbally to elicit mental imagery.”

The Art/Drama Therapy intervention consisted of creating and expressing a recited fairy tale through drawing, water color painting, mask making, movement, pantomime, and mask pantomime improvisations. The program sessions were divided among seven units (I-VII).

The processes followed an established progression:

1. From receptive verbal and imagery (fairy tale) to expressive graphic and imagery (drawing);
2. From receptive verbal and imagery (fairy tales) to expressive movement (movement improvisations, pantomime, mask pantomime);
3. From receptive verbal and imagery (fairy tales) and movement
(pantomime, etc.) to expressive graphic and imagery (drawing);

(4) From receptive verbal and imagery (fairy tales) and visual (observing pantomime) to expressive graphic and imagery (drawing, painting).

The therapeutic intervention for movement, graphic, visual, and verbal stimuli progressed in a similar manner. For the pre- and post-evaluation, Grimm’s fairy tales and Aesop’s fables were used. The Wizard of Oz (Baum, 1957) was used for the major intervention; it proved to be an excellent and meaningful choice for all participants.

The distinction between reality and fantasy was strongly emphasized throughout the art/drama therapy intervention. This distinction was especially clear in the use of masks and in assuming a fictional character identity. Each student selected a character in The Wizard of Oz and made a mask for it. Brigette Taylor’s character identity was Dorothy (Figure 1).

Methods and Results

The pre- and post-Harris tests were administered and scored by the outside school psychologist. Working in a one-on-one setting during testing, the students drew three human figures (1) Male, (2) Female, and (3) Self. This order was held constant regardless of the subject’s sex. The self drawings produced during the pre- and post-test situations were called “Self 1.”

The second self drawing (Self 2) was drawn during class evaluation period in group settings. Self 2 was drawn both during Unit I, which followed the pre-test, and during Unit VII, which preceded the post-test. During both pre- and post-test class evaluations, the Self 2 was drawn immediately after the mirror self-confrontation; the therapist pointed out body parts without giving verbal prompts. After looking at him/herself in the mirror, the student then named the appropriate body part. Responses were recorded in the Body Parts Check List, which provided a measure of the subject’s vocabulary of body parts and clothing. After this task, each student was asked to look in the mirror once again and then draw his/her own picture. Thus, comparative self drawing data were provided for scoring.

Results of the two-tailed t-test indicate significant differences in pre- and post-measures of both Female figure (p<.05) and Self 2 (p<.001) drawings. This suggests some improvement in body-concept and mental maturity resulting from the art/drama therapy intervention.

After scoring the Bender tests, the school psychologist isolated the perseveration score to identify changes in visual-motor rigidity. Two-tailed t-tests on the Bender scores indicate no significant change in either visual-motor maturity or perseveration measures (p>.05). The isolated perseveration score perhaps was not sufficient to measure the cognitive and functional rigidity of the MR participants.

The subjects’ abilities to name body parts as they were pointed out during mirror self-confrontation was assessed through the Body-Concept Check List. The results indicate significant differences in pre- and post-measures (p<.001) and suggests that the art/drama therapy experience improved students’ conceptual knowledge of the body.

During Unit I through VII MR participants produced 386 drawings and paintings. Qualitative research data, drawn from the experimental unvalidated evaluation forms, were analyzed statistically. The forms provided a measure of the participants’ cognitive abilities, as reflected in their art work.

Two raters evaluated the cognitive abilities by Silver Rating Scales (to select, combine, represent, express movement, and express artistically): Rater 1, the researcher, has a background in art and drama therapy with the MR population. Rater 1 scored 386 drawings (mean of 18.6 per subject); Rater 2, the outside judge, has a background in educational psychology and art education, exposure to child art, but no experience with the MR population. Rater 2 scored 121 drawings (mean of 5.7 per subject). The scores for those 121 drawings rated by both raters were analyzed statistically. The remaining 265 drawings, rated only by Rater 1, were used qualitatively.

A repeated measure ANOVA with Tukey post-hoc procedure was applied to assess significant differences in the cognitive abilities of the stu-
Students, as reflected in their graphic responses throughout the program.

The means and standard deviations for the measured cognitive abilities were derived. The mean scores of Rater 1 and Rater 2 for the same 121 drawings were used. The means were found to be significantly different for the cognitive abilities to combine, to represent, and to express movement. No significant results were indicated for the abilities to select and to express artistically.

When the Tukey post-hoc technique was applied to the resulting pair-wise comparisons, some differences emerged. A comparison of means for Unit I, Unit II, Unit IV, and Unit VII showed no paired differences for the ability to select. Hence, the Unit samples did not significantly improve the ability to select. The ability to combine improved from Unit III to Unit IV, while other comparisons stayed statistically equal. For the ability to represent, Unit IV sample scores were significantly greater than scores for both Unit I and Unit III. The ability to express movement improved; Unit IV scores were significantly greater than scores for both Unit I and Unit III. Artistic abilities showed no significant differences in any comparisons. However, a comparison of Unit I and Unit IV scores showed a positive trend of improvement.

From the graphic responses of the students, the cognitive abilities to combine, represent, and express movement showed general improvement from Unit I and/or Unit III to Unit IV.

Pre-and Post-Evaluation

A correlated t-test assessed the differences in the pre-evaluation means of 39 drawings (1.9 per student) and the post-evaluation means of 42 drawings (2 per student). Rater 1 and Rater 2 independently evaluated the same 81 drawings.

For Rater 1, the post-evaluation mean for the abilities to select, represent, and artistic abilities was significantly higher than the pre-evaluation mean (p<.001). Significant differences in results also occurred for the ability to express movement (p<.05).

For Rater 2, the pre- and post-evaluation means were not significantly different in any of the graphic response measures (p>.05).

Inter-rater Reliability

The pre- and post-graphic response measures to assess the cognitive abilities to combine, to represent, to express movement, and the artistic abilities had a reliability range from .589 to .908 (p<.001, except for the pre-test measure of the ability to represent). The pre-evaluation of the ability to select showed no significant correlation between the raters.

Influencing Factors

The test and class evaluation results might have been influenced by unanticipated timing constraints. Eight sessions were rescheduled due to field trips; this delayed post-tests and class evaluations about two weeks. Post-tests and post-class evaluations were conducted during the last weeks of the spring semester; school work had ended and the school was preparing for the spring festivals. The outside school psychologist also observed the change in students' attention spans and concentration, noting in her final report that, at the time of the post-test in June, the students' day "was not structured and they were easily distracted because of their activities."

This observation strongly suggests that the circumstantial variable was not controlled, did not match the pre-testing situation, and might have skewed the results negatively.

The significant improvement in Self 2 drawings could have been caused by (1) students' familiarity with the therapist/researcher and her expectations; (2) familiarity with the drawing activities and structure of the sessions; and/or (3) higher motivational level.

To record the MR participants' smaller steps in progress, the Silver Cognitive Evaluation Scale (Form III) was revised after results were obtained. A rating scale to access the developmental level in drawing human figures was added. A means of measuring cognitive rigidity and flexibility replaced the creativity measure.

Statistical evaluation of improvements in the cognitive rigidity of the MR subjects clearly showed three major phases in their graphic responses: (1) rigid, (2) oscillatory, and (3) flexible.

The general variability of significance levels in the test results for this study suggest that the subjects had reached the oscillatory stage, which is characterized by fluctuation between old and new and/or a synthesis of rigid and flexible responses.

This sample of John Duvall exemplifies the successful transfer from a rigid and perseverative response to a flexible one (see Figures 2-9). Figure 2 was his first drawing, Figure 9, his last.

Fig. 8 John Duvall — “Man and Dog”
It is significant to note that Mr. Duvall's drawings illustrate the impact of movement on his rigid and perseverative graphic thinking. His first flexible example of graphic thinking occurred after movement experiences.

The progress of graphic thinking from rigid to flexible responses was also reflected in the work of a number of John's classmates. This progress is demonstrated, for example, in Esther Harris's abstract drawings in which rigid repetitive copied black circles (Figure 10) were transformed into free line formations with splendid color (Figure 11). In another example, Richard Coulter initially drew controlled scribbles (Figure 12) which evolved into drawings of a representational human figure (Figure 13). The change in body concept is also exemplified in Esther Harris's drawings: from minute and immature stick figures (Figure 14) to more mature two-dimensional human figures (Figure 15). Changes in the body concept of representational drawings by Brigette Taylor occurred from her first graphic expression (Figure 16) to her intermediate work (Figure 17) to her last drawing (Figure 18). In general, the focus of graphic, movement, visual, or image thinking modalities that replaced or supported the verbal thinking appeared as an effective way of approaching cognitive tasks for the participating MR adolescents.

The aim of this study was to prepare the subjects for further art and drama therapy in which the identification and expression of not only their thoughts and ideas, but also their conscious and unconscious feelings are essential components of the therapeutic process. It is often a danger when working with the MR population to interpret their deficient responses as emotionally based, when, in fact, their inability to receive and express cognitively may cause their responses. The differentiation of cognitive and affective etiology in their responses is one of the major challenges in working with the MR population.

Recommendations

Longer art/drama therapy intervention might firmly establish the acquired flexible responses. The common oscillation between rigid and flexible responses in the subjects’ drawings suggested that there was too little time to establish new schemes in the students’ cognitive and graphic vocabularies. The MR population’s development takes time; however, during the brief intervention the observed pace was even more time-consuming than anticipated. Therefore, time is an important element for the art/drama therapy intervention. For further research, the time frame should be expanded to reinforce and to stabilize the MR subjects’ change from rigid to perseverative to more flexible graphic thinking patterns.

A control group, which the author did not obtain, should be used for further data collection and comparison.

Because it sensitively measures the slow progress of the MR subjects, the revised form of Silver Cognitive Rating Scale should be used for further research and implementation of the designed and revised curriculum. Also, other measures need to be developed to document

"... during the brief intervention the observed pace was even more time-consuming than anticipated."
"...measures need to be developed to document changes in rigidity and flexibility of graphic, image, movement and verbal thinking."

Changes in rigidity and flexibility of graphic, image, movement and verbal thinking.

Professionalism in Practice

Presidential Address to the 1988 AATA Conference

The theme of this conference is Professionalism in Practice. One day when I was thinking about what I might say on this subject, I happened to read a story in the newspaper about an elderly lady who was reluctant to fly on an old jetliner. Before climbing up the jet’s rear stairs to board, she gazed up in dismay at the peeling paint and the nicks and dents in the plane’s nineteen year old belly. “Captain,” she called out to the pilot who was standing under the wing, “is this old plane really safe?” “Lady,” he replied, “if this old plane wasn’t so safe it wouldn’t be so old.”

Well, as art therapists, we have a knack for visualization and having read that story my mind started visualizing AATA as that nineteen year old plane getting ready to take a journey. As I visualized, it came to my mind that AATA, too, has had a rather bumpy past.

We’ve been financially broke, and financially flush; we’ve argued over philosophy, ethics, policy and procedure; we’ve fought amongst ourselves and with other organizations, in other words we’ve had our peeling paint and our nicks and dents. But you know what—just like that old plane we’re still safe and we can still fly. And for another thing, there is now room on that plane for all of us, all our different philosophies—analytical, Gestalt, Jungian, behavioral, humanistic—you name it. I believe we’re all in there together, working toward the same goal—getting that plane off the ground, getting it to soar high and getting it to reach its secure destination. Can you all see it? Can you visualize it? I certainly hove so because I feel we are on the verge of a new beginning, a new journey to greater heights.

However, the weather report says that there are still some big black storm clouds ahead. So we will need to figure out how we can either get around them or fly through them in order to achieve the professionalism that is our goal and destination.

One of those clouds has to do with our job opportunities. We have a membership of approximately 2,600 people. In the United States, according to the American Hospital Association, there are a total of 60,841 hospitals. Out of that number there are 652 psychiatric hospitals. Not all of these psychiatric hospitals employ art therapists. Some of the other hospitals have psychiatric units and may employ art therapists. But you can see from the numbers that although hospitals may absorb quite a few of our members there is a discrepancy of about 1,000 to 1,500 people.

A number of these art therapists are currently working in substance abuse programs, convalescent hospitals, some with the developmentally disabled and some in outpatient mental health clinics. But if we are to grow, we need more employment opportunities. Therefore, I suggest we need to look seriously at two other options. One is private practice and the other is working for health maintenance organizations—HMO’s as they are called.

For both of these we will need licensure or certification. Why? Because the Kennedy Waxman Bill, a national health bill that currently is working its way through the legislative process in Washington, D.C., calls for licensing or certification in the mental health section. We have been requesting that “registration” be added to that list, but have our doubts that this will come about. If this particular bill is not passed, there will most certainly be another similar one passed in the near future.

Today, we have art therapists licensed in three states, California, Texas and Florida. A few art therapists have been certified by the National Academy of Certified Mental Health Counselors, a national counseling certification agency. How have these art therapists been able to become licensed and certified? The answer is by taking counseling courses in addition to their art therapy curriculum.

I recently talked to Dr. Michael Campanelli of Wright State University. He said Wright State is well aware of the need for licensure for art therapists and their projected PhD program in art therapy will have a component geared toward that goal.

Currently AT students in their MA program are taking course work in the counseling departments and getting their degree there in order to become licensed. The same is true for California State University, Sacramento and other universities as well. Loyola Marymount and the College of Notre Dame in California are both working for accreditation with the American Association of

Cay Drachnik, President, AATA, 1988-89
Marriage and Family Therapists so that their students may continue to be licensed.

Other university programs are taking a serious look at their options; unfortunately others are not. Some of our educational institutions are continuing to churn out poorly trained master degree art therapists who are unable to find jobs in their field or jobs that pay a decent wage. This is very unfair to our students. That’s one of the big thunder clouds in the sky. Let’s hit this one directly on and solve it—let’s all urge our educators to look at national certification and their state licensing requirements and to add or incorporate the necessary psychological component to their core curriculums, before we turn students off to art therapy education. The board is also looking at the possibility of national certification just for art therapists but this may be a very expensive process and it may be a long way down the road. We shall see.

Another controversial cloud is the suggestion that a masters degree be required for AATA registration. At this time, we are still registering people with BA’s plus 21 units in art therapy course work. Art therapists in the past have opted for alternate ways of becoming registered but that was the past; we are now looking at the future. If we accept the premise that we are counselors as well as art therapists, and we want to demonstrate that we are professionals, we must become more attuned to today’s political realities, we must make our requirements stringent enough so that our members can become licensed or receive certification by an accredited national certifying agency and this of course will require a masters degree.

What about health maintenance organizations? Did you know that nearly two thirds of the major corporations offer HMO’s as part of their benefit programs? Approximately 21 million people belong to them and some industry analysts believe that about half of all Americans will be enrolled in them by 1995. That’s big business. Most HMO’s limit the number of psychotherapy sessions that they will cover. But information from my friends who work for HMO’s tell me that once the prescribed number of sessions are over, the patient frequently continues with them in private practice. Cost effectiveness and putting therapy on a business-like foundation is the way of the future. What could be more cost effective than having art therapists working with children using low cost art supplies versus expensive toys for play therapy. What more cost effective way is there of working with families, than using art materials to observe their true interactions while involved in an art therapy task. We truly are cost effective.

In addition to a few big black clouds I want to briefly point out the silver linings. We’ve made tremendous progress in the past 19 years.

We have registration, we have a new Code of Ethics and a Standards of Practice ready for discussion and approval. In the past two years our chapters have doubled from 12 to 27. We have a program approval process in place. We have a newsletter, a journal, malpractice insurance, some of us are licensed and we are becoming so well known and so highly respected that others, less qualified, seem to be trying to take over our business. That we must prevent.

So let’s all gather together—all the creative, caring, sensitive art therapists and board the jet together. Let’s resolve to leave all the infighting, the rivalry, the fractionalism, all the old baggage behind. Instead, let’s visualize ourselves sitting on that plane talking together, working together; let’s visualize us reaching that goal of true professionalism in practice. We are the best, we know it, so let’s make this vision a reality, let’s make it really come true.

Response to the Honorary Life Member Award:

Graces, Epiphanies and Exclamations

I am already a life member of the arts by virtue of my Welsh inheritance. “Blessed is the man born Welsh, not with a silver spoon in his mouth but with music in his heart and poetry in his soul.”

My theme for my presentations at this conference has been, life is full of graces, epiphanies and exclamations. This moment is a combination of all three for me.

I am here by the grace of the influence of the sum total of those who have stood here, those bypassed who might have stood here, and those yet to be on this spot, symbolically speaking. If it were not for you, colleagues, students, friends of the present and past, I would not be receiving this 1988 Honorary Life Membership.

And looking to the future, if it were not for those who will yet stand here, I would not feel comfortable or complete. Anything worth doing takes more than one lifetime but each of us is allotted only one span. So, I am your root! You are my continuity!

Epiphanies are those high moments, manifestations of something greater than ourselves. Doing creative activity is such an experience for me, personally, but there have been even higher sacred moments of human exchange with patients practicing art in art therapy.

Art has a dynamic life and organic reality of its own. To ignore the power of the expressive art process, its dynamic content and action, is “like standing on a whale fishing for minnows.”

Looking back, such high occasions for me involved working with the people on the original ad hoc committee, the "pioneer-founders." Bob Ault and I at Menninger’s, a long time ago, had a dream now become reality. Myra Levick’s natural executive ability graced and managed many of those early occasions. It was Felice Cohen’s apothecary humor that salvaged the tough moments and eased the tight situations. (I pause here and look over my left shoulder because Felice promised to be here in spirit in this moment.) Elinor Ulman added a clarity and intensity of purpose.

There were exclamations of confusion, competition and misunderstanding as we hammered out practical details. We went around and around but persisted for a couple of years discovering that we moved not in divergent directions but in concentric circles. The centrifugal force of our vision gradually centered our efforts and brought us to consensus and finally unanimity. Others were soon caught up in the swirl of energy and exuberance.

Even so, be reminded that art therapy’s development is not so much determined by individuals as it is by the force and logic of the creative process. In the minutes before my being installed as the fourth president of AATA, I spontaneously recalled and shared with Bob Ault my childhood memory of a small, wide-eyed, anxious boy going to the circus. The ringmaster had announced that the first twelve kids to race to the center could ride on an elephant. A dozen of us climbed on. The beast rose up from a kneeling position. Suddenly came the awareness that it was alive and moving and that riding on the back of an elephant was by its grace and with its indulgence. (It reminded me that all who serve this organization do so with the assent of the collective, creative brawn of the membership body.)

Doing art is a phenomenal expediter of expression, of insight, of comprehension . . . and more. Dostoevsky declared that beauty will save the world and Matthew Arnold believed that we shall be saved by poetry.

I would like to assume that I am receiving this Honorary Life Membership because you have recognized what I have believed and demonstrated in the field of art therapy. The aesthetic spirit is indeed life saving! My further hope and conviction is that beauty and poetry may help to save the world. The experiences of conception, birth, nurturing and growth of the American Art Therapy Association have been full of graces, epiphanies and exclamations for me. I cannot resist one final exclamation to all of you, "THANK YOU!!!"

Joseph Campbell

Don Jones ATR-HLM
Response to the Distinguished Service Award

To receive the Distinguished Service Award from the American Art Therapy Association is a very special honor that must be shared with many of my friends and colleagues within the profession. I regret that I was unable to be in attendance at the 1988 Annual Conference to accept the honor in person when it was presented by our President, Cay Drachnik. A minor medical condition precluded my being there and I appreciate all of the greetings and well wishes from my friends.

Being a past member of the Education and Training Board has allowed me the opportunity to work closely with faculty, staff and students of most of the university, clinical training, and the institute programs. Having been a member of on-site review teams to evaluate art therapy programs throughout the country has strengthened my commitment to the uniqueness and importance of the art therapy profession and the need to retain our diversity in our graduate programs. The excellence that is noted in these individual differences of our training programs is perceived as a unique strength of AATA.

In dialogue with administrators while on review-team visits, I know that we are perceived as a young profession; being small in number when compared to other associations can sometimes interfere with rapid growth within our home institution. I have welcomed the opportunity to “sing the praises of art therapy” to administrators at other institutions in support of my colleagues and their quality programs. Our collective support for each others’ programs is a must and I continue to encourage the cooperation that is being fostered by the current AATA officers.

I am honored to have been able to represent the art therapy profession in programs throughout the country, and look forward to continued professional associations. Thank you for honoring me with this distinction from the Association. I share it with my friends and colleagues and look forward to my continued associations with you.

ON THE SAN FRANCISCO PENINSULA

M aster’s Degree Programs
in Expressive Therapies
and in Creative Arts in
Learning

Offered by the Institute for the Arts
and Human Development
Lesley College Graduate School

Master of Arts in Expressive Therapies
For students interested in the creative modalities of art, music, dance/movement, and drama, presented in a clinical and theoretical framework for a variety of settings.

Master of Education in Creative Arts in
Learning
For students who wish to learn how to integrate the arts for careers in schools, cultural institutions, and human service institutions. Specializations in storytelling and theater studies.

For more information call or write the Institute for the Arts and Human Development, Lesley College Graduate School, 29 Everett Street, Cambridge, MA 02138-2790. (617) 868-9600, ext. 480.

April 1989, ART THERAPY 29
Making Connections: Art Therapy and the Soviet Union
Margaret (Mickie) Anderson, 19571 Farwell Avenue, Saratoga, California 95070

Last spring, I traveled to the Soviet Union with a group of 16 therapists, psychologists, and a psychiatrist. Two of us were Art Therapists. Our purpose was to meet with Soviet therapists, psychologists, and psychiatrists in the cities of Kiev (Ukraine), Moscow, and Vilnius (Lithuania) for an exchange of workshops. These meetings had been set up by two members of our group who had been to the Soviet Union previously. As a group, we were prepared to present 6 to 8 workshops at any one time. Colleen Wells, the other Art Therapist on the trip, and I were to present the Art Therapy Workshop.

The whole trip was intense and exciting. Until we reached each city, we did not know the group(s) we would meet or the format of our meetings. We had to be flexible. We met in Soviet participants' apartments, halls of institutions, and even a small building in a park. In Kiev, we met with several different groups: inpatient therapists, state psychiatrists, research psychologists, and creative psychologists. In both Moscow and Vilnius, we had two day exchanges with the same groups. In Vilnius we were greeted at the University as an "official" delegation, while in the other cities we were greeted more informally. Sometimes, the Soviets were not as interested in having an exchange as they were in hearing from us. Other times, we got into lively discussions of cases, methods of doing therapy, and emotional indicators in art.

I was excited to find art therapy techniques being used in a variety of ways in the places that we visited, with more of an emphasis on their use with children and as a diagnostic tool. Although we didn't have any workshops in Leningrad, we did visit a Polyclinic there which specialized in treating children with "neuroses." The walls of the therapists' offices were filled with art the children had done in therapy, and we interrupted several play therapy sessions. I did not see any sand trays but there were many puppets and toys.

In my workshop in Moscow, I met two Art Therapists/psychologists (Helen Novikova and Natasha ______ ) who act as consultants to the schools. They regularly use a series of projective drawings to assess children who are having problems. The projective drawings they use are as follows: self, family, class, teacher, and imaginary animal (accompanied by a story). We went through many of their examples and found that our way of looking at the art was very similar, with the exception of certain details. For instance, they did not consider knotholes in trees to have any projective significance and, in fact, said Soviet children didn't draw knotholes. We laughingly made many speculations about this interpretive difference, such as, "Trees grow differently in the Soviet Union," or "All Soviet children have happy trauma free childhoods." Actually, going through their children's artwork, and discussing the problems that they represented was not much different than going through the artwork of a similar population here. These were children that were causing problems in school and in their art were indications of aggressive tendencies, low self-esteem, need to protect oneself; histories of broken homes, alcohol abuse, and physical abuse. The therapists have their own Soviet sources of information but are also familiar with the work of Landgarten and Koppitz.

In Vilnius, my co-leader for the exchange was Gintaras Khomentauskas, a psychologist who regularly uses art therapy techniques for their therapeutic value as well as their projective value. He is the author of a chapter on the use of family drawings as a diagnostic technique in a new Soviet text, General Psychodiagnosics, and is familiar with Helen Landgarten's book, Clinical Art Therapy.

This trip was a journey for me on many different levels and has had a great impact on my life, both personally and professionally. It has released a great deal of creative energy. I have several proposed cross cultural research projects with the psychologists in Moscow and Vilnius and would welcome the participation of other Art Therapists. This is an era of great change in the Soviet Union and a time which lends itself to broader and deeper contact between our two countries. To me, the work that we do as Art Therapists can look beyond our obvious cultural differences and into some of our deeper concerns as human beings. It also gives us the opportunity to investigate how our cultural differences influence the way we look at things (art, for instance).

But the dream close to my heart is to have Helen
Novikova and Gintaras Khomentauskas come to the U.S. for a continued exchange. My goal is to have them here for our conference in San Francisco in November 1989. It will be a wonderful opportunity to expand on the concept of “family.” I hope to make their visit multifaceted and welcome ideas toward this end.

What Ever Happened To . . .
Robin F. Goodman, ATR

Recently I came across a registration slip in the psychiatric emergency room of the large metropolitan hospital I now work in. The patient’s name was familiar. The age could be correct, after all these years. Then I glanced at him through the glass of the nursing station. I looked up; he was almost two feet taller than I had remembered him some 9 years ago. Since it was a holiday and his “residence” clinic was closed he only came to the hospital for a check of the side effects he was having from his medication. I was quietly grateful he was not in distress. I interviewed him about his problem. The voice was deeper, that of a man, not a school age boy. Yet his flat, choppy speech and use of language was all too familiar. I listened to his story with more than the usual curiosity. He did not recognize me. I decided to call to check on his situation and spoke to a social worker who, once I identified that “I knew him when,” wanted more information from me than I from her. In fact, the patient was new to the facility, was working on finishing his high school diploma and had recently stopped living with his father. The social worker was quite relieved to know that his current psychological state was a grown up version of what I had seen many years before. She was glad this was not some “downward drift.” Before we sent him on his way I reminded him of our days together way back when. He remembered the place and groups, but not so accurately as me. Somehow I was happy to see that one boy was not failed by the system. Perhaps he would have survived and done as well given other intervention, but I believed that in some way, I contributed to a “treatment plan” that worked. I reassured myself that indeed he was functioning up to his potential and the various supports he had in his young life were offered and used wisely.

I can’t help it. Every now and then I catch a glimpse of someone who seems familiar. Then I realize that I am wondering if it is a grown up version of a child I once worked with in art therapy. I teach a class and talk about a “favorite” patient or a “challenging” case and wish I had the long-term follow-up addendum to tell. The nature of our business is such that we often find ourselves doing work with no concrete finish and asking ourselves how what we do fits into the total scheme of someone’s life. There are those days when I come home and wonder if I made a difference I reformulate my short- and long-term goals, to hone in on something manageable. I tell myself that therapy is sometimes an uphill struggle for client and therapist. I tell myself “How dare I think I should be able to see change so quickly in a life that has been plagued by abuse, neglect, institutionalism, or chronic illness?” I repeat those lines, long familiar and sometimes faded, that I am a small speck in a life; I can not be a savior. I convince myself of the fact that however few or many art therapy sessions some are better than none. There are also those many minutes and days when it all works, it “clicks.” I am walking on air after a session because no paper was ripped up, no one needed time out, a parent says her son is getting along better with kids at school, a cancer patient says he remembers the days he was cooped up in the hospital in isolation and I came in and “played and did stuff.”

Thinking back, I can recall other incidents that brought home the notion of how my doing art therapy is a part of a whole person’s whole life. There was the bright, energetic adolescent cancer patient who liked to help the younger children in the clinic with their art projects. She continued her own hobby of making dolls even while bedridden. We had talked about what I did and she asked about enrolling in an art therapy class while she was on leave from her own college. Her artistic mother has since carried on in her daughter’s footsteps and is finishing her own degree in art therapy. She is thrilled with the new world that has opened up for her and recently told me “now I know what you were doing!” Then there was the beverage delivery boy who followed me down an aisle in the grocery store one day. He stopped me and asked if I was the art lady at the children’s psychiatric hospital. He was married now with two young children. He said the
hospital was a “crazy place” and he had to get out of there but the art was good and he remembered me and the three art therapists who had worked with him seven years ago.

Certainly there are those times when I surreptitiously hear about a patient of long ago who may not be doing as well as I hoped and whose name may be splashed across the news. Or I have found a student supervisee working with an adolescent who has returned three years later to the same hospital where I had seen him as a child. Whether working in large institutions or privately, we often do not have the luxury nor do circumstances allow that we terminate treatment when the work is done. There are many forces with which we must contend. We do the best we can given the situation and try to do the most we can while we have the chance. The reasons why I went into the field of art therapy are different from the reasons for my staying in the field over the years. But I do realize I have always been propelled by the quest for some personal reward. The feeling I get when I work with a patient and I think I am doing exactly what I want to do in life is difficult to articulate and possibly easier to express with color and paper. Our patients do not always say thank you, and working in a hospital they do not even pay us directly. Their appreciation or show of hard work often comes in a metaphoric message and in unpredictable ways. Not every session or case is a “success,” but maybe, just maybe those three months or three years made a difference in someone’s life and he or she is in a better place because of our time together. So we as therapists find ways to take care of ourselves, pat each other on the back, and delight in those simple unexpected events when we are acknowledged for our efforts. As an association and field of peers and peers-to-be, we support each other. Then, when we least expect it, there is a turning point in the therapy, or someone comes up to you and remembers the art, the trouble he or she shared, and your heart is touched again. And that one time in all the hundreds of encounters is what keeps me going and reminds me why I do this.
The Hero Within; Six Archetypes We Live By
Carol S. Pearson, PhD, Harper & Row, Publishers, San Francisco, 1986. 176 pages, $8.95

Reviewed by: Louise M. White, MA, Writer and Editor, Office of University Relations and Development, University of Maryland Baltimore County

To begin, let us draw from May Sarton’s Joanna and Ulysses. It is the story of Joanna who, as a child, witnesses the persecution and death of her mother and maiming of her brother, then lives with the sorrow of her father, and then joins the family in repressing the misfortune. One day, Joanna throws away the boredom of a clerical job, wanders, saves a dying animal, learns to express herself, and in finding herself saves herself, and saves her father. The story is about the hero within, and Joanna is the magician—not in the realm of magic shows and black magic, but as in the culmination of a journey.

That journey is the framework for Carol Pearson’s The Hero Within; Six Archetypes We Live By. From among the many, Pearson has chosen six archetypes, those patterns in the human psyche—the martyr or the warrior, for example—which can be observed in action and even in body language; and has shown that by knowing the language of the archetypes we can “converse” with ourselves. The archetypes are friendly—they help us evolve and through them we grow. To the archetypes she has added the concept of the hero and the journey and the quest and the victory.

Heroes are no longer elite white men. There are no dragons, and the prize is not the damsel-in-distress. Rather, these heroes grow and change and journey but also help transform the kingdom. Pearson’s hero, the hero within, effects change while meeting and dealing with the six archetypes.

The journey begins with the innocent. Loving, believing, a natural for children, the fall occurs through disillusionment with parents, or God, or government, et al. Then the escape, through work or addictions, which produces similar disillusionment and paranoia. Thence, the orphan, who sees that one must move out of the abyss, who fears being dumped, and who then looks for the rescuer—the sugar daddy, the political ideal—who is the warrior or martyr, who has only recently been an orphan and so needs to save and control. At the same time, filled with guilt and shame, the orphan looks for someone to blame, and finds “mother.” Some orphans journey to become martyrs—replicating their mothers’ actions—sacrifice and control—to their children. Others become warriors, getting all for themselves. For them, the danger is despair—the key to movement is hope. Within Pearson’s configuration, there is the archetype of the wanderer, who begins in captivity, who needs to change, to recognize the person and the captor for what they are, and who needs to breach conformity. The wanderer must develop ego to develop self knowledge, without which one cannot give love or take love in. The wanderer is feared by men, who fear intimacy; and by women who, fearing loneliness, hang in as martyrs.

And finally, there is the archetype magician, only arrived at as the journey concludes. Not an overlord, not rabbit-in-the-hat, not martyr gift-giver but capable of great gifts; a wanderer who has found and is comfortable with the universe. The magician is not the warrior but the rain maker, not supernaturally empowered to make rain but for whom the rain can come. And finally, having coped with the Shadows, the magician, although not perfect, is revealed to be ourselves.

Pearson wrote The Hero Within while on sabbatical from the University of Maryland College Park, where she taught women’s studies. With Katherine Pope, she has edited Who Am I This Time? Female Portraits in American and British Literature and has written The Female Hero in American and British Literature. Today, she is president of Meristem.

The Hero Within is scarcely confined to therapists, group workers, employers, teachers and others in the helping professions. It has appeal for general readers, too, because the book is about ourselves. We see ourselves, past or present, in the innocent, the orphan, the martyr, the warrior, the wanderer, and indeed, to some respect, in the magician. And in so doing, we see that the hero’s journey is not linear, but a spiral—woven of the threads of the various archetypes. The Hero Within can also be used as a diagnostic tool for determining where clients, students, or employees are in their lives. Pearson sug-
gests that the book, therefore, can help practitioners
determine what kinds of therapy might best serve
those clients whose current emphasis is on a particu-
lar archetype, and points to teachers and employers
who deal with orphans (they need to work by rules);
with martyrs (they need to be more autonomous);
and with wanderers (they ought not be involved in
teamwork).

This is not an “easy read” because the subject is
complex and extremely thought-provoking. Not
only are there several concepts of the journey, the
hero and the archetypes. There is also the revision
of the mythical hero as white male, saving the
damsel in distress. And although God is not dead,
gender (i.e. Goddess) is at issue.

Pearson writes well. She is a master at organiza-
tion of very complex material, but somehow she is
able also to weave in other concepts—differences be-
tween men and women, and dilemmas surrounding
areas such as affirmative action. And, I suspect the
Pearson is an excellent teacher, because she makes a
point and drives it home by cogent examples, often
drawn from current popular literature or film, exam-
ple which enable even the lay reader to grasp the
point instantly. We all know Shug in The Color Pur-
ple. Shug is the magician. We all know about the
struggle of Salieri when faced with the genius
Mozart. Salieri is the martyr.

I enjoyed this book. It is optimistic and engaging.
It commands you to think, but it works with you
through to the end, inviting you to make your con-
clusions, and then even gives you a chance to dis-
cover the archetypes at work in your life. I found
mine, all right. Read A Hero Within . . . and find
yours.

**Children Who Don’t Want to Live—Understanding and
Treating the Suicidal Child**

work.*

Reviewed by: **Drew K. Conger, MA, ATR, Art Therapist in Private Practice, Harvard, Mass.**

“We can no longer tell ourselves reassuringly that
very young children are incapable of contemplating,
attempting or actually committing suicide . . . in this
book, I have taken the position that suicidal behav-
ior in young children develops in a particular kind of
family setting—namely, a setting where the child is
forced to try to solve an unresolvable problem . . .”. These phrases from the conclusion of this book may
convey the importance of its entire message. Those
of us who have worked extensively with the suicidal
young have been waiting for a volume such as this;
author Orbach’s message is both urgent and timely.

Israel Orbach is senior clinical psychologist at the
Adolescent Suicide Clinic of Albert Einstein School
of Medicine, Yeshiva University, New York. He has
been on leave from Bar-Ilan University in Israel since
1987. For thirteen years he has done clinical work in
suicide and has developed suicide prevention pro-
grams, conducted research and published in this
field. He clearly is well qualified to write on the
topic of suicidal children.

Using a comprehensive review of current research
and theory, followed by careful delineation of his
own extensive phenomenological model (centered
on the thesis of the unresolvable problem), Orbach
has written a text of relevance for every therapist
working with young clients; it also can be helpful to
other professionals (e.g., teachers) in a position to
assess suicidal risk in children. He presents his ma-
terial in a clear and unpretentious style, with well-
organized chapters, using case study vignettes
throughout to illuminate his concepts. In addition,
art therapists will note that he has included a few
(very few) examples of suicidal children’s art work
in the text. Although Orbach writes more about
young children, twelve years old and under, he also
presents clinical material on adolescents.

The major portion of the book concerns the dy-
namics of suicidal thought. Indeed only the final
chapter (out of eleven) addresses the evaluation and
treatment of the suicidal child. An early chapter
summarizes several theories of adult self-destruc-
tion, a far more extensive body of material than that
concerned with suicidal tendencies in the young,
and considers the implications for understanding
the suicidal child. The author reviews psychody-
amic theory. Durkheim’s sociological approach,
Shneidman’s phenomenological model, Smith’s vul-
nerable personality theory and Maris’ theory of the suicidal career.

In the third chapter Orbach offers a well-founded proposition that the most frightening aspect of children’s self-destructive behavior, which rarely culminates in suicide, is that it is frequently a precursor to similar actions at an older age, sometimes ending in suicide. Of interest is his description of how children communicate their need for help and their preoccupation with death through words and through creative activity, and his outline of how suicidal behavior evolves. This chapter is followed by a discussion of children at risk, probing the role of personality traits (or states), especially the relation of depression to self-destructive wishes, and the more clinically useful identification of hopelessness as a diagnostic indicator. The author also explores the relationship of aggression, serious psychopathology, poor self-control, rigid thinking, suggestibility or oversensitivity, masochistic and obsessive inclinations, and sex and age differences to the development of suicidal wishes. This chapter offers the surprising (to this reviewer) conclusion that overt aggression or even impulsivity are not common factors among suicidal children, even though in other parts of the book Orbach stresses the frequency of violence in their families and violent means of death children most often choose.

Central to the author’s theories is his thesis that child suicide is connected with specific life circumstances rather than to specific personality traits. In the chapter on this thesis he advocates the need to understand children’s experiences through their own subjective impressions. These life circumstances include significant loss (especially death of a parent), parental suicide and depression, child abuse and neglect, family aggression, family crises and school pressures. The author considers their role in either directly fostering the conditions leading to self-destruction, or impacting indirectly through feelings of low self-esteem, depression or hopelessness, or even just increasing the stress in the child’s environment. When destructive, all these conditions seem to present an unsolvable problem which the child must face.

The following chapter the author presents convincing data on how children develop an early understanding of the nature of death. Of particular interest is the information that self-destructive children “distort death in a way that makes the execution of it or the consideration of it easier,” as a defense enabling them to view their own death, but not death in general, as a better form of life. I confess to a little disappointment that not here nor anywhere else in the book does Orbach mention the possible effect television programs might be having on children’s concept of death, particularly violent death.

One can hardly understand a child without understanding her family. In the next chapter, the author stresses the force a symbiotic family relationship that lacks empathy can exert on a child’s decline to suicidal behavior. He also considers the impact of the multiple-problem family on that decline and the “deadly message” of rejection some children receive.

After a complex in-depth case study, Orbach then focuses on child suicide theories, including Schechter’s psychoanalytic “internalization of aggression” explanation, Ackerly’s theory of the fear of losing control of aggressive sexual feelings toward the parents, Furman’s theory of the “sadistic-masochistic nucleus,” Sabbath’s “expendable child” theory, Pfeffer’s ideas of object relations and negative self-image, Richman’s concern with symbiotic relations as a cause of child suicide, and a consideration of the impact of familial pessimism toward life. The author then reviews how the slow growth of suicidal thought is related to increased isolation (Jacobs) and to conflicts with the self (Novic), and finally describes his own model of multiple dynamics leading in different ways to self-destruction. Nor does Orbach neglect to mention the recent research into genetical and biochemical variables which may contribute to suicidal feelings. He sums up this section by pointing out that there are probably only three causal constructs underlying suicide theory: attribution of suicide to special life situations, to developmentally increasing stressors, and to “potential interactions between given circumstances and personality dimensions.” He then offers his own theoretical postulate: the thesis of the unresolvable problem.

The thesis is compelling because it clarifies the child’s subjective feeling that she cannot solve an important dilemma thrust upon her, is restricted in choices, finds new frustration with each attempt at solution, while at the same time her own struggle merely hides a larger, deep family conflict. The author cites pertinent clinical material to illustrate each aspect of this complex phenomenological state. Discussing the ambivalence inherent in the death wish and the four attitudes it engenders (repulsion and attraction to death, repulsion and attraction to life), Orbach describes two of his own empirical studies (Orbach et al., 1983, 1984) which seem to have important implications for diagnosis and treatment of the suicidal child. Results indicated that “Children with suicidal tendencies maintain their thirst for life; their attraction to death is a defense serving their self-destructive tendencies.”

The next and to me most significant chapter of the
book is the final one which outlines assessment and therapy issues. The author suggests directions for treatment, starting with assessment of the family as a means of identifying the unresolvable problem which he believes can only be revealed through family sessions. Evaluation of parental conflicts and parental depression, the child's alienation, symbiotic processes, the child's attraction to death and the child's social and emotional responsiveness should be accomplished first. Once the unresolvable problem has been isolated, Orbach states, the therapist often must work on it at multiple emotional levels starting sometimes with the parents alone. Other treatment issues include encouraging flexibility in the family's coping skills, helping the members work through crises, uncovering destructive family secrets and dealing with resistance in the form of denial and even aggression toward the child, while reducing symbiosis. Goals of the therapist include increasing the family's tolerance of conflict and positive communication. Then, differentiating in a helpful way between treating the suicidal child and other child clients, Orbach provides a framework of interventions which include providing corrective experiences (e.g. affection), giving alternatives to self-injury, confronting death fantasies, examining the suicide choice in an empathetic manner, splitting between the positive and negative self-images and allying with the positive self rather than confronting the suicidal self.

The only area in which this book seems deficient and even misleading is in the presentation of the art work of these despairing children. Orbach suggests that one boy tried to "sublimate" his suicide through drawings of cemeteries, crosses, hanging figures. It would seem more likely to an art therapist that this child was desperately trying to gain control of his frightening thoughts through these pictures; sublimation through art is rare indeed. Orbach refers to overt suicidal expressions as "death wishes and suicide threats; displays of pathological curiosity regarding death; repeated games dealing with death and suicide; and, more obliquely, drawings, songs and stories of destruction" (italics are the reviewer's). However, most of us would agree that many suicidal children's drawings are far from "oblique." He also writes of the function of creative expression as a means to "postpone" death but does not reference this statement. And although he acknowledges the usefulness of drawings for information on how young children view death at different ages, his statement about one of his client's art work that "some of the drawings reflected sadness and depressive qualities: dark colors, black skies and earth," reflects a simplistic view of children's use of color which can be highly idiosyncratic. In relation to one drawing in the text (Figure 5) in which a twelve-year-old girl had X'd out a face and scratched lines across a human form, he relates a story of failure that the girl told about the picture and comments, "The story that accompanies the drawing demonstrates the validity of such drawings as a diagnostic sign of suicidal tendencies." It would seem apparent to an art therapist that the painfully explicit picture has its own validity, and indeed that drawings without words are sometimes the only means very young or inarticulate suicidal children may have to describe their anguish and to ask for help. Finally, as might be inferred from the above comments, Orbach never acknowledges the existence of art therapy, consistently referring only to "drawings" as a diagnostic tool, and neither art nor art therapy are included in the Index, only "Drawings."

In balance, however, Children Who Don't Want to Live is an invaluable aid to the understanding and treatment of the self-destructive child, clearly written, well researched and timely, with an extensive reference list and adequate (based on random check) index. The excellent blend of theory, empirical research, case material and therapy suggestions, as well as the significant questions this book raises about children's heretofore underestimated comprehension of life and death, make it an important contribution to the fields of suicidology and psychotherapy.
The Dynamics of Art Psychotherapy

Harriet Wadeson, PhD, ATR (New York: Wiley, 1987, 328 pages)

Reviewed by: Don Jones, ATR, HLM

The Dynamics of Art Psychotherapy overarches many facets of the broad spectrum of the field of art therapy in four major parts: The Art Therapist, The Elements of Art Therapy, Phases of Art Therapy and Context of Art Therapy. Each principle section is subdivided. Part One rightly emphasizes that it is not the “what” but the “who” which is essential; the therapy process begins with the person. Part Two concentrates on the elements of art therapy but the focus is far-ranging beyond a simple description of materials, spaces and project characteristics converging more on relationships and group approaches.

The title including the words ‘dynamic’ and ‘psychotherapy’ led me to expect (or project) a clinical presentation of the ‘psychodynamics’ of art therapy. Even so, Parts Three and Four were not disappointing. This book is well organized to serve as a text for students, interns, as well as being a ready reference for the beginning clinician. It is the kind of compilation of material that few besides Harriet Wadeson, with her extensive experience, could do.

Together with her first book, Art Psychotherapy focused on specific clinical syndromes, one has an anthology of valuable information and vicarious experiences. The choice word is not eclectic but “synaptic,” a sensitive fusing of information and insights by a practiced art therapist.

The autobiographical style is education at its best, a one-to-one, tutorial approach. The author generously and intentionally reveals her personality to the reader in photographs, self portraits, projects and descriptions of clinical interactions. We are invited to enter her inner private spaces and view her as teacher and role-model.

Parts One and Two may seem to be familiar material to many who have explored other previously published literature. I became most interested at Part Three, which deals with assessment and treatment of diverse populations, and Part Four relating the art therapist’s practice in a broader context to include other professional disciplines and the community.

I look forward to a third book, perhaps, even more specifically and intensively centering on the art therapist’s understanding of the psychodynamics of art psychotherapy.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

Four excellent articles — with an interesting variety of content — are presented in this issue. David Henley writes about his visits with Nadia, the autistic savant about whom much has been written. “Nadia Revisited: A Study into the Nature of Regression in the Autistic Savant Syndrome” offers insight into her art work and behavior after a lapse of approximately twenty years, when her story first was told. Henley visits Nadia at her home in England and tells of his interesting experiences and personal insights.

“Visual Transitions as Art Therapy,” by Gerald S. Evans, Jerry L. Fryrear and Irene E. Corbit, is the documentation of a study involving a multimodal art therapy procedure using photography, art, movement, video and verbal discussion. The authors provide a theoretical rationale for their work and statistical evidence for the effectiveness of this multi-arts procedure.

Judith Costello-Du Bois writes about her portrait work with patients or clients in the article “Drawing Out the Unique Beauty: Portraits.” She mentions that she has done portraits “of old people, hospice patients, children with critical illnesses, and adults who have been struggling with a mental illness.” Costello-Du Bois shares her thoughts about using portraiture with patients, and the uniqueness of the process within these special settings.

“Post-Graduate Group Supervision for Art Therapists” is the title of the article by Debra Greenspoon Linesch, with interviews by Julie Holmes, Marcia Morton and Sandra Stark. Their comments on the beginning stages of treatment, setting goals, special techniques and clinical style illustrate how the group discussed parallel and different stages of clinical development.

It is important to occasionally remind readers about the need for confidentiality when working with clients or patients, and to exercise the utmost care when submitting articles for publication. As has been mentioned in previous issues of Art Therapy, the author must obtain clearance or release forms from those patients or clients (or from other legally designated persons), and must keep these forms on hand for reference whenever needed. Pseudonyms should be used, and submitted art work (i.e., photographs of art work) should not include names of clients or patients. If a name occurs on the piece of art work, the name should be blocked out prior to photographing. Never send a photograph with a name on it; this violates confidentiality of the client or patient.

As an example of what should be done, the authors of the article “Visual Transitions as Therapy” (Evans, Fryrear and Corbit), included in this issue, sent copies of the release forms with their article. Notations were also made that “Fred” and “Connie” are pseudonyms of the people cited in their article. This seems to be correct procedure that is easy to follow and yet follows the rule of addressing the issue of confidentiality.

It is the responsibility of the author to address the issue of confidentiality when preparing an article. Be sensible and take the necessary precautions for personal protection and client anonymity relative to publication and dissemination of information. The author may wish to include copies of release forms (not the originals) with the submitted article. Whether submitted or not, certainly the author must have the original copies in his/her possession prior to submitting the article for review and possible publication.

It is not too early to plan for the coming annual A.A.T.A. Conference, to be held in San Francisco, California, November 16-20, 1989. Note that the Conference ends on Monday (November 20th); this is a change from previous years. Our 20th annual meeting has “Painting Portraits; Families, Groups and Systems” as its theme. Plan now for the trip West, and for what will undoubtedly be an outstanding conference.

Editor, Art Therapy
Nadia Revisited: A Study into the Nature of Regression in the Autistic Savant Syndrome

David R. Henley, MA, ATR, Associate Professor of Art Education and Art Therapy, School of the Art Institute of Chicago

Abstract

This paper addresses artistic and behavioral regression in individuals diagnosed as being autistic savants. It recounts a research study undertaken which led the author to visit Great Britain to work with Nadia who is perhaps the most notable case of savantism. Nadia's case account, first published by Selfe in 1972, described the five year old developmentally disabled, autistic child who despite a range of severe deficits, created drawings in an astoundingly precocious, nature style. Over the years, however, her gifts began to inexplicably fade until her art plateaued at a level commensurate with the child's retardation. The scope of this paper addresses this art therapist's attempts to reawaken Nadia's creative drive in both an aesthetic and therapeutic context.

Introduction

In 1977, British psychologist Lorna Selfe published a seminal study involving an autistic child who possessed extraordinary artistic ability. During the period of Selfe's research, Nadia was a six year old, functionally retarded child, whose deficits included echolalic speech, poor motor coordination, cognitive retardation and autistic affect. Despite the profundity of these handicaps, Nadia created contour drawings in a precocious representational style. Her works, which were drawn from memory, were not merely realistic reproductions which displayed optical accuracy. While they did utilize sophisticated elements of foreshortened perspective and anatomical realism, they also possessed an improvisatory, idiosyncratic charm. The line work combined compulsive, chaotic scribbling with airy, flamboyant draftsmanship. So great was Nadia's virtuosity at six years, that her work was compared to such masters as Daumier (Pariser, 1981), Delacroix (Arnheim, 1980), Ucello (Gardner, 1980) and Da Vinci (Winner, 1986). (Figure 1)

Nadia's giftedness emerged quite spontaneously as she was not trained or encouraged to draw as a child. Her style inexplicably manifested in relatively mature form. However, after five years of remarkable artistic productivity, her drawing prowess gradually began to wither until at age 20, her work was commensurate with a mentally retarded individual functioning in the severe range. (See Figure 5) It was this dramatic regression that makes the case of Nadia all the more mysterious and sensational.

What precipitated such a dramatic loss? What measures, if any, could have supported the child through this regression? What effect might art therapeutic interventions have had upon averting or mollifying this regression?

This article recounts a recent trip to Great Britain where I conducted research on the autistic savant syndrome as a visiting fellow at the University of Kent in Canterbury. With the support of the Rotary Foundation and the American Art Therapy Association, I visited and studied

Fig. 1 Remarkably drawn horse drawn in motion at age five.
autistic savants under the tutelage of Roger Cardinal, author of *Outsider Art*. As part of this project, I sought to include a visit with Nadia. After two years of negotiation with Loma Selfe and Nadia's family, I was invited to visit and possibly work with the former prodigy. My intentions were initially quite clear; first, I must admit, was to satisfy my curiosity which had stirred since the late seventies when this fascinating case was first published. I hoped to learn what had become of Nadia and her art. I felt the multidisciplinary community might also share this desire to follow up such a sensational case. However, as the project evolved, the emphasis eventually took a different turn. The focus soon became more active, as I eventually attempted to offer my services to Nadia and her family as one who is skilled at facilitating the art process in individuals with autism. The goal then became to attempt to reawaken Nadia's creative urge so that art could be an enriching part of her life once more.

**Definition of Autism and the Savant Syndrome**

In the 1940s Kanner first described the symptoms that later came to be known as Classical Early Infantile Autism. These symptoms included intense degrees of self-stimulation, obsessively ritualized behavior, echolalic speech, hyper/hypo sensitivity to sensory stimuli and a pronounced affective indifference to interpersonal contact. While this definition has broadened over the years, it still effectively describes a population which differs from the mentally retarded who exhibit autistic-like behaviors. Classically, autistic children are often physically striking, with delicate features and excellent motor coordination, who seem also to possess intact intelligence. Goodman (1972) first discriminated the autistic savant from the idiot savant in deference to the parents of autistic children, who understandably objected to the inaccurate and pejorative connotations of the word idiot. Rimland (1976) and Hill (1978) were first to discriminate the autistic savant from the purely autistic individual, by denoting the ‘islets of intelligence’ syndrome. Rimland studied 5,400 case studies of autistic children and found that 531 cases showed isolated yet extraordinary abilities in areas such as music, motor coordination, extra sensory perception, mechanical genius, memory and visual art. Out of all of these categories, 30.4% of autistic savants demonstrated visual art proficiency. Hill (1976) found a much lower incidence of savantism among the mentally retarded, studying 90,000 institutionalized retardates, with 54 cases emerging as ‘idiot’ savants at .06%. In keeping with the autistic population as a whole, male savants outnumbered females four to one.

The most striking feature of the savants’ ‘islets of intelligence’ phenomenon is the profound contrast between the extraordinary skill and the individual’s overall functioning. In most instances, the giftedness is so intensely focused or narrow in its application, that it does not contribute to the individual’s capacity to function in the day-to-day world. For example, the savant who can instantly memorize a list of twenty digit serial numbers may lack the ability or motivation to master the simplest self-help activity such as feeding or dressing. This phenomenon was present in Nadia’s case; she demonstrated a range of debilitating handicaps which contrasted sharply with her drawing skill. Yet even Nadia’s artistic ability was pervaded by a tenuousness and fragility. Her work could only proceed under certain conditions—she would not draw on command, which precluded structured art education; her medium was limited to one certain type of pen and her themes obsessed over an idiosyncratic group of animals. Nadia’s perseverative and obsessed artistic process and products are, however, within the norm for this extraordinary population. Most case accounts involving autistic or idiot savantism point to an obsession with particular media, theme, studio conditions and artistic style (Henley 1986, 1989).

**Etiology of Savantism**

Before the issue of regression in the population can be addressed, some remarks concerning the etiology of autistic savantism are in order. For the purposes of this paper I have chosen to follow a physiological model of autism, drawing upon the work of Rimland’s neurological theory. Following this review, I will attempt to extend his theoretical framework to consider the affective implications of autism and savantism.

The principal construct of Rimland’s theory (1978) is that autistic savantism is a neurologically based disorder involving problems with sensory modulation and cognition which results in attention deficits. Rimland considers the savant as having a severe disorder of the attentional mechanism that is pathologically locked into a indestructible...
giftedness is purely a symptomatic expression of autistic and attention disordered psychopathology. (The fact that the manifest symptoms happen to be wonderful works of art is beside the point.) Because autistic individuals lack the control or decision-making ability to deploy his/her attention to both narrow and broad ends of the stimulus spectrum as circumstances require, their aberrant skills or gifts remain inextricably tied to the handicapping condition. (Thus, according to Rimland, “distractibility” is seen as an evolutionarily valuable trait while excessive indistractibility is construed as being potentially a threat to the organism’s very survival.) It is this frightening discrepancy between “apprehending” visual or sensory stimuli without “comprehending” its relevant information in a meaningful context, which Rimland sees as precipitating the “secondary” emotional disorders so prevalent in this population.

Thus, in cognitive oriented therapy, the thrust of remediation is to train the autistic individual to shift his/her attention from self-stimulating, hyper-focused modes of attending in favor of processing and comprehending the demands of the real world.

In order to accomplish this shift of attention, the cognitive therapist utilizes behavior modification techniques to train the individual by means which may or may not include aversive or punitive strategies. Regardless of how noxious or alien the demands are to the autistic individual, the emphasis centers upon refocussing the individual by suppressing his/her symptoms. In the process of suppressing inappropriate behaviors in favor of expanding those which are more adaptive, the object of the autistic individual’s hyper concentration (in Nadia’s case, her art) may be lessened, lost or otherwise affected. Most theorists contend that because Nadia was given intensive speech therapy and cognitive training, that her gift became a casualty of the behavioral growth process. As Nadia’s self-stimulatory and other obsessive making behaviors were obstructed, the idiosyncratic nature of her artistic gift may have similarly evaporated. Indeed, what the psycho-dynamically trained practitioner would refer to as Nadia’s “artistic regression” under certain circumstances, might be considered an indication of progress by the cognitively oriented clinician. Given the decidedly cognitive emphasis of Nadia’s treatment, several writers voiced their concern over what they saw as a punitive, coldly clinical approach. Dennis (1979) raised the concern that forcing Nadia to relate and verbalize at a more “trainable level” hindered the preservation of her one admirable characteristic—her art. Dennis argued that S.Life and her staff irremediably destroyed her “priceless gift” in order to create an average state of subnormality (pg. 15). Tinbergen (1983) echoed a similar sentiment, stating that Nadia’s affective life was not considered during her treatment. Indeed, in subsequent conversation with Selfe, she somewhat apologetically maintained that affective therapy was neither her field nor her mission. In retrospect, she agreed that Nadia might have benefited from more affectively oriented therapy. It was upon reaching this insight during my lengthy discussions with Selfe, that she suggested that I might visit and possibly work with Nadia, in the hope that she might respond to art therapeutic interventions as a means of rekindling her artmaking.

Nadia’s Background

Nadia was born in 1967 to Ukrainian emigrés who settled in Central Britain but retained their ethnic language and customs. According to the father, Nadia showed the rudiments of speech by the age of one year but by the age of two, her language development began to falter. This stage coincided with a traum-
ic period when the much cherished mother was hospitalized for over three months while Nadia languished in isolation with her deeply introverted grandmother. It was upon the mother’s discharge that Nadia began to spontaneously draw and exhibit her remarkable precocity. Despite her artistic activity, Nadia was still retarded in her overall development. She was sufficiently withdrawn and self-stimulatory to warrant a diagnosis of autism. At age six, Nadia was referred to the Child Development Unit at Nottingham University. It was here that the mother bashefully showed the Unit’s Director, E. Newson, the first drawings, thinking they might be of ‘interest.’ Newson’s initial response was naturally one of disbelief. Subsequently, Newson handed the case over to Lorna Selfe, then a graduate student, who exhaustively studied Nadia’s cognition and perception for the next five years.

In keeping with her autistic symptomatology, Nadia’s art process was not merely a recreational or social affair. Despite the fact that it was characterized by intense ritual and obscure perceptual and thought processes, Nadia’s affect was one of great excitement and pleasure during the art process. In fact, it was the only instance when her passivity and lethargy gave way to animation and vivacity. The inspiration for Nadia’s work was no less extraordinary. Images suddenly emerged, sometimes weeks after the child would repeatedly stare at an image from a favorite story book. This was not simply a process of looking, gaining inspiration, then copying in response. The storybook illustrations that prompted Nadia’s work were ordinary, farm-yard animals such as horses and cockerels, created in an adult commercial, artistic style. Nadia’s renditions were reminiscent in that they utilized elements of the basic figure—its pose, its detailing, but then she would begin to improvise. In comparison to the mundanely conventional illustration, Nadia’s linework would boil with kinesthetic intensity, her contours elegantly drawn, facial features would appear in fragments in different parts of the picture (even on the reverse side) frozen in autistic fear, pain or shock. As figure 2 attests, barely controlled scribbling would often appear with these mature contour drawings, suggesting that Nadia’s artistic precocity existed with indications of developmental arrest.

Despite Nadia’s blazing artistic output, she failed to thrive. Neither self-help nor academic skills advanced although she received a great deal of speech therapy and other special education. Nadia’s expressive language never attained a fully functioning status and her behavior remained autistic. Her emotional development suffered further setbacks as the mother, suffering from cancer eventually died; at this time, the child began to phase out drawing altogether.

The Visit

With Selfe’s support, I was naturally excited at the prospect of working with this mythic autistic savant. I was flushed with ideas and strategies, expectant of what I might discover. However, as my long journey neared its end and I finally found Nadia’s home and entered it, expectation gave way to discomfort. I immediately felt how intrusive my visit was. The father is a shy, retiring, elderly man, foreign speaking and obviously uncomfortable at having a stranger observe his retarded daughter and their strained relationship. Furthermore, the home seemed as though no one ever visited. Making matters worse was Nadia’s initial reaction of complete indifference which was followed by overt hostility.

These responses immediately forced me to appreciate the complexity of working with clients and their families, particularly when the focus is upon research rather than treatment.

I spent the initial moments of the visit feverishly reflecting upon exactly what it was that I was doing there, by what motives and to what expected end. My soul search was interrupted, however, by Nadia herself, who began to echolocally chant about some of her favorite things—many of which were found in the equivalent of a Sears catalog. Although she was raving obsessively, this was clearly some attempt at communication. Awe struck, I sat across from Nadia as she robustly handled the stack of heavy catalogues. She interrupted herself by going into the kitchen to prepare lunch, which she accomplished quite independently. The sight of this large-boned young woman dressed as a Ukrainian peasant, mixing a huge wooden bowl of porridge is one which I will always retain.

Within this flurry of activity, my feelings of discomfort and self-consciousness diminished as I was slowly able to assimilate, somewhat, into their daily routines. After her lunch, I felt it might be time to attempt to interact with Nadia. My objective was, of course, to gain some modicum of rapport, despite the fact that this poses an enormous obstacle with autistic individuals. Indeed, at Nadia noticed the increase in my activities and interactions, her first words to me were “You Go Now!” responded by taking my leave to walk in the back garden. During this respite from my presence, I was...
viewed through the large bay window. Nadia was given the opportunity to size me up while she remained safely partitioned in a kind of observation blind. Eventually, I ventured back into the house, where I remained unobtrusive and cautious in my actions. After several hours of a kind of parallel play (one is reminded of Fossey’s technique (1983) of parallel existence with the illusive primates she studied) I was able to interact with her favorite objects in her environment. I decided then to sit opposite her and thumb through my own catalog. I cautiously began to point out objects of interest, first talking quietly to myself, eventually making eye contact with her. Soon we were exchanging pictures of objects such as cameras, radios, and other mechanical things which are so often within the repertoire of autistic individuals. Once I was properly introduced to her “things,” I felt that some rapport was established and I bid her goodbye for the day, promising to bring her a gift tomorrow.

The second day of the visit I resumed our picture viewing until I thought Nadia was sufficiently relaxed to introduce the art materials. These included several pads of 14 x 18” rag paper, a range of rolling writers, and berol black fine tip pens. Encouraged by her father to draw something for “our visitor,” Nadia turned away and refused. After a half hour or so, I asked the father if he would leave since his presence was distracting and agitating Nadia. Nadia often obsessed over him with bizarrely aggressive mannerisms and echolalic raving. At this time I, too, left the table to sit across the room, out of her range of vision. This was to ensure that I was not additionally aggravating or distracting her. Eventually however, Nadia began to timidly scribble with the pen. Slowly, as she became absorbed in her drawing, I felt she might endure me sitting in closer proximity. While sitting across from each other, I assured her that the materials were for her as a gift, and that she could use them as she saw fit. Nadia smiled at the word “gift,” and after a few moments with her eyes strangely locked to mine in that powerful autistic gaze, she began to draw. On page one, she quickly drew a stereotyped cloud-form. (Figure 3) Page two, she drew another isolated, schematic cloud. Page three, another. Soon, Nadia was scribbling cloud after cloud, one to a page. I remained uneasily “supportive” with a nervous smile pasted to my face. Almost an entire sketchbook of hastily scribbled images went by until Nadia felt sufficiently assured that these materials were indeed for her. She began yet another series, this time, perseverating upon an audio cassette form. This succession consumed another twenty pages or so, all the while Nadia measured my reaction. I strained to remain unconditionally accepting in the face of Nadia’s testing of my sincerity and, indeed, empathy.

In response to this perseveration, I thought of countless motivational interventions I could apply in this instance, such as a ‘Lowenfeld dialogue’ (1987). I restrained the impulse to intervene until she demonstrated the capacity or willingness to accept such an intrusion. Nadia herself soon became bored of consuming countless pages of drawing paper, as she began to look up at me as if desiring someone or a need for direction. With these interactions, I thought it might be time to intervene. I did begin with a Lowenfeldian commentary, which, in this case, was applied in a parallel fashion. I spoke softly, to no one in particular, how I enjoy horses—describing in great detail their form, movement, their colors, smells, etc. Since Nadia’s most extraordinary

---

“I restrained the impulse to intervene until [Nadia] demonstrated the capacity or willingness to accept such an intrusion.”
problem solving, maintaining her relationship with inanimate objects while also exploring and expanding that relationship in figurative terms. It seemed a logical first step at expressing a modicum of self-concept and image. In this and other cases with this population, there is often such a transitional object which softens and buffers the anxieties that come with relating to, or interacting with, people.

I was fascinated watching Nadia create this picture. While engaged in the art process, she seemed transformed, free of any suggestion of psychopathology. Beforehand, behavioral symptoms were ever present and dominating, yet, they became minimized while drawing. Nadia sat with knitted brow, her fingers lightly supporting her at the temple with an expression of concentration upon her face. The need to self-stimulate or perseverate was seemingly redirected through the art process. She appeared as any freshman art student, intently studying the model, looking, sketching, and looking once again—drawing exactly what she saw with great determination and intensity.

As Nadia was able to relate to mechanical objects and draw them in the anthropomorphic style that is so pervasive among autistics, the next step was to transfer her figurative awareness and fascination with inanimate objects toward live subjects. In this I hoped to facilitate an interaction with people on at least a symbolic basis. I then asked Nadia if she would enjoy drawing a person. In response, Nadia began scribbling a tight black circle which was followed by an equally anxious-looking stick person. (not shown). Amazed at the pace of this progression from stereotype, to autistic imagery, to regressed intensely cathexed scribbling and figure, I grew concerned that I might be pushing her too quickly. However, it soon became clear that Nadia was in fact, in control of the pace, since in her next sketch, she spontaneously drew another figure, exclaiming it to be "Daddy," with much more affective expression than the previous figure. (Figure 5) I ventured next to see if she would consider drawing a "girl," which I considered was a fairly provocative intervention for an autistic individual. Again Nadia quelled my concern by rapidly sketching Figure 6. This innocent image was certainly a self-portrait, as it clearly portrayed Nadia's blouse and page-boy hairstyle. Although somewhat stereotyped and rigid in form, its affect is fairly neutral, with a pleasant, innocent expression. It also bears an uncanny resemblance to her preceding camera "faces," suggesting the disturbing interrelatedness between Nadia and her world of objects. However, Nadia had also demonstrated extraordinary ease at giving life to her figures which suggested her potential for growth.

Wishing to consolidate these modest gains, we broke for a long lunch and walk in the garden. Upon returning, I presented Nadia with a picture first published in Selfe's book—a story book illustration of a horse which had evidently served

---

Fig. 4 Nadia's first elaborated images revolved around her "objects." Note the figurative elements invested in this inanimate camera.

Fig. 5 Nadia's first human figure, "Daddy," displayed marked anxiety, aggression and stereotypic defense. At age 20, her figurative drawing had assumed an impoverished and stereotypic form.
loosely as a model for Nadia’s mature horse and rider drawings. Nadia studied this picture intently. It was difficult to discern an expression of recognition in her face. Still she seemed interested and in response I asked her if she would draw this figure. Nadia echoed “Draw the horse!” and began sketching once again. The result was a naively drawn contour drawing, focusing upon the face, which possessed the form and style commensurate with that of an intact ten year old. (Figure 7) The figure was relatively simplified with few details. However, after this piece was completed Nadia’s impulse to draw spontaneously gained momentum. She also began to look through Selfe’s book as though thumbing through one of her catalogues. Nadia’s interest in her own book prompted me to wonder what would happen if she were to render the mature drawings of her sixth year period?

**Introduction of the Early Drawings**

On the third day of our visit, Nadia seemed to anticipate my arrival. Like many other autistic individuals, Nadia might have associated me not so much as a person with whom to interact, but as the giver of art materials and opportunities for expression. In my clinical practice I often capitalize on this association in order to solidify a working relationship with the autistic individual as it constitutes a minimally provocative approach. Thus, with rapport established, Nadia completed several warm-up exercises in which she engaged with little resistance and, more importantly, demonstrated scant obsessional or stereotypical work. Therefore, I felt it time to reintroduce the drawings she had done as a six year old. As I presented Nadia with the famous “Horse and Rider” (Figure 8) which had graced the cover of Selfe’s book, I asked her “Who drew this?” She immediately responded “Nadia!” I then asked (somewhat tentatively knowing it to be a loaded question) if she could draw this picture. Nadia considered this request for what seemed like minutes, then took up her pen.

Although the resulting production (Figure 9) pales in comparison to the original on a number of fronts, I was astounded that she was able to get through it at all. In any case, the verve, the flair, the audacity of the original is absent in this creation. The draftsmanship is spare and brittle—a pared down inventory of lines and forms compared to the wild flourishes in the original. It is unreasonable and perhaps somewhat demeaning to compare the two on an aesthetic basis in light of the continued circumstances of the present drawing. However, as I studied the two works I found the rendering to be more than just a credible job of copying. There is certain sophistication about the interplay of arcs, serrations, and circles that comprise the piece.

I was particularly interested in Nadia’s treatment of the human figure. In the original, the rider is puppet-like and seemingly at the mercy of the hot-blooded galloping beast. Attached to the saddle like so much baggage, is a grotesque head and body of a small animal. These disturbing images were indeed carried over yet, there was a lack of elaboration of detail and intensity that pervades the original.

The foreshortened angle and cropped view of the re-created horse.

"Nadia echoed ‘Draw the horse!’ and began sketching once again.”

Figure 7 The re-created horse.
are quite bold, as is the flowing tail that trails behind. Regardless of its lack of complexity and flair, it stands as a remarkable effort by an individual who functions in the upper range of severe mental retardation. Nadia’s powers of observation seem to have survived intact. Her response to this work was inscrutable: she exhibited keen interest yet affectively she was exceedingly hard to read.

The next series involved the “cockerels,” which were another of Nadia’s preferred subject matter during her mature artistic period at age six. Once again, I presented Nadia with the story book illustration from the Selpe book to serve as the initial model. (Figure 10) Nadia responded by drawing this figure in her careful look-draw-look-draw manner. (Figure 11) The finished drawing is once again, a credible job

Fig. 8 The horse and rider piece is among Nadia’s most celebrated images. Drawn at age 5.

Fig. 9 Nadia’s re-creation of her formative masterpiece.
"Once it was clear that I would be leaving soon, Nadia was overtly distracted from her drawing."

most powerful images (Figures 14-19). In one of the originals (Figure 12), the figure is formed from a maelstrom of loosely scribbled line-work. It seems to have emerged in a spasm of creative energy, where the abstract draftsmanship is counterpointed by a kinesthetic energy that launches an everyday farm animal into an abstract vision. Throughout the collection of Nadia’s cockerels, there are numerous fragments of the rooster’s face, eyes bugging out, beak opened wide, and head rocking back. Despite all this perseverance and impassioned obsessiveness, the contours are at once loose and precise, utilizing an economy of means that furthers its sophistication and visual impact.

Upon studying this and several other extraordinary cockerel drawings, however, Nadia seemed to remain untouched by their evocative powers. Remaining calm and consistently studious, Nadia treated this exercise in a most academic manner. Her interpretation of Figure 12, (Figure 13), centers upon the head—the seat of the figure’s sensory awareness and affect. In the original the jaws appear agape, the eyes roll back in some unfathomable pain or terror. Such intensity is lacking in the present rendering. It appears once again as an inventory of optical facts which have been compromised and schematized into a sort of shorthand for easier transcription. Yet, seen with a comparison of the overpowering original, this piece does sustain graphic interest in its own right. The composition is a careful mixture of intensely encased line-work, circular and serrated forms which contrast to contained volume of untreated white space.

The afternoon of the third day of this visit, was mainly spent walking through the garden and chatting at the family table, interspersed with several drawing activities as part of our termination process. Once it was clear that I would be leaving soon, Nadia was overtly distracted from her drawing. Indeed, her parting pieces regressed back to a twelve part succession of stereotyped clouds. Instead of repeating the solitary clouds that initiated our session, these were grouped in sixes or eights, each element briskly scribbled with autistic precision and sameness. (These pieces were occasionally counterpointed with astutely drawn insect images drawn from life through the bay window.) This concluded our studio sessions.

Discussion

In 1986, I described a research study for autistic children who, although not savants, experienced behavioral and artistic regression during the two year treatment period. The ebb and flow of emotional stability and the fluctuation in once mastered skills were painful and exasperating to witness. The precipitating factors that plunged, especially one of the children into inconsolable trauma, remained inexplicable despite a careful analysis of physiological history, family dynamics and environmental factors.

In twelve years of clinical work, I have witnessed numerous instances of uneven growth in autistic individuals. I am convinced that regression in individuals with autism is an expected, possibly unchangeable element of their physiological and ontological condition. While not always as severe as the regression cited in Henley, (1986) (which involved regressing to self-injurious head banging) or as sensational as the case of Nadia, regression remains an omnipresent phenomenon that pervades the day to day life of autistic individuals. The forces that drive re-
gression may include irreversible neurological damage, sensory distortion, genetic liability as well as defective environmental nurturing and emotional trauma. It is probable that in most cases there is a complex interplay between several factors. The activation of both physical and environmental variables working in concert may create a cycle as each factor interacts, aggravates the other, escalating the entire process toward greater devastation.

Thus, in the case of Nadia, I cannot subscribe to the theory which links the child’s loss of drawing prowess solely to the supposed progress made in broadening attending behavior. It is documented, both by Selfe’s study and my subsequent visit, that functional expressive language never truly developed. Nor did Nadia expand dramatically in any other academic or social capacity. She essentially remained autistic and retarded despite persistent attempts to provide her with development language and other adaptive behaviors.

It is significant, however, that the very persistence of cognitive oriented programming might have aggravated the child’s regression by failing to support her during a time of personal crisis. It cannot be overlooked that the child’s brief artistic career was inextricably bound, not to the failure to formulate concepts on a verbal level (Selfe, Newson p. 129), but to the fervent symbiotic ties to the mother. Nadia began her spontaneous drawing at age 3½, which roughly corresponded to the mother’s discharge after three months of hospitalization. Prior to the mother-child reunion, Nadia had been essentially deprived of material nurturance and sensory stimulation (given the grandmother’s extreme introversion and inability to cope with a handicapped child) resulting in a period of deprivation and subsequent autistic withdrawal. It is probable that the child was profoundly affected by the intermittent loss and regaining of the mother. Nadia’s outpouring of creative activity may be seen as a celebration of this reunion. Paradoxically, the child’s output during the periods of the mother’s absence might have been fueled by the symbolic need to re-create the lost object (the mother) (Allen, 1989). Such a mobilization of inner resources despite the child’s emotional trauma may point, however, to the role of the art process as an empowering and mollifying agent. Such self-art therapy may have been Nadia’s only resource to process the feelings of abandonment and bereavement, with the art acting both as a bridge and outlet for affect which was incapable of being expressed through any other means.

In the face of the child’s psychological problems and emotional trauma, autistic withdrawal in the form of hyper-focussing attention upon the artwork can be viewed as an adaptive response. The drawing activity in this respect may have additionally functioned as a means of displacing the pressures of social, familial and academic expectation which were probably alien and upsetting to the child. By focusing upon her story books and subsequent drawings, Nadia was able to escape or manage in her autistic way, these incomprehensible demands. Thus, I firmly believe that through her art, Nadia effectively communicated the breadth of her issues. It is in regard to this question, that I disagree with Gardner, who has stated that Nadia “displayed no interest in capturing her ideas, feelings and concepts in a medium that might convey meaning to others.” Gardner need only survey the countless cockerels whose mouths were forever drawn open in desperate hunger, like chicks frantically straining for sustenance at an abandoned nest. (Figures 13–17) The eyes of her cockerels, horses and people clearly act as the windows of the soul, as the perfectly drawn spheres bulge and strain, their pupils masterfully positioned to convey a range of emotional drama.
These haunting images stand as powerful metaphors for the child's emotional requirements which, given the circumstances, were probably not met during her times of crisis. Thus, the possible meanings of Nadia's symbolizations were never taken into consideration by her cognitive practitioners despite the fact that the issues were constantly repeated throughout her imagery. Those who work with autistics on a more empathic level realize that perseveration is not simply mindless repetition without significance. What is said, drawn, sung or written often holds the key to the child's salient concerns. One only need to listen seriously and see in order to partake of their struggles.

Although Nadia probably did benefit from Selfe's attention and encouragement to draw, she essentially was not specifically supported during her time of crisis and loss. She was left to fend with whatever limited resources she could marshall. The issues of sensory deprivation, maternal loss, academic pressure and bereavement were to be faced squarely by the child without therapeutic support. Art therapy was unfortunately not considered as a viable option as a means of supporting and sustaining the child.

Left undefended, Nadia could have regressed into a number of fight or flight positions (Tinbergen 1983). Individuals with intact resources may strike back—assaulting their aggressors or by turning their
rage against the self in the most virulent form of assault—self-injurious behavior (which Nadia reportedly engaged in for years after the mother’s death). Others may take flight; some literally eloping, but most often by sinking deeper within themselves, unresponsive to even the most tenacious attempts at behavior modification or psychodynamic therapy. In less acute re-actions, the autistic individual may take solace in the world of “objects”—where controllable or stereotypical things offer predictable or “safe” stimulation. In its most pathological form, this behavior takes on a more compulsive, ritualized or self-stimulatory quality that effectively binds anxiety (Henley 1989).

These dynamics were certainly operating during my visit to Nadia. Initially, there was a flight response whereby Nadia essentially ignored my presence until I was forced upon her by her embarrassed father. Once prodded, Nadia shouted “You Go Now!” whence I deferred and took my leave. Then a period of parallel “play” allowed for my cautious assimilation. Once the art making proceeded, there was resistance, testing of limits and indications of autistic withdrawal in the form of perseverative, stereotypical cloud scribblings. Once some rapport was established (more of an uneasy coexistence) resistance involving stereotypes gave way to more formed expression, although the themes were still decidedly “object” oriented. Then a momentum developed, allowing for more spontaneous expression, as well as interpersonal relatedness and artistic productivity. Once termination became a factor, however, Nadia’s art and behavior slightly regressed, returning to more defended, stereotyped expressions.

Upon our separation, there were spontaneous displays of ambivalence over our attachment and the art experience we had shared together. In the end, Nadia’s echolalic pronouncement was still obsessively intact, yet the intonation had changed. “You Go Now!” had become a tentative “You Go Now??” Despite the probability that I had unwittingly precipitated another instance of loss and abandonment by our stirring yet all too brief visit, Nadia appeared capable of dealing with our separation as well as coping with the potratically provocative renewed impulse to make art. Such fortitude might point to Nadia’s constitutional resilience as much as the tendency to regress.

The fact that she was handling our relationship, solving artistic problems, and broadening her repertoire of responses supports the possibility of increasing ego strength.

If regression and its manifest autistic symptomatology can be thought of as part of the physiological and existential dilemma facing these individuals, then possible downward slides of performance could be anticipated and be part of the clinician’s expectation. In response to the ebb and flow of one’s performance the child should be nurtured, supported and guided through his/her troubling times, with skills being maintained as best as possible until the child is in a position to meet new challenges. While an emphasis of teaching skills and developing adaptive, attending behavior is a vital part of the treatment process, the clinician must be sufficiently insightful to know when to lessen one’s performance expectations. Regardless of the educator’s tenacity, the growth process cannot proceed by merely suppressing
symptoms and forcing behaviors. Some kind of compromise must be made—one that accommodates the emotionally labile child while taking care not to succumb to the autistic child's formidable powers of manipulation and task avoidance.

Autistic symptoms are compelling signals of psychic unrest. They cannot be simply ignored or suppressed. Such primary process discharge is subject to hydraulic phenomenon—with the drives finding discharge regardless of the attempts at their "extinguishing," with symptoms often surfacing in others areas of affective expression. Bettelheim (1953) was correct in maintaining that the clinician must energetically seek out any evidence of ego strength in these children, such as apparent in autistic art, and gently support efforts which will eventually become both pleasurable and useful.

Conclusions

The experience with Nadia and that of the other savants I had the pleasure of visiting during the twelve weeks in Britain was more than instructive. Delving into the artistic, and in some cases, the personal lives of these special people sensitized me further as to the breadth of issues one must face if he or she is to maintain a humanistic approach to research.

A salient issue which emerged was the need to balance academic investigation with maintaining an ethical and therapeutic approach. As I was initially preoccupied with the observation, intervention and collection of data, Nadia and the others shocked me into a greater awareness. Catching myself in a potentially self-serving and intrusive situation, I was prompted to reflect over my motives, methods and end results. The focus upon research eventually became more aligned with the possibility of contributing something to the clients' welfare; i.e., advocating for services, consulting with those in charge of programs and home life—in short, promoting art, education and therapy as it met with the individual's need. For example, I consulted with Nadia's father with suggestions that he might utilize in order to cope with Nadia's inappropriate behaviors. Having only dealt with behavior modification in the past, he was quite interested and grateful to learn of more empathic means of redirecting and processing aggressive and self-stimulatory behavior. I also assisted him in motivating Nadia to diminish her incessant television watching and other obsessions, so as to utilize the art materials as well as other leisure time activities (such as gardening), on a more constructive basis. Finally, I looked into the local mental health services which might offer Nadia a more structured, longer term therapeutic environment. In this case and in several others, the measure of my success eventually took the form of providing modest services as well as gathering information.

In so far as formulating conclusions regarding savantism, I believe that Rimland's theoretical constructs on the nature of autism and regression are sound. Nadia's giftedness may well be a result of some aberrant, hyper-concentrated attention mechanism defect. It is the response to this diagnosis that is misguided. First, I agree that it would prove dangerously naive to assume that autistic individuals are happy in their state of hyper-sensitivity and isolation. I agree with Seltzer that it is in their best interest that the clinician or educator intervene, sometimes provocatively, to counteract the effects of developmental arrest, cognitive retardation and sensory distortion. Yet, in this case, the process of making art should be seen not simply as an elaborate symptom but as an adaptive, positive means of self-expression that has value as a conduit toward both creative and mental growth. Rimland himself points out that many of history's most creative geniuses had autistic attributes. He suggests that Isaac Newton, Albert Einstein, and Howard Hughes are individuals whose single-minded intensity, obsessiveness and ritualization were more than just casual eccentricity. Nadia, as an artist, follows thousands of mature artists who are self-absorbed, compulsive, isolated, idiosyncratic individuals whose art processes are also subject to violent changes. These changes are often inextricably bound to emotional turmoil and creative impulsivity. Kris (1952) and Kramer (1986) argue that regression is a vital ingredient in properly "cooking" the art product. Without our ability to tap the wellspring of innermost desires, phantoms, and visions, our art is reduced to academic mechanistic exercises, devoid of richness and energy. Yet, access to the primary process can be hazardous, as it demands that the artist must possess sufficient ego strength to resist the gravitational pull of complete regression and disintegration. To manage this, the ego must be firmly in control; such control is, by definition, not within the realm of the autistic artist. However, those autistic individuals whose tenuous egos constantly flirt with oblivion can be guided and supported during their art process by what Kramer (1986) terms the "auxiliary ego." As Nadia's controls began to slip away, there could have been some art therapeutic or other auxiliary support system that complemented artistic, emotional and academic skills, so that they might survive the episodes of regression intact.

In working with these clients, art therapists begin by fostering any talent in evidence by cautious and sensitive interventions that cause a client minimum anxiety or stress. Although art therapy and the art experience are seen as a growth process, these interventions must respect clients' resistance to change (especially their obsession with certain stereotypes), for it bespeaks their vulnerability.
We should concentrate upon providing a stable yet sensorially stimulating environment where the timid client is encouraged to explore, solve problems, and take creative risks without resorting to extreme defenses. The art therapist can assist in this process by providing a model with whom autistic persons can identify and begin to incorporate appropriate behaviors, such as artistic skills, into their own creative and behavioral repertoire. By remaining calm, firm and consistent in the face of bizarre or tedious acting-out behaviors, we communicate our commitment to assist the autistic artist to make positive and productive changes in the studio. The art process can then be promoted as a serious educational and therapeutic activity that engages and challenges the multi-faceted faculties of each individual. Ultimately, the goal is to open channels for the transformation of the client’s ideas, concerns and issues into forms that are comprehensible to others.

Abstract

The present study describes a multimodal art therapy procedure using photography, art, movement, video and verbal discussion, Visual Transitions, and attempts to provide a theoretical rationale for the procedure as well as statistical evidence for its effectiveness. A group of volunteers took part in a seven-week program and filled out questionnaires before and after the experience. The Adjective Check List, the Personal Orientation Inventory, and a self-report critique show moderate but positive results for the program. The results are discussed and suggestions for future research are offered.

Visual Transitions

To achieve its goals, Visual Transitions therapy incorporates still photos, art, movement, video and verbal discussions. The participant has the opportunity to observe and experience his or her "stuckness," move to a new, more alive and meaningful state of being, then opt for transiting more fully to that state or determine a comfortable place on the continuum (Corbit and Fryrear, 1985; Fryrear and Corbit, 1989). Operationally, the clients are provided with experiential exercises which allow them, through photography, to observe themselves in their present state (indicating "stuckness" or "constriction"), and their more preferred state (indicating "freedom" or "non-constraint"). Still photos are combined with artwork to show a relationship between these two states. Body movement becomes part of the therapy as clients enact feelings and actions which characterize these respective states. The movement is shared with others, who in turn assume the same poses in group fashion for psychodramatic effect. Video is utilized to facilitate transition between the two states and becomes an instrument of reinforcement. Visual Transitions, as a therapy, attempts to label, artistically and verbally, two points on a continuum—a constricted behavior often characterized by insecurity and low self-esteem; versus a behavior pattern indicating feelings of security, self-worth, high self-esteem and a sense of freedom. The artwork (which includes the still photos), the movement, and the video all become metaphors for change.

Even though the various component expressive therapies which constitute "Visual Transitions" are among some of the more accepted and commonly practiced psychotherapy strategies, an examination of their combined features deserves consideration. Basic questions that must be dealt with include:

1. Is this really a therapeutic procedure?

2. How effective is this procedure both in terms of statistical significance (objective), and personal evaluation by clients (subjective)?

3. What reaction might the mental health community have with regard to this method?

In order to address the first question, it is desirable to explore some important facets of this new art therapy modality. Such key factors as the relationship of art to the arts therapies, and an examination of the specific art therapies involved in this method need to be considered to better appreciate their respective features and benefits contributing to the effectiveness of Visual Transitions.

As Fleshman and Fryrear (1981) wrote, "the process of all art involves more aspects of the individu-

"The artwork . . . the movement, and the video all become metaphors for change."
al than the verbal therapies can touch. The arts require the involvement of primal elements found in the connection of mind and body. Many of the arts are nonverbal and can deal with presymbolic and non-symbolic subject matter. For example, arts processes involve breaking down and restructuring of conceptual structures. Body rhythms are basic to music, dance, and poetry. They are implied in the structural relationships within painting, sculpture, and architecture. Psychological dynamics may develop out of such physical processes as eating and excreting, sex, locomotion, tension, relation patterns, states of excitement, perception, sensation, fine-motor coordination, and visual motor coordination. Processes that are recognized in the more verbal therapies, such as sublimation, symbolization, identification, and catharsis can be contacted and controlled more directly through the arts. Meaningful areas of the personality that are often quite elusive to the more verbal therapies may be, so to speak, seen and heard, touched and handled through the arts therapies.” (pp. 6-7)

Fleshman and Fryrear further assert in this same text that the field of arts therapies simply is “the use of the elements found in the arts, either in individual form or in combination, to bring about positive changes in the lives of persons needing help... that all areas have much in common. They share a therapeutic purpose and are basically similar in therapeutic philosophy and rationale.” (p. 8)

Regarding art therapy, Wadeson (1980) rhetorically questions the “why” and “what does it have to offer” over other more conventional forms of therapeutic intervention. First of all, she says we, as humans, tend to think in images. We thought in images before we had words. Not only is imagery woven into the core of human personality, but it is also recognized as a primary component of unconscious phenomena, which include dreams. Wadeson mentions that in art therapy the dream, fantasy, or experience is depicted in image form rather than having to be translated into words, as in purely verbal therapy.

Wadeson notes that art objects tend to decrease our defenses in terms of communications. Verbal communication brings with it the ability to use various ways to disguise or modify our thoughts when actually expressing them verbally. Art reveals our images through symbols in a fashion that cannot be easily altered to disguise meaning.

Another facet or unique attribute of art therapy noted by Wadeson is that of objectification—the art object becomes a tangible product. This brings with it one of the central, most important aspects of art therapy—the ability for a resistant client to relate to the art object, since it is often easier than relating directly to the self.

Permanence of the art object is also a feature indigenous to art therapy. The art object is not subject to the distortion of human memory. Wadeson also points out that through reviewing art productions with clients, often new insights develop. The client or therapist may notice emerging patterns in a series of art works which may not be apparent when the work is viewed singly. Other advantages of the art object’s permanence are found in its usefulness for research data, and its therapeutic value in group sharing.

Yet another distinct advantage of art therapy over verbal therapy alone is its spatial matrix feature. Wadeson points out that art expression need not obey the rules of language—grammar, syntax, or logic. Wadeson mentions its spatial nature. “In a picture, I can portray it all at once. I can show closeness and distance, bonds and divisions, similarities and differences, feelings, particular attributes, context of family life, ad infinitum.” (p. 11)

Art therapy also seems to provide its participant with a sense of creative and physical energy. Wadeson mentions an “enlivening quality” to be found in art therapy; that in discussion after an exercise, members seemed to be more open, revealing, and receptive than in initial discussions—a change in energy level activated by art therapy.

This healing process resulting from art therapy is revealed in Corbit’s study (1985) involving a group of combat veterans besieged by terrifying, recurrent playback nightmares. According to Corbit, these nightmares were depotentiated and diminished through a veterans’ dream group experience involving logging their dreams, drawing them, and discussing their nightmares within the group. Corbit further points out that ego-esteem and self motivation also showed improvement as these veterans gained a new sense of mastery from working on their dreams through their drawings.

Photography constitutes another of the modalities of Visual Transitions therapy. Stewart (1979) points to phototherapy as a new use of photography. He defines phototherapy as “the use of photography in a therapeutic setting, under the direction of a trained therapist, to reduce or relieve painful psychological symptoms, and as a method of facilitating psychological growth and change.” (p. 41) Stewart further as-
serts that phototherapy fits most of the 
requirements for a sound theory, 
since it allows for the formulation and 
testing of hypotheses.

One of the major advantages 
found in phototherapy is its analo-
gous nature to art therapy—that of 
projectiveness. It becomes the bridge 
for communication between ther-
apist and client as it takes on meta-
phorical significance in relating to 
underlying problems.

Krauss and Fryrear (1983) have di-
vided the literature on the use of 
photographs in therapy into eleven 
broad areas: 1) the evocation of emo-
tional states; 2) the elicitation of 
verbal behavior; 3) modeling; 4) ma-
stery of a skill; 5) facilitation of sociali-
ization; 6) creativity/expression; 7) dia-
gnostic adjunct to verbal therapies; 8) 
a form of nonverbal communication 
between client and therapist; 9) doc-
umentation of change; 10) prolonga-
tion of certain experiences; and 11) 
self-confrontation.

Gosciewski (1975) underscores the 
applicability of phototherapy as one of 
the modalities of Visual Transitions 
therapy by relating his viewpoint that 
"photographs can serve as a 
transition in discussing 'there and 
then' situations with 'here and now' 
issues and concerns." (p. 600) It is 
this concern with pictorially represen-
ting a "constriction" on the one 
hand, and then a "freedom" pose on 
the other, that is central to Visual 
Transitions. Krauss and Fryrear 
(1983) assert that photographic im-
ages reveal a metaphor map that 
relates to one's participation in life; 
they may range from the extremes of 
a narrow constricting viewpoint to 
the lack of structure or boundaries of 
any type. The authors further speak 
of the strength of phototherapy as a 
self-confrontation device—one of the 
key facets of Visual Transitions 
therapy. They write that "Many of the 
advantages found in phototherapy it is its analogous 
both projections 
viewpoint is that since art therapy is 
and symbolic representations of a 
changes for the better." 
(p. 17) Krauss and Fryrear also point 
out the symbiotic relationship of art 
therapy to phototherapy. Their 
their viewpoint is that since art therapy is 
dependent on externalized internal 
subjects and phototherapy is depen-
dent on internalized external 
subjects...both are projection and symbolic representations of 
casting of a client's reality.

In addition to the modalities of art 
therapy and phototherapy, Visual 
Transitions therapy utilizes video to 
facilitate change. Consistent with 
the blending of several arts therapies 
modalities for an effective proce-
dure, Hung and Rosenthal (1981) 
provide their support by concluding 
that visual feedback of the video-
taped self has its maximum impact 
then when confronted with other 
therapies. Fleshman and Fryrear 
(1981) state that there are several 
concepts supporting the use of this 
type of equipment. "One set of con-
cepts assumes that a person is taped 
and then views himself on a television 
monitor. The feedback serves as 
self-confrontation, provides imme-
(digmatic) and immediate evidence of the 
quality of group interactions, helps 
in the patients' and the therapists' 
recall of therapy events, stimulates 
individual or group psychotherapy, 
and tends to equalize patient and 
therapist." (p. 156)

"One of the major advantages found in phototherapy is its analogous nature to art therapy—
that of projectiveness."

There are some interesting theo-
ries as to why videotherapy works. According to Heilveil (1983), the image on the screen interprets, ques-
tions, clarifies, suggests, criticizes, 
encourages, and contradicts the 
viewer. Video feedback then be-
comes a type of self-confrontation 
which forces the client to face real-
ity. Video has also been credited 
with affecting change through cog-
nitive restructuring. Changes occur-
ing as the result of this self-confronta-
tion therapy can be attributed to an "objective shift" in which the cli-
ent alters consciousness into a more 
objective, observing posture (Wick-
lund, 1975). Yet another theory 
which supports the use of 
videotherapy focuses on its value as a 
therapeutic tool in eliciting clients' 
previously unconscious identifica-
tions with unresolved issues revolv-
ing around relationships with par-
ents, spouses, or siblings. These 
recognitions can sometimes trigger 
insight capable of fostering change 
(Reivich and Geertsma, 1968).

Movement therapy is the last of the 
modalities to be highlighted as a 
component of the Visual Transitions 
therapy. Movement is the "fluid" 
that provides the metaphorical tran-
sition from "constriction" to "free-
dom." Heilveil (1983) reminds us 
that movement is both kinetic and 
cognitive. While movement is ex-
perienced largely through a kinetic 
sense, a person thinks about the 
world in new ways while engaged in 
unaccustomed forms of movement. 
Alper (1976) feels that the focus of 
movement therapy is maintained 
primarily on the "here and now": 
the actions of the individuals involved. 
As clients move, they spontaneously make associations to past, unre-
solved situations in their lives. They 
explore the meaning of these recol-
clections to present life events. While 
associations to unresolved old situ-
ations occur frequently in the process of moving, closure and new solu-
tions can only be discovered by the 
person in the present.

This examination of the various 
component arts therapies modalities 
which collectively form Visual Transi-
tions therapy supports the following 
rationale: Given that these respective 
modalities are as therapeutically 
sound as the cited professional refer-
cences indicate, and that, while each

July 1989, ART THERAPY 59
modality is capable of providing the full range of therapeutic benefits for which it was designed, it follows that this blending of arts therapies should provide a sound and effective multimodal therapeutic procedure. Further, it is hypothesized that data will bear out the effectiveness of Visual Transitions as a therapeutic procedure.

Method

Subjects

The group of 11 subjects consisted of 9 females and 2 males, ranging in ages from 34 to 58, with an average of 46. There were four practicing psychotherapists, three full-time students, one research technician, one graphic artist, and two administrative office workers. The subjects responded to a direct mail pamphlet which advertised the procedure.

Therapeutic Materials

All group members were supplied with the following photographic and art materials for completing their respective art objects:

1. Still photo cameras (Polaroid© 600 Land cameras) and film
2. Art Materials
   Poster board, scissors, glue sticks, Cray-pas (oil pastels) colored chalks, and colored marking pens
3. RCA Nevvicon color video camera system
   a. Color video camera (including zoom lens, rear-viewing monitor, and tripod)
   b. VHS player recorder, Zenith color TV monitor (including hand-held motion control device) The video system was used to provide a replay of presentations.

Testing Materials

1. Personal Orientation Inventory (POI). The POI is a self-report instrument designed to measure personal maturity as based on Maslow’s concepts of self-actualization. The POI consists of 150 paired-opposite items of antithetical, self-characterizing statements concerning value and behavior judgments.

   The POI consists of two ratio scores that assess general personality effectiveness and 10 variables represented by 10 subscales. These scoring categories, in which higher scores indicate better personal adjustment, are as follows:

   Ratio Scores
   Time Incompetence/Time Competence—measures the ability to live fully in the present.
   Other/Inner Support—measures whether or not guidance comes from within the self or from others.

   Subscales
   Self-Actualizing Values—measures the degree to which one holds the values of self-actualizing people.
   Existentiality—measures the ability to react according to the situation without rigidly adhering to principle.
   Feeling Reactivity—measures the extent of responsiveness to one’s needs and feelings.
   Spontaneity—measures the ability to respond and express one’s feelings spontaneously.
   Self-Regard—measures the level of self-esteem.
   Self-Acceptance—measures acceptance of oneself despite one’s imperfections.
   Nature of Man—measures the degree to which man is seen as intrinsically good.
   Synergy—measures the ability to resolve opposites.
   Acceptance of Aggression—measures the extent of tolerance of one’s own hostility and aggression.
   Capacity for Intimate Contact—measures the ability to form and maintain non-manipulative intimate relationships.

2. Adjective Check List (ACL). The ACL is a self-administering instrument designed to assess personality needs and traits. The ACL consists of 300 adjectives, organized into 24 basic scales. Only the scales of “Number of favorable adjectives checked,” “Number of unfavorable adjectives checked,” and “Personal adjustment” were included in this study.

3. A self-report critique. A self-report was included to measure the extent of participants’ satisfaction and their comments regarding the effectiveness of Visual Transitions. Eleven questions were used. A rating scale from 1 to 5 was proposed which ranged from an appraisal of “poor,” “negative feelings,” or “disagree strongly” (1), to that of “excellent,” “superior,” “very positive feelings,” and “strongly agree” (5).

Further, each question asked for a brief comment in addition to the numerical rating value (see Appendix A).

Procedure

The extended workshop was organized as a series of seven, three-hour sessions. At the beginning of the first session, participants were asked to sign a workshop release form. They then completed the POI and the ACL. The pre-test scores of these instruments were later compared with post-test scores from these same instruments recorded at the conclusion of the program.

After the pretest, group members introduced themselves nonverbally using only gestures and movement as their means of expressing themselves to the group. This exercise is usually begun by the group leaders who introduce themselves with a dance or a handshake or an airy walk around the group. This beginning exercise helps group members to get in touch with their bodies,
and sets the pace for the visual nature of the therapy and the enactment of feelings.

Videotaping can occur throughout the entire session or during any specific phase. Release forms are considered a necessity in videotaping any therapeutic procedure. Additionally, if participants do not wish to be videotaped, or if once taped they wish to have the tape erased, these requests are honored.

In the next phase of the workshop, participants formed into pairs to photograph one another. Instant cameras were used to take two photographs of each other. One pose described the “constriction” or “as I was.” This pose reflected the participant “as I was” before therapy, or “as I was” during a time of emotional conflict or when entrapped by personal constriction. The second pose portrayed “as I would like to be.” This represented the way the participant ideally wanted to feel—a “freedom” from constriction.

After the still photos were taken, the group members were provided with art materials. The participants were then instructed to cut out the two photos, to mount them on the poster board in whatever manner they wished, somehow relating the two images to each other with the art materials, and to label these two images with one or two words.

When this exercise was completed, the group members reseated themselves for group discussion/processing of the art objects. Each member presented his/her artwork and explained the relationship of the two photo images, as well as the various symbols drawn to relate them (colors, figures, etc., and in some cases, the lack of them). Immediately after each group member’s presentation, he or she then demonstrated the first pose, then the second. Each member was encouraged to repeat the two poses, concentrating upon the feeling aspect of each pose and the transition movement necessary for moving from one pose to another. Some sequences were repeated several times in order to grasp more fully the transitional feelings associated with movement between the two poses. The entire group then simultaneously joined the presenter for a succession of further enactments of this same exercise. They were encouraged to experience the presenter’s same feelings of transition in moving from the first pose to the second. The group leaders repeatedly asked the presenter, as well as the other group members, to be aware of feelings of tightness, rigidity, or tension, related to the first pose, and then to sense any feelings of freedom, relief, or joy, related to the second pose. The transition was enacted like a group choreography, with members becoming aware not only of their empathic feelings with the presenter, but also attending to personal body sensations and feelings during the enactment.

The entire sequence, from presenter’s discussion of his or her artwork through the group transition movement, was recorded on video tape. Following each presentation, the video was played back immediately for group viewing and discussion. Members were encouraged to interrupt the playback at any time for comment or discussion. The video allowed each member to see himself/herself going through the transition from “as I was” to “as I would like to be.” The artwork and the movement became metaphors for change, as did the images captured by the still photos and the moving tape.

The last phase of the program was the general sharing of the experience, relating the experience to more elaborate possible change in the outside world, and sharing common experiences and feelings. For example, many of the group members’ poses were quite similar, both in terms of “where they were” and “where they wanted to be.” Some of their transitional movements were similar as well. This similarity was helpful in convincing group members of the universality of their concerns—a common phenomenon in verbal group therapies also. This also became a time for closure in which several members dealt with their feelings regarding the overall therapeutic effect of the procedure.

The POI and ACL were re-administered, and the self-report critique questionnaire completed.

Results

Personal Orientation Inventory (POI)

The POI group mean profile reveals consistently higher scores on the post-test versus the pretest (see Figure 1). As mentioned earlier, higher scores indicate better personal adjustment. The Figure 1 profile shows that, while most subscales showed an increase resulting from therapy, one remained unchanged, and yet another even showed a decrease. An ANOVA comparing the pretest and post-test scores show that “Spontaneity” and “Capacity for Intimate Contact” were significant at the .07 level of confidence (F = 3.912; F = 3.683), and that the results for the subscale of “Existentiality” showed significance at the .11 level of confidence (F = 2.911). These comparisons indicate an improvement in the group members’ ability to express feelings spontaneously, a greater capacity for warm interpersonal relationships, and increased flexibility to react ac-

“The similarity was helpful in convincing group members of the universality of their concerns.”

July 1989, ART THERAPY  61
Fig. 1 Group mean profiles for the Personal Orientation Inventory.

According to the situation without rigidly adhering to principles or values.

**Adjective Check List (ACL)**

The ACL was reported in standard scores and was analyzed by a 1-way ANOVA design with only three subscales being considered for comparison. The pretest mean for the Number of Favorable Adjectives Checked was 55.727, as compared to a post-test mean of 59.090, $F(1, 20) = 1.317, p > .25$. The pretest mean for the Number of Unfavorable Adjectives Checked was 43.454, as compared with a post-test mean of 41.727, $F(1, 20) = .787, p > .25$. The pretest mean for Personal Adjustment was 52.455, as compared with a post-test mean of 57.273, $F(1, 20) = 2.354, p = .16$. Even though the score differences were in a positive direction, they did not reach accepted levels of statistical significance.

**Self-Report Critique**

The critique showed uniformly positive assessment ratings and evaluation comments by the group participants on Visual Transitions therapy. Of the 17 areas rated on a scale of 1 to 5 (1 = poor; 5 = superior), the mean rating per question was 4.203; and out of a possible total of 85 points, the mean for the 11 participants was 71.458.

**Discussion**

This extended workshop program on Visual Transitions was conducted to acquire additional information about several aspects of the procedure.

One of the basic questions to be addressed was whether or not Visual Transitions should rightfully be considered a therapeutic procedure. The introductory comments regarding the literature on the component therapeutic methods and their use in combination seems to us to be a clear rationale for considering the Visual Transitions multimodal arts therapies method as a legitimate therapeutic procedure.

Regarding the effectiveness of Visual Transitions, the present study provides some evidence, though not overwhelming, that the procedure is effective. Clearly, the participants were satisfied with the experience and felt that it was helpful to them, as their ratings and comments on the critique show. The more objective ratings on the POI and ACL are more equivocal. Even though the ANOVA design did not yield statistically significant results within the commonly accepted .05 confidence interval, two of the POI subscales, "Spontaneity" and "Capacity for Intimate Contact," did reach a .07 level—and all but two subscales
showed some level of improvement. Also, the ACL showed positive, if statistically insignificant changes on the three relevant subscales. There was, of course, the possibility of discovering "no change" or even "negative change" results.

The fact that the POI and ACL results were marginally statistically significant may be a function of the length of the workshop and the types of areas in which change was expected. To deal effectively with deep-rooted issues that have formed over extended periods of time, perhaps more time is needed to affect significant levels of change. Another possible reason for lack of large statistically significant findings may lie in the homogeneity of this group—a reasonably well-functioning group of adults in which variances were difficult to discern. Positive change did occur. The question seems to be one of determining either the appropriate length of time needed to affect the desired amount of change in terms of statistical significance, or perhaps selecting a more diverse group of individuals or individuals with more significant psychological symptoms.

As with any study that focuses on a small, homogeneous group of individuals, we cannot generalize to other populations. We cannot state whether the procedure will be more or less effective with psychiatric patients, alcoholics, children, or others without further study. We encourage readers to report on the method with other populations.

Concerning the reaction which might reasonably be expected by the mental health community regarding this therapeutic procedure, one might logically anticipate the same general level of acceptance as for the various constituent arts therapy modalities included within its framework. Understandably, receiving much stronger statistical results on the POI and ACL would have been more convincing to those not as well acquainted with the benefits of the arts therapies. Four of the group members in the present study were practicing mental health workers, and, according to the self-report critique, these individuals are accepting of Visual Transitions.

The present study was undertaken in a preliminary attempt to determine the effectiveness of Visual Transitions for those interested persons within the mental health community. It should be considered only as one of many subsequent investigations. Further research in this area using different types of groups, methods of measurement, modification in presentation, and inclusion of other modalities, such as drama, in the procedure should be explored. What is known is that these various individual modalities are continually being demonstrated as effective therapeutic procedures on their own merits. With this in mind, if one considers the notion that the Visual Transitions model of photo art therapy features a framework specially designed to blend these procedures, then how can one not recognize the advantage of having this multifaceted resource at one's therapeutic disposal?

In conclusion, and for the reader's interest, this section has been expanded to include selected brief discussion comments made by two of the presenting group members and the therapists during the actual therapy sessions. Photos are also included of the two participants' artwork.

Fred's (a pseudonym) construction focused on a lack of self-acceptance. The "as I am" pose involved an "unforgiving," even shaming posture (sitting curled up as he shames himself with fingers). He depicted his "as I want to be" pose as one of "conqueror" (standing erect with one foot on chair, and finger pointing to chest boastfully).

Comments:

Fred (when asked about first pose): "I feel like I'm not worth anything,

"Another possible reason for lack of large statistically significant findings may lie in the homogeneity of this group . . ."

everyone is looking at me, just not measuring up."

Fred (when asked about art object): "I'm fighting several obstacles to get to the top."

Dr. Corbit: "How old were you when you first recognized this?"

Fred: "When I was a kid, I was really a klutz. I was a terrible football player in high school and was constantly compared to my older brother who was great. This really

Fig. 2 Fred's first artwork.
did a world of good for me. Later in life, I decided I could excel in scholastics, so I went back to school. This has been my thing. It hasn’t been easy for me, but I feel I’m intellectually gifted."

Fred (pointing to art object): “These are my hurdles. The things I can jump over are school, and the things I couldn’t get over are athletics. You can see all of this achievement here, that is school.”

Dr. Corbit: “Let’s try another pose. What is it?”

Fred: “I feel like I want to change that second pose to confidence; this other pose looks a bit conceited for how I want to feel.” (Fred then created a second art object in which he illustrated this more preferred transition). The “as I am” pose for Connie (a pseudonym) is labeled “I can’t” (standing slump shouldered, arms crossed, head down). This is contrasted with the “as I want to be” pose entitled “I can!” (illustrated by jumping into the air with heels clicking).

Comments:

Connie: In my first pose, I’m pressing on my right leg and chewing on my lip—and my arms are crossed as a way of holding myself together.”

Dr. Corbit: (assuming the same pose): “I’m feeling having been agressed upon—a lot of hurt.”

Connie: “I was the middle of five children—the scapegoat. I was moody and temperamental, and I would stand like this a lot (showing the first pose) . . . a feeling like I didn’t need anybody. I wouldn’t let them know I was hurting, and I wouldn’t let anyone in.”

Connie (illustrating second pose): “I’ve noticed that when I feel really good about something, or I’m happy about something, I’ll give a hop, skip and jump (similar to pose), and it feels so good.”

Dr. Fryrear: “One thing for sure, you can’t jump while you are holding your arms crossed and biting your lip.”

Connie: “Right. I wasn’t aware that body posture could make you feel a certain way.”

Connie (about her decision to grow): “It was a decision to either give up, or go on. I asked myself, ‘are you or aren’t you?’ When I made that decision (to go on), I decided not to go on filled with torment. I felt like if I had a sense of hope, I could try. Ever since then, I’m not at a loss of control over my life. If I lose it tomorrow, it’ll be all right—but I know I won’t be the one that does it—and I feel peaceful about that. But for a long time I didn’t. Because I knew I could always do that if I couldn’t take it any more. But now, I know I don’t want to.”

Fig. 4 Connie’s first artwork.

66 ART THERAPY, July 1989
"Drawing Out the Unique Beauty: Portraits"

Judith Costello-Du Bois, MA in Human Development, with emphasis on Art Therapy, Co-founder of Amber Woods Studio, consulting Art Therapist in Zimmerman, Minnesota.

Abstract

This article focuses on drawing portraits of the client or patient by the art therapist. The author states "This article is an attempt to underscore the therapeutic value of drawing portraits and its [portraiture] potential role in the field of art therapy." Identifying some underlying purposes, the author describes briefly her work with two patients—Amanda and Ted—and concludes with some statements on the reasons for considering this approach when it seems appropriate in the therapeutic context.

As John worked on his painting he became aware of my eyes studying his face. I asked if I could draw him. He said "yes" and shared his own interest in closely studying the faces and the movements of others. Struggling with a mental illness, John seems to search out his own identity by being a careful observer of others. He seemed content to be the object of observation when it was the affirming eyes of my paint brush. He left for the day delightedly hugging the picture I had given him. He said, "This makes my day. I will treasure this, even if maybe I shouldn't because it's of me." His oftentimes averted eyes and guarded expression blossomed into a smile.

Throughout my work in the field of art therapy, I have drawn portraits in the quiet moments, when the people I have been working with are busily working. This article is an attempt to underscore the therapeutic value of drawing portraits and its potential role in the field of art therapy.

Prior to my work as an art therapy student, I drew portraits of street

Fig. 1 A girl with cystic fibrosis draws her "life line" while I draw her.

"Throughout my work in the field of art therapy, I have drawn portraits in the quiet moments, when the people . . . are busily working."
people at a hospitality house. It was a peaceful time for me and the subjects responded to my drawings. It seemed to be a way of giving quiet affirmation. Although I can’t document it, the people who were often prone to violence and self abuse seemed to be less so in the days following our time together.

I began my training as an art therapist in 1984, and have now done portraits of old people, hospice patients, children with critical illnesses, and adults who have been struggling with a mental illness. At the hospital where I worked, parents or grandparents would sometimes rush out of a sick child’s room, to ask me if I would please come and draw a portrait. No one has ever refused me when I have asked, “May I draw your picture (while we talk or while you’re working on that)?” And both the family members and my subjects seem to have felt an impact from this kind of interaction, as well as the end product.

The purpose of art is to communicate nonverbally—touching deeper layers of reality. The artist in me, while doing therapy, has often wanted to share my nonverbal vision with those with whom I work. And so I have taken up pen, pencil or brush at times when I have intuitively sensed that I was ready to communicate via portraiture. And because I have not been trained in commercial portraiture, and where the artist often leaves out wrinkles or ‘imperfections’ for the purpose of flattery, I am never sure of what I will come up with except that it is my immediate observation and feelings about the person.

The following are some of my experiences in doing this, as I have recorded them in my journals:

“It seemed to be a way of giving quiet affirmation.”

