This paper describes a mixed method evaluation study that was developed to assess faculty teaching behavior change in a faculty development fellowship program for community-based hospital faculty. Principles of adult learning were taught to faculty participants over the fellowship period. These included instruction in teaching methods, group facilitation, and curriculum development. Quantitative data were collected through the Principles of Adult Learning Scale (PALS) developed by Conti (1979). Qualitative data were also collected through review of videotaped teaching sessions. The PALS instrument was administered to 18 faculty in a pre- and posttest design, and videotaped sessions of six participants were reviewed. Findings of this pilot study indicate that the Fellows' teaching beliefs and practices are changing from a teacher-centered to a more learner-centered and collaborative mode as a result of the faculty development program. This change is reflected in the improvement in their overall and individual PALS scores. Video observations also show change in the application of adult learning principles in their teaching. The mixed method approach provides rich descriptive data about teaching practice. The videotapes may not be useful for pure evaluative purposes, but they provide valuable feedback for the participants. (Contains two tables and nine references.) (SLD)
Assessing Change in the Teaching Practice of Faculty in a Faculty Development Program for Primary Care Physicians: Toward a Mixed Method Evaluation Approach

A. Objectives/Purpose

The purpose of this session will be to describe a mixed method evaluation study developed to assess faculty teaching behavior change in a faculty development fellowship program for community-based faculty. Quantitative data for the study was collected by using Conti’s (1979) Principles of Adult Learning Scale - PALS instrument. The qualitative data which we compared and contrasted with the PALS instrument results were collected via review of videotaped teaching sessions presented by program participants during their fellowship year. The qualitative data collection was guided by a protocol developed by the authors which seeks to identify and describe behaviors congruent with the collaborative mode of teaching defined by seven factors measured in the PALS instrument. Our intent was to see how the two data sets might complement each other, and how their union might help us to better understand participants’ teaching behavior change.

The authors will attempt to achieve the following objectives in this session:

1. Describe a mixed method evaluation approach used to assess faculty teaching behavior change.
2. Present the PALS as a tool to pre and post test faculty use of the collaborative mode of teaching.
3. Present the protocol for videotape review and explain how it triangulates the PALS instrument.
4. Summarize the data from the PALS instrument and the videotapes review.
5. Use the data to describe how a mixed method evaluation approach may assist faculty developers to better understand and assess teaching behavior change.
6. Explore with participants the benefits and challenges of using mixed methods to evaluate faculty change and development.

Background and Theoretical Framework

The assessment of change in the teaching of a community-based faculty is a major concern in a faculty development program focusing on the integration of adult learning principles into medical education. Adult learning principles are taught in our fellowship program through the on site mentoring of faculty development specialists and workshops that include the content areas of:

1. Andragogy: the art and science of helping adults learn (Knowles, 1980)
2. Introduction to Curriculum Development
3. Implementing Instruction
4. Small Group Facilitation
5. Questioning Skills
It is essential to assess the participant faculty members’ change in embracing adult learning principles, moving from a teacher-centered to learner-centered, collaborative approach in teaching. The literature has reported that faculty development program evaluation has been underemphasized and that programs must objectively document learning achievement by faculty participants (Skeff et al., 1997). Assessment of behavioral change demands a “union of insufficiencies” (Shulman, 1987, 1988). In other words, multiple methods of evaluation are essential for discerning a comprehensive understanding of change.

Lee Shulman and associates at Stanford have proposed a plan for the assessment of teachers. This plan proposes that a full strategy of teacher assessment is a process that demonstrates change and accomplishment in instructional development (Shulman, 1987). It is important that this assessment not only rely on written tests but also authentically assess the real world performance of teachers. Shulman proposes that this assessment should contain the following procedures: “written assessments, assessment center exercises, documentation through portfolios, and classroom observation.” (Shulman, 1988).