Amanda was one of the first women I drew while doing an internship in art therapy at a Minnesota nursing home. She is a tall, white-haired, very sociable woman—85-years-old—who is constantly chatting to anyone who will listen or pretend to listen, which is what many of them do. Usually she is weaving an elaborate story which frequently includes seeing herself as a young woman coming and going in her parents’ house. She deals with the reality of her institutionalized existence by living much of the time in the past or in a fantasy world. But when I sat down next to her to draw her face, I saw another side of Amanda. Before that time she couldn’t sit still in the art room long enough to work on much. But on this day she watched my hand with careful attentiveness and was the best, though toughest critic I have had in a long time. She asked if maybe I was really drawing a horse, and “isn’t that eye too close?” “There, that’s better,” she would say and then comment on another line. Eventually she acknowledged liking the picture. After spending forty minutes with Amanda in this portrait session, I realized that she could be lucid and clear when she had a reason to be in the present. She had contributed to the picture by her comments and proudly went off to show it to the nurses and to hang it in her room. She seemed to enjoy coming to the art room more after this time.

Shortly after my time with Amanda I decided to lead a session on body image. It is no wonder that in our youth-obsessed culture, many elders suffer from a poor self concept. Their bodies are wrinkled and don’t function in the way they used to. On television and in all of our media, the young and “beautiful” are the focus of attention, while elders are ignored or the object of laughter. As a result of the societal and internalized ageism most of my elderly subjects have felt self conscious but my insistence that “Yes, I do want to draw them,” causes a re-evaluation of each one’s bad feelings about his/her body image.

For the hospital patient who is having a portrait drawn, oftentimes he/she is surprised and pleased to get this kind of individual and intense attention. Like the older person in a nursing home, the institutionalized patient may also feel poorly about his/her body—it seems to have let him/her down. That I would want to draw the person “as he/she is” seems to enhance one’s self-esteem.

For the families of critically ill children, who are reluctant to take photos because they don’t want to re-

Fig. 2 I didn’t realize how scared this boy was until I finished this portrait. He has a life-threatening illness.
member hard times, my portraits might be the last precious picture they have of their child. Children at the hospital have had caricature artists come in but they often react strongly against such a portrayal of themselves, perhaps having already felt laughed at because of the changes in their physical appearance due to illness or treatment. The children I have met prefer to see caricatures done of their family members. Feeling that they are the ones who are odd or different is a sensitive issue for many of these children. My serious portraits seem to convey a sense of acceptance and “ok-ness.”

Ted is a young man suffering from schizophrenia. He used to come to our groups spending the entire time complaining about his “horrible, incurable illness.” He started out painting muddy messes, always starting in the same way and ending with the same effect, while talking about how he would never get better. One day I felt the need to reach out to Ted and establish a better connection. While he painted, I drew his face, using charcoal to indicate his unshaven look. I was unsparing in my portrayal of his unkempt appearance and yet also captured his slender and refined features. When I was through Ted stared at my drawing for a long time. He didn’t have much to say on that day, but at our next group he appeared with a clean shaven face and hair cut. His next series of watercolors were circles of color with connecting lines expressing his sense of connection with those around him. He then decided that he would like to draw faces. I had him look in a mirror and attempt to draw his own face. He said, “My

mirror at home makes me look better.” He found the mirror more confronting than my portrait. His drawings now became cartoon faces and totem-like structures. During this time he stopped focusing solely on his illness. Eventually he left our group saying that he wanted to find a job.

Conclusions

Really observing another person’s face makes me keenly aware of the beauty and uniqueness of the person I am drawing. I find it to be a profound experience when I can pay attention to the individual—and portray something about his/her spirit. To find beauty in a face—no matter how distorted by illness, or worn by hardship—is an opportunity to experience the connectedness of all life.

This experience of seeing and recording what I see, is what I pass on to others when I share art materials. Really seeing and connecting to the
"Sharing my drawings with those with whom I work has been a major step towards trust building."

Sharing my drawings with those with whom I work has been a major step in trust building. It breaks down the client/therapist barrier as I share this part of myself. At times it has also been a challenge to those I work with, as in Ted’s case. It is a reality check—bringing my subjects into an awareness of their body in a nonterrorizing way.

Originally I was worried that my drawing would be intimidating, but I have not found this to be the case. Instead, it seems that it is encouraging and inspiring. It is one way I can participate in drawing out the uniqueness of the individual.

Fig. 4 Al’s self portraits with a tree. Al drew this picture while I was drawing him.

Fig. 5 "Trying to keep a stiff upper lip"—the sensitive face of a young boy in the hospital.

life around us and to our inner experience are essential to mental health.

Drawing faces has been a way for me to spend quiet, special time with people, and a chance for them to see themselves through my eyes. For those whose self-esteem has suffered in facing their physical, mental or emotional problems, this process seems to give them a feeling that their existence is acknowledged. Sometimes, while I draw, they draw too, or sometimes they share ideas about how they want the picture to look. While working with children who have cancer, I have added hair and left out masks and tubes for those who want to see themselves this way. I am beginning to understand this as an important part of my work as an artist and therapist. Not only can people be healed through creative expression and therapeutic interactions, they can also find my art and the products of my vision to be healing.

"Post-Graduate Group Supervision for Art Therapists"

Debra Greenspoon Linessch, MA, ATR, MFCC, Associate Director and Assistant Professor, Graduate Department of Marital and Family Therapy (Art Therapy), Loyola Marymount University, Los Angeles, California; Julie Holmes, MA, ATR; Marcia Morton, MA, ATR, MFC; Sandra Stark Shields, MA, ATR, MFOC

Abstract

This article describes the experiences of three recent graduates of an Art Therapy Master's Degree Program as they participated in a post-graduate supervision group. The group offered the participants a context for exploring and developing their emerging identity as clinicians by sharing and confronting their clinical work with one another. The six most important themes that emerged are discussed by the participants: 1) Beginning treatment/assessing clients; 2) Establishing goals; 3) Therapists' techniques; 4) What is psychotherapy anyway?; 5) Understanding transference; and 6) Clinical style.

Introduction

Three recent graduates—Julie, Marcia and Sandra—of a Master's Degree Program in Art Therapy participated in a year-long post-graduate supervision group. This group offered the members a context for exploring and developing their emerging identity as clinicians by sharing and confronting their clinical work with one another. To the gratification of the group leader and its members, the experience became a powerful learning process and motivated this attempt to document the group’s (and the group members’) evolution.

For the purposes of this article, the year-long process has been divided into the six most important themes that emerged as particularly significant for the group members.

Each of the participants addresses—briefly, but succinctly and with personal meaning—the six categories in an effort to illustrate how the group provided the opportunity to support the participants’ parallel but differentiated clinical development.

Beginning Treatment/Assessing Clients

Post-graduate supervision appears to begin with an interesting paradox, the well-trained supervisee who feels she knows nothing. Apparently needing to regress to a dependent mode of learning, the recent graduate approaches this new training experience in a way that catalyzes a fresh developmental process. Just as the group found it necessary to experience the beginning stages of group process, the individual participants (in an apparent recapitulation of their clinical training) found it necessary to reexperience the beginning stages of psychotherapeutic education. The questions and issues were the most basic and focused on developing a procedure for connecting with and assessing clients. Concurrent with these explorations the group members were developing communicative styles for sharing their very personal experiences as clinicians.

Julie

The transition from intern to professional was a difficult one. As an intern I did not have the exposure to the responsibility that is experienced by the professional. The added expectations for skilled performance at this transition filled me with anxiety concerning my abilities. I recognized my responsibility to the clients who were looking to me for guidance, and felt I was not fully up to the demands of the professional requirement. I was looking for a review of the clinical techniques and skills I had acquired to boost my confidence. The shared experience with my associates revealed a community of anxiety that was reassuring, and the guidance of the supervisor allowed a building of confidence in my acquired professional skills. The finding that other professionals at my level were experiencing the same feelings of inadequacy and the strength gained through the sharing of those feelings coupled with the leadership provided by the supervisor was useful in allowing me to proceed in my professional pursuits with confidence.

Marcia

The major source of anxiety that surfaced in the initial phase of treat-

"The desire to perform well and see immediate improvement in the client was intense."

"I remember coming to the group feeling like a small dinghy, separated from the mother ship in rough water."

...ment arose out of my reluctance to trust my knowledge and instincts and what is even worse to be unaware of what I actually knew. The desire to perform well and see immediate improvement in the client was intense. This desire inhibited my ability to react instinctively and creatively to the needs of the client.

Hearing my peers share their similar anxieties, fears and what they referred to as "mistakes" was an important factor in lessening my anxiety and increasing self-confidence. The universality of seeing our similarities helped us to accept ourselves less critically.

**Sandra**

I think my sense of need when I entered the supervision group was a result of many concurrent stressors. First, I had endured a very demanding year-long practicum where case management requirements left little opportunity for positive feedback from supervisors. Second, after graduation I had conducted an intensive four-month job search that further negated my self-esteem. Third, I began a new job the same week that the group started and had the "new job jitters." Finally, the act of leaving school behind brought some unexpected emotional consequences. Suddenly I was supposed to be the "art therapy expert" and could not hide behind the safe role of "student."

I remember coming to the group feeling like a small dinghy, separated from the mother ship in rough water. My questions to the group were asked as if to say, "Please give me something solid, understandable and predictable... a little piece of land where I can moor my boat for a while."

**Establishing Goals**

As the group members began to redevelop a sense of themselves in the psychotherapeutic process, and concurrently develop group norms for the exploration of clinical material, treatment concerns focused on the establishment of goals. Like most novice clinicians, group members developed unrealistically high goals, apparently too idealistic and inexperienced to be able to ground their approach in a realistic assessment of their clients. The group focused for some time on the utilization of the art process as a mechanism for sustaining a goal orientation that is attentive to the clients' needs. Although the shared clinical material was comprised of very diverse populations (adolescent groups, recovering addicts and abused children) this theme held constant as group members attempted to accept responsibility for structuring treatment.

**Julie**

I was working with a population of very disturbed adolescents in a day treatment center. My expectations for the population were beyond what they were capable of. They were not ready to be cohesive in a group and share their experiences, and I was disappointed at being unable to contain them. I found it necessary to reassess my goals for this population and to look at the clients' needs rather than my own. This evolutionary process (in my professional development) was encouraged and supported by the supervision group.

**Marcia**

Nothing less than a complete "cure" with remission of all symptoms seemed an acceptable treatment goal at first. As a beginning therapist I felt obliged to "fix" the client and make him or her "well" or at least conform to my definition of wellness.

The art, we began to explore in group supervision, could provide a valuable tool in helping to establish more realistic goals that would serve the client's immediate needs. To finally accept a less ambitious goal was liberating and allowed me to be a more attentive and patient therapist.

**Sandra**

Establishing realistic goals has been and continues to be, a constant struggle for me. Through the supervision group I learned that my idealism often interfered with the establishment of appropriate therapeutic goals. I sheepishly began to admit that the lofty standards I had been setting had more to do with my needs, issues and values than with my clients'.

In supervision group I learned to make a thorough assessment of my clients' needs, strengths, weaknesses, and hopes for treatment, then begin to formulate what was "do-able" in this context. Consequently, I stopped taking over so much of the responsibility for helping clients "get better" and stopped assuming all the credit for therapeutic "successes" and "failures." Most importantly, the group provided a forum for grappling with the input my idealism had had on my feelings of professional "burnout."

**Therapists' Techniques**

As each of the group members increased her repertoire of clients and therapeutic experiences, the group...
became a vehicle for sharing successful and unsuccessful techniques. It appeared that the members had reached a more autonomous level of functioning as clinicians and were able to communicate with one another as peers and mutual resources. Ideas about murals, art materials and specific kinds of directives were explored and were just as often initiated by group members as by the group leader.

Julie

Once the early problems of confidence were overcome, the group became not only a valuable and stimulating source of ideas, but a satisfying forum for expressing my own ideas and techniques. The opportunity to share with my peers and witness the process by which they developed techniques, augmented my skills in generating ideas. It was exciting to witness the manner in which new techniques evolved within the group discussions.

Marcia

Group supervision became a rich resource for expanding my repertoire of techniques. The supervisor and fellow group members offered suggestions for directives, art materials and innovative approaches from their particular areas of expertise. As an altruism developed in the group as we shared our similar problems, members became extremely generous with both technical suggestions and moral support. Because of this I feel that the group supervision was perhaps a richer experience than individual supervision might have been.

Sandra

As the group became more cohesive and supportive, it became "safer" to question other members about their work and to share ideas. Often each member contributed suggestions based on their unique outlook, style and area of expertise. Occasionally, members would also discuss books they were reading or brought articles of interest to the group.

The group developed to a point where we began to "be in charge" of the process, as we relied more on each other and less on our facilitator. This was important not only to our growth as therapists, but also to our development as potential future supervisors.

What Is Psychotherapy Anyway?

Once the group's norms had been established and each of the participants had begun to feel comfortable with her developing professional identity, larger questions began to emerge. It became evident that graduate school internships, which had been time-limited and focused on acquisition of skills, had not provided an adequately sophisticated appreciation of the psychotherapeutic process. With the increasing sense of themselves as "professional clinicians" the participants appeared ready to genuinely question the true meaning of psychotherapeutic change. Moving into the middle stages of treatment with many of their clients, they themselves seemed to take tremendous leaps forward into the tentative ground of attempting to comprehend the complex process of facilitating change in another human being.

Julie

My understanding of the psychotherapeutic process moved from an academic question to the central issue of effecting change. This transition to meeting the real challenge of my work was at once exciting and difficult. The group process was very effective in providing an opportunity for exchange with other professionals that were at this delicate juncture as well.

Marcia

I had hoped to address in this group the question that had only been dealt with superficially in graduate school, i.e., how does psychotherapy heal? and how do people change? Seeing a client over a relatively long period of time provided an opportunity to deal with this issue in group supervision. Confrontation of this question motivated reading and much discussion. An insight that emerged often within the group was that "being there" emphatically for the client might be more therapeutic than brilliant insightful interventions, a difficult concept to accept for a beginner who is anxious to help.

Sandra

It seemed that all members of the group supervision began to wonder what "healing" was. In my work with children I would often feel that nothing at all was happening in the treatment. Without fail, the group amazed me by pointing out meaning in the work that I had missed. Often I couldn't see any value in what had occurred precisely because the client wasn't up to my ideals of what I thought he was supposed to be working on and what I thought therapy was supposed to be about. My colleagues helped me pare down my expectations and understand what therapy was actually accomplishing.

As a group we learned that there were not final answers to our many questions; rather, as therapists, we were involved in a lifetime sequence of experiencing, revising, growing, and asking still more difficult questions about the therapeutic process.

Understanding Transference

As the concerns of the group turned toward the increasingly complicated issues of psychotherapeutic progress, transference (and countertransference) manifestations became a focus of attention. Each of the participants appeared to be confident and comfortable enough to explore the sometimes disturbing subtleties of the psychotherapeutic
relationships in which she was involved.

**Julie**

I had my own place and identity within the group and how I responded in the group situation often gave me insight into my relationship with my clients. The group supervision was useful in clarifying the importance of transference in the therapeutic process. It also encouraged me to become increasingly comfortable and confident in the exchange between myself and my clients.

**Marcia**

As supervision progressed I was confronted with the reality of my importance to my clients, a fact that is often difficult for beginning therapists to accept. Over the year I was helped to become aware of the development of my clients’ transference reactions. It was reassuring to have an opportunity to present the dialogue between myself and my clients from a previous week’s session. The feedback from supervisor and peers helped me become more sensitive to the dynamics of the therapy session and, importantly, to the client’s transference reaction and to my own countertransference.

**Sandra**

During my time in the supervision group, my understanding of transference grew from seeing it as a phenomenological oddity defined in the literature, to using it as a vital part of treatment. A similar change occurred in my view of the concept of countertransference. As an intern, I remember feeling horrified when supervisors would point out my countertransference about a case. While in the group supervision I began to notice, to my own surprise, that discussions about transference and even my own countertransference no longer made me feel exposed. I became better able to talk about and use these insights for my growth as a person and as a therapist. I think this was aided by the fact that there was increasing evidence that I could do the work and, thus, I no longer dreaded what the process of doing therapy with clients would reveal about myself.

**Clinical Style**

Although the categories outlined above demonstrate how a professional developmental process was delineated in a somewhat linear manner, a more important process that pervaded the life of the group seems to evade these categories. In a remarkable and profound way, each of the group's participants was able to integrate the understanding she developed and the skills she acquired with her own interpersonal style to create a unique clinical approach. It is this concept that is the most significant aspect of postgraduate supervision and one that validates the use of group process for this training experience. Graduate training, which focuses on “becoming a therapist,” provides the necessary groundwork for the postgraduate process of “integrating the therapist identity.” Within the context of peer group supervision, each of the participants was able to define and differentiate herself from the training model to become a unique integration of theoretical and interpersonal approaches.

**Julie**

The group provided feedback to the way I did things, and its acceptance validated my own style. Jealousy was never expressed concerning the individual styles that emerged but rather honest appreciation for the differences in style was evident. This recognition and appreciation for individuality allowed me to fully develop my style with confidence. In some cases when we shared experiences, one of the other group members’ own style stimulated something in myself. While not entirely natural to me, such an alternate approach was often useful to my clients’ needs and did enrich my developing style.

**Marcia**

It is still very difficult for me to recognize that I may have a clinical approach that is unique and personal. Clinical style seems to be unconscious and instinctive and once one becomes conscious of style it seems in danger of disappearing or becoming a mannerism. However, I gradually became aware that each of my peers had a characteristic interpersonal manner. As I began to gain self-confidence I sensed that my approach to therapy (based on my training, beliefs and personal psychotherapy) was emerging, although I would continue finding this approach or style difficult to define.

**Sandra**

One of the striking elements absent in the supervision group was competition. Perhaps in the omission of competition lies the true purpose of postgraduate supervision: that beyond “standardized learning”...
comes "individualized doing," where each person must do the work according to his/her own interests, strengths, goals and personalities. By the end of the year each of us had transformed what we had learned about doing therapy in school into personal clinical styles. Each member openly admired the style of each of the other members, but no one felt that she had to "measure up to" or "become like" the others.

FINAL STATEMENT

The first post-graduate year in a therapist's professional development is a very significant one. The academic and internship training is solidified and integrated with the clinician's personal beliefs and values. Identity begins to be established, providing a springboard for ongoing professional development. The experience of three beginning art therapists attests to the importance of post-graduate supervision and the value of a peer orientation to this learning opportunity.

Guidelines for Authors

Please submit four (4) copies of manuscripts to: Art Therapy Editor Gary Barlow, Ed, ATR, Wright State University, Creative Arts Center, 228 Creative Arts Center, Dayton, OH 45435. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5"x7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

CONFIDENTIALITY: Client/Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.
"Michael" (Whom Carol Loves)

Carol Cockrum, ATR

This poem was written by my friend and colleague, Perie Longo, in response to my case presentation of two years of art therapy with a preadolescent boy in residential treatment. Perie is a registered poetry therapist who frequently lectures in my courses for the University of California at Santa Barbara Extension. I wanted to share Perie's poem since it so powerfully captures the essence of our profession and expresses the resonance creative art therapists of all kinds can experience as working colleagues.

When he is finished making explosions on paper with his fat markers fighter jets bang shoot machines with faces people with none volcanos with one eye at the top of their heads he asks are there survivors in space help help cries a tiny person who eats too much who fractures into uncountable slashes of uncontrolled red then draws again a dwarf tree beside a snowcliff one swipe would demolish such helpless green

but Carol knows to gently mark in one survivor always even after journeying to an Unknown Planet

Set on paper a fat full city mounted on top a spindle set on a tottering rock and they battle on paper she blue he green he blue she green and finally one day he fools her one small survivor drifting in from space onto a field of white in a world of black then Michael moves off into gray after removing all cancer from clay man's body and Carol keeps drawing away

PERIE LONGO, PhD
Adolescent Art Therapy

Reviewer: Marcia Rosal, PhD, ATR, Assistant Professor, Expressive Therapies, University of Louisville.

Adolescence is a time of self-expression. Expressing one’s self is vital in order to make the transition from dependent child to individuated adult. Linesch’s book carefully outlines how self-expression through art in therapy can aid this time of transition for adolescents with troubled lives.

Ms. Linesch is an art therapist who has extensive experience working with adolescents in both clinical and educational settings. Her book is the first art therapy text written specifically on adolescents. Although the main topic is art therapy, the book could benefit clinicians from other disciplines who work with adolescents. Linesch’s book offers a format to think about how to work with adolescents rather than displaying a smorgasbord of activities for the adolescent. The book, therefore, is thought provoking and expanding and is not solely a reference book. The book is written in clear language and is easy to read.

Adolescent Art Therapy offers a psychodynamic perspective on how to understand and impact problems of adolescence through the use of art media. The cornerstone of this volume is Linesch’s use of case material to elaborate on her ideas and to enrich the reader’s understanding of adolescent issues.

The book first focuses on the creative process in adolescence and the relationship between creativity and mental health. Next, diagnostic considerations for adolescents are covered. Diagnosis is covered through describing inadequate defense mechanisms of adolescence and through the diagnostic categories of the DSM III-R. Linesch thinks the DSM III-R outlines behaviors that suggest a particular diagnosis but does not help the clinician to understand the underlying causes of the problem. Therefore, the delineation of the defense mechanisms serves as the theoretical basis for her work with the adolescent population. A chapter on how to interact with adolescents is followed by case examples. Three chapters are devoted to different tasks that an art therapist who works with adolescents may be asked to perform. First, the art therapist’s role as an ad-
the approaches Linesch presents. In Chapter One, the creative process is addressed. The amount of information available on adolescents and the creative process is monumental and not easily condensable into one chapter. However, Linesch limits her discussion to two psychoanalysts, Blos (1962) and Malmquist (1978) and one art therapist, Landgarten (1981). The parameters of three authors constricts rather than enlivens this chapter which could have been rich in its depth and breadth.

In the chapter on diagnosis, Malmquist (1978) is the sole author cited in the discussion of adaptive and maladaptive defense mechanisms. The limited point of view may leave the reader with many questions about this topic.

The other weakness of the book is Linesch’s attempt at a systematic study. The study was to investigate the relationship between self-expression in art productions and the observable behaviors of the adolescent within a milieu treatment facility. Although Linesch admits that the study is exploratory, and therefore limited, she does not provide the reader with the necessary tools to fully evaluate the work. The protocols for observing the client’s behavior are not provided nor are the criteria for assessing the pre- and post-test directed art experience. Without this information the case examples seem flat and purposeless.

However, the weaknesses do not negate the richness the book offers therapists who work with adolescents. Clinically, the book has much to offer in the realm of adolescent therapy.

Don't wait to hear 'Guilty as Charged' to discover that Professional Liability Insurance is a Professional Necessity.

Don't be lulled into a sense of security by a few years of "no incidents." Keep the facts in mind continuously:

Fact #1. A suit for malpractice, whether justified or not, might destroy your career and future security. And it does happen...often.

Fact #2. Trying to forecast a court decision is playing "Russian roulette." Courts may not be familiar with 'appropriate medical practices.'

Fact #3. You can be involved in a malpractice suit even if you were not directly involved in an incident.

Fact #4. If a suit is filed against you, you must be defended, even if the charges are unfounded. And legal fees, alone, can be destructive.

PROFESSIONAL LIABILITY POLICIES ARE NOT ALL ALIKE!
Insurance companies which underwrite Professional Liability policies vary widely in coverages, premium rates and claims handling. There are three major areas of difference:

For almost 40 years, Maginnis and Associates, Inc. has been designing and administering Professional Liability Insurance programs for allied health professionals.

Backed by the experience, continuous annual growth and daily exposure within the constantly-changing field of insurance, we sincerely believe that the Professional Liability plan we provide is the best presently available.

Get the details now! Complete and mail the coupon at right for additional information about all the AATA-sponsored insurance plans.

a. Coverage Limits. Means the dollar amounts of per-occurrence protection and the aggregate total-per-year protection. Look for top dollars!

b. Premium Rates. Compare this feature carefully. The best insurance buy is the policy that offers the highest coverage limits at the lowest annual premium rate.

c. Don't overlook the "Experience Factor." The best liability programs combine reliable "Old Line" insurance companies with a well-seasoned Administrator.

THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3,000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:

• The progressive development of the therapeutic use of art.

• The advancement of standards of practice, ethical standards, education and research.

• The provision of professional communication and exchange with colleagues.

• The provision of legislative efforts to promote and improve the status of professional practice.

• The promotion of the field of art therapy through the dissemination of public information.

Chapters:
Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive:

Publications

• Art Therapy, the official journal of the AATA.

• The quarterly AATA Newsletter.

• Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.

• Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.

• Mailings of professional interest.

Services

• Insurance, including professional liability, major medical, life and disability.

• Access to national experts in art therapy.

AATA Conferences

• Discounts on registration fees to AATA national and regional conferences.

National Advocacy

• Governmental affairs activities including Congressional review and monitoring.

• State legislative and regulatory activities.

• Promotion of recognition and reimbursement of art therapists by third-party payers.

• National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards

• Development of model job and licensure laws.

• Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy.

• Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATION

1. The membership year is the calendar year January 1st through December 31st.

2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY. Please follow the chart below when submitting membership application.

Applications received between

Jan. 1st and May 31st — Full dues payment. Membership will expire Dec. 31st of same year.

June 1st and Sept. 30th — Half year dues plus $5.00 payment; membership will expire Dec. 31st of same year.

Oct. 1st and Dec. 31st — Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.

3. Professional Member applicants must meet criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.

4. AATA Membership and AATA Registration (ATR) each have a separate application procedure. Registration is bestowed only by the Standards Committee.

5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL — by application only; such members may vote, hold office and serve on committees.

Credentialed Professional Member: Individuals who have been dually approved for Professional Membership and Registration (ATR) by the AATA; dues are $50 per year.

Active Professional Member: Individuals who have completed professional training in art therapy; dues are $75 per year.

CONTRIBUTING — Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE — Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT — Individuals who do not meet the qualifications of Professional Membership and are currently taking course work in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.

THE ARTS IN PSYCHOTHERAPY

An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Assistant Clinical Professor, Department of Psychiatry, Yale University; Clinical Psychologist, Veterans Administration Medical Center, West Spring Street, West Haven, CT 06515, USA

Dedicated to scholarship in the creative arts therapies, THE ARTS IN PSYCHOTHERAPY presents innovative research in artistic inquiry and expression, and its use in the treatment of mental disorders.

THE ARTS IN PSYCHOTHERAPY is a quarterly, international journal for professionals in the fields of mental health and education. The journal publishes articles (including illustrations) by art, dance/movement, music, poetry and drama psychotherapists, as well as psychiatrists and psychologists, that reflect the theory and practice of these disciplines. There are no restrictions on philosophical orientation or application.

FREE SAMPLE COPY AVAILABLE UPON REQUEST!

SPECIAL RATES AVAILABLE FOR MEMBERS OF QUALIFYING SOCIETIES!
Members of qualifying societies can receive a discount on one-year Professional subscriptions to THE ARTS IN PSYCHOTHERAPY. Please write for further information.

We are receiving, as I mentioned in earlier issues of *Art Therapy*, a number of articles submitted for review and possible subsequent publication. I appreciate each reader's patience in understanding the time it takes to move everything from the submission of an article, through the entire review process, to publication. As Editor, I also may hold an article for a time in order to "balance" an issue—both in content as well as design. If, for example, there are three articles ready for publication and none of these has visual materials to accompany the article, I will probably pull one for a subsequent issue and replace it with an accepted article that has photographs. Providing that this new article "fits in" with the overall content (an editorial judgment) the photographs will add to the total design of the particular issue. Additionally, the same process may be used relative to the particular content for an issue. A balance of content coupled with good visual design are hallmarks of an attractive, meaningful issue.

In this issue of *Art Therapy* there is a variety of articles, viewpoints, reviews and other information that should pique the interest of each reader. With a cross-cultural perspective, Terry J. Tibbetts, Ph.D., ATR, writes on "Characteristics of Artwork in Children with Post-Traumatic Stress Disorder in Northern Ireland." The horror of war and its tentacles that encircle unwilling participants (in this article, a focus is on children and adolescents) are presented through direct interviews and pictures that seem to underscore the fear and helplessness of battle and the bleakness of life within these conditions.

In a different part of the world—Southern California—Shirley Riley, ATR, MFCC, speaks of some issues that also threaten the life condition—those of safety, chemical abuse, conditions for clinical treatment—and offers advice and direction in "Change: The Reality of the Mental Health Providers' World in the 1990's."

Harriet Wadeson, Ph.D., ATR, similarly describes crises in our professional field (and allied fields), coupled with ideas on art therapy training programs, theory and research, the problems of low pay and questionable training practices. In her article "Art Therapy Education at the Crossroads," she mentions (under "Implications for Training"): "In considering these many possibilities, I encounter more questions than answers." Nonetheless, it seems as if we are at "a crossroads," and Wadeson poses specific areas of concern that (like Riley) challenges the professionals in art therapy to sit up and take notice, to face the issues with understanding, compassion, directness and a sense of purpose for the future.

Ellen Speert's article "Beyond Psychic Numbing: Child Art Therapy and the Nuclear Taboo" presents us with a challenge. Do we, as Speert asks, explore the issue of nuclear existence with openness and sensitivity or do we remain "focussed only on more tangible distress"? In her article, the author identifies Art Therapy as a preventative intervention and discusses how to face the challenge both professionally and personally. It is a timely article about a disturbing topic.

The Viewpoints presentation by Judy Weiser is a poignant account of her volunteer work in the Vancouver Art Gallery during the exhibition of the AIDS Quilt. It is a moving account of some of the experiences (both felt and observed) by her during this exhibit. It also points out the dynamic of the art image as it is presented in various forms and contexts.

Ben Shahn revisited:
"There are, roughly, about three conditions that seem to be basic in the artist's equipment: to be cultured, to be educated, and to be integrated . . . my choice of terms is arbitrary; many words could be substituted and mean approximately the same thing. . . . Begin to draw as early in life as possible. . . . Draw and draw, and paint, and learn to work in many media."1

Enjoy the winter months. Maybe it will be the time to start that drawing, or to get back to that unfinished painting. Draw and draw, and paint and paint, and . . .

Gary C. Barlow, EdD, ATR
Editor, *Art Therapy*

Letter to the Editor

9/21/89
Gary Barlow, EdD, ATR, Editor
ART THERAPY
228 Creative Arts Center
Wright State University
Dayton, Ohio 45324

Dear Gary:

Having just read the article on portraits of patients by Judith Costello-DuBois in the July 1989 issue, I would like to add a few words in support of her approach to art therapy.

During the 1960s when manual language was forbidden in schools for the deaf, I too found that sketching portraits can be very helpful. For one thing, it can establish an atmosphere of shared work and enjoyment, particularly at the start of a program. In addition, the process of drawing, as well as the drawings produced, can be beneficial. My pleasure in drawing was contagious and my portraits served to communicate feelings of admiration and respect.

Enclosed are some sketches of children with auditory or language impairments.

Sincerely,

RAWLEY A. SILVER, EdD, ATR

CORRECTION

In the published overview of the A.A.T.A. 19th Annual Conference (Art Therapy, Vol. 6, No. 1, April 1989) paper #14 (p. 7) was incorrectly listed as “Creating the Human Phase.” It should be corrected to read “Creating the Human Face.” Our apologies to the presenters, Jerald Neuman, Ph.D., and Mildred Lachman-Chapin, M.Ed., ATR, for this error.

November 1989, ART THERAPY 91
Characteristics of Artwork in Children with Post-Traumatic Stress Disorder in Northern Ireland

Terry J. Tibbetts, PhD, ATR, Psychological Trauma Center, Los Angeles, California

Abstract

Continuing civil and military violence in Northern Ireland has resulted in extreme stress and trauma for many children and youth in that region. A total of 14 children and youth, 6-17 years of age, who met DSM-III-R criteria for Post-Traumatic Stress Disorder, were interviewed and asked to draw a picture of their choice. Characteristics of the resulting drawings included fixation on traumatic events, emotional regression, constricted focus, lack of background integration, distorted body image, depressive indicators, somatic concerns, anger and anxiety. Characteristics were also found to vary by age. Suggestions for further studies are discussed.

Psychic trauma occurs when an individual is exposed to an overwhelming event that results in helplessness in the face of intolerable danger, anxiety and instinctual arousal (Eth & Pynoos, 1985). When exposure to such an external stressor results in a significant impairment in the quality of the individual's psychological and/or adaptive functioning, Post-Traumatic Stress Disorder (PTSD) becomes a primary diagnostic consideration.

The characteristic symptoms associated with PTSD include persistent and intrusive reexperiencing or recollections of the traumatic event, an avoidance of stimuli associated with the event or a numbing of general responsiveness, and increased arousal not present prior to the event, all of which have lasted in excess of one month (American Psychiatric Association, 1987). While the initial conceptualization of PTSD as a specific psychiatric disorder was primarily concerned with its features as seen in adults, extensive research evidence in the past few years indicates that children are equally as, if not more, susceptible to PTSD (Eth & Pynoos, 1985).

Eth (1985) has noted that children who have been directly exposed to terrorist activities are at high risk for development of PTSD, and other research has demonstrated that children exposed to warfare and violence often demonstrate pathogenic behaviors symptomatic of PTSD (Arroyo & Eth, 1985). More importantly, there is strong evidence to suggest that children who have been exposed to violence, but not physically injured, can demonstrate similar PTSD symptomatology (Eth, Arroyo & Silverstein, 1985).

Northern Ireland, nominally a part of Great Britain, has been a center of continuing violence and civil war for almost 20 years. Since 1969, the provisional Irish Republican Army (IRA), a guerrilla military organization supported by a large Catholic minority, has sought to defeat British military forces, supported by the Protestant majority, in order to achieve reunification with the Irish Republic. In this struggle, more than 2,700 individuals have been killed, and it has been estimated that by 1975, nearly one family in every six had experienced a relative killed or injured (Rose, 1976). In comparable terms, a similar level of violence in the United States would have resulted in a current death toll of more than a quarter of a million people (Cairns, 1987). Within this setting, children and youth have had little opportunity for escape from ever-escalating cycles of violence. More than one-third of the Northern Ireland population is under 17 years of age (Harbison, 1983), meaning that these individuals have lived their entire lives within the present period of violence which began in 1969.

Other available demographic data suggest additional and ongoing stressors impinging upon the lives of Northern Ireland children and youth. The birth rate is consistently 40% higher, and the average household size more than 20% larger, than for the rest of Great Britain (Berthoud, 1982). Review of infant death trends shows that Northern Ireland demonstrates a higher rate than any other part of Great Britain. The unemployment rate in Northern Ireland is over 25% and more than 30% of children live in a low-income family (Evason, 1976, 1978). Housing in Northern Ireland has been described as "the worst in Europe" (Harbison, 1983), and a 1979 study indicated that one out of five houses was structurally unfit (Harbison & Harbison, 1980).

Efforts to systematically measure the effects of the ongoing violence and stressors upon children in Northern Ireland, however, have remained minimal, due to several fac-

...continuing civil and military violence in Northern Ireland has had major effects upon the emotional health of local children and youth."

ers, were more intelligent and had better educational attainments. Curran (1984) found major differences in that the scheduled offenders scored lower in terms of aggressiveness, autism and value orientation (sensation-seeking) than did regular offenders.

Regardless, it is inescapable that the continuing civil and military violence in Northern Ireland has had major effects upon the emotional health of local children and youth. For example, the rate of involvement of young people in major criminal offenses in Northern Ireland, expressed as a proportion of the total juvenile population, is approximately 13 times the rate for other areas of Britain, and for children under the age of 18 suspected of murder, the rate is 22 times higher (Millham et al., 1978). It is perhaps not surprising that in 1981, the head of the British military forces in Northern Ireland called the children of the community “a lost generation” (Lawson, 1981).

There remains little or no research data, however, attempting to explore the extent of PTSD among children and youth in Northern Ireland, nor have any studies attempted to explore the clinical dynamics of Northern Ireland children and youth who demonstrate PTSD symptomatology.

The present study, accordingly, was undertaken to obtain clinical data on the characteristics of such children and youth demonstrating PTSD symptomatology as expressed in artwork.

**Method**

The author spent several weeks in the nationalist areas of urban Belfast and Derry over a period of two summers. During this period of time, numerous children and adolescents were identified by community sources as evidencing symptoms consistent with PTSD. After obtaining parental consent, these individuals were interviewed, utilizing a modified form of the protocol suggested by Eth and Pynoos (1985).

Of those children identified by community sources and subsequently interviewed by the author, all demonstrated at least two of the diagnostic indicators considered by DSM-III-R as indicative of PTSD. However, only 14 met the full criteria required by DSM-III-R for formal diagnosis. These 14 individuals, ranging in age from 6-17 years of age, reported persistent and intrusive thoughts of the traumatic events they had experienced; they reported recurrent dreams of the traumatic events; they demonstrated emotional detachment and flat affect; and they were reported by their parents to have exaggerated startle reactions and hypervigilant behavior. Additionally, several of the children appeared to have varying stages of generalized avoidance reactions to stimuli reminding them of their particular traumatizing experience.

The interview format consisted of the author initiating a brief, supportive discussion of the child’s traumatizing experience. The child was

 major trauma in an other-
ful life, the children in
study have been forced
ly experience a social en-
that promotes violence,
ma and provokes al-
 anxiety. Thus, these
children may have considerably
more difficulty in their ability to
allow themselves emotional release.
The emotional symptomatology
demonstrated by these children was
highly significant and easily observable.
As noted, while many of the
children evidenced marked anxiety
and agitation while drawing their
pictures, they nevertheless described
the actual traumatic event itself in
flat, detached voices and actively
avoided interviewer efforts to initiate
more intensive affect. These children
often claimed to have forgotten key
elements of the traumatic event, al-
though upon further questioning,
were able to recall many of them.
Children and their parents both re-
ported significant increase in somatic
symptoms such as headaches and
stomach aches, although with some
children who had suffered actual
significant physical trauma, it was
difficult to differentiate between
somatic and actual physical difficul-
ties. The younger the child, the
more likely somatic complaints were
to be present.
The adolescents in this study ex-
perienced particular difficulties in
focusing upon the specifics of the
traumatic event, emphasizing in-
stead ways in which they had at-
tempts to regain a sense of self
control through activities such as
graffiti, throwing rocks at military
and police vehicles, and even para-
military action against British or local
police forces. These adolescents also
demonstrated an emotional lability
that appeared reflective of what Eth
and Pynoos (1985) have identified as
a PTSD-induced "reduced capacity
for modulation," and which may ex-
plain the emphasis of British re-
search on the acting-out activities of
this adolescent population. Inter-
estingly, and paradoxically, these
same adolescents simultaneously ex-
hibited a touching and poignant
sense of their own mortality, and in
some ways appeared more philo-
sophically mature and morally de-
veloped than many adults in their
same community.
Additional characteristics of this
sample of Northern Ireland children
with PTSD symptomatology can be
identified within the context of the
drawings made during their indivi-
dual interviews.

Discussion of Drawings

In reviewing the drawings pro-
vided by the children and adoles-
cents in this study sample, a number
of similarities common to this partic-
ular PTSD population were identi-
fied.

Emotional Regression—Many chil-
dren in the sample drew highly
constricted pictures which suggested
regression to an emotional level
significantly below their chronologi-
cal ability. Figure 1 was drawn by a
10-year-old boy who was shot with
plastic bullets by a passing British
patrol while he was kicking a soccer
ball against a building. The lack of
detail and the poor figural integra-
tion are both highly noticeable, as is
the relatively small size of the figure
when compared to the total size of
the paper upon which the drawing
was made. Interestingly, while this
child was actively resistant to draw-
ing the actual trauma itself, he did
make random dots on the paper
while discussing the event, which
bear a similarity to bullet holes. The
handle on the door also appears sug-
gestive in some ways of a weapon.

Constricted Focus—As noted, al-
most all children drew pictures spe-
cifically related to the primary tra-
dataizing event, focusing almost
completely on one or more specific
symbols or memories of the trau-
mata, and with little interest or con-
cern in drawing background. In Fig-
ure 2, a 9-year-old boy drew his
version of an event in which a British soldier (in the dotted camouflage) suddenly opened fire with plastic bullets upon an individual walking down the street. This individual was unarmed, but was a known leader of the community resistance. The child was only a few yards down the street, and saw the individual hit and collapse in the street from the impact of the bullets.

Again, the quality of this picture appears somewhat impaired from what we could consider typical of a 9-year-old child. Note the lack of hands on the victim, signifying an inability to fend off or to defend against the unanticipated attack. The lines encircling the drawing, which appear functionally unrelated to the picture content, were spontaneously added by the child in an attempt to bind his anxiety, as he described his drawing to the interviewer. The sun with a sad face, often symbolic of children exhibiting depressive symp-

tomatology, was the first object drawn by the child in this picture, who repeated several times during his story that it was a “hot day” when the shooting occurred.

Need for Safety and Security—Some children deliberately chose to exclude themselves from their drawings of the traumatizing events, even when encouraged to include themselves by the interviewer. These children generally appeared to demonstrate the most overt signs of anxiety and mood lability. Other children were able to place themselves into their drawings with little or no encouragement by the interviewer. These latter children, however, tended to symbolically demonstrate their fears and anxiety around the traumatizing event by drawing their bodily boundaries with much thicker and more heavily emphasized lines than other parts of their drawings. This can be seen in Figure 1, and also in Figure 3. In the latter drawing, a child was deliberately targeted and run over by an armored British patrol car. In this drawing, the bodily emphasis is given to the arms, as the child described being so frightened by the apparition bearing down on him that “I hugged myself because I was so afraid.”

Lack of Background Integration—As discussed above, the primary focus of the children upon the traumatizing events often resulted in a lack of concern with integrating background into the drawing, unless that background operated in some way as an associated trigger with the trauma itself. In Figure 4, for exam-

"... one of the more striking findings ... is the almost constant lack of color utilized in the drawings."

November 1989, ART THERAPY 95
ple, a 7-year-old girl drew a picture watching an unarmed individual deliberately shot by pro-British terrorists outside her house. With a great deal of emotional detachment, she discussed how they first shot the individual in the leg, then in the arm and finally in the stomach.

Although this event occurred within a crowded housing project, the child’s drawing includes only the two individuals as seen from her front door. The terrorist, drawn with a hood over his face, is completely colored over in an attempt to bind anxiety. Also the child chose not to draw the weapon. Interestingly, however, a sad sun is also visible in this drawing, as is her conception of a British military helicopter, which hovered over the street throughout the incident.

Depressive Indicators—In addition to other depressive indicators already noted, one of the more striking findings in this sample is the almost constant lack of color utilized in the drawings. Only two drawings from the entire sample actively involved multiple colors. Almost all remaining drawings were drawn in either black or monochrome, despite interviewer encouragement to “use as many colors as you like.” The two drawings which used multiple colors are particularly interesting from a clinical standpoint, in that these were the only two drawings which appeared to represent active attempts by the individuals to engage in activities designed to resolve their feelings of trauma.

Figure 5 is a drawing completed by a 10-year-old child who stated his desire to grow up and become a member of the IRA so that he could fight the British and “help my country.” A more symbolic version of this attitude is seen in Figure 6, drawn by a 17-year-old male, in which a hand, torn by barbed wire, reaches upward through a pool of blood for Irish freedom. The hand is flanked by a flag of the Irish Republic and a flag of the Irish nationalist movement.

Somatic Indicators—Younger PTSD children in this sample tended to avoid discussing particular trauma. Typically, they denied any sig-
nificant memories of the traumatizing events. Instead, they drew pictures of monsters, and described having nightmares of such creatures during a period of time ranging from a few days to several months subsequent to the traumatizing events. In Figure 7, a 7-year-old boy drew a picture of a vampire, of whom he regularly dreamed. This boy, whose father was an active member of the nationalist movement, had been physically held and assaulted by a British military patrol, including being repeatedly jabbed in the stomach with an automatic rifle, while being told that his father was going to be shot and killed.

In drawing this figure, the child’s anxiety was significantly raised, and he immediately drew a box around the vampire in an effort to keep his rising anxiety under control. The lack of both arms and feet is suggestive of the child’s feelings of powerlessness concerning the traumatic event itself. It is also interesting to note that what the child spontaneously drew and identifies as the vampire’s “heart” corresponds to the stomach area where the child was repeatedly struck with the rifle.

A 6-year-old child from another city also drew a representation of his nightmares as a vampire. As seen in Figure 8, this vampire has stunted limbs and lacks fingers or toes, as well as appearing to be suspended by itself at the top of the paper. In discussing his drawing, the child began by talking about being “scared all the time” and that “there’s nothing I can do, they all just keep shooting.” As his discussion progressed, however, he grew increasingly disorganized and associative in his statements; accompanying this, he picked up a marker and began to draw hair on the vampire. Still anxious, he then boxed in the vampire, stating that when vampires die, they are put in a big coffin. The child then drew a figure underneath the vampire, which he identified as the vampire’s gun. As the child continued to talk, he then began to draw initials. When asked what these were, he denied that he was making initials (which did not correspond to his own), and crossed one out. He later drew a third initial, but again denied that it had any meaning.

**Summary**

From a clinical viewpoint, it is clear that many children in Northern Ireland have responded to the continuing violence in that country by the development of identifiable
PTSD symptomatology. It is equally clear that such symptomatology is manifested in the artwork of these children. Emotional regression, constricted focus, lack of background integration, distorted body image, depressive indicators, somatic concerns, anger and anxiety all predominate in the artwork of the children discussed in this paper, and are further underscored in their discussions of their artwork.

While there is an increasing amount of research in the area of PTSD with children (cf. Eth & Pynoos, 1985), however, there has been little done in the area of diagnostic identification of children with PTSD through artwork, nor ways in which artwork may differentiate subgroups of PTSD children. For example, it is unknown whether artwork characteristics might differ or change as a function of length of time subjected to a traumatizing situation (e.g., chronic violence in Northern Ireland as compared to exposure to a severe earthquake); similarly, the degree of similarities and/or differences in children's PTSD artwork across cultural settings remains an open question. Additionally, there is little research in the area of clinical treatment of PTSD children through art therapy interventions.

It is hoped that this article will serve to stimulate further research in the area of artwork with PTSD children. Only by such research will the necessary knowledge be gained to reduce, and hopefully to ultimately eliminate, the pain and trauma such as that experienced each day by the children of Northern Ireland.

Change: The Reality of the Mental Health Providers’ World in the 1990’s

Shirley Riley, ATR, MFCC, Field Placement Coordinator, Graduate Department Clinical Art Therapy, Loyola Marymount University, Los Angeles, California

Abstract

It is important for the art therapist to focus on our environment, the social changes, our professional standards and our training for mental health providers, and to be alert to changes that may be needed for the 1990’s. With these issues in mind, the author focuses on three areas for discussion and raises important questions relative to these particular areas: (1) Education (including a focus on legal matters, the plea for the inclusion of methods of safety measures in our curricula, and a better understanding of chemical abuse); (2) New techniques and goals in treatment (with the challenge to move from “tried and true formulæ for treatment to unexplored and unfamiliar interventions”); and (3) National/Professional Organizations (with brief recommendations for professional associations, publications and planning for the future).

An article in the Los Angeles’ Times newspaper (Brian Cahill, January 22, 1989) reviewed the state of affairs concerning the 1.75 million children living in poverty in the State of California as well as the 48,000 in foster care. He found all proper care sadly lacking and in fact diminishing. The general erosion of funds that support Family and Child Services and the loss of mental health monies for general programs begins on the state and federal levels. The population that formerly was housed and served in hospital settings is now directed to find help in out-patient clinics. The clinics in turn are urged to do short-term therapy with only severely disturbed people and to disregard pleas for preventative work. To make the circle complete, many hospitals are under-utilized because they require insurance coverage to pay for cost of service and insurance companies are cutting back payments. As the brunt of demand for treatment falls on the community mental health centers they are caught in the bind of providing services in response to dollars rather than patient needs.

For example, if the clinic has gotten a grant for families with child abuse, those are the families served. Other families with equally serious problems are put on a waiting list that moves at Dickensonian speed through the system. (See Little Dorrit.)

In addition to these hard facts, the neglect often leads to more severe problems. We have, at least in Los Angeles, the ever-widening influence of drugs and gang violence, moving from the south central city and permeating the whole population of this great area. Drugs, crime and broken homes are not special only to Southern California. Across our nation we have many areas where mental health workers in an infirmed system attempt to give aid to persons overwhelmed by an all too powerful aversive ecosystem.

The situation today is one which forces us to evaluate our standards and to question the following areas: 1) Are we training therapists in our educational settings to deal with the real world? 2) Have we modified our theoretical base and therapeutic techniques to be as effective as possible, given the population we serve? 3) Are our national professional organizations recognizing and supporting the changing demands on mental health clinicians?

As a family therapist who has been employed by the same community mental health center since 1975 in the Family and Child Division and who has taught in a master’s level art therapy program for approximately the same length of time, I would like to share some thoughts on these three areas that affect our future.

Education

The challenge for Master’s programs, in my opinion, is to maintain the ground work required in the core curriculum adopted by the American Art Therapy Association and attend that the content runs parallel to state licensing requirements. We may have to increase the credit hours to prepare for the new demands placed on students in practicum. The intern must bring to practicum a much broader knowledge in many areas than was needed in the past.

In addition (see core curriculum in the AATA Guidelines for Education) somewhere we must find the time to educate our students how to deal with some neglected issues listed below.

1) A greater emphasis and familiarity with legal matters. The prepracticum students must understand all reporting laws that have to do with abuse. The ethical concern for child and elder abuse and laws protecting clients who are threatened or are threatening violence are quite clear. However, the responsibility

"Drugs, crime and broken homes are not special only to Southern California."

November 1989, ART THERAPY 99
The intern must bring to practicum a much broader knowledge in many areas than was needed in the past.

The therapist has in legally protecting herself and the client in cases where the records may be subpoenaed for child custody or in a contested divorce is an area that is rarely discussed in class. There are different approaches to the issue of how much clinical observations or second party reporting should be entered into the progress notes. If the therapist is called to court and held accountable for incidents written into the record the whole matter of confidentiality has to be reconsidered. Each agency has a policy and, hopefully, legal counsel to advise and to deal with these contingencies. The students must be educated how to ask for help if they are called to court, but better still, to ask for instruction how to avoid going to court unless it is absolutely necessary. If the art therapy product is regarded as part of the case record, the students should be very clear what they can say about the art expression and how much of the clients’ verbal references they remember or have recorded concerning each art task. Emotional and psychological support should be given students when they anticipate having to give testimony in court or have any dealings with attorneys seeking information. Their status in a court battle or the pressures that may be brought to bear on them is not part of what we usually discuss when advising students about their training in the field.

In California in 1988-89 eighteen million dollars were eliminated from the mental health budget. This resulted in closing many centers that cared for severely chronically mentally ill patients. When these fortunates became street people, needing medication, having no place to turn where their level of disturbance could be monitored, often the result of these multiple difficulties ended with an outburst of violent behaviors. In February of 1989 a counselor was stabbed to death by a patient who was frustrated by the system. Of course, we recall that this isn’t the first time that a therapist was in mortal danger as a result of uncontrolled behavior of a client. However, what is so painfully apparent at this time is that the safety devices that might be life saving such as a panic button system or an active guard service, cannot even be planned since there are no funds to implement the change. So what should the training programs do? Paint and marking pens are not a defense against guns. We must teach our students procedures about self protection and techniques of restraining a violent person. We must alert them to defend themselves against dangers in society—i.e. the neighborhood, working late hours, the need to have colleagues present in offices close by—the informal guarding that therapists can do for one another. A class like this may be more valuable than any one of us can imagine at this time!

Another area of concern is common use of street drugs. The treatment of persons who abuse drugs can be learned from texts, other clinicians, and in supervision. However, what is often missing is help in learning to quickly recognize the behavior of a client who is high on drugs or experiencing hallucinations due to a chemical reaction. The client may be chronically unable to use cognitive abilities normally because of drug-induced brain damage and therefore be irresponsible. Learning to recognize when the client has used alcohol or street drugs or both, and is out of control, is a course that could be called “Saving Your Life.” This title is facetious, but self protection and awareness of potential violence in mental health settings must also be a part of our curriculum.

New Techniques and Goals in Treatment

The second section of this article which studies therapeutic techniques designed to “fit” the changed population we serve is a much more personal, individual concern. The challenge is to move from tried and true formulae for treatment to unexplored and unfamiliar interventions. This shift is not always desired by the practitioner. However, the practice of regularly reexamining the theoretical, technical and creative approach to performing therapy is a task even more important than it has been in the past. If society, economics and violence have radically changed the world in which our clients live, how can we assume that the “old way” we have worked with people will continue to be effective under these changed conditions? It is up to each therapist to consider how or if modifications in technique and theory could enhance his or her effectiveness with patients.

For myself, the struggle has always been to fit everyone I see into a crisis or short-term therapy framework. However, I have very little choice, except in private practice, because the clinic has a mandate by the state to limit treatment to accomplishing short-term goals. This is not always successful and it is unrewarding and disappointing to offer a service that appears inadequate to meet the task.

“We must teach our students procedures about self protection and techniques of restraining a violent person.”
A few techniques that I have been using more often at this time are identified below. Each art task and construct is designed to enrich a limited once-a-week treatment schedule.

I use many more art therapy homework tasks. Often I suggest an art therapy journal which will focus on helping the individuals observe their own and their families' patterned behavior. That task may be coupled with a proscribed family ritual, formulated to interrupt redundant behaviors. Thus the individual has her/his own focused task and the whole family joins together in different ritualistic tasks. This has proven fairly effective, particularly because the art work has a therapeutic component all of its own. This, contrasted with the "action" requested in a family ritual, seems useful.

A second technique was developed in response to my own confusion in keeping track of the chaotic home life history of many of my clients. A large percentage of the older adolescent youths whom I see in treatment have lived more lives in their limited years than most of us ever will. They often have "done it all" by sixteen years. They often have begun to say "no" to a variety of toxic substances, but the one "no" they cannot say is the "no" their parents must say for themselves concerning their own addiction. Many adolescents and children have, to all intents and purposes, lost their parents completely to the streets, to drugs or to jail. The youths survive in spite of it all—some more successfully than others. I felt that a technique was needed to enhance clarification and appreciation of all the catastrophic events and traumas my patients had survived. By drawing or creating a long "Chinese scroll" piece of paper, a chronological record of their lives is recorded. By reliving these events in the art and gaining some psychic distance, they can achieve some overview of their strengths as they struggle with adversities. They see how they were too young to have the power to change many of the life events. This experience of reliving their lives generally offers an opportunity to relinquish guilt and to mourn and then release the parents who failed them. The scroll becomes a visible record of a battle that has succeeded and a journal of triumph over impossible challenges. An important goal may be reached by these young people—to gain a sense of self worth and pride in their endurance.

Perhaps the greatest change I personally have experienced over the last tumultuous years has been the manner in which I view a family. I rarely see an intact family, in the traditional sense of a married couple with "x" number of children, living together with long-term commitment.

For example, the emergence of the grandparent as parent, and often an unwilling parent for many reasons, is a common family constellation. This often leads to a situation where a youth actively seeks a home environment less stressful than a grandparent's home. This may be manifested by "running away." I have supported that activity if I feel that I can set up a system where the client lets the grandparent family know where they have run in exchange for reducing the demand that they return home. This encouragement is given sparingly and only on a case-by-case consideration. An example follows: an adolescent whose mother and father were entirely out of the picture lived with the grandparent who were confirmed alcoholics. When the girl found a friend who would take her in, and, with the grandparents' consent, I supported this "run away." During this search for a home many of the friends had rejected her, but she persisted until she found a pseudo-foster home for herself. The grandparents approved of the family and were relieved to give up the responsibility of her care.

"Many adolescents and children have . . . lost their parents completely to the streets, to drugs or to jail."

Often in cases like these the weekly therapy session becomes the only time when grandparents and grandchild can meet on neutral ground and examine the realities in the protected environment of the clinic. Helping the grandparent to help the child to "run away" keeps a relationship alive and provides both generations with a feeling that they have maintained some power and preserved their attachment.

There are many other situations where I can only provide limited services because the larger system has more control than I have in the patients' lives. For example, I see a foster mother and her eight foster children in a family group session. Each one of these boys and girls has a history of abuse and neglect that would qualify him/her for individual therapeutic attention. However, considering that they will live together as long as the court allows and that the clinic would be hard pressed to find eight individual hours for these needy children, we do family group art therapy. It is extremely useful that each member can draw about his or her own troubles and also about mutual attempts to reduce stress in the foster home. I do not feel this is poor treatment, but I do feel a sense of helplessness when a child is removed from the "foster family" by the court and there has been no opportunity to clarify any progress or to deal with separation. So again, we are confronted with compromise and questions concerning choices of treatment.

Throughout all of the examples cited above, and in many other clinical cases too numerous to men-
tion, the one constant that has remained positive is the use of the art therapy modality. More than ever the clients need permanence and security. The real and metaphoric value of the concrete expression that can be brought into a future session, or taken home, as a transitional object, has proven worthwhile. Another component of the art task lies in the duplicity of the work. Many families are court-ordered and therefore resentful and resistant to treatment. When they are asked to engage in the mild or non-threatening expressive activity, they are often more compliant. The pleasure component in working together with media, or at the least, keeping eye contact to a minimum, as they focus on the drawing, provides a more positive experience for the reluctant client.

I feel that each of us has an arsenal of creative ideas which will result in therapeutic modifications we desire. If the real world of the clients is acknowledged and incorporated into treatment, there may be a greater success rate for the families and satisfaction for the clinician.

National/Professional Organizations

The individual therapist seeks support and confirmation from peers and from the group that represents him/her professionally. Therefore, if there is a lack of awareness on the state/national level of life on the front-line of mental health service, there will be a break-down in understanding of the larger needs of the professional practitioner. Rather than maintaining an elitist stance, separated from other mental health disciplines, it would be useful to be educated as to the manner in which these are changing disciplines. Conferences can no longer dwell only on clinical presentations, but should give participants practical information, for example, how to write grants, where to find legal advice, how insurance coverage has been challenged, how to lobby, and other political necessities.

The national organization should be courageous and take the undesirable position, when necessary, of leading the members into professional changes that may be unpopular or uncomfortable for many. These changes cannot be legislated without due process, but the members must be clearly informed if there is a threat to their future by neglecting to take certain action. The leaders who have been elected by membership must research the climate of the mental health community at large and guide the members into taking steps that will protect their economic life and their human life.

It is important that the professional publications select material to publish that is reflective of new trends in the mental health field. Change in therapeutic theory and techniques is not only an intellectual challenge but is an economic necessity. For a helping professional to be unaware of current directions in thinking leaves him or her behind when interacting with other professionals. Publishing the current speculations on treatment allows the practitioners in our field to examine the theory and make decisions whether or not it is valid for them. The irresponsible position is not to take the chance of exposing readers to what may, in the long run, be just "trendy." The market place is interested in hiring persons who can "talk therapy" with other professionals. They may then justify the individual choices they have made to be effective therapists.

Cultural diversity is an ever growing factor in our society. The national organization must be willing to demand fair representation of all ethnic groups on the various administrative committees. If the membership has not voted, for whatever reasons, for persons who can voice the concerns of minority groups, then consultants can be brought in from membership to enlarge the world view of the executive committees. There are many other solutions which may very well be more inventive and workable and answer this need.

In the long run the national/state group must change its thinking from linear to systemic. We start with the individual art therapist in the educational system, who graduates and joins the professional mental health service system, who then interfaces with the larger social system and is supported and informed by his/her own state and national professional system. All of these worlds interlock and cannot be seen as functioning independently. This concept is not original or unique by any manner or means, but to operate on all levels with this image in mind seems to be difficult for many therapists.

Summary

The day the mental health worker was stabbed to death in Los Angeles started a ripple effect that impacted the whole state of California mental health service and its economic and moral awareness. My hope is that through education, expert professional techniques, social awareness aided by direction and support of the state and national professional organizations, we can start the same impactful movement toward change without encountering violence and sudden death. The only armor against fear is knowledge. Knowledge of how to stay alive and useful in a system that at this time in history seems to be threatening. The struggle is worth the price and invites growth and change and provides another challenge for each art therapist's creativity.

"Change in therapeutic theory and techniques is not only an intellectual challenge but is an economic necessity."
Art Therapy Education at the Crossroads

Harriet Wadeson, PhD, ATR, School of Art and Design, University of Illinois at Chicago

Abstract

This paper attempts to note the implications for training arising from the contextual development of the profession so that Art Therapy’s growth may be purposeful and directed rather than merely reactive. There is a reciprocal relationship between training and practice; training shapes our future professionals, but influences on the profession direct the shape that training takes. Some of these influences include the effort to gain licensure for art therapists, increasing numbers of art therapists who have undertaken doctoral work and low pay scales for art therapists. Additionally, various training programs are presently training different kinds of professions. One possible outcome may be more clearly delineated diversity within Art Therapy.

The hybrid profession of art therapy has never been particularly light on its feet in straddling the very different worlds of art and therapy, with one foot in each as it shifts its weight back and forth trying to maintain its balance. The question that has been raised throughout art therapy’s existence—are we artists or therapists?—has never been resolved.

The question of who we are and what we do is central to art therapy education. What are we training our students to become? There are those among us committed to the identity of the artist who see our mission as fanning the creative spark in others so that they too may know the warmth and nourishment we artists derive from our creative expression.

Others among us view art therapy as a helping, healing profession whose aim is human growth and whose means is image-making. Some have claimed that art therapists are trying to become psychotherapists by entering that world “through the back door.” And there are the rest of us, probably most of us, who shift back and forth depending upon the needs of our clients and patients and the setting and circumstances of our work.

There is a reciprocal relationship between training and practice. Training shapes our future professionals and therefore the directions the profession will follow. Conversely, influences upon the profession direct the shape that training will take. Some recent events have significantly impacted art therapy training and art therapy practice.

Crisis in California

California, the last frontier in the pioneering of our country, is often the first frontier of new ideas, trends, styles, and practices. California gave us Esalen, New Age, Human Potential, and, politically, Ronald Reagan, John Birch, and Richard Nixon. But more recently, California has given licensure to art therapists. If one has followed California art therapists’ struggle with eligibility requirements for the Marriage and Family Counseling Certification license, then one realizes that this license was readily obtained by art therapists until recently. A couple of years ago MFCC eligibility was tightened and initially art thera-

pists were no longer permitted to apply. After a long and arduous struggle, however, art therapists gained the right to sit for the MFCC examination provided they had taken the following courses:

- Human Growth and Development
- Human Sexuality
- Psychopathology
- Cross Cultural Mores and Values
- Theories of MFC Counseling
- Professional Ethics and Law
- Human Communication
- Applied Psychotherapeutic Techniques
- Research Methodology
- Psychological Testing

As is apparent, a heavy clinical and sociological preparation is now required. Art therapy training programs as previously organized faced the possibility of losing students. In the past, students graduating with a Master’s degree in art therapy programs were eligible for California licensure. In the most art therapy programs were not offering all the newly required courses, this was now no longer the case. The results of this condition have brought about changes in California art therapy training. Two examples are cited:

1) Loyola Marymount College in Los Angeles has reorganized its training to provide the necessary course content to meet MFCC requirements. Two of its faculty even traveled to Washington, D.C. to the Marriage and Family Counseling Association headquarters for advice and recommendations.

"The question of who we are and what we do is central to art therapy education."

November 1989, ART THERAPY 103
2) The art therapy Master’s degree program that for many years had been located in the Art Department of Sacramento State University was discontinued and a new program inaugurated. This program is a Master’s degree in counseling with a specialization in art therapy. It is located in the Counseling Department, and students, in addition to taking the MFCC required courses, must also take the basic counseling courses required by the department. The result is that there are relatively few art therapy courses that are a part of the program.

This latter model of art therapy training poses significant questions for the development of the profession. Due to licensing considerations, will art therapy become a subspecialty of one or another mental health professions (counseling, social work, clinical psychology)? Will training emphasize clinical, non-art based courses as it must in California for license eligibility and as it may for art therapists to be covered by National Health Insurance when it is eventually enacted? For example, Nancy Hall, AATA Government Affairs Chair, has stated that in order to qualify as a mental health profession with “equivalent training” to those likely to be insured, art therapy training will probably need “a more uniform core curriculum, and one that is in line with those for counseling programs” (Memorandum to AATA Board of Directors, February 25, 1988, p. 2).

Directions of “Doctors”

There are other developments as well that both result from training and impact upon it. As our profession has matured, and more training opportunities have proliferated, more and more practitioners are seeking and obtaining doctorate degrees. In Chicago, several art therapists who have earned doctorates in clinical psychology and are presently employed as psychologists, not as art therapists. At the same time, some art therapy training programs are pursuing the possibility of developing doctoral degrees in art therapy (Lesley College and Wright State University, for example). On the one hand, therefore, some of our “doctors” are leaving art therapy, whereas on the other hand, there are likely to be art therapists with advanced training invested in further development of art therapy as an intact profession.

Theory and Research

In the realm of doctoral work, it appears that what is needed in the profession is theory building and research. Interestingly, in editing a book titled Advances in Art Therapy (John Wiley Publishers, in press, 1989), I had hoped to include chapters on theory and on research. The material submitted reported expansion of the field in new populations treated and new methods used, but there was hardly any work in theory building or research. This representation of new work in art therapy is an accurate picture of the way we are advancing—in clinical rather than scholarly directions. What does this imply regarding advanced training? Is there a sufficient body of knowledge to support doctoral work? Or on the other hand, will it be doctoral dissertations that will supply the theory and research the field needs?*

Low Pay

There are other influences within the profession that may develop into directions as well. Some art therapists have become disenchanted with the low pay and low status of art therapy in the mental health hierarchy.

Although attrition is expectable in any profession, low pay has caused some of art therapy's educators to leave the field altogether. Three directors of art therapy training programs who have moved into the financial area come to mind. (One told me recently that her present salary for selling securities is triple what she earned as an art therapy educator!)

Another result has been a movement away from the usual institutions that house art therapy. For example, in Chicago, Gail Wirtz, ATR, has formed The Creativity Development Center, a private entity that is composed mostly of upper middle class "well" children's groups. The purpose appears to be more growth-oriented than problem-oriented. The staff are referred to as "art instructors." Other "centers" utilizing this model have been formed in Chicago for less privileged children. Might more art therapists move in this direction?

Questionable Training

The movement away from a clinical approach has spawned some questionable training as well. Recently I read an advertisement for art therapy training at a "growth cen-

"As our profession has matured . . . more practitioners are seeking and obtaining doctorate degrees."

". . . it appears that what is needed in the profession is theory building and research."
ter” that claims to prepare students for art therapy registration. The advertisement spoke of “soul birthing.” Would one enter such training to obtain a soul? Is it implied that a student doesn’t have a soul until it is born in the training? What does such advertising say about art therapy training and the profession? Do we want others to believe that we will provide them with souls?

Summary of Influences

It seems to me that at present art therapy education runs the gamut from highly clinical (MFCC), to more art and art education based, to out-and-out flakey. It appears as well that influences such as licensure and third-party payment are likely to discourage training of art therapists as specialists in other mental health professions. It is also likely that the low salaries in art therapy will encourage our more ambitious practitioners to leave the field or develop private practices. (The latter may require considerably more financial backing initially than most art therapists have and therefore provide possibilities limited to few.) And finally, the increased number of art therapists earning doctorate degrees will likely have the double effect of enabling some of our most promising professionals either to leave the field or to strengthen it.

Implications for Training

In considering these many possibilities, I encounter more questions than answers. It seems apparent, however, that training will both respond to prevalent directions and create them. If art therapy is true to its past, it will remain divergent. And perhaps the pattern we will see emerge will be one of even greater divergency. The emergent direction may be an even greater division between art and therapy. We may find ourselves embracing clearly identified clinicians who use art, artists who heal, and scholars who conduct research.

With these considerations in mind, it behooves those responsible for art therapy education to recognize that any one training program would be hard pressed to provide an adequate foundation for all directions. In other words, it is likely that the greater divergence in art therapy practice will be paralleled by a greater divergence in art therapy training programs. Art therapy educators, therefore, should plan training carefully for the kind of art therapist they are preparing. They should be clear about the objectives of the particular training they provide and identify themselves accordingly.

Hopefully, the profession’s public relations efforts would reflect the increasing diversity within the field so that those who hire art therapists and utilize our services will be aware of the profession’s many possibilities. Such publicity would inform prospective art therapy students that becoming an art therapist offers a choice of directions. As training programs identify themselves along a continuum of possible training and resultant professional routes, applicants would be able to acquaint themselves with the different objectives of each and matriculate accordingly.

The Crossroads

It is important that art therapists and especially art therapy educators make themselves aware of the strong winds that are blowing and the tides that are shifting in our field. I believe we have reached a point of departure toward possibilities of greater divergence and that this new place is a crossroads for art therapy education.

As a hybrid profession of creative individuals, we have always resisted uniformity. If our emergent pattern is even greater divergence, hopefully the path we follow will be one that embraces our differences with understanding, grace and sensible planning.

Finally, although the picture I am painting might appear to be that of a profession flying to pieces, I believe our developing doctoral programs hold the potentiality of providing us with scholars who will articulate theoretical common ground on which we can all maintain our balance. That in itself will be another new direction.
Beyond Psychic Numbing: Child Art Therapy and the Nuclear Taboo

Ellen Speert MEd, ATR, Instructor University of California San Diego, Adjunct Faculty, the Union Institute, Lecturer, Institute de Perfectionnement de Travailleurs Sociaux in Lusanne, Switzerland, Private Practice in San Diego

Abstract

The existence of nuclear weapons and its effect on the psychological development of children present art therapists, and indeed all those who have any contact with the young, with an unprecedented challenge. Do we as mental health professionals explore openly and sensitively this frightening issue (as we have been trained to do with other previously held taboos such as sexuality) or do we retreat, ignoring the signs, misinterpreting the graphic message, remaining focused only on more tangible distress? This article presents the school age child's dilemma: being aware of the risk of nuclear annihilation but lacking the psychological defenses with which to protect him/herself. Studies are cited demonstrating this knowledge and a framework is presented in which to view the psychological and behavioral ramifications. Art therapy is presented as a preventative intervention and the inclusion of examples of children's art work illustrates both early awareness and concern. The author concludes by addressing the implications for the therapist in meeting this societal taboo both professionally and personally.

This nuclear vision may overwhelm the imagination but the subconscious cannot block it out. And the young, with their higher degree of susceptibility, their more active imagination, also have more fragile defenses. Some begin to believe it's easier not to grow up . . . the future seems too terrifying, too negative, too black."

HELEN CALDICOTT, MD
President of Physicians for Social Responsibility

Our society is becoming increasingly aware of the sensitivity and concern with which children view the world situation and the threat to survival posed by the existence of nuclear weapons. Yet because of the immensity of the situation and the lack of existing guidelines on how to address these issues, most adults have chosen the path of least resistance: numbing themselves to this awareness, keeping busy, addressing more immediate or tangible issues. Perhaps it is as Joanna Macy (1983) contends in Despair and Power in the Nuclear Age, that our society frowns on raising a problem without a solution. We as art psychotherapists are not in the business of providing solutions. Rather, we are the providers of a frame inside which individuals can enact the creative struggle, regardless of the question raised or the problem explored. Do we by our own avoidance of issues without answers, our own fear of confronting not individual death but global death, sidestep an issue which is subtly brought into the art therapy session? Perhaps we contribute to our young clients' sense of isolation and despair by our own "psychic numbing." This is a term Robert Lifton (1982) coined to describe the denial of reality in order to protect oneself from what would otherwise be too overwhelming.

Developmental Theory

A brief citing of developmental perspective will provide the framework through which to view elementary school children's art and to understand the research studies listed. The way children meet the challenges of growing up is greatly influenced by the physical and emotional environment in which they find themselves. Placing this in the context of Erikson's "Ages of Man," one can look at the two primary developmental tasks. The first is "Industry vs. Inferiority" in which the child either becomes absorbed in creative involvement with peers and environment, or withdraws, giving up in such endeavors. The second stage, "Ego Identity vs. Identity Confusion," hinges on the existence of viable adult role models: adults who supply strong, reliable examples for the child to emulate. Are these two tasks being compromised? Does the knowledge of adult responsibility for the nuclear crisis we face interfere with the child's desire to identify with these adults?

Another framework within which to view child development is object relations theory. Mahler and Kernberg write of the need to integrate the good/bad in the emerging sense of self and others (p. 30, Greenwald and Zeilin). In order for the child to develop as a separate and individual human, possessing a sense of empathy, this split must be integrated. How does our society, with its rhet-

"The way children meet the challenges of growing up is greatly influenced by the physical and emotional environment in which they find themselves."
oric posing the United States as all good and "God fearing" and the Soviets as the "evil empire," affect this psychological development? This posing of enemies may inadvertently exacerbate the good/bad split.

As the following research demonstrates, beginning at a very early age children possess both awareness and deep emotional response to the nuclear issue. The studies are listed here beginning with high school seniors and descending in age down to the final study of pre-schoolers.

Research Findings

Bachman (1983), at the University of Michigan, conducted a ten-year nation-wide study of 17,000 high school seniors, finding with each successive year an increase in the number of students worrying about the nuclear threat (p. 86-104).

Goldenring and Doctor (1985) studied children in the seventh through twelfth grades. Presenting a list of twenty fearful situations, they asked each child to rank in order the five that worried them the most. These children responded that nuclear war was second only to the death of a parent as the most frightening (p. 112-133).

Escalona (1965) conducted a study of children ranging from ten to seventeen years old, asking them to describe "What will the world be like ten years from now?" In their response 70% spontaneously mentioned nuclear weapons or destructive war (p. 23).

Educators for Social Responsibility (1982) interviewed 2,000 high school students and found that 80% thought that there would be a nuclear war within the next twenty years. Further, 90% of those who predicted nuclear war felt that the world would not survive it (p. 8, Mack, J. E. 1982).

Snow and Chivian (1983) interviewed first graders and reached the conclusion in their research that "The word 'nuclear' makes first graders think about dying," according to their report delivered at the sixty-seventh annual meeting of the American Orthopsychiatric Association.

Friedman (1984) studied four year old pre-schoolers, presenting them with children's stories including conflict. Then, through the use of associative techniques, he observed their responses. He found that 12% of these pre-schoolers spontaneously included references to nuclear weapons in their play and verbal responses (p. 2).

Goldenring and Doctor, as well as other researchers found that students who worried more about nuclear war had better scores with respect to adjustment and self-esteem than the less worried students (Greenwald and Zeitlin, p. 26). These were children who, as a result of their concerns, talked more with their parents and other adults thus gaining hope as they broke through the veil of silence.

Let us now look at the effects on personality development of growing up under the nuclear threat. Beardslee and Mack (1981), researchers at the Harvard Medical School, in their report to the American Psychiatric Association, describe the effect a sense of futurelessness has on children:

Within themselves, children carry an 'ego ideal', an image of their best selves or of what they would wish to be like. This image, often reflected in hero worship, gives children a vision to mitigate disappointments and to sustain them into adulthood as they experience their childhood limitations. To build a healthy ego ideal and grow toward maturity, children must perceive life as stable and the future as reliable. The building of enduring values within an individual depends upon the delay of present satisfactions in favor of future goals and satisfactions. But the formation of the psychic structures upon which such development depends is compromised...
when the possibility of a future appears to have been destroyed by the adults to whom its preservation was ostensibly entrusted.

It is the contention of Dr. Robert Lifton of Yale University School of Medicine that childhood behavior is also being affected by nuclear fears. Meeting with psychiatrists from around the country in 1982 he drew up the following list of significant behavioral changes.

1. A sense of futurelessness—nothing lasts so all is meaningless.
2. Space and technology as escapes—escapism through the use of video and computer games and movies. This world is unsafe, therefore the need to move to space.
3. The turning to religious cults—reassurance and power come from having “the answers.”
4. Increased use of drugs and alcohol—substance abuse as self medication for stress.
5. Increased suicide rate—teens are the only age group in the United States with an increasing death rate.

Early adolescents (age twelve to fourteen) appear to be the most at risk psychologically. They possess more factual information on the nuclear issue than their younger schoolmates, but they lack the coping skills, the mechanisms with which to protect themselves. Unlike older adolescents and adults, they have not yet developed the tools of abstraction and psychic-numbing. As Maxine Junge (1987) writes, “Typically the adolescent needs to retain the sense of personal immortality in order to forge an identity. If the young person is repeatedly assaulted by death, that sense of immortality is destroyed” (p. 123).

**Art Therapy in Nuclear Education**

This author contends that we must now address the emotional needs of the “normal” child in order to prevent the trends which Beardslee and Mack are observing. Art therapy has primarily been utilized reactively, in the treatment of childhood dysfunction, in an effort to undo the pathology created by the environment. But now we must begin to think in terms of pro-active treatment, addressing the psychological climate created by the threat of nuclear extinction. Judith Rubin (1978) has referred to art therapy as a natural discipline for primary prevention, pointing to the public schools as a logical place for its implementation. Rubin writes of the use of art in this way to serve as a vehicle for increasing self-esteem, feelings of competence and coping skills. It is the lack of these very attributes which leads to the behavioral changes Lifton describes (pp. 85-86).

The need for information about nuclear weapons and technology has been recognized by educators and parents on a national level already. In 1985, the National PTA published a resolution which states in part that:

> Psychological studies have shown that the threat of nuclear war and its possible consequences may have a destructive effect on the well-being and emotional health of some children and youth; ... be it resolved that the National PTA use studies, forums, educational materials and programs and work with community organizations to inform its membership about nuclear age education ... to effectively address children's fears concerning perceived nuclear dangers (p. 13, Beyond War Resource Packet).
Following this statement, the California State Assembly went further to mandate curriculum in nuclear education by passing Assembly Bill #3848. This legislation acknowledges the needs of young students by addressing "...the inherent right of our children to pursue their educational objectives free from the immobilizing threat of nuclear war and their own annihilation" (p. 15-17, Beyond War Resource Packet). In cities around California, committees are working to develop a Social Studies curriculum on nuclear education to respond to this mandate.

As the information is introduced and the veil of silence is lifted on this subject a vital first step is taken. Removal of the taboo against discussion of the nuclear issue will begin to break through adult psychic numbing and release children from their sense of isolation. Yet there remains the emotional component to be addressed, and it is here that art therapy may serve a valuable function. This writer prepared a proposal for the San Diego city schools to add art therapy into the kindergarten through sixth grade curriculum in order to facilitate the communication and processing of this emotional material.

Guilda Grossman (1979), a Toronto art therapist, speaks of sensitizing parents and teachers, within the school context, to the needs of children as expressed through their art. This author feels that nowhere in the public school curriculum is it more important to include an expressive arts component than in the teaching of such an anxiety-provoking topic.

The following hypotheses are the foundation of the program which was presented to the San Diego schools.

1) Children are aware of the crisis we face in living in the nuclear age and are deeply troubled by it.
2) Children benefit emotionally and psychologically by having an outlet for unspoken fears.
3) Children can teach each other, and adults, a new way of viewing present problems and the future, offering fresh insights and perspectives.

4) Art provides benefits to both educators and students.
   a) There is a reduced sense of isolation as children see they are not alone in their feelings, even through few adults openly talk with them about the nuclear crisis.

"Removal of the taboo against discussion of the nuclear issue will begin to break through adult psychic numbing and release children from their sense of isolation."
b) Art increases a sense of mastery as children draw or map out ideas, graphically solving problems.

c) Teachers gain a sensitive tool in understanding the level of concern of each student.

5) Self-concept is enhanced as children take action on issues and feel that their concerns are appreciated by adults. This leads to an increased sense of social responsibility.

Although art therapy has not yet been formally included in the curriculum, some teachers and counselors in the schools are using drawings to both assess children's concerns and provide the students with a productive, problem-solving orientation. The children in several San Diego elementary schools were presented with the directive "If you could teach the world leaders something, what would it be?" These drawings were done before any nuclear curriculum had been introduced and yet a striking number spontaneously included images of war and nuclear weapons. (Not all the drawings were available for review so exact percentages cannot be provided.) This first observation, the choice of nuclear imagery, supports the research findings cited earlier of widespread awareness and concern by young children.

A second finding in the artwork was the inclusion of imminent danger to the head of the person in the drawing in almost every picture. (See photos.) It is all the more striking considering the neutral nature of the directive given, that these children responded with a sense of impending personal threat. While much more research needs to be done before generalizations can be drawn, this is a possible indicator for art therapists to be aware of. As Myra Levick (1986) states, "As society continues to change, it will be more and more common to see these changes reflected in children's drawings." Being sensitized to these signals will aid in appropriate therapeutic interventions.

**Implications for Therapists**

Those of us who choose to be truly open to the concerns of young clients must first look within ourselves, to assess the degree of psychic numbing. We must attempt to free ourselves of denial, openly exploring the personal implications, so that these blind spots may be at least somewhat reduced, allowing us to be more fully available to deal with the nuclear crisis we all face. As Bert Shacter (1986), a social worker, so clearly writes:

... we can safely say that the matter of the nuclear arms race—and its effects on the perceptions, hopes, aspirations, identities and relationships between human beings—can no longer be ignored. As mental health clinicians, we will need to become attuned to clues from our clients related to nuclear anxieties and despair. We will need to understand better the interplay between developmental experience, intrapsychic life, and family process.
still trust and renew our children’s faith in the future. We as art therapists possess a unique tool with which to both gain understanding and promote well-being. This author has noted one possible graphic indicator of nuclear concern. Research needs to continue to provide the foundation for greater understanding. Through our commitment to dealing with this sensitive topic we can both empower ourselves and improve the quality of our work with children.

Stitched to the Beat of a Heart, to Comfort the Terrors of the Dark

Judy Weiser, M.S.Ed., ATR, R. Psych., Director PhotoTherapy Centre/PhotoExplorations, Vancouver, British Columbia, Canada

To me Art Therapy signifies the bridge between inner meanings and the outer world of "translations" that try to represent all these unconscious feelings, thoughts, memories, etc. The symbols that we use at a conscious level are very personal/private representations from each person’s unique unconscious—and yet simultaneously can aim for mutual comprehension by others so that they might somehow understand what we are trying to convey.

It is in this light that I perceive the "AIDS Quilt" as a spontaneously-created, grass-roots level expression of art used not only as creative product to communicate the remembrance of a life now ended, but also (and simultaneously) as a form of "natural" therapy for all concerned with the Quilt panels’ making, viewing, and reflective discussing. The art-making as therapy; the icons, symbols, colors and media within each individual panel as unique, yet frequently (and unknowingly) archetypal; the strong need to have others comprehend the meaning and value of each individual’s life; the permanent trace of that person’s life that will last long after the tragedy of the death event—all of these communicate to me the healing (and therapeutic) value of this incredible exhibition stitched from people’s hearts and minds.

I volunteered to be an "emotional support" worker at the recent local showing of the Quilt. From my experiences I found myself emotionally mandated (from my own unconscious) to write it all down.

There is no single reason for the Quilt; no solitary way to understand it. Death is not that simple; grief cannot be that easily scheduled.

The Quilt started out of grieving individuals’ wish to honor their own casualties; it has spread to cover all of humanity as women, babies, and others besides Gay men have died of AIDS and have had their lives marked for remembrance with panels describing their lives and their love. The original territorial possession of the Quilt by the Gay community has given way to more universal mourning.

Some say grief is private and shouldn’t be shared with, or even witnessed by, strangers. Some say once a person has finished grieving you should shut that door and get on with life (while some call that denial of the depth of it and an attempt to put a lid on feelings much too early). Others say that the pain never disappears, that you only learn finally how to live with its presence. Most agree that no one knows when the right time is for another person to finally "let go."

Very simply, those who didn’t need or want to be there didn’t come—but nearly 15,000 did, and the sheer magnitude of the exhibit at the Vancouver Art Gallery made the abstract experience of AIDS and its death sentence far more personal and individualized than statistics ever could.

As he finished viewing the room full of brightly decorated soft fabrics representing our British Columbia deaths, the 60-ish gentleman said to me: "I haven’t spoken to my son since the day he told me he was homosexual. I told him that in my mind, I no longer had a son, and that if he got sick with AIDS, that I didn’t want to know about it. My wife forced me to come down here, so I did. I warned her that it wouldn’t change my mind any . . . but I want to tell you that I’m going home to phone my son right now and try to talk to him if he’ll let me . . . before it’s too late."

The whole of it all, the sum of all those hundreds of uniquely memorializing details that define and contain a life of a treasured friend, lover, brother, sister, or child make up a mosaic of raw feelings in people that beg to be verbalized, yet still lose something in their essential intensity as they arise to conscious description. People came, each for their own reasons, with their own expectations of death no longer at arm’s length. Others wandered in from other exhibits in the building, not knowing until they found themselves in the midst of it all exactly what they were seeing—and they too usually stayed

November 1989, ART THERAPY 113
on and paused and received whatever messages were their own.

"This was my brother; he died in Ottawa; his lover made this Quilt and we haven't seen it until today. He asked to be cremated, so there's no gravestone; this is all we've got as a memorial that survives him." She had stood, in tears, before the panel photographing it and being photographed beside it. "I wanted to have a last photo of him, and he died before I could get to Ottawa; this is the next best thing, because he's gone now and we hadn't visited in years."

Some of the visitors kept their tears clutched tightly to their chest, stories mute, secrets kept. Others would seek out emotional support workers standing nearby and their stories spilled out, flooding details of special moments—how they were connected to this Quilt panel or that, not satisfied with their private grief but finding that it demanded to be witnessed, recorded in the reality of now and in the minds of others so that the memories were kept living.

The anecdotes and explanations validated not only the grief, but also the proof that this person mattered, that this life was not in vain or lost to anonymity, and therefore could be seen to have had purpose. It was a salve to those who grieved to see how others were touched enough to pause and read and know and share the pervasive sadness and the insane waste of life.

"We didn't know our son was Gay until two weeks before he was hospitalized, and then he died that same month. We rushed to be at his bedside down in the States and met his lover, who said he had written us a letter in case we didn't make it in time. I have that letter with me; it's been in my purse, by my heart ever since; would you like to read it? I would like to share it with you."

The names were read each hour; those who had died sometimes identified by full name, sometimes by first name or coded initials only. It crept into my ears as I wandered through the exhibit; sometimes I felt punched in the chest as I heard a name I recognized, but hadn't expected to be dead. Most people were overwhelmed long before halfway round the exhibit. Eyes and hearts saturated, viewers appeared stunned and muted.

To me it's not just an AIDS Quilt—but it's also a universal grief Quilt. A Quilt to comfort against the terrors of the dark, hugging warmth tightly around.

I watched as it tucked people into their memories and thoughts; the pervasive sadness at a deeply subconscious archetypal level beyond individual stories became also empowering, the isolation joining through its crushing grief into community of shared experience. It originally belonged to people losing lovers, but in its "spread of hope" it has moved beyond that into the very fragility of life and our own mortality.

One answer I find myself giving about the power of the Quilt is that it quickly becomes clear that you don't have to be Gay to understand, and that once you've encountered the Quilt and its message of love-and-loss, that differences may not make such a difference anymore. It is not just a sadness, but also a stubborn defiance.

Five panels were added during the exhibit; two Vancouver people died of AIDS during the five days while it was displayed. It was not what made "them" so different from "us" that hits us all so hard, but what makes us all so much the same in our vulnerable human fragility, the much-too-early deaths so unjustly imposed. Certainly, tears do not have any sexual politics.

Advances in Art Therapy

Harriet Wadeson, PhD, ATR; Jean Durkin, MA; Dorine Perach, MA, (Editors), John Wiley & Sons Publisher, 1989, 451 pages.

Reviewer: Winnie J. Ferguson, PhD, ATR, Assistant Professor of Art Therapy, Wright State University, Dayton, Ohio.

Advances in Art Therapy guides the reader through the development of the art therapy profession in the 1980s. The editors have gathered chapters from a broad range of contributors who are actively enlarging the scope of art therapy. The book is rich both in narrative and in illustrations. The individual contributors have provided an abundance of artwork to clarify the valuable case studies which are provided throughout the book. Harriet Wadeson, one of the editors of the book, authors the preface to the book, the introduction to each of the three parts of the book, and the final chapter entitled “The Art Therapy Termination Process Group.” In the preface, Wadeson sets the stage for the broad scope of the book when she says, “By nature of their work, therefore, art therapists are creative people. But beyond the creativity in work with individual clients and groups, art therapists are creative in evolving their profession. It is this later creativity that is the subject of this book” (p. xiii).

This book is divided into three parts; each is divided into a series of chapters which deals with intriguing art therapy developments. The first part of the book, “New Populations,” provides descriptions of work which has been given little discussion in art therapy literature prior to this publication. The second part, “New Methods,” presents fresh ways of approaching the art therapy process. The final part, “Art Therapy Training,” provides some insights into training developments in our field.

The dimensions of art therapy are explored in the first part of this book. Wadeson says, “It is noteworthy that the ‘New Populations’ section of this book comprises over half its chapters. Art therapy’s greatest movement appears to be horizontal at this time. We are still a young profession, sufficiently unformed to be able to adapt art therapy’s essential potential for enhancing self-expression, understanding, and creativity to the varying needs of widely diverse populations who can benefit from its services” (p. 1).

In chapters 1 and 2, cross-cultural experiences in art therapy are shared by Golub, Thrasher, Yee and Zahnstecher. They offer important insights for the art therapist working with those from other ethnic groups. Golub’s chapter provides specific information relating to clinical issues found in the adolescent Cambodian refugees encountered in her experiences; however, her valuable appendix which outlines the trauma is applicable in other situations.

Zambelli, Clark and Heegaard (in chapter 3) focus on bereaved children and the therapeutic art processes. The implementation of the elementary school bereavement intervention program described is practical and challenging for art therapy. Chapters 4 and 5 focus on the issues of women with an examination of Mary Cairns’s program for mothers in a short-term psychiatric setting, and Rosemary Lagorio’s program for battered women. The issues which are specific to these populations are being dealt with in many facilities across the country by other art therapists. The mother’s feelings of depression following the sudden separation from her children are universally shared by other women. Lagorio says, “The application of art therapy... proved to be an effective tool in terms of education, identification of feelings, and, in general, an enjoyable engagement with the art-making process itself, oftentimes evoking hidden feelings as well as latent talents” (p. 96).

In chapter 6 Julie Serrano writes about “the evolution of a sexual abuse group whose members moved from victim to survivor using the arts in therapy” (p. 114). This author has provided a series of three charts which would be helpful in developing an art therapy program with this population. The charts outline a program from the beginning stages of therapy through termination stages.

Incarcerated clients are the focus of chapter 7 by Day and Onorota. The population is one which is challenging for art therapists. Both the facility and the client would benefit from this type of program.
Day and Onorota found that “Group art therapy provides... building appropriate cohesiveness on the unit... Group cohesiveness is paramount in alleviating inmates' feelings of isolation and depression” (p. 146).

Chapters 8 through 11 inform about clients with physical health problems. Penny Baron provides a stimulating chapter on “Fighting Cancer with Images.” Her case studies and accompanying client artwork gives the reader a clear path following the therapist's treatment plans. Further elaborations are illustrated by Fleming and Cox in chapter 9 as they share their work with clients who have psychosomatic illness. These authors have provided the readers with an outline of the treatment plan developed for treating clients with the somatic-affective process they found effective. The work of Baron, Fleming and Cox offers the possibility that art therapy may shape physical and emotional improvements.

The next two chapters by Judith Wald explore additional medical problems of severe head injuries and of Alzheimer's disease and related disorders. Wald's work provides background information on the knowledge necessary for the art therapist working as part of a rehabilitation team. The importance of working within the “medical model” with this team demands that the art therapist understand and use the vocabulary of the team. Wald’s conclusion recognizes the difficulty which art therapists find in the receipt “... of insurance reimbursement and understanding of our role in a medical model-oriented facility” (p. 203). In her discussion relating to dementia illnesses Wald says, “The primary goal is to help offset these losses [intellect, memory, speech and physical abilities] by providing activities within a framework in which the patient can succeed” (p. 215). Wald shares some practical suggestions for art therapy sessions with clients with dementing illnesses.

Robert Ault's chapter “Art Therapy with the Unidentified Client” extends the scope of the teacher-therapist. A new dimension for the art therapist is offered in this thought-provoking chapter. The positive effects of the process of art with “unidentified” patients can be useful for art therapists in an art school setting, and may open new vistas for the field of art therapy.

David Henley concludes the “New Population” segment of this book with a chapter entitled “Artistic Giftedness in the Multiple Handicapped.” Henley's work with this population is evidenced by the sensitivity which he uses to describe his work with clients. His program has allowed assessment for artistic giftedness with his clients. The criteria for the assessments and the case studies are valuable for those art therapists working with this population. Henley concludes the chapter with discussion of the ethics of “outsider” art in which he presents the problems facing the therapist when answering the needs of the gifted person with multiple handicaps.

The second part of this book looks at some “New Methods” in art therapy. These methods are creative approaches which the contributors to this book have developed. Wadeson says, “They are never an end in themselves, but always a means to achieve a larger end in the realm of human functioning” (p. 273).

Jerry Fryrear and Irene Corbit have written an interesting chapter in which they discuss “Visual Transitions,” a method using videotaping and photography in their art therapy program. The discussion, case study, and art examples could provide a basis for other art therapists wishing to utilize this method. Fryrear and Corbit conclude, “It is primarily visual, ...; it is multi-modal, enabling clients to use a choice or combination of modalities to achieve therapeutic change and personal growth; it provides for metaphoric change within the therapeutic session...” (p. 292).

Devorah Canter, in chapter 15, shares her experiences with “Art Therapy and Computers.” Most facilities have these machines available; however, few seem to utilize the proper software to produce graphics. Canter uses the Apple Macintosh in her program which she reports is easy to use with a variety of clients. Her chapter explains the terms such as “hardware, software and program” in a clear manner. The case examples, computer-generated graphics (including an original music score) and discussion should provide support for those interested in computer art therapy methods.

Art therapy and psychodrama are united in the following chapter authored by Jean Peterson in collaboration with Leigh Files. The authors have provided the reader with a brief history and discussion of psychodrama leading into the method of combining the two into a single process. The art therapist interested in extending his/her creative self into additional expressive arts therapies will find this chapter helpful.

Lenore Steinhardt's chapter offers “Six Starting Points in Art Therapy with Children.” These six interventions, developed in her practice, are clearly outlined and discussed as a resource for other art therapists. Also, Susan Buchalter-Katz's chapter proffers a method which she has found effective in working with depressed clients. Her “Barrier” drawings have evolved from long experience as an art therapist with depressed clients. She reports success in the method which has “... proven to be a more direct route to conscious and unconscious material than spontaneous art when used with depressed patients” (p. 371).
The final part of the book highlights "Art Therapy Training." In her introduction Wadeson says, "... training both develops new opportunities and seeks to meet their challenges" (p. 376). Training programs are constantly striving to stimulate new thinking as well as to promote and develop new research in art therapy.

Barbara Fish targets the problem of countertransference for the art therapist. She says, "I am writing this chapter with the hope that other art therapists will be encouraged to use their own images to monitor and explore themselves within their therapeutic relationships" (p. 376). Her frank discussion of this issue can be used in training and by practicing art therapists. A combined authorship by Jean Durkin, Dorine Perach, Joanne Ramseyer and Ellen Sontag presents "A Model for Art Therapy Supervision Enhanced Through Art Making and Journal Writing." This chapter reports on a model in which the art therapy intern and the site supervisor share artwork and journals as a method to enhance the therapeutic relationship. Many programs use similar methods to help the student communicate with site and university supervisors; however, this chapter provides specific case studies and artwork to document the development of the process. The final chapter of this section of the book is authored by Harriet Wadeson, and deals with a course focused on the termination process. By the development of parallel objectives the students gain an awareness of the importance of termination with clients while also understanding their own termination issues from the training program. The interns' involvement in the art making and subsequent processing of the experience could encourage new professionals to utilize the process for themselves for self-reflection upon leaving the school environment. This approach could be used in other training programs.

*Advances in Art Therapy* contains information not available from other sources. It is welcomed as a supplement to texts in training programs and by professionals in art therapy and other human services areas. Since the receipt of this book I have recommended it to students as a resource for research and for clinical information. The authors, for the most part, have written little about their work prior to this book; however, their easy-to-read text will be well used in the future as a reference by students and professionals alike. Harriet Wadeson's style shines through the book and she should be encouraged to continue with editing this type book as well as with her own writing.

---

**Gods in Everyman: A New Psychology of Men's Lives and Loves**

*Jean Shinoda Bolen, PhD, Harper & Row, 1989, 336 pages, $18.95 (hardcover).*

**The Many Faces of the Masculine**

During the last three decades the dominant image of the feminine has been reconstructed to reflect a multitude of ways of manifesting the female principle. In contrast, efforts to change the ruling image of the masculine have resulted either in grudging tolerance of those supposedly negative traits associated with the masculine—e.g., objectivity, impersonality, competitiveness, toughness, self-reliance, lack of the more "tender" emotions—or in ready dismissal of those features in favor of the cultivation of characteristically feminine qualities. What has been missing in these efforts is a principle or schema designed to guide development of more acceptable masculine images and/or to revise the meaning of current images. Such a guiding principle is found in Jean Shinoda Bolen's newest book, *Gods in Everyman: A New Psychology of Men's Lives and Loves.*

Well suited to develop such a guideline, Bolen, a clinical professor of psychiatry at the University of California, San Francisco, makes use of her training as a Jungian analyst, arguing that the masculine principle is a multi-dimensional archetype and so cannot be encompassed by any one image. As an archetype—a universal, innate predisposition for being, perceiving, and behaving in certain ways—the masculine principle operates in both men and
women. Though the multi-faceted masculine archetypal predisposes individuals to act and react in generally patterned ways, nevertheless, its particular manifestation or image in a particular person at a particular time varies according to the impact of environmental influences that can suppress, enhance or modify different dimensions of the masculine principle.

In *Gods in Everyman*, Bolen examines some configurations of the masculine principle imaged as Greek gods, specifically Poseidon, Hades, Zeus, and the latter's sons, Apollo, Hermes, Ares, Hephaestus, and Dionysus. By investigating how these gods establish relationships with each other, with goddesses, and with the natural and human environment, Bolen creates for each a gestalt of personality traits. Every gestalt becomes an image of one way a man (or woman) may manifest and develop the multi-faceted masculine principle. And every person is born with the potential for actualizing each one of these gods or personality patterns. However, in a particular individual, any one potential god-pattern (and even some aspects of that pattern) of being masculine may never be developed, may be over-developed, or may be rigidly compartmentalized from every other masculine pattern.

Bolen emphasizes that at birth one archetypal image or god rules or at least predisposes the individual's expression of masculinity. Then (focussing now on males), the boy's private and public environments will help determine whether the actualization of the constitutional pattern will be positive or negative or admit of modification through the cultivation of another masculine image(s). For instance, a child born with Apollo dominant in his psyche will have, among other characteristics, a penchant for logicality, objectivity, clarity, moderation, law, and order. If his environment supports the development of these traits in a positive way, the Apollo male might become, among other possibilities, a renowned lawyer or jurist dedicated to impartiality and the maintenance of viable precedents for social intercourse. If, in contrast, his familial and social contexts promote negative development, the Apollo male, says Bolen, may become emotionally inaccessible and develop a slavish allegiance to outworn principles and traditions, a development that, eventually and paradoxically, creates chaos. Still another possibility is that the Apollo male will allow, albeit with difficulty, some development in himself of a complementary, perhaps opposing masculine image, that of Dionysus with his proclivity for sensate experience in contrast to abstract intellectualizing and for passionate intensity in contrast to measured restraint.

As Bolen presents each of the masculine person-ality gestalts (and the many facets of each), the reader easily develops an awareness of the enormous complexity of the masculine principle. A man (and woman) will have within his psychic potential, for example, Zeus' decisiveness and generativity, Poseidon's fierce, passionate loyalty, Hades' penchant for creating an imaginal inner world, Apollo's goal-seeking and mathematical precision, Hermes' ability to communicate concepts and network with others, Ares' emotional expressiveness, Hephaestus' appreciation of beauty and ability to work with his hands, and Dionysus' love of the natural world and capacity to experiment with the dissolution of forms and boundaries. Bolen also begins to revise some of the masculine images often reviled by the general populace; for instance, she emphasizes that Ares, the God of War, is also a lover and a dancer, using the grace of the latter role to integrate mind and body; moreover, unlike the detached, often aloof Zeus, Ares represents the masculine potential for passionate involvement and risk-taking to defend a principle.

Though Bolen has done a very capable job of providing a schema for envisioning and revisiting and ultimately appreciating a multitude of ways of expressing the masculine archetype, she has difficulty maintaining a compassionate space for Zeus in her pantheon of masculine patterns. She does underline the fact that Zeus-like oversight and definitiveness are necessary to counterbalance, for example, the emotional explosiveness of a Poseidon man; and she does approve of the example of Zeus' fatherly support of at least three of his immortal sons. However, these gestures of appreciation are far overshadowed by her unduly long chronicle of the negative effects of this masculine pattern on both men and women. She also fails to give due weight to the contribution of the feminine to the development and maintenance in men of Zeus-like, patriarchal excesses. In her assessment, women tend to be portrayed merely as victims of male domination who benefit in no self-serving way from such a posture. In short, Bolen tends at times to play down the fact that patriarchy, like matriarchy, is an archetypal predisposition in the human psyche and is to be condemned only in its excesses and refusal to be modified by other archetypal patterns.

Bolen's general bias against Zeus-like abstraction and control comes back to haunt her in her own work: the book's organization, while offering a clear hierarchy of topics and subtopics covering all manner of psychological and social consequences of adopting each pattern, becomes over-schematized and thus tedious. Moreover, the lack of highly detailed human and divine case histories makes the work seem rather "bloodless"; the stories Bolen
Adolescent Art Therapy

Reviewer: Susan Evans Spaniol, MA, ATR, Art Therapist at Fresh Pond Day Treatment Center in Cambridge, Mass., and Doctoral Student in Human Development at Boston University.

NOTE:
This is a second review and should be used as a companion to the first review published in the July 1989 issue.

Adolescence is indeed a challenge. It challenges all youngsters as they experience the onslaught of physical, emotional and social changes that constitute the transit from childhood to adulthood. It also challenges mental health professionals who intervene when vulnerable adolescents become overwhelmed by the turmoil of rapid change. Adolescent Art Therapy by Debra Greenspoon Linesch makes an important contribution to the literature on art therapy because the relatively young field has lacked a comprehensive guide to working with this difficult population. The book identifies the central developmental tasks of adolescence and demonstrates the unique ability of art activity to assist adolescents in meeting and completing those tasks. It begins by providing a theoretical rationale for the unique healing power of art for the adolescent, and proceeds by translating theory into practice, providing relevant case studies and illustrations of over 120 artworks. Clinical populations covered range from severely disturbed adolescents residing in psychiatric hospitals to high-functioning youths seen in outpatient clinics; and treatment applications addressed include individuals, families and groups. This breadth of populations and settings provides the student and professional art therapist with a wide-ranging overview of the use of art in the psychotherapeutic treatment of adolescents. The book may also become a reference for other mental health workers who wish to introduce art into their therapeutic practices, because the author does not presuppose any special training or background in the arts. However, it is precisely this lack of grounding in the fundamentals of art that constitutes the major weakness of this book. By presenting art as an activity requiring no specialized technical knowledge or discipline on the part of practitioner or patient, the book takes the “art” out of art therapy, thereby divesting art therapy of a major source of its potency.

The author bases her procedures and formulations on psychoanalytic principles. Those readers who prefer a more eclectic orientation may become frustrated by the narrow frame of the book. However, the value of this point of view is in providing a unifying theoretical basis for understanding adolescent behavior. Linesch uses psychoanalytic constructs to justify her primary thesis that art activity is egosyntonic with the adolescent’s struggle to establish autonomy from the parents and to create an adaptive identity. Citing analysts Blos and Malmquist, she defines the adolescent’s development of ego strength as a creative process in which self-expression and fantasy foster emotional maturation. Through art activity, the adolescent is enabled to explore her or his feelings, experiment with new behaviors, and experience acceptable and productive gratification of instinctual drives. Emotional maturation is facilitated by this control and transformation of instincts. The process of creating artwork thereby
facilitates the adolescent’s process of creating a new identity and attaining emotional well-being.

Psychoanalytic constructs also inform the discussion of how artwork aids diagnosis. To provide a frame of reference for viewing disorders of adolescence, Linesch defines the characteristic defense mechanisms as responses to two basic conflicts: anxiety related to separation from the parents and/or impulsivity stimulated by unsuccessful separation from them. Given this no-win situation, the adolescent inevitably suffers conflicts that generate the formation of defense mechanisms, which may be adaptive or non-adaptive. The author presents adolescent disorders as maladaptive defenses against developmental or environmental stress. She bases her discussion of these disorders on DSM-III-R diagnostic categories. However, Linesch supplements the limited behavioral descriptions in the diagnostic manual with psychodynamic interpretations of underlying conflicts based on the writings of Malmquist. Furthermore, artwork is selected to illustrate the dynamics of each category, demonstrating how art therapy provides graphic evidence of intrapsychic processes. By viewing artwork as a form of unconscious communication by the patient, the practitioner can use it as a guide for treatment.

The book’s discussion of defense mechanisms and diagnostic categories may seem oversimplified because it is formulaic. Artistic responses are reduced to symptoms in the service of demonstrating the relationship between artwork and psychopathology. Richly complex behavior is defined by a limited number of defensive maneuvers and translated into the DSM-III-R argot that is the currency of health insurance providers. Topical issues of concern, such as physical and sexual abuse, sexuality, drug use and trauma, are not addressed directly—perhaps because they do not fit within the classically defined categories of disorders. However, these very sensitive and serious areas of concern often represent the basis for referral and cause of emotional turmoil for many troubled adolescents. A discussion of the use of art therapy in directly addressing such issues would have been welcomed by those who deal with youth in crises. Despite its simplification and omissions, this particular section of the book makes a useful contribution towards professionalism in the field. It provides art therapists with a basic clinical framework for understanding the process of adolescent art therapy and a professional vocabulary for describing its products.

Across the country, art therapists are struggling to attain licensure and the professional recognition that accompanies the credential. However, attainment of these goals may be hampered by the inherent paradox between the modality of art, which is often seen as intuitive and synthetic, and the field of therapy, which is frequently viewed as diagnostic and analytical. Our culture still retains romantic notions about the arts and artists as inviolate and beyond the reach of objective scrutiny, classification and judgment. Some art therapists may be reluctant to use the diagnostic labels of psychological assessment, or to take the scientific stance of clinical psychology, or to adopt the techniques of dynamically oriented psychotherapy. Adolescent Art Therapy, with its clear description of how adolescent artwork can aid diagnosis, can contribute to the art therapist’s pursuit of professional status.

Having established the psychoanalytic and developmental parameters of her approach to art therapy, Linesch describes the nature of the therapeutic alliance with the adolescent and the special role art can play in the treatment process. In this discussion, Linesch reveals herself to be a sensitive clinician. Her general guidelines begin with a description of the formation of the transference relationship as a means of creating a therapeutic alliance. Based on the adolescent’s task of separating from early object relations, the author portrays the delicate balance that must be maintained between limiting replays of earlier relationships while encouraging re-creations of the present parental relationship. Too old for the fantasy of play therapy and too young for unpremeditated free association, the adolescent can express her or himself spontaneously with the art media while maintaining a sense of control over the process and product. Other clinical guidelines for adolescent art therapy include the use of directives to guide the treatment process, the utilization of art review, the role of imagery journals, and a description of how various art media can be used to influence expression. These topics are supported by illustrated case reviews, which include descriptions of art therapy tasks that can easily be adapted or adapted by other art therapists.

Perhaps one of the most valuable guidelines of Linesch’s approaches to practice is her explanation of the crucial role of metaphor in adolescent art therapy. She introduces it in her discussion of interpretation, and develops it in a chapter on the adjunctive role of the art therapist within the treatment team. Metaphor is presented as an indirect means of “making the unconscious conscious.” Visual metaphors are rich conveyors of meaning, frequently communicating more than could be said in words—especially by the typical adolescent who is often reluctant or unable to express her or himself verbally. Less threatening than direct verbal interpretation, metaphorical communication respects the self-protective defenses of the adolescent while encouraging her or his self-expression. The author instructs
the art therapist to remain with the adolescent’s metaphor, responding with empathy to her or his manifest content rather than interpreting latent meaning.

Working within the metaphor helps define the parameters of the art therapist’s role as a treatment team member. Straddling various disciplines (psychotherapy, education, and rehabilitation) often produces a diffuse sense of professional identity for the art therapist, and a feeling of confusion or even conflict with the rest of the staff. Linesch distinguishes between the art therapist as adjunctive therapist, and the social worker or psychologist who serves as primary therapist. Although both stimulate and deal with transference issues, the art therapist is urged to respond with empathy to the “here and now” meaning of the visual symbols supplied by the patient. In contrast, the primary therapist on the treatment team generally uses interpretations to respond to verbal communications related to past life events and family relationships. In effect, the adjunctive art therapist brings about insightless change, while the primary therapist facilitates growth based on insight. This clarification of boundaries, which places the art therapist in a complementary (but not subsidiary) role in relationship to the primary therapist, helps minimize conflict within the team and maximize treatment of the adolescent.

One of the strengths of Linesch’s book is its explanation of how creative artistic expression aids adolescent mental health and emotional maturation. In light of this correlation, it is distressing that fifty of the 120 illustrations of adolescent artwork in the book contain no original imagery whatsoever. Rather, they are collages composed of pictures cut from periodicals and accompanied by written words. Magazine pictures can provide a non-threatening transition towards more direct interaction with art media. However, Linesch’s heavy reliance on second-hand images and verbal phrases seems to represent a crutch, not a bridge.

The lack of emphasis on creative art activity stimulates the crucial issue of the role of art in art therapy. Art therapy approaches may be identified as ranging along a broad continuum from art as therapy, which emphasizes the product and employs procedures of art education, to arts psychotherapy, which values the process above all and is modelled after psychoanalytic practice. Most art therapists today seek to move flexibly between these two poles, adapting their methods to the particular needs of their clients. Adolescent Art Therapy excels in its presentation of the psychodynamic approach to treatment, deftly communicating the attitude, values and behavior that characterize the clinical role. However, it is quite weak in describing how the creative act itself may promote healing.

Art is a process of giving form to feeling. Artistic production is therapeutic in a broad sense because it can force the creator to impose conscious order on the chaotic contents of the unconscious. Emotional development may accompany artistic achievement because the artist’s deliberate struggle to manipulate and control the media may parallel intrapsychic struggles to gain control over conflicting impulses. To fail to encourage the adolescent to explore and master the art media, as Linesch does, is to deprive her or him of an opportunity to express conflict and master anxieties.

Adolescent Art Therapy by Linesch is recommended for those art therapists who have mastered the fundamentals of the artistic process, yet wish to enhance their clinical skills and professional stature. It provides a basic understanding of adolescence as a developmental stage on the way to maturity, and aids the art therapist in using art to assess the conflicts blocking that development. It also provides a sensitive guide to the development and maintenance of the therapeutic relationship based on a psychodynamic model. The book is not enthusiastically recommended for clinicians in other fields who lack knowledge of art materials and their use because it could encourage a superficial use of imagery that fails to engage the adolescent in an interaction with art materials leading to an integration of personality.

### Guidelines for Authors

Please submit four (4) copies of manuscripts to: Art Therapy
Editor Gary Barlow, Ed, ATR, Wright State University, Creative Arts Center, 228 Creative Arts Center, Dayton, OH 45435. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

**FORM:** Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

**COVER PAGE:** A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

**ABSTRACT:** An abstract of 100-125 words outlining the main ideas of the paper is required.

**SECTION HEADINGS:** The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

**FIGURES:** For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

**REFERENCES:** References must be typed, double-spaced, in alphabetical order, on a separate sheet.

**CONFIDENTIALITY:** Client Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.

124 ART THERAPY, November 1989
THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3000 professionals and students. It is governed and directed by a nine-member Board selected by the membership. The AATA has established standards for art therapy education, registration and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:
• The progressive development of the therapeutic use of art.
• The advancement of standards of practice, ethical standards, education and research.
• The provision of professional communication and exchange with colleagues.
• The provision of legislative efforts to promote and improve the status of professional practice.
• The promotion of the field of art therapy through the dissemination of public information.

Chapters:
Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive:
Publications
• Art Therapy, the official journal of the AATA.
• The quarterly AATA Newsletter.
• Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
• Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
• Mailings of professional interest.

Services
• Insurance, including professional liability, major medical, life and disability.
• Access to national experts in art therapy.

AATA Conferences
• Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
• Governmental affairs activities including Congressional review and monitoring.
• State legislative and regulatory activities.
• Promotion of recognition and reimbursement of art therapists by third-party payers.
• National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards
• Development of model job and licensure laws.
• Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy.
• Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATION

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY. Please follow the chart below when submitting membership application.

Applications received before
Jan. 1st and May 31st — Full dues payment; Membership will expire Dec. 31st of same year.
June 1st and Sept. 30th — Half year dues plus $5.00 payment; membership will expire Dec. 31st of same year.
Oct. 1st and Dec. 31st — Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.

3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.

4. AATA Membership and AATA Registration (ATR) each have a separate application procedure. Registration is bestowed only by the Standards Committee.

5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL — by application only; such members may vote, hold office and serve on committees.
• Credentialled Professional Member: Individuals who have been duly approved for Professional Membership and Registration (ATR) by the AATA, dues are $80 per year.
• Active Professional Member: Individuals who have completed professional training in art therapy, dues are $75 per year.

CONTRIBUTING — Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE — Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT — Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.

The interdisciplinary journal devoted to the creative arts as healing arts.

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Assistant Clinical Professor, Department of Psychiatry,
Yale University; Clinical Psychologist, Veterans
Administration Medical Center, West Spring Street,
West Haven, CT 06515, USA

Dedicated to scholarship in the creative arts therapies,
THE ARTS IN PSYCHOTHERAPY presents innovative
research in artistic inquiry and expression, and its
use in the treatment of mental disorders.
THE ARTS IN PSYCHOTHERAPY is a quarterly,
international journal for professionals in the fields
of mental health and education. The journal
publishes articles (including illustrations) by art,
dance/movement, music, poetry and drama
psychotherapists, as well as psychiatrists and
psychologists, that reflect the theory and practice of
these disciplines. There are no restrictions on
philosophical orientation or application.

About Our Cover

Painting by an adult, schizophrenic male at a Mental Health Center in Southwestern, Ohio.

STATEMENT OF PURPOSE

ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.
The variety of articles in this issue should appeal to all of our readers. From Edvard Munch, to working with a learning disabled child, to sexual trauma in the art of bullimics, to a tool for developing verbal skills—these interesting and informative articles are presented by authors Helen Landgarten, HLM, ATR, Edith De Chiara PhD, Sandra Ticen, ATR and Lucy Andrus, ATR.

Additionally, we are presenting our annual feature—the overview of the A.A.T.A. national conference (our 20th annual meeting). This feature has been included in Art Therapy for the past few years to help the reader who did not attend the national meeting to become familiar with the various presentations (such as papers, panels and workshops) and also to offer this feature for those who wish to obtain additional information relative to a topic or area that was shared with conference participants. Please take advantage of this service—that is, if you would like to have additional information, please communicate with the presenter.

I am pleased to add my “congratulations” to the recipients of the awards bestowed by the American Art Therapy Association at the California conference. The Honorary Life Member designation was awarded to Felice W. Cohen, ATR, one of the founding members and former president of our professional association. She is indeed worthy of this honor, and joins the ranks of the distinguished members who have previously been awarded the HLM. The Distinguished Service Award was presented to Suzanne Canner Hume, ATR, for her comprehensive work in the A.A.T.A.—particularly as member and chairperson of the Education and Training Board. Both Felice Cohen and Suzanne Canner Hume represent the American Art Therapy Association with dignity and professionalism. Congratulations to each of you!

“The Childhood Origins of Natural Writing” is a chapter in an interesting and informative book by Gabriele Lusser Rico1 and within this chapter is a section titled “Wonder and Storying.” In discussing “wonder” and the relaxed attitude and receptivity that are basic requirements that support the sense of wonder, plus intuitiveness, openness and participation, the author states that we all have these qualities in childhood and need [must] recapture them in our adulthood. “Children make sense of their world by wondering” says Rico, “and as a result create their own realities in answer to that wonder” (p. 51). The Russian linguistic scholar Komel Chukovsky writes that the child from two to five is the most inquisitive creature on earth in the service of comprehending its world... He cites an example of five year old Volik:

After swallowing each bit, Volik would stop and listen to what was happening inside of him. Then he would smile gaily and say: “It just ran down the little ladder to the stomach.” ”What do you mean—down the little ladder?” “I have a little ladder there and he pointed from the neck to the stomach; every thing I eat runs down this ladder and then there are other little ladders in my arms and legs... all over what I eat runs down little ladders to my body.” “Did someone tell you all this?” ”No, I saw it myself.” ”Where?” ”Oh, when I was in your tummy, I saw the kind of ladders you had there and that means that I, too, have the same kind.” (Rico, p. 51).

Wondering leads to storying, and storying leads to additional creative development during the formative stages. “As soon as children learn to talk, words and ideas tumble forth in an uninhibited flow, limited only by the boundaries of their vocabulary. Storying expresses an innate human need to make mental connections, to perceive patterns, to create relationships among people, things, feelings, and events—and to express these perceived connections to others.” (Rico, p. 51)

Writing is like that. We make connections, perceive patterns and create relationships. We observe events, experience feelings, express our uniqueness, and communicate to ourselves and with others. Is there something—some advice—that both “seasoned” and beginning authors can glean from these thoughts? I suppose it is this: Dare to wonder... to “story”... to make the connections... to identify the feelings... to share the uniqueness... and, finally... to write!

Gary C. Barlow, EdD, ATR
Editor, Art Therapy

CLARIFICATION

Maxine Junge, MSW, LCSW, ATR, Chair and
Associate Professor
Department of Marital and Family Therapy (Clinical
Art Therapy)
Loyola Marymount University
Los Angeles, California

Harriet Wadeson’s article “Art Therapy Education at the
Crossroads” in the November 1989 journal described the
art therapy/marriage, family, child therapy licensing issues
in California. It erroneously stated that our program at
Loyola Marymount University had recently changed its
curriculum to meet these requirements and implied that in
so doing, it may have lost a significant portion of its art/art
therapy emphasis.

First: since 1979, our curriculum has continuously met
the educational requirements for MFCT licensing in Cali-
ifornia; it continues to do so today. Second: rather than
de-emphasizing art therapy as a result, our program pro-
vides an integrated perspective which is based in art ther-
apy theory and practice in all its aspects. We do not typi-
cally separate out clinical and art therapy courses, but
rather integrate them as for example, “Family Art Psycho-
therapy,” and “Child Development/Art Psychotherapy:
Theory and Practice.” Actually, rather than less, our pro-
gram has more art in it than previously. We have always
been and remain committed to a clinical art therapy pro-
gram which trains art psychotherapists. We have been
“Approved” by AATA since 1979. In May of 1989, our de-
gree title was changed to Marital and Family Therapy to
reflect our systems approach.

In my own opinion, there is a false dichotomy and a
wrong-headed scarcity model in our continuing discussion
of art versus therapy suggesting that as you have more of
one you have less of the other. Art therapy education has
been enriched by a diversity of perspectives. But while we
may be different kinds of animals we are all in the same
forest. Perhaps dialogue from our communal vision and
toward synthesis and integration would provide interest-
ing conversation for us all.

Response: Harriett Wadeson, PhD, ATR

Maxine Junge is correct in stating that I erroneously re-
ported that Loyola Marymount changed its art therapy
course offerings to meet MFCT licensing requirements.
Several years ago, changes were made to meet the Ameri-
can Association of Marriage and Family Therapists guide-
lines. The point remains the same however; training pro-
grams are being influenced by credentialing bodies
outside of art therapy.
AATA Conference Overview

"Painting Portraits: Families, Groups & Systems" was the theme of the 20th Annual Conference of the American Art Therapy Association. This meeting was held in San Francisco, California, from November 16-20, 1989, at the spacious and impressive San Francisco Marriott Hotel. As always, the series of meetings and presentations proved to be professionally relevant, stimulating and "re-charging," and once again, it was good to greet old friends and to meet new ones.

A hearty "thank you" must be given to the Conference Chair, Linda Gantt and to the Program Chair, Randy Vick as well as to Mary Lou Hanzlik, Program Co-Chair and Patricia Gould, the Pre-Conference Course Chair. They—and their committees, listed below—did a superb job in pulling everything together by devoting much time and energy to the gigantic task of organizing a national conference.

As in the past, the tradition of presenting a post-conference overview in Art Therapy is continued in this issue. On the following pages is a listing of the papers, symposia, panels and the many other highlights of the conference. This information is offered so that readers and members who can not attend the California meeting could communicate with the presenter(s) for additional information desired on a particular topic or research interest. Please refer to your AATA Membership Directory for addresses, or write to the AATA Office if additional information is needed. Specific categories (such as "Panels") have been grouped together for the reader's convenience. The basic information listed here was taken directly from the Conference Program, and pertinent corrections were made as they became available. If other corrections are necessary and are brought to the Editor's attention, this information will be made available in the next issue of Art Therapy.

OPENING CEREMONY

CAY DRACHTNIK, MA, MFCC, ATR, President, AATA
RANDY VICK, MS, ATR, Conference Program, Chair

PRE-CONFERENCE COURSES

1. The Ulman Personality Assessment Procedure
   GLADYS AGELL, ATR, HLM
   ELINOR ULMAN, ATR, HLM, DAT

2. Getting a Better Picture—Family Systems
   Therapy Using Family Snapshots and Albums
   JUDY WEISER, MSeD, ATR, RCAT

3. Dinosaurs and Dragons—Insight Oriented Art
   Therapy with a Pre-School Psychiatric
   Population
   BETH YOUNG, MS, MPS, ATR

4. The Diagnostic Drawing Series: Its Use in
   Clinical Practice
   BARRY M. COHEN, MA, ATR
   ANNE MILLS, BA, DipAT
   CAROL THAYER COX, MA, ATR
   JEANNE N. CREEKMORE, MA
   CYNTHIA LEAVITT, PhD, ATR
   YURIKO YAMASHITA, MA

5. Integrating Into Their Past and Present
   “Families” Art Therapy with Older Adults
   JULES WEISS, MA, ATR

6. Three Instruments for Assessing the Emotional
   or Cogn:itive Content of Drawings
   RAWLEY SILVER, EdD, ATR, HLM

7. Creative Art Therapy Treatment Approaches for
   Child Sexual Abuse: The Three Stages of
   Pre-Disclosure, Diagnosis and Treatment
   MICHELLE MCLEAN, MA
   LESLIE P. KNOWLES, MA, ATR

8. Techniques of Supervision in Art Therapy
   LAURIE WILSON, PhD, ATR

9. Art Therapy with Group
   DEBRA LINESCH, MA, ATR

10. Clinical Art Therapy with Addictive Populations:
    Applications of the Systems Model
    DIANE KRIEGMAN MCELLIGOT, MA, ATR
    KATHERYN A. WEBB, MA, MFCC, ATR

SPECIAL PROGRAMS/EVENTS

1. Opening and Closing Receptions
2. Assembly of Chapter Affiliates
3. Networking Lunch
4. Notre Dame Special Event/Ralston Mansion Tour,
   Exhibit and Reception
5. Art Exhibits
6. Exercise Program—A Picture of Health
7. Art Therapy Educators’ Convocation
8. Open Art Studio
9. Annual Business Meeting
10. Slides by Art Therapists
11. Hospitality Booths
12. Circle Gallery Reception/Frank Lloyd Wright
    Architecture

EXHIBITING COMPANIES
AND SCHOOLS

Companies:
1. Amaco/Brent, Indianapolis, IN
2. Bookpeople (Wingbow Press), Berkeley, CA
3. Dean L. Frantz, Fort Wayne, IN
4. Nasco West, Modesto, CA
5. Scott Ceramic Products, Inc., Portland, OR
6. Stern’s Book Service, Chicago, IL
7. Texas Art Supply, Houston, TX
8. Therapy Puppets, Berkeley, CA
9. Royal Arts and Crafts, Atlanta, GA
10. Playrooms, Petaluma, GA
11. Sandplay, Etc., Los Altos, CA

Schools, Programs, Departments:
1. California College of Arts and Crafts, Oakland, CA
2. California Department of Mental Health, Sacramento, CA
3. Co'ege of Notre Dame, Belmont, CA
4. University of Louisville, Louisville, KY
5. George Washington University, Washington, DC
6. Loyola Marymount, Los Angeles, CA
7. Phototherapy, Vancouver, BC  
8. Pratt Institute, Brooklyn, NY  
9. School of the Art Institute, Chicago, IL  
10. The Northwest Institute for the Creative Arts, Eugene, OR  
11. Ursuline College, Pepper Pike, OH  
12. Vermont College of Norwich University, Montpelier, VT  
13. Wright State University, Dayton, OH

GENERAL SESSIONS

1. “Are There Differences?”
   CAY DRACHNIK, AATA, President
   EDWARD STYGAR, Jr., AATA Executive Director

2. “Painting Family Portraits: Four Perspectives on Family Art Therapy”
   RANDY M. VICK, MS, ATR
   SHIRLEY RILEY, MA, ATR, MFCC
   DORIS ARRINGTON, EdD, ATR
   ARI FLEMING, MA, ATR
   BARBARA SOBOL, MA, ATR

3. “Avoiding Malpractice”
   NANCY KNAPP, MA, ATR
   CAY DRACHNIK, MA, ATR

KEYNOTE ADDRESS

“Young and Adult Children ‘Changing Family Legacy’”
CLAUDIA BLACK, MSW, PhD

SYMPOSIUMS

1. Screening for Children at Risk
   A. Screening for Depression Through the Draw-A-Story Task
      RAWLEY SILVER, EdD, ATR, HLM
   B. Identifying Students at Risk Through Artwork in a Public School
      DEBORAH F. DEBEVEC, MAT
      WINNIE J. FERGUSON, PhD, ATR

2. Painting Portraits: Fathers and Daughters
   A. Painting Portraits: Fathers and Daughters
      HAINIE CROWN, MA, ATR

B. Portrait of the Artist as an Elderly Gentleman: A Case Retrospective
   WENDY MAIORANA, MA

3. Perspectives on the Profession of Art Therapy
   A. Changing Systems: The Mental Health Providers’ World in the 1990’s
      SHIRLEY RILEY, MA, ATR, MFCC
   B. Freud as Metaphor: Ambivalence and Integration in the Art Therapy Profession
      LYNN KAPITAN, MPS, ATR

4. Art Therapy in Groups
   A. Portrait of a Difficult Art Psychotherapy Group: Effective Intervention and Strategies
      PATRICIA D. ISIS, Med, ATR
   B. Behind the Mask: Exploring Roles and Defenses in Groups and Family Systems
      KATHRYN A. WEBB, MA, ATR, MFCC

5. Art Therapy and the Dementias
   A. The Use of Art Therapy with Alzheimer’s Disease Patients
      ANNETTE SHORE, MA, ATR
   B. Beyond the Patient to the Person: Promoting Autonomy in Individuals with Dementia
      JANE E. HARLAN, MA

6. Art Therapy and Three-Dimensional Materials
   A. Why Joni Can’t Sculpt . . .
      MARI A MIRON, MCA T
      RONALD E. HAYS, MS, ATR
   B. Clay as a Way to Integration in Art Therapy with Children
      JUDITH DUBOFF, MA, ATR

7. Art Therapy and Community Bereavement
   A. A Precious Loss: Community Bereavement Following the Carrollton, Kentucky Church Bus Tragedy
      LINDA A. PROBUS, MA
   B. Grief Time: A Change of Destiny, A Children’s Play
      BARBARA BETKER M CINTYRE, PhD, ATR
      JULIE NUTTER, RMT-BC
      JULIE ADAMS

8. Women’s Issues
   A. Pregnancy and the Art Therapist: Clinical Issues
      AUDREY ELKINSON-GRIFF, MA, ATR
   B. Uses of Art Psychotherapy in the Treatment of Unconscious Conflicts in Women
      MARY DOUGHERTY, MFA, MAAT, ATR
9. The Circle of Abuse
   A. The Child Molester as Victim: Treatment Through
      the Use of Art Therapy
      SHERRY KREITMAN-DANSKY, MAT, ATR

10. Portraits of Teamwork
    A. Portrait of Teamwork: Art Therapy in the Acute
       Care Oncology Setting
       ANN BUSSARD, MA, ATR, MFCC
       PENELLOPE PECK, RN
       LAURA EATON, BA
    B. Family Ties: Integrating Creative Arts and
       Recreational Therapists Under One Roof
       STEWART A. AULT, MFA, MA, ATR

11. Art Therapy in Groups
    A. Latency-Age Group Art Therapy and the Family
       System
       BARBARA MESCHER, MA
    B. Using a Multi-Family Art Therapy Group to Engage
       Families in Treatment
       TERRY DOYLE, MA, ATR
       TERESA HOLTGRAVES, MA, ATR

PAPERS
1. Family Systems Therapy Using Family
   Snapshots and Albums
   JUDY WEISER, MSed, ATR, RCAT, RSW

2. Sandplay and Inner Work
   TERRI L. SWEIG, MA, ATR

3. Art Therapy and Second-Order Cybernetics:

Edvard Munch: An Art Therapist Viewpoint

Helen Landgarten, HLM, ATR

Abstract

Edvard Munch is introduced with a brief look at his family—their tragedies, focus and behaviors. His writing and painting and drawing served as a therapeutic expression in his teen years, with themes occurring as polarizations of conflicts. After hospitalization from work and alcohol, Munch’s art returned to the man-woman theme. The author discusses dual painting techniques (clues to inner conflicts) and psychological clues (relative to the House, Tree, Person Projective Test). The author poses the question “What would I have done if I had the opportunity to treat Edvard Munch through the art psychotherapy at the time of his psychiatric hospitalization in 1908?” and proceeds to discuss her art psychotherapy treatment plan.

Introduction

Edvard Munch, the most illustrious Norwegian artist, was born in 1863. A developmental history reveals a childhood filled with horrendous traumas. When Munch was merely five his mother died of tuberculosis. A few years later that same disease killed his fourteen-year-old sister. Yet additional tragedies followed shortly afterwards when a younger sister was found to be severely disturbed and his brother died. In his youth Munch’s own health was poor due to tuberculosis.

The artist’s father, a military physician, was fanatically religious. The man was plagued with the fear of fire and brimstone and believed it was absolutely necessary to raise his children with strong disciplinarian actions. He frequently punished them physically as well as psychologically through his constant threats of eternal damnation. In spite of his value system, Dr. Munch agreed to let his son Edvard attend an art school where the boy’s exceptional talent was soon discovered.

At the age of seventeen, Munch recorded his need for self expression through the creative process, acknowledging the catharsis which it provided him. After an argument with his father he wrote, “I went home to reconcile myself with my father, but he had already gone to his bedroom. Quietly I opened the door and saw my father kneeling by his bedside praying. I had never seen that before. I closed the door and went to my room. I was restless, unable to go to sleep. At last I fetched my drawing board and began to draw. I drew my father, kneeling by the bed, the light on the table throwing a faint, yellow glow over his nightshirt. I got out my paintbox and put in some color. At last I succeeded and lay down, comforted, falling asleep quickly.”

Aside from the art school Munch was essentially self-taught. He began to exhibit at the age twenty.

The most prevalent themes in Munch’s art portrayed his polarized conflicts: love and hate; good and evil; rage and peace; life and death. He dealt directly with man’s primary emotions perceiving sex as the essential driving force. Munch viewed love as a demonic element which lent itself to the inflictions of pain, abandonment, despair, and loneliness. The artist relentlessly believed himself to be both the perpetrator and the victim of passion, sin, and destruction. He vigorously grappled with his life in the past, present, and future and hereafter.

By 1904, the European art world recognized Munch as an eminent “Independent.” He was an artist who did not follow the tenets of any group style. Nevertheless, it is important to note that he bore a tremendous influence on the German impressionists; current critics have acclaimed him as the Father of German Expressionism.

Between 1892 and 1909 Munch had an overwhelmingly creative drive. During that seventeen-year period he exhibited in 106 shows. The overload of work plus his alcohol abuse were main contributing factors to Munch’s psychological breakdown. He placed himself in a Danish psychiatric sanitarium in 1909 where he stayed for a period of eight months.

After the hospitalization, Munch’s art returned to the man-woman theme. However, there was a major change in the emotional tone of this same subject matter. It was evident that his personal erotic torment and suffering was abandoned, as he turned to primeval times when the idyllic link between the sexes was continuous and everlasting.

As time went on, Munch had greater difficulty in parting with his art. He called his work his children and his friends. When he was convinced to sell his art he experienced the separation as such a void that he

“... Munch recorded his need for self expression through the creative process, acknowledging the catharsis which it provided him.”
compulsively filled it by creating a duplicate piece of work to take its place.

Munch’s long career brought him numerous outstanding accolades. Many honors were bestowed upon him in his native land and abroad. He was a functioning artist right up to the end of his life and died at the age of eighty in 1940.

**Dual Painting Techniques: Clues to Inner Conflicts**

Edvard Munch revealed his inner oppositional conflicts in a number of ways. The first to be explored herein is his two diverse styles of painting. To illustrate this premise, I shall contrast *The Scream* (see Figure 1) and *The Drinking Bout* (Figure 2). In examining *The Scream* one sees it as a powerful work which contains a single undulating figure with a skull face and a mouth that is wide open as it shrieks out in horror. One can experience the speed of the person running down a bridge since it is accentuated by an exaggerated perspective that runs off to the bottom of the picture, and in one’s mind’s eye, continues beyond, thrusting itself onto the viewer. Additional force is fostered upon us, through the vibrating bands of color depicting the sky and waters. The entire painting with its imposing lined quality conveys a symphony of agonizing sound.

I find several features in this work similar to the art of psychotic persons; that is, the lack of negative space and the common skull-faced symbol. However, the major difference is in the use of color. The de-

---
compensated individual tends to paint in primary colors whereas The Scream exhibits an exquisite intellectual use of the secondary process and colors possibly to prevent visual overload.

The style of The Scream painting is in contrast to The Drinking Bout which contains a group of men seated at a table drinking liquor. The major focus is on a red-faced man whose posture is rigid, seemingly in an attempt to control himself. This particular work of art may have served as a means of sublimation or a compensatory device since Munch, himself, had once killed a man while in a drunken brawl. The Drinking Bout contains a very different painting technique than The Scream, since it is composed of very broad flat brush strokes. Importance is given to the negative spaces that serve as showcases for the positive images and are beautifully articulated shapes in their own right.

Psychological Clues: House, Tree, Person Projective Test

Aside from viewing the duality in painting techniques, there are additional psychological clues that may be obtained from Munch’s art. There is a well-researched and validated projective test known as the HOUSE, TREE, PERSON, referred to as the H.T.P. It is a test which requires the subject to draw each of the three symbols. These particular images provide a deeper understanding of the person’s underlying dynamic and is a valuable tool for psychological assessments.

With the H.T.P. in mind, I have examined Munch’s work. Initially I will focus on the house. This object represents one’s family life; for the unmarried adult it refers to the subject’s home life as a child.

Since Munch’s painting titled Virginia Creeper or The Red Vine (see Figure 3) contains all three symbols of house, tree, and person, it will serve as an example of my premise that the H.T.P. projective test offers insightful intrapsychic clues to Edvard Munch.

In the Virginia Creeper canvas there is a house which appears, either on fire or bathed in blood. Either choice depicts destructive life forces. In my experience, I have found that pictures related to this type of painting, are usually done by persons who have had one or several of the following in their developmental history: 1) a seriously ill family member; 2) a family life that was filled with tension, rage and guilt; 3) physical abuse by a parent. In Munch’s case, all three of these clues are true. He had repeated experiences of illness and death among family members. In addition, his father’s physical and psychological methods of punishment must have been accompanied by tension, anger and guilt, in Edward as well as in his sisters and brother. The artist remembering his abused childhood once stated, “Father was almost insane in his violence when he punished me.”

In the picture of Virginia Creeper I also noticed the absence of a door. The door as an object lets people in and out. It represents the artist’s accessibility. This canvas of Munch’s reveals his lack of psychological accessibility. This characteristic is proven by the facts that he was alienated from society and had been unable to establish an intimate relationship. Munch’s doorless house, that is set aflame, is a place where the family is boxed in forever. These findings parallel his developmental history, since family members either

Fig. 3 Virginia Creeper, 1900
died or were psychologically impaired in their early childhood.

*Virginia Creeper* was only the beginning of my search for the "missing door." As I reviewed a number of books and catalogs I saw this phenomena repeated over and over again. In fact, while over a hundred pictures and slides were reviewed by this author, only five had doors, and a few more that may have indicated doorways, were in fact too vague to be identifiable as a door per se. (Refer to pictorial references.)

The second object in the H.T.P. projective test is the *tree*. A great many trees are seen in Munch's painting and prints. At times he intentionally used them to depict anthropomorphistic or personal messages. While other times it was included in the landscape as the subject matter for composition purposes.

In the H.T.P. projective test, the *tree* is a metaphor for the artist's emotional experiences and development. That is, the creator's psychological life history. The trunk stands for self-concept and ego-strength with the extremities as indicators of one's relationship with the environment. Traumas are depicted through scars or knotholes on the trunk and broken or cut limbs and branches.

The tree trunk's knotholes often offer information regarding the particular year when difficult life events occurred. This assumption has frequently been validated by myself during the twenty-two years of my clinic practice. A formula which exists claims the length of the tree trunk is equivalent to the subject's current age. The traumatic experiences are dated by the placement of the hole in the tree trunk. Figuring from the bottom, up, if a hole is shown half way up the trunk it would indicate trauma half way through the individual's life; a hole three-quarters up would display trauma at an age which is seventy-five percent of the subject's current age, and et cetera.

I believe it is necessary to note that tree drawings may be depicted differently at different times, since it reflects the artist's empathic identification to the psychological environment portrayed at a particular time.

Returning to *Virginia Creeper*, the emphasis is now on the *tree*. Considering the cut off limb near the bottom left of the trunk, the trauma in this case would be placed at the approximate age of five. The time of Edvard's mother's death. The top part of the trunk indicates a split, which may represent Munch's inner conflicts. This particular symbol had been repeated by this artist a great many times. In addition, the barrenness of the tree symbolizes isolation and emptiness in the area of relationships. Another tree picture is *Murder in the Avenue* (Figure 4). It reveals a trauma through the scar on the upper part of the trunk. According to the age formula, Munch would be approximately 32; a time that coincides with the death of his brother Andres. Upon investigation, I found this artist's trees as reflective of his traumas and troubled personality in the vast majority of his works.

In the winter of his life when Munch was 77 years old, he produced the *Self Portrait at the Window.* The viewer can see Munch himself, and placed next to him is a window through which a number of snow laden trees are seen. One tree-figure stands out naked and unencumbered. It is thin and barren yet strongly defined. Although the bottom of the trunk is bent indicating difficulties in early childhood, the trunk remains tall and stiff, similar to the self-portrait counterpart.

In the H.T.P. the *person* image portrays the subjects' own body image perception and self-concept. It provides clues to the individual's inner personality.

Karen Machover (1965) found through clinical verification that persons directed to draw a person related "inti

6Hammer 1971
mately to the impulses, anxieties, conflicts and compensations of that individual." She claimed that the drawing analyst "should feel free to interpret directly as aspects which, with striking literalness, often reflect real life problems and behavior of the individual who is drawing."

Although subjects frequently tend to unconsciously reveal their inner self, Munch consciously chose to display his inner thoughts and emotions. Until 1910, he unlayered himself down to the rawest, most vulnerable parts of his being. He transposed the covert into the overt. The viewer does not need an analysis of the hidden meaning behind Munch’s painting, for the meaning is blatantly set forth in his artwork. However, upon reviewing an Edward Munch retrospective show at the Newport Harbor Museum of Art in California (1983), the lack of fingers on the hands of Munch’s figures was discovered. Fascinated by this observation, I reviewed books and catalogs to find only a few pictures out of several hundred contained well-defined fingers on the hands. For example, in the Newport Art Museum catalog titled EDWARD MUNCH EXPRESSIONIST PAINTINGS 1900–1904, there are 33 paintings which depict figures of approximately 80 sets of painted hands yet only one picture displays fingers which are fairly well-defined. In another book, EDWARD MUNCH: SYMBOLS AND IMAGES, published by the National Gallery of Art, Washington, D.C., approximately 190 sets of hand images displayed only five contained well-defined fingers.

Fingers are essential in the experiential pattern of the person, claims Machover, since they are the individual’s contact-points. The mittens type hand and finger, most frequently featured by Munch is identified by Machover as a subject who has “repressed aggression.” Isaac Jolles states that the omission of fin-

[From 1892–1907] the theme of eros, death, anxiety and despair were obsessively repeated.”

Art Psychotherapy Treatment Plan

My final comment deals with the question, “What would I have done if I had the opportunity to treat Edward Munch through the art psychotherapy at the time of his psychiatric hospitalization in 1908?” His case, with the exception of his extraordinary talent, is not so different from patients with whom I have worked. Munch’s work from 1892–1907 contained a great many very large canvases. They are filled with spontaneously applied color. The theme of eros, death, anxiety and despair were obsessively repeated. I believe these factors had some influence on keeping the artist in a heightened emotionally unbalanced state, for Munch’s creativity paid its price through a continued overwhelming confrontation with the self. Viewing one’s ego mirror image can lead to the breakdown of defenses and ego functioning rendering the person too vulnerable to live a reality-oriented, everyday world. Munch’s demons were not exorcised through his art, they served to fan his torment. The artist once stated, "A work of art can arise from man’s inner self. Art is man’s longing for crystallization." However, I believe crystallization is not always a working-through process and in this artist’s case it became a visual and internal form of rumination and kept him in the vice of psychopathology. Therefore, my clinical art therapy treatment plan would have included the following: (1) a distancing means for self-expression; (2) narrowing the focus to reality images; (3) setting limits through the use of space and media.

My treatment plan would have paralleled what actually did happen to Munch when he was hospitalized in 1908–1909. At that time he became a frequent visitor to the zoo. This resulted in his producing a series of animal lithographs, a subject which may be expressive of a person’s primitive inner life; yet it contains a necessary veiled safety factor. For the patient who is in the midst of a break, it is important to diminish the fantasy which exacerbates or amplifies their heightened emotional response. The reality orientation goal was fulfilled through Munch’s interest in making graphic portraits of the nurses, children, friends, and their wives and subsequent themes related to nature. These representational pictures kept the artist focused on an immediate task and aided him in avoiding self exploration.

Prior to the artist’s hospitalization his tortured existence was kept alive not only through the psychological intensity of his subject matter, but also through: (1) his identification and immersion in painting; (2) the openness of the large-sized canvases; and (3) the multiple use of colors. Therefore, as an art psychotherapist, I would have offered the patient symbolic containment where parameters were pulled in and greater control would be required. In addition to the smaller size, containment would also be aided through the limited use of color and hue. For in cases such as Munch’s, the overwhelming visual input serves to

9 Timms, p. 8
floor the patient psychologically. The nature of the print-making media provides the necessity for both structure and control: these two elements were necessary for Munch to function as a person, one who would cease his self-torture and self destruction.

Through the shift in theme, limiting the quantity and hue of the color, changing the media and size of the artwork, I believe that a part of Munch's healing process did lay in the fortunate change from painting to print-making since the graphics required both a reduction in dimensions and color and the discipline of simplification. These factors provided a therapeutic base in the realm of physical and psychological space.

Munch proceeded to work almost exclusively in graphics from the time of his hospitalization at age 35 until his mid-60's when he returned to painting. Although the subjects of his past reappeared on later canvases, they were no longer psychologically destructive for the spontaneity and emotionality were gone. For the artist Edvard Munch, it was fitting, to end his life in the midst of color and limited passion.

Feed me . . . Cleanse me . . . Sexual Trauma Projected in the Art of Bulimics

Sandra Tichen MS, ATR, received her Masters Degree from State University College at Buffalo. She is a registered art psychotherapist in psychiatry and the eating disorder program at Bry-Lin Hospital, Inc. in Buffalo, New York. Ms. Tichen has lectured around the country on the topics of sexual abuse, eating disorders and multiple personality disorder.

Abstract

Very little has been written to address the issue of eating disordered behavior as it may relate to sexual victimization. Eating disorder programs are just beginning to report statistics which shockingly reveal that over 50% of patients have experienced some form of sexual trauma. Bulimic patients who have been sexually abused often speak of an intense desire to wash or purify, even to the extent of eliminating the body. Finding it difficult to control impulses, the bulimic needs a safe, structured place to grieve and recreate her purging metaphor. The art therapy process can provide this while at the same time assisting the patient in the creation of a symbolic meal, leading to restoration of the self.

The statistical data on sexual abuse is frighteningly high and has been well reported in the media and literature. Coping mechanisms are often manifested in maladaptive behaviors such as chemical dependency, sexual dysfunction, withdrawal and silence, self-mutilation, dissociation, suicidal ideation and post traumatic stress symptomology (Johnson, 1987; Spring, 1984; McCarthy, 1986). Very little, however, has been written addressing the issue of eating disordered behavior as it may relate to sexual trauma. In a recent article published in the “International Journal of Eating Disorders,” McFarland, McFarland and Gilchrist report similarities in the psychological processes of post traumatic stress and eating disorders (1988). Both cognitive and affectual disturbances are marked by intrusive thoughts and compulsive behaviors related to eating. The authors postulate that disorders of weight may be triggered by traumatic events since the preoccupation with food is less disturbing than the intrusive thoughts of the trauma, thus giving the victims a sense of control.

Programs across the country which treat eating disordered patients, suffering with anorexia nervosa and bulimia nervosa, are just beginning to report statistics which shockingly reveal that more than 50% have experienced sexual victimization (Wooley, 1987). In Bry-Lin Hospitals’ seven-bed unit, these statistics rang true as patients struggled with the effects of either overt or covert sexual victimization. Although no validation studies have yet been reported, the numbers indicate that sexual traumatization is an issue which must not be overlooked with this population. This is not to say that sexual abuse causes anorexia or bulimia, for, of course, not everyone who has been sexually abused will develop an eating disorder. But, sexual traumatization will certainly affect the treatment approach and outcome. Even with the most careful history taking, the silent patient may not reveal a clue, and, even when the crime is disclosed, she may remain emotionally and verbally paralyzed. Because of what mental health professionals now know about the visual common language of sexually traumatized victims (Figure 1), art therapists can play a valuable role in the assessment phase of hospitalization, providing non-verbal information which may indicate further investigation into the patient’s history.

Geneen Roth, in her book “Feeding the Hungry Heart,” emphasizes the fact that one must first identify what one is hungry for and only then can treatment providers begin to find the appropriate nourishment (1982). The sexually abused patient is going to require a different “menu” than her eating disordered sisters. This becomes the main task of the art therapist, to assist her in preparing, ingesting, digesting and eliminating her own “symbolic meal.”

There has been some speculation that patients who have experienced incestuous victimization at an early age tend to develop the restricting behaviors of anorexia, usually manifesting themselves just before the onset of menses. As one would assume, maturity fears tend to be prominent. Bulimic symptoms most commonly begin to emerge around the age of 18 (Johnson and Connors, 1987), after a significant trauma which may range from familial sepa-

“Both cognitive and affectual disturbances are marked by intrusive thoughts and compulsive behaviors related to eating.”
ration to a life-threatening experience. In the case of rape, the binge-purge cycle seems to become a cleansing ritual which victims speak of as an intense desire to wash and purify even to the extent of eliminating the body, if necessary.

Most of the sexually abused patients with whom I have worked have been difficult to categorize, since many have experienced early incest and were later revictimized by rape and other forms of sexual exploitation. Thus, the eating disorder will often be manifested as a combination of anorexic and bulimic behaviors. There is, however, always an attempt to purge, to spit out, to void. Many patients may have started out restricting and found that thinness does not relieve anxiety, turning instead to binging and purging as a means to control affect and restore internal balance. This too fails, with patients finding themselves more and more out of control while becoming increasingly malnourished. This malnutrition leads to a vicious cycle of depression, mood swings, and increasing withdrawal from the world. Most of the patients studied range in age from late adolescence to late thirties and are in the throes of a post-traumatic syndrome, often experiencing fear of annihilation of the self (Figure 2).

The more traumatized the victim, the more restricted the art will be. With consistent, ongoing abrasive work in art therapy, the imagery will gradually become more fluid, more colorful, more integrated and more dynamic. It is within this desensitization process that the bulimic patient will learn to establish boundaries and retake control of her life. This control is mirrored in her art productions, giving her validation and reinforcement. It is important to note that this attempt to restore inner control is taking place simultaneously with refeeding, behavior modification and psycho-educational processes to assist her in establishing external boundaries as well.

Wooley, in her work with sexually abused bulimics, reports “a progression of responses from blocking and denial, to rage, to shame, and finally to self acceptance” (1986). All this takes place visually and becomes a grieving process on paper and in clay. The bulimic patient, often an abuser of purgatives including laxatives, finds it difficult to control the losses to the self, both control of thought and bodily processes. She needs a safe place to grieve where the maladaptive oral and anal behaviors may be transferred and channeled into productive energy (Figures 3, 4). This sublimation will allow for grief, resolution and mastery of her victimization to evolve. Art therapy creates an adaptive method where the patient can symbolically binge-purge, mess-cleanse, feel-create while the therapist sets the table for self discovery.

I have found that there are few differences in working with the sexually abused anorexic and the sexually abused bulimic. Both are locked into their own obsessive-compulsive

“The more traumatized the victim, the more restricted the art will be.”
prisons, attempting to escape from the intrusiveness of life. However, generally speaking, depending on the severity of traumatization and malnutrition, and the degree of eating disordered entrenchment, the bulimic patient will show more affectual response, take more risks, and usually reach treatment goals more quickly. No effective psychotherapy can be expected to take place if a patient is severely malnourished. Since most bulimic patients are not as nutritionally compromised as the anorexic, cognitive processes are usually clearer, allowing for a faster restorative pattern to occur, both physiologically and psychologically. The criteria for bulimia are briefly reviewed in the following paragraphs, with a look at common symptomology.

Bulimia, or “ox-appetite,” is a private food obsession, often triggered by the drive for thinness and compulsive dieting, which grows into an addiction to control affect and anxiety. It is identified by the consumption of large quantities of food in a short time (usually within two hours) with a progressive feeling of loss of control. This is followed by purges which may include induced vomiting, fasting, laxative abuse, enemas and rigorous exercise. Bulimia nervosa is a life-threatening illness which has become rampant on today’s campuses. Most of the research has focused on the female population. It is now believed, however, that there are large numbers of males who suffer from this illness and clinicians hope the emphasis on bulimia as a “female illness” will be lessened to allow these men to more easily seek treatment. Medical implications can lead to death as electrolyte imbalances, particularly a decrease in potassium, can cause muscle weakness (including the heart) and cramping. Weight fluctuations and compulsive dieting can lead to premorbid obesity as the body’s natural set point weight is forced out of its genetically normal range. There is a decrease in bowel tone, especially if laxatives have become an addiction. Dehydration, swelling of the parotid glands, tooth decay, esophagogastric and gastric ulcers and ruptures are all possible occurrences.

Psychologically, the patient may see herself as the failed anorexic only with a sense of being out of control. She is impulsive with an inability to delay gratification. There is a strict, punishing but ineffective superperego and the patient exhibits a fatalistic outlook on the world. Where there is an overwhelming sense of helplessness, depression and anhedonia, the prognosis becomes poorer. Any type of sensual pleasure is taboo. The fantasy is, “when I am thin, I will be perfect and then I will be happy.” The drive to lose weight is a conscious decision and usually there is a magical weight goal. Often, clinicians have observed the perceptual distortions in body size in the anorexic are not as intense in the bulimic who may describe her body accurately but affectually distorts what she sees. Studies indicate that body dissatisfaction as a generality is greater in the bulimic than in the anorexic (Johnson, Conners, 1987). Obviously, research must be done to understand more clearly the body image disturbances in the bulimic and how sexual abuse will impact on this area. Many persons with bulimia will appear to be at normal weight. Starvation is invisible, but the malnutrition is real. Like the anorexic, the bulimic confuses physical and psychological needs. This is the basis for the symbolic meal research, an holistic approach to heal-

"No effective psychotherapy can be expected to take place if a patient is severely malnourished."
ing. Also, bulimics fear intimacy and revealing the true self. Often lying, stealing and chemical dependency go hand in hand with bulimic behaviors. The presence of a character disorder is not uncommon but must be carefully ruled out since many patients who have been victims of abuse present with post-traumatic stress syndrome. In many, there may be an intense hatred and anger toward men as well as toward the self. As one might expect, this is magnified in the sexually abused patient who is often caught up in the victimization cycle. Male therapists need to be aware of the powerful transference issues when working with this group. Like the anorexic, the bulimic sees the world in black and white. The role of the therapist is to help her see the grays and eventually develop a chromatic world.

It has been documented in most of the literature on eating disorders that these patients have great difficulty identifying and expressing internal feeling states (Garner and Garfinkel, 1985; Johnson and Connors, 1987; Levenkron, 1983; Bruch, 1968). Johnson and Connors (1987), in their comprehensive study on bulimia nervosa, observed from the EDI research that bulimics report more difficulty with interoceptive awareness than restricting anorexics. This is closely aligned with body image disturbance and ineffectiveness. This lack of interoceptive awareness, coupled with the invisible scars of the silent victim, make art therapy even more desirable as a treatment modality with this population. To paraphrase the journal entry of one patient, “It seems that words are inadequate and un usable.” Marian Woodman, in her book “The Owl was a Baker’s Daughter” (1980), reflects on a split between body and spirit, and the need to reconnect these integral parts of the self if healing is to occur. Reflecting on Woodman’s case study of Anne, she writes, “...art becomes a prayer.”

I believe that the creative is deeply rooted within the spirit and, in the work of art therapists, patients are taught to pray, as well as tap into their own God-given abilities to heal themselves from the inside out. Guided imagery, creative visualization, poetry, music, movement, meditation, and storytelling can be transformed by the patient into personal metaphor, which then becomes visual, documented, tangible evidence of the patient’s internal strengths. This reassures her that the creative is not dead but only covered up by the dark, heavy colors which have dominated her vision. Art therapy allows the patient an adaptable method to sublimate and achieve catharsis while providing an extension between self and trauma (Golub, 1985). The patient feasts on media and eliminates that which causes pain through her product, creating a sense of empowerment and perhaps even a little bit of fullness.

Working abreactively with the victim of sexual abuse, the therapist must attempt to regulate the flow of affect if it appears that the imagery may flood the ego, causing the patient to feel more out of control. The bulimic, unlike the anorexic, has very weak ego boundaries. When and what media to offer, when to intervene, when to confront are all issues to which the therapist working abreactively must be sensitive without taking away control or being intrusive. It is often a very slow process. Frequently reminding the

Figs. 5 and 6. These were drawn by a 38-year-old incest survivor suffering from post traumatic stress symptomology. We see the child within. Note the blockage in the throat and chest area (Figure 5).

Fig. 6 She said that this child would scream if she could. It became a symbolic purge (Figure 6).
patient that she is safe and in control, and that the therapist will attempt to help to keep her that way is an important message which gives her permission to vomit out her pain in a symbolic purge (Figures 5, 6). Many times, in an intense abreactive session, the patient will need to wash or brush her teeth. The art therapist assures her that she will offer her whatever support she needs. Ego defenses cannot be stripped away without an adequate replacement. The key to unlocking the healing powers of the creative lies in the use of the patient's own metaphor. The therapist must get ideas and direction from the patient.

It is essential to listen to what is and what is not said. At the end of each individual abreactive session, I have found it useful to allow the patient an opportunity to tap into her spirit and find a peaceful, beautiful, personal image she can then make real. While helping to decrease anxiety and the need for physical purging, it offers her a permanent record of her inward strength and validation that it is still there. Asking her to discover a secret garden, replacing self-hatred with gentle loving eyes from someone in her past, will help her to find personal images she can use outside therapy sessions. These images can be useful as thought-stopping tools when she may become tormented by an intrusive image or is fixated on the need to self-mutilate. One of my patients, a victim of incest, tacked up in the dining room a beautiful mandala of the place she goes when she dissociates. This is an attempt to decrease dissociation when eating, as it decreases tension during meals and helps her to focus, maintaining her nutritional prescription.

One of the most paralyzing effects of sexual abuse is seen in the art projections of the self, revealing intense hatred and body dissatisfaction. Many patients have not looked at their naked bodies in years. The body is seen as disgusting, shameful, and a source of guilt. The binge-purge becomes a dichotomous and maladaptive means to self nurture by stuffing painful feelings, then cleansing themselves of the guilt, shame and anxiety. Wolf, Wilmuth, and Watkins (1986), believe that the more serious the disturbance in self esteem, the more intense the body image distortions will be. As mentioned previously, the distortion in the bulimic may not be related so much to size as to worth. With sexual abuse in the background, body image work must be approached gingerly and sensitively. Through the symbolic meal process, the patient is given the opportunity to self-nurture in a gentle, intellectual, as well as emotional manner. She is given the task to create her own recipe of the self, and in the process learn to explore and eventually accept herself as worthy of attention and symbolic food. The ultimate goal is to help her love herself, for without this ingredient, she will continue to spit out whatever is healthy and life-giving. Collage work with body tracings and placemats to be used in the dining room are just two exercises used in the process of spiritual and emotional nourishing of the self. Group art psychotherapy is held in the dining room, and each member is given a napkin to use for smearing and cleaning. With every opportunity, the patient's own metaphor is utilized to assist her in restructuring cognitive distortions. Exploring the media is exploring the self. The "buffet" of media is spread out so she may easily select or reject whatever ingredients are needed to fill her at that moment. Roth writes that the quality of life is dependent on the ways one nourishes oneself (1982). Exploring the self with the bulimic is remembering that "man does not live by bread alone." As artists, art therapists naturally feast on media, finding release and recreation while processing the pain absorbed in working with this population. Hopefully, both the clinician and the patient will come away from this table a little fuller.

"Art for Special Needs: A Learning Disabled Child in a Special Art Program"

Edith De Chiara, EdD, Associate Professor, Department of Early Childhood and Elementary Education, Herbert H. Lehman College, City University of New York

Abstract

This case study describes the experiences of Peter, a learning disabled child, in a special art program. The objectives of the program were threefold: 1) to improve the body image concept of children with learning disabilities, through art activities which focused on the human figure; 2) to learn more about the learning disabled child's behaviors and skills in an art classroom; 3) to determine what kind of special teaching strategies are necessary for teaching art to this population of learners. Although Peter's response to and progress in the program was erratic at the beginning, his later accomplishments demonstrated that behavioral adjustments and improvement of his body image concept had occurred through his experiences in the art program.

Many learning disabled children are being mainstreamed into regular classes for art. In order to work with these children successfully, it is necessary that art teachers (or classroom teachers) become more familiar with the learning styles and problems experienced by these pupils. However, the learning disabled population is heterogeneous and it is impossible to precisely describe "the" learning disabled child. According to the most common definition, children identified as having learning disabilities are of average intelligence, have intact sensory and emotional functioning, but exhibit a disorder in one or more of the psychological processes involved in learning (Federal Register, 1976).

This article describes one learning disabled child's experience in a special art program which was designed to: 1) improve the body image of learning disabled children through their participation in visual arts activities; 2) to learn more about learning disabled children's behaviors in an art learning situation (e.g., art skills, problem solving competence, capability to remain on task, learning styles and self-discipline); and 3) to determine what kind of special teaching strategies and adaptations are necessary for the teaching of art to this population of learners.

Body image as defined in this program refers to the knowledge and perceptions that a child has about the structure of his/her body — its parts, actions, and its relationship to space. It has been noted that children with learning disabilities may lack the ability to adequately receive and process information from sensory channels. Consequently, they may not have a clear image or knowledge about the appearance (configuration) of their bodies (body image). Thus, the central theme for all the art activities (two- and three-dimensional) focused on the human figure.

Ten children between the ages of 8 and 11 were randomly selected from three self-contained classes for the learning disabled in a public school to participate in the experimental pull-out art program. The group met twice a week for one hour, for ten weeks. The children were tested to determine the status of their concept of the body image by four measures: a human figure drawing test; a manikin assembly task; an imitation of postures task; and a task involving identification of the body parts in response to verbal instructions.

The Special Art Program

The program was comprised of three phases (Uhlin, De Chiara, 1984). Phase one, Body Schema, focused on art activities which directed the children's attention to the body's parts, their functions and actions. Activities were selected which could be completed within one session and did not require pre-planning. All the children were directed to use the same materials and techniques. Limiting options during the first phase was intentional; it allowed time for children to adjust to the new art learning situation. Phase two, Body Image, focused on activities which integrated, synthesized and built on concepts learned during Phase one. The body was viewed holistically. Pre-planning was introduced during this phase, whereas in the initial phase, activities tended to be spontaneous. Some of the activities were extended over several sessions, rather than a single session which characterized Phase one. The children were also given more options in regard to materials. In con-

"... children with learning disabilities may lack the ability to adequately receive and process information from sensory channels."
trast to activities in Phase one, those in Phase two were more open-ended and required greater problem solving abilities. In Phase three, Spatial Awareness, activities were focused on a person's relationship to objects and the environment. Activities during this phase extended over several sessions, were less teacher directed, offered greater options in materials and techniques and encouraged individual and expressive solutions.

Case Study of Peter

Peter, a ten-year old boy, classified as learning disabled, was one of the participants in the art program. The youngest of three children, he lives with his mother and two older brothers. His parents separated when he was four years old. Peter was eight years old when he was placed in a self-contained special education class for the learning disabled. His record describes him as hyperactive, distractible and unable to remain on task for long periods of time; consequently, his concentration skills are described as “poor.” His anecdotal records include repeated comments by his teachers about his disruptive behavior and hyperactivity. Test results disclose that Peter has difficulties in eye-hand coordination, an uneven gait and an immature body image. His receptive language skills are considered poor (e.g., it is necessary to repeat instructions several times before Peter is able to understand what is required of him). The source of his learning difficulties, according to a psychologist’s report, stems from his hyperactivity and perceptual-motor problems, rather than from intellectual limitations. His behavioral disruptions in the classroom are attributed to frustration in attempting to “make sense of and organize” information being presented, rather than being the results of emotional lability. In the area of academic testing, results revealed reversals of some letters in reading. The general prognosis for Peter being able to function and learn in a regular or mainstreamed setting was considered unfavorable.

Phase one, Body Schema—The art activities for the first and second sessions of this phase were figure completion drawings. For these activities the children were provided with drawing paper on which visual clues (magazine images) had been pasted. The children were directed to use colored markers to complete the drawings. For the first assignment they completed a drawing of a person on a paper on which had been pasted a picture of an article of clothing. The second assignment required that they complete a drawing by having a person “relate” to an object. In this instance, the visual clue was a picture of an object such as ball, tennis racket, or baseball bat (Figure 1).

During these highly structured and teacher directed early sessions of the program, Peter was quiet and remained on task. He was overheard telling the children seated at his table that he “loved to draw” and produced several drawings each session. His drawings of the human figure contained a fair degree of differentiation.

Phase two, Body Image—During this phase, the technique of relief (work of art in which forms project from a flat surface) was introduced. The children were instructed to represent the figure of a person “doing something” using found objects (e.g., small boxes, paper tubes, plastic spoons, paper straws) as equivalents for the body parts. Each child was given a cardboard tray and allowed to go to the supply table to select the found objects. Peter’s difficulties began when he was given permission to leave his table; he bolted up from his seat, ran over to the table and “grabbed” supplies. Several minutes later, he returned for different materials complaining that what he had initially selected “didn’t work.” Peter appeared to be having greater difficulty assembling the figure from found objects than drawing it. As he tentatively placed the objects that he had selected for the body parts on the cardboard background, he kept looking at what his friend Edward was doing. Peter finally resolved his problem by copying Edward’s work as closely as he could. He apparently was very dissatisfied with his solution however, for he left the room at the end of the session with an expression of anger. When the group was assembled for the fourth session, Peter ran into the clothing closet in his classroom and refused to come out. He shouted out that he hated the art program and wanted to go to gym instead with the rest of his class. After some persuasion, he con-
sented to leave his hiding place and joined the group.

When the children arrived in the art room, Edward announced that he wanted his construction of a person back so that he could "fix it." Peter then said he also wanted to "fix his person." Edward removed the paper tubes he originally had used for his person's arms and replaced them with popsicle sticks. Peter imitating him, did the same. Once he had substituted the material for the arms, Peter approached his work with noticeable enthusiasm and ability to solve the rest of his construction independently (Figure 2). Apparently, Peter's frustration with his work of the previous session had come about because of his dissatisfaction with some of his choices of equivalents for parts of the body. However, until he saw Edward's solution, he was unable to resolve the problem. (Through study of the children's productions for this activity, it became apparent that the choice of equivalents for body parts was very closely related to the level of body image articulation. Those children with a higher degree of body differentiation sought out materials that closely resembled the body parts, whereas those with a lower degree of articulation were satisfied with a more general equivalent. The availability of structured materials (found objects), unstructured materials (paper, aluminum foil) to form body parts and drawing materials for further delineation, provided for the differences of body image development among the children. Edward then proudly announced that he was going to construct a super hero holding a building in each hand. Peter, in competition then stated that he was going to make an "even stronger super hero" who could hold two buildings in one hand. (Figure 3) After he completed this construction, Peter made a third, this time using both construction and drawing to represent his person's arms (Figure 4). Peter left the art room at the end of these sessions obviously pleased with his accomplishments.

Unfortunately, his positive attitude toward the art program was very short lived. When the children were assembled for the next session, Peter once again stated that he preferred going to gym. He only joined the art group when it was agreed that he could attend art for a half hour and then go to gym.

The art activity for this session was to form a representation of a person using cookie dough as the modeling material; Peter quickly announced that he would stay for the entire art session. Each child was provided with enough dough to complete a small figure. Small candies were made available for the facial features and clothing but the children were instructed to form the figure before adding the candy detail. Before even starting on the formation of his figure, Peter complained that he had not been given a
sufficient amount of cookie dough. He went up to the supply table for more dough and while there filled a plate with candy. As he worked, he nibbled on the candy. His completed form was a large undifferentiated representation of a person with chocolate bits placed indiscriminately over the entire surface (Figure 5). When it was suggested that Peter remove the candy and work on the figure some more, he refused saying, “Can’t you see, I’m finished?”

For the next session, only two children were brought to the art room at one time because of the nature of the activity planned. The first part of the hour was used for the children’s participation in a game called the “movie director-actor” game. In this game, the children took turns being the director and actor. The purpose of the activity was to develop the children’s abilities to give and implement directions pertaining to body positions. In the role of director, the child instructed the actor (the other child) to portray a character by giving explicit directions about the pose that was to be taken. When satisfied with the pose, the director photographed the actor with a Polaroid camera. The children then changed roles.

When the game was explained to Peter he flatly announced that he “only” wanted to be the director. When his turn came to be the actor, he was uncooperative and refused to follow the director’s instructions. His reluctance to be the actor may be attributed to Peter’s language reception difficulties, for the activity required translating verbal instructions into body action. In this instance, his lack of cooperation may be ascribed to the nature of the activity and the children’s need for something more than just following instructions.
“He filled in the outline of the body tracing, painted a shirt and pants and then became involved in adding a belt.”

to his attempt to mask his frustration and fear of failure.

The activities for the next three sessions involved body tracing and painting. Peter was very cooperative when he had to lie down on brown paper to be traced, but lost interest when it was his turn to trace another child. He was very eager to paint and filled his muffin tin up to the brim with poster paints. He filled in the outline of the body tracing, painted a shirt and pants and then became involved in adding a belt. At this point Peter appeared to persevere and not be able to move on. He painted and repainted the same belt until the colors became “muddy” and the image of the belt extended far beyond its original contour. In frustration, Peter dropped his paint brushes on the floor, announced that his painting was a mess and that he was never coming to the art class again. Because several of the children shared Peter’s frustration with facial features, it was decided to postpone completion of the painting activity and introduce a portrait activity with cookie dough as the modeling material. The children were shown art reproductions of modeled portraits and given mirrors to use for reference. Peter was so eager to begin modeling with the cookie dough that he constantly interrupted the introductory discussion. Once the actual work began, however, he took great care in forming the face and modeled, rather than incised (cut into the clay), to indicate features.

At the next session, the children completed the life-sized paintings, cut them out and mounted them on the wall. They then posed next to them and were photographed. Peter was excited about being photographed with his life-sized image as he had successfully resolved the facial features and the belt and had added final details to this painting.

The turning point in Peter’s behavior and the beginning of a more consistent positive attitude occurred half way through the program, at the point when a rod puppet activity was presented. A papier maché technique was introduced for forming a life-size puppet head, with an inflated balloon serving as the basic core for the head. Small lightweight materials were then added to the core for the facial features. The puppet core was then built up with pariscraft (strips of gauze impregnated with plaster which when dipped into water adheres to a core). The puppet was then painted and elaborated with additional objects and the body added (a wood cross bar and rod), draped with cloth or dressed in children’s clothes. Peter began this project with enthusiasm; he promptly selected his materials and began to work. All went smoothly until the point where Peter had difficulty holding some of the found objects in place until he could cover them with pariscraft. His frustration was quickly replaced with anger when he looked down and noticed that he had particles of plaster on his pants.

Peter jumped up and unescorted ran back to his classroom cursing loudly.

I quickly followed him taking the puppet head (which by now had hardened) with me. I showed him how much he had successfully accomplished and how to remove the plaster from his pants with a sponge and water. Peter looked at the puppet head, obviously pleased, but stated that he intended to “quit” the art class anyway. The following day, I went to Peter’s classroom an hour before the session to invite him to come to the art room to do more work on his puppet head. Much to my surprise, he agreed to come.

As Peter worked on the puppet head, he related stories about his family life. He said that his father did not live at home and that he was frequently “hit” by his mother and brothers. He admitted that he had become “really scared of being hit” when the plaster got on his pants. By the time the group assembled for the art class, Peter had completed the preliminary work on his puppet head and was ready to paint. He was particularly pleased because he was “even ahead of some kids.”

Phase three, Spatial Awareness—Peter’s individual session and his success with the puppet experience really impacted on his attitude and behavior in the art class. Now instead of being at the end of the line when the children were escorted to the art room, Peter and Edward would run ahead of the group. Peter’s success with the puppet activity had also built his confidence towards implementing the art activities in Phase three, which were less structured and required more expressive solutions. He was also more able to maintain his focus during the “idea search” component of an art task and problem solve when confronted with technical problems. For example, when given clay to model an upright (free-standing) figure of a person in action, Peter selected to form a baseball player and flattened his clay, pancake-style (Golomb, 1988) to form the figure. Conse-
Fig. 6 Modeled figure of a person in a boat. Materials: self-hardening clay and found objects.

consequently, when he attempted to stand the figure up, it collapsed. This time instead of “giving up,” he requested help. Once given a demonstration as to how to model free-standing figures in clay, Peter began again and successfully formed a baseball player with bat in hand. He worked independently until he experienced difficulty forming a cap for his figure. It was suggested that the cap be formed by modeling it over a bottle cap. Peter was delighted with the results and went on to model a man in a boat (Figure 6). As Peter left the art room, he stated that he would like to be in the art class the following year.

For the next session, colored plasticene was introduced to facilitate the differentiation of the body parts. The task was to model a person involved in an activity using an object. To simulate the objects, candy (lollipops, Easter eggs covered with foil and gold covered chocolate coins) were made available. (This session was our last before the Easter holidays and the same kind of candy was to be distributed at the end of the session.) The children were asked what they thought the candy could represent in their sculptures. Peter contributed many imaginative responses. He stated that he was planning to make a man digging for gold out west and that he was going to use a lollypop for his shovel.

The themes for the last few sessions involved people relating to large objects (e.g., cars) and to the environment. The children were allowed to select the techniques (e.g., drawing, modeling, constructing) and materials they preferred to work with (drawing materials, found materials, clay or colored plasticene). Peter selected clay or plasticene for all the final projects. The subject for one sculpture in clay was a man in a racing car; Peter added plastic checkers for the wheels. When the sculpture dried and the wheels fell off, Peter solved the problem by adhering them with glue. This was in distinct contrast to his behavior earlier in the program, when an occurrence such as this would likely result in destruction of the product or his angry exit from the art room. An example of his being better able to deal with disappointment occurred when one of his clay pieces fell apart upon drying. He picked up the pieces, looked at them and said to the instructor, “Don’t worry, I can make another just like it.”

Another demonstration of the change in Peter’s artistic and emotional behavior was evidenced when the children were involved in activities relating the figure to an environment. The task was to form a person out of colored plasticene and place it on a magazine picture of an environment so that it related to the setting. Peter studied all the available pictures but could not find one to his liking. Again, in contrast to his prior behavior, instead of becoming frustrated and angry, he came up with another solution. He decided to form his own environment with the plasticene (in lieu of the magazine background) and then place a representation of the human figure on it (Figure 7). When the group met for the last time they were told that they would be able to have all their work once it was photographed. During the course of the session, Peter stressed several times that he wanted all his work back so that he could show it to his mother. As the children left the art room for the final time, he turned back and exclaimed, “And don’t forget, I’m coming back next year!”

Conclusion

Peter’s improved representation of the figure over the course of the art
program and his gains on the post-test drawing of a person demonstrated that a program focused on the human figure can improve the body image concept of children. Further, it became apparent that the learning disabled children were a heterogeneous group, each with his/her own learning style, individual needs, strengths and interests which have to be identified and attended to by the teacher if the children are to have a positive art learning experience. Peter, for example, appeared to function best when in a new art learning situation (the earlier stages of the program) he was provided with a definite structure (visual clues or model) and limitations (choice of materials, techniques, movement). Once he comprehended what was required, Peter was able to concentrate and remain on task. Further, given ample structured experiences and some success, Peter became more confident and able to actualize his projects imaginatively. In contrast, when confronted with a state of confusion, frustration tended to escalate to anger and the consequent loss of focus of control within a short space of time. Recognition of

Peter's individual learning and behavioral changes brought about his positive attitude and desire to continue in the art program the following year.

Art Therapy Education: A Tool for Developing Verbal Skills

Lucy Andrus, MS, ATR, Assistant Professor and Coordinator, Art Therapy Studies, State University College at Buffalo, N.Y.

Abstract

The ability to make verbal interventions and use spoken language in a therapeutic manner is an essential competency for the art therapist to possess. Those responsible for the education and training of future art therapists must devote more direct attention to the development of verbal skills for our students within the art therapy curriculum. Many agencies who take our students for fieldwork as well as those who employ our graduates expect art therapists to counsel verbally in addition to providing art therapy services. Feedback from students as well as graduates who are now working as professionals in the field clearly indicates that this area of art therapist competency is one that needs greater attending to.

In this article, I address this very real need by offering a teaching-learning tool for students, supervisors, and art therapy educators.

Background

In my work as an art therapy educator, I have realized that those of us responsible for the education and training of future art therapists must devote more direct attention to the development of verbal intervention skills for our students within the art therapy curriculum. Given today's competitive mental health job market, the new kinds of job opportunities that are opening up for which art therapists may be eligible, and the realities of becoming licensed in order to practice psychotherapy in many cases, we are obligated to prepare our students to best meet these challenges that lie ahead of them. In addition to knowledge, skill, and sensitivity to the therapeutic use of art making, our students need to be skilled in using language and making verbal interventions in art therapy treatment. Listening to feedback from students as well as graduates who are now working as professionals in the field clearly indicates that this area of art therapist competency is one that needs greater attending to.

In this article, I address this very real need by offering a teaching-learning tool for students, supervisors, and art therapy educators.

Throughout the course of study in the art therapy program at S.U.C.B., one of the instruments used in assessment of student knowledge and skill is the AATA Art Therapy Competencies form. Each semester, the form is completed for all students by their clinical fieldwork supervisors and by the students as a means of self-assessment. The competencies are then reviewed by the ATR faculty advisor along with the student advisees. Review of these student assessments coupled with faculty observations of students on site as well as material surfaced in group supervision classes revealed a recurring area of need that appeared to be fairly universal to the student body as a whole. That is, the ability to utilize spoken language in combination with the art as a tool in verbal therapy when this approach is necessary. In their self-assessments, the majority of students indicated that they felt the least skillful and comfortable in using words to verbalize thoughts and observations, to facilitate insight on a cognitive level through verbal processing of an art therapy session, and to make verbal interventions where called for. As might be expected, students rated themselves higher in the items pertaining to the therapeutic use of art making. This seemed to be the case with advanced level students as well as beginning and intermediate level students performing their clinical work in the field.

During supervision classes when students present their clinical case material, questions concerning verbal technique and intervention often arise ranging from “what do I say when . . .?” posed by beginning level students to “how can I more effectively integrate verbal technique(s) with the art making process in order to . . . ?” posed by intermediate to advanced level students. While most students had little difficulty in applying the “art part,” they clearly felt uncomfortable using words. A recent example in supervision concerned a number of students who disclosed their hesitancy to verbally confront their clients with insights gained from the images for fear that by making the non-verbal verbal thus more conscious and overt, they might somehow “scare

“... our students need to be skilled in using language and making verbal interventions in art therapy treatment.”

915

March 1990, ART THERAPY 29
off" the client. Obviously, in processing this issue with students, several elements called for elucidation including the development of clinical judgment in making timely and appropriate confrontational interventions as well as awareness of possible countertransference. It became increasingly evident, however, that in addition to their coursework in theories and techniques of counseling and psychotherapy, students needed more focused attention to the development of verbal intervention skills that could be didactically addressed within their art therapy courses and specifically integrated with art therapy material. Addressing these skills as they may have come up in supervision did not appear to be sufficient in helping students to achieve verbal competency.

While the central activity of the art therapy experience is the creation of images and the "creative exploration of those images" (Wadeson, 1987, p. 15), few would argue that verbal competence is an essential skill for the art therapist to possess. One example that comes to mind immediately is the ability of the therapist to illuminate process in group work (Yalom, 1975), both in individual interactions as well as in commentary directed towards the group as a whole. As art therapists, we are well aware of the power of art as well as the art making in illuminating process. Indeed, there are times in art therapy where the art making and the art itself suffices as an agent of therapeutic process/progress, and there are also times when the art work serves as a catalyst for increased verbalization and self-disclosure on the part of the client (i.e., opening the "verbal flood-gates") that require effective verbal response on the part of the art therapist. In my own practice, it has often been the case where the client uses the art as a point of departure for discussion moving far from the original image. There have been times when the greater part of a session with a client has been verbal therapy

**"While most students had little difficulty in applying the 'art part,' they clearly felt uncomfortable using words."**

as this approach was judged necessary to best facilitate and further the therapeutic process for the client. It is not always enough for the art therapist to be able to put into words something of what he or she sees in the clients' imagery in helping them to become more conscious about it, we must also be able to make independent verbal interventions when and if the situation calls for it. These abilities are new experiences for the art therapist-in-training and as I have seen in our program, students can benefit greatly from more direct and focused attention to verbal counseling skills within the art therapy coursework.

Deserving equal consideration in the determination of need to address verbal counseling skills is the very real fact that many agencies expect art therapists to be competent and able to counsel verbally. This holds true for the student-in-training as well as the professional. In her discussion of art therapy supervision, Riley (1984) states that "since the supervisor must guide the students in the theoretical model preferred by the agency in which they train, they must teach them specific techniques which will enhance the art therapy treatment within this framework."

**"The ability to do 'good therapy' is as dependent on the personality of the therapist as it is on his or her knowledge."**

(p. 102) In the October 1988 edition of the AATA Newsletter, Cay Drachnik, past president of the AATA, makes a compelling case for preparing students now to be eligible for licensure under existing laws. She states that we are attempting to get licensed without appropriate educational credentials and strongly urges that master's degree programs add and or enhance coursework in psychology and counseling. Drachnik goes on to say that she in no way suggests that we take the art or creativity out of art therapy, but expresses her belief that "by following this course of action, we would extend and enhance our programs so we could better communicate with other professionals in the mental health field and to be quite frank, have an easier time getting jobs." (1988, p. 1) She points out that if art therapists could demonstrate that they possess the proper credentials and educational training for a counseling license, then legislators would be hard pressed to turn us down for licensing. More direct attention to the development of verbal counseling skills for students within their art therapy coursework is one way to meet this need.

Requiring students to take additional coursework in psychology and counseling departments may be first step. A second step would be to integrate the necessary didactic material more purposefully into curricular art therapy curricula. What seems to be more successful for our student is combining these approaches and they gain a basic foundation of knowledge in their outside elective courses and then review and translate this knowledge into practical clinical skill within the art therapy coursework.

It is important to offer some cautionary thoughts for consideration. First, no amount of knowledge or grasp of technique alone suffices in making a person an outstanding clinician. The ability to do "good therapy" is as dependent on the personality of the therapist as it is on
his or her knowledge. There are certain personal characteristics and qualities that one ought to possess that appear to be essential to being a good therapist. These cannot be "taught," per se, but they can be shaped and developed. Rubin (1984) states that "an art therapist must know certain things, must believe in others, and must be a certain sort of person" if one is to achieve "artistry" as an art therapist. (p. 67) A unique quality inherent in most art therapists is their potential and ability to utilize their own creativity in doing therapy and to apply creative thinking in finding solutions and approaching the therapeutic task at hand. Second, I am keenly aware of the pitfalls that lie in looking for "easy" and "pat" solutions to the complex problems involved in doing therapy. It can be inadvertently tempting to search for and rely on a "set of techniques" in considering ways to facilitate treatment. I have seen this happen all too often not only in art therapy but in other mental health disciplines. A recent example concerns a clinical social worker who, intrigued by the therapeutic use of art, brought art making into her sessions and began to inquire as to the availability of written materials where she might "look things up" (for purposes of interpreting the artwork) and learn art therapy "techniques." Beginning students are often susceptible to what I call the "cookbook" approach. This kind of approach is a misuse of technique and certainly is not in the service of good therapy.

Given these cautions and with the understanding that knowledge and "knowing therapy" is one essential ingredient in becoming an effective clinician, I offer the following to art therapy educators, supervisors and students as a teaching-learning tool for the development of competency in verbal therapy skills.

**Verbal Techniques in Counseling and Therapy: A Continuum of Leads with Examples**

The following verbal interventions are listed in the order of the least amount of leading to the greatest amount of leading. This listing is in no way meant to be inclusive of the great variety of techniques and approaches the therapist may use in counseling and therapy but is intended as a teaching-learning tool to supplement other learnings within the art therapy curriculum. The techniques discussed have been abstracted from an array of theoretical frameworks including Psychoanalytic, Behavioral, Cognitive, Gestalt, Transactional Analysis, Rational-Emotive, and Reality Therapies. Examples of each verbal technique are offered with the understanding that they are just that and may not necessarily be generalized to the wide variety of client populations and settings that the art therapist may encounter. Since the intention is to focus on language, I have included very few examples of art making applications with the challenge to students, supervisors, and art therapy educators to creatively integrate the verbal with the visual in their own work.

In addition to use by the student-learner, the professional alike is invited to use this paper as a tool in supervision for exploring and examining which kinds of interventions one uses most frequently and least frequently, and which kinds of interventions one might be avoiding and why. The aim is to develop and enhance clinical skills in the endeavor for continued growth and maturity as effective art therapists.

<table>
<thead>
<tr>
<th>1. Acceptance</th>
<th>Therapist's (Th.'s) non-judgmental acknowledgment, acceptance, and positive regard for client (cl.).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silence:</td>
<td>Th.'s silence as cl. expresses self implies openness to cl. and acceptance of cl.'s feelings, issues, etc.</td>
</tr>
<tr>
<td>Non-Verbal:</td>
<td>Th.'s attending indicated through body language, eg., nodding head, body posture, etc.</td>
</tr>
<tr>
<td>Verbal:</td>
<td>Th.'s active acknowledgement/acceptance (Th.) “I understand . . . I hear what you’re saying . . . I understand it’s not easy for you to . . ., etc.</td>
</tr>
<tr>
<td>2. Restatement</td>
<td>A low level response where th. takes what cl. says and gives it back.</td>
</tr>
</tbody>
</table>

**Of Content:**

(Ch.) "I really had a hard time understanding what she meant . . ."  
(Th.) "You had a hard time understanding what she meant."

**Selective:**

Th. selects pertinent statement of cl.'s to focus on and restates part of what cl. has said.

(Ch.) "I really had a hard time understanding what she meant . . . I kept thinking about it but I didn't know what to say. It really made me angry . . . Sometimes she makes me so frustrated . . ."  
(Th.) "It really made you angry when . . ."
3. Clarification
Th. probes/searches for clarification of cl.’s responses.

Of Content or Feeling:
(Th.) “I don’t understand . . . Could you describe (make a picture of) that feeling . . . I’m confused . . .”
(Th., in reference to image) “Can you tell me what this area/line/shape/configuration/etc. is . . .”

Semantic:
Th. asks for clarification/meaning of word(s) used a certain way, eg., slang.

4. Summary
Th. extracts the main message contained in cl.’s statements, paraphrases it in summary, and gives it back to the cl. (the cl. gives the th. a lead).
(Th.) “It was difficult for you to understand her and it was hard for you to respond. You felt frustrated.”

5. Reflection
A higher level of leading where the th. puts the cl.’s perception(s) in different words and gives it back, i.e., same content, different words.
(Th., in reference to cl.’s statements in number 2 above) “It seems that it was difficult for you to express your feelings.”

6. General Leads
Th. initiates leads and questions used are open-ended.

General Leads:
(Th.) “Really . . . Tell me more about that . . . How are you doing? . . .
(Th. poses questions that cannot be answered with a yes or no response.)

Information Giving:
Th. gives back basic information, eg., referral information.
(Th.) “I understand that you sought out/ were referred for therapy because you are having difficulty with . . .”

Incomplete Thought:
Th. begins a statement and allows the cl. to complete.
(Th.) “So when that happened, you . . .”

Cues:
Th. looks for the how or what and excludes extraneous information by presenting a stimulus for the cl. to respond in a certain way.
(Th.) “Tell me about . . . Make a picture of . . . How are things going at home? I’m wondering how you feel when (cl.’s description) happens? Can you make a picture of how you feel when (cl.’s description) happens?”

Structuring of Process:
(Th.) “My job as a therapist is to help you, how can I help you?” (puts structure on cl.)
(Th.) “In art therapy, making pictures/images can offer you another way to express your ideas and feelings, we can look at your pictures/images together and see what messages they might hold for you.”
(Cl.) “Sometimes he makes me so frustrated . . . I just can’t communicate with him . . . It’s hard to explain . . .”
(Th.) “Why don’t you try using the pastel chalks and see if you can make a picture of what that “frustration” looks like?”

7. Interpretation
The th. invites the cl. to look at the situation through the th.’s eyes.

Tentative Analysis:
(Th.) “I’m wondering if it’s difficult for you to express feelings of anger.”

Reflection:
Th. does not reflect content per se, but the subtle messages underlying the content. The th. captures the essential content and adds the affective aspect, i.e., interpreting feelings within the context of the cl.’s content.
(Th.) “It seems that you have angry feelings towards her that may be difficult for you to express, and this appears to contribute to your feelings of frustration.”

Diagnosis:
If diagnosis is seen in a broader context beyond formal procedures and terminology, it can be a dimension of the therapeutic process. As Corey (1982) states, the th. ought to raise certain questions as the th. and cl. are engaged in the search-and-discovery process throughout each session: What is going on in the cl.’s life now, and what does the cl. want from therapy? What are the cl.’s strengths and limitations? What are some of the dynamics going on in the cl.’s life at this time? etc. In dealing with these questions, the th. is formulating some idea of what the cl. wants and needs and how they might best attain their goals thus; diagnosis becomes a form of making tentative hypotheses which can be formed with and shared with cl. throughout the process.

Hypothesis:
The th.’s hunches are guesses as to the cl.’s underlying psychodynamics and their meanings. As a form of interpretation, the th. can present hypotheses of hunches so that the cl. can consider the meanings of certain behaviors and begin to examine the relationship between earlier behavior and present behavior. Presenting hypotheses as open-ended sharing that can be explored in the session allows the cl. to take responsibility for examining his/her behavior.
(Th.) “I’m wondering if . . . Could it be that . . . As a hunch . . .”
(Th.) “I’m wondering if you may have unresolved anger towards her that interferes with effective communication and prevents you from getting your needs met.”

**Confrontation:**

The th.'s use of confrontation is not an attack on the cl., but when it is done in a therapeutic manner out of caring and respect in a trusting and supportive environment, it can be an invitation for the cl. to take a closer look at discrepancies between attitudes, thoughts and behaviors. The cl. is encouraged to look at discrepancies and become aware of how these might be blocking the cl.'s strengths, goals, and desires to change. As Corey (1982) states: “Support is related to confrontation, for a therapist who would limit his or her style to being predominantly reassuring and comforting would not encourage clients to become much more than they presently are. When a climate of trust is created by genuine support, the relationship can endure the challenge.” (p. 237) Confrontations must be appropriate and timely and are usually presented within their own continuum of directness and intensity.

The th. may do a number of things to confront/challenge the cl.:

- Th. confronts discrepancies between what the cl. says and what the cl. does:
  - (Th.) “You say that you believe there is trust in your relationship with him, but you’re afraid to let him know how you’re really feeling inside.”
  - (Th.) “I understand that you want to improve communication with him and you say that you’re trying to be more open, but when he does something that makes you feel angry or upset, you don’t share these feelings with him.”

- Th. calls attention to possible forms of self-deception; acquaints cl. with the reality of the situation:
  - (Th.) “Is it reasonable/realistic to expect him to respond to your needs/wishes if you’re not being direct about how you really feel?”

- Th. points out games and manipulations:
  - (Th.) “When you’re angry with him, you don’t let him know but you expect him to respond to you in a certain way. When he doesn’t, you withdraw and withhvld which seems to contribute to creating a whole cycle of anger between both of you that escalates to a point where neither of you seems to know what’s really going on.”

- Th. points out resistances and evasions: Cl. cancels two sessions at the last minute following a session which resulted in significant self-disclosure.
  - (Th.) “You’ve cancelled two recent sessions at the last minute. Is there something going on we ought to take a look at?”

During a couples session, one cl. repeatedly expresses herself in terms of the other person, “she said this, did that, feels...”

(Th.) “What do you think/feel/do...? Are you avoiding accepting responsibility for your own thoughts/actions/feelings?”

Th. calls attention to the way(s) the cl. is not recognizing resources or potentials:

- (Th.) “The fact that you’ve sought help indicates that you want things to be different which shows your commitment and efforts to making changes for the better.”

- (Th.) “The way you manage a household, work outside the home, and care for your children shows a great amount of strength, determination, ability to be organized...”

- Th. confronts cl. with way(s) he may be engaging in self-deprecation:
  - (Th.) “I hear you put yourself down repeatedly and you don’t seem to take enough credit for what you have accomplished. I’m wondering if it’s difficult for you to be in touch with and own that part of you that is strong, positive and successful.”

Giving advice as a style is not recommended as this would undermine the therapeutic goal of helping cl.s to independently make choices and have the courage to accept the consequences of their choices. The th.’s task is to help cl.s discover their own solutions and recognize their own freedom of action and thus avoid the pitfall of enabling cl. dependency. There are, however, appropriate times for direct advice such as when cl.s. may be in danger of harming themselves or others, or when the time being they are unable to make choices.

The th. presents an idea, suggestion or advice in a non-judgmental manner and frequently in the form of a question which helps the cl. to take responsibility
for his or her own problem-solving and decision-making, thus facilitating greater self-reliance in the process.

**Suggestion:**
(Th.) “I’m wondering what might happen if you . . . What possible alternatives are open to you?”

**Advice:**
(Th.) “I would suggest/advise that you . . .”

**Probing:**
(Th.) focuses on the process quickly by putting statement in the form of a question that calls for a one-word answer.
(Cl.) “She didn’t do what I hoped she would.”
(Th.) “Did you tell her what you wanted/expected?”

**Interpersonal Projection:**
(roles reversal)
(Th.) “What do you think he was feeling/thinking when . . .”

**Personal Projection in Time:**
The th. encourages the cl. to focus on the possible results of his or her choice/decision/behavior.
(Th.) “If you continue to . . ., what do you think will happen?”

**Modeling/Illustration:**
(impersonal)
(Th.) “I know someone in a similar situation who . . .”

**Modeling/Illustration:**
(personal)
The th.’s self-disclosure must be appropriate, timely, and done with authenticity. It should serve the needs and interests of cl.s and should not place a burden on them or hinder them in exploring and understanding themselves more fully. Th. self-disclosure must be facilitative to the therapeutic relationship and serve to move the therapy forward.
There are two forms of self-disclosure the th. may employ, the first usually being more conducive to the therapeutic process:

One, where the th. discloses his/her here and now reactions and feelings to the present transaction of the session. For example, during a session where the cl. is disclosing a traumatic and painful past event, it may be appropriate for the th. to disclose his/her own authentic feelings in reaction to hearing/re-living the event with the cl. This may enhance the relationship as it reinforces the cl.’s awareness of the th.’s caring ability to “get inside” and understand the cl.’s subjective experience. In this situation, the art therapist may choose to share his/her feelings and reactions visually by making artwork alongside of the cl. Another example might be where the th. is feeling consistently bored, angry, or irritated in several sessions over time, then it may be essential to disclose the feeling. In this case, the disclosure must be facilitative to moving the therapy forward. This is a difficult judgment to make and the neophyte therapist is encouraged to seek professional consultation in supervision before attempting this kind of self-disclosure.

The second form of disclosure that may at times be appropriate in serving the therapeutic relationship is where the th. identifies with the cl.’s situation based on a personal past experience:
(Th.) “When I’ve had that experience, I’ve felt angry, too.”

It is important to understand the nature and usefulness of the disclosure as th. self-disclosure often originates from the th.’s own needs and the cl.’s needs become secondary. The th. must be in touch with possible countertransference and needs to ask why s/he is revealing him/herself and to what degree it is appropriate. In discussing the therapeutic benefits of the th.’s ability to share the cl.’s subjective world, Rogers (1977) and Corey (1982) remind us that in the process, the th. must not lose the separateness of his/her own identity, and must be aware of the dangers of blurring the distinction between helper and one who is helped.

**Counter-Propagandizing:**
The th. encourages the cl. to become aware of the irrational beliefs they have incorporated into their way of being, and challenges the self-defeating propaganda the cl. originally accepted without question as well as the ways in which the cl. may be sabotaging him/herself in order to cling to these beliefs.
(Th.) “That sounds like an ‘old’ response of I’m not good enough to deserve . . . How can you get what you want now if you look at the situation in the reality of your here and now experience? What would happen if you were to look at the situation like . . .?”

**Urging:**
There are times when it is appropriate for the th. to use persuasion and strongly urge the cl. to try/do something if it is not overdone. It is a way of saying that the th. has confidence in the cl. even if the cl. has little confidence in him/herself, and if the cl. can trust in the th.’s confidence then s/he may be able to discover this in him/herself. The th. needs to be aware of the cl.’s readiness to try
something. The th. must also be vigilant of the possible dynamic that the cl. may be highly invested in "pleasing" the th. and thus may be following the th.'s suggestion out of a need to receive the th.'s approval instead of working towards self-approval. An example of th. persuasion would be urging a cl. who fears s/he will never succeed to apply for a promotion at work (which the cl. desires and is well qualified for).

When judging the appropriateness of advice-giving, Corey (1982, p. 283) recommends that the th. keep in mind the following questions to ask cl.s: "If I were able to solve this particular problem, how would this help you with future problems? Are you asking me to assume responsibility for you? What possibilities do you see? How have you avoided accepting responsibility for directing your own life in the past? Can part of your present problem stem from listening to the advice of others earlier?"

9. Complex Intervention

A higher level of th. intervention that focuses on helping cl.s to change (and maintain/retain change) undesirable behaviors/feelings/ideas once acknowledgment, awareness, and insight are achieved.

Approval: The th. expresses approval of the cl.'s behaviors and actions. This can be non-verbal (noding head, etc.) as well as verbal.

(Cl.) "This time I was able to . . . ."
(Th.) "You handled the situation in a more effective manner."

Reinforcement: The th. praises cl.s when they acquire/perform the desired responses/actions, thus encouraging the cl. to repeat the target behavior(s) more often.

(Th.) "That's a really important insight and it indicates how much progress you've made in . . . ."
(Th.) "You did a terrific job in . . . ."

Shaping: The th. uses successive approximations of reinforcement, i.e., the desired behavior/response is shaped on a gradual basis through the use of praise.

Reorientation: The th. assists the cl. in putting insight into action and focuses on helping the cl. to consider alternative beliefs, attitudes, behaviors, and goals that are more functional and that will help to make the cl. more effective. The th. both encourages and challenges the cl. to develop the courage needed to take risks and make changes. Cl.s are asked to catch themselves in the process of repeating old habits that lead to ineffective behavior.

(Th.) "The next time . . . . happens, pay attention to your actions and see if you find yourself retreating into an angry silence."

The th. encourages the cl. to act as if they were the person they want to be; this helps in challenging self-limiting assumptions.

The theory here is that people create their own emotional and behavioral disorders through their persistence in irrational thinking with the assumption that a person's cognitive system can be changed directly and that this change will result in altered and more appropriate behaviors (Ellis and Grieger, 1977). Cl.s are helped in the task of developing alternative interpretations of events thus changing the feelings and emotions surrounding these events (Beck, 1976). The th. demonstrates to the cl. how some of their assumptions and beliefs about themselves and the world are unrealistic and helps the cl. to discover their own cognitive distortions and to learn how these assumptions influence behavior. The th. and cl. then collaborate in learning alternative sets of interpretations.

The th. asks the cl. to look at their inferences which may be faulty. The th. challenges the cl.'s conclusions when evidence for such conclusions is lacking, and may ask the cl. to list/stare other possible reasons for the given event.

(Cl.) "I'm feeling stressed out at work again."
(Th.) "What's going on?"
(Cl.) "My boss evaluated me today. He said I could do better in two areas! That criticism depressed me for the rest of the day. It's like I can't do anything well enough [he must think I'm stupid]."
(Th.) "What is your understanding of an employee evaluation at your firm?"
(Cl.) "Well, they're supposed to evaluate you periodically and assess your performance."
(Th.) "Does the evaluation include suggestions for continued growth?"
(Cl.) "Yes, I guess it's supposed to."
(Cl.) "Yes, I guess it's supposed to."
(Th.) "Do you think a good supervisor would challenge his/her employees to strive for further growth during the next phase of their work?"
"Yes, I guess that makes sense. I guess I would do the same if I were in his shoes."

"Were there positive statements in the evaluation concerning your strengths and abilities?"

"Well, yes. As a matter of fact, most of it was positive."

"Do you think it's reasonable then to see the criticisms as areas or challenges for you to work towards as you continue to grow professionally?"

"I hadn't thought of it like that, but yes."

"Given the fact that the evaluation was positive overall, do you think it's realistic to assume that your boss has such little regard for you?"

"I guess it doesn't make much sense, does it." etc.

The th. utilizes role playing during sessions where effective and ineffective behaviors in interpersonal situations are explored and critiqued, and performances are practiced in a variety of situations. Role playing can be done in individual as well as group therapy.

Cls.' speech patterns can often be an expression of their feelings, attitudes and thoughts, and often reflect behaviors that may be maladaptive or unconstructive. The th. gently confronts the cls. using interventions that help the cls. to become aware of the effects of their language patterns on their behaviors.

Depersonalized language:

"It is difficult to do..."

Th asks the cls. to restate by making an "I" statement.

"I have trouble doing..."

Qualifiers:

Th. points out how qualifiers such as maybe, perhaps, I guess, sort of, I suppose, etc. undermine one's effectiveness and keep one ambivalent.

"I suppose I will..."

Th. asks the cls. to omit the qualifier, thus helping to change ambivalent messages into clear and direct statements.

"I will do..."

Disclaimers:

A cls. may deny his/her personal power by adding a disclaimer to his/her statements.

"I know that I'll need to..., but I have no choice."
moving forward. The th. surmises, and the cl. confirms, that the cl. is experiencing persistent feelings revolving around "revenge, retaliation, and restitution." The th. asks the cl. to explore these fantasies through art making and the cl. creates images of retaliation followed by images of restitution. The cl.'s "revenge" drawings offer him an opportunity to release the feelings that are blocking him and the "restitution" drawings offer the opportunity for helping the cl., to discover ways in which he can now nurture the child within himself, thus facilitating the process of letting go and moving forward.

**Dialoguing:**

The th. asks the cl. to engage in a dialogue with opposing tendencies in the cl.'s personality and experiencing with the cl. playing all the parts involved in the conflict. The aim is towards integration of the whole self as the cl. accepts and learns to live with the polarities and conflicts that exist in everyone. The th. may use the empty chair technique where the cl. is asked to sit in a chair and fully assume and exaggerate one position/role and then switch to the other chair and assume the opposite role. The art therapist may adapt this technique by engaging the cl. in a visual dialogue. Creating mandalas is also a useful and effective means for cl.s. to explore polarities and conflicts. These techniques allow the cl. to experience the conflict more fully and get in touch with feelings or a side of themselves they may be denying, thus encouraging the cl. from disassociating from his/her feelings. The conflict can be resolved by the cl.'s acceptance and integration of both sides of the self.

**Homework Assignments:**

The aim of using outside assignments is to facilitate the process of helping cl.s. to apply what they've learned in the therapy sessions to their outside lives. Once cl.s. have achieved insight and increasing awareness it becomes essential for them to put their new understandings into practice in their lives. The cl. can decide what behaviors s/he would like to experiment with outside of the sessions and the th. assists in formulating specific tasks to be performed that will help in acquiring new skills and overcoming inhibitions.

10. **Rejection**

The th. may reject a cl.'s behaviors or dialogue as inappropriate and/or self-defeating and does not condone or excuse any of the cl.'s irresponsible actions. The th.'s accepting attitude may be conditional on cl.'s willingness to face his/her problems and make plans to solve them. The challenge to the th. is to create a therapeutic climate that is free of excessive criticism at the same time as setting limits and maintaining a posture of the cl. being ultimately responsible for his/her own happiness. Care must be exercised in using these techniques as they must benefit the cl. and serve to move the therapy forward with the th.'s attention to authenticity and possible countertransference. Once again, the beginner is cautioned to seek guidance in supervision.

**Impersonal Rejection:**

The th. judges the cl.'s behavior as not appropriate. The th. may, for example, reject a cl.'s abusive behavior towards another during a session, or the th. may reject a behavior that is socially unacceptable such as physical violence, child abuse, sexual abuse, etc.

**Personal Rejection:**

(Th.) "I don’t believe that is what you really want."

**Threat:**

The th. may make a clear and direct statement of likely outcome resulting from the cl.'s behavior.

(Th.) "If you continue to _then_ will happen."

**Coercion:**

The th. compels the cl. to act or choose.

(Th.) "I cannot continue to work with you if you don’t attend our sessions on a regular basis."

---

**In Conclusion**

The compilation of verbal techniques presented here is by no means inclusive. It is not meant to replace in-depth exploration of techniques in counseling and therapy by any means, but to encourage further study. The intention is to offer a beginning reference for the therapist-in-training and a teaching tool for art therapy educators to supplement basic foundation learning within the art therapy curriculum.

As our young profession continues to evolve and mature, we will continue to struggle with issues of professional identity and work through the on-going process of defining who we are and what we do. As in any other growth process, many of us are and will be faced with conflicting feelings, thoughts, and opinions. Indeed, I grapple with
these issues daily, both personally and as a trainer of future art therapists. In the meantime, however, the fact remains that an art therapy education and training program must be responsive to current student need. Ongoing assessment of students' clinical competence in our program at the S.U.C.B. revealed that students need and desire more direct attention to the development of verbal skills within the art therapy curriculum. This is also a common concern for the neophyte art therapists, many of whom are expected by their employers to be competent in verbal counseling as the need arises. This appears to be especially true for those art therapists who are landing jobs in outpatient clinics such as those offering addictions services.

As an art therapy educator, my major responsibility is first and foremost to my students, and I feel that we are doing our students a disservice if we are not directly addressing this very real need in the endeavor to graduate art therapists who are competent as well as competitive in the job market.

Presentation of AATA Awards

Introduction by Cay Drachnik, President

At this time I would like to thank the Honors Committee for their hard work. This committee was headed by Gwen Gibson, and the committee members were: Michael Campanelli, Judith Gerber, Helen Landgarten and Kay Stovall. I am happy to announce that we are presenting two awards today—The AATA Honorary Life Member recognition and The AATA Distinguished Service Award.

Honorary Life Member Award
[From the introduction given by Cay Drachnik, President, AATA]:

Today we honor another member with AATA’s highest award—Honorary Life Member. This year we honor a person who was one of the founders of our organization. She was our first secretary and third president and served on the committee that wrote our original by-laws. Since that time she has served in numerous roles (chairperson and member) for AATA committees.

She is a Distinguished Fellow with the American Society of Psychopathology of Expression, and an Honorary Life Member of the Buckeye (Ohio) Art Therapy Association and the South Texas Art Therapy Association. Her vita lists twelve pages of articles that she has written and lectures that she has presented.

But Felice has really distinguished herself and our profession by research on Incest Markers in Children’s Art Work. This study was published in The Arts in Psychotherapy, vol. 12, 1965. Currently this study has been redesigned and a normal population has been added to the original study and the redesigned study is being submitted to judges for evaluation and assessment. This research is highly significant at this time of professional growth of the American Art Therapy Association.

Felice has developed video presentations of her work in art therapy; [these are focused] specifically with abused populations. Two recent productions are: Child at Risk, a film produced at Channel 8, Public Broadcasting System, 1986, and won an Emmy award, and the other production is Breaking Silence, another film produced at Channel 8 in 1987.

Felice recently retired from the University of Texas Mental Sciences Institute in Houston, Texas. Prior to that she served as Chief of Art Psychotherapy at the Texas Research Institute of Mental Sciences.

Since her retirement she has continued to work in private practice and is still an advocate for art therapy, remaining active as a lecturer, consultant and researcher, and adding a few more pages to the twelve already in her vita.

I am honored to be able to present this Honorary Life Membership Award to one of our past presidents and founders, and a lovely lady as well . . . Felice Cohen.

Response to the AATA Honorary Life Member Award

Felice W. Cohen, ATR.

Madam President, Members of the Executive Board, Members of the Honors Committee, Colleagues and Friends. In 1976, the Buckeye Art Therapy Association honored me with their H.L.M. and in 1985, the South Texas Art Therapy Association honored me with their H.L.M. and now, today, I am again humbled to be the recipient of the AATA’s highest honor, Honorary Life membership.

In particular, I wish to thank my dear friends and colleagues, Lew Shupe and Gary Barlow, for submitting my
name in nomination, and submitting my name in nomination, and submitting my name in nomination to the Honors Committee.

Top credit goes to my husband, Aaron, for without his support and confidence in me, I not only would not have attended that exciting meeting at Hahnemann Medical College on December 5, 1968, but I would not have been able to serve the AATA as its first Secretary, President-Elect, President and also serve on Committees through this time. He was then and continues to be the engineer of my train, saying: “I know you can, I know you can.”

When I was notified that I was to be the recipient of the H.L.M. this year, it brought out the nostalgia in me. There is so much of the early history of the AATA that many of you are unaware of. I hope that those of us who are referred to as pioneers will someday record our reminiscences for posterity. There were good times and there were difficult times; there were many disputes and polarizations but after twenty years, I know that we would not have reached this pinnacle without having experienced such times. Therefore, some of my rememberables are shareable and others are best not shared at this time.

Picture this scenario. In 1968 some of us who were “practicing art therapists” throughout the country received a letter from Myra Levick stating that the Chairman of the Department of Psychiatry at Hahnemann Medical College and Dr. Paul Fink, then Coordinator of Education and Training at Hahnemann, supported an organizing meeting to be held there for the purpose of defining our discipline as a recognized profession and also to found a national art therapy association. A date in our history, December 5, 1968!

The meeting was held in conjunction with a guest lecture presentation by Elinor Ulman. After the lecture we met to elect an ad-hoc committee charged to develop guidelines for the organization of a national art therapy association. I was in awe to finally meet those whose writings were the source of my art therapy knowledge: Margaret Naumburg, Elinor Ulman, Edith Kramer, Hanna Kwiatowska, Harriet Wadeson, and Myra Levick, to name a few. We had disagreements instantaneously—it was worth it. Those present elected Myra Levick, Bob Ault, Elinor Ulman, Don Jones, and me to be members of the ad-hoc committee and we were charged with preparing for the founding of a national art therapy association.

For me, ignorance was bliss and I jumped in with both feet. Bob Ault and Don Jones were to send letters to the Editors of Professional Journals, Myra Levick was to send questionnaires to all the art therapists she could locate within one month, and Elinor Ulman was to assist with this. I was to write a cover letter introducing ourselves and also introducing the concept of the Steering Committee. The letter was to cover four things: 1. PROMISE an organization, 2. PROVE what we were attempting to accomplish, 3. PUSH for a response to the questionnaires and 4. PRESENT notification of a spring meeting to be held at the University of Louisville.

At the Philadelphia Meeting on December 5th, 1969, Bob Ault reported that $200.00 had been received in donations for the work of the Steering Committee. Due expenses incurred, we had left a grand balance on hand of $191.00.

On June 27, 1969 the Organizational Meeting was held by the University of Louisville and Sandra Kagi Graves and it was during that meeting that I first realized that giving birth to the AATA was going to be a painless experience and the labor hours lengthy. I wondered if the means might have been necessary to deliver an unscathed birth. It happened, the AATA was delivered at the birth was eventful!

The first officers were elected: Myra Levick, President; Bob Ault, President-Elect; Marge Howard, Treasurer; and secretary; Don Jones, Publications; and Sandra Kagi-Graves, Membership. Helen Landgarten, Public Information; Ben Ploger, Standards; and Sandra Kagi-Graves, Education.

In my opinion, the AATA would not be in existence today if it had not been for the devotion, dedication, hard work and marvelous sense of humor of our first Treasurer, Marge Howard. No one could pinch pennies like Marge. If a member was a day late paying dues, Margie wrote a scathing personal note on the bill and sketched an appropriate cartoon on it as well—it worked. In 1969 dues were $15/year for active members and $3/year for students.

By September 15, 1970, at our first Conference at the Airlee Foundation, we had seventy-eight active members and four students and those dues coupled with an anonymous donor’s gift, pushed our cash balance to $2,901.98 and we were wealthy!

Today, we are all concerned with licensure for art therapists, this is not new. By May, 1979, I had written a Rational for Art Therapists Certification Act as well as a Bill to be presented to the Senate of the State of Texas. Linda Gantt had graciously agreed to meet me at the State Capitol in Austin to present the Bill with me. However, while Linda was in flight to Austin, some renegade Senators, some of whom we were to see, left the Senate and Austin for political reasons and no one could find them. They did not return until the session closed. We were unable to have our Bill presented. Ten years later we are still trying and let’s not stop trying until we are successful.

Back in the late ’50s and early ’60s, the trust was far from licensure. At that time we were busy trying to educate the psychiatric and medical communities just what art therapy was, that what we did was valuable and that we were needed. How times have changed. I recall asking for the opportunity to give art therapy presentations to anyone, any time, and any place. I recall always asking at the beginning: “How many of you have heard of art therapy?” Dead silence. Today that question is no longer
asked. We are called upon to share our knowledge and the demand for art therapists is overwhelming. We certainly have been doing something right for twenty years!

In the early years of the AATA, the elected officers had the total responsibility for their jobs. There was no Executive Office. I recall typing as many as two hundred letters a month. If nothing else, my typing skills improved but I still had to beg Marge Howard for stamp money.

Now when I read notices for job openings for art therapists today, the Master's in Art Therapy is required as is the ATR. We so-called pioneers cannot qualify today. Yes, we can have a Master's or PhD degrees, but not in art therapy. We were so busy writing and educating future art therapists for that degree and we could not give ourselves that degree in the colleges or universities where we were teaching.

How did we become ATR's in those days? The Grandfather's Clause. A wonderful art therapist, artist and teacher, Ben Ploger, was the AATA's first Chairperson of the Standards Committee. In 1970 he presented the following at our Conference; "and it was unanimously agreed that there must be a clear understanding that the AATA considers the patient-art therapist relationship to be dynamically oriented. If the art therapist is teaching art in a school or any other settings of this type, this is not considered dynamically oriented art therapy. Therefore, all those art therapists making application, who hold active membership as of June 30, 1970, will receive certification from the AATA under our Grandfather Clause providing the art therapist has been working in a psychiatric setting under the direct supervision of a psychiatrist as an art therapist for the past five years up to June 20, 1970. Under this same Grandfather Clause, those art therapists who are active members and have been working for any amount of time under five years and remain active members will receive their certification when they have completed the specified five years. This Grandfather Clause does not apply to any member making application for membership after June 30, 1970."

I would suggest that we were demanding of all those who would be eligible for the ATR under the Grandfather Clause. Such requirements were somewhat discouraging to some and yet we were determined to make it work and it did work.

When I learned that I would be the recipient of this year's H.L.M., my first thoughts returned to my own involvement in presenting the first H.L.M. to Margaret Naumburg at the Airlie Conference in 1970. Before the first Executive Board Meeting in Tulsa in 1969, I agreed to have the plaque made in Houston. The first fiasco—I misspelled Naumburg. I had another one made and took it to Tulsa for the Board to see. After the Meeting Myra Levick took the plaque, put it in her suitcase and her suitcase was lost in Chicago and she lived in Philadelphia.

Because papers from the Tulsa Meeting were in her suitcase along with the plaque, the name of Marge Howard who lived in Tulsa was noted by the airline that found the bag. It was sent back to Marge in Tulsa who then sent it on to Myra. My husband and I flew to Philadelphia and the plan was for us to drive to the Conference in Warrenton, Virginia with the Levicks. We began our drive and were some great distance from Philadelphia on a turnpike when Myra asked me if I had the plaque. I in turn said that I thought she had it. We had left the plaque in Philadelphia. We had to go back to get it and when I presented it to Margaret, I could only stutter: Margaret Naumburg.

My life has been significantly enriched as a result of my association and work for the AATA. I have memories of lengthy and more often than not, heated Executive Board Meetings as well as Business Meetings at Conferences. Oftentimes the Executive Board Meetings lasted until 3:00 a.m. and we consumed pots and pots of coffee. Oftentimes the Business Meetings at Conferences were froth with disagreements and it was not uncommon to have to stop these Meetings and resume them in the evenings to finish the business at hand. We even argued over Robert's Rules of Order. As President, I was able to convince the Board that we could function more expeditiously if we hired an impartial Certified Parliamentarian and in 1974, our first Parliamentarian, Mrs. Kinsman, served us well. I am delighted that we continue to use this professional service.

There were factions that were formed at the December, 1968 Meeting. There were different philosophies voiced then and this has continued to this day. Only the faces have changed. I think that this has been healthy for us. At times some of us feared that our baby AATA would be obliged to mature in a dysfunctional family, but now twenty years later, our family is healthy, strong, still opinionated but functional. Let us all work to keep it this way.

Again, my heartfelt thanks for this wonderful accolade.

Felice W. Cohen, ATR
Distinguished Service Award

The first award is the Distinguished Service Award. The person to whom this award goes was co-founder and chair of the Massachusetts Coalition of Creative Arts Therapists and was editor of their quarterly newsletter. She has spent untold hours working on legislative issues for the coalition. She is a member of the New England Association of Art Therapists and has served as their vice-president and secretary. She has made a great contribution to AATA’s Education and Training Board, having been its chair from 1985 to 1987. She still serves on that Board.

She graduated cum laude from Radcliffe College in Harvard University. She has written articles and given presentations too numerous to mention today. Currently she works as an art therapist with the Boston-North Shore Association and is in private practice. She is also a doctoral student at the Fielding Institute.

I am delighted to present this Distinguished Service Award to Suzanne Canner Hume. (Editor’s note: Shirley Riley accepted this award for Suzanne Canner Hume and read the following response).

Response to the AATA Distinguished Service Award

Suzanne Canner Hume

I regret not being able to be with you this week in San Francisco. Some recent pregnancy complications have forced me to cancel travel plans—and begin “mothering” a few months before my daughter arrives.

I’ve asked Shirley Riley to accept this award on my behalf and to express my appreciation for the Board’s recognition of the yeoman’s work quietly done by the Education and Training Board. The ETB’s tasks grew monumentally in the seven years I was a member, and two I was the Chair. Our challenge was to develop, with the Education Chairs, policies and procedures that could make a clearer, fairer, and more efficient process for the growing number of Master’s Programs, Institutes, and Clinical Training Programs seeking to meet AATA’s training standards.

The process of a program’s obtaining approval takes many steps and sometimes several painful years! I would like to think that the thoughtful evaluation the ETB gives to each program helps it to shape its own character and focus, cultivate its strengths, and improve its weaknesses, while helping AATA to uphold high but fair educational standards, with room for diversity and creativity in art therapy education.

I thank all the colleagues I worked with over those years, especially those with whom I worked most closely (first Board Chair Carolyn Kniazzeh, ETB members Lew Shupe, Bob Wolf, Bob Ault, Maxine Junge, Mari Fleming, Julie Byers, Mary St. Clair, ETB Secretaries Sandy Graves, Tricia Gould and Pat St. John, and Education Chair Shirley Riley) who helped make for a series of great teams to be part of. I have never collaborated with people so willing to disagree intelligently—but so committed to dialogue for as many hours and days as it took to arrive at intelligent and respectful decisions. I thank AATA for recognizing how important the ETB branch is to our profession’s development.

Best wishes for a successful conference and I hope to see you in Washington!

Suzanne Canner Hume, MEd, ATR
Dialogue Letter Writing—A Collaborative Technique for Beginning Art Therapists and Their Supervisors

Michael Campanelli, EdD, ATR, Assistant Professor, Art Therapy, Wright State University, Dayton, Ohio.

A seminar for Art Therapy graduate students functions as one part of group supervision for AT interns who are in practicums at various agencies, hospitals, and schools in our area. The purpose of the seminar is to facilitate the professional growth of interns by providing the kind of feedback they need to become more effective therapists.

To offer the proper support and guidance, I believe a supervisor must respond to each intern’s developing professional perspective. This entails meeting each intern at his/her level, understanding each one’s particular needs for professional growth, and learning each individual’s clinical style. To individualize supervision in this way, the supervisor and intern must engage in an ongoing professional dialogue where they can both gain a perspective about the intern’s clinical experiences and his/her evolving professional identity. This kind of dialogue is important not only because it facilitates the intern’s processing of thoughts and feelings about clinical issues, but also because it helps the intern to develop and enhance the ability to communicate in a professionally effective way. Interns need practice in professional discourse, and supervisors help them exercise and sharpen their communication skills through cultivating a dialogue relationship.

It is often difficult (sometimes impossible) to find enough time during our weekly sessions to talk with every student; we usually have two case presentations which become the focus of the seminar discussions. All interns are expected to consult together about the cases and offer feedback to the presenters. This kind of cooperative interaction with their AT peers is, of course, a critical part of the interns’ training. Yet to carry the process of involvement in seminar further, I believe the supervisor must understand and respond uniquely to each intern’s experiences. Keeping track of each intern’s growth has necessitated spending a great deal of out-of-class time developing rapport with students, discussing specific areas of concern, and providing individual advice and resources for their clinical work.

In my search to find a more efficient means of maintaining one-to-one contact with each intern, I stumbled upon an article in Language Arts (Staton, 1980) titled “Writing and Counseling: Using a Dialogue Journal.” In this article, the author emphasizes the importance of written communication in the learning process and illustrates the use of a dialogue technique that personalizes education and enhances the teacher/student relationship. In addition to addressing academic issues, this dialogue technique may be used to provide guidance for students with personal concerns. When I read of this method’s beneficial effect on student’s attitudes and self-understanding, I decided to give it a try in my seminar classes. The results have been so successful that I have been employing this method for two years now. In sharing what dialogue writing is about, I hope I may lead other beginning Art Therapists and their supervisors to discover its value.

The first important point to note about this method is that it must be based on mutual trust. Each intern needs to know that I will value whatever is written and that I will respect their dialogues as confidential correspondence. I emphasize that I am the only one who will read their dialogues. After confidentiality is assured, I explain that this type of writing is like personal journal writing and as such, is primarily for themselves. Using a letter format, they are asked to write each week about their internship experiences. They may share many things that have happened or focus on one seminal issue. I tell them that writing things down may better enable them to understand themselves and their experiences. I encourage them to share questions, fears, doubts, and problems. They may begin writing with a brief description of a clinical situation or with a perception they had about a client, staff member, or the agency as a whole. Although their entries need not be about exceptional events, I encourage them to record internship experiences that have made a strong impression on them. It is also recommended that they include a drawing or painting to expand upon what they write. To allay anxiety about the writing process, we deemphasize the final product. The purpose is not to have them compose their dialogues as formal academic essays but to help them freely express
what they think and feel. They are simply to write down what comes to mind allowing the dialogue to be an honest description of their experiences.

It is best if their dialogue writing is done at their sites during or after their internship day when experiences are still fresh in mind. As a starting place, they write questions and comments as they occur. They can then refer to some or all of these notes when they write their weekly dialogue letter. I ask interns to spend a minimum of twenty minutes writing and not to worry much about grammatical correctness. The completed dialogue is dated and then handed in at the seminar. Dialogues are filed in separate folders for each intern and during the week I write back to every student replying to their concerns. My responses are ready for them to read at the next seminar session.

The interns’ initial reactions to the idea of dialogue writing are not always positive. Many interns are skeptical of this method’s usefulness for them. This is especially true with students for whom writing is difficult. Once over their initial fears and resistances, however, interns come to realize the value of dialogue writing. They gradually come to use the dialogue process as a way to recognize areas of their work that need attention. They appreciate the individualized responses they receive and the professional partnership that grows out of the dialogue. As the interns become more involved in the dialogue process, thoughts and feelings that had been repressed or forgotten are uncovered. Ideas that were nebulous to them before can be analyzed and understood. How much the intern reveals of himself or herself varies from person to person but for most, the writing becomes a means of gaining clarity and insight about one’s work.

My students have found this process very rewarding. The dialogue format gives them an opportunity to process their clinical experiences immediately and enables them to discuss many more concerns than they normally would. Another benefit is that many interns are more willing to speak up in seminar. The writing seems to activate their verbal participation as well as increase their confidence in addressing clinical issues.

As a supervisor, I have found that this method enables me to get to know the interns better. I can feel a greater appreciation for their struggles and can more easily share in the satisfaction of their successes. Through our dialogues, I play a very active part in each intern’s practicum. I can quickly find out what each intern needs, examine therapy strategies, and detect existing and potential problems with clients and co-workers. The dialogue automatically individualizes supervision since I can respond to each intern working at his or her own pace, exploring various ways to handle unique clinical situations. Our correspondence allows for a thorough examination of clinical material. Issues that are not raised in seminar can be addressed in their dialogues. The dialogue method also enables me to address topics at seminar sessions that are pertinent to the whole group. Informed by the dialogue reports, I am prepared to discuss issues that bear on matters that are immediately relevant for all the interns. Focusing on dialogue issues of common concern contributes to a greater group cohesiveness and involvement in the seminar.

Over the course of a year’s writing, I can easily keep track of each intern’s progress and also see the development of each one’s emerging clinical style. Interns discover and cultivate responsible, professional attitudes by reflecting on their professional beliefs and values. The result is that the dialogue document not only becomes a record of each intern’s unfolding potential, but also a method of self-exploration that contributes to the development of a professional identity.

Although the dialogue method is very worthwhile, it can be a time-consuming process, difficult for many supervisors to include in their already busy schedules. Where this is the case, a selective use of the dialogue during certain critical times is recommended. For example, the dialogue might be employed the first and last weeks of internship or periodically when an intern is feeling confused or distressed over an internship experience. A supervisor might also choose to use the dialogue to establish rapport with an introverted intern who may have difficulty communicating face-to-face. Whether the dialogue is employed on an ongoing basis or only at special times, a supervisor’s responses do not always have to be lengthy. A few incisive comments can sometimes offer the support or advice that is needed while also serving to keep the dialogue process going.