The community-based hospital faculty development program was developed with many inherent parallels to the work of Shulman in emphasizing authentic assessment. The features of evaluation in this program are as follows: 1) Pre and post baseline competency evaluations in curriculum development, and medical presentation skills are administered to the participants each program year. For the 1996-1997 fellowship year we began to use the PALS instrument to assess faculty use of the collaborative mode of teaching before and after the faculty development program intervention. 2) Faculty Development Specialists spend at least one half day per month with each program participant on-site in the community-based hospitals observing teaching activities, providing one-on-one feedback to participants and teaching them skills needed for their educational encounters. 3) Videotapes of the participants’ teaching activities in the hospital/clinic setting are made regularly and feedback is provided on their performance. 4) Participants assemble teaching portfolios to document change throughout the program year. 5) Other evaluative instruments such as exit interviews and focus groups affirm these primary sources and comprehensively aid in the triangulation of data.

As a small part of the data analysis of this larger multifaceted evaluation plan, and taking into consideration Schulman’s (1987,1988) notion of a “union of insufficiencies” to discern a comprehensive understanding of change, the authors piloted a study which combined quantitative (pre and post PALS instrument results) and qualitative (videotape review) data to assess the teaching behavior change of 18 faculty who participated in the 1996-1997 faculty development fellowship program. Our intent was to see how the two data might complement each other, and how their union might help us to better understand participants teaching behavior change.

**Methods**

The study utilized a mixed method approach. First we used a pre and post test research design. The PALS instrument was administered to 18 faculty who participated in a community based, part-time, year-long faculty development fellowship program. The instrument was administered in the beginning and at the end of the fellowship year.

PALS is a 44 item instrument that measures the frequency with which one practices the collaborative teaching mode described in the adult education literature (Conti, 1985). This instrument has been used by adult educators in diverse professions to assess a teacher’s acceptance and practice of adult learning principles (Conti, 1985). The instrument also measures seven individual factors which make up the collaborative mode of teaching: (1) Learner-Centered Activities; (2) Personalizing Instruction; (3) Relating to Experience; (4) Assessing Student Needs; (5) Climate Building; (6) Participation in Learning Process; and (7) Flexibility for Personal Development. This 44-item instrument is a summative rating scale using a modified Likert scale.
Respondents indicate the frequency with which they practice the action described in the items. Scores may range from 0 to 220. The mean for the instrument is 146 with a standard deviation of 20. Scores above 146 indicate a tendency toward a learner-centered approach to the teaching-learning transaction, and lower scores imply preference for the teacher-centered approach in which authority resides with the teacher. High scores in each factor represent support of the learner-centered concept implied in the factor name, and low factor scores indicate support of the opposite concept (Conti, 1985,1990).

After analyzing the results of the PALS, the authors reviewed one pre and one post fellowship videotape of participants’ teaching sessions to compare and contrast PALS results with the faculty’s real life teaching experiences. The videotape review was guided by a protocol developed by the authors which sought to identify and describe behaviors that are congruent with the collaborative mode of teaching defined by the seven factors measured in the PALS instrument.

The protocol was constructed by formulating specific behavior statements out of Conti’s (1990) description of the 7 factors of the PALS. This was a difficult task because some of the factors are very similar and interrelated, making it difficult to create behavior statements that were specific for each factor. We were however, able to come up with items that we thought, were closely related to and sometimes spelled out in Conti’s (1990) description of the factors. The protocol has seven main behavior statements which represent each of the PALS factors, and under these 7 statements are even more specific statements that operationalize the individual factors. Under the 7 behavior statements a ranking scale from 1-10 is provided. High scores on each teaching behavior statement represent support of the learner-centered concept implied in the PALS factor name. Low scores indicate support of the opposite concept. (See appendix A)