I have known many Art Therapy students who dislike and fear writing, feeling unable to function at their fullest capacity in a written-verbal format. Not surprisingly, our profession attracts a sizable number of individuals, who though highly skilled in artistic expression, need some practice in learning to be effective written and oral communicators. Such skills are obviously crucial to our therapeutic work. No matter how proficient an Art Therapist is at nonverbal communication, one will be severely handicapped if he or she is not a sufficiently articulate professional. Our clients and our co-workers depend on us to translate what we see into oral and written descriptions so they can understand and appreciate what Art Therapy is. Through such communication,
VIDEO REVIEW

Art Safety: Hazards and Precautions (Video Tape)

Michael McCann, Center for Safety in the Arts, New York, 1988, $200.00.

Reviewed by: Winnie Ferguson, PhD, ATR, Instructor, Art Therapy, Wright State University, Dayton, OH.

With great anticipation I awaited the arrival of this video tape produced by the Center for Safety in the Arts. Because we, as art therapists, use all media with wide varieties of clients, do we constantly expose ourselves and clients to untold dangers? As professionals, we know that using certain material such as permanent markers (i.e., those with toxic levels) is harmful, but what additional information might this video disclose? I have used McCann’s book Health Hazards Manual for Artists (1985) and found it useful for both myself and for students. The promotional materials informed me that the video was two hours in length. While that is extremely long, I did not anticipate how long two hours of video lecture would seem.

The tape consists of two parts. Part I covers the topic of who is at risk. The second portion of the tape discusses what one can do about the risks. The tape, presented as a lecture by McCann, appears to be in an office setting which is unchanged for the entire two hours. Although the information is valuable, the presentation and delivery make it difficult to comprehend with the lengthy viewing time.

The risk factors discussed verbally by McCann are augmented by a visual list of factors to help the viewer remember the focus of each point of the lecture. The technique of alternating the image of McCann speaking and the information lists was used extensively throughout the tape. While this method is effective when used in a classroom lecture or even in a video with other images offered, in this case, the constant flashbacks were distracting to this viewer.

McCann’s focus on children (and the hazards which increase due to the children’s smaller size and perhaps sometimes unclear understanding of directions) should be noted by all those working with youngsters. In addition, there are cautions regarding the use of art materials with the elderly who are sometimes frail, and persons with disabilities who may tend to ingest media due to mouth painting, or visually impaired individuals working very close to the product. Warnings regarding contamination of food by eating while producing art work or placing hazardous materials in eating utensils were good reminders of dangers we all should remember.

Another important item included in the tape was a discussion regarding knowing the content of art materials. As art therapists we need to be vigilant in this regard. Our well-being, as well as that of our clients, depends on our selection of safe materials to be used in our art therapy sessions.

An enumeration of the types of illnesses resulting from the use of hazardous art materials was somewhat frightening. The list included the following ailments: skin allergies, eye disease, respiratory illness, heart and circulatory diseases, kidney and bladder disease, liver disease, nervous system disturbances, and reproductive system dysfunctions. When reminded of the dangers posed to our clients by careless selection and use of art materials, we must accept the responsibility to safeguard our trust.

Part II of the video provided the viewer with precautions one can take to protect against the hazards in art materials. First and foremost is the need to know the materials. Be sure to know the components of materials and the physical condition of the client. Beware of substitutions either by the manufacturer or by yourself.

Some of the cautions shared in the lecture were simple and ones that we all take for granted. Be careful to use adequate ventilation in the workroom. McCann points out that the open window or door would not provide proper ventilation because the air flow cannot be controlled. Use exhaust fans when working with clay or materials with fumes. Store flammable and inflammable materials in separate storage areas. Have workable fire extinguishers near your work spaces. McCann suggests that persons working with art materials have regular physical check-ups.

In discussion of product labels McCann says the only one which should be recognized is the health label from Arts and Crafts Materials Institute. This organization lists all hazardous materials in products.

The American Art Therapy Association, Inc.

THE ORGANIZATION
The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3,000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:
- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

Chapters:
Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS
Individual members receive:
- Publications
  - Art Therapy, the official journal of the AATA.
  - The quarterly AATA Newsletter.
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest.

AATA Conferences
- Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards
- Development of model job and licensure laws.
- Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATION
1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application.

<table>
<thead>
<tr>
<th>Period</th>
<th>Application Received</th>
<th>Full Dues Payment</th>
<th>Membership Expire Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jan 1st - May 31st</td>
<td>Full payment; membership will expire Dec. 31st of same year</td>
<td>June 1st - Sept. 30th</td>
<td>Half Year Dues plus $5.00 payment; membership will expire Dec. 31st of same year</td>
</tr>
<tr>
<td>Oct 1st - Dec. 31st</td>
<td>Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentations is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (ATR) each have a separate application procedure. Registration is bestowed only by the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES
PROFESSIONAL — by application only; such members may vote, hold office and serve on committees. Credentialed Professional Member: Individuals who have been dually approved for Professional Membership and Registration (ATR) by the AATA; dues are $22 per year.
Active Professional Member: Individuals who have completed professional training in art therapy; dues are $75 per year.

CONTRIBUTING — individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE — individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT — Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $25 per year.

Dialogue Letter Writing (cont'd)

Art Therapists also deepen their own understanding and appreciation of Art Therapy concepts since learning to use language effectively is learning to define, order, and clarify ideas.

Dialogue writing is a powerful resource for developing the kind of heightened awareness and usage of language that Art Therapists need in order to effectively respond to their professional experiences.

Reference:

Art Safety (cont'd)

He also points out that manufacturers must give the consumer specific information regarding the content of a product upon request.

This video tape presents one method to learn about the materials information offered. However, in a classroom lecture the student may ask questions and request clarification of a fact. In a video tape there is no opportunity for this interaction. The art therapist should spend a few dollars to buy the *Health Hazards Manual for Artists* (1985) published by Nick Lyons Books (New York: NY). The book provides a simple synopsis of the entire content of this video. It is the reviewer's opinion that most art therapists will find the $20.00 cost of the book much more palatable than the $200.00 purchase price for this video. It is, nevertheless, important and necessary content (in whatever package it comes) for the art therapist to learn about the nature of art materials and to know the intricacies of safety features of paint, clay, various kinds of drawing materials and numerous other art supplies we all incorporate in our art therapy work.

----

**Guidelines for Authors**

Please submit five (5) copies of manuscripts to: Art Therapy Editor Gary Barlow, Ed., ATR, AATA National Office, 1202 Allanson Rd., Mundelein, IL 60060. AATA cannot be responsible for submissions sent to any other address. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

*FORM: Typewritten, double-spaced on 8½ × 11 inch bond paper, with at least ½ margins.*

*COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.*

*ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.*

*SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.*

*FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" × 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction. Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc. Authors must obtain permission to reproduce the figure from a copyrighted source.*

*REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.*

*CONFIDENTIALITY: Client/Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.*

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Assistant Clinical Professor, Department of Psychiatry, Yale University; Clinical Psychologist, Veterans Administration Medical Center, West Spring Street, West Haven, CT 06515, USA

Dedicated to scholarship in the creative arts therapies, THE ARTS IN PSYCHOTHERAPY presents innovative research in artistic inquiry and expression, and its use in the treatment of mental disorders. THE ARTS IN PSYCHOTHERAPY is a quarterly, international journal for professionals in the fields of mental health and education. The journal publishes articles (including illustrations) by art, dance/movement, music, poetry and drama psychotherapists, as well as psychiatrists and psychologists, that reflect the theory and practice of these disciplines. There are no restrictions on philosophical orientation or application.

SPECIAL RATES AVAILABLE FOR MEMBERS OF QUALIFYING SOCIETIES!
Members of qualifying societies can receive a discount on one-year Professional subscriptions the THE ARTS IN PSYCHOTHERAPY. Please write for further information.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.
EDITORIAL

It is not too early to think about our annual conference, and excitement is building for our meeting that will be held in Washington, D.C., November 15, 1990, at the Grand Hyatt Hotel and the Holiday Inn Crowne Plaza. The theme is "Creativity Through Collaboration," and will focus on a variety of papers, workshops, seminars and other highlights involving not only the American Art Therapy Association, but also our related professions: The American Association for Music Therapy; The American Dance Therapy Association; The American Society of Group Psychotherapy and Psychodrama; the National Association for Drama Therapy; The National Association for Music Therapy; and the National Association for Poetry Therapy. These groups have been working diligently to make certain that the series of meetings will be especially valuable for us all. Mark your calendar and plan to attend. Washington, D.C. will offer its unique brand of hospitality and I hope that each of you will consider joining us for our 21st annual conference.

This issue of Art Therapy highlights a wide variety of thought-provoking and stimulating articles, selected for their intensity of content and importance for us as health-related professionals. "Art Therapy with Homeless Women and Children in a Bridge Housing Program in Scranton, Pennsylvania" is presented by Sister Dorothy McLaughlin, and focuses on an area that is of increasing national concern—that of homeless and displaced persons.

"When A Mother Kills Her Child," an article by Rose Marano Geiser, is concerned with a topic that is both horrifying and poignant, and certainly one of special concern for the art therapist who works with individuals within family constellations.

"Art Therapy Curriculum in an Early Intervention Program for Visually Impaired Children," by Roberta Weiss, points out the need for intelligent curricular strategies and content relative to special populations.

In the article "Exhibiting Art by People with Mental Illness: Issues, Process and Principles," Susan Evans Spaniol raises questions for each of us: When should we exhibit clients' work? How should it be exhibited? Why is it exhibited? What are some cautions to be considered? There are many other questions that are also suggested for thought and discussion.

Finally, a penetrating article by Robert Wolf, titled "Visceral Learning: The Integration of Aesthetic and Creative Process in Education and Psychotherapy," probes into many facets related to being an art therapist, artist, a psychoanalyst, teacher or author, and illustrates various communication needs, levels and strategies relative to the give-and-take between patient and therapist, as well as the insight that a therapist gains of himself/herself within the various roles of responsibilities.

As readers of this journal know, manuscripts are submitted following certain guidelines (see "Guidelines for Authors" elsewhere in this issue). The various categories are outlined that need to be followed, such as the form that the manuscripts are to take, suggestions for section headings, and so on. Two areas must be emphasized from this listing, primarily because they are not given full consideration by many authors who submit articles for review. These two areas are "Abstract" and "Style."

An abstract (100–125 words outlining the main ideas of the paper is required) must be submitted with each article. Often, an author neglects to submit an abstract, and this will delay the processing of the article. Occasionally, as Editor, I have sketched out an abstract for an article if deadlines are upon us and it needs to be done quickly; this, however, takes time away from other important pre-publication duties. If an author is uncertain about the style or "look" of an abstract, he/she should scan other abstracts at the beginning of articles in previous issues of Art therapy and review the appropriate sections on abstracts in the Publication Manual of the American Psychological Association (3rd edition),¹ available from many bookstores, libraries, or from: Order Department, American Psychological Association, P.O. Box 2710, Hyattsville, MD 20784. An author must follow the guidelines presented in this manual relative to style, form, and manuscript preparation.

The second area of concern is style. Because references, especially, are often not submitted in the proper style, it is important for a prospective author to review pages 119–133 in the Publication Manual of the APA. Within these pages correct style is given for book references, periodicals, technical and research reports, proceedings of meetings and symposia, nonprint media, and much more. Relative to many articles submitted in the past, numerous references have had to be redone to comply with the APA style. It would be of immense help if each author would review the correct format and style prior to submitting an article for consideration. This, too, would save time for the Editor and/or reviewers.

Enjoy the remaining days of summer and autumn. I will look forward to seeing each of you at our fall conference in Washington.

Editor, Art Therapy

Art Therapy with Homeless Women and Children in a Bridge Housing Program in Scranton, Pennsylvania

Sister Dorothy McLaughlin, R.S.M., Ed.D., A.T.R., Professor Graduate Art Therapy Program, Marywood College, Scranton, PA

Abstract

This article describes an art therapy program for homeless women and their children in a state-funded Bridge Housing Program in Scranton, Pennsylvania. The goal of this program is to provide a bridge of community services enabling homeless women to reach self-sufficiency.

Art therapy, provided by graduate students of Marywood College under the supervision of the program director, is a means of evaluation and continuing personal development.

Individual evaluation sessions, group art therapy experiences and a case study of a woman who has successfully completed the one year program are presented to demonstrate the use of art therapy in a program for homeless women and their children.

Art therapy is an effective method of evaluating a homeless woman, and it is one of the most successful components of the Catherine McAuley Center Bridge Housing Program in Scranton, Pennsylvania. The goal of the program is to enable homeless women of limited income, living in scattered sites, to cross a bridge of community services to reach self-sufficiency.

A Bridge Housing Grant from the Commonwealth of Pennsylvania, Department of Public Welfare, was received in 1986, by Sister Anne Paye, R.S.M., Ph.D., Executive Director of the Catherine McAuley Center. The program, under the direction of Sister Kathleen O’Halloran, R.S.M., provides a support system based on the right to shelter, dignity and personal decision-making. A total of thirty-five women and fifty-seven children have been served by the Catherine McAuley Bridge Housing Program.

The art therapy is provided by graduate students from Marywood College, Scranton, Pennsylvania, under the supervision of the author. Art therapy is a means of evaluation and is part of the screening process for acceptance into the program. Personal growth and development, goal setting, development of communication and socialization skills, enhancement of self-esteem and emotional expression are some of the major objectives of the weekly individual and group art therapy sessions.

Prior to admission, each woman participates in an art therapy evaluation series conducted by an art therapist. The following series, adapted from the Family Evaluation of Hanna Yaxa Kwiatkowska (Kwiatkowska, 1978) is used: 1. Draw anything; 2. Make a scribble drawing or an abstract drawing; 3. Draw a house, a tree and a person; 4. Draw your original family doing something together; 5. Draw a geometric shape and select a color for yourself, then draw a geometric shape and select a color for each member of your original family; and 6. Draw anything. Six individual sessions are generally recommended; however, three sessions are deemed best in this program. The three are: 1. Draw anything and scribble drawing; 2. Kinetic family and geometric family; and 3. House-tree-person and Draw anything. The evaluation series helps to determine the potential ability of the woman to make personal decisions, to function independently and to manage her own life. Art therapy provides information that supplements the initial interview by the director.

The first art therapy session is important because the establishment of rapport between the client and the therapist leads to a relationship that can be positive or negative. This fact must be recognized at the beginning of therapy. The unconscious process that affects the relationship of the client to the therapist, known as “transference,” and the therapist’s feelings toward the client, or the “countertransference,” affects the outcomes of future sessions. A working relationship between the woman and the art therapist is essential (Wadeson, 1987). In the first session, the art therapist notes the choice of art materials, the size of the paper, the manner of working, the choice of subject matter, the woman’s mode of expression, representational or abstract, and her interests. Color, as perceived by each person, is important in determining

“Art therapy is a means of evaluation and is part of the screening process for acceptance into the program.”

944

July 1990, ART THERAPY 55
feelings in future sessions. The therapist does not interpret color without the woman’s personal description of her color choices.

One of the women recently accepted into the Bridge Program drew a sun at the top of the page and said, “I guess I wanted the sun to shine since it’s a cloudy day.” The page was empty, except for the sun at the top of the paper. In contrast her final drawing depicts her with three children and her comments were, “I wish to get my life and my children back in order.” She has two children to the left with her. The child to her right is with the father’s family. This woman’s wish is to be united as family. (Figure 1)

The kinetic family drawing and the symbolic, geometric family with color assigned to each family member is of great importance in this art therapy evaluation with a homeless woman. The majority of women in the program have a family support system that is meager or non-existent. Each woman, rejected by boyfriend or spouse and family, is seeking a support system elsewhere. In most cases there is no role model for mother. These two family drawings are considered to be the most important in the evaluation series for the women in this program because they generally indicate the break-down in the original family and in the current family structure. Family relationship problems may pin-point current relationship problems.

The house, tree, person drawing using colors is a means of reflecting upon concepts familiar to the individual and is an emotional experience which conjures up memories, pleasant and unpleasant (Hammer, 1958). Drawing the house, tree and person on the same paper instead of using a separate sheet for each provides a means of discerning relationships and extends the House, Tree, Person Test of Buck and Hammer, which elicits a projection of self into each of the topics (Hammer, 1958).

The drawing of choice provides the opportunity for the woman and the art therapist to review the series of drawings together and to discuss the art experiences and the continuance of the art therapy program. The relationship between client and therapist, based upon the therapist’s belief in the potential of the client and the woman’s trust in the therapist, can lead to a healing experience for both.

Group art therapy sessions with the women include the following themes to achieve specific objectives:

1. Body tracing: Working in teams of two, one tracing the outline of the
"The majority of women in the program have a family support system that is meager or non-existent."

other, is a task beneficial to the women and their children. The cut-out, completed body portraits provide the opportunity for self-reflection and allow for the in-put of the group. The objective of the session is to develop self-esteem through self-reflection and group support by discussing the body racing with the others. (Figure 2)

2. Personal mandala: The women are from diverse religious backgrounds; about 10% are Catholic. They all believe in God, so art as a spiritual experience is included as a meditation experience. After a discussion of one’s color psychology and the varied, individual responses to color connotation, each woman lists her favorite-to-least-favorite colors and what each hue or color means to her. This experience enables her to select the color that best describes her reflection during the meditation experience. Using heavy water color paper with a pre-drawn 12” diameter circle and wet-on-wet water color technique, each woman designs a personal symbol for herself and places this in the center of the circle. After the personal symbol is completed, she is asked to center in on “Forgiveness” and “Thanksgiving.” As she recalls a time when she needed to forgive or be forgiven, she uses colors that express her feelings, and she meditates on the remembrance. Events and experiences which are perceived as gifts or joys are expressed as thanksgiving experiences. Each woman shares her meditative experience with the group. The objective for this mandala meditation is to express forgiveness of self and others and to thank God for the gifts and joys received in the day-by-day events of life. (Figure 3)

3. Group mandala: Three groups of four women design a symbol for the center of a mandala, 36” in diameter using crayons, pastels or markers. Each person draws what her involvement in the Bridge Housing Program means to her and discusses the group mandala with everyone. The objective of the group mandala is to demonstrate the ability to work together and to express thoughts and feelings openly to the group.

4. Short-term goals: Each woman selects a goal that she would like to achieve and symbolizes in a drawing how she will go about accomplishing this. She shares her goal with the group and together they discuss the pros and cons of the task. The objective of this session is to identify a short-term goal that is essential to her personal growth and to draw and list ways to achieve this.

Case Study

One case study of a graduate of the Catherine McAuley Bridge Housing Program illustrates the success of the program and the importance of art therapy. Lucy is thirty-one years old and is the mother of seven children, six boys and one girl, ranging in ages from fifteen to four. Lucy was abandoned by her mother when she was two years old. Her father was an alcoholic, and the court denied him custody of the children. Lucy and her older sister were raised by their maternal grandmother, and her younger sister was adopted by her father’s sister. Lucy was married at the age of fifteen.

"The relationship between client and therapist, based upon the therapist’s belief in the potential of the client and the woman’s trust in the therapist, can lead to a healing experience for both."
Subsequent events in her life demand confidentiality so they are deleted from this account. Lucy has always wanted to have a large family.

Lucy moved to Scranton and was living in a house that was condemned, and the family was evicted. Because she was a single parent with seven children, it was difficult for her to get housing; landlords do not like to rent to families with children. Her housing need was apparent, so she was able to get a four-bedroom apartment in one of the projects. Lucy was accepted into the Bridge Housing Program and she became involved in the programs.

Art therapy was well received by this family, especially by Lucy, who has always wanted to paint. She loves color and expresses herself best in abstract drawings. Lucy never complains about having to care for seven children. Her greatest joy seems to be her children.

As a means of getting to know her better and to give her the opportunity to paint, the author held individual art therapy sessions with Lucy each week, using water colors, wet-on-wet technique. Lucy began with an abstract painting of her only daughter, age six, and she discussed how precious this little girl is as she painted a morning glory. "She always wakes up happy," is the way Lucy described Betty. (Figure 4, d) Lucy discussed each child as she painted. She described her oldest boy as warm and loving and laments that she may require too much of him because he is the oldest and assumes a responsible role in the family. She painted a big, red doughnut and made a black center as she commented on his anger. (Figure 4, a) Lucy retained the blank white paper for almost half of the drawing as she described her second oldest as mysterious. (Figure 4, b) Her third oldest she said was like the second oldest. (Figure 4, c) She feels she does not really know these two boys as well as she should. Both boys are introverted. She described the twins as somewhat alike, yet different, and she used the same colors while talking about each. (Figure 4, e) Her youngest son is multi-colored because he is a little bit like each of the other children. (Figure 4, f) We matted and framed her paintings of each child. The art therapy sessions continued at their home where the seven children made a collage about their mother. (Figure 5) After the framing of the collage and the other paintings, the two oldest boys hung the paintings in the living room.

Some of the family art therapy sessions, conducted every Friday evening from 6 until 8 o’clock were: Design a house, design your own room, and make a clay model of yourself. A short-term goal was: no fights in the neighborhood for one week.

Lucy has graduated from the program and is now living in a larger, five-bedroom house. She received a certificate as a geriatric nursing aide.
"The potential for using art therapy as a catalyst for personal growth and development for homeless women and their children is evident."

from Marywood College. Now she is ready to commit herself to full-time study. She asked to continue the art therapy as a means of her setting short-term goals and discussing them with another adult. Each Wednesday, the author has volunteered to have an art therapy session focused on goal setting. Lucy’s goal is to begin her career in a role focusing on children. (Figure 6) The Bridge Housing Program still provides a support system and the art therapy continues to contribute to the development of a cohesive family system.

Through the Catherine McAuley Center Bridge Housing Program, one small candle has been lit in Scranton, Pennsylvania. The potential for using art therapy as a catalyst for personal growth and development for homeless women and their children is evident. Art therapy is a viable means of expression, a process of identifying goals, a way of developing self-esteem, communication and socialization skills. The establishing of personal relationships leading to a caring support system is the healing gift that blesses all persons involved in crossing a bridge to wholeness.

Visceral Learning: The Integration of Aesthetic and Creative Process in Education and Psychotherapy

Robert Wolf is a faculty member at the College of New Rochelle, in the Graduate Art Program, a Visiting Professor for Pratt Institute and a Senior Member of the Faculty of the Training Institute of the National Psychological Association for Psychoanalysis. For over two decades he has taught courses in psychoanalysis, art therapy, sculpting and photography at these and other institutions. As a practicing sculptor, he has exhibited work through galleries in New York City, Westchester, Albany, Washington, D.C. and Boston.

(Parts of this paper have been taken from the Introductory Statement and Gallery Talk held in conjunction with COMPLEXITIES: An Exhibition of Wood and Stone Sculpture by Robert Wolf, at the Center Gallery of the College of New Rochelle, October, 1989.)

Abstract

The author discusses and explains how being a creative artist has been an integrative factor and an influence on experiences as a teacher, author, art therapist, psychoanalyst and artist. With focus on non-verbal communication and symbol formation, aesthetic response and modification, and visceral learning (integration of cognitive and affective growth), the author discusses application on many educational and training levels. In graduate art therapy training the author gives, as examples, image transformation classes, phototherapy groups, and art therapy practicum groups. The application within psychoanalytic institute training offers examples such as advanced seminars on counter-transference (with a case example presented here). The application in clinical practice offers a case illustrating the resistance conflict through drawing and the working through this resistance through creative imagery exercises as well as working with the transference. This many-faceted article outlines how the author integrates concepts of aesthetics in the creation of two- and three-dimensional art within studio art training, art therapy training, psychoanalytic training and clinical practice.

The Artist's Introduction

As I look back over my professional career which now extends through a period of over twenty-one years, I realize the difficult and complex task, I have faced in attempting to integrate my experiences as a teacher, author, art therapist, psychoanalyst and artist.

I have discovered that my own creative work, particularly my sculpture, has facilitated this process of integration. This article is an attempt to explain how my experience as a creative artist has influenced my work in these various areas of my life.

PART I

Non-verbal Communication and Symbol Formation

We all, at first, experience our early environments on a non-verbal level. As perceptual experience becomes more differentiated we react viscerally to what we perceive as images, sounds, smells and feelings. We express ourselves through action and gesture. Later, we learn to organize our thoughts into symbols and eventually we further synthesize our experience into secondary process language. For most people, words and cognitive thought begin to take precedence and cover over the more powerful precursors of language, even though these affective perceptions continue to be present on all levels of interactive experience.

As artists, we continue to explore our non-verbal imagery and by doing so, become familiar with and seek to integrate our primary process functions with secondary process (Robbins, 1987). Through the process of creating artwork we can go back to our basic visceral form of experience and learn to re-own powerful, pre-verbal parts of ourselves.
Our unconscious and preconscious are receptive devices which collect raw perceptual data; we never truly forget what we experience. We are constantly collecting data on a variety of perceptual levels. In fact, most perceptual information comes to us non-verbally and is held in our unconscious; otherwise our conscious thought processes would be quickly inundated. We condense and store much of these data as visual images or symbols but we can learn to recapture the importance of these experiences, and foster integration, only if we train ourselves to encourage the ego regression which we must undergo in order to reach these primitive places within ourselves. Once we retrieve these symbols, we must learn how to work with them in order to unlock their meaning and power. In fact, they may even be distorted and in need of aesthetic restoration or modification before their true meaning may be understood.

Aesthetic Response and Modification

The concept of aesthetics may be seen, within this framework, as a physical manifestation of what feels subjectively ‘right’ on a variety of levels. We often say that something is aesthetically pleasing or not pleasing based on this inner subjective experience which monitors the variety of affective levels described above.

Certain aspects of aesthetic response may be culturally or personally influenced, such as one’s sense of optimally spacial distance between the subject and the object, while others may take on a more universal quality, such as when we agree that a particular work is indeed a ‘masterpiece’ or ‘classic.’

Certain schools of art therapy and expressive therapy suggest that if we discover that a person’s sense of aesthetics is ‘out of balance’ with what is our accepted norm, we can influence him or her to correct this aesthetic sensibility to conform to higher aesthetic standards, and in doing so, we may simultaneously improve his or her inner state of psychological balance. Simply stated: as we strive to correct aesthetic distortions in our artwork, we are simultaneously attempting to reshape the impact of our earliest visceral experiences which have contributed to the original formation of the art/image. This can have an integrating effect on us. For example, Zierer (Zierer, 1987) has introduced the idea of the art therapist deliberately adding what she called “push strokes” to a patient’s work to intentionally break up the aesthetic balance. The patient is then instructed to re-work the painting, this time pushing it toward a higher level of aesthetic integration. She claims, through this approach, to demonstrate a parallel improvement in her patient’s mental functioning.

Robbins (Robbins, 1989), in his discussion of Ehrenzweig’s concept of “ego rhythms,” proposes that depth-oriented psychotherapy which aims to promote structural change, must help patient move between the ego states of “formlessness and form” or, to put it differently, between primary and secondary processes. Because one’s ego is most easily receptive to modification through assimilation on this visceral level of experience, one’s sense of identity and ‘self’ are seen as being enriched or enhanced through the exercise of this rhythmic process.

My concept of being ‘out of balance’ and striving to achieve ‘balance’ moving back and forth between these divergent ego states adds further dimension to these ideas. By letting my art serve as a reflection of primary process, on a level of visceral perception, I can then shift to secondary process functions which help me to recognize, organize and ultimately metabolize this energy in an integrative manner.

How These Concepts Effect My Work as a Sculptor

As a sculptor, I use this same process to externalize feelings stirred by intensive clinical work and personal experience. By creating my own art, I am able to see where I become ‘out of balance,’ as it is reflected back to me through the various forms which may then too, seem ‘out of balance.’ As the artist in me then strives to correct this imbalance, a subtle change often occurs within me which translates into renewed objectivity within my clinical work. Personal issues, not exclusively related to clinical work, but often interwoven within the experience, may also be unwoven and worked through in this process. This technique is often accompanied by secondary process associations which bring cognitive understanding.

“The concept of aesthetics may be seen . . . as a physical manifestation of what feels subjectively ‘right’ on a variety of levels.”
to the experience, and may indeed be likened to Freud’s concept of ‘Self-Analysis.’

Each piece of my own sculpture reflects a time in my life within which an affective issue was externalized and restructured through this process. Some may represent clinical dilemmas stimulated by an interaction with a current patient, while others are more personal in nature. It is very likely that even clinically stimulated issues had some personal conflict interwoven, as is often the case with complex transference/intersference phenomena.

Certain of these experiences are clearer to me than others. For example the ‘COMPLEXITIES’ piece itself, which I chose as the title-piece of a recent Solo Exhibition, took well over five years to complete and clearly reflects a time when I struggled to integrate seemingly diverse parts of myself, the artist and the psychoanalyst, and to find a new integrated identity within these complex and challenging personal and professional worlds (see illustration 1). Another piece, titled ‘THE BEGINNING’ was created during a period when my wife was pregnant with our first child (see illustration 2). I sculpted the form with steadfast determination, moved by a driving force which I did not at that time understand. Months later, looking at the finished piece I was struck with the embryonic sense of form and gesture. It was only then that the full

“There is great satisfaction in developing new ways to teach artists, art therapists and psychoanalysts how to recognize and harness the power of their individual creative energies.”

Fig. 1 “Complexities”
Fig. 2 “The Beginning”
Fig. 3 “Woman Holding a Secret”
impact of my ‘sympathetic pregnancy’ and parallel emotional experience was revealed to me. Another piece, THE WOMAN HOLDING A SECRET, was named by a close friend who took one look at the finished sculpture and spontaneously articulated what I had been trying to communicate, but had been unable to put into words (see illustration 3). In time I realized that this piece served to help me work through strong feelings of loss associated with another friend who had suddenly been diagnosed as having a terminal illness. She was indeed holding a secret which was to unfold throughout the next few months with devastating impact.

PART II
Visceral Learning: Integration of Cognitive and Affective Growth Through Creative Experience

This part focuses on the impact of conducting psychotherapy on creating artwork and the effect of creating art on one’s ability to practice psychotherapy and teach. The concept of ‘Therapist’ is expanded to also include ‘Teacher.’

There is great satisfaction in developing new ways to teach artists, art therapists and psychoanalysts how to recognize and harness the power of their individual creative energies. This process for me is yet another expression of my own drive for aesthetic experience and creative expression.

As a Psychoanalyst, Training Analyst and Graduate Art and Art Therapy Faculty member, I have discovered that one of the most helpful and provocative concepts which I can use in my clinical work and demonstrate to students, is how to get in touch with one’s inner non-verbal imaginal responses or reactions to one’s external experience, and how to use it both clinically with patients and within oneself to promote psychic growth and integration. This concept is demonstrated in the following sections, with specific modifications, for each of these educational and clinical settings.

Application in Graduate Art Therapy Training

A. Bridge Courses:

Within the Graduate Art Therapy Curriculum I’ve developed what I call ‘Bridge Courses’ which provide studio art quality experience within the framework of Art Therapy Training Groups. Students are exposed to sensory stimuli and are encouraged to react through visual images. These images are then transformed into three-dimensional models and finally into gallery quality stone sculpture. This process demonstrates the power and importance of personal images, as each finished piece generates a personal field of energy within which the student/artist may resonate and rediscover a previously lost part of himself/herself. This reemergence of lost symbols is often accompanied by powerful affective reactions, similar to abreactive responses to well timed psychoanalytic interpretations which are designed to push one towards bringing repressed material into consciousness. This experience demonstrates the power of art therapy in an affective manner so the ‘learning experience’ takes on a vitality beyond the limitations of a purely didactic or cognitive exercise.

Example 1: Imagery Transformation Class

Donna, a first year art therapy graduate student, began to carve a piece of alabaster in the shape which she had evolved first in two dimensions. After a short while, it was apparent that Donna was having a very difficult time learning how to master the tools effectively. She seemed unable to have much impact upon the stone. The harder she tried, the more the stone seemed to have a mind of its own and resist her effort. As Donna was as physically capable as any of her classmates, who were all pulling farther ahead in their work on similar stones, we became aware that this ‘experience’ was communicating something for us to understand, on a deeper level.

When asked to describe her feelings about the stonecarving experience, Donna began to explain that she had recently been hospitalized and found to have a previously undiagnosed illness. She described her reaction to this discovery as her being angry, frustrated and hopeless, but she had tried to overcome these feelings by surrounding them with an emotional wall, ‘for otherwise, I might not be able to function effectively in my everyday life.’

It soon became clear to Donna and the class, that the process of chipping away at the stone closely paralleled the feeling of chipping away at her ‘emotional wall.’ Because Donna feared the reemergence of her angry, futile feelings, she was unable to effectively cut through the stone which had become a symbol for her defensive stance, while displacing the affect of frustration onto the stone. As we explored this phenomenon, Donna was able to see that experiencing her anger and futility was actually essential for her to work through this traumatic discovery.

By looking at Donna’s overall experience i.e., attempting to carve her stone and viewing it as an unconscious communication which was being sent out into the world, needing to be received and understood, we were able to help Donna re-integrate this important split-off part of herself.

B. Phototherapy Training Groups:

Within the Graduate Art curriculum I have developed a sequence of courses, starting in basic photography and leading to advanced photography and ultimately pho-
totherapy, which explores the value of non-verbal communication through photographic images. Here, at this most sophisticated level, technically skilled students work together as a group to explore their own reactions to creative exercises.

Students are assigned stimulating creative projects such as ‘redesign your childhood through modifying family snapshots’ or ‘create a self-portrait photograph without using an image of yourself.’ The results of these exercises are systematically explored and processed by the ongoing group. Eventually, the art therapy students may go on to develop and apply these and other original techniques in clinical settings. For the art students who engage in this process, the results can be quite gratifying as they experience the power of their unconscious and begin to understand its effect upon their creative imagery. The over-worked stereotyped view that ‘therapy’ inhibits one’s creative expression is exposed as untrue and, in fact, is clearly experienced as just the opposite!

Example 2: Phototherapy Training Process

Melissa, a graduate art therapy student enrolled in a PHOTOTHERAPY class, presented her experience as she began to work on her FAMILY HISTORY ELABORATION project. The directive had been: Re-photograph various family snapshots taken when you were a child or later as an adult, and, using a variety of creative darkroom techniques, elaborate or change the images to express something that you would have liked to be different.

Melissa explained how as she began to sort out a batch of old photos, she had spontaneously burst into tears as she was suddenly gripped by intense feelings which seemed to come up without warning. She explained that she could not immediately understand her sadness, but had, upon reflection, realized that she had been drawn to examining a particular time in her childhood when she seemed to suddenly look and obviously feel ‘different.’ She went on to explain that in spite of careful examination of her childhood in ongoing psychoanalytic psychotherapy, she had been unable to understand, more precisely, her vague feeling that “something had happened along the way” which had had a great impact upon her. This intrapsychic shift had eluded a more detailed verbal exploration until now. For Melissa had begun to see, when she spread out her family album photos, a particular time in her life when both maturational and familial factors converged in a traumatic way. Without this visual experience, these issues might not have been identified and explored. The impact of the visceral image was able to break through secondary process defense structures and overcome a therapeutic stalemate.

This shared experience was a wonderful learning tool as it communicated on a powerful, affective level, the effectiveness of using photographic images in psychotherapy. Both Melissa and her classmates were deeply moved by the experience.

C. Art Therapy Practicum Groups

In the art therapy Practicum, student learn to draw their image responses to clinical concepts and case material. As they become familiar with this level of communication we continue to demonstrate the power of the non-verbal part of ourselves which is constantly reacting to non-verbal parts of our patients and ourselves. Students become highly sensitized to the power of their own imagery, and its ability to transcend secondary process defenses.

Example 3A:

Betty, a second year art therapy student, presents a case from her clinical fieldwork to her Art Therapy Practicum group. As she begins to drone on about her case which ‘seems’ interesting, her affective disconnection from the material, along with her defensive intellectualization, are reflected back to her by her classmates who have been instructed to react to class presentations by drawing their spontaneous image responses and share them with the presenter. This technique demonstrated how the peer group can focus on non-verbal levels of communication offered by the presenter. The instructor structures the resulting discussion to explore images which arise in response to both the patient’s and presenter’s unconscious process. These images are examined within this transference-countertransference paradigm.

The group’s drawings are compartmentalized, rigid and fragmented. Chaotic forms were drawn often encased in thick lines or shattered in splintered pieces. Surprised by the group’s response, Betty struggles to find the source of her disconnection, and cautiously reveals striking similarities between the patient and an ill family member. As she describes this realization, she becomes more connected to her feelings and the presentation proceeds in a more integrated manner, as her over-identification and initial defensiveness are understood and worked through.

Example 3B:

We recently began another Practicum supervision group and became aware that one member, Marlene,
seemed to be engaged in an internal struggle whether or not to present a case with which she was having difficulty. Fellow students quickly picked up her tension and questioned her about it. With reluctance, she admitted that she was about to ‘give-up’ and admit ‘defeat’ with a case of a eight year old boy whose parents had both recently died of AIDS. He was living with an aunt who complained that he was out of control and she was at her ‘wit’s end’ in dealing with his abusive behavior. This boy had begun art therapy sessions and had consistently tested the limits which Marlene had established. She had adapted a position of trying to contain his aggression. This theoretical stance had led to a further regression whereby Tommy had most recently begun to throw bits of clay at her. Marlene justified her position quoting concepts by Bion and Winnicott, yet, something felt ‘out of balance’ given the escalation of Tommy’s behavior and his subsequent refusal to come to future sessions.

The group absorbed her story and sat, for a few moments, in deep thought. I asked for people to describe their images to us. One person described wanting to reach out and shake Tommy, another described how she’d like to take a large bullhorn and yell at Tommy to “Stop it.” This image struck Marlene, who described how her supervisor had mentioned that she seemed to be too uptight and needed to loosen up and ‘play’ more with her child clients. I asked her to elaborate this image and as a group we came up with a creative intervention for her to employ. She would draw a comic book for Tommy and in it, illustrate this cartoon of her ‘giving up,’ and letting Tommy ‘win’ the battle over control of the art therapy sessions. She would be able to distance herself enough from the feeling of being stuck to creatively articulate the situation in a humorous way, mirroring back to Tommy, a sense of being understood and therefore, paradoxically, not abandoned. This felt aesthetically ‘right’ to her.

In the discussion which followed, it became apparent that the initial feeling of ‘giving-up’ was a multi-determined communication starting with Tommy, as a feeling of deep despair and loss, and projected onto Marlene, for her to either use as a device to deeply empathize with Tommy, or, to act-out and reconfirm that the world is indeed a hopelessly rejecting place. This experience of Tommy being out of control, touched a profoundly similar experience from Marlene’s past and she had begun to close off this affective connection by adapting the defensive position of closing down and disconnecting. With the help of the group, Marlene was able to begin to understand this process. Her dilemma was clearly understood and a solution was discovered through the use of creative imagery which bound up the destructive potential of the projective identifications.

Application Within Psychoanalytic Institute Training

Next, at the Psychoanalytic Training Institute, I have developed ways for the analyst-in-training to become sensitive to his or her own affective and imagery responses to patients. I demonstrate how these responses may be visual in nature and show how and when we can use these responses in our clinical work (Wolf, 1985).

Example 4: Advanced Seminar on Countertransference

Mona, a psychoanalytic candidate, presented the following material:

“During a recent session with my patient, a middle aged woman who I’ve been seeing 3x a week for the past 2 years, the patient, who I’ll call ‘P’ suddenly bolted up from the couch as I made an interpretation and announced, as she literally cringed, that she experienced my comment as an attack or assault upon her.”

Mona reported her own countertransference reaction as being confused, feeling suddenly in the middle of a turbulent place. I asked if she could find an appropriate IMAGE and she replied: “I’m swept up in a tidal wave, spinning around and around.”

I explore this further and ask her to close her eyes and imagine she’s in the wave now and describe to us what happens. “I’m spinning, bobbing up and down, gasping for air, afraid I’ll drown.” She’s visibly shaken and I ask her now for associations. “Beaches, as a child, with my mother I almost drowned. We were together in the ocean waves, and we were both swept away, several times and almost drowned!” What about mother’s presence, I asked? “She was hysterical, worse than me, she incited anxiety and panic and was no help to me.”

I said: Your patient reacted to your interpretation with a sudden and startling feeling of being assaulted and this frightened you. You couldn’t, at that moment, call upon the soothing and calming presence of your internalized mother because your mother was not, in reality, that way, so you grew panic and were inundated and overwhelmed by your patient’s intensity. In your anxious state, like that of your own mother, you couldn’t be with your patient to calm her and explore where, for her, this sudden transference reaction was coming from!

As I said this, Mona relaxed. She was clearly less agitated and seemed to understand what I had said, on a visceral level.

Next week in class Mona reported that it seemed as if her patient had been listening to our discussion in class the week before. She had reported that she felt confusion and turmoil during the session in which she reported feeling assaulted. Mona had then shared her image of being swept up in a tidal wave and the pa-
tient said, “that’s right. I felt like I couldn’t tell who was being swept away, you or me!” Once having cleared the air in this manner, Mona was able to go back to the patient’s material and explore it in more detail. She was able to become a calming and soothing presence for her patient who needed this to counteract the intensity of the negative transference reaction.

Mona’s image of the tidal wave served to help externalize her own countertransference feelings which were triggered by feeling “swept away” by her patient. For as she had been trying to maintain an empathic connection with ‘P’ by making interpretations, ‘P’ seemed overwhelmed, out of control and far away. As these issues were brought out into conscious awareness, Mona was freer to see the differences between herself and her patient. She was no longer swept away. She said “I can now see how my identification with my helpless, ineffectual mother was also a defensive reaction to being accused of attacking ‘P’; and, by being stuck in that place, I couldn’t piece this all together until now.”

Application in Clinical Practice

Within my clinical practice I use my artistic skills to scan material presented by patients and sense where there is an aesthetic imbalance. I then refocus the patient in this direction and help guide patients to deeper personal insight and understanding through a variety of clinical interventions.

Example 5: Integration of Aesthetic Experience Within Psychoanalytic Psychotherapy

The following is a transcript of a sequence of three psychoanalytic psychotherapy sessions which demonstrates how the artist in me influences my work as therapist. As an artist, comfortable with the complexities of multidetermined levels of communication, I am able to listen and flow with the multiplicity of issues presented by this patient. I use my creative energy to react to her in ways which foster a clarification of these issues and promote insight, growth and integration.

VANESSA

History:

Vanessa, a 29 year old artist, has been in psychoanalytic psychotherapy for five years (individual + group). She has recently experienced a strong phase of resistance to our work which has manifested in her feeling stuck. The manifest issues which she presents have to do with problems she is experiencing with her two year old child, with her weight problem and with her relationship with her husband Jerry. As these sessions unfold we begin to see how these issues are woven into a fabric which needs to be responded to in creative ways in order for Vanessa to untangle them, understand their impact on her life and integrate this understanding within a new, more resilient ego structure.

Session 1: Identifying the resistance conflict through drawing:

P: “I’m not getting along with Jerry lately—I hate him, we’re always arguing. The baby threw up in the car and he was no help to me, he just spaced out, I yelled “Help me!” My friend Kathy just walked out on her husband, he was such a jerk!” . . . Jerry says after all these years of therapy I’m still so miserable, complaining, unhappy and negative, maybe therapy isn’t working for me and I should quit. Why do I hold onto so much shit? I want to change but I keep waiting for ‘it’ to happen to me. I get so MAD when I realize that I have to do ‘it’ myself. I waste
so much time... I realize I could set it up so Jerry would leave me if I keep this up.”

TH: “Or, you could make your relationship work well.”

P: “Yes, that’s true. I use a lot of energy being stubborn and negative, I feel smug like a child sitting like a rock saying ‘You can’t make me do it, I won’t do it for you!’ As a child nobody liked me the way I was, so I tried to be whatever they wanted me to be. The ROCK was my way to say fuck you—I won’t be what you want me to be.”

TH: “Can you imagine yourself as the ROCK?”

P: “Yes, it’s triangular, with two little feet and hands, arms crossed with a tiny head balanced on top (see illustration 4).”

TH: I ask her to draw, she reluctantly agrees and I laugh at her ambivalence, and say “you know, rocks really don’t draw!” She laughs at my playful remark as it points out to her that while she may feel like a rock, only part of her is experiencing herself as the rock, and that there is a healthier side which is striving to overcome this resistance.

I ask her to describe what she sees in the drawing.

P: “Now I’m angry, infuriated—I feel I’m in a straight jacket, like my head could roll away, like it’s not attached, but I know better, I don’t want to go there now.”

TH: “You act as though experiencing this image will give it power over you, but, in reality it won’t.”

P: YELLS—“I didn’t do this to myself! Someone else did this to me! I didn’t do this, someone should take me out. I don’t have any responsibility for doing this. I’m mad, look at me, I didn’t do this. I want to scream.”

TH: “It looks to me like the figure is actually behind the rock, HOLDING ONTO IT!”

P: “I don’t want to feel that I’m doing this to myself. I want to take the responsibility for doing it, because then I’d have the control to let go of it! I have such resistance to hearing you say this. It’s so simple, how can I justify the past and all that pain if I admit that I caused so much of it by holding on.”

TH: “So you’d continue to carry this rock forward into your life and risk your marriage and your daughter, in order to ‘justify’ your past behavior?”

P: Indignantly “Yes!” she cries... “I’d be naked without my ROCK!”

TH: “What would you look like without the rock?”

P: (finding new strength from this idea) “I could buy new clothes that I liked. I see that I’m dead with the rock, but without it there’d be room to change. I need to chip away at this!”

Session 2: Further working through the resistance through creative imagery exercises:

P: “My life is too hectic, I need time for myself, to paint...”

TH: (Getting back to last session’s image) “Paint ROCKS?”

P: “You’d be the one to chip away at my rock, you’re the sculptor. I’d just be holding it. I’m so afraid to change it myself, afraid of what is inside and what would come out. I’m afraid I’d smash it or chip away too much so I couldn’t put it back.”

TH: “Like the way you’re afraid to lose too much weight?”

P: “Yes, I’d have less of a barrier between me and the world. I’d feel raw, vulnerable, yet ALIVE, but I’d have no insulation. Men would find me too attractive and I’d have to say yes. I’d have NO BOUNDARIES.”

TH: “So loss of weight means loss of boundaries?”

P: “Yes, that’s what it is. I’d leak out into a puddle and lose my shape. My skin would be too thin to hold me together. I couldn’t stay intact! I’d have nothing left, no core, nothing but dust!”

TH: Genetic interpretation of underlying conflict: “You never discovered how to establish boundaries without creating your rock, but you’re beginning to understand the price you pay for holding onto this rock.”

P: (confirms my interpretation) “I always separated myself from my family by being the ‘fat’ one. Jerry has been losing weight lately, he looks so great, I’m so jealous...” (begins to go off on tangent)

TH: (feeling resistance come alive in the room) “You’re feeling resistant now?”

P: “I’m very aware of holding the rock at this moment, and I don’t know what to do with it. I can’t chip away at it if I’m holding it, if I drop it it’ll break and crumble, and if I put it down it’s not covering me. I NEED IT!”

TH: “Talk to the rock.”

P: “... I need you. I need to hold you, hold onto you forever, yet my arms get tired and I can’t do anything else while I hold you. I have no freedom, I have to use all my strength to hold you, then I have nothing left.”

TH: “Now you be the rock and answer.”
P: ROCK: “I’m dead. I feel nothing, I don’t care what you do with me, I have no purpose in all of this except to ‘BE.’ This is your thing—not mine!”

P: Insight: “When I’m the rock I feel dead, when I’m me I en fuse my energy into the rock. It’s a neat package. It rationalizes my not doing anything to change.”

Session 3: Working with the Transference:

P: “Still feel smug and defiant. I want you to make me change but if you dare try to push me I’ll dig my heels in deeper. I want you to make an interpretation which will make all of this go away so I can move forward.”

TH: “Maybe this is what you need to be doing, and it doesn’t have to be the Met, or the greatest opera singers, or the greatest interpretations by other people that will make everything better.”

P: “My child is so strong-willed, she’s a mirror of me. We butt heads, I’m out of control, I’m her slave, yet I admire her strength. I want to be the child, but who will take care of me?”

TH: Transference Interpretation: “You’re playing out your conflict over control and power with your daughter, and also here with me.”

P: “I feel like this big baby and we battle for space. My mother said that I never did this with her. I was terrorized into not doing it. But by playing this out now, for the first time, I feel so powerful and in control of the whole world. I want to give my daughter this sense of being empowered, in a healthy and good way. But instead I just engage in power struggles with her. I’m afraid to be firm with her and I let her run wild, then I feel terrorized by her. I roll in the shit and complain of being powerless. I love wallowing in shit.”

TH: “Can you imagine yourself in the shit?”

P: “Yes, I’m alone, going at my own pace, exploring it, feeling it, I don’t ever have to stop.”

Insight: “I never had this kind of ‘unlimited space’ as a child. Mother would always intrude on my space.”

TH: “Now we can understand why you have needed this space to feel stuck, and not be pushed out of the shit until you are ready to move out.”

P: “It just felt like you took two wires out of my head and reversed them and stuck them back in a different way. It’s like things are re-framed for me.”

TH: “When you are ready to move on you will do so and feel empowered to make changes in your life. Whereas if you’re pushed out before you’re ready, you’ll feel helpless and powerless and ‘rescued’ by the powerful other person.”

Over the next few weeks, Vanessa was able to slowly metabolize the insight gained through this creative, therapeutic experience. We were able to use other drawings to further articulate feelings and conflicts during this particularly important phase of psychoanalytic treatment.

If I had taken a more classical psychoanalytic view and simply interpreted her resistance as merely resistance, I would have missed the opportunity to explore and understand the significant issues which were being communicated through the resistant behavior. We needed to shift gears so to speak, and move from the language of words to the language of images, and back to words. These images contained the raw power and energy which had been split off and inaccessible to verbal intervention. As they were discovered and explored, Vanessa began to play with her conflicts in a way which gave her space to see the issues more clearly and ultimately move ahead and out of the resistance phase. This is a clear example of how a creative act may be utilized to overcome a resistance (Robbins, 1975), as well as an example of how patients need to understand the value of their resistance and defense mechanisms (Robbins, 1989).

I believe that it is the same quality of elasticity of my own ego, which I exercise and utilize in my creative work as a sculptor, which I also utilize here in clinical work to move in and out of the complex layers of communication presented by this patient. Ultimately however, I must rely on my knowledge of theory and experience as a trained psychoanalyst to synthesize my own levels of perceptual and affective experience and formulate appropriate interventions. This case presents to us a clear example of how this form of ego splitting within the therapist, along with his ability to move easily from secondary to primary and back to secondary process level of thought and communication, clearly benefitted this patient who might have continued to feel ‘stuck’ if a more traditional method of treatment had been rigidly adhered to.

Some Thoughts on Parallels Between Personal Artwork and Clinical Experience

As I begin to think about the similarities between stone carving and clinical work I am aware of many parallel experiences. For example I can see how my work as a clinician has taught me to have a great deal of patience, which is also an important factor in stone sculpting. Perseverence, and an appreciation of the time needed to evolve and integrate new ideas and connections has been taught to me through my work in both of these disciplines.

My work with patients has taught
me to use my sensitivity to know when to dig more deeply, or when to retreat and back away. It has taught me to respect the power of the unconscious and to feel comfortable enough to permit ego regression, which encourages the externalization of highly cathetted symbols. It has taught me how and when to mirror a patient and as a result, I find a heightened ability to resonate with my stone, to reach a place where it feels like the stone is telling me what it needs to have done to it.

This experience may indeed be similar to Winnicott’s ‘Primary Illusion’ where the infant child believes that he magically creates that which he needs, i.e., that which is really coming from the outside is experienced as magically created from within (Winnicott, 1975). In my example, there is, through the process of projective identification, a remarkable reversal whereby I am identified with the stone and I feel as though I magically create myself.

As the years go by, for those of us who engage in depth-oriented clinical work, there is an increasing need to find some way to externalize the toxic inductions, projections and introjections which are inevitably taken in. As therapists, we learn to discipline ourselves, to not act-out these induced feelings with our patients. I have become increasingly aware of the importance of my artwork in facilitating an important avenue of discharge of these feelings. At times when I am struggling with how to deal with a particularly difficult patient I seek the organizing effect of the sculpting process. Other times I may just need a more general experience of seeing some concrete change effected by my energy to counterbalance the painfully slow and imperceptible changes in certain patients, which tend to build up as frustrations within me.

Finally there comes the question, “When do you know when a piece is finished?” Here too is a parallel: “How do you know when a patient has gone as far as he can in treatment?” I have learned to listen carefully to the patient, to listen for clues that an integration of the resolution of issues which has led to growth has been achieved, and for the moment, the growth seems to be stabilized. There is often a feeling of ‘balance’ about this person, an inner peacefulness along with a sense of vitality and energy which has been freed from psychic conflict to now be used in the pursuit of quality life experience.

In deciding when a piece of sculpture is finished I look for a similar kind of balance and integration. The form should work well from all angles. There should be tension, excitement or energy present which did not exist before.

At times a patient may return to treatment at a later period of his life. What had been resolved sufficiently, at an earlier period, may now need further work. Sometimes certain people, especially young people, have had only limited life experiences and some conflicts may not have had the opportunity to be exposed prior to entering treatment therefore necessitating further treatment at a later time. I have found the same is true with my sculpture. I sometimes feel a piece is ready to be polished only to find that when I view the finished piece, there is still something out of balance or incomplete. Sometimes this feeling may not be immediately apparent to me, and I may wait months, or even years for the piece to become, once again, ‘unresolved.’ This may of course never happen to a piece which can remain ‘resolved’ forever (if there is such a time-frame!). I believe that there are times when it is best to leave the piece alone, even if it loses some of it’s power for you, and other times when re-opening and re-working the piece may lead to some further integration. This decision must be made intuitively, just as one must carefully weigh the decision whether or not to re-enter treatment.

CONCLUSION

In this article I have attempted to outline how I have been able to integrate concepts of aesthetics, or what I call ‘Visceral Experience,’ as found in preverbal perception and symbolization which occurs in the creation of two- and three-dimensional art, within the seemingly diverse areas of studio art training, art therapy training, psychoanalytic training and clinical practice.

On a final note, I truly believe that the very best way to enhance one’s training as a depth-oriented psychotherapist, whether verbal, nonverbal or expressive, and be able to meet your patients on whatever level of relating they are functioning, is to develop your own artistic and creative skills. The flexibility of ego states which is constantly being exercised and strengthened through creative work, along with theoretical, clinical and personal knowledge, becomes your greatest asset in these challenging and demanding professions.

Exhibiting Art by People with Mental Illness: Issues, Process and Principles

Susan Evans Spaniol, M.A., A.T.R., Art Therapist at Fresh Pond Day Treatment Center, Cambridge, Mass

Abstract

Growing interest in art by people with mental illness is reflected in the increasing number of exhibitions devoted to art by patients and ex-patients. As the facilitators of this art, art therapists are often in a position to advocate for these artist and to arbitrate the ethics governing exhibitions of their art works. Despite increasing awareness of the issues and problems involved in exhibiting art by people with psychiatric disabilities, general guidelines and specific protocols have been unavailable to art therapists. This article presents key issues, processes and principles governing exhibitions of art by people with mental illness based on the experience of the Committee for Advocacy Through Art in organizing the juried exhibition, “Art and Mental Illness: New Images” held at Boston University in the fall of 1989.

Historical Context

Although art by people with mental illness was rarely exhibited in this country before the 1980s, it has been a vital current in the European art world since the beginning of this century, when psychiatrist and art historian Hans Prinzhorn amassed a collection of 6,000 art works by patients in Europe’s barren, isolated mental asylums. Long before the advent of occupational or art therapy, Prinzhorn had observed that many patients used great resourcefulness in obtaining materials for drawing, rescuing scrap paper from wastebaskets, opening old envelopes and stealing toilet paper to use as drawing surfaces. Apparently driven by strong inner needs for self-expression, it was not uncommon for many of these untrained artists to spend much of their time creating drawings of strong individuality, originality and beauty.

In 1922, Prinzhorn published Artistry of the Mentally Ill (Prinzhorn, 1972-revised), based on his collection. His book was reprinted several times and selections from his collection traveled to various locations in Europe, profoundly affecting the development of modern art. Twentieth century European artists, such as Paul Klee, Max Ernst and Jean Dubuffet, were impressed by the modernism of the drawings in Prinzhorn’s collections. Like the expressionists, the untrained artists often used colors and shapes in an uninhibited way suggesting intense emotion. Like the cubists and their followers, many intuitively employed techniques developed by established artists in reaction to classicism, such as fragmentation, distortion and condensation.

In 1985, selections from Prinzhorn’s collection made their first appearances in this country, touring four American museums and startling the art public with their powerful visual imagery and symbolic content. Since then, art by people with mental illness has begun to enter the mainstream of the American art world through exhibitions in established galleries, such as Rosa Esman’s Gallery and the Calvin-Morris Gallery in New York City. In Maryland, a community support organization for people with mental illness, People Encouraging People, is in the process of establishing an American Visionary Museum that will provide gallery and storage space for a national collection of art by untrained people with mental illness. During the fall of 1989 several exhibitions of patient and ex-patient art were held nationwide concurrent with National Mental Illness Awareness Week during the first week of October. One of these exhibitions was “Art and Mental Illness: New Images” at Boston University. This Massachusetts exhibition was organized by the Committee for Advocacy Through Art, a coalition of diverse groups and individuals with the common belief that art can break through stereotypes of mental illness and the resulting social stigma (Spaniol, 1989, 1990). The committee was sponsored by the Centers for Psychiatric Rehabilitation at Boston University.

From Bias to Concensus

Members of the Committee for Advocacy Through Art included state-wide mental health organizations, ex-patient groups, university departments, ex-patient artists and the author—an art therapist and a doctoral student at Boston University. With such a varied membership, the Committee often seemed like a microcosm of society. When the committee began meeting, each indi-

“Organizing an exhibition of art by people with mental illness can force exhibitors to confront their own biases and question their values.”
individual appeared to have a somewhat different agenda and latent biases. As we continued to meet, these differences emerged as assets because they allowed the committee to view complex and sensitive issues from varying perspectives. The committee's discussions were often provocative, sometimes frustrating and always lively. From our earliest meetings, when it took nearly two months to agree on a title for the exhibition, we struggled with the issues raised, striving to protect the privacy and dignity of the artists while providing an opportunity for them to communicate with a broad audience through their art. Although many of the problems the committee faced did not allow conclusive resolutions, we were able to reach a consensus on the questions raised. This article shares our accumulated learnings with future exhibitors so they, and the artists they represent, may benefit from our experiences.

Organizing an exhibition of art by people with mental illness can force exhibitors to confront their own biases and question their values. The decision to mount a show of art by patients and ex-patients is itself controversial. In addressing the complex issues involved in presenting a show of art by people with mental illness, it can be instructive to consider exhibitions of art by other exclusive categories of artists in America during the past several decades. A few decades ago, cultural leaders of the African-American community began trying to organize art exhibitions exclusively for African-American artists. A major goal was promoting pride in their artistic achievements and educating the white community about the major contributions African-American artists have made to the American art world. The predominantly white art establishment typically responded by offering to represent greater numbers of African-American artists in their exhibitions of contemporary American art. Through their persistence, African-American cultural leaders mounted their own exhibitions of art solely by African-American artists and were also able to convince many established museums and galleries to do the same. Public exposure to these diverse examples of universal human expression contributed to awakening awareness of racial biases and social stereotypes.

When the women's movement gained strength during the past decade, it recognized that cultural events could also function as strong political and social acts. Although many of their attempts to organize exclusive artistic events were at first met by resistance, they persisted in arranging cultural events that awakened public consciousness of latent biases and also celebrated women's contributions to society.

The past few years have witnessed a proliferation of exhibitions devoted to art by people who have experienced mental illness. It is likely that the increasing popularity of art by people with psychiatric disabilities reflects a readiness on the part of the patient and ex-patient communities to confront the general public with its biases. It may also signal a new willingness on the part of the public to examine its stereotypes related to mental illness.

In fact, objections to exclusive exhibitions for particular groups of people may be symptomatic of public stigma against them. As an illustration, a prominent Boston hospital recently organized a juried exhibition of art limited to works by people who experienced severe headaches. No public objection was raised to the creation of a separate category of art for people with that particular disability, probably because there is little stigma attached to it. However, the mention of psychiatric disabilities often evokes strong feelings. Hopefully, as the public becomes less biased towards people with mental illness, exhibitions of art by people with mental illness will be no more controversial than shows of art by people who experience severe headaches.

Language Usage

One of the first tasks confronting the exhibition committee was choosing a title. This seemingly simple task became surprisingly complex as
we realized that our choice of words would have a strong impact on how the exhibition was perceived. The term commonly used in the United States for art by people with mental illness is “outsider art,” first used by the British humanities professor Roger Cardinal in 1972 as the title of his book about untrained artists. Although suitable to characterize spontaneous art works by inmates in Europe’s mental asylums, the committee felt this term was inappropriate to describe the broad range of expression by the diverse population of artists with mental illness in America today. The term “outsider art” connotes alternative art outside the cultural norm done by people who are alienated from society. It is usually used to describe art works (often of haunting power and originality) that express inner visions without premeditation or censorship. However, the committee anticipated that the artists contributing to our exhibition would represent a heterogeneous cross section of humanity both in terms of their art work and lifestyles. To characterize them as outsiders could, in fact, reinforce the social stigma associated with mental illness.

At first the committee avoided using the term “mental illness” in the exhibition title because it sounded startling in its directness. We considered more poetic phrases, such as “images of the soul” and “inner visions,” but decided that they suggested spiritual or nonconforming art works, rather than a wide range of styles. The committee finally decided to name the exhibition “Art and Mental Illness: New Images” rather than using a euphemistic phrase because it suggested that the exhibition would offer a new way to perceive people with psychiatric disabilities and their art. It was hoped that public use of the phrase “mental illness” would contribute towards neutralizing the term by relating it to a positive set of associations.

When the committee became sensitized to the function of language in influencing thought and perception, our awareness of language usage extended to ways of writing and talking about the exhibition. As a guide, we referred to the “Guidelines for Reporting About People with Disabilities” supported by the National Institute of Disability and Rehabilitation Research and adopted by the Associated Press Stylebook (Research

“The term ‘outsider art’ connotes alternative art outside the cultural norm done by people who are alienated from society.”
and Training Center on Independent Living, 1987). These guidelines represent a consensus of over one hundred national disability organizations. They were prepared for the news media because the press shapes public images of groups of people through the words they use. The guidelines urge them to use language that focuses on individuals rather than their functional limitations, and to reserve diagnostic labels for technical medical writing. In keeping with these guidelines, one would write or say “people with mental illness” rather than “the mentally ill,” and would use general terms like “mental disorder” and “psychiatric disability” instead of diagnostic terms such as psychotic and schizophrenic. Although this new descriptive style felt self-conscious and stilted at first, it soon became more natural, like saying “Ms.” instead of “Mrs.” and writing “she or he” rather than using only the masculine pronoun.

Selection of Art Works

One of the major tasks of the committee was establishing the procedures and developing the protocols for organizing the exhibition. Hoping to find prototypes for this sensitive task, we researched the literature and networked by phone and mail with people nationwide who had arranged similar exhibitions. Not surprisingly, the most useful resources were located in art therapy publications.

Several years ago, Pat Parsons helped introduce “outsider art” to the art therapy community with an article that provides an historical context and examines complex problems of definition (Parsons, 1986). The concept of “outsider art” is critiqued by Martha Haeseler in an article that conveys a strong respect for the privacy and dignity of artists with mental illness (Haeseler, 1988). A psychoanalytic approach is employed by psychiatrist Aaron Esman in his exploration of the ambiguous relationships between art, creativity and psychopathology (Esman, 1988). A rich resource was provided at the 19th Annual Conference of the American Art Therapy Association by a lively panel discussion that addressed many of the controversial issues faced by those exhibiting “outsider art” (Cohen, B., Henley, D., Haeseler, M. & Parsons, P., 1988).

While recent art therapy literature
speaks to sensitive issues raised by exhibiting art by people with mental illness, it has not yet provided specific protocols and guidelines for organizing such shows. With few resources as guides, the committee relied on general information available about organizing exhibitions, and adapted it to the needs of our special population.

Unarguably, one of the most critical tasks in arranging an exhibition is the selection of art works. For the committee, the selection process became a three-step procedure: (1) solicitation of artists’ interest; (2) artists’ submissions of slides of their art works; and (3) jury selection of art works from slides.

Potential applicants were contacted through telephone calls, a press release and a mailing of 1700 brochures statewide to art schools and art therapists; universities and libraries; psychiatric hospitals, residences and half-way houses; and local chapters of patient self-help and advocacy groups. Only art works submitted directly by the artists themselves, rather than their caregivers, were considered. This policy was adopted to assure that the individual artists could retain control over the application process and the fate of their art work from the beginning. Soliciting art works was fascinating but unpredictable. It felt like casting a giant net across the state to see what we could pull in.

We received over three hundred requests for applications. As a result, one hundred fourteen artists submitted more than five hundred slides for consideration.

After much deliberation, the committee decided to select works indirectly from slides, rather than judging directly from art works. While judging from the art works themselves has definite advantages because art can never be adequately represented in slides, it could also be a cumbersome and awkward process for the exhibitors and artists as well, especially those whose works were not selected for exhibition. On the other hand, the use of slides made possible several unique aspects of the exhibition.

Art works that were not selected for exhibition were shown in a continuous slide presentation; thus, all people who submitted slides could have their art works viewed by the public. This slide showing became a focal point of the exhibition, capturing the attention of large numbers of gallery visitors at any given time. The use of slides also allowed the committee to create two different sets of permanent records of the exhibition: (1) slides of all the works submitted were recorded on videotape using a dissolve unit; and (2) use of slides also permitted the establishment of a permanent slide registry of the artists and their works. With the artists’ permission, we plan to keep the videotape and slides at the University as educational resources and also as resources for interested collectors.

In choosing art works for an exhibition, it is important to establish criteria that are firmly based on a stated mission that provides focus. The committee defined its mission as reducing the stigma of mental illness by exhibiting art works of high quality by Massachusetts residents who had experienced mental illness. To avoid using diagnostic labels and clinical material, we decided to use self-report as our only criterion for mental illness. We assumed that people would not misrepresent themselves as mentally ill due to the immense social stigma associated with psychiatric disability. The focus of the exhibition was the art works as art and the artists as artists, not mental illness itself. Therefore our main criterion for selection of the art works was artistic merit. We also wanted strong works that expressed...
a broad spectrum of universal human emotions through a variety of styles and media.

Actual selection of art works was conducted by a jury of three art experts in the field. The committee used the jury process although it is more time-consuming and complicated than selection by an exhibition committee. We believed it would confer credibility on the exhibition because decisions would be professional and unbiased. An unexpected consequence of the jury selection was mixed reactions by committee members to some choices of the jury. We had each become attached to particular art works and many of us felt disappointed or let down at first when some of our favorites were not selected. However, when we viewed the exhibition as a whole we all felt satisfied that the exhibition reflected our mission and our focus.

Although the art works were selected without knowledge of the artists, choices reflected a broad cross section of the population who have experienced mental illness. Some of the artists whose works were chosen are highly skilled professionals who exhibit in established galleries, while others are untrained artists who have never exhibited their works, including an outstanding sculptress who had never before shown her work to anyone outside her family. The artists' lifestyles also represent a wide range, from those who live in their own homes and in artists' housing to residents of half-way houses and mental hospitals. Their art works reflect a variety of human emotions, from joy to anguish, and from warm affection to the despair of betrayal. Many are highly proficient renderings that represent current art trends while others are raw and direct expressions of intense private feelings. Despite this diversity, each work evokes our shared human emotions and experiences with striking power and originality.

Once art works had been selected, our goal was to design a registration process that would protect the rights and confidentiality of the artists while allowing us to disseminate information about their art works. This dual goal was accomplished by creating an identification form that allowed artists to describe their art works or their process for making art, while saying as much or as little as they wished about themselves. The artists had the option of remaining completely anonymous, or of being named and writing nothing.
or writing an essay of up to five hundred words about themselves, their art and the role of art in their lives. Information furnished to the news media and the public about the artists was, by and large, limited to statements written and signed by them. Any kind of analysis was thereby avoided. The artists’ comments provided moving and thought-provoking text for the illustrated catalog that accompanied the exhibition. Their comments were also made available to gallery visitors to enrich their viewing.

Opening Celebrations

Our opening reception was held in three phases to serve three distinct purposes. The first was a small private viewing to thank and congratulate the artists; the second was a press opening to enable the news media to preview the exhibition; and the third was a grand public opening to allow the artists to celebrate with family, friends, committee members and the interested public. All artists who had submitted work to the exhibition were invited to all phases of the opening, including those whose works had not been chosen for exhibition.

The private opening gave artists a chance to enjoy an uncrowded viewing of the show and also enabled them to meet one another. Of the thirty-one artists whose works were exhibited, twenty-eight attended the opening, as did other artists whose works were part of the slide showing. For many, it was their first awareness of belonging to a community of artists who shared similar issues and concerns. For others, it was an opportunity to begin to network and establish a support system.

During the media viewing that followed the private preview, artists who were willing to speak to the press were identified by a gold sticker on their name tags. The press was informed that only those with gold stickers were available for interviews and photographs. As exhibitors of art by a population vulnerable to public exposure, the committee’s attitude towards the press was ambivalent. On the one hand, we hoped for a broad dissemination of information about our exhibition. On the other, we feared that the media would make insensitive statements about the artists or their art. News coverage by the local media of past shows of art by patients and ex-patients had sometimes included inappropriate case material and unflattering portrayals. However, by screening the artists who wished to be interviewed and by limiting our printed information to comments written and signed by the artists, the committee was able to exert some control over the publication of information and encourage sensitive handling of the material.

Our major disappointment with the press coverage was its oversight of the aesthetic elements of the art works. The reporters tended to focus on the relationship between creativity and mental illness rather than the art works themselves. Despite the committee’s careful monitoring, reports of personal aspects of artists’ lives seemed unavoidable. Diagnoses and case material found their way into articles because some of the artists conveyed the information to the press during interviews. It may be that a certain fascination with artists’ lives must be expected. It is not uncommon for the public to romanticize artists’ lives, especially their mental illness and unconventional behavior. Biographical tales of Van Gogh’s excesses, Gauguin’s escapism and Nolde’s obsessions stimulated our interest in their art work.

Mr-COYT-TYNER VISION (Acrylic on paper)
Exhibition catalogs of "outsider art" often offer absorbing descriptions of the artists' eccentricities and titillating glimpses of their aberrant behavior. It may be that advocates for artists with mental illness cannot completely censor references to clinical material; however, it is possible to structure a public relations campaign to minimize and control such references.

The large public preview of the exhibition was a gratifying success. About four hundred guests visited the show during a three hour period. A classical guitarist supplied background music and ample food was available. Anyone who did not know the artists would have had difficulty distinguishing them from the university community. Those who knew them could witness their visible pleasure in sharing their art with family, friends and others.

The Show Goes On

Gallery attendance appeared to increase greatly during the exhibition. Students who did not ordinarily visit art galleries were drawn to the show. Groups of people from treatment programs and residents of half-way houses and hospitals visited the exhibition. Others remarked that they had returned several times to view it, sometimes bringing friends. It was not unusual for groups of people to gather and linger in front of particular art works discussing and debating their meanings. The empathic responses of many of the viewers suggest that the art depicted shared human experiences that transcend disabilities. The New England Art Therapy Association held its fall symposium in the exhibition galleries, where the author led a gallery tour and discussion. The response of the audience suggested that many art therapists are keenly aware of the issues involved in arranging such exhibitions, and feel a need to debate and clarify them.

Guiding Principles

Developing guidelines for exhibiting art by people with mental illness was a synergetic process. By merging the diverse value systems of the various committee members, we arrived at a consensus that seemed to represent general standards that could be applied to all exhibitions of
art by people with disabilities or members of minority groups. These principles can be summarized by three words: opportunity, safeguards and empowerment.

Providing opportunity meant creating the occasion for exhibition participants to define themselves as artists. The committee provided a professional context for participating artists by issuing a call for art, selecting works by jury, using an art appraiser to set prices, publishing a handsome catalog and, of course, installing the exhibition in an art gallery.

Risk is inherent in any new step. Due to the strong social stigma associated with mental illness, public disclosure is especially risky. To safeguard participating artists, protections must be built into the process. Foremost among these safeguards is assurance of confidentiality. Exhibitors must obtain written permission before disclosing any verbal or visual information about the artists. (Art therapists are advised to consult the section on confidentiality in the code of ethics drafted by their professional organization in October, 1989.) The committee found that strictly limiting dissemination of information to statements written and signed by the artists allowed them to communicate as much as they wished while assuring them confidentiality.

Empowerment of the artists is perhaps the most significant principle that can govern an exhibition of art by people with mental illness. Procedures should be structured so artists are included in the decision-making and can participate in each step of the process. Including artists with psychiatric disability on the exhibition committee is invaluable because they are able to provide direct feedback on how policies will affect contributing artists. Providing options for the artists also gives them an active role in the exhibition process. Our committee offered artists choices about framing, pricing and selling their art works, and determining what they would communicate about themselves and their art. Arranging a private opening for the artists was also a means of empowering them because it created a community of peers and provided an opportunity to network and seek support.

Conclusion

Due to the growing popularity of art by people with mental illness in this country, all art therapists should be prepared to grapple with issues and conflicts raised by exhibiting this art. The principles of opportunity, safeguards and empowerment can serve as frameworks for developing and refining procedures and protocols that are sensitive to a vulnerable population. Art therapists can also participate in this process by reflecting on their own personal values; they can debate issues that arise with other art therapists and interested colleagues; and, equally important, they can seek feedback from their own clients to gain insight into their perspectives.

As art therapists we must be prepared to advocate for our clients. We must learn to concentrate on their creative abilities as well as their psychiatric disabilities. In so doing, we will be better able to help the public overcome its biases towards mental illness and assist those with mental illness to acknowledge their value as artists and as human beings.

An Art Therapy Curriculum in an Early Intervention Program for Visually Impaired Children

Roberta Weiss, A.T.R., part-time Therapist, Jewish Guild for the Blind Early Intervention Program, Master of Professional Studies in Art Therapy, Pratt Institute, Brooklyn, N.Y.

Abstract

Art therapy provides a pleasurable vehicle to promote learning for the visually impaired young child. Through the use of various art media, the visually impaired child can develop and refine motor skills, spatial relationships and a sense of identity and self-esteem. A basic goal-oriented curriculum is provided including objectives and activities for birth-to-five year old visually impaired children.

Introduction

It has been determined that 80% of a child's learning occurs through visual experiences. A child with a visual impairment must learn to compensate for his or her lack of useful vision by maximizing the development of other senses to develop important educational skills. The child must be an active participant in using his/her remaining intact senses (seeing, hearing, feeling and tasting) by directly interacting with his/her environment (Lowenfeld and Brittain, 1987). Children need instruction in the use of residual vision and other senses to develop their fine motor skills, spatial relationships, and sense of identity and self-esteem. Learning through the creative art therapies allows the child to secure this extra input while participating in enjoyable activities.

Many visually impaired children experience a variety of emotional feelings. They may experience anxiety and apprehension about new experiences and the outside world.

An excessive sense of dependency, especially maternal, is also commonly seen (Laird, 1969). The art therapist makes a special connection with the child by using various art media to help foster independence and a sense of identity.

Because of its varied malleable qualities, art material affords the visually impaired child the opportunity to gain a sense of control over his/her intentions. With paint and crayons, a child learns the concepts of up and down, next to, and over and under. One's understanding of shapes and colors is also reinforced. Large crayons and paper encourage the child to scribble. He/she thereby learns to use art materials in a purposeful manner, and develops skills that will be important in later preschool experiences. Holding crayons and scribbling also helps to strengthen muscles and assists in developing fine motor coordination. The child learns that he/she can control one’s arm and hand to make the crayon move in many different directions (round circles, up and down, zigzag lines) (Miguel and Cecilia, 1964).

Three dimensional art materials (clay, wire and wax) are useful in helping to overcome those restrictions that visual impairment may impose upon a child. Working with and manipulating these materials can assist the child in attaining control of oneself and one’s environment through direction of his/her hands to create something. Coordination improves as the child learns to use his/her hands together as a tool to accomplish the goal of working on a purposeful activity. It also helps to develop a sense of body image and foster a healthy sense of identity. The child’s awareness of shapes, forms and textures of objects is promoted. Working with clay becomes an exercise in expression, as the child is encouraged to pound, pull, poke and roll it (Haupt, 1964).

The development of language and self-expression in a child is associated with one’s growing awareness between people and objects. Piaget states that there is an intimate relationship between language and thought. The need to express oneself is a direct association between thoughts that are based on reality and linked to language. Visually impaired children often have difficulty with self expression because of the lack of visual stimuli which serves to connect them with the outside world. Creative puppetry can enhance a child’s expressive skills by providing an alternative method of expression (Rogow, 1965). By making a puppet out of a variety of materials, the child includes any fea-

“A child with a visual impairment must . . . compensate for [a] lack of useful vision by maximizing the development of other senses. . . .”
tures which are important. This puppet becomes the vehicle through which the child identifies and speaks. One's feelings, inner conflicts and thoughts can be acted out in puppetry.

A visually impaired child may experience a sense of isolation since his/her world is largely limited to touch and sound. One may be slow to realize that his/her arms, legs, hands and feet belong to oneself. In order for the child with visual handicaps to form and maintain a working relationship with external surroundings, one must first become aware that the body is separate from everything else. One needs to know body parts, their functions and their relationship to the environment outside themselves (Lydon and McGraw, 1973). Through the use of art material and creative activities, a positive self image and sense of self separate and apart from the outside world can be attained.

Art therapy holds a special place in the early intervention program for visually impaired children. Activities and media are chosen with consideration for their educational and therapeutic objectives. Along with other disciplines, the art therapist pays special attention to improving visual, perceptual, sensory and fine motor skills, as well as building confidence, mastery, self-esteem and self image (Lindsey, 1972). The use of art material allows for self expression and creativity, which are often stymied in the visually restricted child. We have found that the children in our program respond favorably to the creative art therapies. It is their own motivation to participate in a pleasurable activity which serves to promote learning.

Because there is so little information written about art therapy for the very young visually impaired child, it is important to develop a series of developmental activities and incorporate the principles of art therapy to help the child meet his/her goals. The following section presents objectives and coordinating activities in an ongoing art therapy program for preschool visually impaired children. The activities are correlated to appropriate age levels and stages of development.

In the first year, the activities are similar to those employed by the vision and the motor development specialists. After the first year, the activities become more specialized utilizing art media and specific therapeutic techniques. Many of the activities designed for the 2-5 year olds are very visual to encourage the use of residual vision. The totally blind child would obviously be utilizing tactile media.

**ART THERAPY CURRICULUM**

0—6 Months

**Objective**

1. Child will begin to grasp objects placed in his/her hand.

2. Child will begin to develop a sense of cause and effect.

3. Child will begin to develop a sense of object permanence.

**Activity**

a. Offer an easy to hold squeeze toy in child's hand.

b. Demonstrate how toy sounds when child holds it and squeezes it.

c. Encourage child to hold toy on his/her own.

d. Praise child for each successful try.

a. Have child hold squeeze toy.

b. Show child how the toy sounds each time he/she squeezes it.

a. Have child hold squeeze toy or rattle.

b. When child drops toy, help him/her to find it with his/her hands.

c. Place toy under a blanket.

d. Help child locate toy by guiding his/her hands to feel the shape of the toy under the blanket.

e. Help child to manipulate the blanket so that toy makes noise.

f. Pull blanket off of the toy while saying, "surprise!"

<th>Garland</th>
</tr>
</thead>
</table>
6 Months—12 Months

Objective

1. Child will learn to imitate gestures and correlate them to present experience.

2. Child will imitate facial expressions.

3. Child will hold and transfer from hand to hand various colorful and tactually interesting objects.

4. Child will use index finger to make poking motions.

5. Child will use finger and thumb to grasp object.

Activity

a. At the end of each activity say, "No more," while holding child’s hands up.
b. At the end of the session, say, "Bye-bye," while waving child’s hand with yours.
c. Praise each attempt at independent gesturing.

a. Hold child’s hands on your face. Child feels your changing facial expressions while you explain that are you are smiling, frowning, etc.
b. While holding child’s hands on his/her own face, child feels his/her own expression, as you verbalize.

da. Offer a varied supply of toys to the child while he/she sits in your lap.
b. Assist the child to hold toy in both hands. Help child explore the properties of the toy.
c. Help the child to play with the toy first in one hand, then the other.
d. Reward independent holding and transferring of toy from hand to hand.

a. Provide clay, sand and other tactually interesting medium.
b. Assist child in holding index finger out from the rest of the hand.
c. Help child to poke holes in the clay or sand, while singing rhythmic song or rhyme.

a. Provide different toys and objects for child to handle.
b. Encourage child to use finger and thumb to pick up toy.

12—18 Months

Objective

1. Child will hold crayon in a palmer grasp.

2. Child will scribble when presented with crayons.

3. Child will use his/her arm and hand to imitate a vertical line.

Activity

a. Provide large crayons for child to pick up.
b. Assist child to hold crayon in a position which leads to scribbling.
c. Provide paper for child to use crayon on.

a. Provide brightly colored, large crayons and large pieces of paper.
b. Using hand over hand, show child how to hold crayon, and guide his/her hand to scribble using various movements. Up and down, circles, squiggle lines, back and forth. Explain to child which motion he/she is making.
c. Allow child to scribble independently, praising each try.

a. Provide sand, water and various textured papers.
b. Gently guide child’s hand while he/she explores the surfaces.

continued
Objective

4. Child will tactually explore his/her own body.

Activity

c. Guide child's hand in up and down motions, while singing a song about what he/she is doing. Praise each try.
d. Encourage child to do the same on his/her own.

a. Gently guide child's hands to touch his/her own body parts, while naming what he touches.
b. Play a game of "Show me," i.e. - "Show me your nose." Praise each try.
c. Use a variety of textured material to tactually highlight areas of child's body, while naming parts.

18 Months—2 Years

Objective

1. Child will imitate a horizontal line, a circle and a V-stroke.

Activity

a. Using hand over hand assistance, guide child's hand in a back and forth motion.
b. Using sand, water or clay, help child track horizontal hand movements.
c. Provide salt spread over a black surface. Assist child in drawing several horizontal lines, circles and V-strokes. This surface provides a contrast which is more easily seen.
d. Provide crayons and paint. Use hand over hand to help the child to draw varied lines.

2. Child will attend to picture books and identify common objects.

a. Read books to child that contain pictures of common everyday objects. Point to the picture and name the object.
b. Say to the child, "Show me the ______." Have child point to that picture.
c. Praise child for each correct response.

3. Child will point to and identify 2-3 of his/her own body parts.

a. Ask child to "Show me your nose." Continue with all facial features. Praise each correct response.
b. Use large colorful stickers to decorate a paper plate face.
c. Hold child's hand on a piece of paper. Trace his/her hand with a marker, counting and naming his/her fingers. Show child the tracing and again, point to, count and name each finger.
d. Do the same activity using child's foot.

2 Years—3 Years

Objective

1. Child will match and identify colors (red, yellow, green and blue).

Activity

a. Provide a variety of material (paper, cloth, ribbon, etc.) using two colors. Mix pieces up on a tray. Have child sort out all material of the same color. Repeat this with two other colors.
b. Use sorted material to create a "color book." Have child paste all the material of the same color onto one page. After all of the colors are completed bind book for the child to keep.

continued
Objective

2. Child will identify and match shapes (square, circle and triangle).

3. Child will identify gross and fine body parts (self).

4. Child will draw a person (face, arms and legs).

5. Child will begin to use art material appropriately.

Activity

c. Provide red, yellow, green and blue sand. Show child a simple outlined picture with the colors filled in. Ask child to name the color space on the picture, put glue on top of that color and choose the color sand that matches. Child will then sprinkle the colored sand onto the colored space.

d. Discuss with child everything that he/she is familiar with that is green, yellow, or blue. Focus on one color each session. Provide paint, Play Dough and other material in one color.

a. Provide various textured material cut into squares, circles and triangles.

b. Ask child to sort out the material according to shapes.

c. Have child paste all of the material of one shape onto a piece of paper.

d. When child completes this with all three shapes, bind the pages into a book which child can keep.

e. Provide different colored shapes cut from paper. Have child create a "shape picture," naming each shape as he/she chooses it and pastes it on paper.

f. Provide Play Dough and cookie cutter shapes. Assist child to roll the dough, flatten it and cut out the shapes. Have child identify which shape he/she is using.

a. Take a large piece of paper to the floor. Help child lie down on the paper. Using marker, trace the outline of the body, naming all of the parts while drawing.

b. Provide yarn, buttons, pre-cut felt pieces, material and markers. Assist child in filling in and decorating his/her tracing.

c. Provide a variety of colored and textured material and a paper plate. Help child to create a mask, naming where the eye, nose and mouth belong.

d. Give child a ball of clay and help him/her to make a self-presentation, by first using his/her own facial features.

a. Provide crayons and marker. Using hand over hand, assist child to draw a person. Identify parts as the child draws.

b. Show child how to use each of the media, demonstrate all of their possibilities, and allow the child the freedom to play, experiment and create with each of the presented material.

c. Place the material to be used in a given session on a tray. This helps to define their space and helps the child to focus on the material at hand.

continued
3 Years—4 Years

**Objective**

1. Child will identify and distinguish between textures (hard and soft, rough and smooth, wet and dry).

2. Child will trace a diamond shape and copy a cross shape.

3. Child will begin to express himself/herself through art work.

**Activity**

a. Provide a tray containing a variety of tactually diverse material. Dry sponges, fur, plastic pieces, rocks are some objects to use. Assist child to sort the material according to type of feel.

b. Use plastic meat trays to collect different textured items. Child will put all of the soft material into one tray, all of the rough material in another, etc. The material can then be pasted onto the trays and the child then has a permanent collection to refer to.

c. Provide a small tub of water for child to play in. Emphasize how water feels wet against his skin. Use sponges for child to play with when dry and when wet.

a. Provide a raised relief drawing of a diamond shape and a cross shape.

b. Ask child to use a crayon to outline and fill in the drawing. Assist the child in making controlled vertical and horizontal lines.

c. Use salt on a black tray (good contrast) and assist child to use his/her finger to trace the diamond and cross.

a. Provide markers, crayons, paint and colorful shape stickers.

b. Ask the child, “Can you make a happy picture?” Sad and angry feeling can also be substituted.

c. Ask the child, “Can you make a picture about how you feel today?”

d. Encourage the child to relate an important experience. Then ask if he/she can draw a picture showing that event.

4 Years—5 Years

**Objective**

1. Child will begin to bring in and use discarded items from home. Creativity and imagination are enhanced as child uses these items for art projects.

2. Child will begin to pay attention to the colors, textures and shapes which he/she encounters outside the home. This helps to increase visual and tactual awareness.

3. Child will begin to work on a group art project with a small group of children.

**Activity**

a. Have child bring in egg cartons, milk containers, yarn, broken egg shells, macaroni, etc.

b. Use the item as the basis for an art project, i.e., carton caterpillar.

a. Take child outside on a field trip to the park. Feel the leaves, bark, grass, rocks and everything else encountered outside. Have children draw birds using crayon and paper.

b. Encourage child to discuss what he/she sees, feels and touches.

a. Include child in a small group of children.

b. Set up a large piece of paper taped on the wall. Provide colorful markers. Give each child his/her own space to draw on the paper, thereby creating a group mural. Praise each child’s efforts at working together.

continued
Objective

4. Child will begin to use and be responsible for the art material in an appropriate manner.

Activity

c. Other group projects include:
   1) Decorating a paper tree taped on the wall. This tree can be set up all year. The children can use many themes during the course of the year.
   2) Creating a group story. Begin to tell the children a story. Ask each child to continue by adding his/her own idea. After the story is completed, read it back to the group. Provide markers and crayons and encourage each child to draw his/her portion of the story. Display the picture and the written story in sequential order.

d. Create a simple group quilt. Provide colorful fabric markers and fabric squares. Ask each child to draw a design on the fabric. Sew the pieces together (perhaps with the help of the parents), and secure it to a backing.

a. Child will assist in putting the material back, washing the brushes, and putting the Play Dough in the container.

When a Mother Kills Her Child

Abstract

While listening to the news one will all too often hear a story about the murder of a child. At times we hear of a child who dies after severe physical abuse by the guardian. Less often we hear about the death of a child who had been killed by a parent who had no previous history of abuse toward the child. The act of infanticide raises the implication of suicide and identity fusion with the child by the parent. This article presents a case study of a woman who was incarcerated for the murder of her child. A description of the jail situation, background of murdering parents and possible underlying motivation for child murder by the parent is discussed.

Introduction

During my work in a jail psychiatric program, I was introduced to areas of mental health which are often overlooked. This is partly due to the fact that in jail incarcerated individuals are seen as criminals rather than as needing care. Despite their criminal behavior those incarcerated are some of the neediest people. Many people incarcerated in jail are those with mental disorders. They are those individuals who are no longer maintained by long-term, state-run mental health facilities. For those without supportive families and adequate income, jail has become a part of the revolving-door existence they lead. They pass through doors of short-term facilities, halfway houses, street life and jail. Often they are arrested for vagrancy, disturbing the peace and loitering. Their life is in constant chaos. Jail only adds to their confused thoughts, for jail is a warehouse of bodies waiting for the judicial system to take the next step. The waiting period for a hearing can take up to one year and sometimes longer. During this time the individual waits along with hardened criminals who are physically threatening and emotionally fearful.

My experience was with a major metropolitan department of corrections, one of the largest jails in the country, housing 5,000 inmates. Within this complex, psychiatric services are provided on a crisis intervention basis. The facilities include an acute psychiatric unit, a residential unit for men and a psychiatric unit for women. Treatment is short-term and attempts to achieve remission of mental health problems for the purpose of returning the inmate to the general population of the correctional facility (Cherian, Goldstein, Hardigan, and Simmons, 1981). Therapeutic services are at a minimum with individuals kept in the psychiatric department until medication enhances stabilization. The jail acts as temporary placement for most inmates. Here, an individual waits for a hearing or trial which will determine whether long-term incarceration will be in a penitentiary or a mental health institution. I found the environment to be bleak which added to depression. The walls were constructed from cinder blocks or drab colored tiles. There were only benches and plastic chairs for seating. The lighting was often harsh and added to the nightmarish atmosphere creating a sense that all encounters with individuals were a part of an interrogation process. The short-term situation of the jail restricts most therapy to helping inmates cope with the stress of incarceration. Often, I would see individuals only once, or for a few weeks before they were transferred or released without my knowledge. I was, however, able to work with a few individuals for longer periods.

Among those incarcerated were women who had been jailed for killing their children. Those women seemed out of place in jail. Usually they were actively psychotic and unaware of what was happening to them. Several had killed their infants, some had killed slightly older children. all without premeditation. Their needs were of mental health and not criminal incarceration. (I will generally refer to the killing of a child by a parent as infanticide although there are several terms used.)

Infanticide

The killing of children is certainly not a new occurrence to be attributed to the stress of modern times. Humanity, in fact, has a long history of this continuing horror. Stern (1948) provides a historical description of the killing of children throughout time involving various cultures worldwide. He notes the acknowledgement of infanticide in mythology, religious practice and liter-

“For those [incarcerated persons] without supportive families and adequate income, jail has become a part of the revolving-door existence they lead.”
ature. He cites various literary works which tell the tale of child murder by the parent. He traces infanticide in literature to Greek mythology which includes the story of Cronos who ate his children and to Medea who killed her sons in revenge of her husband’s infidelity. Clinically, he uses the term “Medea Complex” to describe a mother with homicidal wishes toward her child. In her studies, Dr. Maria Piers (1978) describes infanticide to be a secret fantasy held by all individuals. She explores this fantasy in pointing to the lyrics of lullabies such as “Hushaby Baby” where a rocking cradle is threatened by a breaking bough. In a German song the baby is threatened to be bitten by a sheep if the child does not sleep. While working with children, Dr. Dorothy Block (1978) found that many frightful fantasies that children experience reveal their fear of infanticide. In exploring children’s fear of their parents, Block points out that fear of infanticide is justified in that parents may actually have that wish. She refers to Dr. Hyman Spotnitz as having pointed out that Freud argued the first part of the Oedipal myth. Here the parents abandon him on a hillside to die.

**Specifics of Infanticide**

Having reviewed various cases of child murder, Resnick (1969) developed a classification system to define types of infanticide and the underlying motive. He states that infanticide is a general term for child murder. He uses the term “Filicide” for the murder of an older child. “Neonicidicide” refers to a child murdered less than twenty-four hours after birth. He also found that at six months of age the child is in a high risk period due to maternal post partum psychosis. Adelson (1961), D’Orban (1979) and Hamilton (1982) have also pointed out the high risk of infanticide during post partum psychosis.

“More than half of altruistic filicide is linked with suicide and is enacted mainly by mothers.”

After examining several studies Resnick (1969) found that the rate of maternal infanticide was higher than paternal infanticide. He noted that the mothers’ age ranged between 20-50 years old and fathers’ age ranged from 25-35 years old. Mothers were found to be labeled schizophrenic and fathers were said to be “non-psychotic.” Diagnostic procedures did vary, therefore, proved to be unreliable. Adelson (1961) implied that fathers kill their children while highly frustrated by prolonged crying or other uncontrollable behaviors. Mothers were not found to kill for this reason. Infanticide by a father was usually followed by the murder of the wife. Women usually killed themselves and their children. In researching literature in this area, I found that mostly women are documented as having killed their children.

Resnick (1969) described five motives for infanticide. “Altruistic filicide” occurs with the parent(s) wishing to prevent the child from suffering. Parents have committed filicide prior to suicide to prevent abandonment of the child. Filicide has also been committed to prevent or relieve a child’s suffering, real or imaginary. “Acutely psychotic filicide” defines the murder as occurring when the parent is mentally ill. This includes cases in which no apparent motive could be determined. “Unwanted child filicide” occurs when the child is viewed as an impediment to the parent’s life. The child may be illegitimate, seen as a financial burden or seen as preventing romantic relationships from occurring. “Accidental filicide” results with physical abuse as part of the battered child syndrome. “Spouse revenge filicide” is associated with the Medea Complex.

“When filicide/infanticide is associated with a suicidal parent, the child is viewed as an extension of the parent. More than half of altruistic filicide is linked with suicide and is enacted mainly by mothers. The suicidal mother may identify her child with herself and project her own unacceptable symptoms on the victim.” (Resnick, 1969, p. 331). The parent may also be trying to prevent the child from reliving the negative aspects of the parent’s life. These motives contribute to filicide occurring rather than suicide. “In many cases there is evidence that the aggression acted out on the child was displaced from the murderer’s mother, father, spouse or sibling” (Resnick, 1969, p. 331). In cases of altruistic and acutely psychotic filicide, the parent expressed a relief of tension. This may be a reason why the parent did not continue with suicide. These parents also sought help after the child’s murder. Unwanted child filicide and accidental child filicide usually resulted in the parent trying to conceal the child’s death (Resnick, 1969).

Lauretta Bender (1934) first addressed the implication for suicide through infanticide. In cases of infanticide committed by mothers, Bender concluded that the act itself was a gesture of suicide due to an over identification with the child. The suicidal desire changed from wanting to kill the self and the child to only killing the child. After the act the parent often expressed a sense of relief from symptoms associated with schizophrenia and manic-depressive psychosis which had been projected onto the child. Bender also found that in some cases after the murder, the parent recovered from prevailing symptoms. Teutus and Glotzer (1954) also found cases of infanticide by mothers to be an aspect of suicide attempted by the mother, although individual motives for the crime varied.
Diagnosis of the Parent

From all the available literature one can only conclude that a definite diagnosis of the infanticidal parent is a difficult one to make. A general consensus is that the majority of parents who attempted or committed infanticide were suffering from a depression. After the act was committed suicidal ideation and suicide attempts most often follow (Harder, 1967). Focusing on the diagnosis of depression, Harder presented varying viewpoints as to how the depressive state was to be diagnosed. He agreed with Gormsen's (1962) and Hopwood's (1927) findings that generally suicide followed infanticide, but the diagnostic terms differ. He cited Batt (1948) as using the term depressive psychosis to indicate melancholia. Batt also stated that since suicide is an aggressive act against the self, it may be considered that homicide is an extended aggression from the self to include those who are closest to the self such as the child or spouse. Hopwood classified some infanticidal parents to be manic-depressive and others who were diagnosed with exhaustion psychosis induced by lactation in nursing mothers. McDermid and Winkler (1955) labeled infanticide to be a result of child-centered obsessional depression. Rodenburg (1970 and 1971) also emphasized underlying depression in infanticidal parents. He concluded that the risk of infanticide is greater when the parent is suicidal. A history of tension, depression and suicidal ideation, along with obsessional preoccupation for the child's welfare may account for many acts of infanticide.

Case Study

While I worked with the incarcerated women of the jail, I took note that some were especially withdrawn, not only from the staff but from the other female inmates as well. Having committed infanticide these women dared not to share their story with others in fear of being tormented by the others. In my experience most often women who have committed infanticide initially block out the incident and deny the death of their child. For those who were aware of their actions, it was a secret difficult to share. Some explained that they had acted out in obedience to orders given by hallucinated voices. Others seemed to have acted on psychotic impulse in not being able to control their inner rage.

Over a period of nine months I worked closely with one woman who was charged with shooting and killing her daughter. From this particular case I had questions about the underlying drives for this woman. Was the child disliked by the mother? Did the mother project herself on to the child? In killing her child was the mother actually attempting suicide? Another aspect of this case which separated this woman from the other infanticidal mothers was that her child was a toddler and not an infant. Most of the women had committed infanticide while experiencing post partum psychosis. Through the following art work and discussion I will be exploring one case of infanticide in which an element of confusion between the mother's identity and that of her daughter becomes apparent.

This was Terry's first incarceration and she had no previous hospitalizations nor mental health treatment. She was married and had one daughter who was four years old at the time of death. Three months before the incident, Terry and her daughter left her husband and moved into her parent's house where her sisters also lived (one of whom was her twin). Her reasons for leaving her husband were vague; she said that he had been physically abusive, but would not elaborate on those incidents. Partly because of the nature of the jail, extended information on Terry's history was unobtainable. I was not able to speak with her family in order to clarify some of the information she gave me.

Much of what Terry said in our sessions seemed unclear to me. She did not give enough information about her part nor her present situation. Some of the things she told me seemed contradictory. Most often she was releasing her feelings of remorse, pain and confusion about her actions. She was also trying to face her future. The jail, with all it's restrictions and authoritative rules added to the inhibitions that inmates experienced in that setting. We first met during the initial intake at the jail where Terry was interviewed. At that time she refused to answer questions until she had contacted her lawyer. She was placed on the acute psychiatric unit for observation. While on this unit, Terry attended an art therapy group in which participants were asked to draw whatever they wished to share with others. Remaining silent, Terry produced an Easter scene (Figure 1) and withdrew whenever she was asked any questions about her drawing. After the initial days of observation, Terry was placed on the psy-
chiatric tier of the Women’s Division. She was placed in a group of women charged with child abuse and infanticide; still she remained passive and withdrawn. Her passivity prompted a referral to individual art therapy sessions, to which she agreed. Terry and I met once weekly.

In our first session, Terry began with a cheerful demeanor. Beginning with a painting of “Garfield” the cat (Figure 2), she described her love of her own cat who was then at her parents’ home. She added herself hugging the cat and then added a picture of her daughter who she said had been central in her life. With that Terry’s pleasant mood diminished into tears and depression. She described her daughter as an attractive and good child who began to change shortly after Terry and her husband separated. At that time her daughter appeared to regress to a “baby stage” by wanting to dress in baby clothes and diapers. She noted her daughter became aggressive at the time by choking and kicking others. Continuing, she talked about her feelings of having a child and how disappointed she was having had a girl. She felt that she would not know how to raise a girl. Expressing her feelings of anger, Terry described a fear of hurting her child, and thus, locked herself in the bathroom whenever those feelings arose. Although she informed her family and husband of these hostile feelings, no one took her seriously. Terry said she had asked for help, but no one provided any solutions and she did not seek professional help herself. In her drawing, the cat is as large as her daughter and larger than herself. In depicting herself hugging the cat, she seems to be almost hiding behind it. The animal may have come to represent something she loves and has not harmed.

Terry spoke of being afraid of her older sister, fearing that she would take her daughter away from her, although there was not known probability for this occurring. At the time Terry was crying profusely and went on to say that she was afraid that her daughter would be placed in a foster home where she would be beaten and raped. Again there was no apparent reason for this to occur and may have been a delusion. In order to prevent her daughter from experiencing such a life, Terry purchased a toy to distract her daughter and then shot her. She explained that as the gun fired, she could not believe what had happened in that she did not think the gun was real; however, as her daughter cried out she knew she had to kill her. Logistically, she explained that if she had not killed her daughter, the child would have been taken away. She also added that her daughter would not have overcome the trauma of being shot.

In the next session, Terry filled a sheet of paper with a portrait of her daughter. (This was lightly drawn and did not photograph well.) She spoke of her wish to tell her daughter that she was sorry. When asked how she thought her daughter would respond, Terry did not think that her daughter would believe her. Remembering an earlier incident of shaking her daughter in anger, she remembered apologizing to her daughter who in turn rebuked her mother for not being sincere. Terry explained feeling shocked by her daughter’s response because she felt her daughter was correct. As there was time left in the session, Terry drew a full length drawing of herself showing how she felt about herself. She described herself as looking defensive, but felt like a mannequin. In jail one is always told what to do and that made her feel like a child again. In these two pictures she presented some of the overwhelming feelings that she may have felt by her daughter’s presence as her daughter was drawn three times larger than herself. The largeness of her daughter’s portrait may reflect the great amount of need the child demanded with which Terry could not cope. These may not have been provided for her and, thus, she could not provide them for her child. During this session she also discussed her family relationships.

“Her passivity prompted a referral to individual art therapy sessions, to which she agreed.”
"In the next session, Terry filled a sheet of paper with a portrait of her daughter."

Her parent and sister relations were presently improving since her daughter's death (i.e., they all wanted to take care of her). She talked of her husband with whom she did not get along. Reflecting on her marriage she spoke of fights they had with which she said included physical abuse.

Terry often complained of nightmares and drew one that she remembered (Figure 3). In this dream she is pregnant a second time and is hysterical in not wanting the baby. Here she wants her daughter. We talked of her feelings during her real pregnancy. At that time she also did not want to be pregnant and thought of arranging an abortion, but was convinced by her sisters not to do so. Contradicting these sentiments, Terry expressed how much she had loved her daughter and emphasized that she had never hit her. In her description she seemed to have idealized her daughter; doing so may have only added to her overwhelming needs.

During Terry's incarceration her twin sister was hospitalized for a potential nervous breakdown. The twin blamed herself for what was happening because she was not more aware of the situation. Depressed about her sister's situation, I asked Terry to draw herself with her sister. The picture (Figure 4) shows Terry (left) sitting in the kitchen with her twin (middle) and older sister (right). She reminisced about the times they would talk together at the kitchen table. Terry was depressed about the fact that these talks stopped once she moved back to her parents' home. Now she felt that her sisters and father would talk about her and stop whenever she entered the room. She added that she felt she and her daughter had imposed on her family (i.e., her daughter would play with her sisters "all of the time"). From listening to Terry speak of this imposition, I was feeling a sense of envy or jealousy on her part. She stressed that her daughter began to spend all of her time playing with the sisters. Envious feelings seemed to have been felt toward the sisters since they received all the child's attention. In addition envious feelings seemed to have been directed toward the child for receiving all of the sisters' attention.

Terry spoke of experiencing suicidal ideations because of her imposition on her family. She described several planned approaches to suicide such as cutting her wrists, electrocuting herself and shooting herself. These plans were never carried through due to "interruptions." The shooting incident was then recounted. Terry explained that she did not commit suicide due to her realization that she would endure a great deal of pain, but would not feel the pain if she shot her daughter. She added that she felt that her daughter was now in peace and that God intended for the incident to occur because, otherwise, He would not have allowed her to kill her daughter.

Dreams were often the topic of discussion. In the following dream, Terry sees her daughter seated in a high chair (both figures are about the same size). The child is telling Terry that she (daughter) is going to die and would not see her any more. In her dream she walked toward the
child, then turned away and then returned to hug and kiss her good-bye (Figure 5). She explained the sense of relief she felt upon waking from the dream. The dream was described as God's way of telling her not to worry because her daughter would be fine. Both sisters agreed that the dream was indeed a sign. To them it gave credence to the daughter's purpose in life which was to get the family to acknowledge Terry's need for help. After drawing the dream, Terry laughed and felt that she had made herself look like a "madman." She laughed saying she could not understand why she looked like a madman when she had so much love for her child. In her drawing Terry's expression appears sinister. She had first drawn her hands pincer-like grasping the child. Upon completion of the drawing she smeared the hands as they now appear fused with the child's body.

During her stay in the jail, Terry underwent several psychiatric evaluations given through the court (I did not have access to these). Evaluation was to determine sanity which would influence sentencing to be hospitalization or long-term in-}

Fig. 5 In another dream T. says good-bye to her daughter. In the drawing, both are equal in size and the mother's hands are fused against her daughter's body.

carceration. She disliked these because of the series of direct questioning. Feeling pressured, she talked of her depression and that it all felt hopeless (Figure 6). Lying in her cell she is depressed and trying not to think. Asking her to describe her depression in the drawing led to some overt expression of anger. She blamed her mother-in-law and husband for what happened, emphasizing that they put pressure on her. She also felt that her father resented her when she moved back home. Both parents and sisters were blamed for not listening to her cries for help. Throughout our sessions, Terry seemed to project all her depression and anger toward the "bad" people in her life which included everyone in her family.

In the final weeks that we met, our sessions focused more on the hearing and its outcome. Terry's lawyer assured her that they would win the case in court which would lead her to a state mental health facility for treatment. Several of the women on her tier were familiar with the hospital and described parts of it to her. In this session we focused on her going to the hospital. The drawing she did presents three levels of what she expected the hospital to be like (Figure 7). Others had informed her that the hospital had a piano in the dining room where she drew herself playing while other patients sat at the dinner table. She felt like she would rather play the piano then eat because she was afraid that the others might find out what her charges were. She also feared being raped by the male patients and not being able to resist her own sexual desires. As in the previous dream picture, there seems to be an underlying fear of pregnancy in this description.

The second level of the drawing (Figure 7) shows Terry lying on a table where she will be examined by a physician. In a chair she is waiting to be given a dental exam. She spoke of hating to be poked at and was feeling angry. The third level in her drawing depicts visiting day at the hospital. The family was described as having been drawn transparently due to her feelings of uncertainty. It was easy for her to relate to her sisters, but not with her parents.

With a court date approaching, Terry centered on her anxiety. In her courtroom drawing (Figure 8) two lawyers are facing the judge who was described as being understanding of mental illness. The lawyers were said to be scared. To the left are two psychiatrists who evaluated her. Terry is seated at the right table

Fig. 6 Alone in her cell, T. drew herself feeling depressed, but verbally expressed her anger toward various people in her family.
and is crying. Her family is in the foreground. The courtroom was said to be a dreadful place where she would have to hear about the incident again. She described herself to be crying and wishing that she had been given the electric chair which would have eliminated all of this. Continuing she explained the irony of the whole situation as she previously thought that she would go to jail and die, but now she has to face life ahead of her.

During the week of the hearing we met and Terry was in good spirits; she was happy that it had started. As we talked she began to disclose anger. She was angry because she felt that the lawyer had made her look too ill. The anger appeared to be fear that she would be locked away for a long time. She also expressed outrage that the lawyer said she was jealous of her mother-in-law. Next Terry directed her anger toward her twin who had left home without telling anyone where she was going. Anger was directed toward her mother for being more concerned with her sister. Finally anger was directed toward the jail for not providing her with enough treatment. Mentioning that I felt she might be angry with me, she quickly responded by laughing as she explained that I could leave the jail anytime and I could not help her to get out. She added that she felt safe in jail, often more safe than being on the outside. She drew an image which represented how she was feeling at the moment (Figure 9), she said it looked frightened, but mad. She continued saying that the eyes probably resembled the look she had after shooting her daughter. Terry talked of being mad at everyone and afraid of what will come. We talked more about her loss in life and of the people she loved.

Conclusion

Anger stemming from envy appeared to be the underlying feeling Terry had toward others. By killing her daughter she had regained the child's place in the family once again. Now Terry's family was providing for her needs by taking care of her. Although she attempted to develop as an adult, she was unable to cope with the responsibilities of adulthood. Her inner rage attributed to the constant ambivalence she expressed whenever she tried to be independent. Through our sessions Terry had traced her life history. She recollected her first years of life as being troublesome, expressing that as a child she had an aggressive attitude toward her mother. She seldom spoke of her mother and usually confined discussion of her in negative terms. These aggressive attacks of the child toward the mother were repeated by Terry's daughter. She explained that she had felt shocked when her daughter appeared as behaving violently by kicking and choking others after she and her husband separated. Seeing
did not like her. Although I tried to show her that I did like her, it seemed difficult for her to believe that people could accept her after what she had done. She expressed her anger toward me for not being able to free her from jail. Here I was not being the good therapist in providing her with what she needed. Perhaps, I, like her family was not providing enough to fulfill her needs. Her constant questioning of my approval emphasized her own pain and fear surrounding her action. It is a fear I believe to be felt by the general population as well. Presently we need to gain awareness of the complexity of the emotional ties that parents and children share. From research we are learning that mothers who kill their infants during post partum psychosis do so as a result of hormonal and chemical change attributed to child birth. Terry’s case does not fit this category. Her situation was also not simply a murder, but an intricate, uncontrolled release of rage and confusion stemming from her own childhood experiences. These are incidents which are not easy to understand nor are they easy to explore.

Freedom to Create is a concise handbook outlining basic methodology for establishing basic routines and adapting art processes to the needs of individuals with varied disabilities. The central section of the book (by both placement and length: 40 pages) consists of a series of ten art lessons, ranging from experimental/expressive painting through papier maché maskmaking, printmaking and painting still lifes using various approaches. For each lesson, practical hints are given for organizing materials, equipment and space, preceded by reasons (the intended value) of the lesson, possible problems and ways of dealing with or circumventing these, ways of further developing the lesson, and uses of the product.

In the introductory section there is a strong emphasis in encouraging creativity, and on the unique role of artistic creativity in the lives of the disabled. Attention is called to the encouragement and acceptance of individual approaches to problem-solving and interpretation, as well as to sensitively accepting true limitations of perception and skill, while remaining open to the delight of achieving transcendence over these. They state.

Creative self-expression is the outward manifestation in an art form of what one feels internally. This expression may find its outlet in painting, sculpture, music, dance, poetry, or in many other forms. It may be inspired by what one sees in the environment or a transformation of it; or it may be a reaction to inner moods, feelings or sensations (page 3).

The separate sections of this definition are discussed, relating them to children with disabilities, to a philosophy of art teaching, and to a credo for art teachers.

The approach is strongly child or client-centered; the emphasis is on the creativity of the client, acceptance of developmental abilities, a positive and constructive approach to the artist and his work. The role of the teacher is seen as stimulating, encouraging, fostering excitement and the desire to experiment and discover. As might be expected, references to Lowenfeld, Rogers and Maslow are included in a short but helpful Bibliography.

The concluding section consists of practical hints for adapting processes and equipment for differing needs. Safety of materials and non-toxicity are emphasized, as are sources for inexpensive or free materials and equipment. Although specific adaptations are offered, the approach is not prescriptive. Rather, the teacher is expected to work with student-artists in designing adaptations to meet individual needs.

Photographs of both children and adults at work, as well as of art products, illustrate each of the lessons. The artists consistently show intense involvement with their work.