For the purpose of this pilot study, the authors chose to observe the video taped of teaching sessions of 6 fellows. We reviewed two tapes for each fellow, pre and post fellowship program intervention. We also reviewed 3 others’ video tapes while piloting the protocol, a total of 15 videos. We chose 6 cases because we decided that twelve video tapes were the amount we could handle at this time, since each tape had the duration of 45 min. to 1 1/2 hour. The remaining videos will be reviewed in the near future after we carefully train two evaluators. The criteria for selecting these 6 cases was the following: we decided to observe the video tapes of the fellows who had the highest change of scores between pre and post PALS and those who had the lowest change. We thought that these would provide interesting cases to observe since they represent both those fellows that made a significant move to a more learner-centered approach of teaching, and those that even after the intervention maintained a teacher-centered approach. The authors reviewed the videos and scored them separately. We also made sure to write down specific vignettes we observed that would support our score for each fellow and each factor under observation. After reviewing all the videos we met to discuss our findings and shared with each other what we observed. Our scores for each fellow were very close to each other. In most cases we kept our original scores for each fellow. We did allow changing of scores for certain factors when we were able to remind each other with specific vignettes what took place in the teaching sessions that one or the other might have not taken into consideration. Changes were made seven out of a possible eighty-four times (8%). This exercise was essential for the qualitative piece of the research because it helped us as researchers to better make sense of the phenomenon we were attempting to understand, that is, the teaching practice of these fellows.

**PALS Instrument Findings**

A two-sample hypothesis test was conducted using the pre- and post-test data collected from the PALS survey. In General, there was a statistically significant difference between the overall scores in the pre-test and post-test surveys. In fact, on average, respondent scores improved by 11.9 points after the program intervention, a result that was significant at the p = 0.05 level. Comparing
the performance differences of each respondent in a matched pairs analysis yielded similar results (mean = 11.97, p = 0.05).

Of course, the improved performance was not consistent across the seven factors which are elements within the PALS instrument. Doing a two-sample hypothesis test of the mean for each factor revealed that factors 2 (Personalizing Instruction), 5 (Climate Building), and 6 (Participating in Learning Process) showed a statistically significant improvement between the pre-test and the post-test results at the standard p = 0.05 level. For factor Personalizing Instruction, the mean improvement was 4.8 points; for factor Climate Building, the mean score increased 1.2 points; and for factor Participating in Learning Process, the mean score improved by 2.8 points. In addition, factor 3 scores increased on average by 1.2 points, but due to increased variance in these responses, the difference was only statistically significant at the p = 0.10 level. These results are available in Table 1 below.

Additional findings:

Pre-Test

- Seventeen fellows (94%) scored below the PALS mean (146).
- Eleven of these fellows (61%) scored between 1 and 2 standard deviations below the PALS mean (Sd=20).

Post-Test

- Nine fellows (50%) scored equal or above the PALS mean.
- Six other fellows' (33%) scores though improved, fell within one standard deviation below the PALS mean.
- Three fellows (16.6%) decreased their scores between the pre and post-tests. Both of their scores were below the PALS mean. One other fellow had a decrease in scores (2.0 points) but the post-test score remained above the PALS mean.
- One fellows’ score though improved, still remained two standard deviations below the PALS mean.

Videotape Findings

Twelve video tapes were reviewed from 6 fellows with one pre and one post program intervention videotape for each fellow. The ratings between the two evaluators were fairly consistent within a two point margin of each other. Overall the video scores were consistent with the fellows’ PALS instrument results with the exceptions of Fellows 1 and 2 on video one and Fellow 5 on video two. All six fellows scored below the mean (146) on the PALS pre-test which reflects a teacher-centered approach to teaching. However, when the evaluators observed video 1 of Fellows 1 and 2, we were able to identify behaviors that are congruent with the learner-centered approach to teaching. For instance, Fellow 1 administered a needs assessment to identify specific content areas that needed to be addressed in the presentation, he provided opportunities for learners to interact by developing small group activities, and he established a friendly learning climate, etc. Fellow 2, though he utilized a more formal/lecture approach, still chose to utilize other modalities of teaching such as small group discussion, open ended questions, and small group tasks. Scoring of the
videos for the remaining fellows were consistent with their PALS scores. (See Table 2)

* 220 points possible.
+ 70 points possible.