The authors have been instrumental in founding four art centers for disabled people between 1973 and 1987. Ms. Ludins-Katz is an artist, teacher and art critic, and Dr. Katz is a clinical psychologist. Their enthusiasm and dedication to their clients rings through the concise but well-filled discussion of creativity and art in the lives of their clients. An earlier book (Art and Disabilities, reviewed in Art Therapy in October, 1983) discusses the intricacies of establishing and running an art center for the disabled. They bring to this new book a good deal of experience and energy.

There seem to be two primary focuses in this handbook: practical information for management of the room and materials for an active art room, and developing the sensitivity to inner and outer stimuli seen as needed for a creative approach to art-making. The two purposes do not seem, within the structure of the book, to come together. The lesson “plans” do not include many suggestions to encourage open-ended questioning and reflective observations that would help a teacher inexperienced with aesthetic sensitivity to provide sufficient stimulation to encourage creative work. Yet some of the detailed information of set-up and procedures would be
necessary for an experienced art teacher or therapist attempting to adapt to a disabled population. At times reference is made to displaying the “best” art work, but without discussion as to the criteria for “best.” Is this an aesthetic judgment and if so, relative to the student/artist, the teacher, the goals of the plan, or an audience of the general public, since exhibits in public buildings are mentioned? Perhaps the reader best served by Freedom to Create would be the artist, already sensitive to inner and outer nuances of stimuli, who wishes to share that excitement and instill it in those who will greatly benefit from the richness of visual art and the valuing of individual uniqueness that should be implicit in the creative process.

Despite my cautiousness regarding intended audience, I feel Ludins-Katz and Katz have something of great value in offering, and encouraging others to offer, a personalized approach to art that emphasized using students’ highest and best functioning. A verbal vignette describing the invention by a cerebral palsied artist of a way of monoprinting is genuinely moving. Perhaps including more such portraits of the process in action would elucidate the underlying philosophy and its assumptions in a more integrated way.

The Living Psyche: A Jungian Analysis in Pictures

Reviewed by: Howard McConaghey, Ed.D., A.T.R., Professor Director of graduate art therapy program, The University of New Mexico, Albuquerque, N.M.

As an example of the classical Jungian point of view this book is of unique and important value, especially to art therapists. Although the author suggests that a basic knowledge of Jungian psychology is presupposed, a careful reading of the 104 images, the short description of each by the client, and the analyst’s brief comment on each painting, offers meaningful insight into Jungian theory.

Dr. Edinger writes in a manner which is easy to read and which will be clear to any thoughtful reader whether familiar with Jung’s psychology or not. He himself was analyzed by Jung. His perception of archetypal content and of the eminence of the numinous psyche are well founded. He attained his medical degree from Yale University in 1946 and is former chairman of the C.G. Jung Training Center in New York, where he practiced as a Jungian analyst for many years. He has written many books, the best known of which include, Ego and Archetype, Anatomy of the Psyche, and Jung’s Myth for Modern Man.

For art therapists the book is especially valuable because it consists of the reproduction of 104 paintings with only brief text. Half of the content is visual. We must, I believe, bear in mind that the author is not an art therapist and that the Jungian approach is not one of art as therapy but rather one of art used in the service of therapy—as a tool for analysis. There is, for example, little concern for the structure of the work as it would constitute the visual context of the image.

Both art and psychotherapy have much to offer our own profession, and we must not neglect either or simply use either as a tool in the service of the other.

Jung insisted that what he and his patients created was not art (although his anima told him that it was art) and he thought that the more aesthetic the work was the less symbolic. It does seem that artistic clients and art therapists themselves work in a different style when consciously attempting to portray their psychological inner states.

The patient in the case presented by Edinger, “began analysis at the age of 36 with the chief complaint being that in spite of a successful career in the arts he had lost his sense of life-purpose and was on the verge of despair.” It would be interesting to see examples of his professional art work. His “career in the arts” is not further clarified. However, because a number of the images show stage settings, and most of them emphasize dramatic episodes, and because the work in general tends to lack detail, one might suppose the client’s art work was as a set designer in the theater.

This leads me to wonder whether there is an inherent difference between the work one does in therapy and the work the same person would do in simply expressing himself/herself through the visual arts or through professional art work. Although this client had a successful career “in the arts,” the paintings over a five year period do not indicate any appreciable artistic progress. By this I mean a greater unity or greater structural complexity, or clarity of emotional involvement, all of which I would think
might, in art therapy, coincide with psychological improvement and health.

The question occurs to me whether in art therapy as well as in Jungian analysis, the emphasis on psychological theory and the minimization by the therapist of the artistic quality of the work may influence the client's attitude toward his/her artistic production. (Perhaps we don't really appreciate the client's work as art.) I am not speaking of academic conventions of aesthetic quality but of an aesthetic expressive quality—what I believe Edith Kramer means by "formed expression," and what Henry Schaefer-Simmern defines as a developing discrimination of "visual conceiving." Visual conceiving means "a definite mental activity of conceiving relationships of form in the realm of pure vision."

Structural aspects offer a symbolic and archetypal content which may be "amazing" to the analyst if he notices them. Nonetheless, few artists or critics would call this picture an "amazing" or "profound" work of art. My question is whether art therapy might expect formal results equally as profound as the narrative theme itself. Rosenberg has told us that the experience of each individual will be "the ground of a unique inimitable form" and Schaefer-Simmern has shown that ordinary persons in business and the professions as well as delinquent youths and even retarded persons can achieve truly amazing results in visual conception when the subject matter lies in the realm of their interest. The work of his students did achieve progressively greater structural unity and complexity as well as profound clarity of emotional involvement and insight. Such formal development, hand-in-hand with conscious awareness of archetypal numinous values will minister to the integration of personality.

In other words, as there is an interconnection between the formative process and the psychophysical responses of the originator, it can be said that he who forms artistically in turn forms himself. (Schaefer-Simmern, H, The Unfolding of Artistic Activity, 3rd ed., Berkley: University of California, 1970, p. 28).

This emphasis on aesthetic form as opposed to what Kramer calls anti-art is the difference I see between art therapy as a unique profession and psychotherapy which may use art as a tool for analysis.

As a study in classical Jungian analysis The Living Psyche will be interesting to all therapists, as a clear depiction of art in the service of psychotherapy. By contrast to our mode of formative aesthetic therapy it can help art therapists to recognize the uniqueness of our own profession among other professions of psychotherapy. At least the emphasis on art and the dependance of visual presentation in this book is a welcome innovation.
THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration, and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:
- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

Chapters:
Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive:

Publications
- Art Therapy, the official journal of the AATA.
- The quarterly AATA Newsletter.
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest.

Services
- Insurance, including professional liability, major medical, life and disability.
- Access to national experts in art therapy.

AATA Conferences
- Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards
- Development of model job and licensure laws.
- Development and Implementation of national guidelines for approval of Master's Degree and training programs in art therapy.
- Development and Implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATION

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application. Applications received between
   Jan. 1st and May 31st — Full dues payment; Membership will expire Dec. 31st of same year.
   June 1st and Sept. 30th — Half-year dues plus $5.00 payment; membership will expire Dec. 31st of same year.
   Oct. 1st and Dec. 31st — Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.
3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (ATR) are separate application procedures. Registration is bestowed only by the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL — by application only; such members may vote, hold office and serve on committees.
- Credentialled Professional Member: Individuals who have been duly approved for Professional Membership and Registration (ATR) by the AATA; dues are $80 per year.
- Active Professional Member: Individuals who have completed professional training in art therapy; dues are $75 per year.

CONTRIBUTING — individuals, organizations, institutions which contribute annuity to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE — individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT — individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.

Master’s Degree Program in Expressive Therapies and in Creative Arts in Learning

Offered by the Institute for the Arts and Human Development
Lesley College Graduate School

Masters of Arts in Expressive Therapies
For students interested in the creative modalities of art, music, dance/movement, and drama, presented in a clinical and theoretical framework for a variety of settings.

Master of Education in Creative Arts in Learning
For students who wish to learn how to integrate the arts for careers in schools, cultural institutions, and human services institutions. Specializations in storytelling and theater studies.

For more information call or write the Institute for the Arts and Human Development, Lesley College Graduate School, 29 Everett Street, Cambridge, MA 02138-2790. (617) 868-9600, ext. 480.

Lesley College
GRADUATE SCHOOL

Leslie College is an Equal Opportunity/Affirmative Action Institution.

Guidelines for Authors

Please submit five (5) copies of manuscripts to: Art Therapy Editor Gary Barlow, Ed.D., A.T.R., AATA National Office, 1202 Allanson Rd., Mundelein, IL 60060. AATA cannot be responsible for submissions sent to any other address. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5 x 7 black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

CONFIDENTIALITY: Client/Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.
Creativity through Collaboration

National Coalition of Arts Therapists Conference

The Joint Annual Meetings of American Art Therapy Association, American Association for Music Therapy, American Society of Group Psychotherapy and Psychodrama, American Dance Therapy Association, National Association for Drama Therapy, National Association for Music Therapy

- SPECIAL FOCUS on each of the creative arts therapies in the treatment of AIDS, addictions, terminally ill, PTSD, brain injury, geriatric, and psychiatric populations.

FEATURED SPEAKERS:

- Rollo May
  Author of Love and Will, Man's Search for Himself, The Courage to Create.

- Edith Wallace, M.D., Ph.D.

- Joseph Noshpitz, M.D.
  Noted psychiatrist and child psychoanalyst.

- Celeste Holm
  Celebrated actress of the stage and screen; President of the Creative Arts Rehabilitation Center in New York City.

FEATURED ENTERTAINMENT:

- Spalding Gray
  Writer and performer of autobiographical monologues. Movies include "The Killing Fields" and "Swimming to Cambodia."

- Baba Olatunji
  Master percussionist from Nigeria whose albums include Drums of Passion and Dance to the Beat of My Drum.

- Susan Osborn
  A lead singer with the Paul Winter Consort and workshop leader in exploring one's own voice.

Over 300 Sessions!
Pre-Conference Intensives!
Both Interdisciplinary
and Single Modality
Workshops!

November 1 – 5, 1990
Thursday morning
through Monday noon
Grand Hyatt Hotel and
Holiday Inn Crowne Plaza
Washington, D.C.

It's like having
your own conference
plus
much, much more!

Registration material will be mailed out in July 1990 through your professional association. If you are not a member of one of the co-sponsoring organizations and you would like to be placed on the mailing list, call NCATA at 609-848-1000 Ext 213.

The Pre-registration Deadline is September 10, 1990.

ROSS, Colin, *Multiple Personality Disorder: Diagnosis, Clinical Features & Treatment*, 1989 $45.00.

GOLDSTEIN & Goldstein, *Managing Attention Disorder*, $49.95.

TO ORDER: Please call or write us at Stern's. Stern's accepts personal checks, purchase order numbers, Visa, MCard & AmExpress. By mail, please include $3.00 shipping for the first book; 50c for each title after the first. We ship via UPS (no PO boxes please). For foreign shipments or airmail, please call or write for shipping amounts.

The interdisciplinary journal devoted to the creative arts as healing arts.

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Associate Clinical Professor, Department of Psychiatry, Yale University; Clinical Psychologist, Veterans Administration Medical Center, West Spring Street, West Haven, CT 06515, USA

THE ARTS IN PSYCHOTHERAPY is a quarterly, international journal for professionals in the fields of mental health and education. The journal publishes articles (including illustrations) by art, dance/movement, music, poetry and drama psychotherapists, as well as psychiatrists and psychologists, that reflect the theory and practice of these disciplines. There are no restrictions on philosophical orientation or application.

“Our House on the Lake.” A painting completed by an 83 year old woman in art therapy, in a Dayton, Ohio nursing home.

STATEMENT OF PURPOSE

ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

In the book *Acting-In, Practical Applications of Psychodramatic Methods*, the author is concerned with, among other issues, the principles and pitfalls relative to effective helping relationships. In chapter seven Adam Blatner, M.D., writes about the sense of professional commitment and intellectual humility together with the formation of a "truly mutual relationship with clients." (p. 102) Within the section titled 'The Context of Mutuality,' (referring to the wholehearted respect of the client as one who is growing and exploring) the author states that "within the group the sense of mutual trust can only grow when based on norms of respect." (p. 102) Further, in his discussion on professional humility, the author states that it is essential that the director (and therapist) have an awareness of the strengths and limitations of the many methods in helping personal development.

"Over the last decade" says Blatner, "scores of innovations have been introduced into the fields of psychotherapy, education, and management. All too often the proponents of these new methods tend to idealize their pet approach. This leads to the pitfall of applying that method indiscriminately: Those protagonists for whom a certain approach is ineffective may be coerced into useless efforts at staying with that method. The true professional knows that there are many varied populations that require different therapeutic or educational approaches." (pp. 103-4)

Blatner's writing raises implicit cautions for the art therapist. How cognizant are we to the exploration of various approaches or beliefs in addition to the one(s) with which we are most comfortable? How often do we explore other avenues that are available for those with whom we work (client, colleague, parent, and others)? Is it possible that we might fall into a stereotyped approach, method or expected outcome? If so, we need to identify, and practice, ways that can begin to break through the barriers that may hamper further insight and understanding.

The author's brief discussions of "pathological spontaneity" (p. 104) and "Action vs. Awkwardness" (p. 105) are compelling in stimulating personal thinking and evaluation and, although discussion cannot be presented here because of space, these issues are important for any of us to consider. The paperback is a second edition publication, and worth our reading and thinking about.

The articles in this issue are by the following authors: (1) Harriet Wadeson, Rose Marano Geiser and Joanne Ramseyer; (2) Winnie Ferguson; (3) Doris Arrington; (4) Pierre Grégoire; and (5) Stanley Schneider, Shelley Ostroff and Nancy Legow. As in the articles published in past issues of *Art Therapy*, I believe that the readers will find these current articles timely and pertinent for our field. It is gratifying, as an editor, to receive creative, informative and well-written articles that 'say something' to the readership. It has always been a policy to present the various issues of *Art Therapy* in a format that is not only attractive in design, but also carry important messages relative to our profession. So, let me offer my congratulations and appreciation to all past and present authors for a 'job well done,' and I encourage future authors to continue writing important articles to share with others.

I look forward to working with the new A.A.T.A. Editorial Board of Art Therapy. These members are: Paulo Knill; Susan Cheyne-King; Robert Wolf; Paul Rodenhauser; Lewis Shupe; Carol Cox; Maxine Junge; Michael Campanelli; Howard McGonigey; Sandra Tice; Wendy R. Lauter; Marcia Rosal; Betty Jo Troeger; Vija Lusebrink; and Frances Anderson. In addition, Winnie J. Ferguson has agreed to serve as the journal's Book Review Editor since Aina O. Nucho has stepped down from this position. Aina has done a tremendous job, and I thank her for the time and effort given in this capacity. Similarly, the past members of the Editorial Board have contributed time and talent to help make our journal an outstanding one. Sincere appreciation goes to each of them for their excellent work.

"There is always one moment in childhood when the door opens and lets the future in." (Quote by Graham Greene; specific reference unknown) Have a happy, profitable and satisfying New Year!

Editor, Art Therapy
Through the Looking Glass:  
I. When Clients’ Tragic Images Illuminate the Therapist’s Dark Side

Harriet Wadeson, Ph.D., A.T.R., Coordinator, Art Therapy Graduate Program, School of Art and Design, University of Illinois at Chicago

Abstract

Three art therapists utilize their own art work to explore their relationship to their clients’ images of horror, the “darkside” of their lives that is exposed to art therapists. The authors seek to understand their decision to be confronted with the tragic realities their clients present. Questions are raised as to how this work serves the therapist and related cautions are given. Using one’s own post-session art to process strong feelings, increase empathy, explore merging by using the client’s symbols, and the impact of the work on the “artist self” are examined.

This paper and the 1988 AATA Conference panel that spawned it constitute a work in progress. For me the issues here addressed are at the heart of our work. They challenge us to look beyond the mirror of surface images, “through the glass darkly,” to discover who we are and why, as art therapists, we make the choices to work with the troubled people whom we have invited into our lives.

Our explorations of the “dark side” originated in a training group I established for art therapists who wished to learn to do art therapy supervision. Each participant brought in case material and we discussed together how a supervisor might approach the therapist in handling it. Early on, one of the members described her feelings of nausea as a client drew and detailed being raped as a child and recently as an adult. The therapist did not know what to do and asked the group how to deal with such feelings. Another member related her outrage, troubled feelings, and confusion when she, as a new mother, worked with a woman who had murdered her young child. A third member spoke of her own sense of craziness and the fascination she felt in working with psychotics. We were off and running, intrigued by the powerful feelings evoked in all of us as we glimpsed the primitive and provocative in the lives of those with whom we work. I thought of my experience in treating and conducting research with unmedicated acute schizophrenics and my choice to work with child abusers. We shared our stories, made art, and tried to puzzle out the meaning of our decisions to work with the sort of people we do.

We felt the need to expand our inquiry beyond our small group and involve other art therapists in our explorations. To do so we conducted a workshop at an AATA Conference, entitled, THE UNDERSIDE: FASCINATION/REVULSION. The title denoted the underside of a rock, usually hidden from the light, the dank, dark side from which creepy, slimy creatures crawl. This is the side of life civilization shuns, the side that comfortable middle class members of our society seek to avoid. But the underside is exposed to therapists, and to art therapists it is portrayed in dramatic imagery. Why do we in the helping professions in general, and in art therapy in particular, turn over the rocks to view what is underneath? Why do we choose to work with psychotics, violent prisoners, rape victims?

We asked the workshop participants to tell a horror story from one of their clients in the first person as if it were their own story. Next, they were to draw it in the style of their client. The picture was then discussed in the small group in which they had told the story. The purpose of these two exercises was to put participants back in touch with the experience of working with horrific material brought forth in therapy. The next task was to discover one’s own relationship to the horror story of the client. To do so, we asked participants to draw a personal experience from their own past that connected with the horror story, the effect of it on the therapist, or one’s feelings in response to it.

As I applied the same processes to my own clinical experience, some specific horror stories sprung to mind. These were stories that compelled me to think about them over and over as I was working with the clients who lived them and many times since. They came from a child abuse facility where I consulted. I had been hired to train the staff in

“"We shared our stories, made art, and tried to puzzle out the meaning of our decisions to work with the sort of people we do."
using art with their clients, mostly children who had been sexually abused. But my interest was to work with the abusers. On the surface I believed that my motivation stemmed from my belief that abuse can be eliminated only if we understand the needs it fulfills for the abuser. As I heard their horror stories of mutilation and cannibalism and made my own art, I began to see deeper purposes in my choices.

There were two clients, in particular, who were convicted of child sexual abuse and who illuminated my own fascination with the dark side. The first was a very large imposing 35-year-old man whom I will call Harold. He had no teeth. Abused at age 13, as an older teenager he then began seeking out young boys for sexual contact. He estimated that he had probably molested at least fifty boys. Our therapy focused on his lack of employment, his difficulties with his wife and children, his family of origin with whom he was very enmeshed, and especially his feelings of inadequacy in relation to his father and brother. He referred briefly to Vietnam war experiences, and when I mentioned this to the two male psychologists who saw him in a men's therapy group for abusers, they believed he was fabricating the veteran experience.

One day he was particularly agitated in the session. He had been dealing with fears of homosexuality, surreptitiously going to gay bars to pick up men and feeling guilty afterward. He said he had something to tell me, but couldn't. I told him not to push himself, that he would tell me when he was ready. I saw another client after his session, and when it was over, I found Harold waiting for me. He had to talk to me, he said. I had an appointment in another building but told Harold that he could walk with me. As we crossed the parking lot he blurted out that he was in a Vietnamese prison camp with his best friend from childhood. His buddy died there. Harold cannibalized him. When he came home, he had all his teeth pulled.

The second client, Bill, was also a Vietnam vet. He was convicted of sexually abusing his wife's two daughters from a former marriage. They were white; he was black. Bill claimed that the children had framed him, that he was innocent, but he pleaded guilty because, as a black man accused of molesting white girls, he would not stand a chance in court. He, too, was a large imposing man and had serious employment problems. He presented himself as a person who always tried to do the right thing. He was very bright and an excellent artist. He had had a psychotic break and impressed me as a pack of dynamite with a very short fuse . . . and the sparks were flying.

Bill dealt with family life a great deal, past and present. He drew pictures of his war experience. Finally, the following story emerged: Bill had been raped and beaten when captured by an enemy soldier. He escaped and returned to his own unit. For months he searched for his captor. Then the enemy soldier showed up in a group his unit had captured. Bill asked his comrades to let him take care of this prisoner. He took the man out into the woods where for two hours he mutilated him. Finally, he stuck his pistol up the prisoner's rectum and shot him.

What is your reaction to these stories? Mine was horror. It was difficult to stop thinking about them. These were not the violent thrillers of TV and film that I assiduously avoid. These were events in the lives of people I knew. This was life that was totally foreign to my white upper middle-class protected American existence. My clients plunged me into another world. This was life that was raw, primitive, horrible, and . . . yes . . . fascinating.

As foreign as mutilation, murder, cannibalism, and child sexual abuse are to my own life and probably to yours as well, there was something about it naggingly familiar—the fascination part. I tried to probe my own dark nature, reflect on my enjoyment of working with bizarre, non-medicated psychotics, explore my responses with the Learning Supervision group, look at reactions of other art therapists to client horror stories in the "Underside" workshop, and share my own artwork and understand the art of the other panelists in the "Dark Side" panel. The question that nags at me is why do we therapists choose to expose ourselves to the seamy side of life? Why do we "muck around in the miseries"?

My own art work has much to say about my relationship to the dark underside. My experience in working with non-medicated psychotics and child abusers was that they taught me much of life. But when I view my own art, I believe that they also taught me much about myself. Masks made on my own face, taking its form, reveal to me aspects of myself that connect with and identify with painful issues in my clients' lives. These strange visages are very much me. Figure 1 is a concubine, a decorative victim with her eyes closed. Figure 2 is the exciting primitive side that is allowed so little expression in our society. Figure 3 is a brilliant red screaming face—once again an expression that is not allowed. When I began Figure 4, I was determined to make a pretty face since many of my masks are bizarre. I ended up dripping wax all over it, giving it steel wool hair and broken shell eyes. To me it looks tortured. Figure 5 perhaps expresses the ideas of this paper most ex

"There were two clients . . . who were convicted of child sexual abuse and who illuminated my own fascination with the dark side."
Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

Explicitly. The face has a lifeless, china doll look. The hair style is very staid. Cutting my own "face" was a very impactful experience. Through the crack emerges brilliant red, staining the torn edges of the crevice. The placid facade cannot contain the passion, rage, life within. The mask is a metaphor, an image that tells me of my fascination with the underside, the darkside. It is life that needs to break out of the constrictions that contain it.

Unlike the artwork of the other panel members and the participants in the "Underside" workshop, these pieces are not directly related to specific clients, but rather to the themes of victimization, rage, pain, wilderness, fear, but especially important is the frozen face that seeks to cover the consuming heat within. These images, the stories of my clients, and those of others have led to a tentative formulation of ideas that speak in response to the questions raised.

The "Underside" workshop brought forth very direct connections between clients' horror stories and therapists' own life experiences. It seemed likely that through the collaboration with the client of trying to heal the client's life, the therapist moved toward his or her own healings as well. The therapist could achieve distance and connection at the same time. One of the most moving aspects of the workshop was the surprise of the participants at the strength of their feelings. In some instances participants remarked that they thought they had resolved the issues that the clients had brought up for them, only to find themselves in tears again over their own painful pasts.

For me, the connections were much less direct, the issues much less specific. I believe that the protected upper middle-class existence that most of us live has about it significant repression of violent, sexual
id-related experience that in our own lives surfaces only in our dreams, nightmares, and fantasies. The relative safety of our lives may be bought at some cost in excitement and stimulation. Depression and apathy plague many of us at one time or another. As therapists, some of us may counter the relative blandness of our own lives through our fascination with the bizarre realities of our clients’ lives. We remain out of danger while voyeuristically participating in events we would not choose to experience directly.

These thoughts reminded me of the play Equus*, in which the psychiatrist envies his “insane” patient: “… But that boy has known passion more ferocious than I have felt in any second of my life. And let me tell you something; I envy it … I settled for being pallid and provincial out of my own eternal timidity … I use that word endlessly: ‘primitive’ … and while I sit here baiting a poor unimaginative woman [his wife] with the word that freaky boy tries to conjure the reality! I sit looking at pages of centaurs trampling the soil of Argos—and outside my window he is trying to become one … I watch that woman knitting, night after night—a woman I haven’t kissed in six years—and he stands in the dark for an hour suck-

“The key to working with patients in an emotionally non-exploitive, clinically responsible way is self-awareness.”

for the stimulation of the exotic or dangerous or violent passion our patients bring into our lives, then we will be free to choose how we deal with it clinically to effect the best therapy we can, neither denying and avoiding it through fear, nor luxuriating in it through need.

Through the unique and individual story each client brings us, our work remains ever-interesting, seldom routine. Each client is a new challenge, a new adventure. We need not add further excitement. With conscientious attention to ourselves in relation to the roles our clients play in our lives, we are able to guide the therapeutic ship safely through the turbulent waters and dangerous shoals that may threaten the voyage our clients take with us.

As therapists, we wrestle with forces of life and death in our clients and in ourselves. As art therapists, we are privileged to find in our clients, and to create for ourselves, images of the dynamic dance of the chaos and containment that shape our lives. We play with fire that can both burn and weld. Our ability to see the choice is essential to our work.

Through the Looking Glass: 
II. Impact on the Artist Self

Rose Marano Geiser, M.A., A.T.R., Art Therapist for the Center for Consulting Services, Louisville, Kentucky

Thinking about the title of this panel, I wondered as I have done before while looking at my own reflection in the morning mirror, what does exist on the other side? What lies inside? So many myths and fairytales use the mirror as a magic door which opens to a (sometimes dark) secret passage. The shaman enters a hidden passage, descends to the center and is illumined to th "Truth." “Shamanic enlightener
"... essentially every time I sit with a client, work with a client, I am before a looking glass..."

is the literal ability to lighten the darkness, to see in the darkness what others cannot perceive." (Harner, 1980, p. 28)

Having thought about the meaning of being a therapist, I have thought that essentially every time I sit with a client, work with a client, I am before a looking glass so to speak. Images emerge from the surface presented to me as the persona stands guard to the inner personal world of the individual who allows me entrance. In one way this may keep me (as therapist) from getting to the other side (inside) too quickly. As a result I am encouraged to enter this world of the client slowly, cautiously through examining my own reflection, which is so often difficult to do. I am encouraged to look beyond the surface, into the reflection to uncover (dark) hidden realities.

Moving cautiously means being aware of what I bring to the therapeutic relationship. It does not mean that I shy away from taking risks. It does mean joining in the journey through darkness as a partner who guides toward tranformation into light. It is that darkness that surfaces in our therapeutic relationships that we are exploring. As art therapists we not only hear about the darkness, we see it in the images that clients' draw, paint and construct.

During a past (1987) AATA Conference, Harriet Wadeson and I gave a workshop which focused on the darkness as presented to us by clients. All of us who participated explored through making art, how the darkness of our clients impacts upon us as therapists, how it reveals and reflects our own painful issues. The 1988 AATA Conference panel continued the sharing of personal experiences in facing the darkness encountered in the therapeutic aliance. What are the effects upon the self? All of us on the panel use art making as a means toward a fuller understanding of what we encounter as therapists.

I have been looking at how my artist self and therapist self overlap as art therapist. In another paper (1989) I noted that working face to face with the darkness evoked some unconscious art making on my part. The series of drawings I made as "artist," reflected the ominous world I experienced as "therapist" working in corrections. Since that first recognition of therapy entering my art work I have tried to separate the two. This only increased frustrations and hindered any art making at all. I found myself playing with clay, constructing merely decorative pieces. Serious art making became increasingly difficult and scarce. For about two years I did not draw, paint or sculpt. All creative energies were drained into being a therapist. Since I had been an artist longer than being a therapist, that ignored part of me was fighting to survive. I wanted to be an artist again, but what interested me were the people with whom I worked. This past year I deliberately set out to interpret them through art in an attempt to satisfy both artist and therapist. I did this by taking an element of my clients' art therapy work and reworked it as part of my own art.

Delving into the darkness of clients' lives has pulled me toward an exploration of the merging process which often develops within the therapeutic relationship. There is much literature, both pro and con in exploring the merger between therapist and client, but I am investigating the idea of merger from the perspective of being an artist as well as therapist. What happens between the art therapist and the client in the process of making art? How does that relationship differ from the more traditional verbal therapies? If it is strictly "looking at the situation" that a client presents, we ignore our conscious and unconscious response to the image and the multiple symbols which make-up the whole art work. As an artist-therapist how does my formal training in aesthetics influence my response to client art? How does my own data bank of symbols mix with the symbols my clients depict in their art?

Two individuals with whom I have worked had been difficult as they had been defensive and resistive in examining their dark realities. Robbins states "Defended patients transmit nonverbally their symbolic material and the therapist becomes receptacle for the material which will in turn demand some type of inner exploration." (Robbins, 1988, p. 41) The two clients presented below did not verbally transmit their symbolic material, but did so visually in their art work. I responded visually in my exploration of what they presented to me in trying to understand their symbols.

Michelle is a 25-year-old woman who had been in an abusive and incestuous relationship with her father for 20 years. When I first began working with her, she did not discuss the relationship and left out any direct referral to the sexual abuse. Instead she focused on her chemical dependency. She had been given various diagnoses none of which fit.

"Delving into the darkness of clients' lives has pulled me toward an exploration of the merging process which often develops within the therapeutic relationship."
with what I had observed. In the beginning of our relationship I had difficulty grasping what was happening in our session as she seemed entranced whenever painful issues surfaced. She was later diagnosed with Dissociative Disorder. She presented me with several symbols in her drawings. One of these symbols was a hand with rays extending from the fingertips (Figure 1). At first she drew the hand alone saying that it had power and was the hand of a magician. Later in family portraits her father was drawn with the same hands. In the drawing of her "Higher Power" the hands were again present. At times, in self-portraits, her own hands were drawn with the rays. She did not verbally recognize that her father was drawn with rays nor did she acknowledge that he was connected with power.

The symbol of the hands impacted upon me not only as therapist, but also as artist, and I sketched those hands trying to understand that meaning of power. In one of the drawings I completed using the hands with rays (Figure 2), I thought of her as a mythical figure, a type of St. Joan who accepted her flames ignited by her belief in the father. Her spiritual self escapes as did her mother who symbolically dissociated from the reality of incest.

Jack is a 30-year-old man diagnosed with Schizophrenia. His art work often presented archetypal images of a female warrior, wise woman, animals and biblical figures. He never explained what he had in mind about the drawings. Most often he was defensive and angry. He stated that he did not trust anyone, not even me, because I was just his worker who was an employee of the agency. When he alluded to this I felt quite angry and hurt as I envisioned our relationship to be a positive one.

One drawing he did interested me as it contained animal images connected to my own dream symbols (Figure 3), I decided to redraw his picture in an attempt to feel what he felt. His anger evoked my own anger. I incorporated the main elements of his drawing but added a portrait of him as well (Figure 4).

The portrait, however, turned out to be that of a frightened boy rather than that of an angry and defensive man. To see my own drawing helped to dissipate my anger and frustration with him. It had freed me to accept him in his anger and recognize more clearly my own angry reactions to his defensiveness.

I recognize from these drawings I made, that clearly I was working through countertransference in the relationships. Also, these were drawings I made for myself and would not share with these clients. What has surprised me is the idea of merging with these clients through the art work. I have since been investigating the idea of merger with the client through readings about shamanism. Harner (1980) speaks about how the shaman becomes the patient and likens it to the process of countertransference in Western psychoanalysis.

Eliade (1964) and Harner (1980) describe the process of the shaman removing illness from a patient. The shaman actually attempts to "suck out from the patient any intrusiv..."
power which is causing illness. Kalweit (1984) describes how some shamans try to take on or internalize the patient's illness in order to destroy it. In a sense there is a merger between shaman and patient. “The procedure for extracting or removing a power intrusion is the same as understanding the journey for a patient, up to a point.” (Harnen, 1980, p. 151) The merger is controlled before the shaman has gotten very far from an earthly consciousness. The art work acts as control for the therapist and the client in the merging process. The art work I made was itself the merging process as it occurred through an empathic response to the image.

The effects upon my artist self at this point as art therapist have been a blending of the two. I cannot separate art making from the influence of being a therapist. Art reflects with what the artist is involved. “In order to make it all understandable, the abstract life of the psyche is concretized and expressed as myth. . . .” (Kalweit, 1984, p. 241)

Art also expresses reality through myth and is the concrete expression of the psyche. As a therapist making art about the people with whom I work, I am in effect attempting to make abstract symbols from my clients more concrete. It is not an attempt to change the meaning of the symbol for the client, but an exploration of my personal reactions to the image.

The profession of therapist can certainly be a prurient venture in order to experience other realities, but the process of mirroring and merging between therapist and client does not allow for simple voyeurism. The process brings to consciousness the driving force behind the choice to be a therapist. From our 1987 workshop colleagues have shared personal reasons for becoming therapists and choosing to work with the darkside. Personal experiences with sexual, physical and emotional abuse, loss, physical handicaps and living with alcoholic parents have pulled at many therapists. We can recognize and be reminded of the fragility of our own lives through the lives of our clients. In mirroring and merging we reflect to each other the many faceted experiences we live and the symbols we collectively share.

Through the Looking Glass:
III. Exploring the Dark Side Through Post-Session Artwork

Joanne Ramseyer, M.A., A.T.R., Art Therapist and Clinical Supervisor, Edgewater Uptown Community Mental Health Center, Chicago, Illinois, Adjunct Assistant Professor at the University of Illinois at Chicago Graduate Art Therapy Program

Several years ago, after a particularly emotional session with a sexual assault victim, I began creating art in response to the profound impact her story had upon me. Despite specialized training and experience in this area, the client’s sorrow and gruesome details of a childhood rape were difficult to shake when the session ended. In an effort to “detoxify” from the dark intensity that had permeated the hour, I instinctively turned to my own art. Figures 1 and 2 are pictures I created immediately following the session.

In Figure 1 yellow cracked lines cover a red background to express the client’s emotional shock and physical pain. Thick black and purple jagged lines are scattered throughout the picture and also surround a section of bright yellow in the center to represent the violence of the assault and her shattered childhood.

Reflecting upon the picture, I realized it held a dual meaning for me. Although I initially created it to explore my perception of the client’s feelings and experience, I quickly recognized the horror, shock and outrage I had vividly expressed in the picture. Her story was a brutal reminder to me of the darker, sinister side of life that is often difficult to comprehend and even more complicated to talk about. Through the picture I was able to express powerful reactions about the client’s specific assault and identify my own feelings related to victimization. Most importantly, though, I found myself intently questioning my choice to work in a profession that involves continuous exposure to the underside of life and wondered about the long-term effects, professionally and personally.

Needling to explore my thoughts and reactions further, I drew a second picture. A detail of the client’s story was haunting me, so I decided to re-create the scene visually with my own images, hoping to understand its significance more clearly. After describing the events of the rape, the client had tearfully shared how she had gone to a familiar pond near her house, to wash off the blood before she returned home. She was in severe physical pain, and “knew something very terrible had happened.” In spite of this, she painfully recalled stopping to frolic with the fish as she’d always done, while swirls of blood gradually colored the water. It seemed the client was trying to describe her dimly realized loss of innocence at that moment. My picture was a visual response to her story of profound loss.

In Figure 2 the fish and swirls of blood are drawn in the lower right-hand corner. Abstract shapes and red and yellow colors are used again to express the client’s violation, physical pain and betrayal of innocence. Black shapes encompass the central image, emerging from it to form a gloomy background atmos-
"... I quickly recognized the horror, shock and outrage I had vividly expressed in the picture."

Fig. 2

phere. The colors and shapes portray the overall darkness of the event and the depression engulfing the client's life. The client had stated she'd never reported the rape to anyone, which is not unusual for sexual abuse victims. Instead, she "had tried to forget it ever happened." Yet her presenting complaint had been a vague, chronic depression which finally precipitated the serious suicide attempt that led her to therapy.

The imagery in Figure 2 visually emphasizes the strong connection between the client's current and past depression, and her unresolved grief. I had created the picture quickly, without attempting to control the outcome. Still, I trusted it as an accurate assessment of the client's need to consciously acknowledge and explore the impact of her traumatic loss of childhood before she could alleviate her depression. In this respect, the drawing intuitively formed a clinical picture that powerfully affirmed the same assessment I had intellectually formed.

In addition to providing useful clinical information and an outlet for expressing my strong reactions to her story, both pictures deepened my empathy for the client. Because art making is an emotionally expressive experience, the process of creating the pictures and the completed products provided an additional way to resonate with the client's story that was difficult to achieve only at a cognitive level. The permanence of the pictures also offered me the opportunity to reflect upon them more carefully over time, after the session and later in supervision. This helped me to separate more clearly my identifications and personal reactions from the client's treatment issues and needs.

Despite the many benefits of the post-session artwork described above, I continued to feel disturbed by the dark reality of the client's tragic story. I knew it was necessary, therefore, to explore this reaction at a deeper level than I had previously attempted in my work. To do this, I decided intentionally to use my own art to examine the specific effects of the darker side of therapy.

Having worked for many years with chronically mentally ill clients and higher functioning sexual abuse victims, I'm no stranger to disturbing stories and images of insurmountable pain and loss, violence, hardship, isolation, frightening and primitive regression, and a host of bizarre human conditions. Like most therapists, I've developed a protective immunity that generally allows me to maintain contact with many levels of despair and craziness without becoming overwhelmed by them.

At times, however, waging the battle against darkness with client can take its toll and break down my defenses. When this occurs I've tried to discuss it with co-workers and supervisors. Although I've found them sympathetic, most of them seem to have as difficult a time as I trying to articulate their own discomfort with the atrocities of many clients' lives.

Suggestions are frequently made to explore boundary issues, projections, self-identification, and countertransference—which are imperative to examine and monitor. Yet confining these reactions to clinical concepts seems to me to limit the value as potential opportunities I confront and transform the shadow

"... viewing our responses [to clients' tragedies] only from an intellectual perspective diminishes the power and energy of their very real emotional content."

Fall 1990, ART THERAPY 1
elements of our own lives. Furthermore, viewing these responses only from an intellectual perspective diminishes the power and energy of their very real emotional content. For some therapists, this may be the way to maintain a tight rein over the threat of painful identifications evoked by their clients. Needless to say, I’ve observed many excellent therapists working from a theoretical stance that requires more emotional distance from their clients than other orientations, in order to effectively practice their brand of therapy.

But I’ve also seen therapists from all theoretical backgrounds seem to miss the heart of their clients’ struggles because of their own conscious and unconscious fears of the darker elements in a client’s story or behavior. Hoping to avoid the discomfort of feeling our own emotional vulnerability and psychic wounds, we may be quick to try to clean up the client’s life, to organize the pain, or move the client through darkness too fast, so as not to be reminded of our own sorrow, frustration, aloneness or other personal battles.

On the other hand, cultivating an ability to live more closely with our own craziness and tragedies equips us to help our clients move through their crazy, tragic and inexpressable moments without feeling helpless, hopeless, controlling or burned out professionally.

While this is certainly not a new idea, the use of art to explore the impact of our clients’ dark experiences may be of importance to other art therapists. Not only has it enhanced my clinical work as an art therapist, it has also affected the focus and content of my art, and influenced my supervision and teaching of graduate art therapy students. Perhaps most importantly, it has helped me begin to communicate to other professionals about my personal struggle to understand and integrate the darker side of doing therapy more fully with the rewards of the light. The following discussion will illustrate how this process has evolved, heightening my awareness of the value and dangers of exploring the dark side through art.

Figure 3 is a painting entitled, “Madonna Therapist” that I created during a time when it seemed that half my clients were regressing or simply stuck in their treatment. Their hostile negative transference reactions and distorted dependency issues were evoking in me intensely negative countertransference feelings, and simultaneous frustration at myself for reacting that way. I was also becoming more acutely aware of the chronicity and ravaging nature of mental illness. I felt both sad and angry, once again, about being reminded of the darker side of life through my clients’ disturbing affects, behavior and imagery.

Unlike the spontaneous drawing through which I had been channeling these feelings previously, I now felt a need to create artwork in which the process would nurture my worn-out therapist side. I chose to paint a tightly controlled picture about my role as a therapist, because of the soothing, meditative effects of this type of painting for me. The theme of painting about my therapist role seemed especially appropriate at this stage in my professional growth. I had worked for several years with the chronic mentally i
population. The slow, tedious progress of these clients and their harsher lifestyles were becoming painful realities, dampening my early enthusiasm and zest as a novice therapist.

I began the picture feeling angry and frustrated toward my clients and myself for having over-idealized my role as an all-nurturing, rescuing Madonna. The clients are portrayed as innocent children, waiting passively for the Madonna’s help. Various symbols are used to represent each client’s unique brand of craziness or symptomatic behavior. Demons dance around a religiously obsessed man’s head, another client’s skull is cracked open with wavy lines pouring out to symbolize his disorganized thoughts. A third client is shown with a dangling cigarette, its smoke billowing around his head, to represent his endless chain-smoking, and so forth.

The client I felt most drained and repulsed by is placed in “therapy hell” with the frightening, crazed demons I imagined populated this place. She was diagnosed with a borderline personality disorder, and was evoking an intensely negative reaction from me because of her obvious, overwhelming desire to psychologically merge with me. I felt frightened by her inability to make even the slightest progress in her treatment, and by the psychic emptiness that seemed to permeate her personality and artwork. This client’s unrealistic idealization of me, and her piercing, hungry eyes made me feel as though I was truly an object, particularly because I had assessed that neither my nor anyone else’s relationship could heal her at this point.

In the painting she is shown praying for help, but already lost to a darker, painful world that expresses my perception of the living nightmare she was inhabiting. Inside this client is a small, emaciated, hungry child clutching for emotional food. Clearly this picture expressed my strong countertransference, my desire to be a perfect therapist, and quite negative images of the darker aspects of these clients’ personalities. Yet, it also had a remarkable transformative effect upon me.

The technical control required to paint the picture gave me a sense of self-control at a time when I felt most helpless and hopeless about these clients’ tragic lives. And the painting did indeed have a meditative effect upon me. As I painted each individual, I not only expressed my negative feelings toward them, but gradually recalled all the wonderful, lively, special qualities and strengths they possessed. The result was regenerative, allowing me to express my hostile feelings in an ethical manner in the art, rather than destructively acting out in the relationship, while gradually recovering my compassion for them.

At the same time, I was able to recognize bits and pieces of my own struggles and wounds, my own dependency issues, potential addictive traits, etc. through the clients I had chosen to portray. Although not as tormented or wounded as these individuals, I recognized issues and feelings of my own that I had thought were resolved, “once and for all” through my own therapy and personal growth efforts. The painting taught me about the “chronicity” of my own psychological struggles stirred up by these clients, and that I would be called upon to work through those struggles repeatedly, if only to develop a firmer resolution.

The process of creating this painting, and exploring its imagery, allowed me to return to the “therapeutic battleground” with a renewed sense of energy and empathy. It also helped me to explore my sense of failure and desire to be a perfect mother figure in the role of therapist, even to understand more deeply the roots of my choice to enter the helping professions. (The Catholic symbolism is not accidental.)

I would like to underscore, however, that the painting’s primary significance was its power to provide a constructive outlet for the strong emotions I could not articulate related to the darker side of doing therapy. Although the painting helped me to resolve the countertransference feelings I had been working or diligently in supervision, the act of making it was the key to helping me understand, at an emotional level, the complex interconnections between my dark psychological struggles and the clients’ dark battles.

... keep the task of attending to our clients' treatment goals as a priority, rather than becoming overly intrigued with their suffering or tragedies.

...
clients to develop this power should be approached with the utmost intention of avoiding this exploitation. This may be difficult because there seems to be a natural tendency for artists and other creative persons to be intrigued by the darker, bizarre, nonconforming side of life due to its ability to fuel the creative fire. It is important, therefore, to keep the task of attending to our clients' treatment goals as a priority, rather than becoming overly intrigued with their suffering or tragedies.

I admit this is occasionally difficult for me. When clients create dark, disturbing but riveting images based upon their pain, these images often remain with me after the session. This is not only because of their psychological content, but because of my own desire to create art that is also unusual and striking. My artist self may become more active in the relationship at this point, wanting to respond to the clients at a visual level. The danger of unethical appropriation may be a possible outcome here, as well as subtly attempting to manipulate the clients' creation of artwork that is only personally interesting to us.

Another danger of exploring the dark side through art is that in setting up such a directive for oneself, it is possible to create art that may become forced or contrived. At one point, I found myself becoming overly invested in creating visual expressions of my own layers of craziness, under the guise of attempting to relate more fully to the clients' experience of mental illness. The resulting pictures were enlightening, but I felt the boundaries between myself and my clients becoming blurred and my images becoming less authentic than those that had arisen spontaneously following difficult sessions.

At the other end, I've created pictures about the dark side that were almost too threatening because of their evocative emotional power. The pace of exploring the spookier side of life containing our demons should therefore, be approached naturally, with caution and respect. In my opinion, it is also essential to share both images and process with other professionals who are comfortable exploring their own dark side.

Based upon the work presented above, I would like to encourage more art therapists to share the use of their own art in exploring their emotional reactions to clients' disturbing images and stories. It seems important to communicate more openly about these reactions to our work. We are in a unique position to do this through our imagery, since these complex emotional reactions to clients are often difficult to articulate through words alone. Sharing my personal thoughts and art about this subject has not been easy for me because of the fear of exposing my vulnerabilities to other professionals publicly. Yet, I'm well aware that most therapists struggle with similar feelings throughout their careers.

This leads to a second suggestion to expand the work published in this area. While there are publications emphasizing the importance of art in processing the clinical training of art therapy graduate students, there are few pertaining to post-graduate development of the art therapist. It is likely that art therapists move through different stages of professional growth that would be helpful for us to recognize. I would be most interested, personally, in seeing these stages illustrated through the development of the art therapists' art.

Finally, I believe it is important to continue to develop and elaborate upon the various methods we might employ to process our clinical work through art. Since beginning my journey to explore the dark side through art, I've expanded its use to explore many other aspects of my clinical work and therapist role. In addition to creating art about the clients' stories and images, I've created art using their exact media and images, imitating their creative process to obtain a stronger feel for their psychic issues at a physical level. These images are used to assess the clients through art, rather than doing this only at an intellectual level. Not only has this helped me understand their dark side, it has been an excellent assessment tool in general, and establishes what I refer to as "visual empathy." These types of clinical methods are important to develop and contribute to art therapy theory.

Although clients' dark images and stories are sometimes painful to view and hear, allowing me to share their struggles has helped to transform some of my own tragedies and enhanced my professional skills. And even if clients use the creative process only to express the dark, destructive side of their lives, the joy and energy they seem to derive from reconnecting to their creative selves has been immensely rewarding to facilitate. The life-promoting nature of creative work was the force that inspired me to enter the field of art therapy and one that I try to hold on to during moments when clients' lives feel too disturbing. Using my own art to respond to their pain, to understand theirs and mine more fully, is an evolving process I will continue to explore.
Screening Kindergarten Students: An Art Therapy Assessment

Winnie Ferguson, Ph.D., A.T.R., Assistant Professor, Art Therapy, Wright State University, Dayton, Ohio
Deborah Debevec, M.A.T., A.T.R., Art Teacher, Dayton City Schools, Dayton, Ohio

Abstract

Many young children cannot be accurately evaluated with traditional assessment procedures. Early recognition of the dysfunctional child would allow for the school system to provide necessary support of the child and his/her family. Assessment through art tasks may provide identification of both below average children and above average children. In a study of 108 kindergarten children six factors were used to evaluate art products: developmental level, motor control, content, color, line quality, and space. Three different thematic directives were used with the media of pencil, paint, collage and clay to elicit data for the study. Analysis of the data and suggestions for future study are discussed.

Introduction

Art educators, art therapists, and psychologists have attempted to identify the child having emotional, developmental, or other problems through his/her art product (Kellogg, 1969; Lowenfeld, 1957; Harris, 1963; Machover, 1952; Silver, 1978). The communications link which a child may use in the art process provides data not usually gained through interviews or written assessments. Many younger children cannot be accurately evaluated with traditional assessment procedures. The authors of this article have attempted to discover if the “at risk” child can be identified by the art teacher/therapist through evaluation of a series of art tasks. The development of an art therapy/education screening tool aims to provide identification of the kindergarten child who might be gifted, at risk, or normal.

Early recognition of the dysfunctional child would allow the school system to provide necessary support of the child and his/her family. All children at risk are not identified in the current assessment processes, therefore the authors initially focused on the identification of low functioning children who would be in need of additional school services. As the research progressed it became increasingly evident that the gifted child was also being identified through the assessment tool being developed.

The study subjects were five kindergarten art classes with 108 children assigned to a public school art class. Each class met for a 45-minute art period one day a week. The study covered twelve weeks of school. Data were collected and analyzed by the authors following the close of the school year. All data were collected and identified by an art therapy intern who did not participate in the analysis of the data. Subjects who had over fifty percent absence were eliminated from the final assessment due to incomplete data on those individuals. After removing the incomplete data subjects there were 94 sets of data remaining for analysis. Scoring of each individual art product was conducted by each evaluator prior to any discussion of the art work.

The authors selected four media for the subjects to utilize in the process of their art production. Pencil is traditionally used in art assessments (Silver, 1968; Machover, 1952; Goodenough, 1926) so it was the first medium used by the subjects in this study. Collage was selected as the second medium since it allows evaluation of the child’s motor control as well as his/her ability to choose between a variety of materials. The third medium, paint, was selected because of its fluid qualities. It was assumed that most children would have had little experience with this medium and that additional information might be forthcoming through the use of paint. Clay was the final medium offered to the children in the study. The three-dimensional aspect of this medium was provided to promote discovery of the subject’s ability to control this unfamiliar material (Betensky, 1973). Lowenfeld (1957) found that the tactile stimulation of clay was of exceptional value in working with visually impaired individuals; consequently, a relationship between the tactile experience and the young child was included in the hypothesis of this study. The subjects were introduced to each art experience with exactly the same instructions by the class room teacher/therapist.

Three different motivational themes were utilized in the study. First, the children were asked to draw themselves (Goodenough, 1926; Harris, 1963; Koppitz, 1968). Second, they were asked to draw their family “doing something togetherness” (Burns & Kaufman, 1970). Third and last, the children were asked to draw “a place where you spend lots of time.” The thematic approach focused on information which the child would know and for which they would have a concep (Lowenfeld & Brittain, 1987; Kellogg, 1970). Most art therapists/educator concur that the child can draw onl
what he/she knows. Thematic material that was understood by all subjects was chosen.

**Literature Review**

Although many researchers have utilized the visual art product to evaluate both children and adults, the authors discovered no assessments which were specifically geared for the kindergarten child. In addition, none of the assessments was designed to be utilized as a screening process for a group or classroom environment. It was important to separate the substance of the child's art product into at least two categories: those which were specific to mental age and those which were indicators of the child's individual characteristics (Kramer, 1971).

The developmental stages have been identified with chronological ages by art educators, art therapists and psychologists (Lowenfeld & Brittain, 1987; Kellogg, 1969; Machover, 1952; Kramer, 1971; Piaget & Inhelder, 1967). It must be noted that children all over the world develop at a typical and predictable sequence (Kramer; Lowenfeld & Brittain). The developmental stages identified by Lowenfeld & Brittain were used by the authors of this study to identify the developmental level of the subjects. The clinician with a clear understanding of these stages would have little difficulty with developmental identification of children's art products (Oster & Gould, 1987).

Rhoda Kellogg (1969) wrote "Child art could be used as a mental test in the sense that a group of drawings done by a child could be evaluated as 'standard,' 'below,' or 'above' what is commonplace or normal at certain age levels, once such norms were set" (p. 190). She continued to point out that one would need to look at quantities of art work in the evaluative process. The authors of this study designed this research to move toward the goal of establishing an assessment which could identify these groups of children.

The human figure has been identified as usually the first representational symbol a child attempts (Lowenfeld & Brittain, 1987). The use of the self-portrait in this assessment was based upon the knowledge that the self was known to the subjects. The Goodenough-Harris Test (Harris, 1963) corresponds highly with standardized tests such as the Stanford-Binet Test (Oster & Gould). Although the authors did not attempt to use the scoring of either the Goodenough-Harris Test or the Machover Draw a Person Test (DAP) (Machover, 1952), the use of the self-portrait was influenced by the success of these assessments based on the child's perception of self. Through the use of assessments, the art educator/therapist could readily screen kindergarten children in the first weeks of the school year to identify special students.

The family pieces were examined for accuracy in content, such as number of family members, absence of a family member, and inclusion of others. In addition, the child's proximity to his/her parents and expressions of the parents were noted in the assessment of each piece (Burns & Kaufman, 1970; Wohl & Kaufman, 1985).

The authors looked at the use of color in the art products. At this stage of development the child's use of color is not given major significance as a developmental indicator (Lowenfeld & Brittain, 1987). Since the authors elected to allow the subjects in this research a choice of colors, they were a part of the total assessment score.

Another component of the assessment of the art products was based on the pressure used by the subject with his/her art tool. The emotional indicators cited by other authors indicate that line quality should be addressed in the evaluation of the art product (Oster & Gould, 1987). In addition, including the use of space in the evaluation criteria of the study the subjects above or below the typical kindergarten norm were easily identifiable (Kramer, 1970; Lowenfeld & Brittain, 1987).

The media selected for this assessment were pencil, paint, collage, and clay. These basic media are appropriate for the developmental stage of the subjects (Kramer, 1970; Lowenfeld & Brittain, 1987). Most children were familiar with pencils, crayons, and markers. Clay was not familiar to children in the kindergarten grade; however, they were usually familiar with the commercial modeling material "play-dough" and readily understood the three-dimensional activity of modeling. Although few children had used paints prior to the experience in the art class, they were eager to experience the colors and fluid qualities of the medium. Some children who had prior experience with the medium were able to control the brush and demonstrated their understanding of painting.

Literature available in the art assessment area has focused mostly on pencil (Oster & Gould, 1987). However, it would have been impossible for the authors to gain a well-founded assessment of these kindergarten subjects with only pencil. The other media did add both breadth and depth to the data collected. Although a formal testing tool has not previously utilized components such as space and color, both art therapy and art education literature recognize the importance of these heretofore understudied components. The assessment tool was based on earlier research which clearly identifies the developmental levels of the kindergarten child (Lowenfeld & Brittain, 1987; Kellogg, 1969; Machover, 1952; Kramer, 1971 Piaget & Inhelder, 1967).

**Method**

This study was designed to be incorporated in a kindergarten art cur
riculum at the onset of the school year. It provides a working structure for the art teacher and his/her students to carry out general studio art room activities. The artwork collected from the specific activities outlined in this article serves as a record of responses for the evaluation methods designed and implemented to support this study, “Identifying the student-at-risk through artwork in a public school setting.”

Subjects

Five kindergarten art classes participated in this study as part of a research grant supported by a midwestern metropolitan University.

Three of five kindergarten classes were enrolled at a midwestern primary public city school. The school serves as a pilot program designed to foster a cooperative working relationship between the City Schools and the University’s College of Education and Human Services.

Student enrollment is based on: (1) student’s residency; (2) written application by parent or guardian; and (3) random lottery keeping within state mandated desegregation codes.

The remaining two kindergarten classes were enrolled at another public city school. Student enrollment was based on residency. Residency is based on boundaries defined by the Board of Education.

The total population of 108 kindergarten students contained 20 white males, 38 black males, 24 white females, and 26 black females. The ages ranged from four years four months to six years eleven months.

Apparatus

A standard art room was used in this study including six hexagonal tables, child-size chairs, teacher demonstration table, sink, and drying rack.

Individual portions of media and tools were provided for each subject. Drawing supplies were a primary lead pencil, 8½” x 11” white drawing paper, and a rubber eraser. College supplies were 10—6” x 4½” construction paper (packs of black, brown, white, pink, purple, orange, green, red, blue, and yellow), primary blunt-tip scissors, white glue, assorted crayons, set of twelve “Mr. Sketch” water-color markers, and 12” x 18” white construction paper. Painting supplies were six 1—2 oz. cups of tempera paint (red, blue, yellow, white, brown, and black) easel paint brushes, water cans, paper towels, newspapers, and 12” x 18” white construction paper. Clay supplies were one pound red earthenware clay, clay tools, pencil and paper clip, and 9” x 12” cardboard school lunch tray. Clay work was photographed prior to firing with ASA 200 color slide film.

Colored construction paper 36” x 24” was folded and stapled to serve as individual student portfolios. An observational data chart was designed to record on-task behavior by research assistants during work activity. Children’s books, scrap crayons, and paper were set up in a classroom corner for use by subjects completing art tasks early before dismissal.

Experimental Procedures

This study was incorporated into the regular art class schedule required by state-mandated course curriculum. Prior to this study, letters were hand-delivered by student participants to parents and guardians to inform them of the study and events to take place. Administrators and homeroom teachers were informed of this study to promote cooperative support.

Preparation for each art task was executed by the resident art teacher and the art therapy intern prior to art class activities. Kits containing media and tools were prepared to increase free expression by the individual student and discourage student interaction with peers during the work activity. Paper and clay to serve as final product were pre-marked with a student identification number and letter to insure proper placement in individual student portfolios, to secure student participant’s anonymity, and to increase objectivity during the evaluation process.

The project required twelve weekly 40-minute sessions. The art tasks were presented in the twelve weekly sessions. Art tasks were offered and demonstrated by a state certified art teacher.

The graduate art therapy student assisted in the distribution of materials and tools to subjects, assisted in the observation and recording of subject on-task behavior during work activity, and collected artwork at closing of each session.

The twelve works consisted of four media (pencil, collage, paint, clay) for each of three topics (self, family, place). Since each category was expressed in four media, twelve separate works were collected by the end of the study from each participant and compiled in individual portfolios.

Art activity procedures began when the homeroom teacher escorted the subjects to the art room. Subjects entered the room and sat in assigned seats organized prior to this study. Seat assignment varied according to the individual child’s ability to work with peers at the same table. The art teacher verified class expectations and objectives immediately after all subject were seated. Lights were turned off during this period to emphasize an informal total class cooperation during the teacher’s instruction. The graduate art therapy student and the art teacher distributed media and tools to subjects by each subject’s identification number. The art teachers directed students to: (1) refrain from touching distributed materials; (2) listen to class objective; (3) observe teacher demonstration of media procedures; (4) refrain from talking to peers or sharing work and ideas.

Fall 1990, ART THERAPY 11
with peers; (5) raise hand upon work completion for teacher collection. After the teacher instruction, subjects were verbally prompted to raise his/her hand if clarification of class objectives and procedures were needed. A moment of silence prompted by the art teacher signaled subjects to prepare for work activity. This orientation required ten to fifteen minutes.

When the art teacher turned lights on the work activity began. Approximately twenty minutes was allotted for work activity. Media and class behavior varied the time allotment.

The graduate art therapy student observed subjects’ on-task behavior in three-minute intervals and recorded these data accordingly on the observational report designed for this study. The art teacher assisted subjects by insuring that materials were at hand. However, the art teacher refrained from unnecessary verbal interaction with subjects. When a subject requested assistance, (granted only by a raising of hand to discourage talking out), teacher intervention was limited to verbal repetition of the initial task objectives.

Subjects completed work at his/her own pace but were limited to one class period. Upon completion of the task, the art teacher or graduate art therapy student met individually with the subject and prompted verbal clarification of the visual expression (subject artwork). Responses such as, "This is me," or "This is Mom washing the dishes" were recorded in pencil directly on the back of the artwork as pertinent information used in the evaluation process.

Completed artwork was set aside and subjects were directed to clean up and sit quietly with children’s books, crayons, and paper until class dismissal. Upon dismissal, the class lined up at the art room door and was escorted back to the homeroom by the homeroom teacher.

Data Collection

Individual portfolios compiled for evaluation included nine two-dimensional works in pencil, collage, and paint and three slides of three-dimensional work in clay. The 108 portfolios were delivered to the University’s Art Therapy graduate program, for study and evaluation.

The evaluation procedure was designed and implemented by the authors. The criteria for evaluation were based on the problem statement “Identifying the student at-risk through art in the Public School setting,” and six areas supported in this study by literature on children’s art. The six factors for evaluation included:

- Developmental level of artwork (intellectual)
- Motor-control exhibited in artwork (physical/neurological)
- Content appropriateness to task directives
- Color (dark, light, normal)
- Pressure exhibited by art tools used in production (heavy pressure, light pressure, normal pressure)
- Use of space exhibited in artwork (empty, well-used, normal).

Following input from a statistician and a computer analyst a five-point rating scale was devised for each of the six areas indicated as:

1. artwork exhibiting below normal-risk characteristics
2. artwork exhibiting below normal characteristics
3. artwork exhibiting normal characteristics
4. artwork exhibiting above normal characteristics
5. artwork exhibiting gifted characteristics

Though “giftedness” was not initially intended to be identified in this study, researchers concurred after an informal review of portfolios that some students clearly demonstrated high developmental, cognitive, and motor capabilities in their artwork. The five-point rating scale served to encompass low, normal and high level responses to task directives. A chart was designed to place scores in an organized manner for ease in the evaluation process and input into the computer program. A total of sixty-six scores were given in each student art portfolio evaluation. Researchers evaluated and rated each portfolio individually recording scores on the devised rating chart.

Students with less than six pieces of art in the portfolio were excluded from this study. Researchers concurred that to increase the reliability of evaluating subject responses to media, at least two examples in each media should be available. Ninety-four remaining portfolios were evaluated and rated. Scores by both researchers were submitted for computer analysis. An analysis of inter-rater reliability was completed.

Analysis, Findings and Summary

Analysis

Following the data collection and rater evaluation all numerical scores were analyzed through the use of the computer facilities at the university. The inter-rater reliability was compiled by manually recording the agreement and disagreement of evaluated data between the two researchers.

The researchers analyzed the data for the hypothesis that “there would be a difference in the score of male and female subjects in this assessment.” A one-way ANOVA (analysis of variance) was used to test this hypothesis. In this analysis gender was the variable investigated. The hypothesis was disproved with no difference between sex being found in the analyzed data.

In the total scores for collection data the top score was 330, the median score was 178.5, and the lowest score was 80. The Univariate (descriptive) analysis indicated the subjects with a score of 80 or below might be considered at-risk; thos
ith a score of 80–133 might be considered below average; 133–239 could be average; 239–292 could be above average; and scores over 292 could be gifted.

The analysis of variance procedure first used was Duncan’s Multiple Range Test for Variable. Analysis found that collage was different from pencil, paint and clay. There was no difference in the scores between pencil and paint, however, the scores for clay were different from all others. In addition to the Duncan’s procedure the data was also analyzed with Tukey’s Studentized Range (HSD) Test for Variable. These findings were the same as found in the previous analysis. Finally the data was analyzed with the use of Scheffe’s Test for Variable. Again, the data analysis concurred with the findings in Duncan’s Test.

A second hypothesis for this research was that “a difference between the four media and the gender of the subject would be significant.” In this analysis a two-way ANOVA was utilized. The independent variables were media and sex of the subject.

To analyze the possible difference in scores based on sex the data was once again analyzed through the use of Duncan’s, Tukey’s and Scheffe’s tests for variable. All analysis concurred that the score for girls was significantly higher than scores for boys. This analysis was based on medium scores for each male and female subject in the research study.

Final analysis of data found that while there were significant differences between groups (medium and sex) there was no interaction between media and sex. One factor does not influence the other.

In determination of the inter-rater reliability the authors decided scores of one or two would be accepted as agreement. The score of three required a matching score of three from both raters. The scores of four or five were also counted as agreement between raters. This system appears to have been unfairly string

gent in determination of inter-rater reliability. A more acceptable system for determination of inter-rater reliability will be developed for future research. The inter-rater reliability varied between the classes. The agreement in the initial evaluations ranged from a high of 98.5% to a low of 8% for a given subject. Following the analysis of the data the researchers discussed the portfolios of selected subjects where the inter-rater reliability was low. After the clarification of standards to be used in evaluation the researchers independently re-evaluated five selected portfolios with significant improvement in the inter-rater reliability. The five selected portfolios had an inter-rater reliability of 77%, ranging from 100% to 56%. The greatest agreement was found between the below average scores and the above average scores.

Findings

Developmental Level

Developmental level of an art product is defined in a range of ages such as Lowenfeld’s stages (Lowenfeld & Brittain, 1987). The pre-schematic stage which includes the chronological ages of the kindergarten subjects in this research study were familiar to both evaluators.

Figures 1, 2, and 3 illustrate the typical range of examples which were obtained in the study using the directions “Make a collage of your family doing something together.” Figure 1 provides an example of artwork of a low-scoring child. The figure drawing is abbreviated with feet either absent, or useless in their formation. Additional data provided the information that this child has a long history of “foster homes.” Figure 2 illustrates an average example of the figure drawings collected in this research. This example not only shows more complete figure schema, but also shows use of the collage media to depict several of the family members. The child’s example in Figure 3 not only shows a

more mature figure schema, but also shows organizational qualities moving into the schematic developmental levels as defined by Lowenfeld (1987). The inclusion of hair, fingers and clothing provides clues to an advanced intellectual level (Good-enough, 1926; Harris, 1963; Kopitz, 1968; Machover, 1952).

It was found that the pencil drawing, the collage, and the painting were usually comparable in developmental level; however, the clay work was, in many cases, out of agreement with the other three media. A subject who appeared to function at a level above average might have a clay product which scored very low; conversely, a subject who scored very low in pencil, paint and collage would sometimes score quite high in clay. This variability in media is an area which will demand more investigation.

Motor Control

The collage experience was selected to provide the researchers an opportunity to judge the subject’s ability to use scissors, glue and drawing materials other than pencil. The subject who functioned above average offered exceedingly elaborate collage products with intricate fold-overs and layers of forms. These same subjects were able to carefully draw their forms and to cut the same form with dexterity. The below average subject usually pasted large squares of construction paper on a background as his/her attempt to create a collage. Figure 3 shows an exception to the utilization of the collage materials; this child chose to use the large rectangles of colored construction paper to indicate a playing field for a family football game.

Figure 2 provides an example of the typical cutting skills found in most children in the study. The rough, torn edges of the cut forms illustrated in Figure 1 were due to poor cutting skills.

The collage was definitely a diffi-
cult task for those subjects with large families, since the subject needed to spend a great amount of time drawing, cutting and pasting each member of the family. The authors have looked at the time allotment for the family collage and found it probably was restrictive to those children with many family members; therefore, a change will be to increase the time allowed for this task in further development of the assessment.

Content

In studying the content of the art products the authors found emotional indicators in the ‘family and place’ products more than in those of the ‘self’ products. Often subjects from families with divorced parents included the absent father in family drawings. In Figure 1, the child living with foster parents, no father is included and the mother is isolated with the use of collage materials. In addition, this child appears to encapsulate most figures.

It was also noted that teeth were often present in specific family members. The teeth were usually included in more than one of the pieces of artwork. Since teeth may indicate aggression, this information could be identified as significant information in regards to the subject’s family (Oster & Gould, 1987).

One dilemma which was found in analysis of the content of the art product was being able to distinguish between a healthy double image and an unhealthy one in the self-portrait. Often a young subject would include a close friend or family member in his/her self-portrait. A similar example of this problem is illustrated in Figure 3 where the child illustrated his extended family rather than his nuclear family. This child explained the picture with the title “Playing football” and told about the games he enjoyed with his male relatives. The authors selected to utilize the subject’s explanation which was noted on the art product in this analysis.

Color Used

Significant data were primarily evident in work where the subject selected white or light yellow to paint specific family members or himself/herself. The subject’s use of color was not used as a single factor in evaluating the art product, but was one score among six on each piece of art, and four scores in sixty-six in the total assessment picture of each subject.

The subjects often became so engrossed in the process of painting that dark, muddy colors resulted. This was not significant in the color assessment since it was often the subject’s first experience with the medium. It was noted that a significant change in the first “self” painting and the last “place” painting demonstrated the subjects, increased knowledge of the medium. The art teacher did not attempt to instruct subjects on use of materials in this research.

Pressure Used

The lightly sketched line was evident more often than was extreme pressure in the assessed work. There was little fluctuation in line quality with most subjects displaying normal pressure with the drawing tool (Koppitz, 1968). The emotional indicators of line quality, shading, teeth and absent appendages were found in some of the art products assessed (Oster & Gould, 1987).

Space Use

The subject’s self-portrait which was drawn in only a small corner of the paper usually corresponded with the subject’s painted self-portrait which used the lightest yellow or even white. The normal array of color was lost when the subject attempted to make himself/herself as small and insignificant in the art product constructed during class as he/she felt in life. Figure 1 illustrates an example of restricted use of space. In the example each encapsulated figure is constricted in individual space while adequate unused space remains on the drawing surface.

This contrasted with the child (Figure 3) who drew and painted with confidence and joy. He filled the paper with distinct images and appropriate colors to assert his right to be recognized as a part of society. Although a piece of art doesn’t tell it all, a series of pieces of art gives a good understanding of the child (Wadeson, 1980).
Summary

This research has opened the door to a possibility of an art therapy assessment which could be implemented with all kindergarten children. The assessment criteria are based on the understanding of knowledge with which both art therapists and art educators are familiar. It is hoped that after further development of this assessment, it could be used with all kindergarten children as a first assessment in their school career.

The authors conducted the initial assessments of the portfolios without discussion of individual expectations on each of the six concepts assessed. Following the completion of the assessment, five portfolios on which the inter-rater reliability was low were selected for discussion of the expectations of each evaluator. It was found that the two evaluators had some disagreement of the average expected for certain of the criteria. Following discussion and agreement on the standard of average the five portfolios were re-evaluated by the evaluators resulting in an increase in inter-rater reliability.

Additional assessment is now underway with current kindergarten subjects. The authors have reduced the number of sessions from twelve to six by eliminating the thematic area of place and the medium of clay. It was found that little or no new data were found in place which was not in the family art products. Clay was also very difficult to document since photos were taken of the work. The photos were not as clear as the products themselves; however, the task of firing, protecting and transporting numerous delicate sculptural pieces would be unpractical for realistic assessment practices.

In addition, the new art therapy assessments will utilize the subjects’ scores in the standard readiness assessments to look for correlation between that assessment and this art therapy assessment. Plans are in place to increase the raters for the next phase of the development of this assessment. The authors believe there is significant information to be gained from this tool.

It has been noted by many researchers that early identification of children with special needs is important. Since the kindergarten class is the earliest recognized public school class available in most areas of the United States it seems important to develop a method which can be used at this early age. It also seems necessary to assess these youngsters as soon as possible following entrance in school. This assessment is non-verbal and non-threatening since it utilizes the concepts of the child. Further development will provide an important aid to the identification of children’s needs.

Grants: Demystifying the Mystique and Job Connections—Part II

Doris Arrington, Ed.D., A.T.R., Associate Professor and Director, Art Therapy Program, College of Notre Dame, Belmont, California

Abstract

As a follow-up to an earlier article published in Art Therapy (volume 3, 1986), the author presents information relative to grants that were funded in the following categories: 1) family employer; 2) student employer; 3) practicum placement; and 4) community organizations. In the author’s conclusion, it is reemphasized that grant writing is a viable activity for the student and for clarifying the role as an art therapist.

For students in the Art Therapy Program at the College of Notre Dame in Belmont, California writing a grant is beginning to lose some of its mystique, but it hasn’t always been that way. Like many other Art Therapy Programs in their formative years our graduates also had to carve out their ‘niche in the real world’ because agencies, hospitals and special schools did not recruit or roll out their red carpet eagerly clamoring to hire art therapists. Today male and minority students are usually hired prior to graduation. Other graduates are actively recruited by state hospitals and senior facilities. They find jobs in family agencies, special schools and hospitals; but, art therapists are creative individuals who have their own personal dreams and fantasies as to when and how they want to work and live. One challenging way our school encourages creative students to live out those personal dreams is to write a grant in lieu of a thesis.

Our college is fortunate enough to be located in a metropolitan area with large community foundations that provide comprehensive libraries and grant writing classes. In addition the college offers grant writing workshops and/or grant writing assistance. During the past year, nine grants were written. So far, more than $90,000 has been received for seven grants.

The success of grant writing is presenting the right idea to the right funding source at the right time. The following grants have been either funded, or are in the process of being funded, by sources that could be available to art therapists in other sections of the country. They are presented by their funding sources.

Family employer

Maggy Conroy, an artist and an art therapist, believes that the process of artistic creation comes naturally to children and non controlled expression is important in a child’s emotional growth. Maggy’s daughter attends the Apple Computer Child Care Center where her husband is employed. Maggy proposed to Apple that art could be therapeutic in calming an active child, in releasing energy and in giving children an added ability to communicate. She further proposed that the children in the center be given the experience of producing artwork with quality materials and their artworks be displayed in a special way in their center. Apple funded the proposal which resulted in:

1. Six different showings in other Apple divisions and buildings within the Company prior to returning the show to its home in the Apple Child Care Center.
2. A request from a parent advisory group for a second show involving the work of older children of Apple employees.
3. A request that the children’s work be available for purchase with funds going to a local charity.
4. An original art piece by a 4-year-old hangs in the office of a Senior Vice President.
5. An exchange of children’s art with representatives of other countries.
6. Interest in applying the “process over product” principle by other preschools in the area.
7. A traveling lecture, slideshow and workshops about the project.

Student employer

Beverly Stone paid for her education by working as office manager for an energy corporation. Like most corporations it funds local charitable projects yearly. The firm was impressed with Beverly and her career goals. It funded her proposal to run an art therapy group for sexually abused females at a psychiatric treatment center for children.

Ann Reidy works at the Veterans Administration Hospital with Vietnam Veterans with Post Traumatic Stress Disorder (PTSD). Art therapy has been an integral part of this unit since 1981. Since that time over 1500 drawings and paintings done by veteran patients have accumulated. Ann proposed that she be given release time to systematically organize the art and develop a compute database for storing and retrieving information as it relates to imagery and stress disorders. This VA approved proposal could be the basis for future art therapy research in areas of PTSD.

Practicum placement

Nadine Blashak interned with a
art therapist in a hospital that had funded an art therapy program since 1978. Knowing the hospital was supportive of art therapy, Nadine researched the possibility of providing art therapy groups in areas not currently served. After Nadine completed a pilot study in this new area, the hospital funded her proposal.

Elaine Beaver interning with schizophrenic patients in a state hospital became aware of the need for both outpatient therapy and education for clients and their families. She proposed preventive art and family therapy to deter or eliminate the need for first or readmittance to the hospital. Upon the recommendation of employees in the State Department of Mental Health and Mental Retardation, a local outreach clinic funded this program.

After completing a pilot art therapy program in a school for neurologically impaired, learning disabled and severely emotionally disturbed youth, Carol Johnson with the assistance of her administrators at her placement proposed a three year grant to 10 corporate and special event organizations for a Therapeutic Arts Curriculum Program. Carol has been hired by the agency while waiting for responses from the diversified funding groups. If approved, this program could be replicated in other special educational settings throughout the state and country.

Community organizations

Connie Holmlund proposed publishing an Appointment Calendar featuring color photographs of artwork created by children who are patients at the state hospital. Connie believes that publication of the children's art work is a concrete validation of the children's artistic efforts. In addition, she believes the publication will serve to educate others about art therapy and give credence to the power of art as a means of expression for children with psychiatric problems. Connie, quoting from the California Task Force to Promote Self-Esteem noted, that "the arts in their most elemental form—rhythm, song, dance, drawing and play acting—are integral to a child's ability to communicate and interact in the world" as well as offering access to much needed experiences of success. The local foundation funded half of the expenses while requiring the other half to be matched. The Hospital Volunteer Service Group matched the funds within a week.

Cathleen Meadows helped pay her college expenses working for Traveling Art, a program for children on the Peninsula who are confined to hospitals, institutions or shelters. When she prepared to return to her home in Colorado she contacted former associates in Colorado community organizations proposing a similar program. Cathleen has been assured of funding when she returns to the area.

Conclusion

We have concluded that writing a grant continues to be a viable avenue toward not only creating a job that provides income, clarifying a student's role as an art therapist, promoting the field of art therapy, and establishing personal feelings of success and competence but also living out one's personal dreams and fantasies. We have found that writing a grant can make a difference in the grant writer's life as well as in the lives of the grant recipients.

MARITAL AND FAMILY THERAPY

Loyola Marymount University invites applications for a tenure-track position beginning Fall semester, 1991. In its strong clinical training program that prepares students in the art therapy modality, Applicants should hold a Ph.D. or equivalent terminal degree (by August, 1991) and have expertise in art therapy. They should be a registered art therapist (ATR) and have relevant clinical and supervision experience.

Responsibilities include graduate teaching (nine semester hours) and additional administrative responsibilities, including admissions and co-organizing conferences. Applicants should have a professional commitment to pursue research and scholarship.

Rank: Assistant Professor. Salary: Competitive. Application deadline: December 15, 1990. Women and minority candidates are specifically invited to apply. Applicants should send curriculum vitae and the names of three references to:

MAXINE JUNGE, Chair
Department of Marital and Family Therapy
LOYOLA MARYMOUNT UNIVERSITY
Loyola Blvd. at West 80th Street
Los Angeles, CA 90045

Loyola Marymount University is an Equal Opportunity, Affirmative Action Employer.
Imagery as Interpersonal Process

Pierre A. Grégoire, Ph.D., A.T.R., Concordia Art Therapy Program, McGill University Department of Psychiatry; Royal Victoria Hospital, Montreal, Quebec

Abstract

Art therapy presents a unique and privileged situation in which the image can be analyzed as language, which is creation resulting from both the therapeutic process and also the interpersonal relationship between client and therapist. This paper presents the results of a research in which the interpersonal factors are studied as being one of the determinants to the language of therapy and also of the imagery. A theoretical formulation is presented (Part I) along with statistical analysis of data produced by the same clients working alternatively with two therapists (Part II). Rorschach categories of scoring are used in the analysis of the images and recommendations are presented in the integration of experiential and transferential dimensions in the study of language in therapy.

PART I

Studies of the psychological mechanisms and functions of the imaginal and verbal processes have underlined their constant interplay and interdependence (Paivio, 1975; Hebb, 1968) rendered all the more complex when such processes are placed in the perspective of interpersonal interaction such as in the context of the psychotherapeutic relationship. While many theories (Strupp, 1978) attempt to identify the therapeutic factors involved in such a process, very few studies have actually addressed the changing roles and attributes of language within the therapeutic relationship; the language, which is not only the vehicle of the communication between therapist and client but constitutes also, a major modality of the therapeutic process.

Starting from a relatively cognitive concept of language, in which the verbal expression is descriptive and basically informational, we have at least in some of the theoretical frameworks (Rogers, 1967; Gendlin, 1962; Havens, 1978) come to redefine the language as being in itself part of the therapeutic modality, in the ‘here-and-now’ of the therapeutic relationship and thus needing to be addressed as not only information but as very much both vehicle and integral part of the therapy. The multi faceted dichotomies which have been used in regards to language have included the dimensions of sign/symbol (Sausser, 1974), classical/romantic (Todorov, 1977), structural/phenomenological (Merleau-Ponty, 1964), analytical/experiential (Rogers, 1980), accomodation/assimilation (Piaget, 1950), as also the distinction made in reference to language as vehicle of the transferential/existential discourse of the client (Boss, 1979). In these distinctions can be seen two basically different functions of language which consist of making reference to an absent and objective reality as also remaining very much an element of the here and now and experienced as a modality of the subjective interpersonal relationship. We then extend these issues to the complex role of imaginal and verbal language in art therapy, and the language of therapy is all the more brought to the forefront with the highly symbolic and experiential features which it presents. We also are aware of the constant references to an objective reality, recalled, represented and made real and immediate in the ongoing process of the art inherent to the art therapy situation (Wadeson, 1980). That art can be part of a communicative process as well as media of a creative, self-expressive and aesthetic experience forms the basis on which art therapy has gained its momentum. Yet this complex role of the image has remained basically unexplored in terms of its implications as to the therapeutic process of the art therapy situation, as indeed the role of language is also unresolved in terms of the major issues of the psychotherapeutic approaches across theoretical and technical orientations. Emphasis is being placed alternatively on the experiential aspects of the therapist/client relationship or on the diagnostic and prescriptive aspects of this relationship as major contributor to the therapeutic change. In art therapy, when the process of communication between therapist and client is made all the more substantial by the actual creation of a unique and constantly evolving language, the importance of exploring the diverse components of this complex psychological process is crucial. Such analysis is indeed essential, so as to better understand the role and functions of language in psychotherapy and also to better grasp the constant interplay of the experiential and structural aspects of the imagery process in psychopathology as underlined by Prinzhorn and Delay (Jakab, 1956). The language in art therapy is more than a media of communication between two persons, and in fact represents also a reality of its own which must be seen as resulting from the interaction between client and therapist and needing to be understood as expression of the unexplored dynamics of this relationship. The art and language of art therapy is a reality with a multiplicity of semantic, experiential and symbolic elements out of which the therapeutic process will result. The unique situation of art therapy in regards to this exploration of language in therapy is ad
dressed in this article in reference to the interpersonal aspects of imagery. A brief overview of the theoretical implications of this issue is presented, and also a brief report of a study which was undertaken to verify in the clinical setting some of the issues pertaining to this hypothesis.

Art as experience, art as relationship

In the interplay between assimilation and accommodation to the world (Piaget, 1950) the individual is constantly involved in the integration of both an inner world of subjective experience as also of the immediate reality of the objective world out of which integration a creative equilibrium will hopefully result, albeit in a constant state of change. The symbolic structures will in some way reflect this basic polarity (Durand, 1969). One of the major functions of the human organism is this constant process of dynamic and creative mobility in which a dialogue must be established between the individual’s subjective world (as it exists in continually changing patterns of relationships) to an objective reality. Reflecting these constantly changing, ever-renewed sets of reciprocal interactions, language also the imaginal process, partake in these different aspects of the human organism’s basic motives. Art as language is both an expression of an experiential, phenomenal and subjective reality, and expresses involvement in the immediate ongoing reality of the relationship to the world as it exists. From the very beginning of one’s existence, the child proceeds from these dual realities, not only being involved in expression but also his basic drive being one of involvement with the world. The child’s very survival rests on the capacity to express and to be understood by the significant other. The language as modality of adaptation will thus result from a mutual commitment to the self and to the world, the language between the child and the significant other being molded along the lines of both expression and relationship.

Psychopathology as language

Among the many discoveries about human nature which we owe to the clinical situation of psychotherapy, the process of transference has been must central to our understanding of the affective relational components of psychopathology. In all of the psychopathologies, the inner drama of the individual is basically not only an inner experience, but is made up of perceptual, cognitive, affective and symbolic processes which seek an object and a relationship with whom the communicative dimension of the pathology may find expression.

Defined as pertaining to the specific situation of psychotherapy, the concept of transference is but one of the issues pertaining to the “projective hypothesis” (Rapaport, 1968) long held as one of the basic elements in diagnostic assessments and central to our understanding of the interactional and expressive dimension of the human discourse. In its historical development, transference (Heidbreder, 1933) was first perceived with a certain apprehension in that the affective transference to the therapist could become an obstacle to the proper therapeutic exchange. Eventually, it came to be seen as a direct encounter with the client’s pathology and presenting important issues to be worked through in therapy. While there are many dimensions and attitudes on the part of the therapist to the issue of transference (Ulman, 1981) one can focus on the art experience in its relationship aspects (Robbins, 1981) in that the pathological states are not self-directed and static but are clearly attempts to communicate. The illness is intimately intertwined as part of the communicative process. In this perspective, pathology is in the most fundamental sense a communicative; it represents the basic message of the individual as well as his/her basic (or only) available means of communication. The psychosomatic theories have extended this symbolic dimension to the area of somatic illness and, to some extent, to a systemic model in which the illness’s not only an expression but may well be observed as in some pathological families as being part of a communicative process (Ehrenwald, 1963) having become a modality of exchange between the individual and the significant others. In this context, psychopathology, with its symptomatic, transferential and relational aspects may well be seen as a language not only of a cognitive and factual nature, but a message charged with affect and intent.

This language may be very much directed and addresses the elements of the situation and relationship in which it is explored and experienced. The language of therapy, and more systematically so in the modality of art therapy, is not a modality to be observed and analyzed by the therapist but as a modality of interpersonal commitment in which the language is symbolic of the pathology of the client, as experienced in the interpersonal therapeutic situation with its complex and multiple parameters which include and involve the therapist. In art therapy, this creative dimension of the client-therapist’s communicative process is made all the more real in the image which then becomes the expression and its symbolic reference.

Art as interpersonal involvement

The creative arts are not isolated and self-enclosed activities, but are part of an effort to communicate and to relate to significant others (Ecc 1965). This has been emphasize both in the attempt of contemporaneous art to translate the subjective experience into the modality of the media as well as in the continue search for ever renewed language which the impact of the work can also achieve its aesthetic and con
communicative form (Huyghe, 1960). In this perspective, art represents not only a modality of expression but also a contextual statement. Along with the advent of art therapy and certainly intertwined with its development, is the evolution of contemporary art which has progressively addressed the issue of the art as a part of the creativity of the artist in the context of likewise the creativity and the creative experience of the spectator. The spectator has been taken from his/her passive and receptive roles, to be equally involved in the process of creation.

Parallel to this we have the studies on the psychological mechanisms of perceptual processes (Kuffler, 1976) which have underlined the active mechanisms of perception not as simple recording of outside events but as a creative organization and selection of data with emphasis in both scientific and artistic endeavors to explore the phenomenology of the perceptual happening. The spectator and artist become thus involved in an acknowledged relationship of mutual interaction as “the new intents of the artist are no longer to be confined to a monologue but his gesture and his actions are to be met by an act of recognition on the part of the spectator” (Vergine, 1974). The artist is seeking to be confirmed in his/her identity and to find an “other” who is willing to be part of a dialogue. Some of the art concerns have thus become increasingly involved and interested in the “public” and in the creative response which must be engendered so as to have the art work become an integral part of an unfolding awareness and mutuality. In many ways, this evolution of the creative arts has laid the foundation for the establishment of art therapy, with art becoming the expression of a subjectivity and defined as a modality of inquiry. It is no longer an isolated entity but a contextual event, very much a part of the world of subjective and interpersonal relationships. The art of art therapy represents in this way one of the facets of the research that contemporary art has undertaken.

PART II

Imagery as interpersonal process

The interpersonal dimension of the image confers to it a systemic

1The author wishes to thank Mrs. Mary B. Hooper who has contributed to the experimental phases of this project.

Methodology

In order to operationalize this hypothesis, it was assumed that give different interpersonal and contextual elements in the imagery create in art therapy, there would be differences in the client’s imagery, dependent upon the specific therapist the client is involved with. For this purpose, twelve clients (six males and six females) with average age between 26 and 29 were all assigned alternatively with two therapists of the opposite sex and of a 15-year age difference. All clients were inpatients of a psychiatric unit in a large general hospital, and the various working diagnoses included depression, schizophrenia and personality disorders. Patients were of mixed socioeconomic background. The maximum length of time between sessions with both therapists was three days. To deal with the effect of sequential order, one half of the client were first seen by the female therapist and then by the male therapist.
and the other half of the clients followed the alternative sequence of first being seen by the male therapist and then by the female therapist. Clients were offered a variety of drawing materials with the instruction to: “Make an image that will represent what is most relevant to you, what is on your mind, right now, the things you are thinking about.” Upon completion of the first drawing, the client was instructed to make “A picture representing a landscape.” These images were requested to obtain both a spontaneous and a standardized image. Some of the rationale for these particular sets of conditions came from the work carried out in areas of psychological assessment in which situational and interpersonal factors (Masling, 1960) were explored in relationship to variables such as sex and age of interviewer.

Other studies have expanded on these issues (Guillaumin, 1965) and addressed the question of the personality of examiner as possibly having an impact on some aspects of the outcome of the assessment. In the context of psychotherapy research the person of the therapist has also been identified as a determining factor in the therapeutic experience of the client. (Barron, 1978; Van der Veen, 1967; Wadeson, 1986; Strupp, 1978)

1) Scoring and assessment

To measure and statistically compare the client’s drawings when involved alternatively with the two therapists, an established method of scoring (Klopfcr, 1954) used when analyzing the responses to the Rorschach test was employed. The use of the Rorschach scoring methodology in analysis of drawings has been explored in previous studies (De Luca, 1961). In part, the rationale for such an analysis of the images stems from an analogy which exists in that both situations involve projective mechanisms in the context of perceptual-visual elements taking into account both content and structure of the client’s works as underlined by De Luca but also by H. Rorschach in the general introduction of the test.

2) Form and movement

These categories referred to as determinants of the subject’s responses in Rorschach terminology were translated in the analysis of the image as they refer to the form level with drawings given a rating of (F+) for definitely shaped concepts, (F0) for vaguely shaped concepts and a (F-) for an inappropriate or inaccurate shape. The form was also placed in the context of its relationship to movement with a score of M for a human figure in movement and a score of FM for an inanimate object depicted in movement such as a falling rock.

3) Shading

The figures depicted with shading or a choice of color intended to give the impression of texture were scored Fc. When the shading or perspective was used to give the impression of three dimension or depth, we used the score FK. Forms alone, without shading were scored F.

4) Form color

In this category of rating, the relationship between the form and the color of the figures is scored with FC when there is an attempt to place the appropriate color on a good form, while the score of CF was used when the color predominates with a form which is indefinite.

5) Content

The content of the drawings were scored along the categories of human, animal, nature, inanimate objects, geography (such as maps) and abstract forms.

These categories of scoring were retained following a series of trial in which they had proven to be sufficiently easy to assess yet also allowing for an establishment of a scoring that appeared sensitive to the important issues in this study. It remained part of our interests to see if the dynamics of the therapeutic situation might in fact be defined by this process, in that not only would there be a difference in the imagery created but also that we could establish some tentative conclusion as to the underlying dynamics which this involved, as these measures would then be analyzed in the context of the projective tests literature.

Results

The drawings were scored individually by two judges and the results were analyzed using the t-test statistics so as to verify if the differences between the means and deviations of individuals or groups in two separate conditions were significant (Two-tailed test, Siegel, 1956). The different conditions included the comparison of images drawn by the clients when in session with either of the two therapists, also the clients’ images were compared when grouped according to whether the therapist was of the same sex or the opposite sex of the client. Emphasis is placed on the sexual factor in the context of some of the work carried out on the sex of the assessoors as having an impact on the results of the projective tests (Guillaumin 1965), it remains, that the distinction between therapists is in terms of global personal style, the person of the client and the person of the therapist representing the important factors to be underscored as relevant to the imagery process under study.

When comparing the images produced in relationship to the two therapists, the female therapist significantly brought about more good form (F+) type of responses (df 11, t = 2.46, p>.05)* than the ma

*(p = probability associated with the occurrence under a null hypothesis a value as extreme as or more extreme than the observed value)
therapist. Also clients tended to center their images (di) more when in the presence of the female therapist (df = 11, t = 1.85, p > .10). In the context of working with the male therapist details as opposed to whole objects seemed to be somewhat more readily produced (df = 11, t = 1.92, p > .10). There was also a trend (p > .20) in that a greater number of Fm was produced (df = 11, t = 1.449, p > .20) when the client was working with the male therapist.

The comparison of the clients' images when working with a therapist of the same sex as opposed to a therapist of the opposite sex resulted in statistically significant differences in the area of content analysis, with inanimate objects appearing more often when the clients were working with a therapist of the same sex (df = 11, t = 2.60, p > .05). Human figures (df = 11, t = 1.59, p > .20) and geographical representations (df = 11, t = 1.49, p > .20) were seen more often when clients were working with a therapist of the opposite sex while also a noteworthy difference was observed in the number of nature drawings such as plants and trees that were produced when the client was working with a therapist of the same sex (df = 11, t = 1.82, p > .10).

As we try to further analyze the images produced by the female clients when in session with the male or female therapist the noteworthy difference was in the client showing human forms in movement when working with a male therapist (df = 5, t = 1.58, p > .20) while nature was more often depicted when working with the female therapist (df = 5, t = 2.23, p > .10). As for the male clients, they tended to produce more well defined objects, (df = 5, t = 3.87, p > .02) while also placing the images toward the center (df = 5, t = 2.24, p > .10) and including more human figures (df = 5, t = 1.74, p > .20) when working with the female therapist.

Interpretation of these differences suggests that in the work carried out with the female therapist, clients tended to display more control and ego strength (associated with F + responses) whereas with the male therapist, they tended to address underlying conflicts and unresolved issues (Fm,d). As to other aspects of the analysis, when the therapist and client were of the opposite sex, issues were either more of an interpersonal nature (with humans being part of the imagery) or more of a defensive nature (maps) whereas when therapist and client were of the same sex the imagery tended to be more object related with the drawing of inanimate objects and scenes from nature.

The more elaborate responses in terms of ego functioning (M, F +) were observed in the work carried out by male clients working with the female therapist. These interpretations are derived from the Rorschach literature (Klopfer, 1954, Rickers-Ovsiankina, 1960) and attempt to underline the relevance of the differences that were observed and should not be taken as a definitive interpretation of such a scoring procedure. These results confirm the work carried out in areas of diagnostic assessment, in which the person of the assessor appeared to influence some of the results obtained on projective tests. In the cases analyzed here, some statistically significant differences (p > .05) and some trends (p > .20) could be seen in the images produced alternatively by the same clients but involved with two different therapists. Our conclusions must be seen in the context of the experimental design in which for the necessity of simplification we had to establish a situation parallel to but certainly not equivalent to a long-term art therapy relationship.

Art therapy and the interpersonal process

As could be observed in the imagery produced with two different therapists, some elements were specific to the person of the therapist, while other elements of the images were related to other factors such as same sex / other sex of the client therapist dyad. This underlines that the imagery produced by the client in the context of art therapy involves elements of the therapeutic process with both client and therapist being participant in the creation of the language of the relationship. The imagery created in the course of therapy is both an expression of a structural reality which the client is consistently involved with and attempting to actualize in his expression but also the image is a reflection, in some of its components of the immediate and contextual variables which the therapist must take into account as equally being very much a part of the client's verbal and nonverbal discourse.

Art therapy stands in a privileged perspective in its use of the image as a mediator as well as created language in the 'here-and-now' of the relationship. The Art Therapist is thus presented with an issue still left basically unexplored in the models and theories of the more traditional psychotherapies: the role and function of language needing to be studied as the mediating process between client and therapist and from which the curative process of therapy is brought about. The image thus challenges the restricted understanding we have so far of what communication between therapist and client may involve into as well as the yet unresolved question of the complexity of the symbolic process which allows for the intersystemic transformation and transformations observed in therapeutic work.

Enhancement of Body-Image: A Structured Art Therapy Group with Adolescents

Stanley Schneider, Ph.D., Director, Summit Institute, Jerusalem, Israel
Shelley Ostroff, M.A., A.T.R., Director, Vocational Rehabilitation Center, Summit Institute, Hebrew University, Jerusalem, Israel

Abstract

This paper presents a structured, short-term art therapy group designed to enhance the self and body image of adolescents with emotional disturbances. The concept of self and body image is reviewed with a focus on the developmental phase of adolescence. The focused exercises utilized in the group is described with explanations and descriptions of purpose.

The influence of the group on the development of the self concept is explored in general, and the specific therapeutic use of the group in this context is emphasized. This art therapy group has been developed and used at the Summit Institute, a psychiatric residential treatment facility for emotionally disturbed adolescents and young adults in Jerusalem, Israel, and has been found effective in providing group members with an experience whereby they can begin to perceptually, emotionally and cognitively work through conflictual issues related to their self and body image.

Self Image/Body Image: Theoretical Formulation

The first written description of body-image disturbance was from a neurological frame of reference and is found in the works of Ambrose Paré, a sixteenth century surgeon. He wrote about phantom limb disturbances in patients following amputation (Kolb, 1959); a unique neurological phenomena whereby the inner neurological percepts belie the outer reality of a missing limb. However, it was not until the writings of Head, the neurologist, in 1920, that the basic concepts of the body-schema, as we know it today, began to take shape.

The application of body-image theory to psychiatry was pioneered in the works of Paul Schilder (1950), who conceived of a tripartite, tri-dimensional unity: a physiological and sociological basis, and a libidinous structure. Narcissism, expression of emotion, social relations and identification were some of the psychological concepts he introduced into the body-image literature. He suggested that “the development of the body-schema probably runs to a great extent parallel with the sensori-motor development” (Schilder, 1950).

With the works of Melanie Klein (1946), Bion (1962), and Guntrip (1968), object relations theory moved forward; we now note an articulation of the interaction between subject and object not only on a physical level, but also on a feeling level. Sandler (1976) carried this further with his concept of role-responsiveness.

In the literature we find various terms that are used interchangeably with body-image: “self awareness, self-concept, the self, body-ego, self-identity, and body-schema” (Schoenberg, 1969). Torres De Beà (1987) notes that in the field of psychoanalysis, the term most frequently used has been ‘body-schema.’ “This is probably because the term ‘body-schema’ has been used to denote the representation of the body in the mind . . . (and is) the identity factor that represents the body (1987)”’. This holds true for the parent as well as for the child’s conceptualization of the body percept. The introjector and projectives (including projective identification) that take place between mother and child, will influence not only the emotional development of the child, but also the body schema of the child which is part of the object relations realm.

Thus, body-image can be seen as an interactive process between the structural internalizations and the object relations dyad. Schonfeld (1969) defines the structure of the body-image as being determined by “1. subjective perception of appearance and ability to function . . . 2. internalized psychological factors . . . 3. sociological factors . . . 4. ideal body-image.” Torras De Beà’s (1987) object relations view is that “the child partly ‘receives’ it body schema from the mother and father and from the sensorimotor experiences with all their relational and affective components.”

Melanie Klein added “life” to the world of objects. Laplanche and Pontalis (1980) stated: “Objects (projected, introjected) actually act upon the subject—they persecute, reassure him, etc.” In Kleinian terms: the interrelationship between subjects (objects) is not only a physically spatial one, but also an experiential emotional one. Identity, in the Kleinian view, takes on a feeling aspect. This parallels the thinking of Feder (1952) who had differentiated the ego from the body-image and attempted to separate a mental and body ego. Bodily ego boundary and ego-feeling included not only somatic but also mental/emotion phenomena.
Adolescence and Body Image

In dealing with adolescents who are, developmentally, in the continuous process of ego-identity formation—the concept of body-image and its potential disturbance, is of paramount importance. Erikson (1964) wrote of the resolution of the boundaries of ego development as part of the process of adolescence. The boundaries help delineate the internal structures and repositories of feelings from external aspects. On an emotional level, the 'inner' and 'outer' dimension of the identity process allows the person to recognize himself/herself and to feel recognized' (Erikson, 1964; cf. Schneider, Berman, Aronson, 1984).

Body schema occupies an important part in the adolescent's emotional development with a quickening of concern, internal (and sometimes, external) conflicts and fantasies. The physical changes of adolescence awaken new and unfamiliar feelings with a concomitant intensification of emotional turmoil. Parallel development of cognitive capabilities such as introspection and abstraction enable the adolescent to "look at" what s/he is feeling. This involves perception of self by herself/himself as well as concern regarding one's perception in the eyes of others.

The adolescents' attempt at integrating the dramatic physical and psychological changes into a coherent self image are largely determined by the ego strengths s/he brings to this developmental stage as well as by the way in which s/he perceives herself/himself in the eyes of others. This self percept may be relatively realistic or distorted. The generally difficult and painful growth process of formulating a healthy, positive and integrated body image may be complicated in the adolescent with emotional difficulties and unresolved conflicts from previous stages of development, or in the adolescent with perceptual and/or learning disabilities.

The adolescents' preoccupation with her/his changing body is generally an intra-psychic process and certain aspects of the body image which are unacceptable to her/him because of real or fantasized deviations from the norm are often magnified beyond proportion. Oftentimes this may emerge as a fixation on a particular body part. When the adolescent has had inadequate preparations for the physiological changes which occur, these changes may be perceived as frightening and incomprehensible. Information sought out "secretly" may be internalized in distorted ways, further impeding the integration of a healthy body image. Mocking and scapegoating those with deviant physical appearances serves for some as outlets for internal tension over what is an uncomfortable and even taboo subject. While the adolescent is constantly (overtly/covertly) comparing herself/himself with peers, the difficulty in dealing directly with the subject of body image, and the embarrassment surrounding it, prevents her/him from sharing concerns and fears and confronting them with reality. Parents sensing their adolescent's anxiety and her/his focusing on a certain body part, may "adopt" the adolescent's concern, thus reinforcing it as a genuine problem. The symptom then takes on the quality of the focus of attention rather than the underlying anxiety. Among the more emotionally disturbed adolescents, these concerns are often converted into somatic symptoms. Sometimes adolescents utilize denial and repression as defense mechanisms in an attempt to continue being a dependent child. Fears may be manifested overtly and may be expressed as sexual acting-out or verbalized concern about sexual identity.

A Structured Therapy Group

Our plan was to create a carefully structured art therapy group on the subject of the human figure which we hoped would encourage the formation of a more positive, healthy and integrated body image. The art materials and structured exercises provide media with which the group could actively explore, confront, and create images of the human body. The metaphoric and symbolic qualities of art provide a safe realm in which the participants can begin to cognitively, tangibly and emotionally work-through distortions, anxieties, confusion and conflictual issues related to their own body images and identity.

Because of the significance of the peer group in the formation of the adolescent's self image, we utilized the group as an important part in the therapeutic process. Concepts of self-image and body image are interrelated as a complex perception by the individual of herself/himself, based on physiological, psychological and social factors. Self and body image are directly related to the feedback an individual receives from others. A person feels a stronger sense of her/his own existence when s/he is related to and not ignored by others. Her/his attitude toward self is, in a large part, based on past experiences of positive and negative feedback.

Even though art work is, in many ways, perceived as an extension of self, it nonetheless provides a less threatening transitional medium for communication and feedback on the subject of self and body image. The group meets for twelve sessions. Each of the sessions ends with group discussion where member are encouraged to relate to their own art work as well as to that of others.

Many adolescents are so narcissistically preoccupied with the own self image, seeing themselves as inferior or different and perceiving the other as superior, enviable etc. that they are often not realistically aware of the individual differences among others or of share anxieties. Being confronted with different "body images," emotions, figures, portraits and facial expression as expressed in the art work, force...
a confrontation with differences in terms other than “good”/“bad,” “acceptable”/“unacceptable.” When the group has established a safe, intimate sense of cohesion and trust, these differences are often spontaneously related-back from the art work to the group members. However, this occurs on their own initiative and only at the level with which they feel comfortable. As an example, if a person places her/his clay figure apart from the clay figures of others and says that the figure is alone s/he may continue by saying that maybe it is because s/he too feels alone.

A range of activities involving a variety of media were designed to focus on different areas of cognitive, perceptual, and motoric functions and skills and emotional conflicts regarding body image. In addition, the group provides the adolescents with an enriching and ego-building encounter with art activities. A description of the activities is presented in chronological order. Because of the emotionally conflict-laden aspect of the theme of this group, resistance was initially anticipated. Participation in the group is voluntary, although, after the initial commitment, obligatory as a therapeutic activity. Indeed, certain adolescents rejected the idea outright. Yet, the majority in this setting accepted it enthusiastically, particularly after hearing about the group from previous participants, as a rewarding experience. The activities were carefully designed so that they progressed from more simple and less threatening to a more direct and complex confrontation with the subject matter.

Activity 1 (session #1)—Collage

Materials: colored paper, scissors, glue

Description of activity:

Construction of a collage figure using colored paper and involving the cutting-out and pasting of simplified shapes of the body onto a background of colored paper.

Rationale:

This activity allows for a simple expression of the body. It requires the basic steps of identifying and placing parts of the body, taking into consideration their relationship and proportions to one another. This exercise is somewhat non-threatening in that it permits a superficial approach without evoking the need to defend against relating to more emotionlly laden areas of the body in a detailed manner. The colorful materials and relative simplicity of the task ensure an aesthetically pleasing outcome with little performance variability among group members based on talent or sophistication.

Activity 2 (session #2)—Clay figure

Materials: Clay, clay tools, wooden artist’s mannequin

Description of activity:

After a demonstration by the art therapist of two methods of building clay figures, the parts of the body are pointed out using an artist’s wooden mannequin. The participants decide on the movement of the figure and the feeling expressed in the movement and then demonstrate on themselves the position they choose. They then create the clay figure. The closure of this activity involves the group members placing their figures on a clay base, in relation to one another.

Rationale:

Clay is provided to encourage and develop a three-dimensional, tangible, tactile sense of the body’s mass and to consider it from less familiar perspectives. Clay does not require fine coordination but is geared towards a grosser conceptualization of the figure while still allowing for the avoidance of details. The bodily movement exercise invites group members to begin to relate to their own bodies, how they move and to actively think about the body as a dynamic mass in space. The placing of the figures in relation to each other is designed to stimulate the awareness of, and interaction with, other members of the environment. The group members, in a “story-like manner,” discuss their figures actions and feelings in relation to “other” sculptures, and, in doing so, interact indirectly with each other on a symbolic level.

Activity 3 (session #3)—Two portraits in color expressing feeling

Materials: 8½” × 11” paper, pencil eraser, oil pastels

Description of activity:

Two portraits in color are drawn in order to convey two different emotions. The expressive, rather than realistic quality of the picture is focused on, and portraits of famous artists are shown with a discussion of the use of line color, expression and composition. Mirrors are available so that group members can study their own faces and change in expression. Emotions expressed by the group members spontaneously in this session are explored in this context.

Rationale:

At this stage, the group is beginning to experience itself as a cohesive entity with a strong involvement in the shared group experience. It is felt important to allow for and encourage an open airing of some of the feelings and emotions existing in the group. The face is the most expressive part of the body and the most important center of communication. The ease and familiarity with which the face is drawn provides a non-threatening stepping-stone for late drawings of the full figure.

Since group members are often overwhelmed with a particular feeling (sadness, anger, anxiety, etc.), they “forget” the experience of other feelings at the time, so the portrayal of two different emotions and the exposure to the numerous expressions of other group members encourage the awareness of and identification with, a variety of emotions. This allows for the exploration of the complexity and ambivalence of feelings, permits a sense of universality and engenders feelings of not being alone. By seeing other group members’ picture and by receiving feedback to their own pictures, group members can see and hear other feelings rather than being “stuck” within their own dominant feeling of the moment.
Activity 4 (session #4)—Sketching group members

Materials: 8½" × 11" paper, pencil, eraser, charcoal

Description of activity:
The group does a movement exercise to music where the possible directional movements of the various body parts are explored. The group members take turns posing in different positions while the others do quick (approximately two minute) sketches. This is repeated a second time. The focus is on achieving a very rough sense of the movement of the body. Another round of longer (ten minute) poses follows.

Rationale:
The movement exercise is designed to stimulate thought and awareness about the different parts of the body and the way in which they can move, by simultaneously and experientially combining physical, visual and cognitive processes. The sketches are meant to continue this theme by focusing attention on, and visually re-creating, a variety of movements on paper. Drawing the other members of the group stimulates awareness of the other. The discussion afterwards may relate both to the experience of becoming aware of others and to the feelings relating to being the focus of attention (being watched, judged, etc.). The rounds of two minute sketches prior to the ten minute sketches, function as practice-rounds to train the eye to take in the complete body movement in a general sense. This facilitates a more integrated perception by the time the second round is accomplished. The swiftness of the exercises and the intense concentration on the gestalt of the movement frees—up group members from previous stereotypes and fixations in particular conflict-laden areas of the body, evident in previous figure drawings.

Activity 5 (session #5)—Picture of a human figure in color

Materials: 14" × 16" paper, pencil, eraser, oil pastels

Description of activity:
The way in which movement expresses feeling is discussed and various artworks are displayed to show how artists use movement, color, line, compositional and environment to convey a certain mood and character. Group members are asked to choose and depict a character, his/her personality and mood while considering the above mentioned factors in the picture.

Rationale:
The aim of this exercise is to stimulate awareness of the relationship between the psychological/emotional aspects of the person and his/her body. The environment is taken into account as a factor in the drawing and group discussion in order to stimulate awareness as to the relationship (or lack of it) between group members' feelings and the environment.

Activity 6 (session #6)—Picture of an interaction between two people, in color

Materials: 14" × 16" paper, pencil, eraser, oil pastels

Description of activity:
The same materials and concepts are used as in the previous activity, but this time artists' works are used to illustrate the nature and mood of the interaction or relationship between two people. The group is then asked to imagine and depict an interaction between two people.

Rationale:
The aim of this activity is to explore various possibilities of dyadic interactions and the feelings associated with them. Group members at this stage have become more aware of each other and are beginning to feel more secure with themselves and with each other.

Activity 7 (sessions #7—12)—Life-size color picture of human figure

Materials: large paper, pencil, eraser, gouache paints, paint-brushes, full-length mirror

Description of activity:
The final activity involves the drawing and painting of a realistic life-size figure; not necessarily a self-portrait. Emphasis is placed on the careful examination and consideration of the various body parts, shapes, sizes and colors. Again, the members are asked to choose a character to paint, to consider his/her personality and mood, and to think how these can best be conveyed in the movement, choice of line, color and environment. The focus is on a realistic rendition of a person which demands close examination of oneself in the mirror.

Rationale:
This final task is a culmination of the previous tasks and demands paying close attention to various parts and details of the body, their relationship to each other, their shapes, sizes, proportions and colors on a life-size scale.

Because of the attention paid to these details, the psychological distancing enabled by the metaphoric aspect of the previous exercises is no longer readily available. Standing opposite the picture involves the person "measuring" and considering his/her own body parts. By this stage, all the elements involved in the activity are familiar so that the project is less threatening than it would initially seem. This task takes place over a series of five weeks so that time can be invested in achieving a realistic and satisfying result and the art therapist can spend time dealing with each person and with the particular issues which may arise. The end-product is generally experienced as a very strong assertion of the self.

Summary:
The issue of body-image in adolescents is a potentially conflictual issue. In the emotionally disturbed and learning disabled adolescent, this area is even more problematic due to the perceptual, cognitive and integrative deficits, as well as concomitant emotional adolescent turmoil.

This paper describes a time-limited art therapy group whose primary goal is to work on systematically developing a more integrated concept of the body. This structured art therapy group utilized the metaphoric and symbolic qualities of the art in order to provide a safe realm in which group members can begin to cognitively and emotionally work-through misperceptions, confusions and conflicted issues related to their own body-images.

A secondary but related goal of
the group was to foster healthy and positive interaction and relatedness between group members. Self image as mentioned is a function of the way in which others relate to us, thus the enhancement of social skills via the group is a central issue.

Guidelines for Authors

Please submit five (5) copies of manuscripts to: Art Therapy Editor Gary Barlow, Ed.D., A.T.R., AATA National Office, 1202 Allanson Rd., Mundelein, IL 60060. AATA cannot be responsible for submissions sent to any other address. Send manuscripts and illustrations certified mail, with return receipt requested. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½ x 11 inch bond paper, with at least 1½ margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5" x 7" black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

CONFIDENTIALITY: Client/Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.
Depth Psychology of Art

Reviewed by: Gary C. Barlow, Ed.D., A.T.R., Editor, Art Therapy

Depth Psychology of Art, as with Shaun McNiff's other books (The Arts and Psychotherapy; Educating the Creative Arts Therapist: A Profile of the Profession; and Fundamentals of Art Therapy), entices the reader, invites him/her to participate in a dialogue, encourages the probing of philosophical issues, and at the same time, educates about things, feelings, people, illuminates typologies, shares personal insights about the past, the present, and looks to the future. McNiff pushes the reader (sometimes not too gently!) into formulating and reformulating one's own thoughts, aesthetic insights, clinical methods and procedures, and even life itself. The first section of the first chapter is titled "Attending to Soul." Dr. McNiff does indeed 'attend to the soul' in his writing, and the reader is enriched through his insight and dialogue. "I have discovered" says McNiff "that the arts . . . deepen life." " . . . Depth psychology is closer to religion, philosophy and the arts." (p. 3)

The reader is invited into this book with the understanding that religious and artistic creations, and not science, serve to describe psychoanalysis and early depth psychologies, and the author affirms this relationship. "Theories always give way and subordinate themselves to life . . . to the terrain that we share . . . Life and interpretation continue and not necessarily the theory. We are always working from the basis of our personal experience, our craft and our historical epoch." (p. 4)

McNiff states that although he has had difficulty referring to himself as an art therapist because it signified to many people that this symbolized an adjunctive role within a medical system, his definition now returns to the classical origin of the word psychotherapy as "attending to soul." "I now realize," he states, "that I have the freedom to re-imagine the nature of the profession and the tradition from which it emerges . . . I have found that it is through concentration on organic things that we gain access to soul." (p. 5)

In the second chapter ("Nomenclature") the author defines terms ("In psychology we do too little of this.") and he presents or discusses many examples; the ones listed for this review are selected from the many categories listed. In the book some are more descriptive in presentation, others in more depth or detail. Selected terms are: psychology; emotion; health; psychoaesthetics; the unconscious; religion; art as unconscious religion; art; will; clinical realism; evocation; interchangeable interpretations; imagination; genius; therapy; healing and art; emotional jujiitsu; destruction; theory indigenous to art; organic thought; interpretation; image; symbol; metaphor; and openness. What a rich source of language descriptors and interplay that set a stage (many stages) for the reader!