On video 2 all scores were found to be consistent with the fellows’ PALS post-test with the exception of Fellow 6. Fellows 1, 2, and 3 scored above the mean on the PALS post-test, which reflects a change from a teacher-centered to a learner-centered approach of teaching. These scores were supported by the videotape observations. Fellows 4 and 5 maintained a score below the mean in the PALS post-test which was congruent with the videotape observations. Though Fellow 4 had a slight improvement, he still exhibited a propensity for a teacher-centered approach. Fellow 6 presents a special problem because she had the lowest score in the PALS post-test. However, in our observations, we found that she had made significant progress from a teacher-centered to learner-centered teaching approach from her first to her second video. It is indiscernible why the Fellow’s self assessment on the PALS post test so radically differed from her second observed teaching session.

**Discussion**

The finding of this pilot study suggests that Fellows’ teaching beliefs and practice are changing from a teacher-centered to a more learner-centered/collaborative mode, as a result of the faculty development program intervention. This change is revealed in the improvement of their overall as well as individual PALS scores. The major areas of change focused on three factors: 1) **Personalizing Instruction** (i.e., personalizing learning to meet the unique needs of each learner; developing objectives based on the individuals motives and abilities; using various methods, materials and learner’s assignments; and promoting cooperation among learners rather than competition). 2) **Climate Building** (i.e., setting a friendly and informal climate for learning; encouraging dialogue and interaction in the learning setting; accepting errors as natural part of the learning process). 3) **Participation in the Learning Process** (i.e., allowing learners to identify the problems they want to solve and address; allowing learners to participate in making decisions about the topics that will be covered in a learning activity; encouraging adult-to-adult relationship between teacher and learner) (Conti, 1990).

Results from our preliminary video observation show the Fellows’ change or lack thereof in their application of adult learning principles in their teaching. The qualitative observations have provided rich descriptive data that enlighten us about the Fellows’ teaching practice. Secondly, observations seem to indicate that overall, the self assessment of the PALS instrument is affirmed by the videotape review with a few exceptions. However several limitations still exist in this modest study that must be explored further before making definitive conclusions:

- Researchers have only viewed six fellows’ pre and post teaching experience in addition to three pilot videotape reviews. A greater number of videotapes need to be reviewed to further develop the protocol and check for consistency in evaluation. Ultimately neutral evaluators must be trained in the use of the protocol.
• Fellows were not always consistent with the PALS self assessment particularly Fellow 6. The researchers need to address why such a large discrepancy might exist between this Fellow’s PALS post test and the second videotape evaluation.

Conclusions

The mixed method approach provides rich descriptive data concerning fellows teaching practice. One may question the need for video tape observation if it only affirms the results of the PALS self-assessment. A pragmatic consideration in learner evaluation is that video tape observation is an arduous and tedious process. The tapes have validity for fellows’ viewing and conversations about teaching process but one may question the need to use them for pure evaluative purposes.

Dear AERA Presenter,

Congratulations on being a presenter at AERA\(^1\). The ERIC Clearinghouse on Assessment and Evaluation invites you to contribute to the ERIC database by providing us with a printed copy of your presentation.

Abstracts of papers accepted by ERIC appear in *Resources in Education (RIE)* and are announced to over 5,000 organizations. The inclusion of your work makes it readily available to other researchers, provides a permanent archive, and enhances the quality of *RIE*. Abstracts of your contribution will be accessible through the printed and electronic versions of *RIE*. The paper will be available through the microfiche collections that are housed at libraries around the world and through the ERIC Document Reproduction Service.

We are gathering all the papers from the AERA Conference. We will route your paper to the appropriate clearinghouse. You will be notified if your paper meets ERIC's criteria for inclusion in *RIE*: contribution to education, timeliness, relevance, methodology, effectiveness of presentation, and reproduction quality. You can track our processing of your paper at http://ericnet.

Please sign the Reproduction Release Form on the back of this letter and include it with two copies of your paper. The Release Form gives ERIC permission to make and distribute copies of your paper. It does not preclude you from publishing your work. You can drop off the copies of your paper and Reproduction Release Form at the ERIC booth (424) or mail to our attention at the address below. Please feel free to copy the form for future or additional submissions.