Chapter 3 ("interpretation") asks us, as therapists, to consider not only what we do, but how we do it, and on what basis our interpretation is grounded. "Water, sea and depth," for example, is presented in ten pages—meanings, recurring images, myths and associations. References are abundant: the Inferno: D. H. Lawrence (whom the author references in some of his previous writing); Gaston Bachelard; and Herman Melville (Moby Dick). A section titled "Fire and Water" follows ("The former is 'heavy' and dark while the latter is 'light' and illuminating . . . They have commonly been perceived as representing male and female, sun and moon.") (p. 85). Interpretation is complex, implies McNiff, and is a process of "inward seeing" that promotes contemplation through a dynamic system; it is "never final, just as we can never establish a single, complete and all-encompassing image of a single phenomena." (p. 89) The image is mysterious, and McNiff implores the reader to recognize the many meanings that the image has for us. This is the dynamic, the ever-reaching, the on-going potential between the maker and the receiver.

Succeeding chapters are titled "Re-imagining the artist as a therapist" (as in earlier writings, McNiff revisits Shamanic origins), and "Self inquiry." McNiff's earlier works emphasized being an outsider, looking and engaging artworks made by other people; this book does not deal with the engagement of the psychotherapeutic relationship between client and therapist, but to a new direction of moving to the inside of artistic expression.
In the last 113 pages of the book McNiff includes 56 illustrations of his personal artwork ("Self inquiry") with notations, comments, answers to posed questions, and revelations pertaining to the images. He uses dialogue as a mode of inquiry ("The other voice helps me see myself and the art object.") (p. 124) It is important, asserts McNiff, for a person to have a direct relationship with art, with the making of art, and dialoguing with the art piece. McNiff is direct, and he is honest. The reader moves with him in the process of artistic creation, and in the dialogue it generates. People, animals, energies, giving, taking, remembrances, destroyers, conflicts, religion, aggression, emergence, urgency, passage, interconnections—it’s all here, and it’s all compelling. This work was done in foreign cities and countries (Finland, Amsterdam, Switzerland, Sweden, Florence, Israel) where the author, over the past number of years, has conducted seminars and courses.

Depth Psychology of Art is an important book (252 pages, with an excellent bibliography) for the professional field of art therapy. The book makes one think, retrieve, ponder. I could not read it in one sitting. I read a chapter, then re-read it. I was into Chapter 4, and I discovered that I was still thinking about Chapter 3. I was compelled by the author’s personal artwork, and his honest dialogue. I wish some of the artwork were in color, but I am grateful for the power of the presented black-and-white photographic images. Mark it “absolutely necessary” for your next book order; it is highly recommended for all of us in art therapy, and I suspect it will be important reading for others as well.

The Discovery of the Art of the Insane

Reviewed by: Aina O. Nucho, Ph.D., A.T.R., ACSW, Board Certified Diplomate in Clinical Social Work; Distinguished Fellow, American Society of Psychopathology of Expression; Associate Professor, School of Social Work, University of Maryland at Baltimore.

The Discovery of the Art of the Insane is a monumental, superbly illustrated, exemplary piece of scholarship that significantly elucidates a long neglected and often misunderstood area of human endeavor.

MacGregor sets out to define, document, and trace the degree of acceptance and rejection encountered by the art of the mentally ill. He notes the changing psychiatric terminology and wisely decides to retain the terms “lunatic, madman, and insane where they contribute to the correct portrayal of historical attitudes and material” (p. 8). The retention of the term “insane” in the title, however, is unfortunate as it conveys endorsement of a derogatory and outdated notion of mental illness.

MacGregor defines the art of the insane as consisting of drawings, paintings, and sculptures executed by individuals who were clearly diagnosed as mentally ill (p. 6). He states that he is not concerned with the examination of the life and work of celebrated artists who may have exhibited symptoms of mental illness. In the course of the study, however, this distinction proves to be rather tenuous, and the lines between the two categories become somewhat blurred.

The “discovery” is not a single act as the term would suggest but a process that stretches over several centuries and repeats itself in various places in the Western world. The author guides the reader through the process of growing appreciation, excitement, frustrations, dead ends, and eventually an increasing aesthetic pleasure in the art of the mentally ill.

The theme that weaves throughout the book is how the art of the mentally ill, “a product of terrifying intensity and feeling” is gradually admitted to “the charmed but curiously undefined circle of art” (p. 4). The seventeen meticulously researched chapters discuss insanity in the context of Romanticism; Jonathan Martin of Bedlam; Cesare Lombroso and the theory of genius; Paul-Max Simon whose efforts although less well known predate those of Lombroso; the Victorian Bedlam and the case of Richard Dadd; William Noyes and the case of “G”; the Chicago Conference; Marcel Reja, the critic of the art of the insane; Hanz Prinzhorn and the German contributions; the world of Adolf Wolfli; the relationship between German Expressionism and the art of the mentally ill; psychoanalytic studies of psychotic art; the Nazi purge of “degenerative” art; surrealism; Dubuffet and the aesthetic of Art Brut.

The Discovery of the Art of the Insane is a project of immense complexity. It offers fascinating glimpses of patients, physicians, changing concepts of art and of mental illness, art movements, and the formation of institutions for the care of the mentally ill. Mac-
Gregor has sifted through material buried in antiquated and difficult to obtain psychiatric journals and unpublished documents. He examines the contributions of long forgotten psychiatrists, and he adds his own observations and materials gathered through interviews and correspondence with contemporary psychiatrists, art historians and experts in the field of psychopathology of expression.

The current patterns of care of the mentally ill, MacGregor notes, make the image making activities in danger of disappearing. Many roam the streets without access to a safe and caring environment. MacGregor also comments on the dangers of the massive use of powerful and little understood mood altering drugs that often interfere with the process of self-healing (p. 310). These factors, combined with the manipulations and intimidation that often exist on psychiatric wards of general hospitals, make the art of the mentally ill an endangered species. An additional source of danger to the art of the mentally ill, MacGregor points out, is the changing medical education that makes it less likely that modern physician possesses the breadth of culture necessary to respond to the art of the mentally ill. “The average psychiatrist is uncomfortable with any artistic manifestation, whether it is in patients or elsewhere” (p. 310). It is to be hoped that art therapists will make significant contributions in these areas in the future.

MacGregor brings impressive qualifications to the study of the art of the mentally ill. The book originated in his dissertation at Princeton where he received his PhD in art history. He also studied at the School of Psychiatry of the Menninger Foundation; the C. G. Jung Institute in Zurich; the Tavistock Clinic in London; and with Anna Freud at the Hampstead Clinic in London. He was a visiting fellow of Bethlem Royal Hospital in Kent and at the Maudsley Hospital in London. He gained access to the archives of these famous institutions, and he had contacts with leading scholars in Germany, Austria, Italy, France, and Switzerland. For fifteen years he was a lecturer in art and psychiatry at Ontario College, and he spent two sabbatical leaves, each of fifteen months duration to complete the manuscript.

MacGregor is no stranger to the readers of Art Therapy. In 1983 his article, “Paul-Max Simon: The Father of Art and Psychiatry” was published in the very first issue of Art Therapy. Except for its useful subheadings, this material now forms chapter seven in the book.

MacGregor notes briefly that the investigation of the function of art in the patient’s life and illness has lead to the development of “the clinical field of art therapy and of diagnostic techniques that utilize drawings” but he states that these topics are outside the limits of his subject (p. 8). He mentions the work of Raymond Stites, and he refers approvingly to the contributions of Margaret Naumburg several times. (Her name unfortunately is misspelled in the Index.) As for art therapy, he dismisses it with the comment that “much of what is done in the name of art therapy has little to do with either therapy or art” (p. 311). It would seem that art therapy still has a long way to go to gain acceptance and understanding among mental health professionals and art historians.

The folio size book contains fourteen pages of selected bibliography, arranged in two columns per page. The notes, arranged in two columns per page, cover forty-two pages and should prove to be a gold mine of information and inspiration to young scholars searching for dissertation topics. The index, organized in three columns per page, extends over eleven pages. There are twenty-seven plates in full color and almost two hundred black-and-white illustrations.

The book is written in clear, jargon free language that will delight the general reader and scholar alike. It should prove to be of particular interest to art historians, art educators, psychologists, psychiatrists, art therapists, and all those who are concerned with the understanding of the symbol making functions of the mind and healing.
Developing Cognitive and Creative Skills through Art: Programs for Children with Communication Disorders or Learning Disabilities (3rd ed.)

Reviewed by: Marcia L. Rosal, Ph.D., A.T.R., Assistant Professor, University of Louisville.

The first edition of Rawley Silver's book was published in 1978. At that time, Cohen (1980) wrote, "This book is an invaluable contribution to those who are, who have been, and who will be in the future, concerned and involved with deaf and learning-disabled children" (p. 233). Now, eleven years later, the future has arrived and indeed, Cohen's remarks are true. Today the book is still invaluable to those involved with children with communication and learning disorders.

Basically, the book has not changed since 1978. It is divided into two sections: part one explores the role of art in helping children with handicapping conditions to learn, and part two specifically addresses ways to help these children and reports on methodologies and the research which supports Silver's theories and hypotheses.

In part one, the role of art is discussed through three major concepts: cognition, adjustment, and assessment. As Aach (1978) stated about the text, "Silver richly documents her text with case material on individual children and illustrations of their art work" (p. 116). This section also includes a chapter entitled, "Expectations," which addresses the problems of adults who work with such children and how expectations can affect the performance of the child. Again, case material illustrates her thoughts and ideas on the problems of the helping professionals' issues in relation to helping this population.

Also in part one is a chapter reporting on studies that Silver conducted regarding the creative skills of deaf and communication disabled children and adults. In 1978, Silver reviewed literature which indicated that researchers and educators had low expectations of the creative abilities of hearing-impaired individuals. Silver argued that the studies used verbal modalities to measure creativity and that nonverbal means would be more accurate. She then conducted three studies using art as a measure of creative abilities and the results are discussed.

Part two of the book, in Silver's words, "is concerned with objectives and practices in working with impaired and unimpaired children and adults" (p. 103). This section is filled with the data Silver has collected from studies she conducted to support her theories that art is a means towards helping children and adults learn.

In Chapter Six, Silver writes about three controversies which plague art educators and art therapists concerning the ultimate goals of the art experience: form versus content, therapy versus aesthetics, and instruction versus spontaneity. In the chapters that follow, Silver reports on studies that not only shed light on possible answers to these three questions but also on whether drawings can be used as tools in assessing and remediating the cognitive and creative abilities of children who have difficulties with language.

The three cognitive skills that Silver studies are: (a) the ability to associate and represent concepts through drawing from imagination, (b) the ability to order sequentially and conserve through painting, and (c) the ability to perceive and represent concepts of space through drawing from observation. There is a chapter devoted to each of these three skills. Each chapter describes the methodology, assessment tools, and results of the study. Again, there is case material which serves to illustrate how these skills and methods can be useful in a pragmatic manner.

The third edition has two epilogues which describe updates on Silver's work. In the 1986 epilogue, she describes the Silver Drawing Test of Cognitive and Creative Skills and a research project which used the test as a pre- and post-test measure. From this research, Silver developed a Projection scale to rate drawings for distress.

In the 1989 epilogue, Silver reports on two research projects. One concerns gender differences between males and females on the Silver Drawing Test. The other project examines relationships between negativity and depression using the same test.

There are two major problems with the new edition of this text. The first revolves around the lack of updated literature within the text itself. Even in the first edition, Aach (1978) noted that there was not "a framework around which the reader can integrate the information presented" (p. 116). This flaw seems
more evident in the third edition as there is no attempt to update the scant original literature review. The amount of research completed with this population over the past decade has been extensive and fascinating and should have accompanied this new edition.

The second problem involves Silver’s insistence on discussing too many issues in one book. On one hand, she has a strong thesis concerning the use of art to help those who have language barriers. Then, on the other hand, she begins to argue about wider topics such as instruction over spontaneity and the philosophy surrounding this issue. It is either too overwhelming for a small text and readers may find themselves lost in trying to decipher the major focus of the book or there should be more information given on the latter topic and more of an attempt to integrate the two. This problem was also addressed in the review by Aach (1978), “… she would have done well to review them [the three controversies] at greater length and in relation to specific tasks in her approach” (p. 116).

The two epilogues are added in the same patchwork manner as the three philosophical questions. No doubt they are valuable studies that the field of art therapy needs, but there was no attempt to integrate the information into the basic thesis of the text. Somehow the data seems aloof rather than a welcome addition to our knowledge of the use of art with language-limited individuals.

Today, as a decade ago, Silver’s book represents a landmark in the field of art therapy. The dedication and persistence of Dr. Silver’s work are evident in each study she describes and in each client’s case she presents. She has been a leading researcher in the arts for the handicapped and it is in this area that the book has the most impact. It is specifically for professionals working with children who are language impaired that this text will be most useful.

The American Art Therapy Association, Inc.
1202 ALLANSON ROAD/MUNDELEIN, IL 60060
(708) 949-8064
The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration, practice, AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

**The Organization**

Purpose:
- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

Chapters:
Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals. Information and support for Chapter members is passed on from the AATA Assembly of Affiliated Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

**Member Benefits**

**Individual members receive:**
- Publications
  - *Art Therapy*, the official journal of the AATA.
  - The quarterly *AATA Newsletter*.
- Substantial discounts on AATA publications such as *Annual Conference Proceedings*, other professional journals, films, and membership directory
- Free AATA literature, such as *Educational Programs List*, *Art Therapy Media List*, and *Standards of Practice*.
- Mailings of professional interest.
- Services
  - Insurance, including professional liability, major medical, life and disability.
  - Access to national experts in art therapy.

**AATA Conferences**
- Discounts on registration fees to AATA national and regional conferences.

**National Advocacy**
- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

**Professional Standards**
- Development of model job and licensure laws.
- Development and implementation of national guidelines for approval of Master's Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

**General Membership Application**

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing. Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application.

**Applications received between**
- Jan. 1st and May 31st — Full dues payment; membership will expire Dec. 31st of same year.
- June 1st and Sept. 30th — Half year dues plus $5.00 payment; membership will expire Dec. 31st of same year.
- Oct. 1st and Dec. 31st — Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.
3. Professional Member applicants must meet criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (ATR) each have separate application procedures. Registration is bestowed only by the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

**Categories and Fees**

**Professional** — by application only; such members may vote, hold office and serve on committees.

- Certified Professional Member: Individuals who have been dually approved for Professional Membership and Registration (ATR) by the AATA; dues are $60 p year.
- Active Professional Member: Individuals who have completed professional training in art therapy; dues are $30 per year.

**Contributing** — Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

**Associate** — Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

**Student** — Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $30 per year.

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

Congratulations to Frances E. Anderson, Ed.D., A.T.R., H.L.M., who was awarded the "Honorary Life Membership" in the American Art Therapy Association. Frances has long been an active member of our association (she was present at the founding meeting in Louisville, Kentucky, June, 1969), and has contributed much to our professional association as well as to education, art education and art therapy. She is most deserving of this honor. Her acceptance response is printed in this issue.

In this issue of Art Therapy we are assuming an "international flavor," and the multi-cultural articles give insight into historical perspectives ("The Arts in Therapy—France," by Geoff and Hyacinthe Troll), a citizen ambassador's perspective of art education ("Perceptions of Art Education in the People's Republic of China," by Dorothy McLaughlin), a healing performance ("The Healing Qualities of Art," by Klaus Boegel and Louis Van Maris), and a study of art therapists and Native Americans ("A Comparison of the Traditional Education of Native American Healers with the Education of American Art Therapists," by Phoebe Mills DuFrene). These articles offer much insight and information that will be valuable for developing greater understanding of cross-cultural aspects of art therapy and education, and they should be an important resource for the professional art therapist as well as the student and the researcher. Your responses to these articles, and to various aspects of therapy within multi-cultural settings, are welcome.

Recently I have been revisiting a book titled Design Yourself! by Kurt Hanks, Larry Belliston and Dave Edwards.* It is an interesting book—and fun to read—comprised of many parts and many formats. The authors state that "it is not just a book; actually it is more like a special visual device with which you can examine your relationship to design and your role as a designer . . . the book is a little bit of everything in the way of ideas, games, puzzles, experiences and exercises and much of what it says depends upon your feelings, your interpretation, present and past experiences and what you will do about it all." (p. 1) This book offers motivation for thinking, analyzing, visualizing, communicating and planning in this 'personal design' plan. There is much information presented that has direct bearing on the motivations, understandings and actions of an art therapist. For example:

We all have ways of thinking which cause us difficulty, at times, in perceiving or solving problems. . . . Once able to recognize these mental "blocks" to problem-solving, we are better prepared to side-step or deviate them . . . (These blocks are): 1) The tendency to limit a problem too closely (Expand the mind where limits don't restrict it); 2) Isolating a problem (One must learn to isolate the real problems from the apparent ones); 3) Stereotyping ( . . . seeing what you expect to see); 4) Saturation ( . . . when the mind subconsciously ignores sensory inputs because they are familiar sights . . . Look at the world upside down. . . . You'll be surprised at how many details are now noticeable when looked at from a different perspective); and 5) Failure to utilize sensory inputs (Might it . . . be true that people who see rely heavily on vision and partially ignore their other senses?) (pp. 77-78)

From the authors' section on "Judgment," they write:

It is essential not to judge too early. Newly formed ideas are fragile and imperfect and they need time to mature and acquire detail before they can be judged adequately. Also, new ideas often lead to other ideas for problem solving. Many techniques of conceptualization, such as brainstorming, depend for their effectiveness on maintaining "way-out" ideas long enough to let them mature and spawn more realistic ideas. It is sometimes difficult to hold on to such ideas because people generally do not want to be suspected of harboring impractical thoughts. One should not judge too quickly! (p. 82)

Two thoughts that should be comforting to persons who are experimenting with new ideas, and new ways of thinking, expressing, communicating or sharing are quoted by the authors:

Almost all really new ideas have a certain aspect of foolishness when they are first produced. —Alfred N. Whitehead (p. 109)

No idea is so outlandish that it should not be considered with a searching but at the same time a steady eye. —W. Churchill (p. 109)

A reminder for prospective authors who wish to submit articles and other materials to Art Therapy: Please review the "Guidelines for Authors" found elsewhere in this issue. Manuscripts must be sent directly to the AATA National Office. Please remember that the article must contain an abstract, and must follow APA guidelines for article preparation. By carefully following the format as delineated in "Guidelines for Authors" you will make the entire process more efficient. In addition, since we are in a transition period from an earlier plan to the present one, your patience is greatly appreciated. Any suggestions from readers on this structure, of course, are welcome.

Editor, Art Therapy

2 ART THERAPY, Spring 1991
The Arts in Therapy—France

Geoff and Hyacinthe Troll

Geoff Troll is President of the Federation Française des art-thérapeutes, and holds a Diploma of art therapy, Faculty of Medicine, Tours. Mr. Troll works as an art therapist at Dieppe General Hospital. He teaches art therapy at the Institute National de Perfectionnement “INPER” in Lausanne, Switzerland and continues a promising career as artist, sculptor with exhibits throughout France and Europe.

Hyacinthe Troll has a Ph.D. in Anglo-American Studies, Rouen University. She teaches in Normandy, and has a great interest in art therapy following some work in psychiatric institutions in Great Britain.

Abstract

Following a brief timeline overview of the development of significant occurrences in the arts in therapy in France, the authors focus on more current developments that illustrate the rapid growth of arts therapies services, and particularly art therapy, in that country. With a narrative description, the authors cover not only the historical development, but focus on current training, goals and objectives regarding specialized training. The authors reiterate that there is a rapid movement in France relative to the acceptance of arts therapies as a viable professional thrust, with the control of professional standards, training and registry.

If one were to give a brief timeline of the development of the arts therapies in France, it would certainly include the following:

The 19th Century

1840: Seguin used music for the “education of idiots.”

1880: Paul Max Simon studied the drawings of the insane.

1884: Regis noticed a variation of graphic expression during manic-depressive psychosis.

The 20th Century

The psychoanalytic approach of Freud influenced the development of art therapy. During the first part of this century we began to see a real development of artistic techniques in the care and treatment of patients.

1950: The first World Congress of Psychiatry in France provided the foundation for L’art psycho-pathologique, the major work by Robert Volmat. This book remains one of the main references in art therapy in France today. There is very little literature in French on the creative arts therapies. Also, a consequence of this congress was the creation of a workshop of plastic expression for treatment of psychiatric patients in Ste. Anne Hospital in Paris. The directors of the program were Robert Volmat and later, Claude Wiart. It was in this workshop that Bernard de Panafieu investigated the possibilities of working with masks as a therapeutic technique. Shortly before Silvano Arieti’s psychoanalytic study of creativity was published in the United States (Arieti, 1973), Chasseguet-Smirl (1971) wrote Pour une psychoanalyse de l’art et créativité in France.

1976: The Association Française de Recherches et Applications des Techniques Artistiques en Pédagogie et Médecine (AFRATAPEM) was formed.

1980: The first governmental inquiry into the state of art therapy led to the Gallot report (Geanne siève Gallot, chargée de mission) which highlighted the lack of art therapy.

May, 1981: The first international conference organized by AFRATAPEM led to the publication of the first journal in France devoted specifically to art therapy.

1984: A commission was set up by the French health ministry. Its report has yet to be published.

1987: Several organizations and individuals started art therapy training programs. All of them are part-time and are designed chiefly for people already working in the helping professions (such as nurses, psychologists, and special education teachers), providing possibilities of new approaches to their work. Government policy provides a special budget designed for continuing education (known as “formation continue”) for people who are already employed. (These training programs are described in greater detail later.) “Formation continue” encourages the existing medical staff to try to use artistic techniques in a therapeutic milieu but the policy does little for the artists who have completed their training in fine arts who would like to use their creative sensitivity within an institutional setting.

Two universities had shown some interest in being associated with the training programs. The first was the Faculté de Médecine, Tours, associated with AFRATAPEM. The second was the University of Paris with Dr. J. P. Klein. The latter has now closed in favor of a private institute also run by Dr. Klein. For the moment, it is highly unlikely that any full-time university chair will be created without government recognition of the profession.

1988: Due to the rapid development in the last few years, it was necessary to have a national organi-
zation to represent art therapists, both to the public and the government and to other authorities. Hence, the Federation Française des Arts-Thérapeutes was born. The inaugural meeting took place on May 28th, and a good cross-section of artists and therapists from many different backgrounds and training elected the first council of administration. This council has defined their main objectives as:

(1) Define the aims of the profession, its ethical code, and its standards;

(2) Establish the conditions for selection and training of art therapists;

(3) Obtain professional status for art therapy through legislation;

(4) Promote recognition of creative process as applied by art therapists; and

(5) Participate in writing a constitution for a European association.

A FIRST-HAND ACCOUNT—
H. Troll

I am English and live in a tiny Norman village situated 35 kilometers from Dieppe, France, where I am the art therapist and one of the founders of the department of creative therapies in collaboration with Dr. C. Reboul who was the head of the psychiatric department of Dieppe General Hospital. My previous experiences in England consisted of instructing mentally handicapped adults and working as both a psychiatric and a general nurse. It was in the early days of psychiatric nursing that I, already a keen amateur painter and song writer, became extremely interested in the work of Terry Sellar, an art therapist at Runwell Hospital, Essex. Looking back, I do not know how I managed to get a job in Dieppe. My knowledge of French was, to say the least, extremely poor. What made things worse was that the few words I had learned were more or less obsolete in modern French day-to-day conversation. What a fantastic chance to learn about nonverbal communication, especially with the patients who also had great fun teaching me all the words I shouldn’t know!

Anglo-French cultural differences are many, but in therapy they rarely create negative reactions; on the contrary, the need for acceptance and mutual respect is a foundation for lively exchanges. It seems that cultural differences are nearly always counterbalanced by similarities, simultaneously allowing for the maximum exploitation of the individual identity.

Dieppe is a fairly important tourist center and cosmopolitan town, so in addition to my French patients I quite often have overseas clients: Australian, Canadian, American, and Yugoslav, to mention just a few. Their integration in my creative therapy groups always has a positive, stimulating effect, each person adding an original, creative stance influenced by his or her own cultural resources. When communication is too easy and people speak the same language, the result can be superficial; there can be misinterpretation of the real meaning due to differences in sub-cultural terminology. For example, the word *depression* can mean “a hole in the ground” or “a state of mind.” John Henzell, senior lecturer for the postgraduate diploma program in art therapy at Herts College of Art and Design in Great Britain, states:

> The failure of speech adequately to apply is difficult to see just because it is difficult to describe. It cannot, for example, picture the place of a part in a whole as a map does, compare fingerprints, inform others of what sort of person we are as well as keep us warm as clothes do, picture the play of light on a surface, convey exactly how someone looks or moves, actually indicate the humour, tragedy, or majesty of a human face, and so on. (Henzell, 1984:18)

Without this facility of exchange, as inefficient as it is, if people want to communicate they are obliged to develop deeper understanding.

France is a country extremely rich in culture with numerous regional variations. Perhaps that is one of the reasons why art therapists have not attained national acknowledgment or a recognized professional status. However, there are a few organizations working toward this end and have instigated art therapy training programs.

AFRATAPEM offers a Diploma in Art Therapy. Perhaps it is not by accident that its main office and school are situated close to the birthplace of Gothic art and to the Loire Valley, an important location during the French Renaissance. This organization, also known as the Ecole de Tours, is associated with the Department of Medicine of the University of Tours, which has helped them to bring together many important personalities from both the medical and artistic worlds. Its aims are:

(1) To be a meeting place and to enable exchanges between people of different disciplines;

(2) To apply art therapy in medical, para-medical and educational settings;

(3) To re-evaluate and reconsider the worth of the artistic phenomenon; and

(4) To create a research center and develop approved education for art therapists.

Their research includes investigating the relationships between the senses, the autonomic nervous system, subcutaneous phenomena, nonverbal communication, the unconscious, the effects of rhythm, and art and education.

This organization is recognized by the Minist. of “Temps Libre” (leisure-time activities). Youth and Sports as an approved body for the education of art therapists. One aspect of l’Ecole de Tours is the fact that it is open to all forms of artistic expression. Richard Forestier, an art
therapist and director of research at AFRATAPEM, published L'art ou le droit d'être (Art and the Right to Exist), followed by a joint publication Art thérapie: Des concepts à la pratique with J. P. Chevrollier, a psychiatrist and a member of the research committee of AFRATAPEM. This work is a methodological approach to art therapy which now has been translated into English.

L'Ecole de Tours held an international conference in 1986 on the theme of nonverbal communication, with some speakers from the United States.

Examples of Training Programs in France

AFRATAPEM Training

I am able to give a first-hand account of this program as it is one in which I have participated. The Ecole de Tours promotes a complete artistic vision in all artistic fields; in its teaching and therapeutic process, one finds a refreshing wholeness both innovative and anti-fragmentary. Selection of candidates is rigorous. The work includes theory and practice in arts and psychotherapy. It demands the development of one's creative resources, looks at the technique of teaching and learning, the research into artistic form and the understanding of one's original expression. Its multidisciplinary approach to training meant that although I had given proof of my artistic involvement in the plastic arts (painting, collage, and sculpture) they insisted that I try to revive my abilities in playing a musical instrument after eighteen years of abstinence. The process of doing this now gives me great pleasure. I find it not only compatible with my involvement with the plastic arts but an active, stimulating dynamic in both my professional life and spare time.

All candidates participate in a week's introduction/selection. There is a presentation about the association and its politics in relation to the creative arts therapies, followed by active experience in art therapy, music, dance, sensory games, and group dynamics. Intensive and comprehensive sessions are a great way of finding out about art therapy and allows a realistic assessment by both the participant and the association. For the successful candidates, the course is a part-time one which must be completed within four years from the preliminary week. It is comprised of four parts:

1. The artistic phenomenon and method;
2. The history of art in medicine;
3. Neuro/psychophysiology and psychiatry; and
4. The practical aspects of art therapy (work experience).

In all there are about 270 hours of classes and workshops with a considerable amount of personal work and preparation. Passing a written examination gives the candidate entry to the preparation of a thesis which is presented orally in front of a specialized jury. (My own jury consisted of a professor from the faculty of psychiatry at the University of Tours, a child psychiatrist/psychologist, a music teacher, and an art therapist.)

Dr. Jean Pierre Klein

Dr. Klein has initiated a course for art therapy students on a 2-year part-time basis, with five 3-day weekends a year. His program is called the Institute National d'Expression, de Creation, d'Art et de Therapie. Dr. Klein organizes conferences and specific 4- or 5-day courses from time to time. A recent one devoted to creative expression by special populations included research into prisoners, patients in comas, homosexuals, the elderly, and the physically handicapped.

Formation ATEPP

The "Atelier d'expression plastique les Pinceaux" is a workshop originally set up in 1956 as a center for free expression for children in Paris by the artist Gladys Jarreau. Later, this developed into a workshop for adolescents and adults. Surprised by the creations of certain children and adolescents, Jarreau studied psychology and Freudian and Adlerian analysis, and became both friend and collaborator with Sara Pain, professor of psychology at the University of Paris North Bobigny, and Dr. Jean-Charles Febrinon-Piguet, a psychiatrist and psychoanalyst. They began a course in art therapy in 1984 which is designed to help artists and other interested people in associated professions such as nurses and teachers to use artistic techniques in a form of art therapy.

Jarreau (1984) outlined her theory of two types of art therapists—artists and psychologists. For the former, she stresses a creation/therapy paradox and analyzes the motives which prompt artists to express themselves with the patients, while she questions the advisability and the origin of this technique. She distinguishes between two forms of creative approach: that of the patient and that of the artist. With artists, the interest lies in the creative process; whereas with patients, it is the finished work that matters. This is a theory that opposes a global approach where the art therapist can follow and participate in active therapy.

IRAE (Midi-Pyrénéées)

IRAE gives courses to help in instigating psychotherapeutic expressive arts workshops within the institution, with an emphasis on research into language and creation, art as a means of analytic work, and the personal implication of the art therapist and its effect on the individual and collective dynamic.

Université Rene Descartes

A recent breakthrough is a very thorough training at the University Rene Descartes Paris V. It is over a three year part time period and is
recognized by the Minister of Culture and Functions in liaison with the Health Ministry.

INPER—The Institute National de Perfectionnement

Just across the French border in the beautiful lakeside town of Lausanne, a private institute in typical Swiss tradition, organizes a training scheme on a truly international scale with faculty members coming from France, USA, Switzerland and Germany. The courses are in French or with simultaneous translation. This provides a very wide view point of art therapy raising some excellent cross cultural issues. The students are mainly professionals from the psycho social sector and use the training as a specialization rather than fundamental professional training.

Other Programs

There are one or two other institutes that train art therapists in depth, notably Marionette et thérapie in Paris and INFIP in Lyon. There are others throughout France that offer weekend courses on the introduction to art therapy such as the University Paris VII, Instep in Marseille or ARTA in Bordeaux.

Journals

There are two journals in France disseminating facts about art therapy on a major scale. One is Psychologie Médicale, a publication created in 1969 by the French association for medical psychology. It is directed at the medical profession, has many advertisements for pharmaceuticals, and therefore, is not on sale to the general public. This journal often publishes articles on the arts and therapies. It has good coverage of the conferences of the Société Internationale de Psychopathologie de l’Expression.

Art et Thérapie was founded in 1981 by Dr. Jean-Pierre Klein. Its birth was a necessity. Following a conference on art therapy organized by AFTRAPEM in 1981. Dr. Klein tried to find a journal to publish the conference papers. However, all the usual medical and para-medical magazines refused, saying that the subject was too specialized. At the beginning, fifty percent of Art et Thérapie was sponsored by pharmaceutical companies. But since December 1984, because it was in general circulation, pharmaceutical advertisements are no longer allowed, causing considerable financial hardship. Apart from the medical profession, Klein wants it to be available to artists and art colleges where he thinks there is the greatest potential for the future of art therapy. It is the only journal specific to art therapy; its contents are interesting, timely, and of high standards.

The Future

The field is beginning to grow and develop, and the enthusiasm and excitement is fast becoming a forceful power. We now have a central governing body to control professional standards, training, and a registry. In the long term, the government should give even greater recognition to our existence. There is still a long way to go, but it is an unavoidable progression if France continues to be a caring, humane society.

Guidelines for Authors

Please submit six (6) copies of manuscripts to: Art Therapy
Editor Gary Barlow, Ed.D., A.T.R., AATA National Office,
1202 Allanson Rd., Mundelein, IL 60060. AATA cannot be
responsible for submissions sent to any other address. Only
original articles that are not under review by another peri-
dodical are acceptable.

FORM: Typewritten, double-spaced on 8½ x 11 inch bond
paper, with 1” margins.

STYLE: Prepared to conform to the Publication Manual of
the American Psychological Association (Third Edition), avail-
able from APA Headquarters, 1200 17th Street, NW,
Washington, DC 20036.

COVER PAGE: A detachable cover page to facilitate blind
review should include the full name(s) and degree(s) of the
author(s), professional affiliations, and the return mailing
address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the
main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper
should be clearly indicated by headings and sub-headings.
if appropriate.

FIGURES: For line drawings, use black ink and a good
grade of white drawing paper. Photographs must be
5” x 7” black-and-white glossy prints with high contrast.
Charts, diagrams and tables should be of professional
quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back
of all figures. Captions must be typed and submitted on a sepa-
rate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a
copyrighted source.

REFERENCES: References must be typed, double-spaced,
in alphabetical order, on a separate sheet.

CONFIDENTIALITY: Client/Patient confidentiality must be
protected in title, abstract, text, photos and other accom-
panying material. Proper releases must be obtained.

6 ART THERAPY, Spring 1991
"Perceptions of Art Education in the People's Republic of China"

Dorothy McLaughlin, R.S.M., Ed.D., A.T.R., Professor/Director: Graduate Art Therapy Program, Marywood College, Scranton, PA.

Abstract

A group of art educators from the United States, members of the Citizen Ambassador Program of People to People International, met with art educators from the People's Republic of China in July, 1988. This article reports on the personal impressions of one member of the delegation.

China is in the process of change, visible in the construction of modern buildings and in the energetic everyday lives of the Chinese people. Change in ideology is affecting the attitudes and values of the people and the educational system as a result of the implementation of the Seventh Five-Year Plan of 1986.

Art education is trying to catch up with the times in China after years of political struggle. However, art curricula, facilities, and programs are in a state of flux.

In 1988, a delegation of art educators was invited to meet with art educators of the People's Republic of China by the Citizen Ambassador Program of People to People International. People to People was founded by President Dwight D. Eisenhower in 1956. Eisenhower believed that people from the United States reaching out to people of other nations could contribute to world peace. The organization, administered by the State Department until 1961, is now a private, non-profit corporation directed by Mr. Joyce Hall, founder of Hallmark and a friend of Eisenhower.

Led by Dr. Al Hurwitz, the delegation sought to exchange information regarding the objectives, content, and methods of art instruction on all levels from primary school to the academy (Al Hurwitz, personal communication, March 14, 1988). Briefing for the group at the Four Seasons Hotel, Seattle, Washington, on July 13, 1988, was conducted by Mr. John Luppert, Director of the Science and Technology Programs for People to People. After an overnight stay in Narita, Japan, the 47 delegates left for Beijing, China. The 3000 year-old city of Beijing has architecture ranging from ancient temples to 19th Century European and Russian styles, to several ultramodern hotels. This northern Forbidden City and Tian Anmen Square. In addition to these historic places, the Great Hall, Ming Tombs, the Summer Palace, Temple of Heavenly Peace and a Children's Palace were part of the tour agenda.

The American delegation of art educators was greeted by Mr. Zhu Xuesan, the Vice President of the Standing Committee, in the Great Hall of the People where presidents and other dignitaries were once welcomed. The first meeting between the art educators of both nations was held at the Beijing Academy of Fine Arts. The Academy, opened in 1918, built as a new site in 1945, was initially a primary school. The Beijing Academy of Fine Arts, like all universities, was closed during the Cultural Revolution from 1966 to 1970 (Adams, 1987). The building is currently in poor condition, possibly due to neglect during the long political struggle. However, in the words of one Chinese art educator, "The quality of teaching and artistic performance are the best in all of China."

According to the Chinese, the art curriculum is being adjusted, the system of the academy is being changed, and the art facilities are to

... the art curriculum is being adjusted, the system of the academy is being changed and the art facilities are to be improved.
be improved. Government subsidies and scholarships are currently granted for the study of art, and talent and intelligence are required for entrance into the university. The present philosophy of art education is that the past serves the present; in other words, the Chinese study and inherit their heritage. The sharing of art information was very one-sided. It must have been evident to the Chinese that they had little to contribute to the modern art world because of their struggle (Mosher, 1988).

A second meeting between the delegation and Chinese art educators was held at the Beijing Central Academy of Applied Arts. After viewing slides of student art works, the delegation visited the student art gallery and discussed the art with the students and faculty through the aid of an interpreter. Although the oil paintings were skillfully executed, they were imitative and were influenced by the Expressionists, Impressionists and Cubists of the Western world. Traditional Chinese water color paintings are still highly prized and these painters are respected throughout China. This style is characteristic of Chinese art and is appreciated throughout the world, so it is one "classical" of artistic style that is already flourishing.

One observation made by this writer was that the Chinese art educators were mostly middle-aged men who did not have formal degrees. One of the outcomes of the Cultural Revolution was that college faculty educated from 1950 to 1970 seldom had degrees. The very old and the very young have degrees, but the middle-aged college faculty will probably never have degrees (Boone, 1988).

The direction of education within the next five years may depend on the implementation of the Seventh Five-Year Plan proposed in April, 1986. Ideological shifts in the People's Republic of China are evident in that plan. According to Li Shenzhi, Vice Chairman of Social

---

**Emphasis on vocational technical education is consistent with the movement toward economic growth.**

Studies, the political focus has changed. Some of these changes include changes from class struggle to economic construction; from looking down on intellectuals to respecting educated people; from treating knowledge and culture as foreign and antiquated to stressing their importance; from endeavoring to promote world-wide Socialist revolution to striving to maintain world peace (Swanson and Zhijan, 1987). The plan has changed the attitudes of the Chinese people toward their culture and the arts are currently being promoted. According to Swanson and Zhijan (1987), all expansion in the senior middle schools will be in vocational and technical areas. China intends to increase enrollments in these schools by 65%. Currently, there are 104,000 middle schools (regular and vocational) enrolling 48.6 million students, about 68% of the school age population (U.S. Dept. of State). Emphasis on vocational technical education is consistent with the movement toward economic growth. The purpose of education at this level focuses on preparing people for jobs. The delegation observed skilled artists and artisans working in factories who produce arts and crafts for sale to visitors; tourism in China is an important business.

After five days in Beijing, we flew to Xi’an where there are about 20 universities, colleges and research institutes. No visits to any of these institutions were arranged, and the visit was more historic in nature than the Beijing tour. The delegation toured the Qin Army Vault Museum in Xi’an, which contained the terracotta army of more than 8,000 soldiers made to protect the tomb of the emperor 2,180 years ago. The tomb was discovered by local people digging a well in 1974. Researchers believe kilns were built around the figures and then destroyed after firing (Malloy, 1988).

The history of the Tang Dynasty was evident throughout the tour of Xi’an. Recreated Tang Dynasty Music and Dance provided a cultural and recreational treat after a banquet at the People’s Hotel. Even the hotel, opened in 1987, was built by the Japanese in Tang Dynasty Style.

Although the American delegation did not visit the universities, factories were visited and artists were observed embroidering, batikng, painting and carving ivory and jade. School graduates were viewed on-the-job creating arts and crafts for sale to tourists, demonstrating that tourism is an economic factor in Xi’an, as in Beijing.

The most intellectually stimulating experiences were the meetings with the Shanghai delegation at the Hua Ting Sheraton Hotel in Shanghai, where Dr. Hurwitz presented a slide lecture of the art works of children in the United States. The art educators then broke up into three groups discussing art in higher education, primary education, and secondary education/administration.

The dialogue continued at a banquet for the art educators. Six of the higher education members sat at one table and continued the earlier discussion. Zhang Zishen, Vice President of Shanghai University, College of Fine Arts, asked the question, "What is art therapy?" Two Chinese art educators at the table observed (Chinese educators) expressed interest in learning about this concept (of Art Therapy).
art therapy to be a viable experience for their elderly population. Since both were professors of art teaching the talented and gifted on the university level, they did not respond to the use of expressive art for everyone. The fact that the first program for the mentally retarded was developed in 1984 (Malchiodi, 1988) may explain why the concept of art therapy was new to these art educators.

At the close of the banquet, each American was given a jade or a bloodstone chop as a remembrance of China. Most had their name in Chinese and a logo inscribed on the chop in the city of Guangzhou. These gifts served as a reminder to the delegation of their Shanghai visit.

The American delegation also visited the Chinese Welfare Institute (CWI) Children’s Palace which was established by Soong Ching-ling (Madame Sun Yat-sen) in 1953. Children, aged six to sixteen, attend classes in literature, arts, science, and technology. A children’s computer center and the Shanghai Little Companion Art Troupe have been established at this Children’s Palace (China Welfare Institute, no date). Dough sculpture, a Chinese art, was made by the children and sold in the gift shop. The use of computer graphics by these children has great possibilities for the future.

The group watched children painting and drawing and observed their joy as they freely expressed themselves through the art media. The art teacher invited the American delegation to select one child’s painting as a gift. This experience differed from the approach noted in Beijing where a Design Book of copy exercises was given to each of us at that time. The copy method of teaching art is still evident in China. We observed an older group of children in a class drawing from molds. The delegation was also treated to a performance of The Shanghai Little Companion Troupe and a Magic Show.

The Children’s Palaces are also training centers for teachers and coaches (Children’s Palace Brochure, no date). There are twenty-three palaces in Shanghai, some of which are old mansions built by wealthy capitalists (Malloy, 1988). There was no evidence of programs for special populations in any of the Children’s Palaces. All children observed were apparently gifted.

The delegation then flew to Guilin, an ancient cultural city with lush, green hills, clear water and enchanting caves. Originally, Guilin was covered by the sea and the limestone on the sea bed rose and became land, with erosion creating the peak-shaped hills. A boat trip on the Li River, from Guilin to Yangshuo, through enchantingly beautiful countryside, provided an aesthetic experience. Guilin, like other Chinese cities, offered sidewalk sales of arts and crafts to tourists.

From Guilin via Hangzhou, the group traveled to Guangzhou. Many of the arts and crafts became gifts for the American tourists to bring home to family and friends. Each province of China was rich with its own culture. This uniqueness was especially evident in the foods served and in the specialized crafts displayed.

The final journey from the People’s Republic of China included a train trip from Guangzhou to Hong Kong. The Citizen Ambassador Delegation of Art Educators got their last look at the beautiful countryside of China as the train crossed the border and tunneled through the mountain into busy Hong Kong.

The only art exchange in Hong Kong was at the Hong Kong Academy of Fine Art in Kowloon where the group met Hoi-Ying Chan, President of the Academy, and Christopher W. M. Chan, interpreter. Professor Hoi-Ying Chan presented an exhibit of his paintings, which were influenced by the style of John Singer Sargent; his teacher had been a student of Sargent in the United States. This experience was like going back thirty years to the art institute training schools in the large

Fig. 2 Boat Taxi. Hong Kong, water color, 9" x 12" by Sr. Dorothy McLaughlin.
American cities. The art and the academy did not represent the ultra-modern buildings dominating the landscape.

Conclusion

Art education currently is trying to catch up with the times in China after the years lost with the closing of universities and schools during the Cultural Revolution. The great elder art masters are gone; the experienced, educated artists are few in number. Middle-aged artists, deferred from their art practice and study by the Cultural Revolution, are beginning anew. Younger artists are being educated and will eventually replace their teachers.

Art with special populations, a new concept in China, may influence the teacher-training programs and develop art skills for the handi-capped. Vocational and technical middle-school education promotion will include art programs since so many factories produce arts and crafts, essential to the tourist industry. Education for architects, interior designers, fashion designers, illustrators, advertising artists, computer graphics specialists, and stage designers is in the initial stage of development.

Educational and cultural exchanges such as the Citizen Ambassador Program of People to People International can continue to draw the Chinese people and the American people closer together. The art educators of the future, working together, will broaden the scope of all aspects of art on all levels of education. As China moves into the next century, other nations will lend their expertise in those areas of art education needing development.

Discussion

Cathy A. Malchiodi, M.A., A.T.R., Director, Art Therapy Graduate Studies, University of Utah, Salt Lake City, Utah.

In 1987, at the request of Very Special Arts International (VSAL), Kennedy Center, Washington, D.C., I travelled to Beijing, China to conduct a series of training workshops for the purpose of teaching basic concepts of art therapy to special educators, artists and health professionals. I was part of a five-person training team, including a dance specialist, a music therapist and two drama specialists. The exchange was the first of its kind between the two nations and culminated in the first Very Special Arts Festival held on mainland China (for more information, see Malchiodi, 1988).

Like Professor McLaughlin, I was optimistic about the Chinese people’s enthusiasm and their apparent desire to learn our methods and ideas. I also sensed that they were intrigued by the concept of art therapy, particularly with the elderly and disabled. However, what they were most interested in were pragmatic solutions to rehabilitation through creation of salable arts and crafts by their handicapped populations; during my stay in China, educators were eager to hear any pointers I could offer that might help disabled people create crafts for sale. On the whole, the idea of art as an expression of personal feelings and as a representation of the individual’s inner world seemed vague to them, for many reasons, both societal and political.

For example, training in studio art, from primary school to the academy, is generally conducted through observation and copying of work of a master teacher. To be like others is considered more admirable than it is to be different; this is true not only in the arts, but also in Chinese society as a whole. This differs, of course, from American society where individuality is a possibility. Because the concept of art therapy is based largely in the creation of spontaneous imagery and free expression, our methodology does not always make much sense to the Chinese, in light of basic cultural differences as well as the goals they seek to achieve through therapeutic rehabilitation. Also, the Chinese tend to emphasize the practical aspects of
any therapeutic endeavor; this explains their interest in developing arts programs for special needs populations that will integrate the disabled into the larger community and help them to become economically independent. Therefore, programs which include production of arts and crafts, which can be sold to tourists by the handicapped, have great appeal.

Although politics and governmental influence have traditionally affected art in China, it is clear that Chinese art has been reinvigorated in the post-Mao era (Cohen, 1986). It was my observation in 1987 that art education programming was also improving and expanding because of various exchanges both with VSAI and Harvard’s Project Zero under the direction of Howard Gardner. However, artists and art teachers still face political control and the related governmental fear of foreign influences. Although, in recent years, adventurous artists groups such as the Ying Ying (Star Star) have produced art which radically deviates from traditional Chinese art, the issue of political control is still central to what kinds of art are produced and how art is taught. Also, the government, in contrast to the United States, is still the principal patron of the arts. These obstacles affect not only the kinds of art that is produced, but how art educators teach studio art and how art is viewed by the greater community.

Certainly, in 1987, the VSAI visit was considered to be a positive sign that the Chinese were willing to at least allow their professionals to be exposed to Western ideas concerning arts education, arts therapies and mental health (Gladstone, 1988). The invitation to come to China was sought after by the VSAI for several years before a formal welcome was extended by the Chinese government. Part of this invitation was due to the influence of Deng PuFang, the son of then Chinese President Deng Xiaoping. Deng PuFang, who himself is handicapped as a result of an accident during the Cultural Revolution, had a special interest in rehabilitation because of his own disabilities. This unusual situation of a handicapped person being in a somewhat powerful position was probably an overriding factor in allowing the VSAI to gain entrance, rather than cultural reawakening. Again, this circumstance supports the idea that governmental influence is crucial to allowing transmission of information and exchange of ideas to occur.

Since Professor McLaughlin’s and my visits, there have been many changes in China. We are all aware of the disturbing events that occurred in China two years ago. Myself am acutely aware of these events, because former colleagues and friends in China are no longer accessible to me; since the incidents in Tian Anmen Square in 1989, I have received no answers to any of my letters, sent to both professionals and personal friends. Additionally, I have also stopped writing in recent months, fearing that my letters might subject someone to unnecessary suspicion or questioning.

I did have the opportunity to see some of the outcome of the VSAI training team’s visit to Beijing when I attended the First International Very Special Arts Festival at the Kennedy Center as a delegate and Master Teacher in June of 1989, shortly after the beginning of the unrest in China. At that time, I met with the Chinese delegation leaders, Mr. Gan Bolin and Mr. Yao Zhenhuan of the China Disabled Person’s Federation (CDPF), an organization which oversees arts for the disabled. Because it seemed highly inappropriate at the time, I did not ask any direct questions about the current situation in China, respecting that it would be uncomfortable for these men to speak openly about recent events. However, I did find out from the delegates that there had been some significant changes in the nascent arts programming for special populations. The CDPF, along with the Chinese government, was encouraging art activities among the disabled, particularly in the area of musical and dance performance. A national art festival for the disabled had taken place in Beijing in March of that year, attracting more than 300 disabled artists from all over the country. It seemed that the Chinese had adopted at least the concepts of the Very Special Arts Festivals held here in the U.S. and were beginning to develop a national organization of disabled artists.

It will be interesting to see the continuing developments in China in regard to both art education and art therapy as more art educators and art therapists have the opportunities Professor McLaughlin and I enjoyed. However, from my own experiences and in light of recent events, I am both cautious and respectful of how the Chinese will proceed in incorporating Western concepts of both art education and art therapy into their society.

The Healing Qualities of Art

Klaus Boegel, visual artist, an instructor of art therapy, and a supervisor with the Hogeschool Midden-Nederland (Higher Vocational Education) and Louis van Marissing, visual artist, an instructor of art therapy, and a supervisor with the Hogeschool Nijmegen (Higher Vocational Education)

Translation: M.A.H. de Swart, Velp, The Netherlands

Abstract

The authors describe the performance that Klaus Boegel made on the occasion of the death of his wife Carla. This article presents a description of the healing function of art. Analyzing an art performance ("The Carla Performance"), the authors distinguish two levels of experience in art: the concrete level, in which the process of shaping takes place, and the archetypical level, in which the personal imagination and transformation is connected with collective images. The structures of these levels make the healing function of art demonstrable.

PART I:
The Carla Performance,
by Louis van Marissing

Klaus has invited me along with 8 others to be a fellow-witness of the performance that he wants to make on the occasion of his wife Carla’s death.

Saturday, December 19th. It is a glorious mid-winter day. We assemble at his house and at twelve o’clock the ten of us walk to the cemetery. Klaus has taken Carla’s bright pink carryall with him. One of the men carries a large rolled reed mat, and I carry ten bamboo canes 2.5 meters in length. We stop at the grave which Carla shares with Ninja, their little girl who died in 1983. As a result of the warm weather the daffodils that Klaus has put on the grave yesterday have burst into bloom. He takes an anthracite-black stone with a white line and goes before us to the field behind the cemetery.

The field is fenced in and the size of a football field. It is bumpy with deep tracks of caterpillar tractors and short, clumpy grass. We are in the middle of it with our backs to the houses hidden behind overgrowth, and facing the sun that is at its winter zenith. On the right at the edge of the cemetery there are beehives in a row perpendicular to the railway from Baarn to Amersfoort. A rabbit frisks from the compost pit, at the left in the direction of the beehives.

Klaus welcomes us. He squats near the carryall at his feet and takes out an oval stone, a black lacquer box and a photograph of Carla. He ties the photograph to the stone with brass wire. He acts carefully and purposefully. Standing with his eyes closed he keeps the stone with his hands at navel height; he takes his time. Then he turns and walks away.

He walks in the direction of the beehives, quickens his pace and walks faster, then trots with the stone in his hands along the outline of the field. When he is halfway around the rabbit catches up with him from the beehives and overtakes him in a bowed diagonal across the field. We, who are witness of this, yell elatedly. Panting, Klaus returns to the center of the field and continues in a southerly direction.

At a distance of about ten meters from us he is standing there facing the sun. He throws the stone in the air and catches it, throws it again, but higher now. He catches it. Still higher he throws, catches it and throws again. Finally, he throws the stone in the air and roars: “Carla!”

From the spot where the stone has fallen with a dull thump on the squelchy field, he unrolls the reed mat northward. He places the ten bamboo canes around it in a ring. He spreads a white sheet over the reed mat and lies over it, bending down with his head facing the stone. Silently he is lying there.

He squats beside the mat, cleans his spectacles with the sheet, and as the wind threatens to blow it away he puts the anthracite-black stone with the white line on the head of the sheet. Very devotedly and carefully he then takes Carla’s personal possessions out of the pink carryall and displays them in heaps on the sheet: a pink hat, a blue dress, yellow wedding shoes with high heels, a small snakeskin bag with jewelry, trinkets, gloves with threads of wool, pieces with a tiger pattern, a belt, bracelets, sunglasses.

We who are witnesses react silently. Klaus puts Carla’s belongings into individual white cotton pouches. With tender gestures of farewell, he puts the well-loved objects in a white sack, buttons it and ties the bundle to one end of the bamboo canes, stands up and drives the cane forcefully into the earth. A circle of canes with white bundles at the top is created. The cotton pouches fly like flats in the wind. The low position of the sun gives the circle an embracing intensiveness in lowering backlight.

---

He throws the stone in the air and catches it, throws it again but higher now.
the sheet and the reed mat flare up. The fire makes the kite strings snap, then the trembling bamboo canes leap erect. For a long time the bed burns till it has become an ashen-black rectangle in the winter-green field.

Silently, he squats beside the spreading, flaring and ther. smouldering fire. The wind chases long wisps of smoke across the field. In the distance, near the railway, noisy sparrows swarm in the bare trees. When only the far ends are still smouldering, Klaus takes some ashes of the dress and puts them in the lacquer box. He puts it away in the pink carryall. Then he goes to the oval stone and unties the copper wire, loosens the photograph and puts it away as well. He sets aside the stones to take with him.

While untying a cotton bag from the bamboo canes he turns towards us and asks each of us to untie a bundle and take it home. We who had been witnesses, swing into action. I gather the bamboo canes, Klaus takes the pink carryall, and each of us has a white bundle. We go to the grave of Carla and Ninja. Klaus puts the stones in their place. Carla’s girlfriend puts down red carnations.

Walking closely together we go back from the cemetery through Baarn to his house at the Sparrenlaan.

**PART II:**
**Theoretical Considerations**
by **Klaus Boegel**

Art has a healing function. In the following, I describe how I experienced the healing effects of art, after the death of my wife Carla. Using the example of the “Carla performance,” I want to make evident structures of reality that have to do with change and transformation. Hereafter, I create a framework within which the healing function of art is nameable. I describe the structure on
two levels: the concrete level, and the archetypical level, which together are an unbreakable unity which forms the basis of healing.

By the concrete level I mean the concretely visible and tangible reality of an act in or with materials. The archetypical level is the dimension in which the concrete realization may vary much while retaining the collective meaning. “The artistic act is a remedy for the incomplete fragmentary form of life,” the art critic Arnold Hauser remarks. The countless contradictions in human nature—light and dark, good and evil—can never be solved but may be reconciled to each other and united. Art may be a way of enabling one to experience the apparently fixed static contrasts as elements in a dynamic whole. In the creative process old structures are broken open in such a way that something new may be created. In this process healing may take place. Creating, i.e., creating with materials on the concrete level, requires action. That act with materials is concrete and immediately visible and tangible. Then a static whole begins to move, to make way for a creation. Each act with materials brings about a change.

In the Carla performance these two structures became visible. On the concrete level I performed a number of acts that aimed at my being able to take leave of “central symbols” (van der Hart. 1978) like the wedding dress and other precious things. I chose and used materials (the bamboo canes, the cotton pouches, and the reed mat) in order to create a structure within which the parting could take place in my own way. Each part of the process was important; the total of the acts was just as important.

To illustrate my points I will describe a few aspects of the performance. I chose long bamboo canes which I drove into the earth in a circle around the reed mat. One by one I took the precious things from the pink carryall, I felt them, looked at them, and divided them into ten heaps on the reed mat. In that way I showed them to the witnesses. I moved them from a cupboard in my house to the open space in the large field. Carla’s things began to move, to be taken from their old order and become part of a new order. Meanwhile, they were looked at and felt one-by-one, chosen from many things. By putting them in a completely new context (in this case, the field outside) and by showing them to other people, my relation to these things changed and began to move. I looked at them in a different, new way.

Next I carefully put the things in the ten cotton pouches and hung them on the ends of bamboo canes. Then they were hidden from view again. They were hanging free from the earth in a circle in a border area between heaven and earth. They surrounded the wedding dress which I put on the reed mat. The mat was fastened to the sticks by pieces of string and floated just over the earth. The wedding dress was the center on which attention was fixed. I set fire to it and while the dress was transformed, changing from matter to smoke ascending to the sky, the pouches were hanging on the ten bamboo canes, silent witnesses blowing in the wind. They were the material, permanent environment for the radical and total process of change, which took place in the middle of the circle.

This change, the definitive transition from one form to another, I felt intensely. I was convinced of the sense: this is the last act, after this it is finished and I shall never again see the wedding dress in its familiar form. Breaking away . . . parting by creating for yourself a structure in which the different acts with materials are important . . . these are essential steps to reach the goal: taking leave.

By creating with concrete material the apparently fixed order begins to move, and with that, the way in which the creator related to those things changed as well. That relationship had to be reconsidered, with the result that the “external” movement caused an “internal” movement. The active act with materials on the one hand led to a concrete and perceptible result, and on the other hand set something in motion inside me. This was made clear by the example of the wedding dress. After it had been burnt I could neither look at the dress anymore nor feel the material between my fingers. The transformation from dress to ashes forced me to a different inner perception. Something standing for an important change in my life was not there anymore, at least not in its familiar form. Carla’s precious things, put away in pouches, were given to the witnesses at the end of the performance. I broke away from them, I literally gave them away and entrusted them to a circle of people. These things were not exclusively my personal memories any longer, but for a number of people they became memories of Carla and me. I acted.

From the pink carryall Klaus takes a deep yellow dress embroidered with flowers.

The countless contradictions in human nature—light and dark, good and evil—can never be solved but may be reconciled to each other and united.
actively by choosing my personal form and thereby I newly created a piece of reality, to which I have to relate once again. I had to make a move in order to reach a new balance.

According to C. G. Jung, healing starts where we remember resources behind the “personal.” This archetypical level may be expressed in different ways; archetypical images are expressed, for example, in dreams, fairy tales, myths and artistic expressions.

On the archetypical level, a structure that goes beyond the personal may be distinguished. The aim of the Carla performance was specifically taking leave of “central symbols” (wedding dress and precious things). I did this by means of a drastic act with the wedding dress. In the fire the complete transformation took place; the material dissolved in smoke that ascended to the sky and disappeared. The only thing that remained was ashes.

It was not only grief for my deceased wife. An image was created of the transitory nature of the material. The material disappeared, dissolved and in that way was included in the eternal cycle of birth and death. The impulse to express is the desire to approach what is unspeakable and elusive. How can you get access to the mystery of death?

At the beginning of the performance I threw a stone in the air; on this stone was tied a photograph of Carla. I called her name. Against the laws of gravity a message was forcefully sent to heaven, to the deceased person. For a moment it seemed as if heaven might receive this sign, the stone went up in the air, higher and higher, but fell so much harder on the earth again after the third time and the highest flight. Gravity won.

We, the living, are tied to these laws and therefore come upon the border of the world of the dead. Here, other laws apply. We cannot live in both worlds at the same time. A desperate effort, a cry that may have crossed this border... who knows? The apparently static factor—death as the end of life—has been put in motion by this artistic act. I created images, structures in which the factor of death was part of the dynamic whole, the level of the archetypes, in which individual and collective images coincided. In this, the resources are to be found. By completely going through the pain of loss, the idea that we are a part of a larger whole and are included in something that transcends the personal may be remembered. And then the help that has been always available may be gotten. Then the healing effects may start. What happens then cannot be described in general terms. It depends on what one needs at the moment.

Finally, in both the process of mourning and the creative process, loss is involved, and there are temporary experiences of being “not complete,” or of being able to acquire something in the end. Instead of division as the result of a constantly advancing process of splitting up, there is the experience of wholeness as a result of synthesis.

**Discussion**

**Linda Gantt, Ph.D., A.T.R.**

In his description of a specially constructed (as opposed to a traditional or prescribed) event Boegel demonstrates both the individual and the universal aspects of memorial rituals. There are several points which art therapists might derive from this article. The first is the necessity of giving full voice and responsibility of the direction and content of the ritual to the chief mourners so that the elements of the process and the symbolic props are consonant with the survivors’ needs. Psychotherapy has demonstrated the crucial need for attention to individual experience and individual interpretation. This was a unique ceremony and celebration. Due to the many personal ingredients, it cannot be repeated. So we do not have here a specific template for future rituals which could be applied as is to another situation. And yet, Boegel’s memorial observance has elements in common to other rites of passage such as sacrifice, destruction, and implied renewal. These are the same metaphorical components that cremation of the corporeal body has. That is the second point: that through a careful study of other cultures we can learn the general forms such ceremonies take and thus can help our clients in devising their own. Through our understanding of universal processes we can support clients’ choices and stress their connectedness to others. Flowers, fire, ashes, precious possessions, symbolic acts (for example, communication sent in the direction of heaven), leave-taking, and radical transformation of objects are fea-
tures commonly found around the world, not just in funerals but in ceremonies of all types. Fire (and its opposite, water) is frequently con-
ected with a transition to other states (especially initiation). Ashes are not only a return to the earth ("ashes to ashes, dust to dust") but a symbol of rebirth (as in the story of the phoenix). In India, ashes were the "seed of Agni" (the consort of Destroying Kali) (Walker, 1988: 340).

Arnold van Gennep describes 3 major phases of rites of passage—separation, transition, and incorporation. "The individual would first be ritually removed from the society as a whole, then would be isolated for a period, then would be incorporated back into the tribe in his or her new status" (Haviland, 1978: 344). While van Gennep cautions "these three subcategories are not developed to the same extent by all people or in every set of ceremonies" (van Gennep, 1960: vii-viii), we can use our knowledge of these stages to better frame a client’s ritual.

The third point is that doing something (symbolic action) is crucial to the mourning process. Here our guides can be the psychodramatists (Moreno and Moreno, 1959). Of course, through art we can condense a symbolic act into pictorial form. If one cannot go to a cemetery to place flowers on a grave, one can draw the event. Perhaps the creation of a memorial picture, sculpture or special object is psychologically satisfying because it requires sustained action on the part of the creator as well as being permanent and concrete.

The art therapist must support the natural tendency to give vent to emotion through symbolic expression especially in those whose grieving has been thwarted by well-meaning relatives, religious custom, or unacknowledged anger. Knowing that virtually all rites of passage require a special place for their conduct, the art therapist can encourage the construction or selection of such a place. All details of the ritual can be tailor-made to the situation, shaped by the participant(s) and supported by the therapist.

In her book on art and anthropology, Evelyn Hatcher states "... whatever the theoretical explanation, it is clear that art somehow helps human beings cope with the trauma of death. Beauty and art forms have been part of funeral ceremonies since Neanderthal times. This universal human problem is met everywhere with symbolic solutions to satisfy the mind and esthetic solutions to release the emotions" (Hatcher, 1985:106-107).

A Comparison of the Traditional Education of Native American Healers with the Education of American Art Therapists

Phoebe Mills Dufrene, Ph.D., A.T.R., Assistant Professor, Art and Design, Purdue University, West Lafayette, Indiana

Abstract

This study compared the traditional education of Native American healers with the education of American art therapists. This first part of the article gives an overview of traditional Native American healing practices. The second part describes results of a survey conducted with 20 Native American healers and 16 art therapists using a descriptive field study approach.

For art therapists working with Indian clients, knowledge of the Indian philosophy of health may help to overcome cultural barriers. Mutual respect for both cultures will more easily facilitate a therapeutic relationship.

Introduction

Preparing art therapists to be sensitive to their clients' needs, feelings, strengths, weaknesses, and cultural perspectives is as demanding of the educator as the art therapy student. With the cultural diversity prevalent in most of the United States, it is particularly difficult for an aspiring professional in the helping professions to always be aware of the subtleties needed to work with clients of varying backgrounds. This seems especially true when the client is a Native American, an ethnic group not even legally recognized in some American communities (Katz, 1986).

Until the passage of the 1978 Freedom of Religion Act, many Native Americans had difficulty obtaining access to Native American healers due to laws prohibiting the practice of traditional religion and medicine. American Indians must often rely on publicly funded health facilities whose staff members approach mental health problems from a classical Western psychoanalytic perspective.

Art therapists have a responsibility to their clients to determine the most appropriate and efficient observation techniques, the extent to which their creative productions are influenced by tribal, religious, and other cultural factors. There is much that is universal to all humankind, but when differences do exist, different solutions for treatment must be considered (Joseph, 1974).

It is also difficult for therapists and educators of the same ethnic background as their clients to work with those who are caught in two worlds—the world of their family origin and the world of the general American society. Traditional healers, working with American Indian patients with a host of problems ranging from the physiological to the emotional, are also coping with concerns around sensitivity to tribal identity.

Part I—Background

The inclusion of traditional Native American healing techniques, particularly the use of the arts in institutions that serve Native Americans is extremely important because a disproportionate number of Indians are seeking the services of psychiatric hospitals, mental health clinics, and special education schools. This is due to the devastating social, economic, and environmental pressures of racism, poverty, alcoholism, substandard reservation housing conditions and a hostile education system (Jilek, 1982). In many cases, the therapists Indians encounter have little experience in understanding the dual problems of having psychologically based disorders and the social stresses of being dislocated/relocated away from traditional land bases due to United States government policies.

The role of minorities in art therapy, both as patients and as therapists, is well documented by Joseph (1974). The use of art for creative/therapeutic purposes by Native Americans, Africans, and Asians is also being documented by New York-based psychiatrist, Dr. John Bolling. Documentary information on Third World mental health issues is being compiled by the National Alliance of Third World Therapists. Contemporary medicine men/women such as the faculty of the Traditional Indian Medicine Conferences (1985 to the present), are nationally

Note: This article is based on a dissertation by the same title written by Dr. Dufrene at the University of Maryland under the direction of Randall J. Craig, Ph.D., in 1988. Copies of the complete dissertation are available through University Microfilms International, Ann Arbor, Michigan (order number 8818390).
recognized for helping in the current revival of traditional Native American healing methods.

During the Eisenhower years the religious ceremonies of many tribes, such as ritual dancing, sweat bath purification, peyotism (using the hallucinogenic cactus peyote), and vision quests, were done openly after many decades of suppression. Indians began to rediscover their own culture; they began to describe the reality of their own religious experience and to distinguish between the technological superiority of Western culture and the moral corruption of the West (Deloria, 1973). Tremendous interest in tribal religion manifested itself in the recent activist movement which has attempted to recoup lost ground and return to the culture, outlook, and values of the old days.

As tribal religions re-emerge and begin to attract younger Indians, problems of immense magnitude appear. Many people are trapped between tribal values constituting their unconscious behavior responses, and the values they have been taught in schools and churches which demand primarily conforming to seemingly foreign ideals. Alcoholism and suicide mark the tragic facet of reservation life. People are not allowed to be Indians and cannot become whites (Deloria, 1973).

Formerly, one of the main functions of the tribal religions was the performance of healing ceremonies. This function was impaired by lack of any rights to train new people to perform the ceremonies and a general lessening of dependence on tribal medicine due to the presence of U.S. Public Health Service hospitals on the larger reservations. Indian healers were generally considered to be superstitious magicians by the missionaries and government officials and segments of the healing arts were lost to many tribes.

The revival of Indian customs and traditions seems to be one of the answers to many Indian problems. Conscious efforts are made by Indian leaders to uphold the young Native generation the exemplary ideal of Indianness, a pan-Indian rallying sign (Jilek, 1982).

The revivals occurred between the mid-1950's and late 1960's which was the era of global decolonization and geopolitical retreat by Western powers. It was in such a changing climate that Native Americans turned to their own heritage and that health professionals came to recognize the value of Native therapeutic resources.

The interest in indigenous healing ceremonies cannot be attributed to a lack of modern treatment services; it has more to do with a lack of culture-congenial and holistic approaches in modern medicine. The persistent tendency of most Western therapists (art therapists included) to approach the problems of Third World people from a Western psychoanalytic perspective is unrealistic (Burns and Ruiz, 1974).

Today, healing remains one of the major strengths of tribal religion. This particular field is thus open for Indian religious figures who have received specific healing powers and are being recognized by the Public Health Service as competent to perform certain ceremonies. Special grants have been given to train more medicine men/women and to have them work closely with doctors trained in internal medicine.

Almost all of the healing disciplines came originally from religious beliefs and the spiritual leader's practices. The severing of medicine and psychology from religions has only been a recent event. Throughout North America there are Native American secret societies in which holy people share the power of their visions with a group of initiates, sometimes their former patients (for example, the Iroquois Society of the Mystic Animals, the Midewin of the Ojibwa, the numerous societies of the Pueblos and Navahos) (Tedlock and Tedlock, 1975).

The Shaman

The medicine person and/or shaman is a traditional doctor, practitioner of medical magic, seer, prophet, and herbalist. Classifications vary with tribes. There are slight, subtle differences between the terms medicine man/woman and shaman, although sometimes they are interchangeable. Generally, the shaman acts out vividly and dramatically through ecstatic trance, the ascension and descent to other "worlds." The medicine person draws upon a vast body of traditional symbolism (paintings, prayers, and songs) but does not go into an altered state of consciousness (Sandner, 1979). The word shaman comes from the Tungus people of Siberia, and has been widely adopted by anthropologists to refer to persons in a great variety of non-Western cultures who were previously known by negative terms such as witch doctor, sorcerer, or wizard (Halifax, 1981).

Shamanic knowledge is remarkably consistent across the planet. In spite of cultural diversity and the migration and diffusion of peoples across the earth, and the basic themes related to the art and practice of shamanism form a coherent
complex. There are superficial features as well as deeper structures which appear to be constant (Halifax, 1981). Trance, dance, painted drums and shields were as central to early shamanism as they are to its continuing practice today. For the shaman, the cosmos is personalized. Rocks, plants, trees, bodies of water, two- and four-legged creatures—all are animate. The world of the human being and the world of nature and spirit are essentially reflections of each other in the shaman’s view of the cosmos. This special and sacred awareness of the universe is codified in song and chant, poetry and tale, carving and painting.

Common Symbols

In Eskimo stone carvings and Native American paintings, the eagle symbolizes transportation to other realms. The eagle, rising to great heights, overcomes the earthly world and enters the gateway of immortality, the place of origin. The shaman’s association with bird figures is found all over the world. The bird always denotes rising, activation, change, and vitality. In some traditions, the bird is symbolic of the soul; in others, the bird is recognized as an intelligent collaborator with man, the bird being the bearer of celestial messages (Halifax, 1981).

Among the Eastern Woodland Indians, birdstones were used by the medicine men as talismans or charms to protect against disasters. Some medicine men wore a small black bird over one ear as a badge of office (Leftwick, 1970). Masks resembling snakes, bears, and other animals were carved from wood by Cherokee medicine men. Other materials used for making masks were hornets’ nests, gourds, bear skin, woodchuck hair and dyés from sassafras and red earth.

The use of animals and other symbols to portray religious longings, visions, tribal affiliations and other deep-seated beliefs is a universal phenomenon. Carl Jung was one of the first Western therapists to show that symbolism produced by his patients and the symbolism found in mythologies from various parts of the world have basic similarities.

Among the Navaho, cultural symbols are expressed by the medicine men during sand painting ceremonies. The presentation of origin myths in song, prayer and sand painting allows the patient to identify with those symbolic forces which once created the world, and by entering into them to re-create himself/herself in a state of health and wholeness (Sandner, 1979).

One of the main functions indigenous healing shares with mythology in general is the construction of a symbolic world in which the individual can feel familiar, safe and comfortable. Sometimes, as among the Navaho, this is done with sand paintings. The Tibetans and the American Indians have developed mandala-like forms (mandala being the Sanskrit word for circle) to a degree found nowhere else. These art works are chiefly geometric shapes in a concentric organization. The mandala is primarily an imago mundi; it represents the cosmos in miniature and, at the same time, the pantheon. These images of world order are in the form of a schematic diagram showing the balance of forces in the symbolic universe (Sandner, 1979). Black Elk, of the Lakota Nation, describes a mandala in the form of a medicine wheel, an ancient symbol used by almost all the North and South American tribes. It is a ceremonial circle of stones with horizontal and vertical lines drawn through the center where an eagle feather is usually attached. The circle represents the sacred outer boundary of the earth; the vertical and horizontal lines represent the sun and man’s paths respectively; the crossing of the lines indicates the center of the earth where one stands when praying with the pipe; the eagle feather is a sign of the Great Spirit’s power over everything. The wheel is often marked with sacred colors. It symbolizes the four cardinal directions, the four symbolic races, and other relationships expressed in sets of four (Stolzman, 1986).

The Tibetans make large four-sided designs in sand on the temple floor, just as the Navaho do in the hogan. These are also oriented to the four directions, and bring into relationship around the center of the mandala the powers ruling those directions. Both the Tibetan and Navaho sand paintings are destroyed and remade each time the ceremony is given. Both are expected to bring about important transformations in the participants (Sandner, 1979).

Shamans, medicine people, seers, and visionaries still practice the arts of traditional healing in the Native American community and in various parts of the world. Many are attempting to pass on the wisdom of the ancient ones to the people of today. They know that the traditions of the past are threatened by modern technology. The return to the “Medicine Way” involves a bridging of culture and time. According to Halifax (1981), shamans are trained in the art of equilibrium, moving with poise and surety on the threshold of opposites.

Part II—The Survey

A descriptive field study using surveys and on-site visits to reservations and healing ceremonies were conducted to compare related techniques and training among Ameri-
can art therapists and Native American healers.

Subjects

The respondents consisted of traditional Native American healers living both on and off reservations and American art therapists. Most of the Indian subjects were selected for nation/tribal affinity and religion.

The American Art Therapy Association listed approximately 1,000 art therapists in its 1987 membership directory. From that list, 100 were randomly chosen to contact via mail.

According to the National Indian Health Board, there were approximately 500 practicing traditional Indian healers in the 1980's. Of that 500, 50 were contacted by mail. The list of 50 names was generated by the National Indian Health Board and the National Indian Health Service. Due to the various tribal rules regarding secrecy, it was impossible to generate a random list from a directory. The names were suggested based on the healers' willingness to discuss medicine matters with someone outside their respective tribes.

Sixteen responses were received from art therapists. This 16% response rate was disappointingly low. Twenty responses were received from Native American healers (a 40% response rate). This is a high rate considering the secrecy associated with many traditional Indian customs, especially in regard to discussing medicine matters. Despite the relatively low numbers, the study is representative because of the regional variety. The art therapy respondents included persons who had studied in art therapy graduate schools across the United States and are now working in a variety of cities. The traditional healers came from the main regional areas: the Eastern Woodlands, the Southeast, the Southwest, the Plains, and the Pacific Coast.

A detailed analysis of the findings, including comparisons between the two sets of responses, provided answers to the research questions and a better understanding of procedures necessary to collect data from traditional peoples.

The Questions

The research questions included:

- What are similar and different variables in the education of art therapists and traditional Native American healers?
- How has the education of traditional healers changed since contact with Europeans?
- Do Native Americans still study under the direction of traditional medicine practitioners?
- How important is the use of art in the education of traditional Native American healers?
- Is American art therapy education relevant for Native American healers?
- Is the traditional education of Native American healers relevant for American art therapists?

The Procedures

Descriptions of the education and techniques of traditional Native American healers and American art therapists were obtained. Both groups were surveyed on their training and general practice (see sample letters). A comparative analysis of the two sets of responses was conducted.

The Findings

1. What are similar and different variables in the education of art therapists and traditional Native American healers?

The similar variables are: previous illness as an incentive, inspiration, or requirement to be a healing practitioner; validity of healing techniques for a variety of races or nationalities; the types of people who enter healing professions; availability of healers in one's community; percentage of population seeking healers; the use of art in the training process; reasons for people to seek healers; and percentage rate of cures or recovery. The different variables are: length of training; formal versus informal education; evaluation criteria; age to prepare for a healing profession; admission into program of study; sex and gender; race or nationality; the roots of art therapy and traditional healing; learning alternative techniques; individual versus group training; sexual habits; retirement; payment; physical environment; definition of the term art; prediction; and legal regulations.

2. How has the education of traditional healers changed since contact with Europeans?

Traditional healing has been forced to change adversely since contact with Europeans. Changes have been forced due to colonial and present-day expansion on Indian lands, forced conversion to Christianity by overly zealous missionaries, laws enacted to either forbid or restrict the use of traditional Native American healing, and compulsory education for Indian children (Myers, 1987).

Ninety-nine percent of the traditional healers who responded to the survey reported that Federal and local governments imposed legal restrictions on their activities and the majority reported that there were times when Indians had to practice traditional healing in an "underground," covert, or hidden manner. Even with the passage of the 1978 Freedom of Religion Act, there are still restrictions. Some of the grievances cited that affect traditional healing are the inaccessibility to former sacred grounds, cultural bias, Bureau of Indian Affairs dominance over reservation activities, restrictions on using eagle feathers which are required for most medicine/religious procedures, loss of indigenous languages, and loss of psychic abilities due to assimilation.

Another way in which traditional
healing has changed is its inability to treat certain illnesses. Prior to European contact, most physical ailments could be treated with herbs, natural hot springs, sweatbaths, massage, and the setting of broken bones. However, Indians had no natural immunities or herbal remedies for European epidemics such as tuberculosis, smallpox, measles, and venereal disease. When traditional healers were unable to cure European-introduced diseases, many lost the respect of their tribal members. Those who were still respected had difficulty obtaining the necessary herbs and roots due to loss of their original land. Compulsory education has interfered with the preliminary training of young children for the roles of traditional healers. Indian youth often have to start training at a much later age, after the completion of public school requirements. Students who attended boarding schools often became alienated from Indian culture (Myers, 1987).

One positive way in which traditional healing has changed is the new merging of Western medicine/psychological techniques with traditional Indian therapeutic measures. Since the Pan-Indian movement of the 1960’s, younger, educated Indians are trying to retain traditional values of health and also study Western health concepts. Indian schools in the Southwest afford students the opportunity to study and integrate indigenous and Western modalities.

3. Do Native Americans still study under the direction of traditional medicine practitioners?

Despite the numerous negative obstacles that have to be overcome, Native Americans still resort to traditional shamans and medicine people. After a sharp decline in the use of traditional healing, there is a re-emergence of Indians wanting to be treated by Indian medicine and wanting to study Indian medicine. There is an Indian ideology that is, like the Egyptian or Christian worldview, bound up in rituals, dances, and other aspects of an elaborate oral tradition. For Indians who lived prior to the final subjugation of the native peoples of America, roughly at the turn of the century, this ideology was commonplace and was apparent everywhere in their arts. For the Indian artist at the middle of the 20th century there is often a gap between his identification with Indians and his legal identity as an Indian. Many Indians have made an effort to rediscover what it is to be an Indian in language, ritual, and values (Highwater, 1976).

4. How important is the use of art in the education of traditional Native American healers?

Respondents to the Native American survey indicated that art is very important in the education of traditional healers. However, the term art is used in a broader sense among Indians, often referring to the natural beauty found in nature, ritualism, the blending of all the arts (singing, chanting, drumming, and dancing), beadwork, and the physical design of the healing environment. Apprentices are trained in the construction of a tipi, hogan, medicine wheel, or sweatlodge, and taught the appropriate colors and symbols to decorate the medicine environment.

5. Is American art therapy education relevant for Native American healers?

Based on the findings from the survey, literature in the field, and participation in traditional ceremonies, this researcher has concluded that art therapy education is relevant for Native American healers who are interested in pursuing Western therapeutic techniques to complement traditional healing. With the exception of some of the Canadian tribes and some of the elders in the southwestern tribes, most Indians are now living in two worlds and need a dual approach to health care. Because of poverty, racism, and substandard reservation housing conditions, alcoholism and suicide have become prevalent in many Indian communities. Perhaps these problems could be addressed and treated by a blend of traditional healing techniques and contemporary mental health techniques such as art therapy.

6. Is the traditional education of Native American healers relevant for American art therapists?

Unfortunately, the issue of American art therapists learning the value of traditional Indian education or any other non-Western techniques has not been explored as much as the reverse situation. When questioned about learning therapeutic modalities other than art therapy, no art therapist mentioned any interest in non-Western education or culture. The types of alternative therapies they had studied had their roots in Freudian analysis or some other Western model.

The lack of interest or insensitivity to other cultures affects the treatment of Indians and other ethnic groups seeking counseling (Joseph, 1974). For art therapists working with clients of Indian descent, a knowledge of some of the basic elements in the Indian philosophy of health and medicine may help to overcome cultural barriers between the art therapist and the Indian client. With mutual respect for both cultures, both the art therapist and the Native American client can facilitate a therapeutic relationship.

Conclusions and Recommendations

This comparative study of the education of American art therapists and traditional Native American healers explored issues for those interested in alternative methods of training health professionals. It explored techniques of promoting mental health and well-being not usually taught or discussed in Amer-
ican institutions of learning, i.e., traditional shamanic healing. It was felt that this type of exploratory research would be beneficial for art therapists working with Native American populations. Non-Indian populations were also considered for modified uses of traditional Indian healing techniques. The stimulation of further research into the creation of art therapy educational techniques that are relevant for American Indians and also universal for other art therapy clients was a research goal.

The recommendations supported by the conclusions of this study pertain to further research. It is recommended that:

- Art therapists working with Native Americans and other diverse ethnic populations have an understanding of the traditional beliefs of the population they serve;
- Art therapists incorporate multicultural art forms and techniques in their art therapy practice;
- Art therapists consider the spiritual dimension of a client during evaluation and treatment;
- More dialogue and exchange take place between traditional healers and art therapists and other health professionals;
- College educators be more flexible in their requirements for adherence to the "scientific method" when research is conducted on topics that do not conform to the scientific model, i.e., shamanic or traditional healing;
- Art therapists be more involved with the social issues that affect clients and place more emphasis on helping clients develop positive strengths for bringing about social change. Art can be used as a cohesive force with the power to bring oppressed people together, inspiring them to action;
- Organizations such as the American Art Therapy Association establish inexpensive training alternatives for those who cannot afford prohibitive college tuition;
- People of Native American heritage as well as other diverse ethnic groups be encouraged to enter special education and mental health professions, thereby providing appropriate responses to culture-specific emotional disorders; and
- The National Indian Health Board and the National Indian Health Service seek matching grants for exchange programs involving traditional Indian healers and art therapists or other health professionals/educators.

Sample Letter to Traditional Native American Healer

Dear ________:

May this letter reach you at a time when you and the members of your community are in good health and enjoying peaceful relations. Your name was given to me by ________ of the ________ organization. You were mentioned as a respected traditional healer.

I am an art therapist, working with handicapped children in the public school system of Washington, D.C. At the same time, I am trying to further my own education so that I may help the people. It is for this reason that I am writing you. The gift of tobacco and cloth of the four sacred colors is a prayer that you will hear my request, which is to ask you some questions having to do with my studies.

My mother’s family is of Powhatan heritage, the indigenous Indian nation of Virginia. My family encouraged me to pursue an academic course of study that will enhance our Native American heritage. To accomplish that, I am writing a doctoral dissertation on the topic, “A Comparison of the Traditional Education of Native American Healers with the Education of American Art Therapists.” As an art therapist, I am interested in the ways both Indians and art therapists use art in healing.

Officials at my school, the University of Maryland, requested that I develop a survey. Although obtaining knowledge from a survey is not the traditional way to seek information about Indian healing, I am in the difficult position of having to comply with university requirements. I would be very grateful if you would take the time to read and answer the survey based on your knowledge as a traditional healer. Thank you for taking the time to read this letter.

In Unity,

PHOEBE DUFRENE

ART THERAPY, Spring 1991
Sample Questionnaire to Tribal Chiefs and/or Native American Healers

1. Are there any traditional healers working in your tribal community?
2. How many traditional healers are currently practicing?
3. What are the Indian names and English translations for persons practicing traditional healing?
4. What percentage of the population uses traditional healers only?
5. What percentage of the population uses only Western healers such as physicians, psychologists, psychiatric social workers, etc.?
6. What percentage of the population uses both traditional and Western-trained healers?
7. Can you please supply me with the following information concerning the training/education of traditional healers?
   a. At approximately what age or stage in life do people prepare for training as a healer?
   b. How are people chosen and/or accepted for training as a healer?
   c. Is being a former patient sometimes a requirement for being a healer?
   d. If so, what percentage of healers are former patients?
   e. Are traditional healers isolated from Western-oriented educational institutions?
   f. Are traditional healers encouraged to also learn Western healing methods?
   g. Are there specific healing societies that train groups of students or is training conducted individually?
   h. Are women trained to be traditional healers?
   i. Are there any restrictions placed on women in training that are related to menstruation and/or menopause?
   j. Is there an age when healers “retire” or cease to work?
   k. Is there any kind of payment required of the student? If so, what kind of payment?
   l. Is celibacy required or encouraged during part of the training period?
   m. Is the use of art important in the training process?
   n. Are ritual masks used in healing ceremonies? If so, how are they used?
   o. Are certain colors significant in ritual objects? If so, how or why are certain colors used?
   p. Is body paint used?
   q. Is the design or architecture of the healing place important?
   r. Does the traditional tribal language have a word that is comparable to “art”?
   s. Do healers have a term that approximates “art therapy,” the use of the arts in the healing process?
8. For what reasons do people seek traditional healers?
9. What is the percentage rate of “cures” from traditional healing?
10. Is divination or prediction used in healing?
11. How has the forced relocation of Native Americans onto reservations affected the training process of traditional healers?
12. Did the U.S. government ever impose legal restrictions on the activities of traditional healers?
13. Was there a period when traditional healers practiced in an “underground,” covert, or hidden manner, to avoid U.S. government interference?
14. Are legal restrictions still in progress?
15. If not, when were U.S. government restrictions on traditional healers ended?

Sample Letter to Art Therapists

Dear ________:

I am a registered art therapist, currently pursuing a doctorate at the University of Maryland, College Park. As part of my dissertation research I am compiling the results of a survey mailed to American art therapists. My research topic is a comparative study of the ways both art therapists and traditional Native American healers use the arts in the healing process.

If you will please take the time to respond to the enclosed questionnaire, I would greatly appreciate it. Confidentiality will be assured.

Yours truly,

PHOEBE DUFRENE, A.T.R.

Spring 1991, ART THERAPY 23
Sample Art Therapy Survey Questionnaire

1. Are there any art therapists in your community?
2. If so, approximately how many art therapists are currently practicing?
3. What percentage of the population uses art therapists?
4. What percentage of the population uses other therapists such as physicians, psychologists, and social workers?
5. What percentage of the population uses both art therapists and other types of therapists?
6. Can you please supply me with the following information concerning the training/education of art therapists at the institution you attended or are presently attending?
   a. At approximately what age or stage in life do people prepare for training as an art therapist?
   b. How are people chosen and/or accepted for training as an art therapist?
   c. Are art therapy students required to undergo therapy before, during or immediately following the training period?
   d. What kind of educational background is required of the art therapy student?
   e. Are art therapy students encouraged to learn other therapeutic techniques?
   f. Is training/education conducted individually or in groups?
   g. Are women accepted as art therapy students and practitioners?
   h. Are there any restrictions placed on women in training that are related to menstruation and/or menopause?
   i. Is there an age when art therapists retire?
   j. Is there any kind of payment required of the student? If so, what kind or how much?
   k. Is celibacy required or encouraged during part of the training period?
   l. Is the use of art important in the training process?
   m. Is understanding color symbolism important?
   n. Is the technique of mask-making used in the art therapy process?
   o. Is face or body paint used in the art therapy process?
   p. Is the design or architecture of the art therapy environment (office, hospital room or classroom) important?
   q. How would you define “art”?
   r. How would you define “art therapy”?

7. For what reasons do people seek art therapists?
8. What is the percentage rate of cures/recovery?
9. Are there legal regulations/restrictions for practicing art therapy with clients?
10. What role does prediction/prognosis play in art therapy?

Burns and Ruiz (1974). Lectures at Pratt Institute, New York, N.Y.

Remarks on Receiving Honorary Life Membership—November 3, 1990

Frances E. Anderson, Ed.D., A.T.R., Professor of Art, Illinois State University, Normal, IL.

I want to thank Doris Arrington for her belief that I should be standing here right now. I also want to thank Marcia Rosal and Doris Arrington for nominating me for this award. For all the words that I have written and spoken in my 26 years in the academic world, I am at a loss for words at this moment.

Back in 1963 when I was considering career options and trying to decide where to go for graduate school, I had wanted to study art therapy. My search led me to ponder occupational therapy and to consider becoming an activity therapist—however what I knew of these fields did not “fit” my professional model.

My search led me to study in a related field, art education. I did not learn about the one program in the country that offered art therapy courses—Hahnemann Medical School in Philadelphia—until I was almost finished with my doctoral studies in art education at Indiana University. By then, it was better to finish my work at Indiana University.

A year later in 1969, I heard of the founding meeting of AATA and went.

I am flooded with images from that founding meeting on June 27, 1969 at the University of Louisville in Kentucky. I remember that day vividly. The meeting was held in a room in the University College Building. There were about 50 in the room. I remember someone standing up and saying something like, “Well, we all know why we are here! This is the founding meeting of the American Art Therapy Association. Do we have suggestions as to who will fill the various offices?” At that point, people began to suggest names for various offices, and these were written on a green chalkboard. There was a general consensus as to who was to fill what office. I remember someone stating that Sandra Kagan (Graves) had agreed to fill the office of Education Chair and that she was interviewing for a job at that very moment on the University of Louisville campus.

I knew only one person in that room: Ms. Dorothea Lange who was the Director of Activity Therapy at Our Lady of Peace Hospital in Louisville. I had met Ms. Lange while doing research on a seminar paper on art therapy for one of my doctoral classes at Indiana University. Ms. Lange, knowing of my work, wanted to nominate me for Research Chair. I did not feel at all qualified and begged off. When all the positions of the newly formed AATA Board were filled the meeting was adjourned. I remember offering to serve as cab driver to help those who needed to make transportation connections. I took one attendee to the bus station. I do not remember this woman’s name but in retrospect she looked very much like Edith Kramer, and spoke with a German accent. She told me she had come all the way from New York City by bus to be at the meeting.

I remember seeing a brief (about one inch long) report in The Louisville Courier Journal the next day. The headline read: “Art Therapy Organization Formed.” The rest is history.

Some time later after completing our graduate work, Sandra Packard, a colleague and fellow doctoral student at Indiana University, and I discovered our mutual interest in art therapy. When I visited Sandra in 1975, we debated the antecedents of both fields and ended up mapping the content for an article that was published in the American Journal of Art Therapy which we titled, “A Shared Identity Crisis: Art Education and Art Therapy” (Packard & Anderson, 1976).

That same year I was invited to be a part of a general session panel at the 1976 AATA Convention in Baltimore, Maryland. The panel discussed the origins and precursors of the field. As a part of my remarks I asked members of the audience to raise their hands if they had come into art therapy from an art education background. Three-fourths of the audience of over 800 raised their hands (Anderson, 1977). My point had been graphically made—that art therapy needed to acknowledge some of its roots from the field of art education. Today I want to ask that same question because I think it is important to know our heritage and to “own” it. Would those of you who have come from an art education background please raise your hands? (About one quarter of the audience raised their hands.) I think the major difference between 1976...
and 1990 is that now there are over 20 AATA-approved training programs in this country and Canada.

I want to also state that had it not been for my training in research and scholarship in an art education graduate program, I would not have had the preparation to conduct all those research studies, to write all those articles, grants and monographs. And had it not been for a mentor at Indiana University (the late Mary Rouse) who instilled in me a missionary zeal and passion for documenting with hard data what we as art professionals know—that art therapy works—some research would never have been undertaken, for instance the first survey in 1974 of Mental Health Agencies and Hospitals in Illinois and Los Angeles and the job potential for art therapists (Anderson & Landgarten, 1974; 1975). Or the nationwide evaluation project for Very Special Arts in Washington, D.C., in 1984 that documented with hard data that the Very Special Arts Festival programs were one of the only places where handicapped persons could participate and be integrated with non-handicapped persons (Anderson & Morreau, 1984; Anderson, 1986; Anderson, 1991).

I want to add another more personal note to encourage art therapists to engage in research of all kinds so that the body of knowledge in art therapy can grow. I also want to encourage art therapists to consider a career in teaching. There has been great concern expressed by art therapy educators as to where the next generation of university teachers will be found. I urge the new generation of art therapists to seriously consider teaching. It’s the hardest job you will ever love.

I want to further encourage this group of bright and gifted art therapists to consider undertaking doctoral studies in rigorous traditional institutions of higher education. All the universities of which I am familiar do not permit someone with a master’s degree to teach graduate courses. Additionally, doctoral dissertation research in art therapy will further the knowledge base of art therapy in a systematic way with deliberate speed.

Lest you think that this charge is impossible or unattainable, I will add a personal note about my own experience in graduate school. I did so poorly on my own Graduate Record Examinations that I was conditionally admitted to Indiana University. Few endeavors in the academic world have ever come easily for me. I am a very slow reader and writing is a very slow and difficult task for me. The reasons for these difficulties were not apparent until ten years ago when, as part of the treatment of a head injury due to an auto accident, I discovered that I had a learning disability. I was told by the Harvard University psychologist who did the evaluation that if I were entering public schools that year (1980), I would qualify for special education services.

So I must add, if I can do it, you can do it! I also am aware of a great deal of test anxiety that surrounds issues related to licensure and certification for art therapists. This has been evident in the sessions during this conference that have included discussions of the prospects of having a national certification test for art therapists. I again say . . . if I can do tasks related to writing and testing, you can do these tasks also!

Finally, I must acknowledge that because of my own upbringing which instilled in me the rubric that “one never toots one’s own horn,” it is difficult to “own” things that I have accomplished. So I have some difficulty owning this award. You see my life and actions have been governed by the statement made by a primitive tribesman, “We have no word for art, we do everything as well as we possibly can.” My profound hope and aim is that this philosophy will continue to govern all my actions. Thank you.

Dreams in Analysis

Nathan Schwartz-Salant and Murray Stein (Eds.), (1990) Wilmette, IL: Chiron Publications. $15.95, with black and white illustrations.

Reviewed by: Vija B. Lusebrink, Ph.D., A.T.R., Professor, Expressive Therapies, University of Louisville, Louisville, KY.

Dreams in Analysis is a thoughtful and thought-provoking book for the psychotherapist versed in Jungian concepts and approach as well as for the novice.

The book consists of eight main chapters, five of which (by Whitmont, Stein, Kirsch, Humbert, and Barz) deal with the main concepts of Jungian dream analysis. Two chapters cover topics related to the archetypal femininity (Meador) and nuclear warfare in dreams (Reëfearn). One chapter (Perera) presents a conceptual framework for dealing with dream cognition through the analogy of the non-linear pattern of Celtic designs.

Whitmont differentiates between easily decipherable dramatic exhibition dreams which can be seen as metaphors, and dream dynamics which can be only intuitively, thus indicating their symbolic nature. According to Whitmont, the Jungian approach presumes that “each dream dips into basic existential pattern or archetypal motives” (p. 8), whereby the dream constitutes a bridge to the archaic level. Dream interpretation is seen as inadequate if it does not bring into awareness new insights. Whitmont also points out that dream interpretation requires adequate ego functioning and some self-introspective quality.

Stein, in reflecting on dreams and history in analysis, highlights complexes as the building blocks of the personal unconscious; at the same time, they possess an archetypal core.

Thus dreams represent personal history, as well as symbolically reflect the psyche’s drive for wholeness. One of the main axioms of analytical psychology is that the unconscious assimilates experience by comparing it to the past; thus dreams use history as a metaphor clarifying the present. In a therapeutic transformation, the memory structures and affective patterns are changed. Stern gives the example of toilet dreams as an indication of a need for change. According to Stein, the ego-syntonic material needs to renew itself through the contact with the archetypal layer of psyche. This need is counteracted by the separation anxiety of letting go of personal history. The contact with the archetypal substratum transforms personal history into personal myth.

Perera examines dream design through an analogy to the designs and forms of Celtic art and mythology. Dreams interweave pertinent information from past, present, and future, based on the individual, socio-cultural, and archetypal dimensions. The eternal archetypal energy pattern which underlies the complexes may be expressed by the analytical in visual notations. According to Perera, Celtic designs provide a metaphor or a guide for the nonlinear levels of cognition which reflects the underlying contextual and emotional processes of the archetypal patterns. Perera discusses the designs of spiral, maze, interlacing, and double spiral interfaces as conceptual templates for relating to dream cognition.

The dream may appear at first like a chaotic maze, but it eventually reveals its center. The interlace pattern assists to find a “psychologically meaningful crossing point between associations, explanations and amplifications” (p. 59). The double spiral interlace represents the union of opposites, and integrates the personal complex with the archetypal image.

Kirsch, in his chapter on a pedestrian approach to dreams, considers changes in his attitude towards dreams in analysis over the past 25 years. Kirsch’s emphasis is on the affect present in all the analyst’s expressions, since, in his view, emotions tap into the archetypal psyche. Resistances can be manifested as long and complicated dreams without a particular thread, or as an intruder or other circumstances which keep the analyst from communicating to the therapist. Kirsch emphasizes the importance of the first association. He also discusses Mattoon’s paradigm of correct dream interpretations, namely, whether the dream “clicks” with the analyst and acts for him/her in bringing a new vitality in the therapeutic relationship; whether it is con-
firmed by subsequent dreams; and whether the interpretation is followed through with actions and occurrences in the dreamer's waking life.

Humbert emphasizes dream experience as a lived experience during dreaming, whereas the dream sequence forms memories which then can be reviewed or told as a narrative to others. The dream provides access to a superior part of the psyche and thus activates "unsuspected potentialities" of it which then are translated in the framework of social and cultural norms. The integration of the plural parts of self acted out in dreams takes place in daytime consciousness.

Barz applies psychodrama methods to dream work in a Jungian frame of reference. The psychodrama is played following the Protagonist's conscious dream content, while the co-players contribute their feelings, associations, and ideas similarly to the analyst in individual therapy. The observation of the ritualistic format of psychodrama creates a participation mystique among the participants. In this procedure the Protagonist's Self is not projected on the group, but emerges as an autonomic dynamic experience based on the group's definition of a symbol.

Meador's chapter on "Forward into the Past" explores the archetypal feminine based on Goddess images from Paleolithic and Neolithic cultures. Meador points out that much of this art was created by women, whereby the goddesses were portrayed as rulers of fertility and givers of life and death. The contemporary woman needs to reestablish a connection to the unconscious archetypal matrix of her psyche with the assistance of archetypal images in dreams. The psychological conflict in woman is related to her body and its functions which are seen as obstacles to creativity instead of being "imbued with a divine meaning." A part of her still may feel like an abandoned little girl, living in an "animus prison." The connection with the feminine Self leads to the healing of the injured child, and emergence of a new animus.

Redfearn deals with the topic of nuclear warfare in dreams as opposing forces within the psyche of the dreamer. These forces can shatter the defenses, but if this struggle is brought on a conscious level, it can lead to a stronger and enriched personality. The shattering effect of the dream is felt by the ego like the end of the world; at the same time, it can be experienced as a moment of truth.

Examples of dreams presented throughout the chapters illustrate the conceptual discussions. The visual examples of Celtic and Neolithic art elaborate on the concepts presented by Perera and Stevens. The chapter on book reviews by Cwik is very useful in that it summarizes a number of works of analytical psychology on dreams, as well as provides comparative overview of other approaches. The two brief chapters by Stevens and Corbett as discussions of two other chapters do not add much to the overall view of the book.

Dreams in Analysis presents rich material; several of the chapters reveal additional insight on re-reading them, especially those by Perera and Stein. Humbert's chapter raises interesting questions about dream consciousness, but at times it is harder to follow than the others, possibly due to its translation from French. The chapter by Stein stands out in that it deals with the role of personal history. Not every dream is indicative that the archetypal level of the psyche has been activated, as seems to be implied in most of the material covered.

The information covered by the different authors addresses different functions of dreams. For example, Whitmont states that dreams integrate past information while Humbert contends that dreams are "explicit dramas" in which the integration takes place in daytime consciousness. An overview by the editors of the material covered in the book could have bridged the different aspects presented; a subject index would have helped the reader to locate these aspects in the different authors' work.

As an art therapist who is familiar with the power of images, especially archetypal images, and the reciprocal influence of their external representations on the psyche and dreams, I have an additional thought. Books like the present work would benefit from a Jungian viewpoint of the perceptual activation of the client's psyche through the exposure in visual and other modalities to archetypal and mythological images. Through works of art, myths, and rituals, such images have spoken to the human psyche through millenia, and still are capable of evoking strong responses even in individuals with a limited capacity for insight. Sophisticated therapists are not the only ones who can resonate with mythic, visual images.

As a therapist who is not a Jungian analyst, but has a strong interest in and knowledge of Jungian thought, I can recommend this book as a rich source of information for approaching and working with the archetypal healing layer of the psyche.
Art as Technology: The Arts of Africa, Oceania, Native America, Southern California.

Reviewed by: Phoebe Dufrene, Ph.D., A.T.R., Assistant Professor of Art and Design, Purdue University, West Lafayette, Indiana

Arnold Rubin’s Art as Technology: The Arts of Africa, Oceania, Native America, Southern California examines the structures relevant to the production and use of art within a cultural context. Similarities and differences between the arts of Africa, Oceania, Native America and Southern California are analyzed through social, political, and economic systems. Instead of using terms like Primitive Art, Exotic Art, Traditional Art, Folk Art, and Tribal Art, Rubin uses geographical terms that are more neutral.

The text stresses the cultural systems that both shape art and are conversely shaped by art. This approach of understanding other cultures through their art, beliefs, and behaviors emphasizes the research of social scientists.

However, the focus is art, and the points of departure and destinations will always be objects, where they come from, why they look the way they do, and what they mean. Objects are records of cultural process, and they provide direct, unmediated access to the values and experiences of their producers—if we know how to read them. (p. 12).

The author feels that 20th century European Cubists and Expressionists used non-Western art objects as a means of aesthetic exploitation. Instead of using non-Western art objects for insightful or informative purposes, French Cubists and German Expressionists used non-Western arts as “found objects” comparable to scraps of mass-produced industrial materials. Rubin deplores the fact that few European artists were concerned about the cultural contexts from which the objects were produced or motivated to “try to explain why they look the way they do, to reconstruct their origins and evolutions in order to dissipate their aura of exoticism and threatening strangeness” (p. 13). Rubin offers the reader a different and controversial position that challenges the usual interpretation of African, Asian and Oceanic influences on 20th century avant-garde artists.

As a way of understanding art outside of our own culture, the author offers three relatively universal areas that delineate the ways art functions in a society. The first broad area is the establishment and proclamation of individual and group identity; the second, a didactic system that links generations in shared beliefs and behaviors, and the last, a form of technology by which people relate to their environment and secure their survival. According to this theory all art has three properties: material (wood, ivory, clay, jade, etc.), motif (representational figures or abstract forms) and workmanship (the degree of capability the artist brings to the execution).

Viewed as such, art is no longer self-contained, gratifying by itself. A function is implicit. Due attention is now given to the purposes of art, which range from concrete (healing, influencing the environment) to more abstract (unifying the community, enculturation, individual identity). Artists are now introduced as technicians and they are acknowledged and expected to be individuals who contribute to the orderly functioning of the community. (p. 17).

According to the author, the treatment of artists as technicians does not deprecate their role or status. It is a positive contrast to the “exalted” or “elite” position dominant in an industrial society that separates the artist from “the people.” Rubin’s stance may be criticized by those in the art establishment who prefer stricter boundaries between artist/artisan and fine arts/crafts.

In Rubin’s world view the artist is a conveyer of the community’s social and cultural values, a person who has the potency to effect social coherence and cultural integration. Formal and stylistic analysis is not sufficient in understanding art’s social context and function. To understand art outside of our culture, Art as Technology asks us to consider the following questions:

Where is it from? Who made it (the ethnic group and the artist)? Who uses it, actually and symbolically? In what social context is it used? What is it called by the people who use it? (p. 23).

A goal of this book is to search for rules and principles associated with the arts in all human societies. One of the universal factors appears to be the exploitation of both ephemeral and enduring materials. In many societies enduring materials such as skeletal remains, crystals, sea shells, and cast metal are chosen for intrinsic symbolic content. Body art,
often ephemeral, is connected with conceptions of individual identity and group membership. Body art has a "function in helping to choreograph relationships between individuals and groups—a major mode of non-verbal communication" (p. 28).

The West African Fulani aesthetic system is oriented toward the body. At annual ceremonies, young men participate in a male beauty contest. The body is painted and adorned "to the point that a blurring of boundaries between male and female systems of dress and adornment is considered to enhance their attractiveness rather than diminish it." (p. 70).

Also ephemeral are the dry paintings of colored sand and other powdery materials executed by the Australian Aborigines and Navajo Indians. Navajo dry paintings are created in connection with curing procedures in which the patient sits on the sand composition, absorbing the energy and thereby "destroying" the painting.

Also found throughout the world are containers associated with women's art activities such as basketry and pottery, often extending to responsibility for erecting shelter as well. Consistently found on containers throughout the world is geometric, non-representational ornamentation. Containers tend to be relegated to a lower level of significance, as craft rather than art because of their utilitarian functions.

Rubin dismisses art historians who erroneously describe these geometric designs as purely ornamental and asserts that the designs have cultural content and philosophical meaning associated with the primacy of centering, dynamic balance of complicated elements within the design field, and a striving to harmonize the natural world. The designs are described as representations of spirit principles or shamanic helpers and are used to solve the general problem of representing spiritual entities in art.

The technological shift from an itinerant to a sedentary way of life also influences art production. The extension of textile motifs and techniques to works in other media can be traced to this shift. When containers did not have to be carried long distances there was a transition from basketry to pottery. The transition from itinerant hunting and gathering to sedentary cultivation also led to the emergence of permanent public works such as architecture, roads, and an expanded material culture.

The geometric symbolism that began with the presedentary lifestyle continued during the technological transition and is evident today in Native American Southwest pottery and architectural motifs that identify villages. Modern potters such as Maria Montoya Martinez, Lucy Lewis, and Nampeyo created new forms based on old traditions.

Throughout *Art as Technology* the author discusses the phenomena of cultural confluence, "the blending of previously distinct cultural streams and the effects of that blending on the arts" (p. 124). The Native American Athapaskan experience is one of the examples cited by Rubin for studying cultural confluence. Athapaskan art in the Far North is influenced by Inuits (Eskimos), but also reveals some divergence. Athapaskan interaction with North West Coast peoples and those of the Great Lakes also shows a combination of influence and divergence. Southwest Athapascons (Navajo and Apache) also reveal selectivity. Weaving and dry painting were borrowed from the Pueblos but among the Navajo these weavings were done by women rather than men.

Also documented as an example of cultural confluence is the West African Asante nation. Aspects of their art are borrowed from the Nger Bend in the north and other tribes in the east, south, and west. Asante art and culture has survived intact despite colonialism. The emergence of the Asante nation into preeminence was partly due to their synthesis of diverse elements as evident in the king's regalia. His kente cloth is made of reweoven Chinese silk traded by the Portuguese. His thrones are derived from European chairs and his royal parasols from Islamic states. Gold ornaments that are reflections of the Asante king's wealth and political power are "analogous to jade among the Maya and Maori; their forms relate to proverbs, aporiaisms, and other elements of folklore and traditional wisdom" (p. 124).

Rubin's premise is that favorable conditions and an ethnic balance give cultures time and latitude to adjust and adapt to alien cultural forms. Under positive circumstances, confluence can approach the utopian scene painted on a 16th century Peruvian beaker in which a Spanish trumpeter, African drummer, and Indian official share equal ground. However, the Plains Indians were not given sufficient time by European expansionism to successfully adapt to change and their culture suffered extreme devastation.

Cultural confluence had an impact on the late 19th century revival of traditional Maori art. The rounded, volumetric approach to form and a restrained use of ornamental detail typical of older works changed to an icy brilliancy, a profusion of decorative details, and a conventionalized perfection, although the basic system remained intact: large heads, bowed limbs, and complex arrangements of forms and ornamentation.

Other Oceanic art, such as the Australian Aborigine has not been greatly influenced by outside factors. Among the Australian Aborigine, direct asso-
ciation with nodal sites, contact with one’s ancestors, and sources of creation inspire the more ephemeral arts of singing, dancing, and body painting. Body painting renews and revitalizes the Dreamings (demigods whose movements and activities produce the landscape); it is an expression of territoriality and cultural heritage through generations.

Throughout Rubin’s book, he emphasizes the impact of society on art. He discusses how centralized societies reflect specialization at all levels and subordination of the individual to the social order. A sense of collective identity beyond the community is enforced through direct administration in which the arts play major roles. Large-scale projects and glorification of the worldly dominate the arts. Representational portraiture emerges to document historical occurrences such as births and deaths of the elite, battles, and political alliances.

These characteristics of centralized societies are evident among Mayan art in southern Mexico and Guatemala. At one time, historians thought that Mayan inscriptions and art depicted deities and myths. Later evidence revealed that most of Mayan art is dedicated to the glorification of the ruling elite. Their battles, marriages, alliances, and tributary relationships were propagated through public art works that reinforced their elite status.

Modern Hispanic culture in southern California is a combination of indigenous Mexican Indians and their Spanish conquerors. The Los Angeles Hispanic “Day of the Dead” parade recalls traditional Mexican rituals. Death is celebrated as a reinforcement of the continuity between the living and their ancestors. Other forms of cultural continuity are expressed in the Mexican mural tradition that interprets the Pre-Columbian, Colonial, and Modern phases of life. Symbols and motifs drawn from many sources are used to interpret traditional, historical, and present events, thus creating a contemporary collective identity that unifies the Hispanic population.

An important premise that permeates *Art as Technology* is the usefulness of studying the art of all cultures. Art directs us to the heart of a community’s values and reveals how successfully or poorly it functions. African, Oceanic, and Native American art reinforces networks of collective responsibility, however different the forms may appear to those of us outside some or all of those cultures. Rubin does an excellent job of enticing us to delve deeper into culture areas that we may be unfamiliar with.

African, Oceanic, and Native American combinations of art, architecture, music, and dance are most concerned about people—their values, beliefs, and behavioral conventions within a community rather than about objects per se. Anthropologists and other social scientists have a history of exploring these concerns. Recently, humanities scholars have combined the methods and perspectives of art history with those of anthropology in order to better understand African, Oceanic, and Native American art.

Consciously, willingly, unconsciously or unwillingly, every person can and does participate in a web of decision-making about art and material culture analogous to that which has been at the core of this book. That is, moreover, not a remote, esoteric abstract phenomenon of the sort usually termed “aesthetic.” Rather, it is bound up with every community’s most fundamental social, political, economic and spiritual values. (p. 162).

*Art as Technology* was written as a supplement to Rubin’s UCLA art history class prior to his death. Rubin attempted to add the technological model to further understand art across cultures. The experiences of other peoples offer essential information on available options for our own developing cultures. Rubin’s technological model is a way of uniting people’s cultures through time and space.

THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice; AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:

- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education and research
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

Chapters:

Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals, information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive

Publications
- Art Therapy, the official journal of the AATA.
- The quarterly AATA Newsletter.
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest.

Services
- Insurance, including professional liability, major medical, life and disability
- Access to national experts in art therapy.

AATA Conferences
- Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy
- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards
- Development of model job and licensure laws
- Development and implementation of national guidelines for approval of Master's Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATIONS

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application.

Applications received between
Jan. 1st and May 31st—Full dues payment.
June 1st and Sept 30th—Half year dues plus $5.00 payment.
Oct. 1st and Dec. 31st—Full dues payment.

3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (A.T.R.) each have a separate application procedure. Registration is bestowed only the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL—by application only; such members may vote, hold office and serve on committees.

Credentialed Professional Member: Individuals who have been dually approved for Professional Membership and AATA Registration (A.T.R.) by the AATA; dues are $80 per year.
Active Professional Member: Individuals who have completed professional training in art therapy; dues are $75 per year.

CONTRIBUTING—Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE—Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT—Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.

The interdisciplinary journal devoted to the creative arts as healing arts.

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-in-Chief:
David Read Johnson, PhD, RDT
Associate Clinical Professor, Department of Psychiatry,
Yale University; Clinical Psychologist, Veterans
Administration Medical Center, West Spring Street,
West Haven, CT 06515, USA

THE ARTS IN PSYCHOTHERAPY is a quarterly, international journal for professionals in the fields of mental health and education. The journal publishes articles (including illustrations) by art, dance/movement, music, poetry and drama psychotherapists, as well as psychiatrists and psychologists, that reflect the theory and practice of these disciplines. There are no restrictions on philosophical orientation or application.

SPECIAL RATES AVAILABLE FOR MEMBERS OF QUALIFYING SOCIETIES! Members of qualifying societies can receive a discount on one-year Professional subscriptions to THE ARTS IN PSYCHOTHERAPY. Please write for further information.

Editors welcome original manuscripts. Submit papers in triplicate to: Managing Editor, Sylvia Halpern,
20 Ridgecrest East, Scarsdale, NY 10583

STATEMENT OF PURPOSE
ART THERAPY is the official journal of the American Art Therapy Association. The purpose of the journal is to advance the understanding of how art functions in the education, enrichment, development, and treatment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, and research. An emphasis will be placed on the visual arts but articles in related disciplines that have relevance to art therapists will also be published.

 INCLUDED IN THIS ISSUE OF ART THERAPY IS A VARIETY OF IMPORTANT AND RELEVANT ARTICLES FOR THE ART THERAPIST. "COUPLES THERAPY/ART THERAPY: STRATEGIC INTERVENTIONS AND FAMILY OF ORIGIN WORK" PRESENTED BY SHIRLEY RILEY, "AN INFORMAL SURVEY OF ASSESSMENT USE IN CHILD ART THERAPY" BY ANNE MILLS AND RACHEL GOODWIN, "ART THERAPISTS' COUNTERTRANSFERENCE AND POST-SESSION IMAGERY" BY JOANNE KIELO AS WELL AS A 1991 UPDATED COMPREHENSIVE MEMBERSHIP SURVEY COMPILED BY TRUDY MANNING AND RAYMOND A. GORDON.

IN ADDITION TO THESE EXCELLENT ARTICLES, WE HAVE IN "VIEWPOINTS," "ART THERAPY IN A WAR ZONE" BY HANNAH SHEREBRIN AND TWO POEMS WRITTEN BY TEDDY RAMSDEN. I HOPE THAT FOR FUTURE ISSUES THERE ARE MORE SUBMISSIONS FOR THE "VIEWPOINTS" SECTION; THIS IS YOUR CHANCE TO OFFER VIEWS, ADVICE, CONCERNS, ART WORK AND OTHER CONTENT RELEVANT TO ART THERAPY, AND FOR ART THERAPISTS.

A RECOMMENDED BOOK

THE TRIARCHIC MIND, A NEW THEORY OF HUMAN INTELLIGENCE IS A FASCINATING BOOK BY ROBERT J. Sternberg (PUBLISHED IN 1988 BY PENGUIN BOOKS, 40 WEST 23RD ST., NEW YORK 10010). "IN SEEKING TO UNDERSTAND INTELLIGENCE," SAYS Sternberg, "WE SHOULD INHIBIT OUR DESIRE TO LOOK IN OBSCURE NOOKS AND CRANNIES, AND DAMPEN OUR FASCINATION WITH THE UNUSUAL AND BIZARRE." THE AUTHOR SAYS THAT WE SHOULD INSTEAD LOOK IN "THE MOST OBVIOUS PLACES—ORDINARY PEOPLE LIVING THEIR EVERYDAY LIVES—TO GAIN SOME INSIGHT INTO WHAT INTELLIGENCE IS, HOW IT SHOULD BE MEASURED, AND HOW IT MIGHT BE IMPROVED. MOST IMPORTANT, WE NEED TO UNDERSTAND THAT INTELLIGENCE COMPRISSES THOSE ABILITIES THAT ORDER AND MAKE THE MOST OF OUR DAILY ENVIRONMENT, NOT JUST ENVIRONMENTS ARTIFICIALLY CREATED IN PSYCHOLOGISTS' TESTS OR LABORATORIES." (P. 6)

IN DEVELOPING HIS RATIONALE FOR A THEORY OF INTELLIGENCE, Sternberg looked at the major theories of intelligence that were proposed during the twentieth century. His review led to understanding of intelligence by paying attention to three things: "THE INTERNAL WORLD OF THE INDIVIDUAL; THE EXTERNAL WORLD OF THE INDIVIDUAL; AND THE EXPERIENCE WITH THE WORLD THAT MEDIATES BETWEEN THE INTERNAL AND THE EXTERNAL WORLDS." (PP. 58-59) THE CONVERGENCE OF THIS ANALYSIS OF LITERATURE AND THE AUTHOR'S PERSONAL EXPERIENCES LED TO A 'TRIARCHIC' THEORY OF HUMAN INTELLIGENCE—ONE THAT RECOGNIZED AND GAVE EMphasis TO THESE THREE ASPECTS: 1) THE RELATIONSHIP OF INTELLIGENCE TO THE INTERNAL WORLD OF THE INDIVIDUAL: COMPONENTS OF INTELLIGENCE; 2) THE RELATIONSHIP OF INTELLIGENCE TO THE EXPERIENCE OF THE INDIVIDUAL: FACETS OF HUMAN INTELLIGENCE; AND 3) THE CONTENT OF INTELLIGENCE: FUNCTIONS OF MENTAL SELF-MANAGEMENT.

ODD AND ENDS TO THINK ABOUT

"AT THE RATE AT WHICH KNOWLEDGE IS GROWING, BY THE TIME A CHILD BORN TODAY GRADUATES FROM COLLEGE, THE AMOUNT OF KNOWLEDGE IN THE WORLD WILL BE FOUR TIMES AS GREAT. BY THE TIME THAT CHILD IS 50 YEARS OLD, IT WILL BE 32 TIMES AS GREAT, AND 98% OF EVERYTHING KNOWN IN THE WORLD WILL HAVE BEEN LEARNED SINCE THE TIME HE [OR SHE] WAS BORN"  

Dr. Robert Helliard, US Federal Communications Commission

"THE DOUBLING TIME FOR INFORMATION IS CURRENTLY FIVE YEARS, AND BECAUSE OF ADVANCES IN SCIENCE AND TECHNOLOGY, WITHIN THE NEXT FEW YEARS THE DOUBLING TIME FOR INFORMATION WILL BE REDUCED TO APPROXIMATELY TWENTY MONTHS."  

John Naisbitt, Megatrends

WHAT MIGHT WE DO—OR WHAT ARE WE DOING—to meet the rapidly changing society and the technological demands that are inherent in this change? WHAT SHOULD WE BE DOING NOW IN ORDER TO BE MORE EFFICIENT AND EFFECTIVE HUMAN SERVICE PROVIDERS IN THE FUTURE? HOW CAN WE EMBRACE NEW WAYS OF THINKING AND DEALING WITH HUMAN PROBLEMS THAT MAY LEAD US TO NEW INSIGHT IN THE DELIVERY OF SERVICES? HOW CAN WE EMBRACE THE NEW TECHNOLOGIES SO THAT WE CAN MAXIMIZE THEIR POTENTIAL FOR OUR PROFESSIONAL FIELD OF WORK?

We have much to learn and to do...
... And Finally

With this issue I am bringing to a close my term as editor of Art Therapy. I remember our first issue (Volume 1, Number 1, October, 1983) and what a milestone for the American Art Therapy Association! Barbara Katz Mandel, 1981–83 Publications Chair, and the Journal Planning Committee, together with Vija Lusebrink, Harriet Wadeson, Sandra Packard, Anita DeVivo, Debra Bass, Scott Stoner and the A.A.T.A. staff all worked diligently to bring this new journal forward. I was brought on board to serve as Editor beginning with the second issue. Although there were some hectic and trying times in those initial stages, it was exciting to play a part in the establishment and growth of our own professional journal. Personnel changed over the years, but the excitement of the challenge has remained constant as all of us have attempted to not only build, but maintain, this highly professional quality publication in Art Therapy.

To Ed Stygar, Executive Director, and the many A.A.T.A. staff personnel who have worked diligently behind the scenes to bring forth each issue, I owe a debt of gratitude—especially to Marcia May-Chambers, Managing Editor, with whom I have worked closely during recent years. (I will miss our long “proofing the galleys” sessions by telephone!) I am sincerely grateful to our officers and the many other people in our Association who have encouraged me in my efforts, and who have offered their enthusiasm for the “look, feel, texture and soul” of the journal. To the various members of the Editorial Board, I offer my sincere thanks for their hard work, patience, and at times having too much to read, while at other times not having enough. To the countless authors who submitted manuscripts for publication, your work has been greatly valued, for each of you has helped our readership to understand and appreciate the importance of our field through your narratives, case studies, documentation and research. Poems, art work and personal concerns have piqued our interest through the “Viewpoints” section, and many persons are to be thanked for their contribution to this aspect of Art Therapy.

My congratulations to the new Editor, Cathy Malchiodi M.A., A.T.R. who was appointed at the A.A.T.A. Conference in Denver. Let’s all offer support and encouragement to the new personnel associated with our journal, and make a personal commitment to submit that article, photograph or viewpoint in the coming year. With the American Art Therapy Association’s tradition of perseverance for excellence, we will continue to produce a professional journal of which we all can be proud.

Editor, Art Therapy
Couples Therapy/Art Therapy: Strategic Interventions and Family of Origin Work

Shirley Riley, M.A., A.T.R., M.F.C.C. Faculty: Graduate Department of Marital and Family Therapy, Loyola Marymount University, Los Angeles, California; Didi Hirsch Community Mental Health Center, Los Angeles; Clinician of the Year in Family Service, 1990, American Art Therapy Association

Abstract

Couples therapy is often focused on conflicting world views and expectations concerning male/female role assignment which had been learned in each person's family of origin. Misunderstanding and conflict arising from these issues, as well as other problems, have a tendency to lead toward rigid and nonproductive repetitive patterns of problem solving. These unacknowledged messages challenge the therapist in her attempt to clarify the difficulties presented by the clients.

The usefulness of the art therapy modality in making visible the covert messages and hidden edicts from the family of origin will be illustrated. Through use of art materials couples are given an opportunity to solve problems in a manner which is unique and unfamiliar. The challenge of art tasks leads the couple to problem-solving and a creative approach in mastering a change in their relationship.

“She’s fat, just to embarrass me and inhibit my career.” “He’s thin, to spite me and he eats twice as much as I do!” “This is making our marriage a failure. How can you help us?” How many couples have come into treatment with equally impossible tasks for the therapist to solve? However, if we try not to listen to the words and just attend to the message, perhaps something can be accomplished.

Couples therapy can be exciting and challenging both for the client and the therapist. It provides a particularly creative opportunity for the therapeutic relationship. The very nature of the triadic structure of art therapy gives mobility and flexibility to the joining and destabilization processes available to the therapist. Treatment may be based on a variety of theoretical approaches; the concepts described in this paper have been the most helpful when combined with art therapy.

Theoretical Overview

These theories of family therapy have proven to be useful in the ongoing process of evolving a better understanding of how to treat couples.

I have freely translated notions from many authors of family treatment and I dare say they may be uneasy with my interpretation of their ideas, and I anticipate incorporating other concepts as I change and learn. However, I believe that most practicing therapists educate themselves in the hopes of finding a methodology that synthesizes other persons' ideas with their own ideas. The clinician then evaluates if this "grouping" of concepts proves helpful in facilitating their clients' treatment plan. In the material below I have briefly discussed some of my convictions at this time.

Family functioning is an interactional system—not in the sense of the mechanical cybernetic model—but as a human system with the power to modify patterns of behaviors. Therefore, a therapist must observe the system with sensitivity to gender issues and larger social impingements. Strategic interventions, including those which use art therapy modalities, are useful to achieve a successful outcome for some families (Riley 1988; 1990). Interventions made through an art task often help the family become aware of their redundant patterns in unsuccessful problem-solving.

In addition to strategic/systemic theories, there are multiple ways of looking at family treatment that are complementary to this philosophy of therapy. Murray Bowen (1988) provides a conceptualization of the complementary nature of relationships seen in couples work. His explanations free the therapist from seeing one or the other partner in a judgmental manner and reinforce the stance that each member of a "marriage" chooses the other for the ideal "fit" to balance out their strengths and weaknesses. This balance is not obvious to the therapist or even to themselves, but, with patience, the nature of the impeccable selection process becomes known.

I differ with Bowen's proposal that individual treatment may be as effective as family or couples work and feel strongly that the couple must be seen together. My goal is to encourage an increased individuation and differentiation for each of the relational partners. The conjoint therapy encourages and acknowledges each member's growth and the growth of the relationship. It does not either avoid or encourage the maintenance or dissolution of the marriage, which is always a possibility when change is experienced.

Bowen describes the process of differentiation from family of origin as one of the basic tasks that must be successfully completed to achieve adulthood and establish a functional, intimate relationship. The
growth that he refers to is an individual’s internal acceptance that he or she has developed a “real self” with values and perspectives that differ from those learned in early childhood. He further discusses how, later in life, each of us is attracted to others that have achieved similar degrees of individuation from their families of origin. On this basis we seek a more or less successful relationship. Bowen observes:

It is the basic level of differentiation that is largely determined by the degree of emotional separation a person achieves from his family of origin. Since one of the main variables that influences how much emotional separation (and basic differentiation) a person achieves is the amount of emotional separation (and basic differentiation) his parents achieved, and since how much the parents achieved was influenced by how much their parents achieved, basic differentiation is determined largely by a multi-generational emotional process. . . . People can function at levels that are higher or lower than their basic level depending on the circumstances of the relationship system in which they are operating. (Bowen, p. 98)

Since differentiation is an internal process, the external manifestations may cover up the degree a person has become an autonomous individual. Successful individuation does not preclude deep attachment.

Bowlby (1969) although not a family therapist, added important, fundamental understanding to the appreciation of early development. The part I emphasize and which I feel is directly related to couples work is related to an understanding (at least superficially) of the touching, holding, bonding attitudes of the family of origin. However, we accept that this report from the client will be biased information, seen through the lens of the persons who are being treated. For example, youngsters that are stroked and cuddled bring a far different kinesthetic sense to the marriage bed, than those who have been treated in a distant manner, or, far worse, cuddled and rejected at the same time. Obviously, in short term treatment these profound and basic introductions into the couples’ early life experiences are not going to be fully explored. But, even a modest sharing of how each partner recalls his or her childhood moments of intimacy or yearning for affection can be very revealing and helpful in couples’ work.

Another concept that may help the therapist induce some movement into a relationship that appears helplessly role-bound is the notion of “delegation.” A concept is well-described by Helm Stierlin (1981) and delineates how different children in families are chosen to carry out some unfinished developmental business of a parent. These children are subtly trained to go out in the world and master the tasks that were never accomplished by a parent. The deeds they go forth to do are more or less worthwhile; indeed, how faithfully the child chooses to act on this mission varies with each and every youth. Many times I have seen clients feel ecstatic when they recognize that they no longer have to “be” for someone else (the parent)—that their own desires and goals are valid. When a wife and husband share this experience, they find strength in the mutual recognition that they no longer have to be the “chosen” one. Furthermore, this concept of a child being assigned a role to achieve gratification for a parent can be a useful subject for discussion when a couple wishes to have or has children. A session can be based on how, or if, they might identify with a parent who chooses to impose a role on a child.

Within the above amalgamation of ideas let me now state that I believe that most persons are positively motivated as they attempt to solve problems and change their partner to “make it better.” It is not the motivation that seems to go wrong, but the numerous unsuccessful attempts to achieve this goal which have failed. Therefore, it is the repetitive manner of problem solving that is the problem. This has been very well explained by the MRI group in Palo Alto, California (see Watzlawick, et al, 1974; Fisch, et al, 1982).

None of these belief systems can stand alone or can be valid without taking into consideration the social system in which each exists. Social constructivism theory opens the horizon to include not only all the factors that enter into the creation of each person’s perceptions of his/her world, but also the impingement of the outside social structures that may dramatically influence a couple’s world view. The theory of social constructivism (Watzlawick et al, 1984) looks at the invented worlds we all uniquely construct, the power of words to shape our thinking, and the necessity to be gender-sensitive in defining problems. It appears that within this framework the other theorists may exist in comfort and assist a couples’ therapist with the business of treatment.

Every couple, as they tell their stories and explain their world views, stimulates the therapist to respond through herself and her knowledge and to choose what appears to be the theory, or grouping of theories, that best “fits” the problematic situation and the personality of the clients. The final criteria is not to mold their treatment into a theory, but to allow the couple to lead the therapist into the theoretical framework that best holds their own picture of themselves and their lives.

Role of Therapy in Couples Work

And what about the art? How is this component valued in all the talk about theory and techniques? The art product is the foundation on which all the theory rests. It is the window to the clients’ world and the resource that informs the therapist about the couple’s meaning to their stories. Above all, the art tasks give

Autumn 1991, ART THERAPY 5
the couple an action oriented mode of solving problems. The action is based on creativity, both in the execution of the art expression and in the invitation to be creative toward problem-solving. The art moves the clients from the frame of a rigid unsolvable problem toward one that is manageable and resolvable. The art product reveals the second level meanings and invites a fresh look at long-standing beliefs.

With encouragement from the therapist, the couple can look at their situation through the art product, create a new meaning for old patterns and invent a future that meets their desires. The therapist is able to be more effective since the information in the art work allows her to wear a similar set of lens, enabling her to see the couple’s world and appreciate their viewpoint. With these unique lens, the art therapist can utilize many theories, many modes of interventions, and introduce a variety of art directives that reflect the couple’s story, giving new meaning to the ancient myths of the family.

Case Example I

Cindy and Larry sat in despair in the office. They both expressed how hopeless they felt about resurrecting their dying relationship. The facts were concrete—there was no hope for change. I was to help them through this time which probably would lead to separation. The sadness they both felt was over the fact that they still felt love for each other, but that “wasn’t enough to make the difference.”

The major problem was (as they presented it) the fact that Cindy was six years older than her husband. He was thirty-six and she was forty-two. Everything was tainted by the dire reality that she stayed six years older. She had “consistently” been six years older all through their seven year marriage, the birth of their son three years ago, the blossoming of his career, and her decision to retire from work and be an at-home mother. They both shared guilt over their respective ages. He tried to get older faster—but it never worked.

Faced with this situation, I decided not to be helpful. I listened and empathized with the reality, the inevitability, and the clarity of the difficulty. I then asked them to return the following week with copies of their birth certificates. They were each to do their own zeroing and be responsible for bringing the copy to the session. I did not discuss the reason for this request with the couple and they left somewhat puzzled.

The following week they each complied with my recommendation. Without further discussion I immediately presented them with an 18” x 24” piece of construction paper (they chose the color), two pairs of scissors and glue. I asked them to cut apart their birth certificates and create a single collage made of the two documents. They began their work slowly, but in due time she took a decorative theme from his certificate border and extended it onto hers. He took the dates of their births and cut them out and scramble their order. She made inventive shapes of the hospital names. This continued until the two original certificates were unrecognizable. What resulted was a rather attractive collage which was embellished with a large golden seal they had created together and placed on the bottom of the paper with the date of the session inscribed.

From this experience Cindy and Larry seemed to simultaneously understand what they were destroying and what they were creating. They needed very few words. They touched hands, chuckled a lot, encouraged each other to press on with the collage process and smiled at their completed project.

The final step was my request for them to take it home, frame it, and place it in a prominent place, at least for a little while. They agreed and their response appeared to be one of relief, a feeling not expressed through words, but through their heightened affect and their embrace of each other at the door as they left. They remained in treatment and never mentioned age again. They were released from this dilemma and were able to move on to other difficulties in their relationship for which the “six years” issue had served as an avoidance device.

Discussion

This example addresses a basic theme in couples’ therapy. These two people were tormented by multiple stereotyped messages from society and their families about age in relation to roles of men and women. At the initial session, there was no time to pick apart these issues. The couple were covertly asking me to save their marriage and release them from their symbolic symptom that stood in the way of facing the real distress they felt. I gave them a chance to solve the problem, without interpretation, and create a new reality.

Symbolically through the art, they addressed the meta-meaning of age. They started on the path of therapy by establishing their own family interpretation of age by working on a meta-level that paralleled their trouble. Cindy and Larry presented a problem that defied a logical solution. Therefore, it was syntonic to find a solution to the problem in a non-logical way. The resolution did not need to be verbalized. It was visual, concrete, and creative.

It is important to note that the first

Interventions made through an art task often help the family become aware of their redundant patterns in unsuccessful problem solving.
The art tasks give the couple an action-oriented mode of solving problems.

Reflects the intimate world view of the clients. For the therapist to presume to understand how the client perceives the world would most probably be faulty, particularly in the first few sessions. Therefore, we observe and listen to the family story and the illustration provided through the art task.

Case Example II

The evolution of family work into conjoint marital therapy is very common. Most family treatment benefits from some adult sessions after the systems have been regulated and the children relieved of their delegated roles (Steirlin, 1981). It is not unusual at various times in the developmental growth of either of the parents, the children or the family, stressors impact the couple to a degree they perceive as unmanageable. At these times of flux couples in rigid relationships who have not developed coping skills for change often turn to therapy. The following example illustrates how two apparently high-functioning adults were no longer able to maintain their facades when developmental pressures escalated.

Soon after Ellen and Craig started family treatment it became apparent that it was a relationship problem between these parents and not the difficulties with their teen-aged daughters that needed attention. The stress of adolescent rebellion had stirred up their own problems around individuation. For this reason, we moved to conjoint sessions.

Both Craig and Ellen were well-educated, financially secure since birth, committed to good ethics and rigidly programmed by their families in the “proper” roles and behavior of each sex. They had a sixteen-year marriage, and although at this time they were very unhappy with each other, they had no desire for divorce. Their situation seemed clearly to indicate a need to explore their family of origin, and look at the question of differentiation theories referred to above.

We began by doing a genogram which was then amplified by art therapy in the following manner. Utilizing the usual indicators of sex, relationship through marriage, age, children and death (see McGoldrick & Carter, 1988), the genogram also introduced color to express dominant trigenerational personality traits. For example, a circle used to indicate “grandmother” was colored in red, blue and a little green. It had been agreed by the couple that these colors would respectively show anger, depression and nurturing. The connecting lines on the genogram that show relationships were color-coded to express behavioral traits such as affectionate, cold or violent. How they indicated these traits through a color or a combination of colors helped to clarify how the families taught their children how to “be.”

As Ellen and Craig explained and compared their genogram, they better understood how they were carrying on the family beliefs and the inheritance became clear. They observed the following: her mother was dominant and fiercely rude; his mother was passive and weak; his father was a male mirror of her mother and her father was the retiring “sweetie.” What they hated in themselves were behaviors incorporated from their same sex parent; what they feared in the other was the threat of having to live with a duplication of the opposite sex role that they grew up with. Con-
The art product . . . is the window to the client’s world.

sciously, they were only partially aware of these roles and dynamics.

To help make the above characteristics more visible, the next task was to “do a collage of your parents.” Using magazine pictures each one created a composite of family traits. How amazed they were when they found the many similarities in their families of origin. They learned a great deal by being able to distance themselves from the strong personalities of their parents and feeling more free to criticize a collage rather than a real person or parent. At last Ellen could say she didn’t want Craig to be a “wimp” like that picture of her father on the page. Finally, he had the courage to say that when she was like her mother, he cringed inside as he always had with his father. The major gain was to see that they each wanted the same change from the other partner and to say to each other, “please don’t be your parent.”

Following this exploration of roles and learned behavior the next step was learning how to be who they wanted to be. Late individuation in adults who have neglected this process in adolescence always offers a therapeutic challenge. To explain the process of this treatment is too extensive for this paper. However, I can note that we used the art therapy to rework, in the light of adult understanding, real and concrete residual events of the past.

After a six-month period, their daughters showed remarkable improvement [sic] and the couple terminated with the resolve to keep on “becoming themselves.” An unexpected plus was the reward that the relationship with their own parents had become much easier. They no longer felt controlled and therefore could spend more pleasurable time together and observe them from a position of action rather than reaction.

Discussion

The choice of partner is one of the most important decisions we make. It is often a puzzle to the therapist how each member of a dyad has chosen the other. However, as we look at the visual representations of the relationships, expressed through art, of their family of origin, it becomes clear that past behaviors and patterns remain alive in the present.

In the second case example, recognition of the mirroring is difficult to achieve with words, but dramatically clear in the art. It is a real triumph when Ellen is able to say “I heard myself sounding just like my mother, and I think he is acting just like his mother. I hate both those women in myself and in my husband.” At this moment she was able to transcend sexual identity, recognize the source of the behavior, and move toward change. Moreover, when couples draw their family of origin in a manner that displays relationships they are able to compare parallels in the drawings of how they, in turn, have created their own dependency relationships. With freedom to redraw, cut out, amplify, and expand a family drawing, the ability to recreate and reinvent new meanings to the process that “shaped” those individuals becomes a more manageable task.

This case also presents a good example of a man and woman who, at first meeting, seem to have achieved full adult functioning in the family and socio/economic areas of their lives. Only under the stress that arose from confronting two teenage children did they undifferentiated emotional attachment to their family of origin become an issue. They experienced great frustration as their own daughters strove for differentiation from them as parents, since their own unresolved individuation from their parents left them deficient in skills to manage this crisis. Two generations were struggling to accomplish this same goal and, instead of differentiating, they were emotionally escalating their dependency. It was no surprise that as the parents became more aware and capable of establishing their own sense of self, the daughters in turn, made progress toward autonomy and conflicts diminished. This ripple effect is one of the ongoing pleasures family therapists experience when they observe parents change and children benefit.

In conclusion, it is important to be curious, modest in hubris, aware that each person’s reality is a creation of his or her own, and to understand the power of early teaching of the families of origin. The therapist must also look for the possibility of conflict between overt behavior and what those observable actions truly represent. An ability to sprinkle sessions with humor, be comfortable talking about sex, and realize that you are a temporary part of the system—comprise a realistic formula for the therapist interested in doing couples therapy.

Add to this a willingness to let the art process inform the art therapist and lead the way, through pictures that both surprise and illuminate the couples’ story. It is particularly important to look for the second-level message in the visual expression. Vital material to both clients and therapist is more easily assessible through the image and indicates the dormant possibilities of change in the tarnished script of the relationship.

Modifying undesired patterns through a creative solution can be a festive occasion in couples therapy. To paraphrase Bateson, art is the difference that makes a difference.

ANNOUNCEMENT

THE ART THERAPY ASSOCIATION OF FLORIDA
IS PLEASED TO ANNOUNCE ITS 1992 STATE-WIDE CONFERENCE
AT THE HERITAGE HOTEL
IN
ST. PETERSBURG, FL
FRIDAY/APRIL 24 TO SUNDAY/APRIL 26, 1992
THE CONFERENCE WILL FOCUS ON “ART AND THE OLDER ADULT”

Workshops and presentations will be offered on Life Review process using art therapy, Expressive Therapy with addictive disorder clients, Test results from recent data collected by Dr. Rawley Silver, with other presenters all sharing insights from working with older age adults using the arts in various settings. Special guest speaker will be Larry Barnfield, A.T.R. from Charleston, S.C. sharing his knowledge on art programs mindful of the environmental-housing needs of older adults. A private dinner and after hours tour at the Salvador Dali Museum will begin the conference on Friday evening, presentations on Saturday and concluding Sunday at noon.

An Informal Survey of Assessment Use in Child Art Therapy

Anne Mills, M.A., A.T.R.; Rachel Goodwin, M.A.

Abstract

The authors surveyed participants at a national art therapy conference on the use of assessments in art therapy with children. Different levels of experience, geographical areas and training programs were represented by thirty-seven respondents. Relative familiarity with projective tools was greater than with art therapy assessments. However, most respondents cited preferred tools which relied on modifications of existing projectives and art therapy techniques, and unpublished assessments. The authors infer from their results that art therapists have a great diversity in training and approach to assessments, coupled with a strong need to innovate. The results, although from a small sample, have implications for both clinicians and researchers.

Art therapists who work with children observe that, with some exceptions, children do not need suggestions about what to draw or sculpt (Koppitz, 1968; Nucho, 1987). In fact, direction can sometimes be a form of interference (Rubin, 1978). Further, ‘non-directed’ or ‘free’ drawings are considered of primary importance by some theorists (Naumburg, 1966; McNeilly, 1983). However, the skilled art therapist must be prepared to assess clients (McNiff, 1986). As the art therapist plans the assessment of a child, it may be that directed drawing tasks from the art therapy or psychology literature as well as non-directive methods are considered.

It is because of the philosophical and practical questions raised in assessment that the authors wished to learn more about the frequency and type of assessments given children in contemporary art therapy practice.

Method

We designed a questionnaire that was distributed at the 20th Annual Conference of the American Art Therapy Association in San Francisco 1989. Respondents were asked to identify themselves by: level of training (undergraduate or graduate student); professional status (student, alumni); institution where training took place; number of years of experience; work setting; and age range of child or adolescent clients. We listed twelve published assessments (see below) and asked respondents which ones they had used. Included were assessments like the Ulman (1975) and the Diagnostic Drawing Series (DSS) (Cohen et al., 1988), which are commonly associated with assessment of adult populations, but which are also used with adolescents. Several pencil-and-paper projective techniques were also included. Although originating in the field of psychology, such directive drawing tasks seem to be in widespread use in contemporary art therapy practice.

The authors also asked which assessment the participants had found to be most ‘beneficial to my clients.’ Space was provided for respondents to indicate any other assessments, including ones of their own devising, which were not listed in the questionnaire.

Results

Approximately 100 questionnaires were distributed. The majority were picked up by conference participants from a conference message board. A number were given to participants after discussing the survey. Ten were delivered to three graduate programs in art therapy that are widely separated geographically and philosophically. Of the 100 questionnaires distributed, 37 were returned.

Graduates of art therapy programs accounted for more than three-quarters of the respondents. The remainder of the respondents were students. All respondents were either in graduate programs or were Master’s-level art therapists. No bachelor’s-level practitioners responded, nor did any non-art therapists. The participants were: seven students; nine M.A./M.S. graduates; and 17 A.T.R.s (nine of whom had more than ten years of experience).

Almost all the student responses came from one graduate school. With this exception, the distribution of participants across North America (judged by college where training was received) appeared to be good. The survey, although small, is somewhat representative because of regional variety. Seventeen different colleges and universities and one institute were represented in the sample.

In most categories, similar responses were given by art therapy students, Master’s-level art therapists, A.T.R.s, and A.T.R.s with more than ten years experience.

Child clients were reported as predominantly: younger than school age (3 respondents); six- to twelve-years (28); and adolescents (17).

Child clients were seen in the following settings: schools (7); medical (3); psychiatric/substance abuse (14); and private practice (6). Other settings mentioned by respondents were family or community clinics, and residential settings and outpatient clinics for survivors of sexual and other abuse.

The choices offered are listed below in the manner presented in the survey. The first number in brackets indicates the number of re-
spondents who had used that particular assessment with children. The second number, in bold type, indicates how many respondents selected that assessment as “most beneficial” to their clients.

- Bridge (Hays, 1981) [4] [0]
- Diagnostic Drawing Series (Cohen et al., 1988) [5] [1]
- Draw a Person (Harris, 1963) [19] [0]
- Favorite Kind of Day (Manning, 1987) [3] [0]
- House Tree Person (Buck, 1948) [16] [4]
- Kinetic Family Drawing (Burns & Kaufman, 1970) [21] [5]
- The Kramer Assessment (Kramer & Schehr, 1983) [15] [6]
- The Rubin Assessment (Rubin, 1984) [10] [5]
- The Scribble Technique (Cane, 1951) [13] [1]
- Stimulus Drawings (Silver, 1986) [4] [1]
- The Squiggle Game (Winnicott, 1971) [6] [0]
- The Ulman Assessment (Ulman, 1975) [8] [2]

Respondents were very familiar with the DAP (Harris, 1963), H-T-P (Buck, 1948; Buck & Hammer, 1969), and the KFD (Burns & Kaufman, 1970; Burns & Kaufman, 1972). In fact, respondents signalled almost as much familiarity with these three projective drawing tasks (56 total) as with the other art therapy techniques combined (66 total).

Simple familiarity with a given assessment did not necessarily predict it would be judged as “most beneficial” by participants. The projective drawings were voted “most beneficial” only nine times in total, as opposed to the combined art therapy techniques, selected 16 times in total. That is, one in six art therapists familiar with these projective drawings selected it as “most beneficial,” whereas one in four art therapists familiar with an art therapy tool selected it as “most beneficial.” Despite greater familiarity with and a strong acceptance of projective drawings, art therapists tended to prefer the art therapy tools.

When the listed methods were broken down into high and low levels of structure in the manner of Bolander (1977), more art therapists preferred tests where stimuli are relatively unstructured and responses are not limited. However, structured tests also were frequently used.

Some published and well-known techniques were also cited by respondents who had either used them or found them most beneficial (see below). For reasons of space and/or simplicity they had not been included in the questionnaire’s list of 12 possible assessment tools.

However, it is important to note that respondents at all levels of experience modified existing techniques and created new ones, rather than relying on published tools. Some techniques cited by respondents were not known by the authors. Where this was the case, we have not appended a bibliographic reference. We conjecture that such tools were created by the respondents themselves, or that they may have been taught them via a sort of “oral tradition” of art therapy education and supervision.

The following is an alphabetized list of assessments, techniques and modifications that were submitted by participants. They were proffered either as an assessment the respondent had used or as the one considered “most beneficial.” The participants’ own descriptions are quoted.

- “A combination of two—one multiple picture assessment (DDS or Kramer) and one person picture (DAP or KFD)”
- “A drawing of a tree, a bird, and a ball — then tell a story about the drawing”
- “A Scary Dream”
- “A seven-drawing series with 8” × 12” paper and various drawing materials: (1) favorite weather (2) developed scribble (3) DAP (4) Draw person of opposite sex (5) KFD (6) Abstract family (7) free choice”
- “Affect drawings: sad, angry, happy, scared, on 8¼” × 11” paper with markers and pencils”
- “Combination of DAP and KFD”
- “DAP modified”
- “Dot-to-Dot” (Hays, 1979)
- “Design—lines—shapes—colors—don’t look like anything—associates feelings to colors and lines”
- “Draw a person of the opposite sex” (Hammer, 1975)
- “Draw what happened to you” (similar to the Event Drawing, Burgess et al., 1987)
- “Family Portrait” (Kwiatkowska, 1978)
- “Free drawing—choice of subject and materials”
- “Free drawing and directed second picture, such as DAP”
- “HFD” (Koppitz, 1968)
- “HTP modified”
- “HTP, combined chromatic and monochromatic”
- “KHTP” (Burns, 1987)
- “Kramer assessment modified in materials and protocol. Specifically, markers and colored pencils are also provided and the order of the tasks is determined by the child.”
- “Kramer with HTP, substituting scribble or squiggle when there is resistance to drawing”
- “Kwiatkowska Family Art Evaluation” (Kwiatkowska, 1978)
- “Life Size Body Drawings” (Malchiodi, 1987; Malchiodi, 1990)
- “Mandala” (Slegelis, 1987; Bush, 1988)
- “MARI cards combined with Mandala” (Kellogg et al., 1977; Kellogg, 1978)
- “Reasons for hospitalization”
- “Rubin assessment modified”
- “Sequence: telling a story in eight squares”
- “Sandtray” (Kalff, 1980)
- “Shared drawing”
- “What is it like to be your age?”

Four participants responded that they do not use assessments. The authors suspect this number is deceptively low; other art therapists who do not use assessments would tend not to pick up or complete such a survey. One art therapist prefers to not use assessments but monitors
"the gestalt of their art over time." Another participant noted that her job duties preclude assessments because, due to time pressure, "testing is completed by others."

Discussion

A question that is begged by the proliferation of assessments Above the difference between subjects or themes for drawings, and evaluations or assessments. If a clinician finds that requesting a certain subject yields useful information, we presume s/he will use it regularly and will develop a special understanding of the many ways clients respond to this subject. Can this then be termed an 'assessment,' even if it is not widely known and accepted? As Kinget wrote more than thirty years ago (Hammer, 1958), a technique's value is limited by the worker's mastery, which can be acquired by time and systematic study alone. A full discussion of this issue is, however, beyond the scope of this report.

The presence of a number of assessments with which the authors were unfamiliar seems evidence of an 'oral tradition' operating in the field of art therapy. That is, an assessment's publication may be delayed, thus limiting knowledge of it (and its influence) to others in the same geographical area or professional network. The authors wonder if every lesser-known assessment has its own proponents who are linked by ties of familiarity and loyalty and who share similar training and ideology (Kuhn, 1962).

Virtually all respondents offered an assessment or modification that seemed of their own devising. This may be testimony to our professional identity as artists and innovators. It may also indicate widespread unfamiliarity with or rejection of published assessments. Some respondents were very eager for information on assessments and requested copies of the questionnaire because it listed citations. A hypothesized lack of familiarity with art therapy techniques is interesting in view of the continued use, teaching, and, in some cases, preference for projective techniques. Despite ethical and legal concerns regarding areas of competency and proprietary use of tools, and the postulated drive to innovate among art therapists, interest in tools derived from psychology remains robust. In contrast, it is noteworthy that support for projective drawing techniques has declined within the psychology community after repeated tests failed to support their usefulness for research or clinical work (Pruitt, Smith, Thelen & Lubin, 1985).

Philosophical and other differences among training programs suggest that each chart's own course about whether or how assessments be taught. One respondent noted, under the name of the college where s/he received training, "But, really, I've learned assessment on my own, with experience."

There were, not surprisingly, no repetitions among the list of personalized or modified assessment techniques. This lack of consensus hints at a difficulty that faces researchers who seek art therapists' involvement in studies that employ standardized procedures, in that clinicians may tend to resist or reject any standardization, a priori. It also implies a degree of diversity among clinicians that may compromise accountability and communication around clinical issues.

The authors acknowledge the effect that the simplification of the concept "most beneficial" had on the questionnaire. It is important to note, as participants pointed out, that, "most beneficial to my clients" may not be the same as "most preferred," "most used," or even "most beneficial to the therapist." It may be, that the tool the therapist considers ideal, preferred or even most beneficial, is not used. Some assessments are more time-consuming or unwieldy than others. Some institutions, in fact, may specify what evaluation is to be used. As another respondent very correctly points out, there is "no single assessment that will fit the needs of all children, all the time."

Conclusion

Certainly art therapists wish to clearly understand the problems of child clients. However, respondents demonstrate diverse opinions about the place and value of assessments in clinical practice. Some say they do not assess, but perhaps perform a similar function in a different or more informal manner.

Others show an eagerness for information about assessments and a need to modify and create adequate tools for assessment. Still others prefer tools which are familiar to art therapists but have their origins in other disciplines. From this the authors infer that some art therapists lack knowledge about or are dissatisfied with extant art therapy assessments.

This questionnaire asked only about frequency and preference and should not be mistaken as a statement about the value of each tool. That is, of course, dependent on the skill of the clinician (Boland, 1977).

Our hope is that this report on the outcome of a small, relatively informal survey may foster awareness and discussion of attitudes toward the use of assessments.

Art Therapists' Countertransference and Post-Session Therapy Imagery

Joanne B. Kielo, M.A., A.T.R., Art Psychotherapist, Montreal Canada

Abstract

This article presents an overview of a study on countertransference and art therapy based on interviews with fourteen professional art therapists exploring their use of drawings they did after sessions with clients. While none of these art therapists suggested that they relied on this method to identify their countertransference issues, the experiences of several showed that post-session art making was useful for them in developing an empathic capacity, clarifying confused feelings, or rendering unacknowledged feelings into form.

Whether the focus of art therapy treatment lies in the interpretation of the relationship through the use of art or primarily within the artistic experience, most art therapists agree that transference and countertransference exist within art therapy (Agell et al., 1981). In fact, by the very nature of their profession, art therapists may be particularly sensitive to unconscious messages that constitute a large part of communication. In describing the intrapsy- chic and interpsychic dynamics of art therapy, a number of authors have suggested that art therapy can open the door to the pre-verbal world that was experienced through images and sensations (Lachman-Chapin, 1987; LaMonica & Robbins, 1980; Wolf, 1985; Wood, 1984).

Unconscious reactions are unavoidable as the art therapist travels with his or her client into pre-verbal territory, no matter how much analysis or psychotherapy the therapist has undergone. The art therapist's effectiveness depends partially on an ability to gain insight into such personal reactions as the subtle interplay of projections, unconscious distancing, or undefined feelings so that they may be used to facilitate the treatment process.

Too often art therapists' attention to the pictorial image is client-sided, employing verbal means for the exploration of the art therapy interaction. This study explores the use of image-making by art therapists as a way of examining countertransference reactions within the art therapeutic interaction and promoting effective interventions.

Countertransference

One of the problems encountered in discussing countertransference is that the term is used in a variety of ways. On one end of the spectrum are the therapists who consider countertransference as consisting of the therapist's unconscious resistance based on early object internalizations, and as an interference in the therapeutic process. At the other extreme are those therapists who view the term from a broader perspective as including the sum total of their reactions in the therapeutic relationship. In this view, countertransference is seen as a helpful tool for exploring clients' projections as well as the therapist's perceptions. Enrique Racker's (1968) concept of countertransference, including the entirety of this spectrum, is the framework used in this study to examine art therapists' countertransference responses.

The first psychoanalyst to present a systematic study of the transference/countertransference paradigm, Racker conceptualized the therapeutic relationship as a dynamic process wherein the exchange between the therapist and client is considered. Racker provided a definition of countertransference which takes into account the gamut of the therapist's emotional reactions. He suggests that there is "no 'normal' emotional state for the therapist, but [that] the inner state is continuously, profoundly and in certain precise and definable ways, responsive to the patient and to what the patient is saying or doing." (cited in Hunt & Issachoroff, 1977, p. 97).

Within this definition which encompasses the therapist's emotional reactions and conscious or unconscious responses, Racker described three categories of countertransference: neurotic countertransference (direct countertransference), countertransference proper which consists of concordant and complementary countertransference (direct countertransference) and indirect countertransference (Racker, 1968).

His concept of neurotic countertransference, resembling Freud's definition of countertransference, has been defined as the unconscious identification of therapists with infantile feelings within themselves in connection with their patients, and their defenses against these feelings. Therapeutic progress is brought to a
The present study set out to explore the ways some art therapists successfully use their post-session imagery to understand countertransference...

The transference, the art therapist is subject to the “overspill of unconscious content, at unconscious levels of interactions” (1984, p. 70), and that the art therapist must deal with countertransferrential material relating to both the client and the client's art work. As well, LaMonica and Robbins (1980) suggested that because of the preverbal nature of the unconscious interchange between the art therapist and the client, the art therapist will occasionally contribute to the re-creation of past traumas.

Examples from the interviews with art therapists completed in the present study seem to support these suggestions. One of the interviewees described a reaction to a client’s imagery, exemplifying a neurotic countertransference:

Another example was when I was depressed and the client was depressed. The [client’s] art symbols made me feel my depression. I was so overwhelmed by the depression in the art work that I had a sense of futility and uncertainty, and I was not able to respond adequately to the client. The client’s symbols corresponded so closely to my own inner state. The therapist in me folded up her suitcase and went home because the part of me which was depressed had taken over. (Kiello, 1988, p. 142)

Circumstances may also arise in art therapy where the art therapist’s reactions are not solely motivated by the art. Another interviewee described one of these experiences:

I knew I was feeling anxious and sometimes getting angry at the client, not during the drawings but in situations where she would refuse to leave at the end of a session. (Kiello, p. 116)

Robbins made the point that art therapists must not “fool themselves with false notions of professionalism or objectivity” (Agell et al., 1981, p. 7). He contended that art therapists are susceptible to primitive, nonverbal messages and may use defenses that inevitably interfere with therapeutic progress. According to Wolf (1985), a common limitation of therapists is in not receiving and creatively using the countertransference as a tool for understanding their clients.

Both Robbins and Wolf suggested that art work by the therapist could help clarify countertransference issues. LaMonica and Robbins (1980) proposed that drawing an artistic representation of the client can help the art therapist evolve a better understanding of both the transference and countertransference. They suggested that this could be done outside of the session. Similarly, Wolf described a particular intervention whereby the therapist attempts to maintain an empathic connection with the primitive organization of the client’s psyche by drawing. The therapist draws spontaneously during the session as the client talks and draws, which could result in the therapist’s artistic rendition of the client’s projection or the complementary countertransference.

Purpose of the Study

The present study (Kiello, 1988) set out to explore the ways some art therapists successfully use their post-session imagery to understand countertransference issues and to facilitate therapeutic progress.

The basis for this inquiry is the idea that therapeutic progress is partially contingent upon the therapist’s personal capacity to respond in such a way as to further the relationship. If image-making by the client is an integral part of the client’s growth, what
then is the potential of image-making by the art therapist as a means of responding to the therapeutic relationship, monitoring countertransference responses, and clarifying conscious and unconscious communications?

Method

This exploratory study was designed to investigate art therapists' experiences in relation to their own post-session art work. The part of the study described in this paper included open-ended interviews with professional art therapists, examining their experience with art and art therapy; a second phase, which will not be described here, included an exploration of some of the author's experiences with her own post-session art work.

Tape-recorded interviews with 14 art therapists were conducted individually and privately on an informal basis, lasting 20–35 minutes. Each interview began with an open-ended question: “How do you as an art therapist use your art in relationship to the art therapeutic process?” More directed questioning followed, depending upon the path the interview was taking. Each interview was transcribed and returned to the interviewee to be edited.

Results

Of the 14 art therapists who were interviewed, 12 returned their edited versions. Eleven interviews were included in the study because one was returned too late for review. While the number of interviews was too small to permit extrapolations regarding art therapists in general, a content analysis of the interviews did provide some interesting indications for future investigations.

The analysis followed guidelines for qualitative research described by Polet and Heingler (1983), beginning with a search for themes, or commonalities. A theme was delineated by at least two art therapists describing similar experiences. In an attempt to validate the results of this procedure, the iterative approach was used, reviewing the themes to see if the material reflected the subject and then refining them if necessary.

Of the 11 interviewees, two art therapists said that they never used post-session art as a means to help clarify the art therapeutic relationship. Although they both explicitly stated that they did not use their art in relation to the therapeutic situation, they did not deny its potential usefulness. Rather, in response to the question that was put directly to both of them, “Do you ever do art to help clarify the therapeutic session?”, both responded by reflecting on the limitation of time.

Like countertransference, the term art has many meanings: Each of the interviewees used it to represent at least two if not three different experiences. At one end of the spectrum, there was art which was created separately and considered separately from the art therapeutic situation. Terms such as “academic art,” “social art,” “art art,” “proper fine art” and “authentic art” were used to describe one approach. The general consensus of this variety of terms seemed to be that this art is created for its own sake.

Another type of art was “art work for a (personal) therapeutic reason.” This art was described variously as “self-restoration art,” “art therapy art,” “non-art,” “clean-the-slate art,” or “spontaneous art.” The principal purpose for doing this art was as a therapeutic experience, whether for catharsis or self-exploration.

The third category of art work cited was that done by the therapist in relation to the art therapeutic experience. This included art work done inside the session as well as art work done outside the session but related to the session. This latter type, post-session art work, is the focus of this paper.

The themes which emerged from the interviewees' experiences with their post-session art work were:

1. Art used to develop empathy through replication of client's imagery;
2. Art used to clarify feelings;
3. Art used to explore the pre-conscious and unconscious;
4. Art used to help differentiate affect;
5. Art used to explore the relationship.

The countertransference experiences, clarified through post-session imagery, described in this study will be considered in the context of Ranker's concept of countertransference. Complementary countertransference is indicated by a description of the imagery and the art therapist's experience which suggests the client's projections of early significant objects onto the art therapist. A description of an experience which developed a more empathic understanding of the client and the client's imagery is referred to as concordant countertransference. Neurotic countertransference is identified when the art therapist's reactions to the clients' art work or the client were not recognized and in some way made the art therapist less effective. Indirect countertransference is not reviewed in the following discussion since it was not mentioned by any of the art therapists who were interviewed.

Themes

That concordant countertransference is not always achieved within the immediacy of the art therapy session was exemplified in the situation of the interviewee who was unable to respond adequately to the client due to his or her own emotional state (Kielo, 1988). Looking at the described experiences of most of the art therapists interviewed, it would seem that they used their post-session art work to help them develop a concordant countertransference
toward their clients and their clients’ imagery.

Robbins (1987) pointed out that the skill of the art therapist is in maintaining a positive supportive relationship to ensure effective art therapeutic intervention. Edwards (1987) suggested that the art therapy process is best served when the art therapist “is able to channel countertransference feelings into caring about and bringing ideas to the image” (p. 104). This ability to maintain an effective relationship with both the client and the client’s imagery depends upon the art therapist’s concordant countertransference. That is, the art therapist must be able to empathize with both the client and the client’s imagery. Bees and Arlow (1974), two psychoanalytists who addressed the issue of empathy, concluded that the empathic response involves transient identification with as well as a remaining separateness from the object. It is not only a matter of being with the person but also of thinking about the person. According to Beres and Arlow, both the with and about are essential components of the empathic process.

Three art therapists made specific reference to the idea of replication of clients’ art productions as a means of developing their empathy. As one said:

Occasionally if there is some client’s art work I’m having particular difficulty understanding or empathizing with, I will try to replicate this work myself and thereby hope to ‘get inside’ it. (Kielo, p. 161)

To the author’s knowledge, there has been no published research into the motivation and the outcome of replication of client’s imagery as a way to develop empathy. Although not within the scope of this study, an interesting avenue of investigation in this area would be that of an analogue to empathic processes in mimicry and dance. It has been suggested by some psychoanalysts (Feinichel, 1926; Jacobs, 1973) that emotion can be transmitted through identification by way of the emotion we see in action. The following description provides another example of the art therapist copying the client’s productions:

In art therapy I have drawn with the client in mind independent of the sessions and I have copied the work of clients (dynamic of the art process experiences). It made me observe more closely the person and the work and because of that observation, that attention, that “living with the image,” I would be more empathic. (Kielo, p. 140)

Being with is one aspect of concordant countertransference, but just as important is the capacity to separate and think about the client. “Living with the image” suggests the being with the patient’s imagery, while the more differentiated state is suggested by the interviewee’s observations about the imagery. The art work, as concrete evidence, appears to have facilitated a growing empathic response.

For some interviewees, post-session art served as a way to clarify feelings by means of identifying with the client’s symbols and experiences. G. described an evolving concordant countertransference situation:

I often made countertransference drawings after my sessions when I was working with a client who was working through incest issues. She used the metaphor of broken glass. The image of being cut by glass is extremely painful. Although I hadn’t been sexually abused, but analytically had dealt with the fantasized elements in my personal therapy, I had been recently mugged. In a separate but perhaps parallel way, I was responding to what it felt like to be violated or intruded upon. My drawings reflected the “fear of life leaving you.” Psychodynamically, once you have been sexually abused your damaged body often is felt as it is never being truly yours again. (Kielo, p. 137)

The paradox of being with and thinking about the client and the client’s imagery is illustrated in G.’s experience of concordant countertransference. The “countertransference drawings” seemed to permit G. to identify with a shared affective experience, i.e. “through introjection I feel that this part (metaphor of the broken glass) of you is me and through projection I feel this part (fear of life leaving you) of me is you.” The affective reactions of both the therapist and the client were also clarified through observation and associations.

A similar processing of introjection and projection was remarked upon by B.:

I produced four pictures with the client in mind, with minimal intellectual processing. They seemed entirely spontaneous. At least, the first one was. The first painting showed the persecutory aspects of the transference, the constellation of the mother complex. I knew I was feeling anxious and sometimes getting angry at the client, not during the drawings but in situations where she would refuse to leave at the end of a session. It wasn’t until I produced the four drawings that I realized these feelings were persecutory. I don’t know how much it helped me with the processing but the drawing refined what the feelings were and enabled me to pinpoint the hypothetical age to which she had regressed. It was possible to gain access to this information by the feelings she was evoking in me and presumably the feelings I was evoking in her. I have a feeling.

Like countertransference, the term art has many meanings.
that sometimes when one does spontaneous art work that sort of thing does come out, if one but knew it. I probably have other pictures that came about as a result of something that happened with a client. (Kielo, p. 117)

It may be deduced from this description that prior to doing the drawings, B. was caught in the introjective phase, feeling anxious and angry. Money-Kyrle (1956) described these states as periods of non-understanding. According to him, these periods, if not clarified, can lead to conscious or unconscious anxiety which in turn continues to diminish the possibilities of understanding. He also suggested that this anxiety is likely to affect the patient. B.'s imagery provided an opportunity to refine the therapist's feelings, become conscious of the shared experience of "persecution" and to lower the anxiety level. This clarification of feelings resulted in a better understanding of the client.

J.'s experience with post-session imagery provides an example of clarification of feelings; however, in this case the feelings were unconscious:

It [the post-session imagery] shows me a little bit and sometimes it's no surprise, nothing much happened. Or sometimes I think I've been supportive and I find out from my art work that I really was quite angry at what was happening or I was frustrated because . . . of whatever. It [post-session art] is very helpful. (Kielo, p. 151)

According to LaMonica and Robbins (1980), the process of creating can provide a relaxed atmosphere where free association is possible. They suggested that art therapists who use their own imagery are involved in an experiential interplay of the art process, the art product and a free associational response to the patient in absentia. Thus, while involved in the act of creating, the art therapist is in a fully enmeshed state where he or she becomes aware of early impressions. These impressions can be experienced through the art-making process and sensations, providing the therapist with an access to pre-verbal material. On the other hand, the process provides a distance between what is experienced (the fully enmeshed state of doing the art) and what is observed (the looking at the art).

What had been experienced in a fully enmeshed state during the art therapy session seemed to be differentiated for some of the interviewees through post-session imagery. The following comments suggest such experiences. J.: Yes [the after-session drawings help to evaluate and clarify the countertransference]. Anyway you can help yourself to clarify what went on in the session. You have to realize you are one half of the human element in the session. It is important to clarify and separate what has been happening in the session. The more we clarify what was happening with us, the more we can separate it from what was happening with the client and the more we can see how the interrelationship leads to a healthier functioning for the client. (Kielo, p. 153)

G. commented:

I used response drawings to sort out a separation between my feelings and those of my clients. (Kielo, p. 133)

And C. said:

As I reviewed the process I would ask the question: Was I furious or was it the kid's [the client's] fury I was picking up on? (Kielo, p. 120)

The clarification of boundaries can result in a clarification of the complementary countertransference and subsequently, in the renewal of the concordant countertransference. As H. said:

Drawing with the client in mind probably doesn't help me so much with the understanding of the client as much as understanding of my own dynamics and what's going on with my relationship with that client. It helps me clarify things because I can then figure out what's "me" and what's "them" a little better. For example, I had a client who every week did something that related to me or some work of art I had done, and it was a little eerie. I spent a lot of time thinking this through because it was so close. I sat down and drew specifically. The drawing helped to clarify the relationship or the role I played to that client in what ways I was replaying for the client what the role that his mother had in relationship to him and what aspects of my personality played into this. (Kielo, p. 140)

Through the art work, H. was able to differentiate the therapist's affect from that of the client's. This differentiation led to a more profound understanding of an unconscious identification with the patient's projected internalized object—the complementary countertransference. Ultimately, H. was able to renew the concordant countertransference.

Another experience illustrates a developing awareness of the complementary countertransference. B. commented:

In my own art work it moved me to be more self-aware, so that I didn't become debilitated and therefore ineffectual to the client. One of the fears that particular stage of development (or regression) is that she would destroy the nurturing figure. In some ways that can be done, the energy can be sapped. What helped me was the acknowledgement of that, and therefore I became a little clearer with my boundaries so that she couldn't scoop me out any more.

---

... post-session art served as a way to clarify feelings by means of identifying with the client's symbols and experiences.
This was clarified for me through my art work. (Kielo, p. 118)

The imagery helped B. to recognize an unconscious identification with the patient’s internalized part object and to clarify the boundaries within the complementary countertransference. Concordant countertransference resulted, making the interchange more effective.

Conclusion

Creating post-session art is not always necessary to clarify the countertransference response. None of the art therapists who were interviewed suggested that they relied on this method on a continual basis. Some, in fact, never used post-session art. Nonetheless, the experiences of several of the art therapists seem to demonstrate that post-session art was useful as a means to develop an empathic capacity, to clarify confused feelings or render acknowledged feelings into form, and to evaluate an array of countertransference reactions.

References

In 1990 and 1991, a demographic survey was mailed to AATA Members along with annual membership dues billing. Members were asked to provide information regarding their areas of specialization, job setting, types and ages of populations with whom they work, as well as optional demographic information such as gender, age, hours worked, job title and salary. Of the 3492 surveys mailed, 1633 were returned, representing a 46.8% return rate. Reflecting in this high return rate is the marked increase in AATA membership. As can be seen in Table 1, there has been a significant increase since 1989 in all but one membership category.

The rate of overall membership has increased two-fold (9% to 18.4%) from the last survey. Illustrations A and B provide national and international membership statistics.

The educational level of survey respondents shifted slightly between categories as can be seen in Table 2. Many of the respondents with Bachelor’s degrees noted that they were currently working toward a Master’s degree or higher indicating a commitment to high professional standards within AATA.

Specialty Areas: As in the 1988–89 survey, specialties listed by AATA members reflect current mental health trends and areas where art therapists are finding employment. Note, however, that these figures may be an underestimate of actual specialization because only the first three areas were included in Figure 1. Many members chose more than three (some up to 15) contrary to the survey instructions.

Many members (N = 293) selected the “Other” category as an area of specialization. The most frequent of these areas is listed in Table 3. Less frequent categories included adult children of alcoholics, hearing impairments, crisis intervention, child neglect/abuse, depression, art teaching, personal growth, sexual offenders, hypnotherapy, homeless, and workshops and seminars. (Note the percentage column in Table 3 repre-

Primary and Secondary Work Settings: In several cases members selected more than one work setting. Figures 2 and 3 reflect only the first setting selected for each job. From this over-selection of settings, it seems members have diverse interests and employment. Also, many members neglected to complete this section of the survey even though they completed other sections.

Ages of Populations: Figure 4 presents the age ranges of clients with whom members work on their primary and secondary jobs.

Major Job Activities: Figures 5 and 6 display the breakdown of members’ three major job activities. Percent of time spent performing activities on their primary job are as follows: Supervision, 31.1%; research, 5.1%; teaching/training, 27.3%; administration, 16.4%; individual therapy, 71%; group therapy, 60.3%; family therapy, 21.3%; organ-
izational consultation, 12.2%; other activities, 1.8%. (Note that totals add to more than 100% due to three rank ordered activities being combined.) Other activities not listed but suggested as additional categories consisted of workshops, assessment/evaluations, paperwork, and writing books.

Time spent performing activities on their secondary job are: Supervision, 19.4%; research, 6.1%; teaching/training, 35.3%; administration, 6.7%; individual therapy, 55.7%; group therapy, 44.1%; family thera-
py, 22.4%; organizational consultation, 18.4%; other activities, 0.8%. Information used to create Figures 5 and 6 is based on only the first three rank ordered activities listed by members. Many respondents indicated numerous activities per job that were disregarded due to failure to follow directions. Four hundred fifteen members left this section of the survey blank.

**Population Types:** Figures 7 and 8
show the types of populations worked with by members. Only the first two population types listed by members were used in these figures.

**Salary by Title and by Hours Worked:** A total of 1022 members answered this question. Some respondents indicated that this question was too personal to answer. Others noted that they were unsure of their income due to variable billing and/or multiple jobs. Figure 9 presents a breakdown of salary ranges by five broad job categories. The figure titles used approximate the titles listed by respondents. Table 4 provides a summary of this data in $5000 increments.

Figure 10: Total Annual Salary by Hours Worked Each Week

Figures 10, 11, and 12 provide members’ salary ranges broken down on an hourly basis. Figure 10 gives information for total salary and Figures 11 and 12 display salary data for members’ primary (N = 1022) and secondary (N = 483) jobs.

Age, Gender, and Race: Figure 13 provides data concerning the age distribution of AATA members. 1512 members provided age information. Figure 14 shows data for gender of members. 1627 respondents provided gender information. Table 5 gives a breakdown of members’ racial background. 1573 members provided information for this data.

Survey Limitations: The primary limitations of this survey are: 1) it was incompletely or incorrectly filled out, and 2) many members failed to return their surveys. The percentage of incomplete data ranged from 0.4% (Sex) to 37.4% (Salary). Also, data such as areas of specialization or type of population were oversampled. However, a return rate of 46.8% is an acceptable percent of return, and even though specific directions to limit responses were not followed, respondents did provide usable information (e.g., areas of specialization was answered by 91% of respondents).

A copy of this survey may be obtained by AATA, Inc. members by sending a SASE ($2 postage) to the AATA, Inc. National Office (Also available to non-members for $2.00 per copy.)

Art Therapy in a War Zone

Hannah Sherebrin, A.T.R.

When I left Canada on December 2, 1990 to visit family in Israel, I had no inkling that I would be needed in a professional capacity. Because I had lived in Israel from 1944 until 1967, I am fluent in Hebrew, and therefore was able to lend a hand in alleviating some of the anxieties and tensions of professional therapists in the midst of SCUD attacks. On January 30, I conducted a workshop for the southern section of the Israel Arts Therapies Association in Beer Shevah, a thriving southern town.

Despite the nightly SCUD attacks, the reluctance to go out at night was overcome on that evening by close to thirty-five members, who came from the surrounding area to participate in a workshop exploring their own fears and reactions. The eerie sight of a row of gas masks lining one wall was a grim reminder of the frightening possibilities. I sensed the tension mounting as participants anticipated the nightly air raid. Laughter, work, and sharing started as I announced that I have a communiqué from the “highest authority” that there would not be an attack that night. One participant asked “What about tomorrow?” to which I replied that we should concentrate on one day at a time. The “high authority” did not disappoint me, and we were able to work through some of the tensions.

Not surprisingly, much of what had to be worked through was baggage from other times of stress. Grieving past wounds and reliving fears was a commonly shared experience. Anger surfaced, along with much of the worry about the children and the elderly.

Workshop participants also directed criticism toward men. This war was particularly difficult on the men since in the past, they were used to kissing their wives and children goodbye and going to the front as protectors. In this war, the entire country became the front, and the reserves were not called up! For the first few weeks of war, there was no school and only essential services were operating, forcing most men and women to stay home with their children. On the positive side, it created opportunities to get to know the children much better, and to have a feeling of togetherness in many families. The television station provided programs 24 hours a day; some of the programs concentrated on instruction in common family activities for the homebound population. Some men, however, chose not to wear their masks as a form of protest and a “macho” demonstration, which did not provide good examples for the children, and there were programs in which psychologists warned about the results of such behavior.

One of the techniques I used at the workshop to enable participants to explore and share was the Personal Shield drawing. This technique was adapted to Jewish culture by the use of the Star of David as the shield. Another was the folio envelope on which participants paste cut-out magazine pictures of objects or draw and paint things about themselves that they want to present to the world. This is their “mask” which they are willing to share. Inside they could represent the significant things they want for themselves, but cannot or will not share. It was interesting to see one of the participants, with a smile, stash her Personal Shield drawing in the envelope for safekeeping.

Since returning to Canada I have received encouraging letters from participants in the workshop. Some sent newspaper clippings on the various uses of art therapy within the schools, and with victims of the attacks who lost their homes. I would like to share some of those with you, but since they are in Hebrew, you will have to trust my translation. I will certainly make the originals available to those of you who want them.

DRAWING THE FEAR
(Maariv, Beer Shevah and the Negev, February 22, 1991)

THE CHILDREN WHO HEARD FOR THE FIRST TIME THIS WEEK AN EXPLOSION OF A MISSILE, GAVE EXPRESSION TO THEIR FEELINGS.

Until last Saturday the southern Israel region did not suffer long stays in the sealed rooms. The heroes were definitely the children who without realizing why, had to experience the masks and the loud booms which were heard clearly over the city. We asked the children to draw their feelings. Naomi Traklin, an educational psychologist, explained that the fears were transferred to drawings, which became manageable. The drawing of viper snakes (the code used on the radio before each actual alarm was sounded) pinpointed the moment of fear to the
sounding of the alarm. The resourcefulness and mental strength of the school population was praised by Traklin, who exclaimed, "Where else in the world did you see that children, after a night of alarms, pick up their gas masks and go to school to study? . . . We have to appreciate the mental strength that both children and adults who accompany them have displayed."

The lack of experience that the children and youth have in horrors of war can be to their benefit. They learn to cope with the dangers, and the aids that were provided, such as art therapy, help to decrease the fears.

**SCUD DRAWINGS**
*(Al Hamishmar, February 22, 1991)*

The Israel Art Museum in Ramat Gan was closed because it is located in an area which was hit by SCUDs several times. The museum staff, including artists and art therapists, went to work with the displaced families whose homes were demolished. The aim was to help externalize their anger by channeling it into creative drawings. The drawings are now displayed in the museum, and despite the fears and feelings which are revealed, the works portray aesthetic sensitivity and authenticity.

Many other articles appeared by art therapists, extolling the virtues of the use of art therapy. This is a curious after-effect of an unfortunate situation, which aided in bringing to the awareness of the general population the benefits and power of our profession. I would like to close with a letter which appeared in the second week of the war, while I was still there. This is a dialogue which was recorded by a sensitive father of two daughters, five-year-old Lilach and seven-year-old Iris. The two drawings were done by the children spontaneously.

**Fig. 3 Seven-year-old Iris**

**Fig. 4 Five-year-old Lilach**

**A DIALOGUE BETWEEN LILACH AND IRIS**
*(Haarez, January 25, 1991)*

This dialogue took place in the sealed room on the first night of the SCUD attacks between Thursday and Friday.

LILACH: I thought Sadam will arrive here, break down the door and fight us.
IRIS: And what will happen then?
LILACH: I don’t know what will happen. He did not materialize.
IRIS: I felt like throwing up from this mask. I almost choked. I felt I have no strength left. This is the first time I see such a long war. Imagine that the door is flung open and a monster arrives. I shuddered from fear. Mother told me “relax, relax.” I coughed and felt a total collapse.
LILACH: And how come you did not collapse?
IRIS: Mother calmed me down.
LILACH: What day is today?
IRIS: Friday, so we will see on television “The Beautiful Animals.” Maybe it will be good to kill Sadam’s wife?
LILACH: What, he has a wife? Does he love her? She must be ugly for sure. Instead of killing her, maybe they and their helpers could be disarmed?
IRIS: I wish they announced that war is over. You can be free. But maybe we should not go to school or work for a week.
LILACH: Why should we not go?
IRIS: Because maybe the Iraqis have planted a bomb or a mine and we will go out and step on it and it will blow us up. I pray that on Shabbat there will be no air raids. It will spoil our Shabbat.
LILACH: I pray that there will be no wars, period.

At 6:25 that morning Iris calls up her friend Mor, and tells her: “First we were afraid that the bomb contained gas, but it turned out that it was only a firebomb. So, Mor, do you want me to come over to your place someday when they will tell us that war is over and there is no need for masks any more?”

These last two drawings were produced at the time of the stay in the sealed room. Most families prepared their rooms with plenty of art supplies, books, games and other materials to occupy the people while in this state of isolation.

The war is over now, and I am sure that Iris has gone to visit Mor. Only time will tell if there are lingering psychological effects on the population of the entire region. Also, we should not forget that more than half of the population of Israel are either survivors or children of survivors of the Holocaust.

The experience of living through the recent Gulf War in Israel has filled me with awe and admiration for the spirit of restraint shown by one and all. There was a determination in everyone I met to see that life should get back to “normal” as soon as possible. I hope we can find encouragement in the positive use of art therapy and in the increased profile it is achieving as a result of the war.

---

For my clients

Approaching the door of health
you see light seeping.
As the door opens
you enter.

Out of your hearts leap colors of the spirit
the pain and joy of your living.

In the shadows of the deep crevices
the murderer of pleasure can be put to rest
once expressed.

What one feels can be said in art.
Truth is welcomed here
the truth of ink
the truth of colors
the rainbow after the storm.

Put your pain on paper.
Transform the serpent with fire red.

---

Let him breathe a gentler pink.
Laugh in yellow.
Cry in green, healing.

I have this button
that lies close to my heart
propelled also
by my mind and knowledge.
I press it when I get to work.
I call it my helper button.

I turn it on
and react.
and think
and love carefully
profoundly.
It’s light is not red
but green
for healing.
Art and Interaction: An Academic Fieldwork Program for Colleges, An Activities Program for Institutions

Reviewed by: Lynn Kapitan, MPS, A.T.R., Director of Graduate Art Therapy, Mount Mary College, Milwaukee, WI.

For the past fifteen years, Judith Peck, Associate Professor of Art at Ramapo State College of New Jersey has led an undergraduate fieldwork program with unique qualities. Students from diverse majors and areas of the college enroll in the course for a first-hand opportunity to learn art and social interaction to people living in institutions. The objectives of the program are two-fold: 1) To benefit those who live in a state of confinement by generating creative activity, enhancing self-esteem and confidence, and 2) to provide students with a field-based educational opportunity, fostering personal contact with "out-of-reach individuals and their distinctive situations and problems" (p. 1).

Consequently, the field manual Art and Interaction is written to inform the institution of the scope and sequence of such an art activity program, as well as to help the student and college support personnel who will carry it out. Peck decided to publish the field manual as more and more institutions and students were attracted to the program, recognizing its potential use in other colleges and universities. Indeed, the manual is very thorough in its presentation of the many complexities of undergraduate fieldwork. Because of the extensive detail contained in the manual, it is conceivable that the Ramapo College "Art and Interaction" interdisciplinary course could be replicated and serve as a model for a variety of related fieldwork programs.

The manual is divided into seven parts, beginning with an overview of the concept and design of the program and a description of the "magic mix: art and social interaction" as a basis for art programming in institutions. Part Two details the wide range of needs and characteristics which students and supervisors encounter when working in the field. Barriers to success are given attention, focusing on the impact of volunteers brought into the established routines of the institution. The reader is given many thoughtful ideas and suggestions for dealing with typical obstacles to the acceptance of art-making activities. Part Three describes how to combine the fieldwork component of the program with academic concerns and needs, and is written with an eye toward involving faculty of various disciplines. The detailed logistics of developing an undergraduate fieldwork course are provided, from curriculum planning to budgeting supplies. Part Four shifts to finding appropriate sites for the program, and emphasizes communication with on-site personnel who will be involved. Part Five presents the art projects that have been used successfully in the program with diverse populations. Readers who are unfamiliar with art processes can look to the program manual for a source of creative ideas and ways of presenting them to others who may be equally unfamiliar with art media. Suggestions for presenting the projects, displaying artwork, and interacting with the participants help the reader understand how the program works on a concrete level. Finally, evaluation criteria are discussed, followed by detailed appendices of evaluation instruments which have been useful. The detailed thoughtfulness of the material reflects a program that has been many years developing. Peck has anticipated and answered the questions of her readers from the sheer experience of finding the best means to deal with the unique challenges of field programs.

While the program presented is specific to an undergraduate non-major fieldwork course, supervisors, students, instructors and institutions may find this a useful book for developing art activities programming. In particular, institutions may look to it as a concrete example of an art activity program that is successful without being overly idealistic. Communication between the institution and those who carry out the program is well addressed; art therapists who are attempting to bring a new program into an institution will find this manual useful because it addresses many of the initial assumptions, problems and challenges involved.

The thoroughness of detail, however, is both of
value and a possible detriment to some of the manual's potential users. In this very specific form, Peck describes a program that could easily be misidentified and misconstrued as an art therapy program despite the care with which she claims it not to be. Art therapy programs in institutions aspire to identical goals and objectives, yet carry them out through trained expertise and long-term commitment. The danger in "how-to" manuals is their use by unknowing persons who are attracted to techniques but unaware of or unconcerned about the principles on which those techniques are based. The espoused value of bringing art into the lives of institutionalized people can be unwittingly trivialized when presented as a "free" program using student volunteers and short-term projects.

Art therapists who read the manual may also have difficulty with the use of art as a hand-maiden to other goals. Art in the program serves as a tool for college students with or without an art background to make contact with out-of-reach people, supported by the perspectives of non-art related professors and supervisors. Students in the course may have no contact with art other than having been taught how to do the projects for their presentations. If the value of art is not of great importance in the lives of the providers of the experience, it is difficult to imagine how its value will be communicated to those on the receiving end of these experiences.

After the manual is disseminated to a generic assortment of disciplines, who among those who use the manual will be committed to preserving the important, delicate balance which differentiates a solid art activity program from its identical-looking but superficial cousin? This is no small concern since Peck advises that institutions which have used for her program must demonstrate need, that is, should have no similar art program. In-patient and out-patient psychiatric patients, substance abuse, emotionally disturbed youth and abused children are among the populations targeted for this program—people who have critical needs that may be better served by art therapist than by student volunteers.

Because this is not an art therapy program, Peck does not focus on the profession other than in passing reference to training and expertise. Ironically, more reference to art therapy would have served as a professional "anchor" here which would do much to prevent the type of misinformed use the manual may unwittingly encourage. Readers would be able to see the interrelation and overlap of the various disciplines from which this manual draws, and understand how Art and Interaction is both different from and similar to art therapy, the field to which this program is most closely related.

When compared to some of the familiar artist-in-residence field-based programs which bring artists into institutions for a similar purpose, this manual is a welcome improvement. Often structure is lacking, goals are lofty and unrealistic, and presenters are unprepared and disruptive to the existing programming. It is apparent that Peck has been instrumental in making the Art and Interaction program an excellent one, and she has been sensitive to the many issues it raises. A lingering question, however, is how can she safeguard the values on which she bases this manual when the how-to is made accessible without a full context for understanding the foundation on which it is based? Art programs are often seen by non-art professionals as a "magic mix," to use Peck's term, and the idea of bringing in art is not explored beyond vague enrichment goals. Peck acknowledges the magic, but supports it with the hard work, care, and complexity that is intricately involved whenever people and institutions meet for art and interaction.

Multiple Personality Disorder from the Inside Out

Reviewer: Louis W. Tinnin, M.D., Associate Professor of Psychiatry, West Virginia University, Morgantown, West Virginia.

"What can I read about MPD (multiple personality disorder)?" It used to be that there was one answer for your clients, another for your supervisees, and still another for your colleagues. Now, the answer can be the same for all: "Start with Multiple Personality Disorder from the Inside Out." The idea for this book must have been a Eureka! experience for art therapist Barry Cohen who wanted a collection of writings by clients with MPD to hand out at his Eastern Regional Conferences on Abuse and Multiple Personality. His co-editor, Lynn W., publisher of MANY VOICES, a newsletter for clients, solicited
contributions from some 2300 readers. One hundred and fifty responded, and writings of 132 individuals are in the book. The other co-editor, Esther Giller, arranged publication by the foundation that she directs, the Sidran Foundation. The Sidran Press was established to publish this book.

The main text of the book is the contributions by clients with a final chapter by family members. The first chapter deals with feelings about the diagnosis of MPD: “We’re not crazy; we just lead complicated lives.” Other chapters express the pain of unresolved trauma, the mutual resentment between people with MPD and skeptical mental health workers, the “Vanishing Friend Syndrome” (“friends just drifted away”), and “Straight Talk for Therapists.”

This is what Julie W. wants all therapists to know:

1. *Keep your hands to yourself.* Child alters are in an adult body and that body has no business in your lap, being kissed, being cuddled.

2. *You’re not our parents.* . . . You can’t replace what never was and never will be. Child alters are not “your children” and you cannot re-raise us.

3. *Keep your opinions and emotions to yourself.* We don’t need your tears or your anger. We have a gracious plenty of our own.

4. *Don’t foster and encourage our dependence, helplessness and fears.* . . . Playing God may be fun, and for us, having someone who will love and protect us at every turn is enticing and seductive, but you’re not God and we’re not children!

5. *We’re not there for your entertainment.* Things that happened are not substance for “let’s amaze the neighbors.” Don’t tell or hint at our stories to others (especially to those who know us), other multiples included.

6. *I’m not your therapist.* . . . Take the money we pay you and go get your own therapist.

7. *You are not going to heal us.* Given support, guidance, boundaries, the freedom to err, make our own decisions, patience, honesty, we are the only ones who can heal us. You are not a mechanic, and we are not cars.

8. *Remember that we are real, living, breathing people.* At the end of the hour, we don’t get to leave our memories behind.

There is an excellent overview of multiple personality disorder and dissociation in just three pages of the introduction. The book also has lists of treatment programs, non-profit organizations, periodicals, tapes, and books.

Art therapists will find that the book’s weakness is the lack of pictures. The poetry and prose engage the reader but pictures by the contributors would really make a connection.

The unique quality of this book is the authentic voice of the person with multiple personality disorder describing an unimaginable experience of life that becomes comprehensible and familiar. At some point the therapist who is learning about MPD must gain this understanding from the inside out and this can be a slow process when working with only one or a few individual clients. This book offers a giant step towards this understanding.

SEND TO: ________________________________ MBR. ID. NO. ________________________________

City __________________________ State ___________ Zip Code ___________
THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3000 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice. AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA’s dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

Purpose:

- The progressive development of the therapeutic use of art.
- The advancement of standards of practice, ethical standards, education and research.
- The provision of professional communication and exchange with colleagues.
- The provision of legislative efforts to promote and improve the status of professional practice.
- The promotion of the field of art therapy through the dissemination of public information.

Chapters:

Affiliated Chapters of the AATA have been established throughout the U.S. Chapters conduct meetings and activities in an effort to promote the field of art therapy on a local level. Chapters provide a forum for addressing professional issues as well as a network of people working toward common goals, information and support for Chapter members is passed on from the AATA Assembly of Affiliate Chapters to the local level.

You must be a national member to become a Chapter member. Information on locating the chapter nearest you is available from the AATA office.

MEMBER BENEFITS

Individual members receive

Publications

- Art Therapy, the official journal of the AATA.
- The quarterly AATA Newsletter.
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest.

Services

- Insurance, including professional liability, major medical, life and disability.
- Access to national experts in art therapy.

AATA Conferences

- Discounts on registration fees to AATA national and regional conferences.

Nationwide Advocacy

- Governmental affairs activities including Congressional review and monitoring.
- State legislative and regulatory activities.
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy.

Professional Standards

- Development of model job and licensure laws.
- Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists.

GENERAL MEMBERSHIP APPLICATIONS

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY: Please follow the chart below when submitting membership application.

Applications received between
- Jan. 1st and May 31st—Full dues payment.
- Membership will expire Dec. 31st of same year.
- June 1st and Sept 30th—Half year dues plus $5.00 payment, membership will expire Dec. 31st of same year.
- Oct. 1st and Dec. 31st—Full dues payment; membership for the remainder of current year and the next full year through Dec. 31st.
3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (A.T.R.) each have a separate application procedure. Registration is bestowed only the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL—by application only; such members may vote, hold office and serve on committees.
- Credentialed Professional Member: Individuals who have been dually approved for Professional Membership and Registration (A.T.R.) by the AATA, dues are $60 per year.
- Active Professional Member: Individuals who have completed professional training in art therapy, dues are $75 per year.

CONTRIBUTING—Individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year.

ASSOCIATE—Individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year.

STUDENT—Individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.
LOOKING FOR JUST THE RIGHT WORDS TO DESCRIBE A CLIENT’S BEHAVIORS?

You’ll find them in The Clinician’s Thesaurus 2E. You can tailor your narratives choosing from 17,000+ descriptive terms and standard phrases for all aspects of psychological and social evaluations.

Perfectly organized for easy access, to prompt your recall of a client, to stimulate your thinking, and to sharpen your writing. It offers hundreds of descriptors for Mental Status and cognitive functioning, words and phrases for Behavioral and Interpersonal Observations, Affects, ADLs, Vocational, Recreational and Social Functioning, all Personality Disorders, Diagnoses, Prognoses, Closing the report, Recommendations, Confidentiality Notices, and more handy items.

Suitable for older children and adults, and any orientation or evaluation purpose. Ideal for students and refreshing for the senior practitioner. 16,000+ sold. Order today and you will have it in 2 weeks with a money back guarantee of satisfaction. $23.50 includes shipping to Three Wishes Press AT1, Box 81033, Pittsburgh, PA 15217. Thanks.

Guidelines for Authors

Please submit six (6) copies of manuscripts to: Art Therapy Journal, AATA National Office, 1202 Allanson Rd., Mundelein, IL 60060. AATA cannot be responsible for submissions sent to any other address. Only original articles that are not under review by another periodical are acceptable.

FORM: Typewritten, double-spaced on 8½”×11”-inch bond paper, with 1” margins.

COVER PAGE: A detachable cover page to facilitate blind review should include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent.

ABSTRACT: An abstract of 100-125 words outlining the main ideas of the paper is required.

SECTION HEADINGS: The organization of the paper should be clearly indicated by headings and sub-headings, if appropriate.

FIGURES: For line drawings, use black ink and a good grade of white drawing paper. Photographs must be 5”×7” black-and-white glossy prints with high contrast. Charts, diagrams and tables should be of professional quality, and legible enough to withstand reduction.

Write figure numbers on gummed labels and attach to the back of all figures. Captions must be typed and submitted on a separate sheet. In the text, refer to figures as Figure 1, Figure 2, etc.

Authors must obtain permission to reproduce the figure from a copyrighted source.

REFERENCES: References must be typed, double-spaced, in alphabetical order, on a separate sheet.

CONFIDENTIALITY: Client/Patient confidentiality must be protected in title, abstract, text, photos and other accompanying material. Proper releases must be obtained.

THE ARTS IN PSYCHOTHERAPY
An International Journal

Editor-In-Chief:
David Read Johnson, PhD, RDT
Associate Clinical Professor, Department of Psychiatry, Yale University; Clinical Psychologist, Veterans Administration Medical Center, West Spring Street, West Haven, CT 06515, USA

THE ARTS IN PSYCHOTHERAPY is a quarterly, international journal for professionals in the fields of mental health and education. The journal publishes articles (including illustrations) by art, dance/movement, music, poetry and drama psychotherapists, as well as psychiatrists and psychologists, that reflect the theory and practice of these disciplines. There are no restrictions on philosophical orientation or application.

SPECIAL RATES AVAILABLE FOR MEMBERS OF QUALIFYING SOCIETIES!
Members of qualifying societies can receive a discount on one-year Professional subscriptions to the THE ARTS IN PSYCHOTHERAPY. Please write for further information.

Editors welcome original manuscripts. Submit papers in triplicate to: Managing Editor, Sylvia Halpern, 20 Ridgecrest East, Scarsdale, NY 10583

SUBSCRIPTION INFORMATION
ISSN: 0197-4556
Volume 17, 1990
Published 4 issues per annum
Annual Institution Subscription Rate (1990) US$130.00
Two-Year Institution Rate (1990/91) US$247.00
Professional Rate (1990) US$ 40.00
Student Rate (1990) US$ 16.00
STATEMENT OF PURPOSE: Art Therapy: Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development, and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 35-3180568) is published triannually by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois, U.S.A. 60060. Telephone (708) 949-6064, FAX (708) 566-4580. Non-members may subscribe at the following annual rates: $25 (U.S.) and $42 (Foreign); Institutions: $36 (U.S.) and $53 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issue: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060 (708) 949-6064.

This Journal is abstracted in: Psychological Abstracts, Art Bibliographies Current Titles and Art Bibliographies Modern.

Advertising: Please see advertising rates listed elsewhere in this Journal or contact the American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 (708) 949-6064. The publication of any advertisement by the AATA, Inc., is not an endorsement of the advertiser or of the products or services advertised. The AATA, Inc., is not responsible for any claims made in an advertisement.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

Reviews
The Art Therapist's Third Hand—Reflections on Art, Art Therapy and Society

About the Cover: "Considering Context—Collecting Data"; plexiglass/collage box by Carleen Jimenez. About the piece, Ms. Jimenez says: "Art therapists make art; that’s what we do that makes us unique. That’s how we do our personal research. Art is our method for collecting data, as well as gifts of the self.”
Editorial

Beginnings and Endings

The position of Editor of Art Therapy: Journal of the American Art Therapy Association is an adventure that I am honored to undertake. Although Art Therapy begins its ninth year of publication with this issue, there have been only two previous Editors of this journal. In 1983, Linda Gantt, Ph.D., A.T.R., served as Interim Editor along with Mildred Lachman-Chapin, M.Ed., A.T.R., who served as Interim Associate Editor. Gary Barlow, Ed.D., A.T.R., was later named Editor, beginning with the second issue of Art Therapy. During the collective terms of these three individuals we have witnessed a tremendous growth in AATA membership, educational programs, standards and professional diversity. The latter has been reflected in the variety of articles presented in the journal during the last eight years, with topics focusing on theoretical issues, practice and application, and research.

To some extent, Art Therapy guides the identity of our profession. All the various authors who have written articles, viewpoints and reviews for the journal have contributed in a very important way to the direction our profession has taken over the years. For this reason, Art Therapy has become a unique forum for the exploration and discussion of ideas about the theory and practice of art therapy within the profession. It provides the opportunity for our observations and conjectures to be tested and critiqued, refined and reconsidered. This constant reevaluation, integration and synthesis of ideas makes our professional field accountable in both concept and application.

You have probably noticed that there have been some dramatic changes in the look and style of Art Therapy, which I hope you will find refreshing. Members of the Editorial Board and I felt that it was important to create a new image for the journal that was both contemporary and professional. I wish I could take full credit for the fresh new graphics and fonts, but that credit belongs to David Larson and Tom Rose, Department of Graphic Design at the University of Utah. They listened carefully to the ideas and suggestions I presented for Art Therapy and designed a new cover and layout that would meet our esthetic and practical requirements.

With regard to the layout, some of the section headings in Art Therapy are familiar to you, and others are new to this issue. When submitting manuscripts or other materials to Art Therapy, please consider the suggested intent of each of the following categories:

1. Full-length Articles. Full-length articles are received by Art Therapy at any time, and may focus on theory, practice and research in art therapy or related areas relevant to art therapy. Submissions in this category must include an abstract of approximately 75-125 words summarizing the major point of the article.

2. Brief Reports. This section is new to Art Therapy and is intended for short articles which focus on the results of research. Submissions should include information on research design, methodology and results; an abstract of approximately 75-125 words should also be included.
3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.

4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted for consideration at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office.

5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office.

6. **Commentaries.** This is a new section which includes brief comments on articles published in *Art Therapy*, issues critical to the profession, or letters to the Editor.

*Art Therapy*, as stated in the Guidelines for Submissions (see the back section of this issue) and the policies and procedures of the journal, uses a blind peer review system to determine publishability of theoretical, methodological and research articles. Each submission (except Viewpoints, Book or Film/Video Reviews, and Commentaries) is reviewed by two individuals for style, content, strength of thesis/data presented, and relevance to art therapy. If accepted, it is generally expected that the author will be asked to make some revisions to the manuscript before resubmission and eventual publication. This process insures that all submissions are treated equally and that the highest standards of excellence and scholarship can be applied.

There are three aspects of submissions to *Art Therapy* I would like to encourage. The first is that a critical review of the literature be undertaken by all authors. The most provocative articles often begin with a hard look at what has been previously presented; they do not simply recount what has been already done. Raising questions about the theoretical bases and practical applications of art therapy, while drawing upon the literature and the author's own observations, enhances the strength of an article and leads to the discourse necessary to advance our professional field.

Secondly, I would also like to encourage a greater number and variety of research submissions to *Art Therapy*, both as full-length articles and as brief reports. It is necessary to have a variety of methodological models presented, not only to demonstrate the multiplicity of possible approaches, but because different models measure different aspects of what we do as art therapists and how we perceive the art expressions of our clients. Case studies, which have been the staple of submissions over the years, can be useful if a specific model of case study research is used; however, it is the Editorial policy of *Art Therapy* to discourage lengthy case studies that are not guided by a precise methodological approach.

Lastly, I would like to encourage visual art to become a more prominent part of *Art Therapy*. Articles, brief reports, viewpoints and commentaries which emphasize the centrality of visual art to the practice and theory of art therapy are especially welcome. Also, I encourage you to submit art created by art therapists as well as client art expressions (with appropriate releases, of course) for consideration for publication on the front cover of the journal. It is equally important to honor the "art" part of our lives as it is to display our talents as clinicians and educators.

To begin my term as Editor I have at my side an admirable group of individuals, including: Patricia St. John, Ed.D., A.T.R., who will serve as Associate Editor; Elizabeth Radcliffe, MFCC, A.T.R., Book Editor; James Consoli, M.A., A.T.R., NCC, Film/Video Editor; and Frances E. Anderson, Ed.D., A.T.R., HLM, who has been appointed as Publications Chair. Additionally, there is an impressive list of members of the Editorial Board (see inside cover) who represent areas of clinical, educational and related expertise necessary to a well-balanced professional viewpoint.

**An Ending**

Lastly, as I began my term as Editor of *Art Therapy* in December, the field of art therapy lost one of its finest editors, clinicians and educators, Elinor Ulman, D.A.T., A.T.R., HLM (please see special feature following this editorial). Dr. Ulman was the founder and long-time editor of the *Bulletin of Art Therapy* (started in 1961), later renamed the *American Journal of Art Therapy*. For many, the *Bulletin* was a lifeline during a time when very few published works on art therapy were available. Art therapists and students could finally read about the experiences of other art therapists and, for the first time, had a forum to share their observations and discoveries about an emerging field. The *Bulletin* became not only a vehicle for communication, but it also validated and affirmed the work of art therapists throughout the U.S. and beyond.
BEGINNINGS AND ENDINGS

I was not exposed to the Bulletin and the American Journal of Art Therapy until almost two decades from its inception when I was a graduate student in art therapy. It was obvious to me, even as a novice, that Elinor Ulman had a unique capacity as editor for recognizing a variety of theoretical approaches and techniques, while at the same time maintaining a high standard of excellence in these two publications. And, as many graduate students, I poured over all the volumes of the Bulletin and the AJAT, encouraged and excited by the wealth and diversity of information on those pages.

In a recent conversation regarding Dr. Ulman’s death, Cay Drachnik, MFCC, A.T.R., HLM, observed that Elinor Ulman was an important force in the lives of many art therapists as well as the milestones of our collective history as a profession. Cay emphasized how the course of her own life was greatly affected by Elinor Ulman and, because of her encouragement, Cay helped to establish the Northern California Art Therapy Association (NCATA), became legislatively active in both the NCATA and the AATA, and eventually successfully ran for President-Elect of the AATA. It is likely that many, many other achievements and important events in the lives of art therapists were a direct result of Dr. Ulman’s broad influence, support and advice.

In the first issue of Art Therapy in October 1983, Mildred Lachman-Chapin, M.Ed., A.T.R., also observed the effect that Elinor Ulman has had on our field, particularly in her ability to exquisitely articulate and logically analyze the issues we struggle with as a profession. Of Dr. Ulman, she said:

“Through her writings she clarified some of our basic concepts. She has been a relentlessly demanding editor of that journal (AJAT), insisting on the highest standards of clarity in thinking and writing. Not only did she require you to have something meaningful and relevant to say, but she also insisted that you say it well, which, I think, comes down to combining the word-language of the scientist on one hand with the poet’s reconstruction of reality on the other” (Lachman-Chapin, 1983, pp. 48-49).

I am honored and humbled to have the opportunity to pay tribute to the passing of one of the most significant historical figures in our field. I hope to begin and continue my term as Editor of Art Therapy in a tradition of excellence that Dr. Elinor Ulman, A.T.R., HLM, established for our profession.

SPECIAL FEATURE:

Tribute to Elinor Ulman, D.A.T., A.T.R., HLM

Elinor Ulman, D.A.T., A.T.R., HLM, adjunct professor emeritus of art therapy at George Washington University, died on December 11, 1991. According to a personal communication from Claire Levy, Dr. Ulman "died peacefully in her chair in her apartment. She simply fell asleep after dinner with friends."

An obituary in the Washington Post dated December 15, 1991, read as follows:

"Elinor Ulman, 81, adjunct professor emeritus of art therapy at George Washington University, died of congestive heart failure Dec. 11 at Sibley Memorial Hospital. She had lived in Washington since 1945.

She retired in 1988 from George Washington, where in 1971 she helped establish the art therapy training program in the Graduate School of Arts and Sciences. A pioneer in art therapy starting in the 1950's, she was founder and editor of the American Journal of Art Therapy.

Dr. Ulman was a native of Baltimore. She was a Phi Beta Kappa graduate of Wellesley College and had a second bachelor's degree, in landscape architecture, from the University of Iowa. She also studied drawing and painting privately in the United States and China. She had an honorary doctorate degree in art therapy from the Vermont College of Norwich University.

Her paintings were exhibited at the Corcoran Gallery of Art, the New York World's Fair of 1939, the Phillips Gallery, and the Baltimore Museum of Art, where she also helped catalogue and manage the Cone Collection.

She was a psychiatric art therapist at D.C. General Hospital from 1955 to 1965, and until 1973 taught art therapy at the Washington School of Psychiatry.

Dr. Ulman was editor of two collections of selections from the American Journal of Art Therapy. She belonged to the American Art Therapy Association and the Phi Beta Kappa Association.

Survivors include a brother, Joseph Ulman of Bethany, Conn."

A service was held for Dr. Ulman on January 18, 1992, at The George Washington University, Marvin Center Ballroom, Washington, D.C. Contributions in Elinor Ulman's memory may be made to: Craftsby Library, Craftsby Common, VT 05827 or to: Founder's Fund for Art Therapy, 4101 Cathedral Avenue NW # 610, Washington, DC 20016.
IN MEMORY OF ELINOR ULMAN
1910-1991

by Linda Gantt, Ph.D., A.T.R.

Elinor Ulman, who, more than any other individual, gave us precise words to describe what is often called a nonverbal therapy, died of congestive heart failure on December 11, 1991, in Washington, D.C. At the time of her death, she was the Executive Editor of the American Journal of Art Therapy, the professional journal she had founded 30 years before. That scholarly publication, established when there were an estimated 30 practicing art therapists, linked previously isolated individuals together, offered theoretical points and clinical technique, informed them of lectures and training courses in the United States and the rest of the world, and served as the forum for discussing the pros and cons of developing an association.

Background

Elinor was born in Baltimore, Maryland, where her father was a liberal judge. He was an excellent writer; both Elinor and her brother Joseph had similar skills. Elinor received a bachelor's degree in English from Wellesley College where she was a member of Phi Beta Kappa. She obtained another bachelor's degree from the Iowa State College in landscape architecture and had a brief apprenticeship under Frank Lloyd Wright.

As Elinor stated a number of times, "My talent and taste for literary expression are at least equal to my talent and taste for the visual arts" (Jordan, 1986, p. 128). Her initial selection of a profession was that of an artist. Her painting teachers included George Grosz, Maurice Sterne, and Othon Coubine. She studied brush painting in China. Her paintings were exhibited at the New York World's Fair (1939), the Corcoran Gallery of Art and the Phillips Gallery (both in Washington), and the Baltimore Museum of Art. It was at the Baltimore Museum where she served as the curator of the Cone Collection.

Becoming an Art Therapist

In 1945, Elinor moved to Washington. By the early 1950's she had "drifted" into art therapy because she had become a "frustrated painter." She entered psychoanalysis "shortly before [her] first for-
ay into art therapy” and ultimately had three analyses with Freudian therapists (Jordan, 1986, p. 128). When she began working for the District of Columbia Health Department in 1951, she considered herself to be an art teacher. She led an art group and supervised a program of occupational and recreational therapy for patients of the Alcoholic Rehabilitation Clinic, District of Columbia Department of Mental Health. For ten years (1955-1965) she was the director of the art therapy program she had initiated at the District of Columbia General Hospital.

It was at DC General that she developed and refined her assessment procedure (now termed the Ulman Personality Assessment Procedure). This three-picture series is a carefully thought-out process designed to elicit a patient’s response to certain types of situations. Dr. Bernard Levy, a psychologist with whom Elinor worked, encouraged her to standardize the materials and method of instruction. Bernie, an excellent watercolorist, became Elinor’s life-long friend and professional colleague and devoted almost as much energy to promote art therapy as she did.

**Founding the Bulletin of Art Therapy**

In 1961, at Bernie’s urging, Elinor launched the *Bulletin of Art Therapy*. The Levy family contributed more than moral support and encouragement to this publishing venture; Bernie served on the Editorial Board and wrote “pithy” (one of his favorite words) book reviews and his wife Claire became Book Review Editor, Editorial Assistant, and Office Manager (which entailed handling mail, subscriptions, and heavy packages as well as serving as a sounding board). Subscriptions increased by word-of-mouth and by the third year, there were readers throughout the United States and in 21 countries.

Elinor found her own writing to be an arduous process, as had happened earlier with her painting, but she devoted her energies to becoming a superb editor. The articles she painfully and painstakingly crafted about professional issues are worth reading today for their timeless quality. And sprinkled throughout the three decades of issues are tiny gems such as the four-part series on the “War Between English and Therapese.” In these brief essays, she urged readers to send examples and to monitor the *Bulletin* “if you spot a fancy word . . . where a plain one would serve” (1962, *Bulletin of Art Therapy*, 2, (2):p. 77). After Elinor’s death, Edith Kramer said she had urged Elinor repeatedly to add to the series but to no avail.

Elinor loved to have a juicy topic to punch up the “Reader’s Forum” and delighted in printing the letters whose writers said she would not print. (My personal favorite is an exchange of letters about one of Edith Kramer’s articles with the counterpoints being made by Elinor’s brother Joseph, who was himself a professional editor. He objected to an interpretation of a particular picture (1964, *Bulletin of Art Therapy*, 3 (2):42) and this brought several thought-provoking responses (1964, *Bulletin of Art Therapy*, 3 (3):82, 117-118)).

The *Bulletin*’s regular features included news and listings of recent publications from around the world and became an unofficial record of the field’s development. The back issues still remain the best source for anyone interested in art therapy’s historical material.

Elinor joined the faculty at the Washington School of Psychiatry the same year she launched the *Bulletin*, and taught both introductory courses and advanced seminars on art therapy there until 1973. It was at the Washington School that I took such courses with Elinor and I count myself as quite fortunate to have been in class the night Bernie asked which of us would like to get a Master’s degree in art therapy. He and Elinor had been working on plans for a graduate training program at The George Washington University where she had become an Assistant Professorial Lecturer in 1968, and Bernie was Professor of Psychology and the head of the Psychology Department. When six of us agreed to apply for special status in the graduate school, Bernie was certain he could convince the Dean that there was sufficient interest in the field to warrant a full-fledged program. The program officially began in 1971 with Elinor in the position of adjunct Assistant Professor and Coordinator of Training. Elinor’s devotion to high standards was supported by other faculty members with similar convictions. In addition to Bernie, they included Hanna Yassa Kwiatkowska and Edith Kramer who came once a month from New York City. By this time, Elinor had left DC General and was a Consultant in Art Therapy for the Northern Virginia Mental Health Institute.

**The Formation of the Association**

In its October 1968 issue, the *Bulletin* carried an announcement of a meeting to be held in Philadelphia on December 5, for art therapists interested in forming a national association. Elinor was invited to give a lecture following that afternoon meeting. When the group met the following year to make the American Art Therapy Association official, Elinor duly reported that in the *News* section.
Initially, Elinor was not in favor of having an association (Jordan, 1988). To her, such a step seemed premature and more likely to hinder innovation in the field rather than promote it. However, unlike Margaret Naumburg who did not actively participate in creating a national organization, Elinor reluctantly joined the crucial discussions about its purpose, proposed committees, and standards. When Elinor realized that she could not quell the impetus toward forming such a group, she concluded that "I didn't like organization, but if I was going to be organized, I would rather organize than be organized by other people" (Jordan, 1988:107).

In the same issue in which she reported the beginnings of the AATA she announced that her publication would become the American Journal of Art Therapy. She modestly characterized her own part in the formation of the Association as "indirect." But many have credited her with greatly hastening the birth of the organization even though she certainly did not intend to. She acknowledged that her prophecies in the Bulletin's beginning was that a professional association would bring about "an eventual decrease in both the naive foolishness and the creative adventure subsumed under the name of art therapy" (1969, American Journal of Art Therapy, 9 (1):2).

**Association Work**

Not too long after the Association was formed Elinor offered a discount on subscriptions for AATA members (1970, American Journal of Art Therapy, 9, (3)). At that time she stated that the Journal had always operated at a loss—but she did not ever write of that issue again. As sole owner and publisher, she bore all the costs of the operation and bailed it out when necessary. In 1966, she had formed a corporation (the Association for Art Therapy) with the "principal objective [being] to assure continued publication of the Bulletin of Art Therapy" (1966, Bulletin of Art Therapy, 5, (3):86, 104). A major task of the corporation was to seek additional funding. While Elinor had hoped that as subscriptions increased they would cover the considerable costs of editing and production, they never did. When I was the AATA Publications Chair I urged her to raise the subscription rates but she refused, saying that she wished to make it available to as many people as possible.

At the AATA's Second Annual Meeting, September, 1971, Elinor was elected to serve as Education Chair and Board member for two years. In that capacity, she (assisted by members of the Education Committee) wrote the first Guidelines for Art Therapy Training, adopted by the Board in 1973. This position was followed by another Board term as Recording Secretary (1975-1977). In 1972, the Association bestowed on her its third Honorary Life Membership. Her chief contribution to the Association was as its conscience—to point out truths and principles which others would not voice.

Elinor served as a catalyst to the formation of the Potomac Art Therapy Association in October, 1975, just as she had in the formation of the AATA in that she provided us with the mailing list of Washington, D.C., subscribers to AJAT. She and Bernie attended the first meeting at which the bylaws were adopted but never attended another formal business meeting after that. I thought that they had, by attending that initial meeting, determined that the group was on solid ground and that they need not worry about its direction.

Because Elinor did not talk about the precarious financial situation of AJAT, most of the AATA members had no idea of the amount of money needed for publishing a journal of high quality. But financial costs were the least considered when a debate about the AJAT/AATA affiliation arose. In 1974, AJAT entered into a formal affiliation with the AATA, with the expressed intent of having the Association own the Journal one day. The first two AATA representatives to the Editorial Board were Barbara Treasure and Mildred Lachman (later Lachman-Chapin), Chair of the Publications Committee. But Elinor continued to be the Editor and the chief rescuer from debt. The association paid for the subscriptions to members but did not underwrite any other costs.

For a long time, the Journal served as the only publication of its kind. When The Arts in Psychotherapy was established, some members sought to have a choice of subscription. Bitter debates ensued. A rallying point was the selection of book reviewers (see, for example, S. McNiff, 1981:2). During the Annual Membership meeting at the 9th Annual Conference the members passed a motion to separate the dues from journal subscriptions. Since there was a binding contract in force at the time, a full membership vote could not be immediately taken.

An editorial in the AATA Newsletter (Vol. X, No. 2, April/May 1980, p. 10-11) supporting continued affiliation attempted to give an assessment of the Journal place:

... Ms. Ulman would not want to be lauded for her monetary contributions, the extent of which few have known until now, but for her literary contributions which have earned the Journal respect far be-
Beyond art therapy circles as evidenced by a readership three times the Association's membership.

That the *Journal* has adhered to the highest standards of scholarship is not in dispute. It can be confirmed by perusing past volumes. Ms. Ulman has labored to create a publication which presents a wide variety of well-written articles by authors representing different theoretical stances, philosophical bases, and professions. A brief scanning of the indices for recent years shows contributions by art therapists and allied professionals from Germany, Ireland, England, Israel, Brazil, Romania, Czechoslovakia, and Italy.

That the *Journal* [has been involved in heated debates is not in dispute either. Ms. Ulman has never backed away from a topic or opinion because it was controversial or unpopular. The maiden issue carried an editorial which outlined the hopes and plans for the new publication which 'should be first and foremost a forum for the vigorous discussion of ideas.'

Acrimonious debate led to the passage of the motion at the Conference but cooler heads prevailed, and the AATA Board voted to continue the relationship. When the question was submitted to the entire membership by mail ballot in 1982, 248 members voted for continuing affiliation and 88 voted against it.

Those who want the details of the subsequent negotiations can find a detailed chronology in the *AATA Newsletter* (Vol. XII, No. 2, April, 1983). When the negotiations were irreparably broken off, the AATA formed a journal planning committee and began its own journal in October, 1983.

**Vermont**

Elinor, having fallen in love with Vermont, had established a summer home there. A fortunate result of this was her relationship with Gladys Agell. The all-day workshop Elinor conducted in 1973 at Vermont State Hospital at the request of Gladys who was then Acting Director of Activities at the hospital eventually led to development of another graduate training program, first at Goddard College and then at Vermont College. (Later, Norwich University acquired Vermont College. For her contributions to the development of the field, the university bestowed on Elinor the first honorary Doctorate of Art Therapy.) Bernie Levy and his family had come to buy their own summer place so he was available for teaching.

**AJAT's Move to Norwich**

In the fall of 1984, *AJAT* accepted an offer from Norwich University to move its operations there. Elinor was given the permanent position of Executive Editor and Barbara Sobol served briefly as Editor. Gladys Agell, who was instrumental in getting Norwich to become the publisher, is now the Editor. Elinor worked on *AJAT* until her death, reviewing and commenting on every article considered for publication.

**Later Life**

Those who knew Elinor for any length of time continued to be surprised at her capacity to overcome physical illness. She had a serious bout with breast cancer in middle age, and severe heart problems (she underwent valve replacement and installation of a pacemaker). Yet, these major health problems did not keep her from swimming in her cold Vermont pond, taking long walks in the woods, and presenting at the 1990 AATA Conference in Washington.

When she retired from George Washington in 1988, *AJAT* and GW established the annual Elinor Ulman Prize for Writing. She held the title Adjunct Professor Emeritus at her death.

**Special Relationships**

At her memorial service those of us who knew her only through art therapy were treated to a different side of her personality as we heard family and friends describe in detail her generosity (especially toward children), her delight in cats, her love of beautiful objects, her collection of children's drawings on the second floor of her Vermont farmhouse, her pleasure in European trips, her excitement over new experiences, and a brief note found in her desk after she died which described her thoughts about her failing health. One of the most passionate statements was made by a man who spoke of Elinor's mentorship for his career as an artist and told how she introduced him to the works of her favorite painters by taking him to museums.

Her often brusque demeanor in professional situations seldom gave an inkling of this aspect of her that she reserved for a select few. But those with whom she had a personal relationship were rewarded with a magnanimous spirit.

**Assessment of Her Contributions**

Elinor wrote, "Perhaps the quality most needed by the art therapist is courage", *Ulman*, 1975, page 6. That she had in spades. In 1988, Edith Kramer wrote a public letter of appreciation: "I have often
told Elinor that she is the Eleanor Roosevelt of art therapy, brilliant, incorruptible, and ready to do battle. As all just individuals she has not hesitated to prod and mobilize those who shared her ideas, but would have avoided battle and retired into discontented inertia’ (Kramer, 1988: 112). In an interview with Henrietta Jordan, Elinor summed up her views: “Edith Kramer and I recently agreed that we both tended to enjoy the isolation that goes with being a pioneer because it gave us great freedom and we liked being unencumbered, self-directed, accountable only to ourselves. I have often told students how it pleased me in the early days that nobody around me knew as well as I did what I was supposed to be doing. I don’t envy today’s students their chance to study in degree programs in preparation for their careers as clinicians. Edith suggested that this helps explain why I started AJAT single-handed, and was as willing to foot the bills as I was unwilling to compromise” (Jordan, 1988: 11).

Biographical details convey only part of what Elinor was like. That some of her relationships with other officers and members of AATA were difficult is an understatement. Her insistence on rigorous thinking and accurate writing was legendary. As a result, some people had a hard time seeing why she was so insistent on certain points. But she had no need to be liked by large numbers of others. She accepted conflict as an innate part of human existence (Ulman, 1986, p. 125) and never shrank from it, be it internal or external. But it was not conflict for its own sake that she relished but the battle to uphold a cherished principle.

Since writing was difficult for her, the book she wanted to write never materialized. Instead, she turned her labors to editing the works of others. Many authors (especially students who received their first papers bleeding with her corrections) felt physically wounded. But her editing was not a hostile act; it was more like an annealing process—tried by fire and Elinor’s red pencil!

To describe Elinor as the backbone of art therapy may sound like a strange metaphor, yet this is precisely the way she functioned. She provided both a structure for the developing field by giving shape to ideas about its definition and a conscience for its members. An extraordinary woman, she had rare attributes—not of compromise and diplomacy but of intelligence and tenacity.

All art therapists and art therapy students should read her last extensive article (Ulman, 1986) and her interview with Henrietta Jordan (Jordan, 1988) to gain a perspective on her views. Far from contributing to polarizing the field, Elinor pointed out the utter necessity of remaining flexible in one’s approach. Whether one used art as therapy or art psychotherapy, one must make the choice according to the situation so as to better serve the client. But “. . . every choice entails as a sacrifice of whatever lies along and at the end of the road not taken” (Ulman, 1986: 131). By not only pointing out such complexities but celebrating them, Elinor Ulman has left to us a precious legacy.

ELINOR ULMAN (1910-1991)

Gladys Agell, Ph.D., A.T.R., HLM.

Elinor Ulman died peacefully on December 11, 1991. She had returned to her apartment, following dinner with Claire Levy and a close mutual friend, when she fell asleep in her chair. She did not awaken.

When I spoke with Claire about a memorial service she and Katherine Williams were planning I remarked, not really meaning it as a question but rather as a statement, "How can I write about Elinor . . . who will edit what I write."

Edith Kramer preceded me as a speaker at the memorial service and she opened her tribute with a similar question that she too meant as a statement. Elinor’s love of the English language and her marvelous precision in its use was throughout the day repeatedly noted by those who spoke of her and loved her. It was her hallmark and one of the gifts she conferred on others . . . by her own admission, not always to their liking.

Elinor was born and raised in Baltimore, Maryland. I don’t know much about her childhood other than that over the years she introduced me to many of her childhood friends with whom she still maintained close relationships. A woman with whom Elinor had lost contact, read of the memorial service in the morning paper. She said that she had been a tentmate of Elinor’s when they were 11-year-old campers. She also spoke of Elinor’s governmental position as an industrial designer of kitchen’s for the poor during the thirties . . . a surprise to many of us.

Elinor received a Bachelor of Arts degree from Wellesley College (1930) and a Bachelor of Science in Landscape Architecture from Iowa State University (1943). Shortly after graduating from Wellesley, she began serious studies in drawing and painting with several well-known artists, including Maurice Sterne, George Grosz, and Othon Coubine. From 1934 to 1936 she studied Chinese brush painting in Peiping. On her return to the United States she taught painting and exhibited her own paintings at the Corcoran Biennial, the New York World’s Fair of 1939, the Pennsylvania Academy, the Baltimore Museum of Art (one-person show), and the Phillips Memorial Gallery. Her work is included in the Cone Collection at the Baltimore Museum of Art.

Although she taught art to children with disabilities, it was not until she led a group for the Alcoholic Rehabilitation Program of the District of Columbia that she called herself an art therapist. In 1955 she became a psychiatric art therapist for the D.C. General Hospital where she remained for ten years. It was then that she cemented her close friendship with Bernard I. Levy.

During the fifties, sixties, and early seventies Elinor became firmly allied with the nascent field of art therapy. She attended lectures of Margaret Naumburg, became a faculty member at the Washington School of Psychiatry and a guest lecturer in art therapy for Edith Kramer at the Turtle Bay Music School.

Encouraged by Bernie, Elinor, in 1961, became the founding editor and publisher of the American Journal of Art Therapy (formerly the Bulletin of Art Therapy). She remained as editor/publisher until 1985 when she became the executive editor. In part, because of the influence she had in bringing together isolated individuals who established the art therapy profession. In 1971 the American Art Therapy Association conferred on Elinor their highest honor, the Honorary Life Membership.

In 1968-1969 she was an Assistant Professorial Lecturer at The George Washington University (GWU). From 1971-1998 she was the Coordinator of Training in the Master’s Degree Program in Art Therapy at GWU and one of the people responsible for founding the program. A late starter, Elinor was well into her late seventies when she retired from GWU.

It is clear that Elinor was an accomplished
woman who had a remarkable life. Thus it is not surprising that she had an effect on so many of us who knew her.

The striking influence Elinor has had in shaping my professional life has been as profound as it has been wide-ranging. My indebtedness to her had steadily increased over the twenty some years that we were friends and colleagues.

It was 1969 or '70 when Edith Kramer introduced us. In 1971, Elinor asked me to become a member of the committee she chaired for the American Art Therapy Association, the Education Committee. As a girl scout dropout I had vowed never again to be a joiner, nevertheless, Elinor was the prize, so I became a committee member . . . and my education began.

My formal training started when I invited Elinor to teach the Ulman Diagnostic at Vermont State Hospital. I didn't anticipate the impact that Ulman, both the procedure and the person, would have in shaping my focus.

Several years later Elinor, audacious and determined that I would be her successor on the Executive Board, spearheaded a write-in campaign, nominating me to the Education chair. Because of Elinor's endorsement I defeated a sho-in, an AATA past-president. Those glorious and slightly self-righteous days were the beginning of Elinor's mellifluous rewriting of my undistinguished prose. That same year Elinor was elected to the Board as the AATA Recording Secretary. She claimed, and rightly so, that the first time the Association had correct minutes was when she was Secretary. During those days when we both served on the AATA Board, I had the opportunity to scrutinize and learn from her every move.

Later on, because of the warm reception received by a workshop Edith Kramer and Elinor had given, a Goddard College Dean talked to me about developing an art therapy program at the college. Elinor taught the Case Studies course and the Ulman Diagnostic the summer the art therapy program opened. To this day, students recall Elinor's editing of their papers, particularly the Ulman Diagnostic.

Some students were challenged and continued to write . . . some chuckled and chucked their typewriters for a paintbrush.

Although Elinor taught Case Studies for only three summers, she remained on the Program's Advisory Board. Until two summers ago she taught and presented the Ulman Diagnostic, renamed the Ulman Personality Assessment Procedure (UPAP), at Vermont College of Norwich University. The President of Norwich University awarded Elinor with the first and perhaps the only Honorary Doctorate in Art Therapy in the field.

For many years Elinor and Bernie co-led seminars of the UPAP. Following Bernie's death Elinor and I teamed up. Kibitzing with her as we led a workshop was my great pleasure. Until her death we had been collaborating on a UPAP manual.

The AJAT had for a number of years been the AATA affiliated journal until it was brutally excised from the AATA in 1983. Soon after the coup, the AJAT was acquired by Vermont College of Norwich University. Elinor became the Executive Editor. Although she no longer did line by line editing, she had been instrumental in selecting and reviewing final article drafts for publication. The week before she died Elinor returned a manuscript on which she had red penciled corrections several editors, myself included, had overlooked. She had a remarkable eye and a tireless red pencil. Her marginal comments as I'm sure Kirsten Gardner recalls, were priceless—accurate and witty—and not to be seen by others.

Linguistic acuity and conceptual clarity were certainly Elinor's endowments as evidenced by the few, but brilliant articles that she did write. She claimed that as a child learning about language occurred at her dinner table where the dictionary was kept. I put a dictionary on my dinner table . . . and I'm still waiting.

Since her death I've caught myself reaching for the phone to talk with Elinor about the Journal or some quixotic event of the day. Her phone has been disconnected. Elinor as she said in anticipation of her death has "been called to Harvard!" Lucky Harvard.
THE AMERICAN ART THERAPY ASSOCIATION
22nd ANNUAL CONFERENCE
Marriott City Center/Denver, Colorado
NOVEMBER 13-17, 1991

November 13
Pre-Conference Courses
The Use of Art Therapy in Grief and Loss/Barbara Beker McIntyre, Julie Adams, Sandra Graves, Linda Lee Goldman, Judith Rothschild
Sexual Abuse: Interventions and Issues with the Child, Family and Court System/Joan Phillips
Illuminating the Monster: Documentation in the Mental Health Care Setting/Josie Abbenante
Imaginaction: Action Methods for Art Therapists/Leigh Files
Art Therapist's Art: Its Use for Professional Processing/Harriet Wadeson
The Expressive Therapies Continuum/Vija B. Lusebrink
Healing Through Sandplay/Terri L. Sweig
Developmental Analysis of Visual Form/Patricia St. John
The Symbolic World of the Multiple: Treatment Strategies & Techniques/Dee Spring
Uses of Mandala Assessment in Art Therapy/Phyllis Frame, Carol Cox, Patty Morini

Study Groups
International Networking Group Open Discussion/Bobbi Stoll
Study Group on Ritual Abuse/Trish Knode

Papers
Unmasking Anger Through Caricature/Judith Wald
Drawing & Talking with Pediatric Cancer Patients: Does It Make a Difference?/Robin Goodman
Ethnicity Illuminated in Humor and Art Therapy/Christina R. Mango
The Use of Art Psychotherapy Evaluations of Children in Custody Disputes/Sherry J. Lyons
Adventures in Short-Term Group Art Therapy: Reservations, Itineraries and Baggage Handling/Patricia D. Isis
Art Therapy Meets Hypnosis and Neurolinguistic Programming/Sandra Lee Zavadil

Panels
Art Therapy Treatment of Sexually Abused Clients: Child, Adolescent, Adult/Mimi Farrelly-Hansen, Heidi Lack, Diane Safra, Terri Sweig
From Outside In and Inside Out: Viewing AIDS Thru Art Therapies Window/Sandra White, Gail Fenster, Michael Franklin, Irene Rosner-David, Judy Weiser
Manifestations of Health: Art Therapists Creating Art/Lin Carle-Anderson, Mimi Farrelly-Hansen, Ron Huefle
Art by Abuse Survivors: A Lifecycle/Carol T. Cox, Barry M. Cohen, Anne Mills, Barbara Sobol

Symposia
An Inquiry into Systems of Creativity: An Alternative Realities Approach/Maxine Junge
Family Art Therapy from an Alternative Realities Perspective/Christine Lind. Jane Walter, Maxine Junge
From Image to Metaphor—Why Don’t You Just Say What You Mean?/Debra Behnke-Marthaler
Visual Metaphor: Its Role in Therapy/Vija B. Lusebrink

November 14
Opening Ceremony/Linda Gantt
Welcoming Remarks/Cecily Mermann
Art Therapy: Post Mortem/Cathy Malchiodi, Maria-grease Cattaneo, Patricia Allen
Using Creative Thinking Strategies to Image a 21st Century AATA/Doris Arrington, Cay Drachnik, Paul Howie, Judy Rubin

Poster Sessions
Art in Assessment: Identification of Sexual Abuse in the Images of Adolescents/Elaine Genser
Art Therapy with Mexican-American Alcoholic Families/Renee Magana
The Man Behind the Sunglasses: The Inner City Child's Personal Metaphor and Model/Lorin L. Davis
Applications of Art Therapy with the Elderly/Kevin Forrest
Illuminations: Program Concept for Art Therapy with the Elderly/Bernadette Callanan
Was It Schizophrenia, or Ritual Abuse?/Cay Drachnik
Surviving the Survivors of Ritual Abuse: Images of the Client and Therapist/Kathryn L. Cox

November 15
Student Open Forum/Ruth Cohen
Sharing and Networking About Helping HIV Positive Clients and Families/Judy Weiser
Addictions/Lynn Jones
U.S. Study Group on Symbolic Language (Sexual Abuse and MPD)/Dee Spring
Keynote Address—The Art of Dying: Images, Insights and Interventions/Sandra L. Bertman, Linda Gant

Study Groups
Personality and the Arts Therapies: Partners in the Dance of Healing/Sondra Geller
U.S. Study Group on Puppetry and Doilmaking in Art Therapy/Matthew Bernier

Poster Sessions
Symbiosis in the Artwork of Clients with Borderline and Narcissistic Personality Disorders/Mary Ellen McAlevey
Exploring the Ecology of the Mind: The Landscape Montage Technique/Michael Campanelli
Psychoaesthetics Dolphin Project/Barbara A. Levy, Clio Pavlantos, Jackie Hand-Vigario, Marina Zurkow

Papers
Liberty and Conflict: Images from Psychologists in a War-Torn Country/Marcia L. Rosal
An Image in Transition: From Student to Professional/Peg Schwartz, John Bolde
Journey to Recovery: One Step at a Time/Marietta M. Miller
Multiple Family Group: Art Therapy with Hospitalized Adults and Families/Kay Stovall
Image as Healer, Metaphor as Helper/Edith Wallace
Creative Therapies for Adult Children of Addiction Recovering from Alcoholism/Ursula Goebels
Illustrating the Family Story: Art Therapy—A Lens to Viewing the Family’s Reality/Shirley Riley
Maybe Tomorrow: Art Therapy with AIDS Patients/Winnie Ferguson, Donna Kronick
Case Study: A Woman with a Dissociative Disorder/Gladys Agell
Artistic Expression of Alzheimers in Adult Daycare: Assisted Living, and Skilled Nursing/Kathleen Kahn, Michelle Tarisano
Art Rx: Art Expression and Physical Health/Cathy Malchiodi
Dedication to the Contemplative Life/Leslie Howard, Mari Flemming
Images as Defense Mechanisms/Vija B. Lusebrink, Myra Levick, Roberta Jonkers, Robert Gorstein
Aggression Depicted in Abused Children’s Drawings: Development of an Assessment Tool/Trudy M. Manning

Panels
Confronting Cancer Through Art: A Collaborative Effort by Hospital, Patient and Therapist/Virginia M. Minar, Julie Erdmann, Lynn J. Kapitan, Susan D. Richter-Loesl, Lori Vance
Systems Approach to Art Therapy/Robert Schoenholtz, Aina Nuocho, Vija B. Lusebrink, Janie Rhyne, Judy Weiser
My God Left Me? Spirituality, Wholism and the Transpersonal in Art Therapy/Roberta Schoemaker-Beal, Dean Frantz, Bruce Moon, Sheldon Kopp
Bringing Down Additional Walls for Greater International Understanding/Bobbi Stoll, Angela Philippi
The Dominions of Transference/Debra Behnke-Marshaler, Abby Calish, Anne Canright, Suellen Semekowski, Harriet Wadeson

Symposia
Comparison of Verbal and Art Group Therapies with Adult Female Incest Survivors/Carolyn S. Waller, Cathy Malchiodi
Ceramic Mural Messages from Incest Survivors/ Frances E. Anderson, Karen Deske
Gay/Lesbian Open Forum

November 16
Papers
Art Therapy—Adjunctive and Primary in a Therapeutic Community for Children/Judith Duboff
Deja Vu: Comparing Schizophrenic and Affective Psychotic Patients Utilizing the Bridge Projective/Ronald E. Hays, Sherry J. Lyons
Using Expressive Journals to Measure Feelings in an Adolescent Group/Jennifer Morgan, Marcia Rosal
Ritual, Rhyme and Reason: Art Therapy with a Child and an Adult Multiple/Patty Churchill, Dee Spring
A Three Session Package for Assessment, Confrontation and Treatment Planning/James J. Consoli
Hard Time Art: Creative Expression in Prison/Marcia F. Taylor, C. Eamon Walsh
The Effects of Stimulant Medications on the Art Products of ADHD Children/Julie Epperson, J. Lane Valum
Art Therapy—The Tool for Treating Multi-Abuse/Nancy Slater
Reality and Relationship: A Structured Art Therapy Approach with Schizophrenic Adolescent Patients/Trudy M. Manning
Images of God: The Effects of Abuse on God Representatives/Cathy Moon
Artistic Expression of Large Mammals Confined to Zoological Institutions/David R. Henley
Doorways to Life: Art Interventions with Suicidal Clients/Drew K. Conger
Linking Interpretations of Children’s Visual Images to a Developmental Art Scale/Betty Jo Troeger
Art Therapy Treatment of a Narcissistic Adolescent with Asthma: Case Study/Robin L. Gabriels
Personal Snapshots—Mirrors with Memory: Phototherapy Techniques for Bringing Abuse to Light/Judy Weiser
Exhibiting Art by People with Mental Illness: Issues, Process and Principles/Susan Evans Spaniol
Finding a New Niche: An Art Therapy Program in a Public School/Monica Otcacek
The Perception of Doors/Maxine Junge
Being in Creation: Revisioning the Artist in the Identity of Art Therapists/Lynn Kapitan, Lori Vance

Art Therapist Providing Services to Children and Adolescents/Deirdre M. Cogan, Martha Giles, Carol Cox
Idealization, Transformation and Disillusion in the Art of a Cross-Addicted Transsexual/Renee Ostfeld
The Canvas Mirror: Images of Existential Art Therapy/Bruce Moon
Dying of a Broken Heart: Imagery of Eating Disorder Patients/Mary Davies Cole
Healing Medical Symptoms Exacerbated by Stress: Using Art Psychotherapy/Gretchen Tartakoff

Workshops
Assessing Selected Jungian Based Images—The Visual Preference Test/Doris Arrington, Christian Arrington
Images of Loss—Growing Stronger Through Loss/Carole Kunkle-Miller
Art Works! Art Activities for People with Severe and Profound Mental Retardation/Jacquelyn M. Martin, Diane Meros
Using Visualization and Art to Promote Ego Development/Joan Bloomgarden, Frances Kaplan
Exploring Therapeutic Resistance Within a Psychodynamic Context/Arthur Robbins
The Window: A New Media for Witnessing the Self and the Other/Janet Long, Hella Bahnson Merrill
The Self-Portrait Box: A Photo Art Therapy Workshop/Irene Corbit, Jerry Fryrear
Art Therapy and the Older Person: Images of Yesterday and Today/Gary C. Barlow, Winnie Ferguson, Lewis Shupe
Anger Monsters and Fearful Friends: Taming the Negative Within/Kurt Brewster
Transformation of Women’s Loss and Grief into Creativity and Power/Ellen Speert
Treating Sexual Trauma Through Integration of Mind, Body and Emotions/Becky Olivera, Daryl Hlavsa
Guided Imagery or Misguided Trauma?/James J. Consoli

Panel
Comparisons of Drawings Produced by Abused Children and Survivors in Adulthood/Myra Levick, Karen L. Gomer

American Art Therapy Association
Honorary Life Member Award—
Cay Drachnik, MFCC, A.T.R., HLM

CAY DRACHNIK

Cay Drachnik was tenth President of the American Art Therapy Association, from 1987-1989, and President-Elect from 1985-1987. Previous to her election to the presidency, she was active in a number of AATA committees, serving as Region I Standards Chair, on the Board of Ethics and Professional Practice, and as a member of the Governmental Affairs Committee from 1979 to 1984. In addition, Cay has spent numerous hours assisting states in developing job descriptions for art therapists and travelling on her own personal time to give legislative support to art therapists seeking licensure.

Cay Drachnik is well-known for her legislative efforts to promote and protect art therapy. She was appointed to a four-year term on the State of California Health Facilities Advisory Board by the Governor of California, where she monitored regulations in order to protect the interests of art therapists. As a member of this Board, she took personal time off from work and forfeited pay in order to attend meetings. For this and other legislative work she did in California, she was made the first Honorary Life Member of the Northern California Art Therapy Association. She has also continued to be involved in the ongoing battle to keep Marriage, Family and Child Counselor licensing available to art therapists in the state of California. Because of her efforts in this area, California is one of few states where it is
possible for art therapists to receive third party payments under the MFCC umbrella.

On a regional level, Cay Drachnik is one of the founders and charter members of the Northern California Art Therapy Association (NCATA). She also served as the Vice President and as Legislative Representative of that regional association and has been continuously involved in various Northern California activities for over a decade. While on the NCATA Board, she was instrumental in achieving state civil service job classification for art therapists to prevent occupational therapy from becoming the only rehabilitation therapy to head rehab departments in state agencies. She also helped to found the first coalition of rehabilitation therapists in California. Because of her efforts to support and protect art therapy in Northern California, Cay was presented the Distinguished Service Award by NCATA in 1990.

Cay has worked as an art therapist at Psych West (formerly Eskaton) for more than 15 years, providing model art therapy services to adults, children and families. She has been a lecturer at colleges and universities on topics such as sexual abuse, symbols of psychopathology and brief art therapy with the mental health client and has contributed articles on clinical practice and governmental affairs to professional journals. She has also presented at the annual AATA conference as well as regional conferences as an invited speaker on clinical, ethical and legislative issues.

Cay Drachnik has made many outstanding contributions to the AATA and has worked as an art therapist and art therapy educator for twenty years. Her work in legislative and governmental affairs, education, and clinical work has made a significant impact on the American Art Therapy Association as well as the field of art therapy in general.

Remarks Upon Receiving the AATA Honorary Life Membership

Thank you!—I feel like I just won the Academy Award. I want you to know I am truly grateful to all of you for having bestowed this high honor upon me. To be recognized by one’s peers is indeed something very special in one’s life.

I know that I have held offices and have been involved with art therapy committees, both state and national, for the past 20 years, but my most significant contribution, I am sure, has been in the field of governmental affairs. I believe that in bestowing this honor upon me, you have recognized the importance of legislative activities in our organization, and for that I am doubly pleased.

This honor, however, should be shared with many others who have worked so diligently in the field of legislation on behalf of the American Art Therapy Association. I may have led the battles on many occasions, but nothing could have happened without the support of all the others.

It’s kind of fun to look back and remember how I got started in all of this. My husband and I were moving from Washington, D.C., to the Bay Area in 1972. Elinor Ulman gave me a list of subscribers to the American Journal of Art Therapy. I looked up Vija Lusebrink and Janie Rhyme, and the Northern California Art Therapy Association was born.

Shortly after, we moved to Sacramento, the state capital, and I was given the task of trying to get art therapy a state civil service job classification. After 30 phone calls trying to find who to talk to, with negative results, I gave up. Within a week, I received a phone call from a man who said he had been searching for the past three months for an art therapist, in order to help set up a state civil service job classification for art therapists. He had gotten my name from a music therapist who I had just happened to meet along the way. So all my 30 phone calls were for naught, but we did get our classification.

Then there was the time we were trying to get defined in Title 22 of the State’s Health Regulations. Helen Landgarten flew up from Los Angeles to help out in this. At this time, we had a total of 60 members in both the Northern California and Southern California Art Therapy Associations. Naturally, during Helen’s testimony before the regulatory committee, she was asked about how many art therapists there were in the state. She gulped, did some quick thinking and decided that, although there were only 60 official art therapists, there must be loads of people out in the hills of California who claimed to be, so she replied that a rough estimate might be 300 to 500. We got our definition based on those numbers; however, now that we are organized, we are trying to get rid of those same people who call themselves art therapists, but who don’t have the necessary
HONORARY LIFE MEMBER

qualifications. They served their purpose at that time. That is politics for you.

Another person who in the early days was important to our legislative efforts in California was Dr. Don Uhlin, now deceased, who headed the art therapy program at Sacramento State University. He was a big, imposing man, something like Matlock, except he was always in a wheelchair. He had had polio as a youth. He served on the board of the AATA as Secretary, and was one of the finest men I have ever known. We disagreed on many issues, but agreed totally that art therapy was the greatest thing that ever happened to both of us.

Anyway, the occupational therapists in California were trying to get licensed, and we, along with the rest of the creative arts therapists and the physical therapists, were opposed. We got inside information that they were going to wheel in some patients to make an impression on the hearing committee. When we got to the hearing, they had three little old skinny women in wheel chairs, but we wheeled in our 260-pound Don Uhlin, and with flags flying, counteracted their act. We won that day!

Then, later in 1985, the Board of Behavioral Science Examiners threatened to take away the marriage and family counselor licenses of art therapists who were already so licensed. That was a battle that took many warriors. All the troops from Northern and Southern California assembled: Helen Landgarten, Maxine Junge, Shirley Riley, Doris Arrington, and Mari Flemming, plus others too numerous to mention.

We reinstated the coalition with the help of David Read Johnson, wrote letters, made phone calls, and were doing fairly well until one hearing before an August body of men. It was a time when anyone in the audience could come up to the podium and speak, and up tripped a dance therapist—and I mean tripped: she wore sandals with no stockings, a long flowing chiffon gown, jangling bracelets and earrings, topped off with flowers in her hair. In a lilting voice, she said to this imposing body of men in their gray flannel suits, "I am a movement therapist and I move..." and with that, she danced down the hall and out the door. We all looked at one another and we thought our chances of convincing this committee that we were professionals had gone right out the door with her.

At about that time I was teaching my regular summer session class at the College of Notre Dame, when Doris Arrington came into my classroom with fifty assorted sheets of stationery and envelopes. She told the students that if they wanted to pass this class, they had to write two letters, one to their assemblyman and one to their state senator, protesting the BBSE's action to divest us of our MFCC licenses. The variety of papers and envelopes were used so that it wouldn't look like a "put up job." My, we were clever in those days!

As you can see in legislative affairs, along with the hard work of writing position papers, testifying before legislative committees, making phone calls, and getting letter writing campaigns going, there is nonetheless a lot of fun and excitement, and even a few cheap thrills.

All of those early experiences helped out later, when art therapists in other states were trying for state job classification and licensure. Other art therapists who have worked hard on legislative issues and who deserve a great deal of credit are: Nancy Hall, who did a magnificent job as Governmental Affairs Chair when I was President, and who, along with Robin Goodman and Laurie Wilson, got art therapists' state civil service job classification in the state of New York. Suzanne Canner Hume spent untold hours working on licensing in Massachusetts. Deborah Good practically moved into the capital building in New Mexico, trying to get art therapists licensed there—she didn't succeed, but she's still trying.

Robin Gabriels did get art therapists licensed as counselors in Colorado, and continues to work for the AATA as our Governmental Affairs Chair—and doing an outstanding job. Nina Denninger and Karen McMichael deserved a lot of credit, too—they are currently working with me on a new state definition for art therapists in California. It's like having a baby—we've been at it for nine months, now!

Others, too, have made major contributions, but because of time constraints, I can't name them all today; however, I want them to know that I gladly share this honor with them.

As a result of their hard work, art therapists can now be licensed as counselors in Florida, California, Massachusetts, Maryland, Louisiana, Alabama, Colorado, Oklahoma, and Texas and can be certified in Nebraska and Washington State. Art therapists are in the process of applying for licensure in both Michigan and Delaware.

It's been a long, hard road—but we've come a long way, and I am extremely proud to have been a contributor to this process. Thank you again for this wonderful honor. We hope to move soon to Carmel, California, where Clint Eastwood lives, and as he would say, "You've made my day!"
American Art Therapy Association
Distinguished Service Award—
Cathy A. Malchiodi, M.A., A.T.R.

Awarded at the 22nd Annual Conference of the American Art Therapy Association, Inc.,

CATHY MALCHIOIDI

Cathy A. Malchiodi, M.A., A.T.R., is currently the Director of the Graduate Art Therapy Program, University of Utah, Salt Lake City. She also maintains a private practice specializing in domestic violence, child abuse and chronic illness. She has recently published a book, Breaking the Silence: Art Therapy with Children from Violent Homes and has produced the educational video, Art Therapy: Releasing Inner Monsters. She has presented workshops and papers on art therapy regionally, nationally and internationally in Europe, Canada and Asia, and has presented at all the AATA national conferences since 1982. In 1987, she went to Beijing, China, at the request of Very Special Arts International (Kennedy Center, Washington, D.C.).

The Chinese government, and the U.S. Information Agency, to teach educators and mental health professionals in China about art therapy. While there she participated in the first Very Special Arts Festival on mainland China and appeared on China Central Television before an audience of over 300 million to discuss and demonstrate art therapy.

Cathy Malchiodi is a charter and founding member of the Rocky Mountain Art Therapy Association and currently serves as its Bylaws Chair; she also served as Program Chair for the first Four Corners Regional Art Therapy Conference. She is also past-president of the New England Association of Art Therapists and served as Chair of various NEAAT committees, including Public Information.
and Education. Since 1982, Cathy has been actively involved in many AATA committees, including Public Information, Finance, Ethics and Professional Practice, Membership, and National Conferences; she was also Pre-Conference Chair (two years) and the Chair of the AATA Film Festival (two years). She has also served on the AATA Executive Board as Membership Chair (1987-89), Ethics Chair (1987-1990), and Certification Chair (1989-1991). Cathy chaired efforts to create a revised Code of Ethics, and developed an AATA Membership Brochure, a Membership Survey and Specialty List, and an Art Therapy Media List. She also held the position of Secretary (1989-1991) on the AATA Executive Committee, overseeing the Bylaws, Policies and Procedures Committee and the Publications Committee.

Cathy has received many awards for her work in the field of art therapy, including: Recognition of Service Awards from the China Fund for the Handicapped and Hong Kong Social Services for art therapy training seminars presented in Beijing and Hong Kong, an Outstanding Service Award from Very Special Arts for distinguished service and teaching, the Art Therapy Pioneer Award from the Four Corners Art Therapists, and recently received a Thomas Dee Distinguished Educator Award for research in art therapy.

Remarks Upon Receiving the AATA Distinguished Service Award

First, I want to say that this is going to be a very short "distinguished moment," due to time constraints!

I want to thank the Honors Committee for selecting me and the AATA Board of Directors for approving of their selection. Without all of you, I would not be standing here today.

I also want to thank my husband, David, because at least one-half of this award belongs to him. He has shown a great deal of distinguished service in answering AATA related telephone calls and making many dinners when I was busy with one art therapy project or another. Without David’s support, I would not be standing here today because it was he who encouraged me to pursue training in art therapy over a decade ago.

What has been most important to me in serving and promoting art therapy has been all the fine people I have met as a result of my involvement with the AATA, people who have given me great joy and people whose friendships I cherish. And, even through the politics and power struggles that come with Association work, you have always been there for me and I continue to be inspired by you.

So, I particularly want to thank you for this special gift as well as this honor you have given me today. Thank you.
Artist-in-Residence: An Alternative to “Clinification” for Art Therapists

Abstract

This article identifies and describes the "clinification syndrome," a process where art therapists gradually cease making art as clinical skills become the primary career focus. Priorities of training programs and the policies of the American Art Therapy Association contribute to this trend. Lack of research and theory development in art therapy are seen as major ramifications of the clinification syndrome. Several suggestions are offered to anchor art therapy students and beginning professionals more firmly in an art-based practice.

As an art therapy educator and supervisor, I have noticed over the years certain phenomena which I will be so bold as to label a syndrome. I refer to a trend in the field of art therapy towards a "clinification" of the art therapist as he or she proceeds along a career path. This clinification syndrome can be described as a dual developmental process whereby the art therapist gradually takes on the skills and characteristics of other clinicians, while at the same time investment in and practice of art skills decline. While the issue of whether one is primarily an artist or a therapist or some amalgam of the two has been addressed in a number of presentations and articles (Ault, 1977; Landgarten, 1989; Rosenberg, et al, 1983; Wadeson, et al, 1977), the ramifications of one’s choice and the long-term impact on the field have not been investigated. What are the benefits, concrete and intangible, which accrue to the art therapist who is able to remain an art maker? What is the long-term effect on the field of art therapy, still in a nascent stage of development, when art therapists give up making art?

The Clinification Syndrome in Art Therapy

Clinification occurs when the primary focus in art therapy is the discussion and interpretation of the art product. The art therapist provides basic art supplies, such as markers, pencils, crayons and pastels and allots a limited amount of time for the use of such materials. The understanding of a particular issue or image is the major goal. Often such work takes place in an office or other non-studio environment, such as a patient dining room. Little or no effort is made to engage the client in experimentation with a range of art processes. The marks on paper are a means to an end of insight into a problem the client is having.

Often a directive is given to aid the client in focusing on the problem. The products of such sessions are usually graphically rudimentary, and may combine words to clarify the meaning or use magazine pictures in place of self-created images. The interventions of the art therapist tend to be verbal, encouraging the client to look for meaning in the picture or, at times, offering possible meanings to the client. The image is generally understood in relation to the client’s clinical diagnosis. So, for example, if a client with a diagnosis of depression draws a yellow sun with a smiling face, denial of depression may be deduced. The frequent impoverishment of such images is seen as evidence of the pathology of the client in graphic terms and used in team meetings to support the treatment plan. In fact, such art may reflect the impoverishment of the environment which is ill equipped to sustain the production of more realized art work.

The style of art therapy briefly described here has many variations and can be useful in clarifying underlying conflicts, seeking solutions to problems, and identifying hidden emotional factors. While

Editor’s note: The author wishes to thank students and supervisors, both past and present, for stimulating much of the thinking contained in this paper. Thanks also to those art therapists who read and critiqued this paper while in progress: Evelin Carvalho Weber, Susan O’Brien, Dayna Block, and especially Deborah Gadiel.
emotions may be aroused by these means, the primary process at work is one of identifying and naming whatever emotions do surface. The value of such work is evident to anyone who has seen the light bulb of insight go on for a client who then takes steps to change detrimental behavior patterns. However, insight alone does not guarantee that behavior changes will occur.

There are two major limitations in regard to this cliniified art therapy that I wish to offer for scrutiny. First, such work can successfully be done by any well-trained, reasonably sensitive clinician. Discussion of the art product in relation to the client’s psychological issues requires knowledge of the client more than knowledge of art, as well as a good measure of common sense. To use a visual image as a starting point for dialogue is a small shift for the clinician practiced at active listening and used to pointing out figures of speech as a form of imagery. Bernie Siegel, M.D., (1986) the well-known surgeon, is an example of someone without psychiatric training, yet able to use drawings with cancer patients to elicit their unconscious beliefs about disease and treatment due to his high degree of empathy for the experience of cancer. Jeanne Achterberg and G. Frank Lawlis (1978) have studied the medically predictive value of patient images by correlating drawings and blood chemistry. In fact, the medical training of such individuals allows them a broader range of understanding of the potential meaning contained in the images of ill patients than most art therapists would generally have.

The second and most troubling aspect of cliniified art therapy is that it neglects to employ the very specialized knowledge that derives from our background in art making itself. This knowledge comes most directly from the art therapist’s firsthand experience in using the art process to negotiate his/her own emotional life. It is this concrete and specific fluency with materials as emotional equivalents that forms the art therapist’s intuitive response to the client and enables him/her to empathetically witness and facilitate the transformation of primary process and the expression of metaverbal states. The knowledge of the effect of working with various materials—the difference between watercolor and tempera, between using a 4H pencil versus a 6B pencil, between working on a 4” × 4” piece of paper hung on a wall or a 8” × 11” piece with a ruled border—are things the average clinician cannot relate to as appropriate containers for emotional states.

The uniquely therapeutic potential of the art process is that it allows sustained experience of emotional states to the point where integration of a change in such a state can occur. For example, the realization that one is feeling sad may or may not lead to the insight that sadness is connected to the anniversary of a significant loss. Insight may produce some relief in that meaning arises from the ability to name the feeling “sadness” and identify that one is experiencing grief. But, grief once named does not abate and indeed, may intensify. It is the sustained experience of the feelings and memories associated with the loss that makes way eventually for peace. The art making process provides the means to dwell deeply and fully in those memories and feelings. The engagement with materials helps to regulate and temper the experience of emotional states that might otherwise be overwhelming and engender a defensive response. These are the aspects that enable art therapy to be a discipline in its own right and not only a means to jump start psychotherapy. In the creative and emotionally appropriate use of materials art becomes therapy and moves beyond a diagnostic adjunct to verbal work.

Clearly, useful work can be accomplished with standard materials. In such work, the therapist must rely upon a thorough understanding of the clinical situation the client is facing. A whole-hearted emphasis on inculcating such understanding has been pursued by some graduate art therapy training programs by introducing courses in many aspects of traditional clinical work. While clinical understanding is a basic requirement in working with clients in therapy, the emphasis on the clinical over the art has led to a stunting of the development of art therapy as a discipline in its own right. Understanding of the therapeutic potential of art media can best be gained by doing art, in a sustained, mindful and self-invested way.

Factors That Predispose the Development of the Cliniification Syndrome

There are a number of factors that predispose the occurrence of the cliniification syndrome. Our national organization (AATA) and our training programs inadvertently encourage the development of the syndrome. For example, emphasis on the prerequisite nature of art involvement for the beginning art therapy graduate student ensures that some exposure to and involvement with art materials has taken place, though rarely beyond the survey level. Most art departments and even schools of art tend to
emphasize technique over content at the undergraduate level. Few teachers on the college level can relate to or nurture a psychological approach to art making that is compatible with art therapy. These art skills need to be developed in an atmosphere of support and trust rather than in competitive critiques. Admission portfolios to art therapy graduate programs routinely show a range of levels from undeveloped skills in rendering, color, and form, to adequate skills with little relation to personal content. Occasionally, powerful personal content is well executed, but without the sort of psychological awareness necessary for an art therapist. None of these inevitabilities would be a problem if continued art making was a mandated and supported part of graduate art therapy training. Art therapists need to concurrently learn to attend to art, listen sensitively, and respond empathetically while knowing how to engage fully with materials. The therapeutic skills need to be grounded in an immersion in an art environment.

However, although the majority of students accepted into art therapy training need to develop depth or skill in their art making, opportunities to do so elude them. McNiff (1979) reporting a survey of art therapists about perceived importance of art making wrote: "A problem which contributes to the artistic inactivity is the fact that courses for personal artistic development are not included in training programs" (p. 105). Graduate art instructors are unwilling to allow such students into their classes whose portfolio work or commitment to a particular art area doesn't measure up. Even students with exceptional talent who would be welcomed into a graduate painting or sculpture seminar have difficulty finding the sufficient time, amid the demands of internships and class work, to devote to creating ongoing work. Hence, they complain, they are not taken seriously by instructors.

While the art work created in art therapy seminars is crucial to the understanding of the art therapist, it is neither wholly therapy nor fully art due to the didactic restraint imposed by trying to experimentally teach students what might be done with clients. These experiences may serve to challenge the didactic art school concepts students enter with and, at times, result in wonderful bursts of talent or insight. Ideas for new directions may blossom in the creatively stimulating environment of "art therapy art making." Yet, little is done in graduate training to nurture that creativity to fruition to ensure that it will take firm root and continue to nourish the student in the transition to beginning professional and beyond. The lack of a portfolio requirement for A.T.R. registration, as even a symbolic reference to the necessity of art making, conveys to the student that being an art maker is unnecessary to the professional self.

A second factor contributing to the clinification syndrome stems from ambivalence around clinical skills among art therapy educators. Training programs are faced with sending students into a multiplicity of settings for internship and eventual work where expectations for clinical expertise vary widely. Educators would like students to gain sufficient clinical understanding to inform an art-centered practice. But, knowing that clinical therapeutic skills may aid their stature in the work place and facing a dearth of genuine art therapy theory, educators usually fall back trying to convey clinical expertise gleaned from established areas of psychology—psychoanalytic, Jungian, client-centered, gestalt or some eclectic amalgam—suited to the individual personality. Partly this has been a political decision to save the art therapist from the disempowered position of the "adjunctive therapist" label. The unfortunate result has been an over-saturation with a hodgepodge of clinical concepts. It can also engender a chronic fear of clinical inadequacy that results in a sort of "catch-up" mentality. Some students respond by over compensating, becoming the "star clinicians" in their placements or jobs.

In the previously cited report, McNiff also states that art therapists reported that: "An excessive intellectual analysis of art works and the habit of interpreting every expression tends to produce self-consciousness and inhibition; and the pressures to develop a clinical rather than an artistic identity generally dominate the consciousness of the art therapist" (p. 105). This 'pressure to develop a clinical identity' arises out of failure of nerve in leading with the art and neglect of the sort of primary studio research that would help articulate what happens in the art process, rather than any action taken by forces outside the field. This leads to factors in the work place which encourage the clinification syndrome.

Isolation

After some level of camaraderie in graduate school where the students travel with a peer group, the neophyte art therapist is often alone in his or her first job. It is human nature to become like those around us both to fill needs for affiliation as well as to develop a professional identity. If one is the lone
art therapist among other clinicians, the likelihood of absorbing the style and information of others is
great, especially if they are welcoming and seen as
competent. Inservices, workshops, and supervision
in the work place are likely to stress shared clinical
aspects to which the art therapist will respond in an
effort to find a common ground. While work super-
visors and other staff will often enjoy learning from
the art therapist, few will be in a position to chal-

legen him/her to grow or enlarge his/her conceptu-
alizations about art therapy. Supervision from a
more experienced A.T.R. certainly can alleviate this
problem somewhat though that, too, is often an iso-
lated occurrence and often takes place outside the
work environment. Additionally, new grads with
heavy debts from training and entry level salaries
may defer A.T.R. supervision for economic reasons,
making due with little or no supervision on the job.

Couple these pressures with the sheer rigor of a
full-time clinical job, which is financially required by
most new grads, and one quickly begins to wonder
how any art therapist continues as an artist for long.
Within the job itself charting, team meetings, and
case consultation all eat into the art therapist’s time
so that some don’t even have a balance of client con-
tact hours. All these activities have certainly contri-
uted to the awareness of art therapy in institutions
and have raised perception of its value in the eyes of
other health care professionals. But, what happens
he who gains the respect of the whole staff if in so
doing he loses his soul?

The end result of this type of skewed develop-
ment is that after a period of a few years, the art
therapist’s actual work with clients may be indistin-
guishable from that of a social worker, psychol-
ogist, or counselor who has a bent toward art or has
taken a few art therapy workshops. Some art ther-
апists go on for one of those credentials and the trans-
formation is complete. Why is this a problem? I be-
lieve the clinicalization of the art therapist is a factor
contributing to several problems endemic to our
field:

1. Burn out
2. Career drift
3. Lack of art therapy research
4. Lack of theoretical depth

These first two problems may be grouped as exis-
tential ones in which the purpose and drive of the
art therapist to do good, to help others, to learn
about human behavior through art begins to wane. A
sense of futility may overtake the art therapist who
sees patients released after a numbingly brief length
of stay during which one or two art encounters en-
sued. S/he begins to doubt his/her career choice.
Clinical art created and used to search out or con-
form pathology conveys an emptiness. The art ther-
apist may begin to wonder, “What was so important
about the art?” No longer a conduit to the client’s in-
er life force, the art can seem contrived, hollow,
meaningless. In fact, these feelings mirror the art
therapist’s own abject emptiness arising from a dis-
connection from his/her own art and own center.
The estrangement from one’s own art inevitably
leads to an estrangement from the art of the client.
The art of the client can become a painful reminder
of the lack of art in the life of the art therapist.

Other professions seem more attractive, with
greater financial rewards to offset a sense of help-
lessness. Becoming a psychotherapist circumvents
the painful conflict about the place of art in the life
of the art therapist. When taking stock of work du-
ties, the art therapist begins to see that she is doing
a form of psychotherapy, yet somehow that is not
what she set out to do. At this point the art therapist
may begin to think about returning to school for an-
other degree in a related field, feeling ill-equipped
to meet the needs of the job as perceived. Several
art therapists have expressed the concern that they
were “not doing enough for the clients” by “only”
providing art. Without good art therapy supervision,
this perception can erode the art therapist’s sense of
confidence completely.

The second two problems are pragmatic ones,
thought they follow from the first two. Theoretical
depth can only come in tandem with research. This
means research in the most basic sense: a thorough
and rigorous immersion in the study of some human
phenomenon, methodology being a secondary con-
sideration. The human phenomena in which art
therapists are presumably interested is art making
and the effects of art making on human behavior and
emotional life. If little art making is taking place, or
comes to be considered as second in importance to
insights or verbalization, no art therapy research can
occur and thus no art-based theory can be derived.

This paper proposes a philosophical shift as well
as several concrete suggestions that intend to wed
the artist to the therapist in a consciously articulated
and morally necessary marriage. The artist-therapist
who sustains the conceptualization of art-centered
art therapy is crucial for the survival of our field:
“... the effectiveness of therapists depends upon
the nature of their personal relationship to art”
(McNiff, 1989, p. 121).
ARTIST IN RESIDENCE: AN ALTERNATIVE

A Modest Proposal

The changes suggested are ones requiring only a slight shift of vision, but if they take hold, can have major ramifications for the health of art therapy and art therapists. First, training programs must look hard at the internship sites in use and develop a better balance between hospital placements and alternative sites where art making can serve a more central role. Secondly, all new grads who seek employment in a facility which does not already employ a registered art therapist on staff should be encouraged to negotiate for A.T.R. supervision to be paid for by the agency. At the very least they should request this support for long enough to attain their own A.T.R. A small but growing number of former students have been successful in negotiating for paid outside supervision as a professional necessity by stressing the specialized nature of the work they perform. Facilities see this cost as an investment in staff development which will eventually allow the art therapist to bring in students and help to insure high quality service. By taking this step the art therapist is seen as a dedicated professional and addresses the issue of specialization directly. Whatever supervision is provided by the agency should be seen as necessary as well and not seen as replaced by A.T.R. supervision.

The next proposition is more controversial: art therapists have a right and even a responsibility to make art at their placements during training and subsequently at their jobs. I am not talking about superficial sketches dashed off during an art therapy group. Rather, I am suggesting that the opportunity for clients to observe involved art making is in itself therapeutic. Many individuals harbor mistaken ideas about how artists work, or have no idea about how an art piece comes to look the way it does when finished. They have no reference for visual experimentation or skills for translating complex inner experiences into satisfying images. Art therapists assume such capacities are present or at least latent in everyone and fall to realize some effort must be made to allow such capacities to manifest. Here is a crucial point where art therapy differs substantially from psychotherapy. The art therapist must do a certain amount of teaching in order to help the client articulate inner experience. This is not teaching in terms of content, giving directives that tell the client what he or she ought to make art about, but rather how to use one's whole hand to smear pastel chalk over a large space, how to physically loosen up and draw with one's body and not only the wrist, that it's okay for charcoal to break and paint to drip. Learning through direct observation is extremely effective. Martha Haeseler (1989) writes that when she uses strong colors and works intensely with materials, clients become able to do likewise. "If I work spontaneously and express strong affect, I demonstrate that art can contain and express strong feelings without overwhelming the artist, and clients will follow suit" (p. 71).

Last Spring, an energetic student at the School of the Art Institute, Deborah Gadiel, crystallized this idea into a simple yet powerful concept. She proposed that some portion of her hours during her major internship of her second year of training be devoted to functioning as an "artist-in-residence" at her site. She would carry out regular duties in assessment, individual and group art therapy as well. During the artist-in-residence time she would pursue her own art making and clients and staff would be welcome to come and observe or participate in their own art making. These hours would count as contact hours. Deborah's use of the term artist-in-residence, a familiar one from the intersection of education and the art world, creates a bridge to and from her core self to her role as therapist. She recognizes that her artist identity is an asset to her art therapy work and it would be a waste not to utilize it in her job. Deborah says:

"I see my identity as that of an artist. I am most in sync when I am making art. This drive to do art work, this enthusiasm for the artistic journey is the most powerful tool I have to share with the client. It's the opportunity to share the most unique part of me every time I make a piece" (D. Gadiel, personal communication, 1991).

Deborah continually experiments with materials and methods and so does not fall prey to simply handing out the same things over and over. By acting as a witness to the centrality of art in her life, she presents a role model of commitment and self-esteem. She continually renews and reinvents herself in the work place and is able to model what is good and right about work: discipline, struggle, serendipity, enterprise and invention.

Rather than attempting a schizoid solution of therapist by day and artist by night, weekend or during periods of illness, art therapists have an opportunity to place themselves squarely in their souls and remain true to themselves and grounded in their identity. Training and experience being equal, art therapists who are active art makers will become the better clinicians by the very fact of remaining more in touch with themselves. Deborah continues:
ALLEN

We as artists can demonstrate problem solving, risk taking, and self-fulfillment. We can create an atmosphere of involvement. We model a dialogue between ourself and a piece of art (D. Gadiel, personal communication, 1991).

The art therapist working in this way will be continually reminded that whatever healing there is comes through us in the vehicle of the art, we make way for something already existent within the client to become manifest.

The Work Place

"More and more, we take for granted that work must be destitute of pleasure. More and more, we assume that if we want to be pleased we must wait until evening, or the weekend, or vacation, or retirement. More and more, our farms and forests resemble our factories and offices, which in turn more and more resemble our prisons—why else should we be so eager to escape them? . . . We are defeated at work because our work gives us no pleasure" (Berry, 1990, pp. 139-140).

Many art therapists say, "Oh, how will the site react to these demands? I couldn't possibly ask for that!" One must ask for what one needs. So far, my observation has been that new sites, accepting students or hiring their first art therapist are open to whatever the art therapist says is needed. No art therapist would settle for using ball point pens and typing paper without first explaining that proper supplies are necessary to carry out their work. The picture may be different in facilities where art therapy is already established. The art therapist, already suffering from the clinification syndrome, may be far more resistant to the proposal for artist-in-residence time. Additionally, nearly any community-based site, mental health center, day treatment, sheltered workshop, special school, or halfway house will be more accepting of such a plan than an inpatient hospital unit, in most cases. In many such facilities, a rigid hierarchy is already in place and art therapy is likely to be rather circumscribed. The art therapist on staff may be unwilling to support a major departure from the established routine and risk whatever positive perceptions have been created about art therapy already. Space is a crucial issue for the art therapist. Shared or transitory space defeats our purpose which is to create a culture of creativity, an art-enabling space that is both safe and stimulating, and invites and allows art making behavior with its messy aesthetic.

The final suggestion is for art therapists as soon as possible to form peer support groups. In the early stages these can serve as support in finding jobs and sharing resources, later as peer supervision or shared art making times. In any case the cost is only time to deepen one's skills together and keep focused on one's professional goals and development. A "scarcity" mentality about jobs is self-defeating. When viewing one another as peers in a support network, art therapists can organize and effect the work place by sharing strategies.

A Starting Place

Not all art therapy interns or new grads may be interested in the challenge of blazing new trails for art therapy into untried institutions. Not all art therapists will feel comfortable with the artist-in-residence concept. For some, the clinified art therapy approach is comfortable and works well enough. However, if just a handful make this attempt, in a few years, they, too will have students and be able to offer them a model of practice that includes remaining active as an artist. Working in this way and sharing the outcome is a valid and important form of primary research of paramount importance to our field. Certainly some sites are more likely candidates for this proposal than others. Deborah Gadiel, the student mentioned earlier, originally planned to do her long practicum in a state psychiatric hospital well known for its clinical training. After discussing her proposal with her prospective supervisor, who cited space and time constraints, Deborah realized her goal might be more easily met elsewhere and set about to call sites and inquire about their willingness to meet her requirements. She ended up with several to choose from.

Conclusion

To be an artist in the work place is to risk some of our ego-reassuring status. When we make art in an open studio, amongst clients and staff, we are vulnerable because we are as exposed as the client. Only continued practice of our art can keep us spiritually fit for such a challenge and prevent our art making from being an exhibitionistic dodge. What we are saying is that it's all right not to know, to show one's self. We affirm that we, like all human beings, are in process, never finished with growth and change.

If, however, clinified art therapy is the sum and
substance of what we do, the field of art therapy is in danger of being subsumed into counseling or other related disciplines. Why not just get a counseling degree to begin with, if a few art therapy electives can be had along with the more conventional degree? We have created our own orthodoxy in an ironic attempt to protect our field from interlopers while at the same time feeling no compunction to mimic the courses of counselors and social workers. Consequently, it is those outside of art therapy, artists like Tim Rollins and K.O.S.\(^2\) and Michelle Cassou of “The Painting Experience”\(^3\) who are working in fresh and exciting ways, helping others, maintaining themselves as artists, and by the way, disavowing any connection to the field of art therapy. Nor are we stopping clinicians who have discovered the methods of using art to elucidate the issues their clients present. As my friend, art therapist Barbara Fish, A.T.R., likes to say, “you don’t need a prescription to buy a box of crayons.” The most crucial factor in the life or death of the field of art therapy is not certification, not licensure, but whether sufficient numbers of individual art therapists maintain an ongoing connection to their own art. Without that, the work has no depth, no life, no spark and can be carried out by almost anyone, from a decent O.T. to a well-meaning volunteer.

Work life is ego life. In the worst of cases it is only ego. If our work is not connected to our soul, our very selves become stagnant, even toxic: illnesses and injuries abound in the ranks of unhappy workers. Institutional politics take the place of job satisfaction in providing the spark and interest that keep us showing up every day. The immersion in one’s art is risky, dangerous, invigorating. To walk that path is to be alive. Originally, we art therapists believed ourselves to have something unique to offer; as artists we have the capacity to see differently, be agents of change, be humanizers. We can be subsersive in this most human of ways, reminding ourselves and others of truth by staying in contact with it ourselves. Without our art we are more at risk than even the average worker to succumbing to ennui and creation of a false self. We have firsthand knowledge of authenticity and we got that knowledge through our own art making. Each person’s epithet is written or, in our case, drawn, with our own hands.

“To overcome the anxieties and depressions of contemporary life, individuals must become independent of the social environment to the degree that they no longer respond exclusively in terms of its rewards and punishments. To achieve such autonomy, a person has to learn to provide rewards to herself. She has to develop the ability to find enjoyment and purpose regardless of the external circumstances. . . . And before all else, achieving control of experience requires a drastic change in attitude about what is important and what is not” (Csikzentmihalyi, 1990).

Application of Child Art Theories to the Interpretation of Children’s Art

Betty Jo Troeger, Ph.D.; A.T.R., Associate Professor, Florida State University, Tallahassee, Florida.

Abstract

The primary purpose of this paper is to assemble information about theories of child art into a conceptual basis related to the interpretation of children’s art. A general overview of nine theories or models of child art (naïve realism, recapitulation, personality, developmental, intellectualist, haptic-visual, perceptual development, perception-delineation model, and the author’s synthesis) gives implications for existing concepts and interpretations of art.

One of the most effective ways to comprehend theories is to use them in practical applications. Three of the theoretical concepts described in the paper provide a framework for an interpretation of one child’s art work to illustrate three points of view. Art therapists should be familiar with the current literature before making assumptions about the meaning of specific features in children’s art.

Art therapists look at children’s drawings, paintings, sculptures and other personal expressions in art media for a variety of reasons. These art works are often used for assessment of developmental and/or emotional stages of growth. Understanding implications of atypical art is heightened when it is contrasted to images considered to fall within normal ranges of artistic expression. Children’s art can also serve as a diagnostic tool for certain indicators of psychological disorders, sexual abuse and neurological dysfunction. Researchers are striving to validate the recurring use of specific symbols, color choices, techniques and spatial organization as significant in diagnosing disabling conditions.

A number of theories about children’s artistic expressions exist. The major theories espoused by art therapists are generally linked to a psychological theory which informs their practice. Both theory and practice in art therapy have diversified from a primarily psychoanalytical approach to include creative, developmental, psychoeducational and humanistic/existential approaches. Rubin (1984) cites Freudian, Jungian, Gestalt, humanistic and phenomenological psychological frames of reference for the practice of art therapy; cognitive and behavioral psychology guide some art therapists. Nevertheless, the visual image of the client remains an integral part of each practice period. The primary purpose of this paper is to help art therapists assimilate available information about artistic expression into concepts related to interpreting visual images of children.

A general overview of nine influential theories or models of child art (naïve realism, recapitulation, personality, developmental, intellectualist, haptic-visual, perceptual development, perception-delineation, and the author’s synthesis) gives implications for interpretations of art. These theories are presented in Table I. Our knowledge has moved beyond Cizek’s 19th century view of child art which concluded that all children possess a universal language of visual symbols (Wison & Wilson, 1982). Children were thought to experience a natural unfolding of skills when there was no interference.

The theories of naïve realism, recapitulation and personality evolved during the first half of the 20th century. Naïve realism assumes children or adults can draw the same way with the development of proper motor skills (McFee, 1961). The recapitulation theory (Kellogg, 1969) is closely associated with Jung and archetypal images, i.e., those symbols which occur universally, appearing in divergent groups of people who have not been influenced by other cultures. Freud’s concepts of the role of the subconscious and free association are linked to the personality theory (Clarke, 1979).

Table I

<table>
<thead>
<tr>
<th>naïve realism theory</th>
</tr>
</thead>
<tbody>
<tr>
<td>• postulates that there is no difference between the physical object and its image as perceived by the mind.</td>
</tr>
<tr>
<td>• considers differences in motor control responsible for the variations in the art of children and adults.</td>
</tr>
</tbody>
</table>
• limits art activity to reproduction.
• omits influences of emotions, improvising, and inventing.
• assumes that realism is the same for all people, with no consideration of cultural effects.

recapitulation theory
• embraces the concept that a child evolves through stages of artistic expression as reflected in the development of the human species.
• links interpretation of symbols to universal images (Jung, 1964).
• identifies Kellogg (1969) as a leading proponent of this interpretation of children's art.

personality theory
• accepts Freud's perception that art reveals unconscious states.
• examines children's art work according to the quality of expressiveness; art primarily reflects how the individual feels.
• influences majority of art therapists' interpretations of art. This majority shares a psychodynamic perspective.

developmental theory
• associates Piaget (1971) with stage-theory interpretation of cognitive development.
• establishes criteria for child's knowledge through examination of art product, extent of detail and chronological age of child.
• postulates that learning is linked to prior learning, and the ability to symbolize complex life experiences is identified through emerging imagery.
• indicates that the content and organization of the child's art work reflects the child's cognitive development.
• incorporates recent pluralistic approach to cognition, i.e., multiple human symbol systems of Gardner (1985), multiple cognitive domains of Feldman (1980).

Intellectualist theory
• possesses many of the attributes of the cognitive development theory.
• postulates that what a person knows about an object is his concept of it.
• supports the view that both concept formation and visual analysis are influenced by training, experience, and culture.
• acknowledges that mental age can vary widely from chronological age.
• incorporates formal testing of drawing abilities into mental development.
• Goodenough's Draw-a-Man test associates with this theory (Harris 1963).

haptic-visual theory
• attributes an individual's space orientation to a biogenetic factor.
• describes haptic individuals as more dependent on their own emotional and bodily feelings, and visual people as more dependent on their visual environment.
• identifies differences between children and adults in the ways in which they orient themselves in space.
• encourages use of both internal and external cues for artistic expression.
• Lowenfeld's (1978) work associates with this theory.

perceptual development theory
• identifies Gestalt psychologists as providing basic structure for this theory.
• describes perceptual growth as an increase in the ability to use visual information that is available, to organize and synthesize it so one can respond to it.
• establishes the concept that a child first perceives undifferentiated wholes and is gradually able to discriminate details.
• recognizes Arneheim's view (1974) that perception is linked to culture and related to intellectual ability.

perception-delination model
• accepts psychological and biological findings that every individual has a somewhat unique potential for learning.
• indicates that culture influences a person's perceptual training by giving more opportunities and rewards for observing things important to that particular group.
• considers the psychocultural as well as the visual/physical learning environment effects on information handling.
• states that delineating and responding to art encompasses development of visual images and symbols.
• presents a feedback interaction system which includes student development, teaching effectiveness, and assessment of changes in readiness.

author's synthesis
• defines physical and mental maturation as evidenced in art growth.
• acknowledges numerous individual differences and learning styles within this maturation process.
APPLICATION OF CHILD ART THEORIES

- views environment as affecting learning.
- describes art as an expressive mode of knowing which gives ideas visual form.
- recognizes art as a symbol system which can be understood through the study of art history, art criticism, aesthetics and production.

By mid-century the research on human development had a major influence on the interpretation of children's artistic expression. Piaget developed a universal view of human intellect linked to stages of mental growth, i.e., concrete operations achieved in childhood and formal operation achieved in adolescence. Both Schaefer-Simmern (1948) and Lowenfeld (1971) incorporated these concepts into their views of art development. In the practice of art therapy Rubin (1984) maintains that theoretical underpinnings should include developmental considerations as well as psychodynamic ones. A basic understanding of art development can extend insights into art expressions. For example, scribbling is associated with two to four years; preschematic or the early attempts at symbolic representation is linked with four to seven years. Schematic or repeated use of symbols is attributed to seven to nine years, while realism generally begins at nine years and becomes more accentuated by age thirteen (McFee, 1961). These concepts of normal development provide a structure for identifying images which are atypical at particular levels of growth.

Developmental theory from a universal view has been reflected in the work of Piaget (1971). Additionally, contemporary perspectives in developmental psychology have been expanded to include a pluralistic approach to cognition, focusing on multiple human symbol systems. Gardner (1985) enumerates these as linguistic, logical, numerical, musical, bodily, spatial and personal symbol systems. Feldman (1980) extended Piaget's "unilineal" developmental scheme to five domains:

1. universal, which is achieved by all humanity;
2. cultural, which is achieved by all members of a culture;
3. discipline-based, which is achieved by a small segment of a culture;
4. idiosyncratic, which is achieved by a few members of the culture;
5. unique, which is achieved by an individual.
(Feldman, 1980, p. 31)

The intellectualist theory is associated with Goodenough's initial Draw-a-Man test. Measurement of mental aptitudes is linked to drawing abilities and is the main factor in determining how a child draws his/her concept of the object or idea (McFee, 1961). Lowenfeld's (1978) application of several of the theories to art education is well documented in the literature, specifically his views on creative expression; but he is most closely associated with the haptic-visual theory when interpreting child art. According to this view, variations in images occur depending on the individual's internal or external motivations for expression.

Other child art theories influencing contemporary practices in interpreting children's art are found in the perceptual development theory, the perception-delineation model and a synthesis of existing views. Gestalt psychologists' points of view (Bigge, 1982) as well as the work of Arneheim (1974) are reflected in the perceptual development theory. Children's capacities to perceive the world around them are linked to maturation, intellectual abilities and cultural views regarding learning and artistic expression. McFee (1961), an art educator with a sociological orientation, developed the perception-delineation model. This holistic concept of a child's art development encompasses the learning environment, the teacher and the individual's readiness levels, unique abilities and cultural conditioning.

A synthesis of models is not yet stated in a precise theoretical framework, but has been developed in the practice of the author (Troeger, 1985). Recent advances in cognitive psychology provide new concepts for interpreting symbols. Various cultural influences in art images and children's formal study of art objects also affect perceptions and interpretation.

One way to comprehend theoretical structures is to apply them. Anderson (1978), author of Art for All the Children, suggested an actual interpretation of a child's art work to illustrate different points of view. Three theoretical concepts have been described in this paper, providing a framework for that practical application. All of the theories or a synthesis of current views can be found in interpretations of visual images done by contemporary art therapists. The personality theory, the developmental theory and the current synthesis are used in discussing the selected drawings of one child.

Lucinda (a pseudonym), a seven-year-old African American girl with congenital deformities in the upper extremities, attended a special school for
students with physical disabilities and health impairments. The child exhibited average intelligence and normal social adjustment as evidenced in her school records. Her foster home environment was also described as very supportive. Because one arm was not developed and her other arm extended to a wrist with three rudimentary fingers, Lucinda's range of motion was severely limited. She functioned at grade level in her academic subjects and appeared to have good visual memory. During an art assessment (Troeger-Clifford, 1981) the art therapist observed that the child cut with difficulty and manipulating clay was laborious for her. Lucinda was successful in handling a paint brush and very spontaneous when drawing. Despite normal intellectual and emotional development, the human figures portrayed in her art work were atypical.

From a personality theory perspective, Lucinda's drawings might be described as expressive with a direct linear quality typical of a child's work. It could be surmised that Lucinda's body image was reflective of the way she feels about human form. In the drawings of the family (Figure 1), the people appear closely linked, with Lucinda in the foreground and the baby slightly disconnected from the group. The drawing of the man, woman, and self (Figure 2) are depicted as father, mother and Lucinda. The schema for the figures reflect more detail and the bottom of the page serves as the baseline. The two female figures are clothed in transparent dresses. In the drawings of the cowgirl (Figure 3) Lucinda projects the female figure in vest, jeans, and boots, with holster and gun and a cigarette dangling from her mouth. A smile is a consistent feature in all of the drawings. From this theoretical orientation, no instruction in figure drawing would be necessary, but rather a supportive environment would be provided with art materials readily available where the child could draw or paint spontaneously. Verbal dialogue about the art work might be encouraged. Feelings surrounding the subjects would also be explored, but symbolic meanings would be determined by the adult.

A developmental theory application might include a determination of the stage of cognitive development of the artist. Lucinda would be in an early schematic stage. Generally, work progresses from scribbling to preschematic to schematic to some form of realism. These stages correspond to chronological age and an early schematic stage is compatible with Lucinda's being seven years old. The content and the organization of the child's art work are also a basis for judgement. The lack of detail in Figure 1 and Figure 2 would be viewed as an indication of immaturity. Figure 3 would represent a marked improvement with attention to detail and clothing reflecting a more complex drawing. The cowgirl theme would be associated with emerging imagery. An art intervention could consist of verbal inquiries about where the cowgirl lives, was the cowgirl indoors or outdoors, or what kind of animals might be in the picture. Motivation might include reading stories, doing improvisational exercises such as dressing in costumes and listening to music related to a theme. Efforts would concentrate on stimulating and extending the concepts the child was developing. The adult would not demonstrate any figure drawing exercises, but rather set the stage for the child to express ideas in visual form.

Theoretical concepts from the author's synthesis of perceptual and cognitive perspectives (Troeger, 1985) would produce yet another kind of information about Lucinda's art work. Although developmental indications of an early schematic stage would be acknowledged, more attention would be given to the atypical representation of the body image. Direct learning experiences could be initiated to extend the child's perception of the human body. Visual as well as tactile experiences often extend limited information caused by lack of instruction and awareness of human form. Lucinda's own arms were not like most other people's. She could observe human form in works of art, look at her peers as they modeled for small group drawing sessions and watch demonstrations of rendering the human figure by the therapist or teacher.

Figure 4 represents the first effort of Lucinda to draw arms and hands. She had just reached eight years of age. The upper extremities were typical of an eight-year-old's drawing capacity. Praise was given for improved attention to detail. The final drawing (Figure 5) in the series is much more complex and represents gains made over a semester of instruction. Background detail is included and overlapping is shown by a figure placed in front of a chair. Arms are extended upward depicting movement. The items on the table reflect a visual perspective while the layering of clothing on the woman is still transparent, indicating what she knows as well as what she sees. Lucinda's imagery appears richer not only because of the details, but she has expanded her images to include a cat, adding more interest to the drawing. She also labeled the cupboard in case the viewer needed further information. The base line remains at the bottom of the page but the overall composition is richer in the variety of shapes.
and forms. The next educational intervention could include making her aware of patterns and textures.

Lucinda's case is but one simple example of the very complex challenge of interpreting children's art based on a specific theoretical orientation. A historical perspective regarding the development of information on this subject is important when establishing an orientation for interpretation. The more recent theories of child art are clearly linked to learning while most of the theories developed before and during the middle of the 20th century are more closely associated with maturation. Maturation has been described by Bigge (1982) as a developmental process within an individual that reflects genetic "blueprints" by manifesting different traits; learning is an enduring change not heralded by genetic inheritance and occurs in insights, behavior, perception or motivation, or a combination of these. Wilson & Wilson (1982) discount the commonly held view that children's spontaneity and creativity will be destroyed if the natural process of making art is influenced by adults. From their point of view adult assistance is necessary to encourage the child's spontaneity and creativity. The timeliness of a theory must be constantly examined in terms of current practices. Rogers (1965) advocates testing theories, and, by such testing, profitable directions for action may be found.

Perhaps the final task in examining theories of child art is to establish a personal model for interpretation. Pertinent questions to build such a model could include the following:

1. What is your psychological orientation and is it compatible to a theory of child art?
2. What is the developmental level of the client?
3. What cultural considerations are to be taken into account?
4. What effects do learning about art have on image-making?
5. What physical, medical or drug-related factors distort the art process?

Rubin (1984) stated that her practice involved various ideas from different theories which she called "additive eclecticism." She now doubts the validity of such a heterogeneous mix. Art therapists need to establish criteria for judgements before making assumptions about meanings of visual images. A holistic perception of the client provides interrelated data, establish relationships, broadens conceptual bases, and expand the understanding of art as therapy.

The Effects of Stimulant Medications on the Art Products of ADHD Children

Julie Epperson, M.A., A.T.R., University of Utah, Department of Art, Salt Lake City, Utah.
J. Lane Valum, M.S., NCSP, University of Utah, Salt Lake City, Utah.

Abstract

The present study investigated the effects of varying doses of psychostimulant medications on the expressive qualities evident in children's art products and, furthermore, considered how changes in expressive qualities corresponded to overt behavioral changes. Expressive qualities are thought to reflect a child's attention, activity level and degree of impulsiveness and were measured by a rating instrument that considered line quality, use of materials, degree of organization, integration, and completeness. The results indicate that the specific areas assessed were influenced by varying doses of psychostimulant medications. In addition, data from art products corresponded in a positive manner to data obtained from a behavioral assessment measure. The findings indicate that art therapists can contribute to the appraisal of responsiveness and treatment effectiveness of medication interventions.

It is generally estimated that 3-5% of school-age children are affected by Attention-Deficit Hyperactivity Disorder (ADHD) (Barkley, 1985). This disorder is characterized by inattentiveness, distractibility, impulsivity, and motor hyperactivity (American Psychiatric Association, 1987). In addition to these primary symptoms, children with ADHD may experience difficulties with social and academic functioning, evidenced in conflicted interactions, poor self-concept, low self-esteem, aggressive and antisocial behaviors, and a history of physical injuries related to impulsive behaviors (Frick & Lahey, 1991). Furthermore, these problems can extend into adolescence and adulthood (Barkley, 1985).

Common treatments for children with ADHD have been primarily pharmacological interventions (DuPaul, Barkley & McMurtry, 1991), and secondly behavioral therapies, both directed toward management of symptoms. The three most often used medications are methylphenidate (Ritalin), dextroamphetamine (Dexedrine), and pemoline (Cylert). These drugs produce changes in behavior within one to two hours of ingestion and provide therapeutic effects for four to eight hours (Donnelly & Rappoport, 1985). Psychostimulant drugs influence concentration, attention, and may decrease impulsivity. Behavioral therapies used for the treatment of ADHD include behavior modification, parent training, self-control, and social skills training. It is recognized that using a combination of behavioral and pharmacological interventions provides greater efficacy in the treatment of ADHD (Barkley, 1985).

Approximately 30-40% of all child referrals to mental health facilities are related to AL-HD (Barkley, 1982). As a result, art therapists providing intervention services to child populations in mental health facilities or in educational settings find themselves working with children affected by the symptoms of ADHD.

Art therapists may provide therapeutic services directed towards assessment and treatment of the primary symptoms of ADHD: impulsivity, inattentiveness and hyperactivity and in the treatment of the associated secondary symptoms, poor self-concept, low self-esteem, and impaired social relatedness. Furthermore, art therapists are in the position to provide valuable information on children's responses to medication due to the unique nature of art making processes. These creative processes pro-
vide a record of the child's emotional/behavioral status with the creation of a permanent product.

Wadeson and Epstein (1976) investigated the effects of stimulant medication on a child's behaviors and art productions in order to understand the intrapsychic experience as it is influenced by varying doses of the psychostimulant medication, Dextroamphetamine. They reported significant differences in the child's expressiveness and relatedness. Epperson (1991), in a clinical case study, reported on changes in a child's art products in response to a multimodal treatment intervention including behavioral therapies, art therapy, and a medication intervention. Differences were evident in the depressive imagery represented in this child's art products. These studies are interesting and informative contributions; however, both are limited in scope due to the reliance on a single individual's response, and to varying degrees lack sufficient research controls to address the effects pharmacological interventions and dosages may have on the art products of ADHD children.

The purposes of the present research were twofold. The primary objective was to investigate children's art products in order to examine if changes in imagery were evident and could be explained by variation in medication dosages. Secondly, this study considered how changes in the art products corresponded with behaviors measured by a behavioral rating assessment.

In order to limit the scope of the research, the study was restricted to the expressive qualities of the permanent product; content was not considered. Expressive qualities evident in art products are thought to serve as a record of children's behaviors at the time they were involved in the art making process. Uhlin (1972) and Andrews and Janzen (1988) describe expressive qualities and related characteristics in the art products from children with attentional and/or learning problems. Thus, motor movement, attention, and degree of impulsivity are thought to be reflected in line quality, use of materials, degree of organization, integration, and completeness evident in the resulting art products.

Method

Participants

Eight children, ages 6 to 12 years, participated in this study. The participants were involved in an eight-week summer treatment program for emotionally and behaviorally disordered children. The program consisted of social skills training, art therapy, recreation therapy, education, and parent training. Management and reinforcement of children's behaviors was assisted with a structured behavior modification program. The eight children participating in this investigation were those whose parents had requested a medication evaluation be conducted on their child. This evaluation determined whether medication had a sufficiently beneficial effect on an individual child and if it should be made a part of the child's long-term treatment. This medication evaluation was conducted during the final three to four weeks of the treatment program.

Setting

The study was conducted in a private psychiatric hospital in a large suburban area in the intermountain west. The art products for this study were collected during art therapy group sessions. The participants took part in art therapy sessions with a group of nine to ten similarly aged peers.

Data Collection Procedures and Instruments

The medication evaluation was a double-blind placebo-controlled evaluation conducted with a type and dose of medication that was appropriate for each child. For the overall evaluation, the effects of medication were evaluated by gathering information on multiple aspects of a child's functioning and comparing the data obtained on active medication days with data obtained on placebo days. For the purpose of this investigation, counselor behavioral ratings were employed. For all participants, differences were assessed between behavior on medication days and placebo days using the counselor ratings on the Abbreviated Parent-Teacher Conners Rating Scale (Conners, 1973). This questionnaire is a ten-item behavioral assessment measure of inattention, impulsivity, and hyperactivity (maximum rating 30). A higher score indicates increased ADHD symptoms present in a child's behavior. Counselors rated behaviors daily within several hours of the time art therapy sessions took place.

Art products used in this study were created during 50-minute art therapy sessions. Art tasks varied in structure and a variety of media was offered, with drawing materials most often used.

All art products were dated and photographed. Two independent raters were trained prior to being shown slides of the art products of each participant.
Raters reviewed and scored each art product using an Expressive Qualities Rating Form designed by the first author to measure the expressive qualities of the art products. This rating form is a four-item assessment measure designed specifically for this study in order to assess qualities in art products thought to be related to inattention, impulsivity, and hyperactivity. Use of scribbling, control of materials, degree of organization, and completeness was rated on a 0 to 2 scale for degree of presence. A maximum score of 8 was possible for each art product rated. A higher score was indicative of a child experiencing difficulty with expressiveness related to ADHD symptoms. Scores on the art products were tallied and means computed for each condition.

Results

In order to determine the degree of interrater objectivity on the ratings of the art products, interrater reliability was computed using correlation analyses. After being determined acceptable ($r = .72$), the raters' scores were combined to obtain a single mean for each treatment condition.

The changes in the mean expressive qualities scores across conditions were graphed and presented along with the changes in mean counselor scores. The results from all eight subjects indicate that the art products were influenced by the differing conditions when the subject demonstrated a response to medication. For those subjects responding positively to medication, mean scores on expressive qualities were lower when done while under the effects of medication. In cases where several conditions were assessed, variations were evident between dosage levels. Also, the expressive qualities scores corresponded to scores derived from the behavioral rating measure. Additionally, the scores obtained from the Expressive Qualities Rating Form were in agreement with the overall treatment recommendations derived from all data obtained during the medication evaluation.

Data from four of the eight subjects representative of the overall results are presented in graph form in Figure 1.

M2 is a 9-year-old boy with a history of ADHD being treated with Ritalin. M2 was evaluated on 10 mg. Ritalin, and placebo. Data (Fig. 1) on Subject M2 demonstrate that he experienced reduced symptoms of ADHD when under the medication condition. When under the placebo condition, an increase in difficulties as measured by both assessments was evident.

J2 is a 9-year-old male with features of ADHD. J2 was evaluated on 10 mg. Ritalin, and placebo. As the expressive qualities graph indicates (Fig. 2), J2 responded positively to 10 mg. of Ritalin. The expressive qualities assessment appears to be slightly more sensitive to changes due to medication condition than the behavioral assessment measure.

P1 is a 9-year-old boy with a history of ADHD and was being treated with Ritalin. P1 was evaluated on 7.5 mg. and 10 mg. of Ritalin, and placebo. Overall, it appears that he showed a positive response to Ritalin. The data derived from the art products depict changes that are not completely consistent with the results from the counselor observations (Fig. 3). P1 responded positively to medication, and the data from the art products supports the 7.5 mg. dosage although the data from the behavioral measure indicates that 10 mg. is more effective. However, additional data obtained during the medication evaluation not included in this study were supportive of the 7.5 mg. dose. This lower dose was ultimately recommended by the treatment team.

T2 is a 7-year-old boy with a history of ADHD. T2 was prescribed Cylert to control ADHD symptoms. T2 was evaluated on 37.5 mg. Cylert, and placebo. Results indicate that T2 did not appear to have a response to Cylert. Both rating instruments display identical patterns indicating no significant difference between conditions (Fig. 4).

Discussion

Psychostimulant medications are considered effective interventions in the treatment and management of symptoms associated with ADHD. However, a medication's intervention effectiveness is contingent on the individual's clinical response to a specific medication and to the dosage. Thus, objective assessment is important in evaluating responsiveness and is facilitated by the use of a double-blind, placebo-controlled research design.

There are a variety of methods available for monitoring responses to medication. These assessment tools consist primarily of behavioral observations measures and rating scales. However, an additional source of objective data reflecting a child's response to medication is the assessment of a child's art products. This investigation provides information indicating that stimulant medications can have a significant influence on the expressive qualities evident in art products from children with ADHD. Furthermore, these results indicate that the expressive
qualities ratings are consistent with the data obtained from behavioral rating measures.

However, as the results indicate, not all subjects investigated showed a clear response to the medications behaviorally, in their art products, or with both measures. This may partially be explained by the behaviorally oriented setting in which the investigation was conducted. Hence, the influence of medication may have been less pronounced since the setting may have limited the appearance of symptoms. Secondly, unclear results are understandable when one considers that 20-30% of children do not respond or respond negatively to psychostimulant medication (Barkley, 1977).

Further study is recommended to address validity issues of the Expressive Qualities Rating Form. In addition, it would be interesting to research how the structure of the setting, art tasks, and differing media may contribute to expressive quality scores.

Summary

The results of this study indicate that art therapists can contribute valuable information to other mental health professionals and physicians regarding a child's response to medication when basing the information on the objective analyses of a child's art products. The influence psychostimulant medication has and whether it is positive, negative, or neutral appears to be receptive to objective evaluation using an assessment measure such as the Expressive Qualities Rating Form used in this study.

Finding Light at the End of the Funnel: Working with Child Survivors of the Andover Tornado

Tamara Kay McDougall Herl, M.S., Art Educator, Andover, Kansas.

The Funnel

Since Biblical times, the rainbow has served as a sign of hope. In Genesis, Chapter 9, God tells Noah:

Behold, I establish my covenant with you and your descendants after you. . . . When I bring clouds over the earth and the bow is seen in the clouds, I will remember my covenant.

But at 6:38 p.m., on Friday, April 26, 1991, in Andover, Kansas, there were no rainbows. Though dark clouds threatened, the town's residents were enjoying a warm spring afternoon and many were making plans for the weekend. Suddenly a devastating tornado ripped its way through the town, leaving behind a forty-acre path of destruction which will darken the lives of many for months and perhaps even years to come.

Eighty miles away, I toured an exhibit in Manhattan, Kansas, with a colleague as part of the Kansas Art Education Association spring conference. A thunderstorm raged overhead as we left the exhibit, and the bus driver mentioned that a small twister had touched down in a nearby town. It was not until much later that I heard that the town of Andover was hit by a much larger tornado—and that I realized that many of my students could be among the victims, including my own daughter, who was staying with a friend in Andover.

And so began three hours of frantic phone calls to determine what had happened. I turned on the local news in the hope of getting more information, but the news was scanty and brief. Finally, miraculously, instead of hearing a busy signal or a recording, I heard the shaky voice of my daughter telling me she was safe. I thought to myself that there must have been divine intervention at the switchboard! I wanted to return to Andover immediately, but I learned that only emergency vehicles could enter the town. News reports said that as many as 21 people had died as a result of the storm's fury.

"Were any of my students hurt? . . . they'll need food and water . . . I can get those clothes that we were planning to take to Goodwill . . . ." These and a hundred other thoughts filled my head as, after a sleepless night, I drove toward Andover. As I traveled through the Flinthills, bits of debris dotted the hillside like macabre wild flowers. As I neared the city itself, smashed vehicles and up-rooted trees littered the ditches. And the closer I got, the more real the nightmare became.

My first thoughts were to locate my daughter, and, after a frantic search, I learned that she was at home, so I phoned her. As I heard her voice, something inside me snapped and I broke down with tears of relief. Somehow, knowing my daughter was safe helped me to move past my personal fears and to focus on the needs of others.
It was not until I rode with a group of teachers distributing food and water into the area where the twister tore its path that I realized the total extent of the destruction. People's descriptions of the area as a "war zone" were completely accurate. Mountains of twisted metal and shredded fiberglass insulation interspersed with broken glass and scraps of paper, formed a backdrop for broken trees, stripped of their bark. We watched as survivors searched through the dreary piles of rubble for bits and pieces of their lives. That night I returned home, falling into bed exhausted and emotionally spent.

Eventually, Andover teachers were called in for a special meeting to discuss how to best deal with their students' and their own feelings. I listened numbly to the counselors and speakers from organizations such as the National Organization for Victim Assistance. They advised teachers to let the students talk about and draw their experiences. About halfway through the meeting, the principal said, "And we are fortunate enough to have an art therapist on staff. Perhaps she has some ideas." I suggested that perhaps students could design a storm shelter. As the meeting turned to other matters, I wondered why I had not given any previous thought to how to use art as an intervention with the students. Finally, I realized that I had been in a stage of denial, ignoring the fact that I would be among those expected to help students piece together their broken lives.

In order to design additional art interventions, I began by making a list of the feelings the students might be having, such as fear, anger, helplessness, vulnerability, loss, shock, anxiety, denial, and guilt, and issues revolving around giving and receiving help. In reviewing art therapy and crisis intervention literature* (See editor's note at the end of this article.) I did not find anything specifically related to tornadoes, but I was able to come up with some guidelines for art activities for the teachers to use with their students.

Some Personal Observations of Art Expressions Created After the Tornado

The first part of each day at school was set aside for discussion and special activities, including art. Some children wrote in journals and others created group murals, depicting images which ranged from stereotypical art to realistic scenes of the storm (Figure 1). Other students devoted unusually careful attention to tiny details—especially in the portrayal of debris (Figure 2) and in the use of big orange "X's" which meant that someone's house had been condemned. One student created a picture called "My Grave" after hearing about a man and his son who thought they would die together in a culvert (Figure 3). While some students created fantasy scenes, others created metaphors for their experience, showing how many students perceived the crisis they had experienced (Figure 4).

When the students came to art, I told them how glad I was to see them and asked them to share their experience on paper or in modeling clay. At first, I noted that there was a great deal more copying than is normal. For example, when one class member started drawing a picture of heaven, many others turned their papers over and began using that same theme (Figure 5). I also saw some of the most expressive work these students have ever created. Many drawings showed people with tears streaming down their faces, some of them being swept up by angry black scribbles (Figure 6).

Other students depicted underground shelters and other safe places. In one class, several members depicted tepees in their art, and I was puzzled until the students explained. Just a few hours before disaster struck, classes had toured a local "Mountain Man Rendezvous," where they had been told that one reason Native Americans used tepees was because their shape made it difficult for a twister to lift the structures.

Many other pictures showed scenes of battle (Figure 7) or of someone or something facing nearly insurmountable odds. Much of the class time was spent sharing. Although many students seemed talkative and lively, I noticed that some of the students who had been hit the hardest were reluctant to share and I respected this.

Eventually, the excitement of the situation began to wear off. However, tornado images continually appeared in projects which were not related to that theme. For instance, the swirling forms of twisters appeared in response to a third grade lesson centered around texture and pattern. Students' doodles often contained swirling and spiral forms (Figure 8). Some fifth graders drew tornado pictures after seeing a video about the history of America as related to art. In a guided drawing experience, several fourth graders created imaginary c-atures that fought tornadoes, had tornado bodies, or helped tornado victims.

As the school year drew to an end, some students continued to create tornado-related art. Some expressed resentment over the privileges the tornado victims received, while others complained that they were sick and tired of talking about tornadoes.
Andover's Counseling Center sent a representative to warn us that some students may need help dealing with their issues for a long time to come. He explained a plan to set up support groups over the summer.

A few days before the end of the school year, tornadoes again threatened Andover, taking almost exactly the same path as before. Teachers noted that some students ran to the window when low flying aircraft caused the glass to rattle. One student sought refuge under his desk when a classroom bell startled him.

Concluding Observations

In observing the art produced by students in response to this catastrophe, the work seems to fall into three major categories which I referred to as documentary, proclamatory, and recovery. The documentary category, which involved the children's ability to acknowledge or own the situation, had three components: denial/escape-oriented art, stereotypical art, or realistic art. The proclamatory category, which dealt with the children's vulnerability and basic needs, included art which depicted survival or safety needs and expressive/affective art. The third category of recovery included the emergence of original art, more "normal" line quality versus heavy and/or scribbly lines, and clear, clean colors versus muddy, smeared colors.

Movement through these categories seemed erratic and illogical, and not all students produced first documentary, then proclamatory, then recovery images. Immediately after the storm, some children drew pictures in the proclamatory and even the recovery stage, depending on a variety of factors including their own coping skills, their parents' coping skills, proximity to the storm, pre-existing problems, etc.

Documentary Category

In the documentary category, the children's images seemed to be saying, "It can't happen to me . . . but it did." Some students wanted to deny or escape the situation, and thus created art which helped them fantasize about a safer time or escape from the nightmare of the situation. An example of denial was provided in a creative writing experience when one student began his story fairy tale-style with the words "Once upon a time" and then listed actual numbers and names of businesses which had been destroyed, and yet gave his own family a fictitious name. Feelings of insecurity caused other students to regress to the creation of stereotypical and safe images such as "ninja turtles" or to copy themes created by their peers, as in the "heaven" pictures discussed earlier (Fig. 5). Some students were able to own the fact that this horrible ordeal had indeed happened to them, and created art which contained realistic images and excessive details (Fig. 1 & 2).

Proclamatory Category

In this category, students attempted to announce or proclaim, through their art, the desire for their basic needs to be met. The images now seemed to say, "Yes, it happened . . . now I need help and reassurance." Because the storm had left so many children feeling vulnerable, they created tepees, storm shelters, and other safe havens. Many students depicted an even more basic need—the instinct to survive—in their "against the odds" drawings and scenes of battle (Fig. 7). Some students who had formerly needed to be coaxed into adding expressive or affective details such as a curved mouth or raised eyebrows spontaneously drew details such as a screaming mouth (Fig. 3) and lines with movement (Fig. 6).

Recovery Category

Children who were fortunate enough to be in situations in which their needs were recognized and met were able to create art which falls into a third category which I call recovery. Art in this stage seemed to say, "Yes, it happened, but I survived. I have someone to take care of me." Studying changes in the content, color use, and line quality of the students' art provided clues to the artist's sense or lack of well-being.

Figures 9-12, drawn by one child over a four-week period, illustrate the progression of images toward the recovery stage; however, as previously discussed, the movement through the stages was not always sequential. In the first drawing (Figure 9), the student, in a documentary style, depicted what had happened to him in a very realistic manner. A few days later, the student created another documentary picture in an almost identical, yet less violent and chaotic manner (Figure 10). In the third picture (Figure 11), the student began creating puffy storm clouds which were almost identical to those in the first picture. He then drew creatures which rise, volcano-like, from the ground line in the center of the page. These creatures were copied from the drawing of a student sitting next to him. He had reverted back to the documentary category in which ster-
eotypical images are created. At that point he became frustrated, scribbled through the "creatures" and attempted to draw a building below, through which he also scribbled. Even though he did not consider himself successful in this attempt, the student had gone beyond documentation and had made a move toward recovery with his attempt at the expression of an original idea (the building).

In his final picture (Figure 12), the student was able to create a drawing which did not contain the storm clouds and funnels, images which had been central to his earlier work. Though the lines of the car are heavily drawn, the theme was original. The image of the car could be seen as a symbol for escape, yet it could also represent his ability to "move on" at this point.

I feel the changes apparent in the art of these students provide evidence for the value of using art therapy in crisis intervention. Had the children not been allowed to graphically express their feelings surrounding the experience, the recovery of many may have been a much more lengthy process. The therapeutic art activities helped many students work through the crisis and served, as they continue to serve today, as indicators of how these students are coping with this horrible experience.

*Editor's note: There are some references that art therapists may find useful when working with children who have been exposed to severe stress or crisis such as the experience the author has described. The following list contains information on the use of art expression and imagery in crisis intervention and treatment of post-traumatic stress disorder (PTSD) which may be applied to child populations who have experienced crisis in their lives:

Reviews

The Art Therapist's Third Hand—Reflections on Art, Art Therapy and Society

Several years ago, as a very naive art therapy student, I recall acquiring information about one of my teachers before classes began. I was told that she was a pioneer in the field, had written several books and was traveling from New York to Washington, D.C. to teach our class. What a stage was set for our first meeting! I remember having a tape recorder in hand, ready for Ms. Kramer's first class. She turned to me and said, "Why are you taping this? I don't have a paper prepared." To me, that was irrelevant; her credibility had already been established. I was certain that whatever she had to say would have an impact on my "third hand."

Throughout the video, Kramer uses case examples and patient artwork to display the influences of the therapist's third hand as a productive intervention. Many of us are taught to avoid adding to or physically altering our client's art forms, even if solicited. To "rescue" clients in times of frustration may encourage helplessness, and breaking boundaries, however symbolic, may be contraindicated for certain populations. However, Ms. Kramer presents an intervention strategy that goes beyond the art teacher's technical assistance. Case examples she discussed included adding a border to an image that was cut off by the edge of a page, providing a different shape of paper to a mentally retarded client who was quite fixated, and the art therapist's more realistic rendering of a child who was dangerously grandiose. In these instances, the art therapist's involvement weaves together the artist, the teacher and the empathic clinician into a healing fabric that is subtle but potentially potent therapeutically.

Kramer also adds her own humorous commentary to lighten her observations of how bombarded we are by stimuli in the world around us, and of the risks involved as we develop a quasi-autism in coping or filtering assaults on our senses. Her discussion on graffiti is particularly compelling; she theorizes that the illiterate and semi-illiterate use letters ("... the enemy") in an enlarged and aggressive manner to decorate and deface parts of a world they don't share.

Recently, Ms. Kramer was a guest speaker at
Eastern Virginia Medical School. In the workshop portion of the day we first practiced developing our third hand by taking a client’s unfinished work of art and duplicating it. This gave us the opportunity to empathetically “draw a mile” with our clients’ hands. I found myself looking at the drawing much differently, and knowing more about it and the client than I did before. In imagining what the drawing needed, I recognized what the client needed as well, and an opportunity to intervene therapeutically by using a metaphor was born.

The content of the 1986 presentation has been useful to me as an art therapist and as an educator. The text appears in The American Journal of Art Therapy, Vol. 24, No. 3, February, 1986 and I highly recommend it to others. It would be interesting to hear more about Ms. Kramer’s recent work in this regard. But this video, as produced, recorded and edited by James Pruznick, does a disservice to both the content and its author.

I advocate the use of video as a compelling method of communicating to colleagues and the public about who we are and what we, as psychotherapists, can do. However, it must be accomplished in a professional manner. Just as the quality of the paper used for a written article adds to its credibility, so should the quality of a video production enhance a presentation.

Regrettably, The Art Therapist’s Third Hand falls short in several respects. Essentially, the sound, lighting, camera angles and poor editing in this production are all as distracting as in those 16 mm high school films that flutter, slip and annoy so often. The videographer could have significantly improved the production by filming the artwork in a studio, rather than repeatedly fading and zooming in and out onto the projection screen. Images of the environment introduced in the presentation are distracting and counterproductive; if intended to highlight, they serve instead as samples of the bombardment Ms. Kramer describes and produce instead the same numbing and distancing effects in the viewer. Strategic portions of the original audio, skillfully dovetailed with a narrator’s introduction, summary and closure, would have been sufficient to produce a strong film—a proper forum for Ms. Kramer’s abilities and one worthwhile for the field.

At one point during her eloquent presentation, Edith Kramer likened the artistic gift to spice: “God just goes with a salt shaker or sugar shaker all over the world and spreads it out and among any 100 people you will find some gifted ones regardless of what mental level or emotional state or cultural status they happen to be.” Clearly, Ms. Kramer has received several grains of insight. This video is a poor showcase for her considerable talents.
Guidelines for Submissions

All submissions will be acknowledged upon receipt by the AATA National Office. Art Therapy uses a blind peer review procedure for full-length articles and brief reports; final decisions regarding publication are made by the reviewers and the Editor. Decisions regarding submissions to other sections are made by the Editor, Associate Editor and special section editors.

The following are guidelines for developing and submitting a manuscript. Manuscripts that do not conform to these guidelines will be returned to the author without review.

**Manuscript Categories**

1. **Full-length Articles.** Full-length articles may focus on the theory, practice and research in art therapy or related areas. Manuscripts must include an abstract of approximately 75-125 words summarizing the major point of the article.

2. **Brief Reports.** Short articles which focus on the results of research are appropriate for this section. Manuscripts should include information on the research design, methodology and results; an abstract of approximately 75-125 words should also be included.

3. **Viewpoints.** Short articles focusing on personal experiences, poetry or original art may be submitted to this section.

4. **Book Reviews.** Reviews of books of interest to art therapists may be submitted at any time. Books which authors wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

5. **Film/Video Reviews.** Reviews of media (films or videotapes) may be submitted at any time. Media which producers wish to have considered for review may be sent directly to the AATA National Office at the address listed above.

6. **Comments.** Brief comments on articles published in Art Therapy, issues critical to the profession and practice of art therapy, or letters to the Editor may be submitted to this section and should conform to the style of all other submissions.

**Other Requirements**

1. Send five (5) clear copies of each manuscript to Cathy A. Malchiodi, A.T.R., Editor, Art Therapy: Journal of the American Art Therapy Association, c/o AATA, Inc., 1202 Allanson Road, Mundelein, Illinois 60060. Neither AATA nor the Editor can be responsible for submissions sent to any other address.

2. Only original articles that are not under consideration by another periodical or publisher are acceptable.

3. Manuscripts must be typewritten on 8½" x 11" white paper with margins of at least an inch. The body of the paper, references, tables and quotations must be double-spaced.

5. An abstract of 75-125 words must be included with full-length articles and brief reports.

6. Please avoid footnotes wherever possible.

7. A cover sheet should be prepared to include the full name(s) and degree(s) of the author(s), professional affiliations, and the return mailing address of the author to whom correspondence can be sent. Authors' names, positions, titles and places of employment should not appear in the body of the paper to assure anonymity and to facilitate blind review.

8. Use tables sparingly and type them on separate pages. Refer to the APA Publication Manual for style of tabular presentations. All tables, charts or diagrams must be legible and able to withstand reduction.

9. Photographs must be at least 5" x 7" and black and white glossy prints, preferably with high contrast. Xerox copies of illustrations or art expressions are not acceptable for publication. Figure numbers and captions should be noted on the back of photographs, captions must be typed and submitted on a separate sheet of paper. Please refer to figures in the text as Figure 1, Figure 2, etc.

10. Lengthy quotations (300 words or more from one source) or reproduction of works of art (this does not include client art expressions, which is addressed below) require written permission from the copyright holder for reproduction. Adaptation of tables or figures from copyrighted sources also requires approval. It is the author's responsibility to secure such permissions; a copy of the copyright holder's written permission must be provided to the Editor immediately upon acceptance of the article for publication.

11. Client/patient confidentiality must be protected in the title, abstract, text, photos, illustrations and other accompanying material. Proper releases for use of client art expressions and other client information must be obtained and kept on file by the author.

12. It is expected that any manuscript accepted for publication in Art Therapy will go through at least one revision before publication. If authors have prepared their manuscripts on either an IBM, IBM-compatible or Macintosh computer, upon acceptance, they can send a 3.5" diskette containing an electronic copy of the manuscript to the AATA office. This will help speed processing, editing and publication.

**Note:** Authors bear full responsibility for the accuracy of all references, quotations and materials accompanying their manuscripts.
ATTENTION AUTHORS

In order to help us process your submission more quickly, please complete the following information and attach one copy to your manuscript:

Name: 

Degrees/Credentials: 

Address: 

Phone #: work home

Type of Submission [check one]:

___ Article
___ Brief Report
___ Viewpoints
___ Book Review
___ Film/Video Review

Title of Submission: 

Checklist:
___ Five copies, typewritten on 8½" × 11" paper.
___ Abstract of 75-125 words (for articles and brief reports only).
___ Detachable cover sheet with author(s), name(s), affiliation, degrees and credentials.
___ Appropriate release forms obtained for use of client art expressions and client information. (You do not need to send these with your submission, but you must have them on file.)

Author's signature ____________________________ Date __________

THE ORGANIZATION

The American Art Therapy Association (AATA), a non-profit organization founded in 1969, is a national association which represents a membership of approximately 3500 professionals and students. It is governed and directed by a nine-member Board elected by the membership. The AATA has established standards for art therapy education, registration and practice. AATA committees actively work on governmental affairs, clinical issues and professional development. The AATA's dedication to continuing education and research is demonstrated through annual national and regional conferences, publications, films and awards.

MEMBER BENEFITS

Individual members receive

Publications
- Art Therapy, the official journal of the AATA
- The quarterly AATA Newsletter.
- Substantial discounts on AATA publications such as Annual Conference Proceedings, other professional journals, films, and membership directory.
- Free AATA literature, such as Educational Programs List, Art Therapy Media List, and Standards of Practice.
- Mailings of professional interest

Services
- Insurance, including professional liability, major medical, life and disability
- Access to national experts in art therapy

AATA Conferences
- Discounts on registration fees to AATA national and regional conferences

Nationwide Advocacy
- Governmental affairs activities including Congressional review and monitoring
- State legislative and regulatory activities
- Promotion of recognition and reimbursement of art therapists by third-party payers.
- National liaison with related professional organizations for recognition and promotion of the profession of art therapy

Professional Standards
- Development of model job and licensure laws
- Development and implementation of national guidelines for approval of Master’s Degree and training programs in art therapy.
- Development and implementation of nationally recognized Standards of Registration of Professional Art Therapists

GENERAL MEMBERSHIP APPLICATIONS

1. The membership year is the calendar year January 1st through December 31st.
2. Contributing, Associate and Student applicants for NEW MEMBERSHIP ONLY. Please follow the chart below when submitting membership application.

Applications received between
Jan. 1st and May 31st—Full dues payment
Memorial will expire Dec. 31st of same year
June 1st and Sept 30th—Half year dues plus $5.00 payment, membership will expire Dec. 31st of same year
Oct. 1st and Dec. 31st—Full dues payment, membership for the remainder of current year and the next full year through Dec 31st

3. Professional Member applicants must meet Criteria for Professional Membership. Formal application with documentation is submitted to the Membership Chair for approval.
4. AATA Membership and AATA Registration (A.T.R.) each have a separate application procedure. Registration is bestowed only the Standards Committee.
5. National AATA membership is required for Chapter Membership. Please contact the AATA office for information on AATA Chapters.

CATEGORIES AND FEES

PROFESSIONAL—by application only, such members may vote, hold office and serve on committees

Credentialed Professional Member: individuals who have been dually approved for Professional Membership and Registration (A.T.R.) by the AATA, dues are $50 per year
Active Professional Member: individuals who have completed professional training in art therapy, dues are $50 per year

CONTRIBUTING—individuals, organizations, institutions or foundations which contribute annually to the AATA. Such members may not vote, hold office or serve on committees. Dues are $100 per year

ASSOCIATE—individuals interested in the therapeutic use of art who support the purposes and objectives of the AATA. Such members may not vote, hold office or serve on committees. Dues are $75 per year

STUDENT—individuals who do not meet the qualifications of Professional Membership and are currently taking coursework in art therapy or related fields. Requires a current statement from the institution of learning indicating full-time status and coursework content. Student members may not vote or hold office but may serve on the Student Subcommittee of Membership. Dues are $35 per year.

STATEMENT OF PURPOSE: Art Therapy. Journal of the American Art Therapy Association is the official journal of the AATA, Inc. The purpose of the journal is to advance the understanding of how visual art functions in the treatment, education, development and enrichment of people. The journal provides a scholarly forum for divergent points of view on art therapy and strives to present a broad spectrum of ideas in therapy, practice, professional issues and research. An emphasis is placed on the use of the visual arts in therapy, but articles in related disciplines of interest to art therapists will be considered for publication.

ART THERAPY: JOURNAL OF THE AMERICAN ART THERAPY ASSOCIATION (ISSN 36-3180580) is published triannually by the AATA, Inc., 1202 Allanson Road, Mundelein, Illinois, U.S.A. 60060. Telephone (708) 949-6064; FAX (708) 566-4580. Non-members may subscribe at the following annual rates: $25 (U.S.) and $42 (Foreign); institutions: $36 (U.S.) and $53 (Foreign). AATA members receive the journal as a benefit of membership.

Single Issues: For price and ordering information, call or write to AATA, Inc., 1202 Allanson Road, Mundelein, IL 60060 (708) 949-6064.

This Journal is abstracted In: Psychological Abstracts, Art Bibliographies Current Titles and Art Bibliographies Modern.

Advertising: Please see advertising rates listed elsewhere in this journal or contact the American Art Therapy Association, Inc., 1202 Allanson Road, Mundelein, Illinois 60060 (708) 949-6064. The publication of any advertisement by the AATA, Inc., is not an endorsement of the advertiser or of the products or services advertised. The AATA, Inc., is not responsible for any claims made in an advertisement.

Authorization to copy: No part of this publication may be reproduced, stored in a retrieval system or transmitted in any form or by any means, electronic, electrostatic, magnetic tape, photocopying, recording or otherwise, without permission in writing from the copyright holder.

Change of Address: Notices should be sent at least six weeks in advance to AATA, Inc. Subscribers should notify the post office that they will guarantee forwarding postage. Undelivered copies resulting from address changes will not be replaced, but single issues may be purchased at the single issue price.

About the Cover: "Connect," 12" x 9", monoprint with pastel, by Mildred Lachman-Chapin, M.Ed., A.T.R. About the piece, Ms. Lachman-Chapin says: "This is one of a recent series of monoprints in which there is a figure of a woman with hand raised. Reaching to connect? To heal? To soothe? To judge? To work? To paint? In various writings and presentations of the past few years I have been investigating my role as woman engaged both as an artist and therapist. This body of art work continues the search."
Editorial

Writing about Art Therapy for Professional Publications

Cathy A. Malchiodi, M.A., A.T.R., Editor

Art Therapy, like other professional journals, receives a great many submissions that must either be rejected or must undergo substantial revisions before publication. Therefore, when taking the time and effort to write an article for Art Therapy or another peer-reviewed publication, it pays to carefully consider the following aspects in developing and finalizing a manuscript for submission.

With regard to this publication, it is extremely important for all prospective authors to first pay close attention to the “Guidelines for Submission” as outlined in each journal. Oversights such as lack of adherence to APA style and format in both the body of the text and references, failure to disguise author identity or lack of an abstract will undoubtedly slow down the processing and possible publication of a manuscript. As Editor, I see a great many manuscripts that present interesting and thoughtful information, but have not met these simple standards and are therefore returned to the author without review. This procedure is not only standard to Art Therapy, but to most professional journals, particularly those with competitive acceptance rates.

A thorough and accurate literature review is extremely important to building your argument if your article is theoretically based, and is a necessity if you are extending some area of research. Often manuscripts are returned to authors because there are obvious gaps in citations of current literature. Undoubtedly, a literature review is time-consuming, and a good reference library with a current collection of periodicals and dissertation abstracts must be consulted. Often a computer search is also necessary; access to CD-ROM data bases can provide periodical, dissertation abstracts and other references. It is also important to look closely at what has been published during the last five years, particularly if you are reviewing literature relevant to research.

In some ways, a literature review is often more difficult in the field of art therapy than in other disciplines. First, an author has to sift through references in a variety of subjects such as social and behavioral sciences, medicine, psychiatry, visual art, art education, special education, anthropology, etc., depending on the theme of the manuscript. This will often involve looking at material in several different data bases and perhaps even different libraries. Additionally, much of our knowledge base has been part of oral history at the Annual AATA Conferences where current professional issues, methodology and theory have been discussed and debated over the years. Also, presented in this forum are research findings, many of which have not been published in any professional journal, book or source other than self-published manuals; the latter is difficult for most individuals to obtain because they are generally only available directly from the author(s) and are not referenced for library purposes. Much of the information presented at the AATA conferences may only be available on audio tape or in the annual Proceedings.
in which short papers, synopses of presentations or, since the mid-1980's, abstracts have been published. Therefore, due to the variety of sources, it takes a special effort to explore what has already been discussed, developed or distilled in our professional field.

It is also imperative to define how observations were made and authors often neglect to identify how they specifically derived their information. There is a vast difference between clinical observations and observations made as the result of definable research methodology. Also, research methodology must be accurately described so that the reader is fully informed of how the author arrived at his/her conclusions. Again, consulting APA style, if writing for this journal, or the guidelines for submission for other journals will describe the format and content of how to present research methodology.

Clinical observations are generally those made in the course of treatment of a client and involve personal views and speculations about what has transpired. There is nothing particularly wrong with clinical observations, although it is likely that such observations are less robust than those conclusions drawn from well-designed and carefully executed research. They occur most frequently in narrative case research, which has been a traditional staple of art therapy writing. There are, as many in this profession are aware, significant drawbacks to the narrative case study approach (Rosal, 1989) and this journal discourages case studies unless a particular methodology is utilized. However, what is important is that the author identify the origin of observations so that the reader is fully cognizant of the manner in which the author derived any conclusions.

One of the greatest dangers that authors confront when they write scholarly papers is that the final manuscript may be only a collection of appropriate quotations and really nothing of their own. Many a student paper and some doctoral and masters theses have succumbed to this practice. To avoid this over reliance on quoted material, a rule of thumb when using quotations is to always move on from the quotation and continue the paragraph by developing the idea presented in the quote. By forcing a response to the quote, the author begins a dialogue with the information. This process also naturally leads to a synthesis of ideas, both those from the quoted source and the author's own developing arguments.

It is particularly important in writing to be critical. This does not mean that you have to be cruel in order to make your point, but you need to ask questions about what others have written. On one level, being critical means taking nothing for granted, e.g., not believing things because an authority figure says so or because it is in print. It also refers to the capacity to thoughtfully analyze the ideas, statements and premises of others. Additionally, you may have to examine the author's definition of terms, because the use of a term may be true when defined one way and not another.

As our profession continues to expand and become more visible, it is essential for authors to be aware of what is going on in the world outside art therapy. It is obvious that others are investigating the use and meaning of art in therapy and that their perspectives are important in defining our own. For example, one major a.e.a. of investigation by professionals outside the field of art therapy that many prospective authors seem unaware of is the current debate over the use of projective drawing tests in assessment. Articles are frequently submitted to Art Therapy that utilize the results of some traditional projective drawing tasks as the major content of the manuscript. Although there are standard tests on projective tests readily available and this information has been taught in graduate level art therapy programs, there has been some controversy about the use of such tests for quite a few years. In fact, there are many who question the assumptions underlying projective drawings (Palmer, 1983; Cummings, 1986; Colomb, 1992, to name a few) and a great deal of published material on the pros and cons of utilizing drawing projectives in assessment. Martin (1983) went as far as calling the use of projective drawings unethical and insisted that they not be used by clinicians because of their unreliability. Although Martin's stance proved to be quite controversial in the therapeutic community, there are still recognized problems in the validity of certain projective tests (Gittleman, 1980) and the reliability of others (Kamphaus & Pleiss, 1991).

The debate over the use and meaning of projective drawings is obviously only one area that art therapists who intend to write need to be aware of. With the rapid advancement of knowledge in so many disciplines that are related to art therapy, it may seem impossible to stay abreast of current trends and developments that affect our field. However, one way to keep informed is to regularly consult professionals outside art therapy or, at the very least, peruse their professional journals. In this way, an author can at least get a "feel" for what is currently being debated or investigated and will know where to look for necessary information to develop
ideas for theoretical, methodological or research papers.

The need to accurately, eloquently and substantially articulate our profession is at a critical point. In recent years, art therapists have been asked to demonstrate the value of our profession from a variety of sources. Some of these sources have included insurance care providers and health service regulating bodies. Still others have involved the federal government; the formal hearing on the use of art therapy with the elderly in conjunction with the Older Americans Reauthorization Act is a recent example at this level. As we continue to be recognized as a viable professional discipline, there will be undoubtedly other hearings and other arenas in which we will have to publicly and credibly demonstrate our worth as a profession through our ability to write about art therapy both accurately and convincingly.

Additionally, in 1991, the AATA membership voted to go ahead with a national certification program for art therapists and at a subsequent business meeting at the AATA Annual Conference in Denver, Colorado, a majority indicated that they would like to see certification implemented in three years. Certification will probably involve an examination or evaluation of some sort to determine a minimum level of competency in art therapy. This idea of an examination or competency evaluation brings the profession rapidly to the question of what exactly our knowledge base consists of and how what is published supports this knowledge base. Therefore, it is paramount that writing about art therapy theory, practice and research be articulate and exacting, especially if art therapists want to demonstrate a unique knowledge base which is distinctly separate from other related disciplines. Needless to say, writing about research is particularly important, although art therapists have been squeamish to admit it and resistant to undertaking it.

Lastly, much of the writing that defines our field has appeared in *Art Therapy*: this publication contributes substantially to our identity and to directions for further exploration. Additionally, this journal often defines our profession to others in related fields. Therefore, it is essential that authors consider the power that their written words have in shaping and defining art therapy as a discipline and endeavor to contribute material to that is well-written, insightful and substantive.

Commentaries

Kudos to Gary Barlow, Ed.D., A.T.R.

When one knows and lives the truth that the image is central to healing... when one chooses a profession where the creative visual process can tap and record the message from deep inside to serve people in their growth and healing... when birthing this profession takes much of our time and energy, then imagine editing the verbal message of this ever-birthing field of art therapy! Such a challenging labor of love Gary Barlow has given art therapy for eight years.

Picture the first editor of Art Therapy, at the end of his work day, going into a room with papers piled high on tables. Here in quiet repose, in their manila bassinets, lie the mind-children of highly creative people, waiting to be nurtured into the world of print. As midwife to this process, he acknowledged the reception of each paper, telling the anxious mothers and fathers that finger- and toenails may need to be trimmed. The editor disperses the mind-children for review and perhaps re-birthing. The editor’s job can be like the surgeon at the circumcision, for each article has a thrust, a point to make, and its unique view of our field. Each art therapist/author/parent may cringe and scream in protest at the surgery. But they usually learn that the pain of shaping an ailing child is worth the agonies of editing a professional paper.

The process of circumcision across the entire field of art therapy is not an easy one. In my editing of art therapy papers, most parents of art therapy word-children were appreciative of my work, but not all. In our work with the first AATA Proceedings our task was to include all papers in some form. We did not have to face telling a paper-parent that there was no room for their baby due to cost limitations, or that it was too weak to walk into print at that time. As best I can tell, Gary’s midwifing did not discourage anyone from attempting another birth.

Gary stands in my mind with the great mothers and great fathers of art therapy. Elinor Ullman, my art therapy mother and first editor in the field of art therapy, gave the vision of art therapy a broad horizon—“art in therapy, education and rehabilitation.” You have kept that vision in the breadth of your articles. As Dr. Bernard I. Levy and Claire Levy co-created training wheels for us all in many articles written and co-edited with Elinor, Gary has kept us rolling along for eight years, issue after issue. As Edith Wallace, MD, PhD, and Dr. Myra Levick participated in the birthing of a journal for all the creative arts therapies, so Gary brought benefits from these colleagues with him. Gary brought us a rich background in art education and from kids with special needs, supporting and extending the horizons of “art psychotherapy,” as highlighted by Harriet Wadeson and others; “art as therapy,” from Edith Kramer and Dr. Judith Rubin; “the arts in the service of therapy,” as delineated by Dr. Don Ullin; and, “the services of the art teacher/therapist in psychoeducational settings,” documented by Dr. Frances Anderson and others. The Book Reviews and choice of book reviewers have given art therapy broad ground to walk across.

Despite the fiscal restraints that often surrounded AATA, Art Therapy brought us our first color pictures. As a previous member on the AATA Board, I know that they, too, are surgical teams with scissors sharpened by the limits of budget. How-
KUDOS TO GARY BARLOW

ever, Art Therapy covers now stand as windows into our profession, glimpses into the power of the silent record, on library shelves across the country.

As Editor, Gary also nudged us in birthing our mind-children into a professional world. The issue of July 1989 comes to mind as I recall little gifts of guidance that Gary gave us, gently but clearly, in the editorials. Gary complimented Drs. Jerry Fryrear and Irene Corbit for including the format of their “confidentiality release” with their theory/research article, “Visual Transitions as Art Therapy.” We were all alerted to the importance of this task specific to art therapy writers. Little feedings like this are tucked away in editorial after editorial. I go back and “digest their meals” when I need to renew my writing energies.

And art therapists are known to have a few viewpoints. We are so busy birthing our creative works, ourselves, our clients, and our profession that, of course, the point on which we stand has a viewpoint! From my standpoint of inclusionism, Gary has let us see the view from both the mountain peaks of poetry and the depths of disagreement. And, to your credit, I cannot recall any plateaus of platitudes.

Au Revoir

From one former editor to another, Gary Barlow, I say you are one of the great fathers in the field of art therapy. And it seems obvious we need to send love and appreciation to the few we have. You have midwifed us through many dark nights. You have done it with grace, humor, thoroughness and wisdom. You have brought us further into the world. We are grateful, and, though we never saw you in that room your Wright University Art Therapy staff has told me about, we appreciate all those issues delivered to our mailboxes. Your many laborious hours are now our history, and we all share it with you. Now, Gary, what would you like to birth with us next?

Roberta Shoemaker-Beal, M.F.A., A.T.R.,
Slidell, LA.

Call for Submissions to Art Therapy

Art Therapy: Journal of the American Art Therapy Association is considering the publication of a special issue on “Art and Medicine” for 1993. Articles may focus on the use of art expression in assessment or treatment of physical disease, theoretical, ethical or practical issues in the application of art expression in a medical setting or with physical illness, or original research in medical art therapy.

As with all submissions to Art Therapy, authors must submit five clear copies according to the “Guidelines for Submissions” as outlined in the current journal; please review these guidelines carefully because submissions which do not meet these requirements will not be accepted for review and will be immediately returned to the author(s).

DEADLINE for submissions is SEPTEMBER 15TH, 1992. Please send manuscripts to:
