   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 6: MASTER Handout No. 6

Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW
1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
d. Grind the finished root pass to remove high spots and any slag at weld toes

e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   f. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
j. Adjust voltage to procedure specification
k. Adjust inductance to procedure specification
l. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

- A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
- B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
- C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
- D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

- A. Do not touch live electrical parts.
- B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
- C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
- D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
- E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
- F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
- G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
- H. Shut off electrical power when working on welding equipment.
CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.

A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.
B. Cover all skin surfaces. Keep shirt sleeves rolled down.
C. Wear cuffless pants to eliminate spatter traps.
D. Wear leather boots. Pant legs should cover boot tops.
E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.
F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.
G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.
I. Wear a 100% cotton cap to protect the head from sparks or spatter.
J. Wear long gauntlet leather gloves.
K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.
L. Protect nearby workers from exposure to the welding arc by putting up shields.
M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)
SMAW

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.
A. If possible, weld in specially designated areas or enclosures of noncombustible construction.
B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that cannot be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.
D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.
E. If combustibles cannot be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.
F. Do not weld on materials having either a coating or internal structure that is combustible.
G. Place hot scrap and slag in non-combustible containers.
H. Ensure that fire extinguishers are available nearby.
I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.
J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.
DON'T CARRY A BOMB IN YOUR POCKET.
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. Choose Proper Power Source
   Step 1. With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.
   Step 2. An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. Choose a Proper Electrode
   Step 1. Choose the proper electrode for the job.
       NOTE: The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

       The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   Step 2. Store the electrodes properly.
       a. Low-hydrogen electrodes:
          (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.
          (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.
          (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

**Figure 6 Typical Current Ranges for Electrodes**

3. Prepare Weldment for Welding
Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.
   a. Weld joint configuration will depend upon:
      (1) Product design
      (2) Material thickness
      (3) Design strength requirements
      (4) Welding process employed
   b. SMAW weld joint configuration may be a:
      (1) Lap joint
      (2) Tee joint
      (3) Corner joint
      (4) Edge joint
      (5) Butt joint with backing
      (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely
related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.

a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. **Troubleshoot Welding Problems**

   **Step 1.** Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement

   **Step 2.** Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions

   **Step 3.** Be aware of any weld discontinuity and the relevant welding variables that may have caused it.

Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Self-Assessment No. 1

Circle the best answer.

1. What is the approximate temperature required for stress relief annealing of low-carbon steels?
   A. 950°
   B. 1000°
   C. 1950°
   D. 1700°
   E. None of the above

2. What crystalline processes result from stress relief annealing?
   A. All grains reform into softer grains
   B. Distorted grains reform into softer grains
   C. Ferrite grains reform into softer grains while pearlite grains are basically unaffected
   D. Pearlite grains reform into softer grains while ferrite grains are basically unaffected
   E. None of the above

3. Which of the following is NOT a cause of quenching cracks?
   A. Improper quenching medium
   B. Overheating during the austenitizing cycle
   C. Improper quenching angle
   D. All of the above are causes of quenching cracks
   E. None of the above answers is correct

4. Which of the following is NOT a characteristic of typical quench cracks?
   A. The fracture tends to run from the surface toward the center in a smooth curve
   B. Untempered quench cracks will not show any decarburization
   C. Tempered fracture surfaces will show a fine crystalline structure
   D. All of the above are characteristic of quench cracks
   E. None of the above
5. During tempering by color, which of the following colors represents the highest temperature?
   A. Gold
   B. Purple
   C. Dark Straw
   D. Pale Blue
   E. Violet

6. During tempering by color, which of the following colors represents the lowest temperature?
   A. Gold
   B. Purple
   C. Dark Straw
   D. Pale Blue
   E. Violet

7. What is meant by step quenching?
   A. The workpiece is first quenched in a slow medium (e.g., air) then in a fast medium (e.g., water)
   B. The workpiece is first quenched in a fast medium (e.g., water) then in a slow medium (e.g., air)
   C. The weaker parts of the workpiece are quenched separately from the main body of the workpiece
   D. The workpiece is lowered into the quenching medium in steps so that different parts of the workpiece attain different hardesses
   E. None of the above

8. What is the simplest thing that the technician can do to minimize the vapor-blanket stage of liquid quenching?
   A. Agitate the workpiece or the medium
   B. Heat the quenching medium to just below its boiling point
   C. Quickly insert the workpiece into the medium
   D. Slowly insert the workpiece into the medium
   E. None of the above

9. Liquid carburizing, as used in case hardening, utilizes _________ and is therefore extremely dangerous.
   A. Sodium chloride
   B. Calcium carbonate
   C. Cyanide salts
   D. Ammonia
   E. None of the above
10. Workpieces which have been cut with an oxyacetylene torch often display edge hardness because
A. The torch was starved for oxygen
B. The workpiece was cut at too low a temperature
C. The wrong type of cutting torch was used
D. Oxyacetylene torches always leave hardened edges
E. None of the above

Circle the best answer.

1. The hardness of a metal is its ability to resist:
   A. Permanent deformation.
   B. Oxidation.
   C. Chemical reaction.
   D. All of the above answers are forms of hardness.
   E. None of the above.

2. Rockwell testing machines test the sample metal's resistance to:
   A. Abrasion.
   B. Penetration.
   C. Elastic deformation.
   D. Electricity.
   E. None of the above.

3. Materials such as nitrided steel and hard cast irons generally have Rockwell hardness numbers in excess of
   A. B-50.
   B. B-75.
   C. B-100.
   D. B-150.
   E. None of the above.

4. During the file test, if the file will mark the metal but not cut into it, then the metal should be treated as:
   A. High-alloy steel.
   B. Mild steel.
   C. Hardened tool steel.
   D. Medium-carbon steel.
   E. None of the above.

5. Probably the best use of the spark test is to:
   A. Determine the alloy content of the sample.
   B. Identify cast iron.
   C. Compare the sample to a known piece.
   D. All of the above answers are valid.
   E. None of the above.
6. Tool steel has a Rockwell hardness of ________, while hardened tool steel has hardness number of ________.
   A. C-42 - C-64
   B. C-42 - B-65
   C. C-64 - C-42
   D. B-65 - C-42
   E. None of the above.

7. Which of the following surfaces should be avoided when hardness testing?
   A. Curved
   B. Rough
   C. Decarburized
   D. All of the above surfaces should be modified before testing the sample's hardness.
   E. None of the above.

8. For hardness testing, the minimum recommended clearance from the edge is:
   A. 1/2”
   B. 1/4”
   C. 1/8”
   D. 1/16”
   E. None of the above.

9. If a Rockwell tester is in daily use, it should be calibrated:
   A. Annually.
   B. Monthly.
   C. Weekly.
   D. Daily.
   E. Never.

10. Technician A says that, for large samples, multiple hardness test should be made and their results averaged. Technician B says that many materials vary in hardness over the length of the sample. Who is correct?
    A. Technician A only
    B. Technician B only
    C. Both technicians are correct.
    D. Neither technician is correct.

Choose the best answer.

1. The size of the bead is ________ proportional to the speed of travel.
   A. Directly
   B. Inversely
   C. Not
   D. None of the above

2. The eye shield of the welding helmet should be:
   A. Just light enough to clearly see the arc.
   B. Too dark to clearly see the arc.
   C. A minimum of #5.
   D. None of the above.

3. Welding in confined spaces may require:
   A. Air supplied hoods or hose masks.
   B. Frequent breaks.
   C. Large, high-displacement fans.
   D. All of the above.
   E. None of the above.

4. Long sleeves protect the arms against:
   A. Ultraviolet radiation.
   B. Infrared radiation.
   C. Welding splatter.
   D. All of the above.
   E. None of the above.

5. Which of the following is NOT a variable in the SMAW process?
   A. Current polarity
   B. Arc length
   C. Length of the electrode
   D. All of the above are variables in the process.
   E. None of the above.
6. Acceptable welding footwear includes:
   A. Roman sandals.
   B. Tennis shoes.
   C. Canvas boots.
   D. All of the above.
   E. None of the above.

7. A welder whose travel speed is too fast may have problems with:
   A. Excess convexity.
   B. Overlap.
   C. Porosity.
   D. All of the above.
   E. None of the above.

8. Technician A says that low-hydrogen electrodes can only be in the open air for two to four hours. Technician B says that the humidity and the base metal determine the amount of time that low-hydrogen electrodes can be exposed. Who is correct?
   A. Technician A only.
   B. Technician B only.
   C. Both Technicians A and B.
   D. Neither Technician A nor B.

9. E6010 electrodes should only be used with:
   A. DC-.
   B. DC+.
   C. AC.
   D. There is no such electrode.

10. Technician A says that they should weld only in well ventilated areas. Technician B says that welding produces gases that are odorless, colorless, and heavier than air. Who is correct?
    A. Technician A only.
    B. Technician B only.
    C. Both Technicians A and B.
    D. Neither Technician A nor B.

11. Technician A says that they should never carry butane lighters into the welding area because they may explode. Technician B says that gasoline should never be taken into the welding area, either. Who is correct?
    A. Technician A only.
    B. Technician B only.
    C. Both Technicians A and B.
    D. Neither Technician A nor B.
12. When repairing welding equipment, its electrical power should be:
   A. On.
   B. Off.
   C. On or off, depending on the repair.
   D. The SMAW machine is not electrical.

13. To prevent electrical shocks, all electrical equipment and the workpiece should be:
   A. On rubber work mats.
   B. Elevated off the floor.
   C. Grounded.
   D. All of the above.
   E. None of the above.

14. Which of the following electrodes is NOT in the low-hydrogen family?
   A. E7015
   B. E7016
   C. E7018
   D. All of the above are low-hydrogen electrodes.
   E. All of the above are fast-freeze electrodes.

15. Technician A says that undercutting is caused by too much current. Technician B says that wet electrodes can also cause undercutting. Who is correct?
   A. Technician A only.
   B. Technician B only.
   C. Both Technicians A and B.
   D. Neither Technician A nor B.

16. Fire inspections should be continued for at least _________ after completion of the welding.
   A. Fifteen minutes
   B. Thirty minutes
   C. One hour
   D. Two hours

17. The welding area should be:
   A. Isolated from other workers by shields.
   B. At least 35 feet from combustible materials.
   C. Dry.
   D. All of the above.
   E. None of the above.
18. Seam welds generally require __________ oscillation.
   A. No
   B. Very little
   C. Moderate
   D. Great

19. Technician A says that all electrical connections must be tight, clean, and dry. Technician B says that poor electrical connections can heat up and even melt. Who is correct?
   A. Technician A only.
   B. Technician B only
   C. Both Technicians A and B
   D. Neither Technician A nor B

20. If it is impractical to properly remove combustible materials from the vicinity of the welding, then:
   A. Do not weld
   B. Take frequent breaks to inspect the area for fires
   C. Station a fire watcher near the combustible materials
   D. Any of the above is acceptable
   E. None of the above

21. E7018 electrodes should never be used with
   A. DC-
   B. DC+
   C. AC
   D. There is no such electrode

22. Areas to be welded should be thoroughly cleaned
   A. Prior to fit-up
   B. By brushing, sanding, or grinding
   C. With safe solvents
   D. All of the above, as necessary
   E. None of the above

23. Technician A says that porosity can be caused by a current setting that is too low. Technician B says that porosity can be caused by too long an arc. Who is correct?
   A. Technician A only
   B. Technician B only
   C. Both Technicians A and B
   D. Neither Technician A nor B
24. Low-hydrogen electrodes may be stored
   A. In sealed cans or heated rod ovens
   B. Under water
   C. In petroleum jelly
   D. Any of the above
   E. None of the above

25. As the material being welded increases in thickness, the travel speed of the weld must
   A. Increase
   B. Decrease
   C. Either A or B, depending on the desired effect
   D. Stay the same
   E. None of the above

WELDER SERIES
MASTER Technical Module No. WLD-L12

SUBJECT: WELDING TECHNICIAN

DUTY: SHIELDED METAL ARC WELDING (SMAW) (ADVANCED)

TASK: Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe in the 6G Position

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up work area and equipment;
B. Set-up work piece; and,
C. Weld test piece according to specifications.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written tests on pipe welding
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
Miller Module Method Video materials
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Shielded Metal Arc Welding machine
Welding shop tools
Selection of base metals for welding and cutting
Selection of filler metals and electrode wire
MASTER Handout No. 1 (WLD-L12-HO1)
MASTER Handout No. 2 (WLD-L12-HO2)
MASTER Handout No. 3 (WLD-L12-HO3)
MASTER Handout No. 4 (WLD-L12-HO4)
MASTER Handout No. 5 (WLD-L12-HO5)
MASTER Handout No. 6 (WLD-L12-HO6)
MASTER Laboratory Aid (WLD-L12-LA)
MASTER Laboratory Worksheet (WLD-L12-LW)
MASTER Self-Assessment No. 1
MASTER Self-Assessment No. 2
MASTER Self-Assessment No. 3

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses.

- **WLD-L1** "Preheat Joint"
- **WLD-L2** "Initiate Welding Process"
- **WLD-L3** "Perform Weld Sequence"
- **WLD-L4** "Control Weld Technique"
- **WLD-L5** "Maintain Preheat and Perform Interpass"
- **WLD-L6** "Use the Carbon Arc Process to Cut and Gouge Weld Materials"
- **WLD-L7** "Apply Welders Identification"
- **WLD-L8** "Control Post-Weld Temperature According to Procedures"
- **WLD-L9** "Post Clean Weld"
- **WLD-L10** "Post Finish Weld"
WLD-L11 "Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe in the 6G Position"

**INTRODUCTION:**

The Course Introduction will Include:

- An overview of certification procedures for pipe welding
- A class demonstration of effective welding techniques required for certification
- A discussion on additional training activities that can lead to certification.

**PRESENTATION OUTLINE:**

**Instructor Topics:**

A. Considerations and principles involved in the welding of pipe with SMAW
B. Joint design and welding terms for pipe welding
C. Interpret drawings and blueprints for pipe welding
D. The proper application of welding skills for pipe welding
E. The adequate preparation of welding surfaces for pipe welding
F. Skill levels needed to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match SMAW electrodes to an appropriate base metal

**Student Activities:**

A. Preheat weld surface
B. Perform pipe welds in multiple positions
C. Use welding techniques appropriate for pipe welding
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

**PRACTICAL APPLICATION:**

The student will gain knowledge and experience with as much practice as possible. Employer certification in pipe welding, as well as AWS certification, is the goal of the professional welder.

**EVALUATION AND/OR VERIFICATION:**

The major examinations should result in certification.
SUMMARY:

Emphasis is placed upon skills necessary to pass a SMAW performance qualification test in pipe welding.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M1) dealing with identifying GMAW equipment.
WLD-L12-HO1
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up work area and equipment;
B. Set-up work piece; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructor Topics:
A. Considerations and principles involved in the welding of pipe with SMAW
B. Joint design and welding terms for pipe welding
C. Interpret drawings and blueprints for pipe welding
D. The proper application of welding skills for pipe welding
E. The adequate preparation of welding surfaces for pipe welding
F. Skill levels needed to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match SMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform pipe welds in multiple positions
C. Use welding techniques appropriate for pipe welding
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. Chicken Wire markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
    A. Britteness
    B. Distortion
    C. Discoloration (sometimes unimportant)
    D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

WLD-L12-HO4
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which over lap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
WLD-L12-HO5
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 5: MASTER Handout No. 5

Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brush
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

h. Chip slag and wire brush weld

i. Grind any lack of fusion and/or high spots

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Weld pipe joint

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Roll weld pipe

h. Place pipe coupon on workbench in the 1G roll welding position

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique

l. Visually inspect weld on the root and face sides to ASME Section 9

m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
WLD-L12-HO6
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 6: MASTER Handout No. 6

Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
c. Fit and tack backing ring to one pipe end
d. Fit other pipe over backing ring
e. Adjust gap and tack in place
   f. Adjust shielding gas flow
g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
j. Adjust voltage to procedure specification
k. Adjust inductance to procedure specification
l. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.
CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.

A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.
B. Cover all skin surfaces. Keep shirt sleeves rolled down.
C. Wear cuffless pants to eliminate spatter traps.
D. Wear leather boots. Pant legs should cover boot tops.
E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.
F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.
G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.
I. Wear a 100% cotton cap to protect the head from sparks or spatter.
J. Wear long gauntlet leather gloves.
K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.
L. Protect nearby workers from exposure to the welding arc by putting up shields.
M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.
A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.

C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   NOTE: The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   a. **Low-hydrogen electrodes:**
      
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding
Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.
   a. Weld joint configuration will depend upon:
      (1) Product design
      (2) Material thickness
      (3) Design strength requirements
      (4) Welding process employed
   b. SMAW weld joint configuration may be a:
      (1) Lap joint
      (2) Tee joint
      (3) Corner joint
      (4) Edge joint
      (5) Butt joint with backing
      (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation
Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.
Step 2. Use any preheat that may be required by welding codes or company procedures.
Step 3. Make the required weld to be defect free and pleasing in appearance.
Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.
Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely
related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.

a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.

Self-Assessment No. 1

Circle the best answer.

1. What is the approximate temperature required for stress relief annealing of low-carbon steels?
   A. 950°
   B. 1000°
   C. 1950°
   D. 1700°
   E. None of the above

2. What crystalline processes result from stress relief annealing?
   A. All grains reform into softer grains
   B. Distorted grains reform into softer grains
   C. Ferrite grains reform into softer grains while pearlite grains are basically unaffected
   D. Pearlite grains reform into softer grains while ferrite grains are basically unaffected
   E. None of the above

3. Which of the following is NOT a cause of quenching cracks?
   A. Improper quenching medium
   B. Overheating during the austenitizing cycle
   C. Improper quenching angle
   D. All of the above are causes of quenching cracks
   E. None of the above answers is correct

4. Which of the following is NOT a characteristic of typical quench cracks?
   A. The fracture tends to run from the surface toward the center in a smooth curve
   B. Untempered quench cracks will not show any decarburization
   C. Tempered fracture surfaces will show a fine crystalline structure
   D. All of the above are characteristic of quench cracks
   E. None of the above
5. During tempering by color, which of the following colors represents the highest temperature?
   A. Gold
   B. Purple
   C. Dark Straw
   D. Pale Blue
   E. Violet

6. During tempering by color, which of the following colors represents the lowest temperature?
   A. Gold
   B. Purple
   C. Dark Straw
   D. Pale Blue
   E. Violet

7. What is meant by step quenching?
   A. The workpiece is first quenched in a slow medium (e.g., air) then in a fast medium (e.g., water)
   B. The workpiece is first quenched in a fast medium (e.g., water) then in a slow medium (e.g., air)
   C. The weaker parts of the workpiece are quenched separately from the main body of the workpiece
   D. The workpiece is lowered into the quenching medium in steps so that different parts of the workpiece attain different hardnesses
   E. None of the above

8. What is the simplest thing that the technician can do to minimize the vapor-blanket stage of liquid quenching?
   A. Agitate the workpiece or the medium
   B. Heat the quenching medium to just below its boiling point
   C. Quickly insert the workpiece into the medium
   D. Slowly insert the workpiece into the medium
   E. None of the above

9. Liquid carburizing, as used in case hardening, utilizes __________ and is therefore extremely dangerous.
   A. Sodium chloride
   B. Calcium carbonate
   C. Cyanide salts
   D. Ammonia
   E. None of the above
10. Workpieces which have been cut with an oxyacetylene torch often display edge hardness because
   A. The torch was starved for oxygen
   B. The workpiece was cut at too low a temperature
   C. The wrong type of cutting torch was used
   D. Oxyacetylene torches always leave hardened edges
   E. None of the above

Circle the best answer.

1. The hardness of a metal is its ability to resist:
   A. Permanent deformation.
   B. Oxidation.
   C. Chemical reaction.
   D. All of the above answers are forms of hardness.
   E. None of the above.

2. Rockwell testing machines test the sample metal's resistance to:
   A. Abrasion.
   B. Penetration.
   C. Elastic deformation.
   D. Electricity.
   E. None of the above.

3. Materials such as nitrided steel and hard cast irons generally have Rockwell hardness numbers in excess of
   A. B-50.
   B. B-75.
   C. B-100.
   D. B-150.
   E. None of the above.

4. During the file test, if the file will mark the metal but not cut into it, then the metal should be treated as:
   A. High-alloy steel.
   B. Mild steel.
   C. Hardened tool steel.
   D. Medium-carbon steel.
   E. None of the above.

5. Probably the best use of the spark test is to:
   A. Determine the alloy content of the sample.
   B. Identify cast iron.
   C. Compare the sample to a known piece.
   D. All of the above answers are valid.
   E. None of the above.
6. Tool steel has a Rockwell hardness of _______, while hardened tool steel has hardness number of ________.
   A. C-42 - C-64
   B. C-42 - B-65
   C. C-64 - C-42
   D. B-65 - C-42
   E. None of the above.

7. Which of the following surfaces should be avoided when hardness testing?
   A. Curved
   B. Rough
   C. Decarburized
   D. All of the above surfaces should be modified before testing the sample's hardness.
   E. None of the above.

8. For hardness testing, the minimum recommended clearance from the edge is:
   A. 1/2”
   B. 1/4”
   C. 1/8”
   D. 1/16”
   E. None of the above.

9. If a Rockwell tester is in daily use, it should be calibrated:
   A. Annually.
   B. Monthly.
   C. Weekly.
   D. Daily.
   E. Never.

10. Technician A says that, for large samples, multiple hardness test should be made and their results averaged. Technician B says that many materials vary in hardness over the length of the sample. Who is correct?
    A. Technician A only
    B. Technician B only
    C. Both technicians are correct.
    D. Neither technician is correct.

Choose the best answer.

1. The size of the bead is _________ proportional to the speed of travel.
   A. Directly
   B. Inversely
   C. Not
   D. None of the above

2. The eye shield of the welding helmet should be:
   A. Just light enough to clearly see the arc.
   B. Too dark to clearly see the arc.
   C. A minimum of #5.
   D. None of the above.

3. Welding in confined spaces may require:
   A. Air supplied hoods or hose masks.
   B. Frequent breaks.
   C. Large, high-displacement fans.
   D. All of the above.
   E. None of the above.

4. Long sleeves protect the arms against:
   A. Ultraviolet radiation.
   B. Infrared radiation.
   C. Welding splatter.
   D. All of the above.
   E. None of the above.

5. Which of the following is NOT a variable in the SMAW process?
   A. Current polarity
   B. Arc length
   C. Length of the electrode
   D. All of the above are variables in the process.
   E. None of the above.
6. Acceptable welding footwear includes:
   A. Roman sandals.
   B. Tennis shoes.
   C. Canvas boots.
   D. All of the above.
   E. None of the above.

7. A welder whose travel speed is too fast may have problems with:
   A. Excess convexity.
   B. Overlap.
   C. Porosity.
   D. All of the above.
   E. None of the above.

8. Technician A says that low-hydrogen electrodes can only be in the open air for two to four hours. Technician B says that the humidity and the base metal determine the amount of time that low-hydrogen electrodes can be exposed. Who is correct?
   A. Technician A only.
   B. Technician B only.
   C. Both Technicians A and B.
   D. Neither Technician A nor B.

9. E6010 electrodes should only be used with:
   A. DC-.
   B. DC+.
   C. AC.
   D. There is no such electrode.

10. Technician A says that they should weld only in well ventilated areas. Technician B says that welding produces gases that are odorless, colorless, and heavier than air. Who is correct?
    A. Technician A only.
    B. Technician B only.
    C. Both Technicians A and B.
    D. Neither Technician A nor B.

11. Technician A says that they should never carry butane lighters into the welding area because they may explode. Technician B says that gasoline should never be taken into the welding area, either. Who is correct?
    A. Technician A only.
    B. Technician B only.
    C. Both Technicians A and B.
    D. Neither Technician A nor B.
12. When repairing welding equipment, its electrical power should be:
   A. On.
   B. Off.
   C. On or off, depending on the repair.
   D. The SMAW machine is not electrical.

13. To prevent electrical shocks, all electrical equipment and the work piece should be:
   A. On rubber work mats.
   B. Elevated off the floor.
   C. Grounded.
   D. All of the above.
   E. None of the above.

14. Which of the following electrodes is NOT in the low-hydrogen family?
   A. E7015
   B. E7016
   C. E7018
   D. All of the above are low-hydrogen electrodes.
   E. All of the above are fast-freeze electrodes.

15. Technician A says that undercutting is caused by too much current. Technician B says that wet electrodes can also cause undercutting. Who is correct?
   A. Technician A only.
   B. Technician B only.
   C. Both Technicians A and B.
   D. Neither Technician A nor B.

16. Fire inspections should be continued for at least _________ after completion of the welding.
   A. Fifteen minutes
   B. Thirty minutes
   C. One hour
   D. Two hours

17. The welding area should be:
   A. Isolated from other workers by shields.
   B. At least 35 feet from combustible materials.
   C. Dry.
   D. All of the above.
   E. None of the above.
18. Seam welds generally require ___________ oscillation.
   A. No
   B. Very little
   C. Moderate
   D. Great

19. Technician A says that all electrical connections must be tight, clean, and dry. Technician B says that poor electrical connections can heat up and even melt. Who is correct?
   A. Technician A only.
   B. Technician B only
   C. Both Technicians A and B
   D. Neither Technician A nor B

20. If it is impractical to properly remove combustible materials from the vicinity of the welding, then:
   A. Do not weld
   B. Take frequent breaks to inspect the area for fires
   C. Station a fire watcher near the combustible materials
   D. Any of the above is acceptable
   E. None of the above

21. E7018 electrodes should never be used with
   A. DC-
   B. DC+
   C. AC
   D. There is no such electrode

22. Areas to be welded should be thoroughly cleaned
   A. Prior to fit-up
   B. By brushing, sanding, or grinding
   C. With safe solvents
   D. All of the above, as necessary
   E. None of the above

23. Technician A says that porosity can be caused by a current setting that is too low. Technician B says that porosity can be caused by too long an arc. Who is correct?
   A. Technician A only
   B. Technician B only
   C. Both Technicians A and B
   D. Neither Technician A nor B
24. Low-hydrogen electrodes may be stored
   A. In sealed cans or heated rod ovens
   B. Under water
   C. In petroleum jelly
   D. Any of the above
   E. None of the above

25. As the material being welded increases in thickness, the travel speed of the weld must
   A. Increase
   B. Decrease
   C. Either A or B, depending on the desired effect
   D. Stay the same
   E. None of the above

WELDER SERIES
MASTER Technical Module No. WLD-M01

SUBJECT: WELDING TECHNICIAN TIME: 6 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Identify GMAW Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Safely identify and inspect gas metal arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Understand ANSI A49.1, Safety in Welding, Cutting and Allied Processes, Part II-Specific Processes, 11. Arc Welding and Cutting Equipment Safety;
C. Perform routine safety inspections of protective equipment and clothing, gas metal arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area; and,
D. Understand welding related terms and definitions.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Safety and GMAW Procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M1-HO1)
MASTER Handout No. 2 (WLD-M1-HO2)
MASTER Self-Assessment
REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW equipment and shielding gas equipment
- A class demonstration on safe start-up and operation of equipment
- A discussion on training activities resulting in an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences in equipment from previous classes
B. Illustrate safety and preventive practices
C. GMAW welding variables and adjustments to equipment
D. The most common GMAW welding applications  
E. GMAW filler metal classification by AWS standards  
F. Shielding gases used with GMAW  
G. Power sources used with GMAW

Student Activities:  
A. Select and use personal protective equipment for GMAW  
B. Set up equipment for GMAW process  
C. Understand the operation and purpose of the wire feeder control system  
D. Discuss use of shielding gases  
E. Understand the power source operation and the output curve characteristics of both constant current and constant potential power sources

PRACTICAL APPLICATION:

The student will gain theoretical knowledge of GMAW operational concepts and principles, and gain the practical knowledge of equipment identification for use.

EVALUATION AND/OR VERIFICATION:

An examination will be given in this module to determine student progress. Student participation in identification and equipment assembly will also be evaluated by the instructor.

SUMMARY:

The student will understand the GMAW process and the function of GMAW equipment. The gas metal arc welding (GMAW) process was first developed in 1948. It was a natural development based somewhat on the idea of the gas tungsten arc welding (GTAW) process. The principal difference in the two welding processes is that the GTAW process uses non-consumable tungsten electrodes. The GMAW process uses continuous solid wire consumable electrodes. There are also some differences in the shielding gases. The gas metal arc welding process requires a constant voltage (constant potential) DC welding power source, some method of controlling and feeding the electrode wire to the arc, and some type of hose/cable assembly and gun through which the electrode wire reaches the welding arc. Electrical contact is made at the barrel end of the gun, through a copper contact tube, to electrically energize the welding electrode. Some type of shielding gas is used with this process. The shielding gas may be inert or chemically active to the base metal. The speed of metal deposition will vary depending on the method of metal transfer used, the shielding gas, the electrode type and diameter, the welding position, and the base metal classification. In almost every instance the gas metal arc welding process is faster than the shielded metal arc welding process.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M2) dealing with identifying the safety hazards.
Identify GMAW Equipment
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Safely identify and inspect gas metal arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Understand ANSI A49.1, Safety in Welding, Cutting and Allied Processes, Part II-Specific Processes, 11. Arc Welding and Cutting Equipment Safety;
C. Perform routine safety inspections of protective equipment and clothing, gas metal arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area; and,
D. Understand welding related terms and definitions.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences in equipment from previous classes
B. Illustrate safety and preventive practices
C. GMAW welding variables and adjustments to equipment
D. The most common GMAW welding applications
E. GMAW filler metal classification by AWS standards
F. Shielding gases used with GMAW
G. Power sources used with GMAW

Student Activities:
A. Select and use personal protective equipment for GMAW
B. Set up equipment for GMAW process
C. Understand the operation and purpose of the wire feeder control system
D. Discuss use of shielding gases
E. Understand the power source operation and the output curve characteristics of both constant current and constant potential power sources
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique

1533
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M1
Perform GMAW Basic
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% Co2
    C. 100% argon
    D. 100% Co2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
    A. 100% argon
    B. 100% Co2
    C. 75% argon, 25% Co2
    D. 95% argon, 5% oxygen
    E. All of the above
    F. None of the above
13. In MIG welding, what causes electrode stubbing?
   A. Wire feed too high
   B. Wire feed too low
   C. Voltage too high
   D. Voltage too low
   E. Both A and C
   F. None of the above

14. In MIG welding, how long is the stickout?
   A. 1/32”
   B. 3/16”
   C. 3/8”
   D. 3/4”
   E. 1”

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
WELDER SERIES  
MASTER Technical Module No. WLD-M02

SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Identify the Safety Hazards

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review ventilation requirements;
B. Provide demonstrations related to routine safety inspections of protective equipment and clothing;
C. Provide demonstrations related to ANSI Z49.1; and,
D. Provide demonstrations related to safe handling of shielding gas equipment and accessories.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on safety and welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M2-HO1)
MASTER Handout No. 2 (WLD-M2-HO2)

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW safety hazards
- A class demonstration of effective use of protective clothing and equipment
- A discussion training activities resulting in an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment

Student Activities:

A. Use personal protective equipment
B. Set up procedure for GMAW process and equipment
C. Perform beginning welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds

1546
PRACTICAL APPLICATION:

This module requires the student to understand and recognize the source of safety hazards for GMAW processes. If welding in confined areas, shielding gas can build up and displace oxygen. Areas must be ventilated properly.

EVALUATION AND/OR VERIFICATION:

An examination will be given in this module to determine student progress.

SUMMARY:

The gas metal arc welding process uses a continuously fed wire for the electrode and filler metal. Welding heat is produced by an arc that is established between the consumable wire electrode and the base metal. Shielding gas is fed into the arc area to protect the weld puddle and base metal from atmospheric contamination.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M3) dealing with describing the preventive and protective measures.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review ventilation requirements;
B. Provide demonstrations related to routine safety inspections of protective equipment and clothing;
C. Provide demonstrations related to ANSI Z49.1; and,
D. Provide demonstrations related to safe handling of shielding gas equipment and accessories.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment

Student Activities:
A. Use personal protective equipment
B. Set up procedure for GMAW process and equipment
C. Perform beginning welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
Identify the Safety Hazards
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique
WLD-M2
Identify the Safety Hazards
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% Co2
    C. 100% argon
    D. 100% Co2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
    A. 100% argon
    B. 100% Co2
    C. 75% argon, 25% Co2
    D. 95% argon, 5% oxygen
    E. All of the above
    F. None of the above
13. In MIG welding, what causes electrode stubbing?
   A. Wire feed too high
   B. Wire feed too low
   C. Voltage too high
   D. Voltage too low
   E. Both A and C
   F. None of the above

14. In MIG welding, how long is the stickout?
   A. 1/32"
   B. 3/16"
   C. 3/8"
   D. 3/4"
   E. 1"

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
SUBJECT: WELDING TECHNICIAN  
TIME: 2 HOURS

DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)

TASK: Describe the Preventive and Protective Measures

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Ensure that existing or new training materials are in compliance with the AWS documents specified for this learning objective;
B. Provide instruction related to ANSI Z49.1;
C. Reinforce previous instruction on safety; and,
D. Observe trainee following safe practices.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on safety and welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M3-HO1)
MASTER Handout No. 2 (WLD-M3-HO2)
MASTER Self-Assessment

OTHER:

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of preventive and protective measures for GMAW
- A class demonstration of effective preventive and protective welding measures
- A discussion on training activities resulting in an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of GMAW equipment as compared to oxyacetylene
B. Illustrate safety and preventive practices
C. Understand ventilation requirements for shielded gases
D. Use proper filter lens in helmet and protective clothing
E. Wear safety glasses, properly ground the welding machine, and secure all cylinders with safety chains or cables
F. Illustrate welding variables and adjustments to equipment

Student Activities:

A. Use preventive measures and wear protective equipment
B. Set up procedure to be followed for GMAW process and equipment
C. Perform beginning welds on T fillets and butt-joints with various metals and filler wire using single and multi-pass welds

PRACTICAL APPLICATION:

The student will use preventive measures and wear protective equipment. The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

An examination will be given in this module to determine student progress. Instructor will monitor the student in the use of preventive measures and wearing of protective equipment.

SUMMARY:

The emphasis in this module is the need to follow procedural and prescriptive methods. The use of preventive measures to reduce hazards and follow procedures in the use of protective clothing must be understood by the student.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M4) dealing with identifying welding variables and their effects upon weld quality.
WLD-M3-H01
Describe the Preventive and Protective Measures
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Ensure that existing or new training materials are in compliance with the AWS documents specified for this learning objective;

C. Perform beginning welds on T fillets and butt-joints with various metals and filler wire using single and multi-pass welds
WLD-M3-HO2
Describe the Preventive and Protective Measures
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten all screw
   c. Screw on gas defuser and tighten all screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
1. Choose the correct shielding gas and flow rate for the given application, material and material thickness
2. Choose the correct electrode for given material and applications both type and size
3. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
Describe the Preventive and Protective Measures
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode

   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M04

SUBJECT: WELDING TECHNICIAN TIME: 6 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Identify Welding Variables and Their Effects Upon Weld Quality

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to gas metal arc welding equipment and accessory set up;
B. Provide demonstrations related to shielding gas equipment and accessory set up;
C. Demonstrate gas metal arc welding principles of operation;
D. Identify the shielding gases relevant to the gas metal arc welding process;
E. Understand the gas metal arc welding filler metal identification and selection process;
F. Introduce related terms and definitions;
G. Follow safe practices;
H. Set up gas metal arc welding equipment and accessories;
I. Set up shielding gas equipment and accessories;
J. Develop and administer formative or diagnostic tests relevant to gas metal arc welding principals; and,
K. Demonstrate proficiency in the gas metal arc welding principles of operation, and filler metal identification/selection,

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on welding principles and quality welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders

Competency Standards, American Welding Society, Latest Edition

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need to identify welding variables and understand their affects on weld quality
- A class demonstration of effective GMAW techniques
- A discussion on training activities resulting in an increase of skills and knowledge
PRESENTATION OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
C. Discuss welding variables to include:
   1. Filler metal classification
   2. Material thickness
   3. Joint design
   4. Type of base metal
   5. Welding process
   6. Amperage
   7. Travel speed
   8. Shielding gas flow

PRACTICAL APPLICATION:

The student will understand the need for controlling weld variables. The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

An examination will be given in this module to determine student progress. Student will also demonstrate knowledge and control of GMAW variables in the laboratory exercises.

SUMMARY:

The planning of welding activities requires an understanding of weld variables, their potential impact on outcomes of the process, and the need for their control and adjustment, based upon approved procedures and professional judgment.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M5) dealing with troubleshooting equipment.
WLD-M4-HO1
Identify Welding Variables and Their Effects Upon Weld Quality
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
Choose the correct shielding gas and flow rate for the given application, material and material thickness

Choose the correct electrode for given material and applications both type and size

Set voltage and wire feed speed for a given application, material and material thickness

Weld With GMAW Using Pulsed Spray Transfer

Choose the correct shielding gas and flow rate for the given application, material and material thickness

Choose the correct electrode for given material and applications both type and size

Set voltage and wire feed speed for a given application, material and material thickness

Weld T Joints on Carbon Steel Using GMAW Equipment

Inspect area for safety

Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel

Adjust the welding parameters for this task

Tack a T joint using GMAW

Weld 1/4" fillet welds in 2F position using string bead technique

Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

Weld Multi-Pass Fillet Welds - All Positions

Inspect area for safety

Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel

Adjust the welding parameters for this task

Tack a T joint using GMAW

Weld the second pass with electrode centered at the bottom toe of the first pass

Weld the third pass with electrode centered at the top toe of the second pass

Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

Weld Multi-Pass Fillet Welds - 3F Vertical Position

Inspect area for safety

Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel

Adjust the welding parameters for this task

Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M4
Identify Welding Variables and Their Effects Upon Weld Quality
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
A. Stops the electrode
B. Stops the gas
C. Stops the polarity
D. Causes too much voltage
E. None of the above

8. What should the shielding gas be set at for MIG Welding?
A. 5 ech
B. 15 psi
C. 30 psi
D. 25 cfh
E. 5 psi

9. What is ER 70S-3?
A. Shielding gas
B. Miller MIG Welder
C. Lincoln Wire Feeder
D. Electrode
E. None of the above

10. In MIG welding, what does a flow meter do?
A. Controls shielding gas flow
B. Measures amperage
C. Feeds wire electrode
D. Voltage sensing device
E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
A. 98% argon, 2% oxygen
B. 90% argon, 10% Co2
C. 100% argon
D. 100% Co2
E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
A. 100% argon
B. 100% Co2
C. 75% argon, 25% Co2
D. 95% argon, 5% oxygen
E. All of the above
F. None of the above
13. In MIG welding, what causes electrode stubbing?
   A. Wire feed too high
   B. Wire feed too low
   C. Voltage too high
   D. Voltage too low
   E. Both A and C
   F. None of the above

14. In MIG welding, how long is the stickout?
   A. 1/32"
   B. 3/16"
   C. 3/8"
   D. 3/4"
   E. 1"

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M05

SUBJECT: WELDING TECHNICIAN       TIME: 8 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Troubleshoot Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Provide demonstrations related to gas metal arc welding component identification;
B. Provide demonstrations related to shielding gas equipment and accessory component identification;
C. Provide demonstrations related to minor external repairs on gas metal arc welding equipment and accessories;
D. Provide demonstrations related to minor external repairs on shielding gas equipment and accessories;
E. Understand related terms and definitions; and,
F. Perform repair assignments when required.

INSTRUCTIONAL MATERIALS:

Student Workbook
Two written tests on safety and GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M5-H01)
MASTER Handout No. 2 (WLD-M5-H02)
MASTER Self-Assessment
REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students will complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of troubleshooting processes with GMAW equipment
- A class demonstration of effective troubleshooting
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
Student Activities:

A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
G. Demonstrate ability to repair welds
H. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:

The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

Two examinations will be given in this module to determine student progress.

SUMMARY:

Troubleshooting means inspecting and finding causes of trouble or malfunctions. It requires conceptual and theoretical knowledge of the system, problem solving skills, and mechanical/electrical skills.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M6) dealing with describing AWS electrode classification system.
WLD-M5-H01
Troubleshoot Equipment
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to gas metal arc welding component identification;
B. Provide demonstrations related to shielding gas equipment and accessory component identification;
C. Provide demonstrations related to minor external repairs on gas metal arc welding equipment and accessories;
D. Provide demonstrations related to minor external repairs on shielding gas equipment and accessories;
E. Understand related terms and definitions; and,
F. Perform repair assignments when required.

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment

Student Activities:

A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee's and butt-joints with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
G. Demonstrate ability to repair welds
H. Demonstrate ability to preheat weld area if necessary

1582
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M5
Troubleshoot Equipment
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% Co2
    C. 100% argon
    D. 100% Co2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
    A. 100% argon
    B. 100% Co2
    C. 75% argon, 25% Co2
    D. 95% argon, 5% oxygen
    E. All of the above
    F. None of the above

A. Weave it in
B. Whipping
C. Pulse arc with trigger
D. U-Weave
E. Both C and D
F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
A. Moves the MIG gun
B. Guides the MIG gun
C. Feeds the electrode
D. Wheels inside gun liner attached to flow meter
E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M06

SUBJECT: WELDING TECHNICIAN
TIME: 6 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Describe AWS Electrode Classification System

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify GMAW Electrodes using AWS Classification System;
B. Identify compatibility of parent metals and electrodes; and,
C. Illustrate compatibility of parent metals and electrodes/wires by proper selection exercises.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on AWS Electrode Classification Systems
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M6-H01)

INTRODUCTION:

The Course Introduction will Include:
- An overview of the AWS Electrode Classification System
- A class demonstration of effective selection methods for compatibility
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Use GMAW filler metal classification by AWS standards
F. Select GMAW filler metal by Aluminum Association Metal Classification System
Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select GMAW electrodes using AWS and Aluminum Association Classification methods
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
Examinations will be given in this module to determine student progress.

SUMMARY:
There are several AWS Specifications applicable to the gas metal arc welding (GMAW) process. The AWS is a good standard to use as a guideline. Other AWS Specifications are available for all of the electrodes and filler metals presently used in welding processes. There are two sections to each of the AWS Specifications. The first part is the actual Specification which provides all the legal data such as chemical compositions, electrode classifications, tests required, etc. This is where the designers and welding engineers select the correct filler metals for the weld joints. The second section of the specification is actually the “Description and Intended Use” information for each electrode classification, it’s specific application defined, and special storage requirements. All electrodes are alloys of two or more elements. Some of the elements added to electrode core wire serve as alloying agents while others function as deoxidizers and scavengers of unwanted elements that could weaken the weld. Some alloying elements work as deoxidizers with one metal, and as an alloying element in another, and yet can be the prime metal in still other alloys.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M7) dealing with describing Aluminum Assoc. metal classification system for aluminum alloys.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify GMAW Electrodes using AWS Classification System;
B. Identify compatibility of parent metals and electrodes; and,
C. Illustrate compatibility of parent metals and electrodes/wires by proper selection exercises.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Use GMAW filler metal classification by AWS standards
F. Select GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select GMAW electrodes using AWS and Aluminum Association Classification methods
C. Perform welds on Tee's and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the
first pass
f. Weld the third pass with electrode centered at the top toe of the
second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS
D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye
level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS
D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3"
X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon
25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at
approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single
V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots
and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is
applied. The electrode is moved from one root pass to the other with
a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave
technique
   j. Using GMAW and on upward Z weave technique the third pass is
welded. The electrode is moved from the left toe of the second pass
to the right toe on back. Each weave is accompanied by a slight
upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16"
above the base metal, have good fusion etc. The weld face shall meet
D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique

Describe AWS Electrode Classification System
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
A. Stops the electrode
B. Stops the gas
C. Stops the polarity
D. Causes too much voltage
E. None of the above

8. What should the shielding gas be set at for MIG Welding?
A. 5 ech
B. 15 psi
C. 30 psi
D. 25 cfh
E. 5 psi

9. What is ER 70S-3?
A. Shielding gas
B. Miller MIG Welder
C. Lincoln Wire Feeder
D. Electrode
E. None of the above

10. In MIG welding, what does a flow meter do?
A. Controls shielding gas flow
B. Measures amperage
C. Feeds wire electrode
D. Voltage sensing device
E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
A. 98% argon, 2% oxygen
B. 90% argon, 10% Co2
C. 100% argon
D. 100% Co2
E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
A. 100% argon
B. 100% Co2
C. 75% argon, 25% Co2
D. 95% argon, 5% oxygen
E. All of the above
F. None of the above
13. In MIG welding, what causes electrode stubbing?
A. Wire feed too high
B. Wire feed too low
C. Voltage too high
D. Voltage too low
E. Both A and C
F. None of the above

14. In MIG welding, how long is the stickout?
A. 1/32”
B. 3/16”
C. 3/8”
D. 3/4”
E. 1”

15. In MIG welding sheet metal, how do you fill a large gap?
A. Weave it in
B. Whipping
C. Pulse arc with trigger
D. U-Weave
E. Both C and D
F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
A. Moves the MIG gun
B. Guides the MIG gun
C. Feeds the electrode
D. Wheels inside gun liner attached to flow meter
E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M07

SUBJECT: WELDING TECHNICIAN    TIME: 6 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Describe Aluminum Assoc. Metal Classification System for Aluminum Alloys

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Illustrate GMAW Filler Metal classifications by AWS standards; and,
B. Demonstrate knowledge of aluminum alloys by practice.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures with aluminum
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M7-H01)
MASTER Handout No. 2 (WLD-M7-H02)
MASTER Self-Assessment

REFERENCES:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition  

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for filler metal classifications as part of the welding process
- A class demonstration of effective GMAW techniques with aluminum
- A discussion on training activities resulting in an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment  
B. Illustrate safety and preventive practices  
C. Illustrate welding variables and adjustments to equipment  
D. Describe the most common GMAW weldability problems  
E. Illustrate GMAW filler metal classification by AWS standards  
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select compatibility filler metal or alloys
C. Perform welds on Tee's and butt-joints with various metals and filler wire
   using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:
The student will use GMAW with aluminum and compatibility alloys classified by AWS and
the Aluminum Association Metal Classification System.

EVALUATION AND/OR VERIFICATION:
Examination will be given in this module to determine student progress. Practical exercises
will be evaluated by student and instructor.

SUMMARY:
The metal classification system for aluminum alloys must be fully understood to insure that
welds are performed, according to AWS standards, with these materials.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M8) dealing with describing most common weldability
problems associated with aluminum and copper alloys.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Illustrate GMAW Filler Metal classifications by AWS standards; and,
B. Demonstrate knowledge of aluminum alloys by practice.

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:

A. Set up procedure for GMAW process and equipment
B. Select compatibility filler metal or alloys
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Describe Aluminum Assoc. Metal Classification System for Aluminum Alloys
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten alen screw
   c. Screw on gas defuser and tighten alen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique

Describe Aluminum Assoc. Metal Classification System for Aluminum Alloys
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% CO2
    C. 100% argon
    D. 100% CO2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
    A. 100% argon
    B. 100% CO2
    C. 75% argon, 25% CO2
    D. 95% argon, 5% oxygen
    E. All of the above
    F. None of the above
13. In MIG welding, what causes electrode stubbing?
   A. Wire feed too high
   B. Wire feed too low
   C. Voltage too high
   D. Voltage too low
   E. Both A and C
   F. None of the above

14. In MIG welding, how long is the stickout?
   A. 1/32" 
   B. 3/16" 
   C. 3/8" 
   D. 3/4" 
   E. 1"

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for filler metal compatibility
- A class discussion of appropriate references of effective welding techniques for aluminum and copper
- A discussion on quality welds

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems with aluminum and copper
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Demonstrate ability to repair welds
E. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible with aluminum and copper.

EVALUATION AND/OR VERIFICATION:
Two examinations will be given in this module to determine student progress.

SUMMARY:
Aluminum and copper alloys can present a number of weldability problems if filler metal compatibility is not insured.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M9) dealing with performing GMAW fillet and groove welds on T and butt joints on various metals in various positions.
Describe Most Common Weldability Problems Associated with Aluminum and Copper Alloys

   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
# WELDER SERIES

**MASTER Technical Module No. WLD-M09**

## SUBJECT:

**WELDING TECHNICIAN**

**TIME:** 15 HOURS

- **DUTY:** GAS METAL ARC WELDING (GMAW) (BASIC)
- **TASK:** Perform GMAW Fillet and Groove Welds on T and Butt Joints Various Metals in Various Positions

## OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Provide demonstrations related to gas metal arc welding equipment operations;
B. Provide instruction related to gas metal arc welding principles of operation;
C. Provide instruction related to common process variables for gas metal arc welding;
D. Provide training exercises related to gas metal arc welding equipment operation;
E. Provide training exercises related to starting and maintaining an arc on plain carbon steel;
F. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel, using short circuit transfer, .035 or .045 diameter E70S-X electrodes and a CO₂ or 75% argon/25% CO₂ shielding gas;
G. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel using spray transfer, .035 or .045 diameter E70S-X electrodes and an argon with shielding gas 2%-5% oxygen;
H. Observe trainee following safe arc welding practices;
I. Observe trainee operating gas metal arc welding equipment;
J. Visually inspect trainee's workmanship samples; and,
K. Develop and administer formative or diagnostic tests relevant to gas metal arc welding principles of operation and common process variables.

## INSTRUCTIONAL MATERIALS:

- Student Workbook
- Written tests on GMAW procedures
- Transparencies will be prepared to emphasize each subject
- Miller Module Method Video Materials
- Hobart Institute Video Material
- Student worksheets and alloy charts
- GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M9-H01)
MASTER Handout No. 2 (WLD-M9-H02)
MASTER Self-Assessment

REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students will complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview on preparation for GMAW fillet and groove welds
- A class demonstration of effective welding techniques with shielding gases
- A discussion on best methods and techniques for GMAW applications
PRESENTATION OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventative practices
C. Discuss use of shielding gases for best results with specific applications
D. Illustrate welding variables and adjustments to equipment
E. Describe the most common GMAW weldability problems
F. Illustrate GMAW filler metal classification by AWS standards
G. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select shielding gases
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:

The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

Two examinations will be given during this module to determine the progress of the class. Selection and use of shielding gases will be made in specific applications for best results.

SUMMARY:

Because of oxidizing effects, oxidation of oxygen or carbon dioxide to argon may cause porosity in some ferrous metals, as well as loss of alloying elements of chromium, vanadium, and aluminum (among others). Filler wires used with oxygen containing shielding gas require addition of dioxides to counteract the effects of oxygen.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M10) dealing with demonstrating aluminum GMAW flat horizontal, vertical and overhead.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to gas metal arc welding equipment operations;
B. Provide instruction related to gas metal arc welding principles of operation;
C. Provide instruction related to common process variables for gas metal arc welding;
D. Provide training exercises related to gas metal arc welding equipment operation;
E. Provide training exercises related to starting and maintaining an arc on plain carbon steel;
F. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel, using short circuit transfer, .035 or .045 diameter E70S-X electrodes and a CO₂ or 75% argon/25% CO₂ shielding gas;
G. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel using spray transfer, .035 or .045 diameter E70S-X electrodes and an argon with shielding gas 2%-5% oxygen;
H. Observe trainee following safe arc welding practices;
I. Observe trainee operating gas metal arc welding equipment;
J. Visually inspect trainee’s workmanship samples; and,
K. Develop and administer formative or diagnostic tests relevant to gas metal arc welding principles of operation and common process variables.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventative practices
C. Discuss use of shielding gases for best results with specific applications
D. Illustrate welding variables and adjustments to equipment
E. Describe the most common GMAW weldability problems
F. Illustrate GMAW filler metal classification by AWS standards
G. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select shielding gases
C. Perform welds on Tee's and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Perform GMAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"
9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M9
Perform GMAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above
6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above

7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% Co2
    C. 100% argon
    D. 100% Co2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
   A. 100% argon
   B. 100% Co2
   C. 75% argon, 25% Co2
   D. 95% argon, 5% oxygen
   E. All of the above
   F. None of the above

13. In MIG welding, what causes electrode stubbing?
   A. Wire feed too high
   B. Wire feed too low
   C. Voltage too high
   D. Voltage too low
   E. Both A and C
   F. None of the above

14. In MIG welding, how long is the stickout?
   A. 1/32”
   B. 3/16”
   C. 3/8”
   D. 3/4”
   E. 1”

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
SUBJECT: WELDING TECHNICIAN

TIME: 12 HOURS

- **DUTY:** GAS METAL ARC WELDING (GMAW) (BASIC)
- **TASK:** Demonstrate Aluminum GMAW Flat, Horizontal, Vertical and Overhead

**OBJECTIVE(S):**

Upon completion of this unit the student will be able to understand spray transfer process on GMAW aluminum alloys.

**INSTRUCTIONAL MATERIALS:**

- Student Workbook
- Written tests on aluminum GMAW welding procedures
- Transparencies will be prepared to emphasize each subject
- Miller Module Method Video Materials
- Hobart Institute Video Material
- Student worksheets and alloy charts
- GMAW equipment and accessories
- Various types and sizes of electrode wires (labeled)

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of GMAW aluminum welding
- A class demonstration of effective welding with aluminum
- A discussion on special techniques for vertical and overhead positions

PRESENTATION OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform selection of shielding gases and filler wire
C. Perform welds on Tee's and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary

**PRACTICAL APPLICATION:**

The student will gain knowledge and experience with as much practice as possible.

**EVALUATION AND/OR VERIFICATION:**

Two written examinations will be given in this module to determine student progress.

Practical exercises will be evaluated by the student and the instructor.

**SUMMARY:**

Metal is generally deposited either by spray transfer or by globular transfer spray transfer (usually more desirable) produces relatively deep penetration at the center of the bead and shallow penetration at the edges; globular transfer produces a broader and more shallow penetration pattern.

Shape of a weld bead and penetration pattern are determined by metal transfer characteristics which are affected by the shielding gas, which protects the molten metal from contamination by oxygen and nitrogen in the atmosphere.

**NEXT LESSON ASSIGNMENT:**

MASTER Technical Module (WLD-M11) dealing with describing GMAW filler wires.
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand spray transfer process on GMAW aluminum alloys.

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:

A. Set up procedure for GMAW process and equipment

Demonstrate Aluminum GMAW Flat, Horizontal, Vertical and Overhead
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique

   E. 1"

15. In MIG welding sheet metal, how do you fill a large gap?
   A. Weave it in
   B. Whipping
   C. Pulse arc with trigger
   D. U-Weave
   E. Both C and D
   F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
   A. Moves the MIG gun
   B. Guides the MIG gun
   C. Feeds the electrode
   D. Wheels inside gun liner attached to flow meter
   E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M11

SUBJECT: WELDING TECHNICIAN TIME: 3 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Describe GMAW Filler Wires

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand compatibility of filler metal to base metal; and,
B. Understand AWS Electrode Classification System for GMAW.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on AWS Electrode Classification System
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M11-HO1)
MASTER Handout No. 2 (WLD-M11-HO2)
MASTER Self-Assessment

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
Copper and Copper-Alloy Welding Rods, AWS A5.7-84, American Welding Society, Miami, FL, Latest Edition
Mechanical Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
Impact - Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the AWS Electrode Classification System
- A discussion of sources and references of information such as the AWS A5.18-79, "Chemical - Composition Requirements for Gas Metal Arc Welding - Electrode."

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of electrode and classification markings
B. Illustrate the significance of classification numbers
C. Present mechanical property requirements
D. Present impact property requirements
E. Present chemical composition requirement
F. Describe principles of use and storage of rod and filler wire  
G. Describe the most common GMAW weldability problems associated with electrodes and filler wire  
H. Illustrate GMAW filler metal classification by AWS standards/classification charts  
I. Illustrate GMAW filler metal by Aluminum Association Metal Classification System  

Student Activities:  
A. Discuss GMAW filler wires, fluxes, and GMAW applications  
B. Perform classification exercises, given weld specifications from the instructor  
C. Discuss the importance of mechanical properties, impact properties, and chemical composition of filler wires to the welding process  

PRACTICAL APPLICATION:  
The student will gain knowledge and experience with as much practice as possible.  
Emphasis is on specific applications that involve selection of filler metal and fluxes with GMAW.  

EVALUATION AND/OR VERIFICATION:  
Written examinations will be given in this module to determine student progress.  

SUMMARY:  
Welder improve their techniques and methods with knowledge of AWS standards and specifications, to include electrode classification systems. Originally a color identification system was developed by the National Electrical Manufacturers Association in conjunction with the American Welding Society to identify electrode classification. This was a system of color markings. In 1964, AWS required the classification numbers be imprinted on the covering. Since some sizes are too small to be imprinted, color code is still used for some electrodes.  

Filler metal electrodes are generally classified by chemical composition, mechanical properties, type of shielding gas, corrosion resistance, usability (current, polarity, welding position, etc.). Some are also classified on the basis of simple or multiple pass operation. Fluxes are classified separately on the basis of mechanical properties. Welders should be aware of the need for compatibility studies, using the wide resources available for this purpose.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M12) dealing with demonstrating ability to repair welds.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand compatibility of filler metal to base metal; and,
B. Understand AWS Electrode Classification System for GMAW.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of electrode and classification markings
B. Illustrate the significance of classification numbers
C. Present mechanical property requirements
D. Present impact property requirements
E. Present chemical composition requirement
F. Describe principles of use and storage of rod and filler wire
G. Describe the most common GMAW weldability problems associated with electrodes and filler wire
H. Illustrate GMAW filler metal classification by AWS standards/classification charts
I. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Discuss GMAW filler wires, fluxes, and GMAW applications
B. Perform classification exercises, given weld specifications from the instructor
C. Discuss the importance of mechanical properties, impact properties, and chemical composition of filler wires to the welding process
GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
Circle the best answer.

1. What polarity does MIG normally run on?
   A. AC
   B. Electrode Negative
   C. Electrode Positive
   D. Both A and C
   E. None of the above

2. Spray MIG Welding is used to weld what thickness metal?
   A. Thick
   B. Thin

3. How do you change the amperage when MIG Welding?
   A. Wire feed speed
   B. Current setting
   C. Voltage setting
   D. None of the above

4. What does the gas do for MIG Welding?
   A. Cleans the base metal
   B. Burns and makes heat which helps melt the base metal
   C. Forces the weld metal onto the base plate
   D. Keeps air away from the molten weld pool
   E. None of the above

5. Short Circuit MIG Welding is used to weld what thickness of metal?
   A. Thick
   B. It is not used with MIG
   C. Thin
   D. Thick aluminum only
   E. None of the above

6. With MIG Welding, what technique is usually used?
   A. Push
   B. Pull
   C. Whip
   D. Spot
   E. None of the above
7. Why is a spatter buildup on the inside of the nozzle harmful to a good weld?
   A. Stops the electrode
   B. Stops the gas
   C. Stops the polarity
   D. Causes too much voltage
   E. None of the above

8. What should the shielding gas be set at for MIG Welding?
   A. 5 ech
   B. 15 psi
   C. 30 psi
   D. 25 cfh
   E. 5 psi

9. What is ER 70S-3?
   A. Shielding gas
   B. Miller MIG Welder
   C. Lincoln Wire Feeder
   D. Electrode
   E. None of the above

10. In MIG welding, what does a flow meter do?
    A. Controls shielding gas flow
    B. Measures amperage
    C. Feeds wire electrode
    D. Voltage sensing device
    E. None of the above

11. In MIG welding, what shielding gas makes a rough looking weld with a large amount of spatter?
    A. 98% argon, 2% oxygen
    B. 90% argon, 10% Co2
    C. 100% argon
    D. 100% Co2
    E. Both A and B

12. In MIG welding, which shielding gas is used for spray transfer?
    A. 100% argon
    B. 100% Co2
    C. 75% argon, 25% Co2
    D. 95% argon, 5% oxygen
    E. All of the above
    F. None of the above
13. In MIG welding, what causes electrode stubbing?
A. Wire feed too high
B. Wire feed too low
C. Voltage too high
D. Voltage too low
E. Both A and C
F. None of the above

14. In MIG welding, how long is the stickout?
A. 1/32”
B. 3/16”
C. 3/8”
D. 3/4”
E. 1”

15. In MIG welding sheet metal, how do you fill a large gap?
A. Weave it in
B. Whipping
C. Pulse arc with trigger
D. U-Weave
E. Both C and D
F. None of the above

16. In MIG welding, what is the purpose of the drive rolls?
A. Moves the MIG gun
B. Guides the MIG gun
C. Feeds the electrode
D. Wheels inside gun liner attached to flow meter
E. None of the above
WELDER SERIES
MASTER Technical Module No. WLD-M12

SUBJECT: WELDING TECHNICIAN        TIME: 6 HOURS

- DUTY: GAS METAL ARC WELDING (GMAW) (BASIC)
- TASK: Demonstrate Ability to Repair Welds

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the need to repair welds;
B. Understand the removal of discontinuity; and,
C. Repair by re-weld.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on safety and GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M12-H01)
MASTER Handout No. 2 (WLD-M12-H02)
MASTER Self-Assessment

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for repair of welds
- A class demonstration of effective techniques in re-welding

PRESENTATION OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
Student Activities:

A. Set up procedure for GMAW process and equipment
B. Perform welds specified by instructor with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Determine the defect or non-conformity that can be corrected by re-weld
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary

PRACTICAL APPLICATION:

The student will gain knowledge and experience with as much practice as possible. Student will recognize the defect or non-conformity that can be repaired by re-weld, and those that cannot be corrected.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Re-welds will be tested following performance of work.

SUMMARY:

The removal of weld metal or portions of the base metal may be done by mechanical means. The remaining base metal must not be undercut. Unacceptable portions of the weld shall be removed without substantial removal of base metal. Metal added shall be deposited by a qualified welder with filler of the same composition in accordance with an approved welding procedure.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M13) dealing with demonstrating machine adjustments (voltage, amps, wire speed).
WLD-M12-HO1
Demonstrate Ability to Repair Welds
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the need to repair welds;
B. Understand the removal of discontinuity; and,
C. Repair by re-weld.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform welds specified by instructor with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Determine the defect or non-conformity that can be corrected by re-weld
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
Demonstrate Ability to Repair Welds
Self-Assessment

Circle the best answer.

1. What polarity does MIG normally run on?

### Tasks

| M-14 Demonstrate machine adjustments (volt, amp, speed) |
| M-15 Perform weld process |
| M-16 Perform weld sequence |
| M-17 Perform weld technique |
| M-18 Perform welds |
| M-19 Perform post weld preparation |
| M-20 Perform post weld finish |
| M-21 Describe OMAW filler wire |
| M-22 Describe basic weld discontinuities |

#### Tasks

- **M-14** Demonstrate machine adjustments (volt, amp, speed)
- **M-15** Perform weld process
- **M-16** Perform weld sequence
- **M-17** Demonstrate OMAW in basic, horizontal, vertical, and overhead positions
- **M-18** Perform welds
- **M-19** Perform post weld preparation
- **M-20** Perform post weld finish
- **M-21** Describe OMAW filler wire
- **M-22** Describe basic weld discontinuities

WELDER SERIES
MASTER Technical Module No. WLD-M13

SUBJECT: WELDING TECHNICIAN
TIME: 8 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER
  (INTERMEDIATE)
- TASK: Demonstrate Machine Adjustments (Voltage, Amps, Wire Speed)

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the effects of variables on weld quality; and,
B. Adjust GMAW equipment to improve weld quality.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written tests on safety and machine adjustment procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M13-HO1)
MASTER Handout No. 2 (WLD-M13-HO2)

Impact - Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW short circuit transfer methods
- A demonstration of effective machine adjustments

PRESENTATION OUTLINE:

Instructor Topics:

A. Describe SMAW short circuit transfer methods
B. Emphasizes the principles involved in of GMAW machine adjustments
C. Demonstrate knowledge of voltage and amperes and their effects on welding outcomes
D. Demonstrate uses of wire and wire speed
E. Demonstrate knowledge of the proper application of welding skills
F. Identify polarity requirements using GMAW short circuit transfer on various metals
G. Increase knowledge of current industry standards and techniques
H. Identify welding variables and their effects on weld quality
I. Identify the AISI steel classification system
J. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss GMAW short circuit transfer methods
B. Set machine adjustments to approved values for welding procedure
C. Preheat weld surface
D. Adjust wire feeder mechanism, as appropriate
E. Perform single pass and multi-pass welds
F. Perform welds in four positions
G. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with practice in setting the two basic controls (open circuit voltage and wire feed speed) and understanding the function of current limiting slope control.

EVALUATION AND/OR VERIFICATION:
Two examinations will be given during this module to determine the progress of the class.

SUMMARY:
GMAW or "MIG" equipment is more complex and requires detailed setup, verification, and adjustment procedures. The GMAW process requires four major pieces of equipment. These are: power supply, wire feed-unit, welding gun, and a gas supply. The power supply, providing constant DC voltage, offers constant arc voltage output by regulating current and wire feed speed. Current increases or decreases automatically to match electrode melt rate to wire feed rate. Machine power configuration is DECP. Many constant power machines have a current limiting device called slope control, that changes (manually or automatically) the slope of the power source volt-amp output curve.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M14) dealing with initiating welding process.
Demonstrate Machine Adjustments (Voltage, Amps, Wire Speed)

Attachment 1: MASTER Handout No. 1

**OBJECTIVE(S):**

Upon completion of this unit the student will be able to:
A. Understand the effects of variables on weld quality; and,
B. Adjust GMAW equipment to improve weld quality.

**MODULE OUTLINE:**

**Instructor Topics:**
A. Describe SMAW short circuit transfer methods
B. Emphasizes the principles involved in of GMAW machine adjustments
C. Demonstrate knowledge of voltage and amperes and their effects on welding outcomes
D. Demonstrate uses of wire and wire speed
E. Demonstrate knowledge of the proper application of welding skills
F. Identify polarity requirements using GMAW short circuit transfer on various metals
G. Increase knowledge of current industry standards and techniques
H. Identify welding variables and their effects on weld quality
I. Identify the AISI steel classification system
J. Match GMAW electrodes to an appropriate base metal

**Student Activities:**
A. Discuss GMAW short circuit transfer methods
B. Set machine adjustments to approved values for welding procedure
C. Preheat weld surface
D. Adjust wire feeder mechanism, as appropriate
E. Perform single pass and multi-pass welds
F. Perform welds in four positions
G. Make adjustments to improve weld quality
GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
      carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS
      D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step
      1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
      carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the
      first pass
   f. Weld the third pass with electrode centered at the top toe of the
      second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS
      D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
       carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a
       1/4" fillet in the vertical position, upward using a slight weave
       technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN  TIME: 15 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)
- TASK: Initiate Welding Process

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand codes and specifications given to produce a desired weld;
B. Understand welding techniques necessary to produce a desired weld; and,
C. Understand principles and use of short circuit transfer.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW short circuit transfer
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M14-H01)
MASTER Handout No. 2 (WLD-M14-H02)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview on codes and specifications
- A class demonstration of effective GMAW techniques with short circuit transfer
- A discussion on methods leading to optimum quality welds

PRESENTATION OUTLINE:

Instructor Topics:

A. Discuss applications for GMAW short circuit transfer methods
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of codes and specifications
F. Demonstrate knowledge of the proper application of welding skills
G. Demonstrate knowledge of adequate preparation of welding surfaces
H. Increase skill level to pass certification tests offered by an employer
I. Prepare butt joints, and tee joints, for welding
J. Increase knowledge of current industry standards and techniques
K. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
L. Explain short circuit transfer events of contact, melting, separation, flattening, and recontact
M. Identify polarity requirements using GMAW short circuit transfer on various metals
N. Demonstrate preheat and how to maintain desired temperature
O. Identify welding variables and their effects on weld quality
P. Identify the AISI steel classification system
Q. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss principles and use of short circuit transfer
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with GMAW short circuit transfer.

EVALUATION AND/OR VERIFICATION:
Examinations will be given during this module to determine the progress of the class.
Instructor will monitor and coach the student in safe operation of the equipment.

SUMMARY:
Short-circuit transfer is the slowest of GMAW metal transfer methods, but its major advantage is low heat input, making it useful in welding thin sections, and welding in all positions.

When the electrode touches base metal, a short circuit is created, and the high level of current produces heat to melt a portion of the electrode.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M15) dealing with performing weld sequence.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand codes and specifications given to produce a desired weld;
B. Understand welding techniques necessary to produce a desired weld; and,
C. Understand principles and use of short circuit transfer.

MODULE OUTLINE:

Instructor Topics:
A. Discuss applications for GMAW short circuit transfer methods
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of codes and specifications
F. Demonstrate knowledge of the proper application of welding skills
G. Demonstrate knowledge of adequate preparation of welding surfaces
H. Increase skill level to pass certification tests offered by an employer
I. Prepare butt joints, and tee joints, for welding
J. Increase knowledge of current industry standards and techniques
K. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
L. Explain short circuit transfer events of contact, melting, separation, flattening, and recontact
M. Identify polarity requirements using GMAW short circuit transfer on various metals
N. Demonstrate preheat and how to maintain desired temperature
O. Identify welding variables and their effects on weld quality
P. Identify the AISI steel classification system
Q. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss principles and use of short circuit transfer
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten alien screw
   c. Screw on gas defuser and tighten alien screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness
7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness
8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"
9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW short circuit transfer
- A class demonstration of effective welding techniques and advantages of GMAW
- A discussion on weld sequence

PRESENTATION OUTLINE:

Instructor Topics:

A. Present the advantages and possible disadvantages of use of GMAW short circuit transfer methods for comparable applications.
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss advantages and possible disadvantages of the short circuit methods
B. Select shielding gas
C. Preheat weld surface
D. Perform welds in four positions
E. Use approved welding technique
F. Perform single pass welds with thinner metals and multi-pass welds with thicker metals
G. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
Examinations will be given during this module to determine the progress of the class. Welds will be inspected for compliance with AWS standards by the student and the instructor.

SUMMARY:
Short circuit transfer is a unique method because the electrode metal does not flow across the arc gap, but is deposited directly into the weld puddles. The short circuit method of metal transfer is designed primarily for welding steel materials 1/4" thick or less. The shielding gas maybe either welding grade carbon dioxide (CO2) or an argon (CO2) gas mixture.

Solid electrode wires for short circuit transfer are classified in the AWS Specification AS-18 for carbon steel and AS-28 for low alloy steels. Filler metal selection should be based on requirements of the specific application and the shielding gas.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M16) dealing with controlling weld technique.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand adequate machine adjustments; and,
B. Perform welds in various positions.

O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss advantages and possible disadvantages of the short circuit methods
B. Select shielding gas
C. Preheat weld surface
D. Perform welds in four positions
E. Use approved welding technique.
F. Perform single pass welds with thinner metals and multi-pass welds with thicker metals
G. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. **Assemble GMAW Gun and Name All Parts**
   - Install adapter for particular brand of wire feeder
   - Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   - Screw on gas defuser and tighten allen screw
   - Install contact tip
   - Install gas nozzle
   - Adjust gun for tip to work distance

2. **Understand Gas Metal Arc Power Source**
   - Compare and contrast constant current and constant voltage power sources
   - List effects of inductance on circuit
   - List effects of pinch effect

3. **Shielding Gas Application**
   - List arc characteristics caused by welding with 100% carbon dioxide
   - List arc characteristics caused by welding with 100% argon
   - List arc characteristics caused by welding with 75% Argon and 25% CO2
   - List arc characteristics caused by welding with 95% Argon and 5% CO2
   - List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. **Weld With GMAW Using Spray Transfer**
   - Choose the correct shielding gas and flow rate for the given application, material and material thickness
   - Choose the correct electrode for given material and applications both type and size
   - Set voltage and wire feed speed for a given application, material and material thickness

5. **Weld With GMAW Using Short Circuit Transfer**
   - Choose the correct shielding gas and flow rate for the given application, material and material thickness
   - Choose the correct electrode for given material and applications both type and size
   - Set voltage and wire feed speed for a given application, material and material thickness

6. **Weld With GMAW Using Globular Transfer**
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M16

SUBJECT: WELDING TECHNICIAN TIME: 4 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)
- TASK: Control Weld Technique

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements; and,
B. Understand weld techniques to produce specific welds.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on techniques to control welds in GMAW short circuit transfer
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M16-H01)
MASTER Handout No. 2 (WLD-M16-H02)

REFERENCES:

TEXT:

OTHER:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need to develop and control weld techniques
- A class demonstration of effective welding techniques in various positions
- A discussion on methods leading to an increase of skill in use of welding techniques

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

The student will gain knowledge and experience with as much practice as possible. Because each welding task may be somewhat unique, it takes practice to recognize the before, during, and after-weld conditions that will yield the best possible weld. Also, if a joint is being welded in vertical or overhead positions slight variations in current and feed speed may improve weld quality and reduce metal run-out.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

Basic variables that must be controlled by the student are the gun angle relative to the workpiece, electrode extension from the contact tube, the speed of travel, and the gas shielding pattern.

When welding in the overhead position, welders must take special care to keep spatter, or molten metal from falling back on the gun nozzle and contact tube, as well as on themselves.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M17) dealing with understanding welding characteristics of various shielding gases.
WLD-M16-H01
Control Weld Technique
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements; and,
B. Understand weld techniques to produce specific welds.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M17

SUBJECT: WELDING TECHNICIAN

DUTY: GMAW SHORT CIRCUIT TRANSFER
       (INTERMEDIATE)

TASK: Understand Welding Characteristics of Various Shielding
       Gases

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand gas bottle safety; and,
B. Perform welds on various metals using various shielding gas and gas mixes.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M17-H01)
MASTER Handout No. 2 (WLD-M17-H02)

Impact - Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of the need for shielding gases
- A class demonstration of effective use of shielding gases

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass qualification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Select approved shielding gases
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved and appropriate welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with practice in the use of shielding gases. The choice of the best shielding gas for a given GMAW application depends on many factors -- desired arc and metal transfer conditions, required penetration and fusion, shape of the finished weld, and welding speed.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:
Shielding gases have specific applications leading to desired outcomes. The main purpose of a shielding gas is to protect the molten weld puddle from contamination by the atmosphere. The most common shielding gases used in GMAW are argon (chemical symbol AR), helium (He), and carbon dioxide (CO2). Both argon and helium are true inert gases, but carbon dioxide is not. Each of these gases can be used alone as a "pure" shielding gas. However, they are usually combined in varying proportions to achieve desired conditions of the welding area.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M18) dealing with post-cleaning weld.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand gas bottle safety; and,
B. Perform welds on various metals using various shielding gas and gas mixes.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass qualification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Select approved shielding gases
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved and appropriate welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M18

SUBJECT: WELDING TECHNICIAN
TIME: 4 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER
  (INTERMEDIATE)
- TASK: Post-Clean Weld

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld surface preparation;
B. Understand the use of solvents to clean weld surfaces; and,
C. Understand the process chipping and grinding.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M18-HO1)

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for surface preparation
- A class demonstration of effective preparations and cleaning techniques

PRESENTATION OUTLINE:

Instructor Topics:

A. Weld surface preparation
B. Cleaning of weld surfaces
C. Knowledge of the proper application of welding skills
D. Knowledge of current industry standards and techniques
E. Identify welding variables and their effects on weld quality
F. Identify the AISI steel classification system
G. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-clean weld

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:
There is very little requirement for cleaning with GMAW processes. With exception of flux cored electrodes used in the FCAW process, there is so flux and therefore no slag removal required. With proper welding processes and procedures, there should be little or no spatter from welding. Chipping, grinding, and finishing will be at a minimum.

Welders improve their techniques and methods with practice in GMAW short circuit transfer that corresponds with realistic industry standards and expectations.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M19) dealing with performing interpass preparation.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld surface preparation;
B. Understand the use of solvents to clean weld surfaces; and,
C. Understand the process chipping and grinding.

MODULE OUTLINE:

Instructor Topics:
A. Weld surface preparation
B. Cleaning of weld surfaces
C. Knowledge of the proper application of welding skills
D. Knowledge of current industry standards and techniques
E. Identify welding variables and their effects on weld quality
F. Identify the AISI steel classification system
G. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-clean weld
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass  
f. Weld the third pass with electrode centered at the top toe of the second pass  
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position  
a. Inspect area for safety  
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
c. Adjust the welding parameters for this task  
d. Place the T joint in the 4F overhead position approximately at eye level  
e. Weld a 1/4" fillet weld (wire brush weld after each pass)  
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW  
a. Inspect the work area and equipment for safety  
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle  
c. Use grind to clean the bevel face and apply a 3/32" root face  
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps  
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening  
f. Weld root upwards  
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.  
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion  
i. Complete the second pass using GMAW and upward Z weave technique  
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges  
k. Make fourth and final pass with the same technique  
l. The electrode is weaved from one bevel edge to another  
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position  
a. Fit up and tack pipe according to given tolerances

1720
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M19

SUBJECT: WELDING TECHNICIAN       TIME: 3 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER
  (INTERMEDIATE)
- TASK: Perform Interpass Preparation

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements;
B. Understand the use of various tools to prepare welding surfaces; and,
C. Understand the purpose of interpass.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M19-HO1)
MASTER Handout No. 2 (WLD-M19-HO2)

REFERENCES:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for interpass methods
- A class demonstration of effective interpass techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Discuss pre-heating and maintaining interpass temperatures
B. Emphasizes the principles involved in preheating and reducing the quench rate
C. Demonstrate preheat and how to maintain desired temperature
D. Demonstrate knowledge of joint design and welding terms
E. Demonstrate knowledge of adequate preparation of welding surfaces

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

*Copper and Copper-Alloy Welding Rods*, AWS A5.7-84, American Welding Society, Miami, FL, Latest Edition

*Mechanical Property Requirements for Gas Metal Arc Welding Weld Metal*, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

*Chemical - Composition Requirements for Gas Arc Welding Electrode*, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
F. Prepare butt joints, and tee joints, for welding
G. Demonstrate knowledge of the proper application of welding skills
H. Identify the AISI steel classification system
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Increase skill level to pass certification or qualification tests offered by an employer
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Identify welding variables and their effects on weld quality
M. Increase knowledge of current industry standards and techniques
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds, maintaining recommended interpass temperatures
C. Use approved welding techniques
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with practice in preheating, and maintaining interpass temperatures.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class. Welds will be inspected using AWS standards by the student and instructor, who will also review student’s interpass procedures.

SUMMARY:
A metal that requires preheating to a specified temperature must also be kept at this temperature between weld passes. Heat input during welding may be sufficient, but on larger weldments torch heating between passes may be required.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M20) dealing with demonstrating short circuit GMAW flat horizontal, vertical and overhead.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand welding requirements;
B. Understand the use of various tools to prepare welding surfaces; and,
C. Understand the purpose of interpass.

MODULE OUTLINE:

Instructor Topics:

A. Discuss pre-heating and maintaining interpass temperatures
B. Emphasizes the principles involved in preheating and reducing the quench rate

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100\% carbon dioxide
   b. List arc characteristics caused by welding with 100\% argon
   c. List arc characteristics caused by welding with 75\% Argon and 25\% CO2
   d. List arc characteristics caused by welding with 95\% Argon and 5\% CO2
   e. List arc characteristics caused by welding with 95\% Argon and 5\% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)

TASK: Demonstrate Short Circuit GMAW Flat Horizontal, Vertical and Overhead

OBJECTIVE(S):
Upon completion of this unit the student will be able to perform welds in flat, horizontal, vertical and overhead positions using GMAW equipment.

INSTRUCTIONAL MATERIALS:

- Student Workbook
- Written tests on GMAW procedures
- Transparencies will be prepared to emphasize each subject
- Miller Module Method Video Materials
- Hobart Institute Video Material
- Student worksheets and alloy charts
- GMAW equipment and accessories

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW applications
- A class demonstration of effective welding in flat, horizontal, vertical, and overhead positions
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Discuss the need for specific techniques and adjustments that maximize weld quality in multiple positions
B. Emphasizes the principles involved in the weld sequence/control of basic variables and operation of GMAW equipment
C. Demonstrate knowledge of the proper application of welding skills
D. Demonstrate knowledge of adequate preparation of welding surfaces
E. Demonstrate ability to interpret drawings and blueprints
F. Demonstrate knowledge of joint design and welding terms
G. Prepare butt joints, and tee joints, for welding
H. Identify polarity requirements using GMAW short circuit transfer on various metals
I. Maximize GMAW quality using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Increase knowledge of current industry standards and techniques
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding techniques, with major consideration for safety
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with applications in multiple positions, following proper weld sequence, control of basic variables improving technique and maximizing safety considerations.

EVALUATION AND/OR VERIFICATION:
Two examinations will be given during this module to determine the progress of the class. Quality of welds will be emphasized and each weldment will be inspected by the student and the instructor.

SUMMARY:
Welding techniques need to be appropriate for the approved procedure and application, with full consideration for the metals being welded, the position of welding, and the shielding gases.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M21) dealing with post finishing weld.
OBJECTIVE(S):

Upon completion of this unit the student will be able to perform welds in flat, horizontal, vertical and overhead positions using GMAW equipment.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the need for specific techniques and adjustments that maximize weld quality in multiple positions
B. Emphasizes the principles involved in the weld sequence/control of basic variables and operation of GMAW equipment
C. Demonstrate knowledge of the proper application of welding skills
D. Demonstrate knowledge of adequate preparation of welding surfaces
E. Demonstrate ability to interpret drawings and blueprints
F. Demonstrate knowledge of joint design and welding terms
G. Prepare butt joints, and tee joints, for welding
H. Identify polarity requirements using GMAW short circuit transfer on various metals
I. Maximize GMAW quality using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Increase knowledge of current industry standards and techniques
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match GMAW electrodes to an appropriate base metal

Student Activities:

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer

1734
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass.
f. Weld the third pass with electrode centered at the top toe of the second pass.
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1.

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position

a. Inspect area for safety.
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel.
c. Adjust the welding parameters for this task.
d. Place the T joint in the 4F overhead position approximately at eye level.
e. Weld a 1/4" fillet weld (wire brush weld after each pass).
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1.

12. Weld Single V Groove With GMAW

a. Inspect the work area and equipment for safety.
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle.
c. Use grind to clean the bevel face and apply a 3/32" root face.
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps.
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening.
f. Weld root upwards.
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion.
i. Complete the second pass using GMAW and upward Z weave technique.
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges.
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another.
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges.

13. Weld Pipe - 1G Position

a. Fit up and tack pipe according to given tolerances.
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN
TIME: 4 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)
- TASK: Post Finish Weld

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements; and,
B. Understand adjustments of GMAW equipment to increase weld quality.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of procedures for weld post-finish
- A class demonstration of effective post-finish techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Presents post-finish weld methods and techniques
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-finish weld

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:
Welders improve their techniques and methods with practice that is benchmarked with AWS standards.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M22) dealing with describing GMAW filler wires.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements; and,
B. Understand adjustments of GMAW equipment to increase weld quality.

MODULE OUTLINE:

Instructor Topics:
A. Presents post-finish weld methods and techniques
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-finish weld
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)
- TASK: Describe GMAW Filler Wires

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand filler metal related to the job requirements.

INSTRUCTIONAL MATERIALS:

- Student Workbook
- Written test on GMAW procedures
- Transparencies will be prepared to emphasize each subject
- Miller Module Method Video Materials
- Hobart Institute Video Material
- Student worksheets and alloy charts
- GMAW equipment and accessories
- Various types and sizes of electrode wires (labeled)
- Personal protective equipment
- Examples of welding guns (standard and 1 pound spools)
- Examples of wire feeders
- Shielding gas regulator-flow meters
- Welding shop tools
- MASTER Handout No. 1 (WLD-M22-H01)
- MASTER Handout No. 2 (WLD-M22-H02)

REFERENCES:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of this selection process for GMAW filler wires
- A class demonstration of selection of filler wires
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Discuss the process of filler wire selection; emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Increase knowledge of current industry standards and techniques
F. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical, and overhead positions
G. Identify polarity requirements using GMAW short circuit transfer on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Select, install, and adjust electrode filler wires
B. Preheat weld surface
C. Perform welds in four positions
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

The student will gain knowledge and experience with selection, installation, and adjustment of filler wires.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Student selection and wire feed adjustments will be observed by the instructor.

SUMMARY:

Welders improve their techniques and methods with practice that is benchmarked with AWS standards.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M23) dealing with describing basic weld discontinuities.
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand filler metal related to the job requirements.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the process of filler wire selection; emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Increase knowledge of current industry standards and techniques
F. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
G. Identify polarity requirements using GMAW short circuit transfer on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Select, install, and adjust electrode filler wires
B. Preheat weld surface
C. Perform welds in four positions
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass.

f. Weld the third pass with electrode centered at the top toe of the second pass.

g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position

a. Inspect area for safety.

b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel.

c. Adjust the welding parameters for this task.

d. Place the T joint in the 4F overhead position approximately at eye level.

e. Weld a 1/4" fillet weld (wire brush weld after each pass).

f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1.

12. Weld Single V Groove With GMAW

a. Inspect the work area and equipment for safety.

b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle.

c. Use grind to clean the bevel face and apply a 3/32" root face.

d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps.

e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening.

f. Weld root upwards.

g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.

h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion.

i. Complete the second pass using GMAW and upward Z weave technique.

j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges.

k. Make fourth and final pass with the same technique.

l. The electrode is weaved from one bevel edge to another.

m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges.

13. Weld Pipe - 1G Position

a. Fit up and tack pipe according to given tolerances.
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M23

SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

- DUTY: GMAW SHORT CIRCUIT TRANSFER (INTERMEDIATE)
- TASK: Describe Basic Weld Discontinuities

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the welder's responsibilities related to discontinuities and defects;
B. Identify and define discontinuities and defects;
C. Understand causes of discontinuities related to shape, size and contour;
D. Understand causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Understand common causes of discontinuities related to weld and base metal properties.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M23-H01)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of causes of weld discontinuities
- A class demonstration of causes demonstrating improper and proper techniques
- A discussion on methods leading to an increase of skill and knowledge in order to be diversified, and a more valuable employee
PRESENTATION OUTLINE:

Instructor Topics:
A. Discuss the causes and prevention of weld discontinuities
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given during this module to determine the progress of the class.

SUMMARY:
Welders improve their techniques and methods with the use of approved methods and techniques that will prevent discontinuities.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M24) dealing with demonstrating pre-weld cleaning.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the welders responsibilities related to discontinuities and defects;
B. Identify and define discontinuities and defects;
C. Understand causes of discontinuities related to shape, size and contour;
D. Understand causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Understand common causes of discontinuities related to weld and base metal properties.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the causes and prevention of weld discontinuities
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Describe Basic Weld Discontinuities
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique

SUBJECT: WELDING TECHNICIAN  
TIME: 3 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Demonstrate Pre-Weld Cleaning

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the safe method of cleaning surfaces to be welded using hand tools (wire brush, power tools, etc); and,
B. Describe surface preparation procedures using cleaning solvents such as acetone.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written test on GMAW pre-weld cleaning and preparation
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M24-HO1)
MASTER Handout No. 2 (WLD-M24-HO2)

*Competency Standards*, American Welding Society, Latest Edition

*Copper and Copper-Alloy Welding Rods*, AWS A5.7-84, American Welding Society, Miami, FL, Latest Edition

*Mechanical Property Requirements for Gas Metal Arc Welding Weld Metal*, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

*Chemical - Composition Requirements for Gas Arc Welding Electrode*, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need for pre-weld cleaning
- A class demonstration of effective pre-weld cleaning techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe

B. Discussion on the safety and health of welders

C. A discussion on set-up, operation, and shut down procedures
D. Pre-weld cleaning methods
E. Preparation and assembly of various materials and shapes
F. Describe AISI Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class. Instructor will observe pre-weld cleaning and preparation methods.

SUMMARY:
Welders improve their techniques and methods with practice that is benchmarked with AWS standards.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M25) dealing with demonstrating interpass cleaning.
WLD-M24-H01
Demonstrate Pre-Weld Cleaning
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the safe method of cleaning surfaces to be welded using hand tools (wire brush, power tools, etc); and,
B. Describe surface preparation procedures using cleaning solvents such as acetone.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Pre-weld cleaning methods
E. Preparation and assembly of various materials and shapes
F. Describe AISI Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten
      allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power
      sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25%
      CO2
   d. List arc characteristics caused by welding with 95% Argon and 5%
      CO2
   e. List arc characteristics caused by welding with 95% Argon and 5%
      oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15° with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M25

SUBJECT: WELDING TECHNICIAN

TIME: 3 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)

- TASK: Demonstrate Interpass Cleaning

OBJECTIVE(S):

Upon completion of this unit the student will be able to perform material and weld cleaning after each weld pass is applied using wire brush, or power tools with or without cleaning solvents such as acetone

   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Demonstrate Adjustment to Pulse and Spray Transfer Machines

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform welds using spray and pulsed spray transfer with FCAW, and GMAW equipment;
B. Identify weld variables in the weld quality; and,
C. Make adjustments to GMAW and FCAW equipment to improve weld quality.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M26-H01)
MASTER Handout No. 2 (WLD-M26-H02)

Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of pulse and spray machine adjustments
- A class demonstration of effective machine adjustment techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:
A. Discussion of pulse and spray machine adjustments
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes for GMAW
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate destructive and non-destructive tests on various metals welded for pipe

Student Activities:
A. Set-up welding station
B. Perform adjustments on pulse and spray machines
C. Clean weld surface
D. Tack weld joints
E. Deposit root pass
F. Perform interpass
G. Deposit multiple pass to fill groove on various metals
H. Perform destructive and non-destructive tests

PRACTICAL APPLICATION:
The student will gain knowledge and experience with pulse and spray machine adjustments. Destructive and non-destructive tests with pipe welds will be performed by the student and critiqued by the instructor.

EVALUATION AND/OR VERIFICATION:
Two examinations will be given at the end of this section to determine the progress of the class. Adjustments and tests will be evaluated by instructor.

SUMMARY:
Welders improve their techniques and methods with practice in pipe welding and testing that is benchmarked with AWS standards and approved procedures.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M27) dealing with demonstrating GMAW in flat, horizontal, vertical and overhead positions.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform welds using spray and pulsed spray transfer with FCAW, and GMAW equipment;
B. Identify weld variables in the weld quality; and,
C. Make adjustments to GMAW and FCAW equipment to improve weld quality.

MODULE OUTLINE:

Instructional Topics:
A. Discussion of pulse and spray machine adjustments
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes for GMAW
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate destructive and non-destructive tests on various metals welded for pipe

Student Activities:
A. Set-up welding station
B. Perform adjustments on pulse and spray machines
C. Clean weld surface
D. Tack weld joints
E. Deposit root pass
F. Perform interpass
G. Deposit multiple pass to fill groove on various metals
H. Perform destructive and non-destructive tests
WLD-M26-HO2
Demonstrate Adjustment to Pulse and Spray Transfer Machines
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten
      allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power
      sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness
6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

TIME: 12 HOURS

DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)

TASK: Demonstrate GMAW in Flat, Horizontal, Vertical and Overhead Positions

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Prepare material for welding;
B. Place material in a designated angle to perform weld;
C. Perform weld sequence in the flat position using GMAW spray and pulsed spray transfer;
D. Perform weld sequence in the horizontal position using GMAW spray and pulsed spray transfer;
E. Perform weld sequence in the vertical position using GMAW spray and pulsed spray transfer; and,
F. Perform weld sequence in the overhead position using GMAW spray and pulsed spray transfer.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written tests on GMAW welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW spray and pulsed spray in multiple positions
- A class demonstration of effective GMAW spray and pulsed spray techniques
- A discussion on methods leading to an increase of skill and knowledge
PRESENTATION OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive test on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform flat groove and fillet welds, and horizontal fillet welds
E. Deposit root pass
F. Deposit multiple pass to fill groove
G. Perform vertical and overhead welds under the direct supervision of the instructor
H. Perform nondestructive and destructive testing

PRACTICAL APPLICATION:

The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

Two examinations will be given during this module to determine the progress of the class. Welds will be evaluated by the student and the instructor.

SUMMARY:

Welders improve their techniques and methods with continued practice that is benchmarked with AWS standards. Spray transfer is accomplished by the movement of a stream of tiny droplets of molten weld metal from the electrode, across the welding arc column, to the base metal. It is performed with relatively high load voltages and high amperages with arc argon or argon shielding gas. Amperage is determined by electrode type and diameter (size). Pulsed (current) spray is slower than true spray transfer and produce less heat input to the base metal. It can be used to join their sections of metal, and is suitable for all welding positions.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M28) dealing with pre-heating joint, if required; understanding joint preparation.
WLD-M27-HO1
Demonstrate GMAW in Flat, Horizontal, Vertical and Overhead Positions
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Prepare material for welding;
B. Place material in a designated angle to perform weld;
C. Perform weld sequence in the flat position using GMAW spray and pulsed spray transfer;
D. Perform weld sequence in the horizontal position using GMAW spray and pulsed spray transfer;
E. Perform weld sequence in the vertical position using GMAW spray and pulsed spray transfer; and,
F. Perform weld sequence in the overhead position using GMAW spray and pulsed spray transfer.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive test on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform flat groove and fillet welds, and horizontal fillet welds
E. Deposit root pass
F. Deposit multiple pass to fill groove
G. Perform vertical and overhead welds under the direct supervision of the instructor
H. Perform nondestructive and destructive testing
WLD-M27-HO2
Demonstrate GMAW in Flat, Horizontal, Vertical and Overhead Positions
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER SERIES
MASTER Technical Module No. WLD-M28

SUBJECT: WELDING TECHNICIAN
TIME: 3 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Pre-Heat Joint, If Required; Understand Joint Preparation

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements for penetration and preparation of surfaces; and,
B. Perform pre-heat on 3/8 and 3/4 plus 1 inch steel and aluminum plate.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GMAW spray and pulsed spray procedures
- A class demonstration of effective GMAW spray and pulsed spray techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Introduction to gas metal arc with spray and pulsed spray transfer, welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive testing on various metals.

Student Activities:
A. Set-up welding station
B. Pre-heat joint
C. Tack weld joints
D. Use of spray and pulsed spray arc process
E. Clean weld surface
F. Deposit root pass
G. Deposit multiple pass to fill groove and fillet on various metals
H. Perform Non-destructive and destructive tests as assigned by instructor

PRACTICAL APPLICATION:
The student will practice with spray transfer and pulsed spray GMAW.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:
In the spray transfer method, the arc heats the end of the electrode and fine droplets melt and form a stream across the arc gap. The spray transfer produces a buzzing sound, producing higher heat input, greater penetration and a higher deposition rate than other forms of transfer.

The pulsed current arc process is a spray transfer process wherein one small drop of molten metal is transferred across the arc for each high current pulse of weld current. During the low current portion of the weld cycle, the arc is maintained and the wire is heated, but the heat developed is not adequate to transfer any metal. Gases for pulsed arc welding are argon plus 1% oxygen, the same as used for spray arc welding. Thin material can be welded, producing a smooth weld with less current.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M29) dealing with initiating welding process.
WLD-M28-HO1
Pre-Heat Joint, If Required; Understand Joint Preparation
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements for penetration and preparation of surfaces; and,
B. Perform pre-heat on 3/8 and 3/4 plus 1 inch steel and aluminum plate.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer, welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive testing on various metals.

Student Activities:
A. Set-up welding station
B. Pre-heat joint
C. Tack weld joints
D. Use of spray and pulsed spray arc process
E. Clean weld surface
F. Deposit root pass
G. Deposit multiple pass to fill groove and fillet on various metals
H. Perform Non-destructive and destructive tests as assigned by instructor
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

TIME: 5 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Initiate Welding Process

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements from procedure;
B. Check all parameters of adjustment; and,
C. Initiate specific process from a procedure.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on GMAW welding procedures
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M29-H01)
MASTER Handout No. 2 (WLD-M29-H02)

Impact - Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of special considerations for GMAW for pipes and AISI Code requirements
- A class demonstration of pipe welding techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Introduction to AISI Code requirements for GMAW for pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.
I. Perform inspection weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test

PRACTICAL APPLICATION:

The student will gain knowledge and experience practice with the pulsed arc process (spray transfer) and pulsed GMAW spray techniques.

EVALUATION AND/OR VERIFICATION:

An examination will be given during this module to determine the progress of the class. Welds will be inspected by student and instructor.

SUMMARY:

Pulsed GMAW is a modification of arc and spray transfer welding. Pulsed GMAW characteristics show excellent transfer with lower currents. Advantages include low spatter and penetration without melt-through.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M30) dealing with performing weld sequence.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements from procedure;
B. Check all parameters of adjustment; and,
C. Initiate specific process from a procedure.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to AISI Code requirements for GMAW for pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.
I. Perform inspection weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)

TASK: Perform Weld Sequence

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand sequence of welding application;
B. Test parameters of adjustment; and,
C. Make adjustments to equipment to ensure quality of welds.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written tests on GMAW welding procedures
Transparencies will be prepared to emphasize each subject

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of possible and recommended adjustments with GMAW spray and pulsed spray
- A class demonstration of effective welding techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Practical applications using gas metal arc with spray and pulsed spray transfer welding plate and pipe

B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, and recommended tests on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended tests on various metals

PRACTICAL APPLICATION:
The student will gain knowledge and experience with practical exercises in GMAW spray and pulsed spray.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class. Work will be inspected and tested by student and instructor.

SUMMARY:
Diameters of electrode wires for GMAW are generally between 0.030 and 3/32 inches. For each electrode diameter, there is a minimum welding current and voltage must be exceeded to achieve spray transfer.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-M31) dealing with describing AISI stainless steels classification system.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand sequence of welding application;
B. Test parameters of adjustment; and,
C. Make adjustments to equipment to ensure quality of welds.

MODULE OUTLINE:

E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, and recommended tests on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended tests on various metals
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer

1819
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN  
TIME: 4 HOURS

- **DUTY:** GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- **TASK:** Describe AISI Stainless Steels Classification System

**OBJECTIVE(S):**

Upon completion of this unit the student will be able to understand AISI code requirements.

**INSTRUCTIONAL MATERIALS:**

- Student Workbook
- Written test on AISI stainless steels classification system
- Transparencies will be prepared to emphasize each subject
- Miller Module Method Video Materials
- Hobart Institute Video Material
- Student worksheets and alloy charts
- GMAW equipment and accessories
- Various types and sizes of electrode wires (labeled)
- Personal protective equipment
- Examples of welding guns (standard and 1 pound spools)
- Examples of wire feeders
- Shielding gas regulator-flow meters
- Welding shop tools
- MASTER Handout No. 1 (WLD-M31-HO1)
- MASTER Handout No. 2 (WLD-M31-HO2)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of GMAW spray and pulsed spray
- A class demonstration of effective GMAW spray and pulsed spray techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Use of GMAW with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures with spray techniques
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Perform inspections and weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test

PRACTICAL APPLICATION:

This module focuses on how to obtain a level of confidence in this procedure, before starting on a work piece. If any questions arise, the students will check with their supervisor to make changes and determine optimum welding techniques.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

Proper understanding of the AISI stainless steels classification system is necessary to selection and welding of stainless steels.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M32) dealing with describing weldability problems associated with straight chromium, nickel and stainless steel.
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand AISI code requirements.

MODULE OUTLINE:

Instructional Topics:
A. Use of GMAW with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures with spray techniques
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Perform inspections and weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN

DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)

TASK: Describe Weldability Problems Associated With Straight Chromium, Nickel, and Stainless Steel

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand chromium and stainless steel alloy compatibility; and,
B. Understand weldability problems with nickel.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Metal Arc Welding pipe
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment
Examples of welding guns (standard and 1 pound spools)
Examples of wire feeders
Shielding gas regulator-flow meters
Welding shop tools
MASTER Handout No. 1 (WLD-M32-HO1)
MASTER Handout No. 2 (WLD-M32-HO2)

Impact - Property Requirements for Gas Metal Arc Welding Weld Metal, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition
Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of typical welding problems in production welding
- A class demonstration of effective techniques with chromium, nickel, and stainless steel
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Production welding for Gas Metal Arc Welding Pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with chromium, nickel, and stainless steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test

PRACTICAL APPLICATION:

This module will increase student level of confidence in using GMAW spray and pulsed spray procedures for pipe welding. Visual inspection after welding and heat treatment, if any, shall determine that the weld is free from cracks, surface porosity, and unfilled craters, and that the weld face is at least flush with the outside surface of the pipe. The root of the weld shall show no evidence of cracks or incomplete fusion.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Welds will be inspected and tested by student and instructor.

SUMMARY:

Some stainless steels have a tendency toward hot cracking or tearing. When welding these, more welding passes than indicated in procedures may be needed. Stringer bead techniques are also recommended rather than weaving or oscillating. Preheating helps to improve bead contour and weld-metal hot cracking may also be reduced by short-circuiting transfer welding.

Alloys can be used for hard surfacing. A major disadvantage of GMAW for hard surfacing is that not all surfacing alloys are available in the necessary form (rolls or spools of wire). Nickel-chromium-boron alloys form deposits consisting of hard carbides and borides in a nickel base. The alloys provide good metal-to-metal wear resistance compared to an alloy steel of the same hardness.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M33) dealing with describing detrimental effects of vibration on the life of piping systems.
WLD-M32-HO1
Describe Weldability Problems Associated with
Straight Chromium, Nickel and Stainless Steel
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):
Upon completion of this unit the student will be able to:
A. Understand chromium and stainless steel alloy compatibility; and,
B. Understand weldability problems with nickel.

MODULE OUTLINE:

Instructional Topics:
A. Production welding for Gas Metal Arc Welding Pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with chromium, nickel, and stainless steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. **Weld With GMAW Using Globular Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN  TIME: 4 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Describe Detrimental Effects of Vibration on the Life of Piping Systems

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the effects of pressure and steam on metal piping systems; and,
B. Understand the effects of vibration.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Metal Arc Welding pipe
Transparencies will be prepared to emphasize each subject
Miller Module Method Video Materials
Hobart Institute Video Material
Student worksheets and alloy charts
GMAW equipment and accessories
Various types and sizes of electrode wires (labeled)
Personal protective equipment

INTRODUCTION:

The Course Introduction will Include:

- An overview of the effects of pressure, steam, and vibration on piping systems
- A class demonstration of stress on piping systems
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Effects of pressure, steam, and vibration on piping systems
B. Gas Metal Arc Welding Pipe
C. Set-up, operation, and shut down procedures for GMAW -Pipe
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. The reliability of pipe welds under stress
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended tests
J. Welding techniques to counteract stress and strain on pipe welds

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended inspections and tests on welded pipe materials

PRACTICAL APPLICATION:

Students will note that discontinuities and incomplete welds can lead to premature failure.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Welds will be inspected by the student and the instructor and sufficient to destructive tests.

SUMMARY:

Welders improve their techniques and methods with a knowledge of the causes of premature failure.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-M34) dealing with describing methods of minimizing detrimental effects of pressure and heat on life of pipe systems.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the effects of pressure and steam on metal piping systems; and,
B. Understand the effects of vibration.

MODULE OUTLINE:

Instructional Topics:
A. Effects of pressure, steam, and vibration on piping systems
B. Gas Metal Arc Welding Pipe
C. Set-up, operation, and shut down procedures for GMAW-Pipe
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. The reliability of pipe welds under stress
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended tests
J. Welding techniques to counteract stress and strain on pipe welds

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended inspections and tests on welded pipe materials
GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN          TIME: 6 HOURS

- DUTY: GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- TASK: Describe Methods of Minimizing Detrimental Effects of Pressure and Heat on Life of Piping Systems

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand material requirements and specifications.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the need to minimize detrimental effects of pressure and heat on piping systems
- A class demonstration of detrimental effects
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Analysis of detrimental effects on piping systems welds
B. Use of Gas Metal Arc Welding-Pipe
C. Discussion on the safety and health of welders
D. A discussion on set-up, control of variables, operation, and shut down procedures
E. Preparation and assembly of various alloy pipe work pieces
F. Describe AISI Stainless Steel Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended and approved tests on pipe materials

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended and approved tests on pipe weldments

PRACTICAL APPLICATION:

Students will research ways of improving pipe welds by a greater knowledge of cause and effects.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Pipe systems welds will be examined and pressure tested.

SUMMARY:

A knowledge of cause and effects of failure sill assist the welder in performance of high quality of pipe welds. Welders improve their techniques and methods with continued practice that is benchmarked with AWS standards.

NEXT LESSON ASSIGNMENT:

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand material requirements and specifications.

MODULE OUTLINE:

Instructional Topics:
A. Analysis of detrimental effects on piping systems welds
B. Use of Gas Metal Arc Welding-Pipe
C. Discussion on the safety and health of welders
D. A discussion on set-up, control of variables, operation, and shut down procedures
E. Preparation and assembly of various alloy pipe work pieces
F. Describe AISI Stainless Steel Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended and approved tests on pipe materials

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended and approved tests on pipe weldments
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
SUBJECT: WELDING TECHNICIAN  TIME: 6 HOURS

- **DUTY:** GMAW SPRAY AND PULSED SPRAY, PIPE TRANSFER (ADVANCED)
- **TASK:** Pass a Performance Qualification Test Using GMAW on Pipe in the 6G Position

**OBJECTIVE(S):**

Upon completion of this unit the student will be able to:

A. Understand the procedures and applications for GMAW pulsed spray with pipe;
B. Learn standards and codes for piping; and,
C. With practice, pass a performance qualification test.

**INSTRUCTIONAL MATERIALS:**

- Student Workbook
- Written test on GMAW spray and pulsed spray pipe transfer
- Transparencies will be prepared to emphasize each subject
- Hobart Institute Video Material
- Student worksheets and alloy charts
- **MASTER Handout No. 1 (WLD-M35-H01)**
- **MASTER Handout No. 2 (WLD-M35-H02)**

Chemical - Composition Requirements for Gas Arc Welding Electrode, AWS A5.18-79, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of metal pipe materials and applications
- A class demonstration of effective GMAW pulsed spray transfer welding techniques
- Background on the need for standards and procedures for ratification

PRESENTATION OUTLINE:

Instructional Topics:

A. Metal pipe materials and weld characteristics
   1. Cast iron
   2. Low carbon or medium carbon steel
   3. Higher alloy steel
      a. Stainless steel
b. Aluminum

B. Standards and codes for piping
   1. American Society for Testing Materials (ASTM)
   2. The American Society of Mechanical Engineers (ASME)
   3. American Petroleum Institute (API)
   4. American Welding Society (AWS)

C. Spray transfer methods for GMAW

D. Use of shielding gas

Student Activities:
A. Choose the correct shielding gas and flow rate for the given application, material, and material thickness
B. Choose the correct electrode for given material and applications
C. Set voltage and wire-feed speed for a given application, material, and material thickness
D. Apply welding technique

PRACTICAL APPLICATION:

This module will assist the student in obtaining a level of confidence in the use of GMAW pulsed spray. With practice, the student can reach performance qualification levels.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Individual students will prepare for specified performance qualification test.

SUMMARY:

The GMAW spray Transfer Method makes good welds in thin-gage metals in all positions. It is also appropriate for vertical and overhead weld of heavy materials. The ability to bridge gaps with the spray transfer method makes it useful for welding joints with poor fit-up.

Welders improve their techniques and methods with continued practice that is benchmarked with AWS standards.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-N1) dealing with understanding the safety factors using FCAW equipment.
Pass a Performance Qualification Test
Using GMAW on Pipe in the 6G Position
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the procedures and applications for GMAW pulsed spray with pipe;
B. Learn standards and codes for piping; and,
C. With practice, pass a performance qualification test.

MODULE OUTLINE:

Instructional Topics:
A. Metal pipe materials and weld characteristics
   1. Cast iron,
   2. Low carbon or medium carbon steel
   3. Higher alloy steel
      a. Stainless steel
      b. Aluminum
B. Standards and codes for piping
   1. American Society for Testing Materials (ASTM)
   2. The American Society of Mechanical engineers (ASME)
   3. American Petroleum Institute (API)
   4. American Welding Society (AWS)
C. Spray transfer methods for GMAW
D. Use of shielding gas

Student Activities:
A. Choose the correct shielding gas and flow rate for the given application, material, and material thickness
B. Choose the correct electrode for given material and applications
C. Set voltage and wire-feed speed for a given application, material, and material thickness
D. Apply welding technique
WLD-M35-HO2
Pass a Performance Qualification Test
Using GMAW on Pipe in the 6G Position
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
e. Install contact tip
d. Install gas nozzle
f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
c. List arc characteristics caused by welding with 75% Argon and 25% CO2
d. List arc characteristics caused by welding with 95% Argon and 5% CO2
e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another

SUBJECT: WELDING TECHNICIAN  TIME: 4 HOURS

- DUTY: FLUX CORE ARC WELDING (FCAW)
- TASK: Understand the Safety Factors Using FCAW Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform safety inspection of work area;
B. Identify an unsafe work environment;
C. Understand the use of protective equipment and clothing; and,
D. Utilize FCAW equipment in a safe manner.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on FCAW safety and procedures
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
FCAW welding equipment
Power supply
Wire Feeder with guides and rollers
Shielding gas regulator and hose
Welding gun with contact tip
FCAW tubular electrode wire and shielding gas
Welding shop tools
MASTER Handout (WLD-N1-HO)

REFERENCES:

TEXT:

OTHER:

Competency Standards, American Welding Society, Latest Edition

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of FCAW applications and potential safety hazards
- A class demonstration of effective FCAW welding techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasize potential safety hazards with FCAW equipment
B. Emphasizes the principles involved in the operating of FCAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using FCAW on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Identify all FCAW components and analyze them for potential safety hazards
B. Preheat weld surface
C. How to perform welds in four positions recommend and approved
D. How to use larger diameter flux cored electrodes for flat or horizontal filler
   welds only and use smaller diameter electrodes for all positions
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

The safety factors in FCAW welding operations are emphasized, along with safe welding
procedures in all welding positions. The student must insure that the hose and cable assembly
from the wire feeder to the torch is not put under severe bending stress. A worst case is this
problem would cause a burnback of the electrode into the contact tube.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

This module introduces the student to Flux Core Arc Welding (FCAW) equipment and filler
metals. Theory and safe operating procedures are emphasized. The FCAW process can
make deep penetrating welds in mild steels, low alloy steels, and some stainless steels. For
most FCAW applications, the power source ratings range from 450 to 650 amperes with
maximum open circuit voltage at approximately 65 volts. The power sources have ratings at
100% duty cycle, and normally have remote voltage control capability.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-N2) dealing with troubleshooting FCAW equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform safety inspection of work area;
B. Identify an unsafe work environment;
C. Understand the use of protective equipment and clothing; and,
D. Utilize FCAW equipment in a safe manner.

MODULE OUTLINE:

Instructor Topics:
A. Emphasize potential safety hazards with FCAW equipment
B. Emphasizes the principles involved in the operating of FCAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using FCAW on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Identify all FCAW components and analyze them for potential safety hazards
B. Preheat weld surface
C. How to perform welds in four positions recommend and approved
D. How to use larger diameter flux cored electrodes for flat or horizontal filler
   welds only and use smaller diameter electrodes for all positions
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-N02

SUBJECT: WELDING TECHNICIAN  TIME: 4 HOURS

- DUTY: FLUX CORE ARC WELDING (FCAW)
- TASK: Troubleshoot FCAW Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform inspection of shielded and self-shielded FCAW equipment;
B. Perform equipment adjustments and repair;
C. Understand principles of FCAW process; and,
D. Understand terms and definitions.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on FCAW safety and procedures
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
FCAW welding equipment
Power supply
Wire Feeder with guides and rollers
Shielding gas regulator and hose
Welding gun with contact tip
FCAW tubular electrode wire and shielding gas
Welding shop tools
MASTER Handout (WLD-N2-HO)

REFERENCES:

TEXT:

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of FCAW troubleshooting
- A class demonstration of equipment adjustments for optimum welds
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:
A. Discuss the principles involved in the operating of FCAW equipment
B. Present differences in SMAW, GMAW, and FCAW
C. Demonstrate set up of equipment and machine adjustments
D. Demonstrate applications of joint design and welding terms
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Prepare butt joints, and tee joints, for welding
G. Match FCAW electrodes to an appropriate base metal
H. Discuss electrode extension
I. Identify polarity requirements using FCAW on various metals
J. Identify the AISI steel classification system
K. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions
Student Activities:
A. Perform machine set up and troubleshooting
B. Practice using FCAW tubular electrode wire
C. Practice with proper electrode extension
D. Preheat weld surface
E. Perform welds in four positions
F. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

Electrode extension, measured from the end of the copper contact tube, depends upon a variety of things including electrode type, diameter, and position of welding. With the solid metal sheathing, higher current and deposition rates are possible than with SMAW. The student should read electrode manufacturers instructions and follow them for best results. Student will practice changing the wire speed and adjusting the welding amperage or current and assess the advantages or disadvantages for the specific application.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Instructor will observe machine setup, electrode extension, and adjustments by the student.

SUMMARY:

FCAW is an arc welding process similar to GMAW that uses a continuously fed electrode. While GMAW uses a “solid” electrode wire, FCAW employs a tubular electrode wire, with a solid sheathing surrounding the “granular flux core” of the electrode, thus giving FCAW its name. The core of the electrode helps shield the welding arc. Depending on the application, flux cored electrodes may be self-shielded or gas shielded with an externally supplied gas. Better mechanical and physical weld properties can normally be expected from the gas shielded flux cored electrodes.

The core flux materials perform the same functions as the covering materials on a SMAW electrode. They form slag, deoxidize and clean the weld, supply alloys to the weld, stabilize the arc, and provide some shielding of the arc when a separate shielding gas is not supplied.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-N3) dealing with performing weld sequence.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform inspection of shielded and self-shielded FCAW equipment;
B. Perform equipment adjustments and repair;
C. Understand principles of FCAW process; and,
D. Understand terms and definitions.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the principles involved in the operating of FCAW equipment
B. Present differences in SMAW, GMAW, and FCAW
C. Demonstrate set up of equipment and machine adjustments
D. Demonstrate applications of joint design and welding terms
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Prepare butt joints, and tee joints, for welding
G. Match FCAW electrodes to an appropriate base metal
H. Discuss electrode extension
I. Identify polarity requirements using FCAW on various metals
J. Identify the AISI steel classification system
K. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions

Student Activities:
A. Perform machine set up and troubleshooting
B. Practice using FCAW tubular electrode wire
C. Practice with proper electrode extension
D. Preheat weld surface
E. Perform welds in four positions
F. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-N03

SUBJECT: WELDING TECHNICIAN     TIME: 8 HOURS

- DUTY: FLUX CORE ARC WELDING (FCAW)
- TASK: Perform Weld Sequence

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review safety requirements;
B. Perform Flux Core Arc Welding on steel and stainless steel in the flat, horizontal, vertical, and overhead position; and,
C. Practice FCAW using local industry standards as guidelines.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on FCAW safety and procedures
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
FCAW welding equipment
Power supply
Wire Feeder with guides and rollers
Shielding gas regulator and hose
Welding gun with contact tip
FCAW tubular electrode wire and shielding gas
Welding shop tools
MASTER Handout (WLD-N3-HO)

TEXT:

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of sequence of operations with FCAW
- A class demonstration of effective FCAW welding techniques
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasizes the principles involved in the operating of FCAW equipment
B. Discuss the use of the FCAW flux cored tubular electrode
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills the FCAW
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Use larger electrodes in flat and horizontal positions only
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions (using smaller diameter electrodes for vertical and overhead)
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify polarity requirements using FCAW
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Use proper electrode extension
C. Perform welds in four positions
D. Use recommended and approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

Students will learn proper weld sequences in this FCAW module. Welding with the FCAW process requires knowledge of torch handling techniques similar to those used with the GMAW process. In manual operations the FCAW gun is held almost perpendicular (at right angles) to the work.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Students will be observed using proper weld techniques. Welds will be inspected by the student and the instructor.

SUMMARY:

This module emphasizes production welding with FCAW in multiple positions. As with GMAW, the typical FCAW welding machine would be a DC constant potential type. The machine should be able to handle the highest amperage needed for the largest size electrode to be used. Most large sized flux cored electrode wires can require up to 650 amps for welding. Advantages of FCAW over SMAW are that the electrodes can deposit weld metal faster, and that long joints can be welded without stopping to replace consumed electrodes.

FCAW can make deep penetrating welds in mild steels, low alloy steels, and some stainless steels.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-N4) dealing with shutting down FCAW equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review safety requirements;
B. Perform Flux Core Arc Welding on steel and stainless steel in the flat, horizontal, vertical, and overhead position; and,
C. Practice FCAW using local industry standards as guidelines.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of FCAW equipment
B. Discuss the use of the FCAW flux cored tubular electrode
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills the FCAW
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Use larger electrodes in flat and horizontal positions only
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions (using smaller diameter electrodes for vertical and overhead)
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify polarity requirements using FCAW
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Use proper electrode extension
C. Perform welds in four positions
D. Use recommended and approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-N04

SUBJECT: WELDING TECHNICIAN TIME: 4 HOURS

- DUTY: FLUX CORE ARC WELDING (FCAW)
- TASK: Shut Down FCAW Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures with FCAW equipment; and
B. Perform shut-down procedures with FCAW equipment.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on FCAW safety and procedures
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of the importance of proper FCAW shutdown
- A class demonstration of effective shutdown and securing equipment
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of FCAW equipment
B. Sequence of procedures for equipment shutdown
C. Securing of equipment
D. Safe maintenance and repair of equipment

Student Activities:
A. Shut down equipment, following approved sequence
B. Inspect for safety and make necessary repairs
C. Safely secure and store equipment
PRACTICAL APPLICATION:

Following shutdown, safe maintenance and repairs will be performed.

The student gains knowledge and experience with practice provided in this module.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Shutdown procedures will be observed by the instructor.

SUMMARY:

This module emphasizes proper shut down and maintenance of FCAW equipment. In wire feeder-control applications the wear and tear of system components must be considered. Following shutdown, welders should examine the inlet guide tube for grooves from electrode movement. The drive rolls can also wear until they are not usable. If work, they should be replaced before weld defects occur in later operations. Preventive maintenance is best performed during equipment down-time.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O1) dealing with identifying GTAW equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures with FCAW equipment; and
B. Perform shut-down procedures with FCAW equipment.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of FCAW equipment
B. Sequence of procedures for equipment shutdown
C. Securing of equipment
D. Safe maintenance and repair of equipment

Student Activities:
A. Shut down equipment, following approved sequence
B. Inspect for safety and make necessary repairs
C. Safely secure and store equipment

WELDER SERIES  
MASTER Technical Module No. WLD-001

SUBJECT: WELDING TECHNICIAN  
TIME: 6 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Identify GTAW Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW equipment identification; and,
B. Understand shielding gas equipment.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-01-HO1)
MASTER Handout No. 2 (WLD-01-HO2)
MASTER Self-Assessment

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GTAW equipment
- A class demonstration of GTAW equipment
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Identify the AWS GTAW filler metal classification systems
F. Match filler electrodes to base metals
G. Identify GTAW welding variables and their effects on weld quality

Student Activities:

A. Set up GTAW equipment, identifying all components
B. Start up equipment, emphasizing safe procedures
C. Make adjustments to GTAW equipment and understand process steps to be followed
D. GTAW fillet and groove welds on T and butt-joints on various metals in various positions
E. Perform in process weld inspection

PRACTICAL APPLICATION:

This module emphasizes proper identification of GTAW equipment, familiarization with purpose and use and knowledge of shielding gases.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Students will describe the functions, safety hazards, and operation of each piece of equipment

SUMMARY:

In this module, students learn to identify, assembly, and adjust GTAW equipment. The GTAW process produces welding heat with an arc in an inert shielding gas. Filler metal, as needed, is added by melting a rod into the weld puddle. The electrodes used are non-consumable tungsten materials. The welding process is often called the “TIG” process, for the words “tungsten inert gas.” The AWS has selected the name “Gas Tungsten Arc Welding” as the correct professional name for the welding process.

The inert gases used are argon (Ar), or helium (He), or their combinations.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O2) dealing with identifying the safety standards.
WLD-O1-HO1
Identify GTAW Equipment
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW equipment identification; and,
B. Understand shielding gas equipment.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Identify the AWS GTAW filler metal classification systems
F. Match filler electrodes to base metals
G. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Set up GTAW equipment, identifying all components
B. Start up equipment, emphasizing safe procedures
C. Make adjustments to GTAW equipment and understand process steps to be followed
D. GTAW fillet and groove welds on T and butt-joints on various metals in various positions
E. Perform in process weld inspection
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system
      such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

5. **Weld on 1/8" Material and 100% Penetration**
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. **Weld 2G Position Using GTAW**
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. **Weld 3G Position Using GTAW**
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. **Weld 4G Position Using GTAW**
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
a. Locate root of weld
b. Demonstrate control of depth of cut
c. Demonstrate control of width of cut
d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
e. Make gouges of uniform depth
f. Observe discontinuities as gouging proceeds
g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
b. Measure to make sure excavation is at proper location and depth
c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
a. Check area for safety
b. Set SMAW equipment current and polarity for 1/8" E7018
c. Attach work lead
d. Preheat and maintain interpass temperature as required
e. Weld first pass paying special attention to low hydrogen techniques
f. Grind the weld start and stop to remove cold lap and lack of fusion
g. Weld the second pass starting from opposite end
h. Repeat starts and stops until weld is completed
i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
a. Check work area for safety
b. Position steel in a T joint and tack at ends
c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-01
Identify GTAW Equipment
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
WELDER SERIES
MASTER Technical Module No. WLD-002

SUBJECT: WELDING TECHNICIAN    TIME: 3 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Identify the Safety Standards

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW principles of operation; and,
B. Understand storage and safe handling of inert shielding gas.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding safety
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-02-H01)
MASTER Handout No. 2 (WLD-02-H02)
MASTER Self-Assessment

REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- The importance of safety standards for GTAW operations
- A discussion on methods leading to a continued awareness of potential safety hazards

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Identify the types of shielding gas and gas mixtures
C. Identify GTAW equipment and possible safety hazards
D. Electrode holder assembly
E. Compressed gas cylinders and flow meters
F. Storage and handling of shielding gases (argon, helium)
G. Welding power sources and safe range of operations
H. Safe trouble-shooting and repair methods

Student Activities:

A. Inspect all equipment with safety as a major consideration
B. Set up and test GTAW equipment for safe operation
C. Perform a hazards analysis of the workplace
PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the identification of safety standards and necessary precautions in GTAW operations.

This module will provide practice in insuring safe operations with GTAW.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Students will demonstrate safe handling of equipment and perform a hazards analysis of the workplace.

SUMMARY:

Safety with GTAW involves the proper use of shielding gases, the water cooled welding torch, the heat of the process, and the power source, among many other aspects. The type of welding current needed will depend on the type of metal to be welded and the desired arc characteristics. DCEN provides a stable arc and makes a narrow bead with deep penetration. DCEP produces wide welds with shallow penetration, and has a strong cleaning action.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O3) dealing with describing the preventive and protective measures
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW principles of operation; and,
B. Understand storage and safe handling of inert shielding gas.

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the types of shielding gas and gas mixtures
C. Identify GTAW equipment and possible safety hazards
D. Electrode holder assembly
E. Compressed gas cylinders and flow meters
F. Storage and handling of shielding gases (argon, helium)
G. Welding power sources and safe range of operations
H. Safe trouble-shooting and repair methods

Student Activities:
A. Inspect all equipment with safety as a major consideration
B. Set up and test GTAW equipment for safe operation
C. Perform a hazards analysis of the workplace
Student laboratory exercises as assigned by Instructor.

**GAS TUNGSTEN ARC WELDING (GTAW)**

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system
      such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth, air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect
20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter
21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away
22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O2
Identify the Safety Standards
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green  
   B. Yellow  
   C. Red  
   D. Blue  

8. Post-weld gas flow time should be
   A. At least 20 seconds  
   B. For as long as the weld is hot  
   C. Set according to the cup and tungsten sizes used  
   D. No longer than needed to protect the tungsten and weld  

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air  
   B. Allows cathodic cleaning  
   C. Produces deep penetration  
   D. Prevents electrode waste  

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
   A. Work like an air-cooled torch cable  
   B. Automatically stop the current  
   C. Rapidly overheat  
   D. Have no problem carrying the welding current
SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Describe the Preventive and Protective Measures

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Identify to gas tungsten arc welding components;
B. Use shielding gas equipment and accessories component identification;
C. Demonstrate the functions gas tungsten arc welding components;
D. Provide demonstrations in the use of protective clothing and preventive action arc welding equipment and accessories;
E. Perform minor external repairs on shielding gas equipment and accessories;
and,
F. Understand and prevent injury from electric shock, fires, explosions, lack of ventilation, and exposure to infrared and ultraviolet radiation.

INSTRUCTIONAL MATERIALS:

- Student Workbook
- Written test on GTAW preventive and protective measures
- Transparencies will be prepared to emphasize each subject
- Hobart Institute Video Material
- Student worksheets and alloy charts
- Personal protective equipment
- GTAW equipment
- Power supply
- Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
- Examples of tungsten electrodes
- Examples of torch gas nozzles in various sizes and styles
- Various types of filler metal rods
- Shielding gas regulator, flow meters and accessory equipment
- Selected metals for welding exercises
- Welding shop tools

MASTER Handout No. 1 (WLD-O3-HO1)
MASTER Handout No. 2 (WLD-O3-HO2)
MASTER Self-Assessment
REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- The importance of preventive and protective measures that must be known and followed by the welder.

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Identify the importance of using shielding gas mixtures in a safe manner
C. Identify GTAW equipment, and areas of greatest potential hazards
D. Discuss safe and unsafe methods of operation
E. Troubleshoot and make minor repairs
F. Matching of electrodes to base metals
G. Identify the AWS GTAW filler metal classification systems
H. Identify GTAW welding variables and their effects on weld quality
Student Activities:
A. Wear protective equipment
B. Follow preventive and protective measures
C. Set up GTAW equipment
D. Make adjustments to GTAW equipment and process to improve weld quality
E. Make repairs assigned by instructor

PRACTICAL APPLICATION:
This module will provide necessary orientation on use of protective equipment and the need for preventive measures.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class. The instructor will observe student implementing safety repair practices and using proper terms and definitions.

SUMMARY:
The purpose of this module is to assist the student in the use of preventive and protective measures.

GTAW has developed into a most reliable method of making extremely high quality welds. As in other welding operations, the operator assumes major responsibilities for safety and must plan ahead with preventive measures to preclude accidents and hazardous occurrences.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-O4) dealing with identifying the welding variables and their effects upon weld quality
WLD-O3-H01
Describe the Preventive and Protective Measures
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify to gas tungsten arc welding components;
B. Use shielding gas equipment and accessories component identification;
C. Demonstrate the functions gas tungsten arc welding components;
D. Provide demonstrations in the use of protective clothing and preventive action arc welding equipment and accessories;
E. Perform minor external repairs on shielding gas equipment and accessories; and,
F. Understand and prevent injury from electric shock, fires, explosions, lack of ventilation, and exposure to infrared and ultraviolet radiation.

MODULE OUTLINE:

E. Make repairs assigned by instructor
Student laboratory exercises as assigned by Instructor.

**GAS TUNGSTEN ARC WELDING (GTAW)**

1. **Understand Technical Aspects of GTAW**
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. **Weld Fillet - 2F Horizontal Position**
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. **Weld Fillet - 3F Vertical Position**
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. **Weld Fillet - 4F Overhead Position**
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture

b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging

c. List the polarity that air carbon arc is run on

d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes

e. Connect air carbon torch arc and compressed air hose to welding machine

f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld

a. Locate root of weld

b. Demonstrate control of depth of cut

c. Demonstrate control of width of cut

d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique

e. Make gouges of uniform depth

f. Observe discontinuities as gouging proceeds

g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect

a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth

b. Measure to make sure excavation is at proper location and depth

c. Use air carbon arc equipment. Shape excavation to ensure proper fusion

d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate

a. Check area for safety

b. Set SMAW equipment current and polarity for 1/8" E7018

c. Attach work lead

d. Preheat and maintain interpass temperature as required

e. Weld first pass paying special attention to low hydrogen techniques

f. Grind the weld start and stop to remove cold lap and lack of fusion

g. Weld the second pass starting from opposite end

h. Repeat starts and stops until weld is completed

i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints

a. Check work area for safety

b. Position steel in a T joint and tack at ends

c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.

d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW

e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O3
Describe the Preventive and Protective Measures
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool to it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
SUBJECT: WELDING TECHNICIAN  

DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)

TASK: Identify the Welding Variables and Their Effects Upon Weld Quality

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide instruction in gas tungsten arc welding principles of operation;
B. Understand shielding gases as related to the gas tungsten arc welding process;
C. Understand the performance and functions of aluminum and stainless steel shapes, and identification/selection;
D. Perform tungsten electrode identification/selection for plain carbon steel, aluminum and stainless steel;
E. Perform gas tungsten arc welding filler metal identification/selection for plain carbon steel, aluminum, and stainless steel; and,
F. Understand gas tungsten arc welding principles of operation, aluminum and stainless steel weldability, and filler metal classification portion of a summative closed book examination.

INSTRUCTIONAL MATERIALS:

- Student Workbook
- Written test on Gas Tungsten Arc Welding
- Transparencies will be prepared to emphasize each subject
- Hobart Institute Video Material
- Student worksheets and alloy charts
- Personal protective equipment
- GTAW equipment
- Power supply
- Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
- Examples of tungsten electrodes
- Examples of torch gas nozzles in various sizes and styles
- Various types of filler metal rods
- Shielding gas regulator, flow meters and accessory equipment
- Selected metals for welding exercises
- Welding shop tools

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition
Specification for Bare Stainless Steel Electrodes and Rods, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.
INTRODUCTION:

The Course Introduction will Include:

- An overview of weld variables for GTAW
- A class demonstration of effective GTAW techniques
- A discussion on methods leading to producing high quality weldments

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Match electrodes to base metals
F. Identify the AWS GTAW filler metal classification systems
G. The GTAW process
H. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Identify weld variables and plan their input settings and control for quality outcomes
B. Input of variables (setting and controls) for specific welds
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Set up GTAW equipment
E. Perform in process weld inspection
F. Perform in process rework (if required)
G. Discuss weld

PRACTICAL APPLICATION:

The purpose of this program is to assist the student in understanding the weld variables and their effects on weld quality.

This module will provide understanding and practice for the student in GTAW.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Welds will be examined and inspected for quality.
The basic equipment used in the GTAW process is different than the SMAW process. Power source configurations differ with the type of metals, and usually have special equipment such as gas valves and solenoids. Torches may be air cooled or water cooled. The water cooled torch channels shielding gas to the arc area and holds the tungsten electrode while passing current through the torch body and collect to the electrode. Among the many GTAW equipment and process variables are: voltage, amps, current (AC or DC), polarity, torch configuration, compatibility and characteristics of metals and alloys to be welded, cooling method, use of shielding gas or self shielding electrodes, special electrodes, weld techniques, specified weldment limitations, electrode extension, weld positions, types of joints, and specific treatments as required used on specification. These many variables cause the welder to study the design of the weld process, plan and control the variables relative to the specific job, and apply weld techniques, procedures, and adjustments to obtain the optimum weld, based upon the specifications.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-05) dealing with troubleshooting equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide instruction in gas tungsten arc welding principles of operation;
B. Understand shielding gases as related to the gas tungsten arc welding process;
C. Understand the performance and functions of aluminum and stainless steel shapes, and identification/selection;
D. Perform tungsten electrode identification/selection for plain carbon steel, aluminum and stainless steel;
E. Perform gas tungsten arc welding filler metal identification/selection for plain carbon steel, aluminum, and stainless steel; and,
F. Understand gas tungsten arc welding principles of operation, aluminum and stainless steel weldability, and filler metal classification portion of a summative closed book examination.

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Match electrodes to base metals
F. Identify the AWS GTAW filler metal classification systems
G. The GTAW process
H. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Identify weld variables and plan their input settings and control for quality outcomes
B. Input of variables (setting and controls) for specific welds
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Set up GTAW equipment
E. Perform in process weld inspection
F. Perform in process rework (if required)
G. Discuss weld
GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon
      1. gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
SUBJECT: WELDING TECHNICIAN  TIME: 8 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Troubleshoot Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide safety tour and orientation to gas tungsten arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Provide demonstrations related to ANSI Z49.1, Safety in Welding, Cutting and Allied Processes, Part II - Specific Processes, 11. Arc Welding and Cutting Equipment Safety
C. Provide demonstrations related to routine safety inspections of protective equipment and clothing, gas tungsten arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area
D. Introduce related terms and definitions
E. Observe trainee conducting safety inspections
F. Observe trainee following safe practices
G. Observe trainee using proper terms and definitions

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Various types of filler metal rods and wires
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools

TEXT:

OTHER:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GTAW troubleshooting and operator repairs
- A class demonstration safe and productive
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify GTAW equipment
C. Inspection and safe trouble-shooting procedures for all equipment
D. Safety and handling shielding gas mixtures/containers
E. The welding power source configuration
F. How to prevent aspiration of outside atmosphere into the shielding gas
G. Gas flow rates
H. Make minor repairs
I. Electrode diameters and penetration patterns
J. Problems with weld quality related to equipment

Student Activities:
A. Set up GTAW equipment
B. Make adjustments to GTAW equipment and individual techniques to improve weld quality
C. Perform GTAW fillet and groove welds on T fillet and butt-joints on various metals in various positions
D. Perform in process weld inspection
E. Perform in process rework (if required)

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in troubleshooting GTAW equipment to improve skill levels in order to pass any welding test or qualification tests. This module enables the student to setup and troubleshoot GTAW equipment with a high level of confidence.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Procedures will be evaluated by the instructor.

SUMMARY:

GTAW processes and outcomes become predictable after students combine an understanding of variables with continued practice. GTAW has several advantages over other welding processes. It will weld more kinds of metal and metal alloys than any other method. GTAW can also weld some dissimilar metals.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-06) dealing with describing AWS electrode classification system.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide safety tour and orientation to gas tungsten arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Provide demonstrations related to ANSI Z49.1, *Safety in Welding, Cutting and Allied Processes, Part II - Specific Processes, 11. Arc Welding and Cutting Equipment Safety*
C. Provide demonstrations related to routine safety inspections of protective equipment and clothing, gas tungsten arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area
D. Introduce related terms and definitions
E. Observe trainee conducting safety inspections
F. Observe trainee following safe practices
G. Observe trainee using proper terms and definitions

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify GTAW equipment
C. Inspection and safe trouble-shooting procedures for all equipment
D. Safety and handling shielding gas mixtures/containers
E. The welding power source configuration
F. How to prevent aspiration of outside atmosphere into the shielding gas
G. Gas flow rates
H. Make minor repairs
I. Electrode diameters and penetration patterns
J. Problems with weld quality related to equipment

Student Activities:
A. Set up GTAW equipment

C. Perform GTAW fillet and groove welds on T fillet and butt-joints on various metals in various positions
D. Perform in process weld inspection
E. Perform in process rework (if required)
GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Millersyncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

Visual inspection of joint for burn through, weld size and workmanship

Weld on 1/8" Material and 100% Penetration

5. a. Conduct safety inspection of the area and equipment
    b. Weld on 304 stainless steel
    c. Set up GTAW for high frequency start, direct current electrode
       negative, 40 amps. Remote current control, assemble GTAW torch.
       With 3/32" pointed 2% thoriated tungsten
    d. Cut stainless steel and grind a .30" bevel on edges
    e. Place two pieces of stainless steel in the backing purge in the 1G
       position fixture with a 0" gap. Using 100% Argon as the backing gas
       at a flow rate of 15 cubic feet per hour
    f. Weld achieving full penetration while adding .062" ER308-L. Make a
       2 pass weld
    g. Remove from backing purge and visually inspect for full penetration.
       No color on welded surfaces except straw is permitted. The back or
       root of the weld shall be silver.

6. Weld 2G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode
   negative, 40 amps. Remote current control, assemble GTAW torch.
   With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G
   position fixture with a 0" gap. Using 100% Argon as the backing gas
   at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a
   2 pass weld
e. Remove from backing purge and visually inspect for full penetration.
   No color on welded surfaces except straw is permitted. The back or
   root of the weld shall be silver.

7. Weld 3G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode
   negative, 40 amps. Remote current control, assemble GTAW torch.
   With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G
   position fixture with a 0" gap. Using 100% Argon as the backing gas
   at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a
   2 pass weld
e. Remove from backing purge and visually inspect for full penetration.
   No color on welded surfaces except straw is permitted. The back or
   root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
e. Make gouges of uniform depth
f. Observe discontinuities as gouging proceeds
g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
c. Attach work lead
d. Preheat and maintain interpass temperature as required
e. Weld first pass paying special attention to low hydrogen techniques
f. Grind the weld start and stop to remove cold lap and lack of fusion
g. Weld the second pass starting from opposite end
h. Repeat starts and stops until weld is completed
i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O5
Troubleshoot Equipment
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
A. Green  
B. Yellow  
C. Red  
D. Blue 

8. Post-weld gas flow time should be
A. At least 20 seconds  
B. For as long as the weld is hot  
C. Set according to the cup and tungsten sizes used  
D. No longer than needed to protect the tungsten and weld 

9. Argon is used as a shield gas with GTAW because argon
A. Is lighter than air  
B. Allows cathodic cleaning  
C. Produces deep penetration  
D. Prevents electrode waste 

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
A. Work like an air-cooled torch cable  
B. Automatically stop the current  
C. Rapidly overheat  
D. Have no problem carrying the welding current
WELDER SERIES
MASTER Technical Module No. WLD-006

SUBJECT: WELDING TECHNICIAN TIME: 3 HOURS

• DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
• TASK: Describe AWS Electrode Classification System

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand AWS Electrode Classification System; and,
B. Understand “filler metal to parent metal” compatibility.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on AWS Electrode Classification System
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Various types of filler metal rods and wires
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-06-H01)
MASTER Handout No. 2 (WLD-06-H02)
MASTER Self-Assessment

Competency Standards, American Welding Society, Latest Edition

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition

Specification for Bare Stainless Steel Electrodes and Rods, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the AWS Electrode Classification System
- A class demonstration of the selection process for filler metals
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Describe the AWS Electrode Classification System
C. Identify the importance and variations of shielding gas mixtures and filler metal
D. Identify GTAW equipment
E. Types of “non-consumable” tungsten electrodes
F. Describe the possible effects on weld quality of electrode selection
G. Identify resources for research on metallurgy and metals compatibility
H. Describe Classification Systems information available from professional sources and government sources
I. Describe Library/computer software/internet resource materials

Student Activities:
A. Understand the purpose of metals classification and proper filler metal selection
B. Prepare GTAW equipment with various tungsten electrodes
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Select the weld materials required based on job requirements or specification
E. Perform weld inspection following use of different sized electrodes

PRACTICAL APPLICATION:

This module provides information and practice with various tungsten electrodes and filler metals. A general discussion and practical exercise on sources of compatibility information will follow.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Students will perform a compatibility exercise by selecting weld materials based upon job requirements or specification.

SUMMARY:

The purpose of this module is to assist the student in the use of the AWS electrode classification system, as it applies to GTAW.

The tungsten electrode is non-consumable and is not intended to become part of the filler metal in the weld deposit (unless tungsten base metal is used). Tungsten has the highest melting point of any of the metals (6170 degrees F)

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-07) dealing with describing AWS filler metal classification system.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand AWS Electrode Classification System; and,
B. Understand "filler metal to parent metal" compatibility.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Describe the AWS Electrode Classification System
C. Identify the importance and variations of shielding gas mixtures and filler metal
D. Identify GTAW equipment
E. Types of "non-consumable" tungsten electrodes
F. Describe the possible effects on weld quality of electrode selection
G. Identify resources for research on metallurgy and metals compatibility
H. Describe Classification Systems information available from professional sources and government sources
I. Describe Library/computer software/internet resource materials

Student Activities:
A. Understand the purpose of metals classification and proper filler metal selection
B. Prepare GTAW equipment with various tungsten electrodes
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Select the weld materials required based on job requirements or specification
E. Perform weld inspection following use of different sized electrodes
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

g. Visually inspect joint for burn through, weld size and workmanship.

5. Weld on 1/8" Material and 100% Penetration

a. Conduct safety inspection of the area and equipment.

b. Weld on 304 stainless steel.

c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.

With 3/32" pointed 2% thoriated tungsten.

d. Cut stainless steel and grind a .30" bevel on edges.

e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour.

f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld.

g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.

With 3/32" pointed 2% thoriated tungsten.

b. Cut stainless steel and grind a .30" bevel on edges.

c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour.

d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld.

e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.

With 3/32" pointed 2% thoriated tungsten.

b. Cut stainless steel and grind a .30" bevel on edges.

c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour.

d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld.

e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW

1943
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth, air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
Describe AWS Electrode Classification System
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
WELDER SERIES
MASTER Technical Module No. WLD-007

SUBJECT: WELDING TECHNICIAN TIME: 4 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Describe AWS Filler Metal Classification System

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand compatibility of filler metal to parent metal; and,
B. Use the AWS Filler Metal Classification System.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on filler metals for Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled
Torch
Various types of filler metal rods and wires
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-07-HO1)
MASTER Handout No. 2 (WLD-07-HO2)
MASTER Self-Assessment

Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition

Specification for Bare Stainless Steel Electrodes and Rods, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the AWS filler metal classification system
- A discussion of capability issues

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Discuss shielding gas and filler metal selection
C. Identify the AWS GTAW filler metal classification systems
D. Identify GTAW equipment and the process of introducing the use of filler metal
E. Identify the effects of filler metal on weld quality
F. Metallurgy and metals characteristics of most popular metals

**Student Activities:**
A. Set up GTAW equipment
B. Use AWS filler metal alloy charts
C. Perform in process weld inspection
D. Make adjustments to GTAW equipment and process to improve weld quality
E. Perform in process rework (if required)

**PRACTICAL APPLICATION:**

The purpose of this module is to assist the student in the use of the AWS filler metal classification system. This lesson will be a study on AWS filler metals, alloys, and related variable weld characteristics. The GTAW process can be implemented with or without a filler metal. When it is used, it is added to the weld pool from a separate rod or wire, being melted by the heat of the arc rather than transferred across the arc as in the consumable electrode arc weld processes. Its most common applications are for aluminum and stainless steel.

**EVALUATION AND/OR VERIFICATION:**

An examination will be given at the end of this section to determine the progress of the class. Students will explain compatibility issues, use of filler metals, and metals characteristics that require special preparation and treatment.

**SUMMARY:**

Students should have a thorough knowledge of the AWS filler metal classification system and be capable in researching metals characteristics influencing the weld quality, metal preparation, and preheat.

Tungsten is employed as a non-consumable electrode in the gas tungsten arc welding process, the plasma welding process, and the plasma cutting process. The addition of thoria and zirconia was originally intended to promote better arc starting in tungsten electrodes and it was found that up to 0.6 thoria would increase carrying capabilities. Most porous weld structures are caused by moisture in the electrode covering. To minimize this condition, the electrodes are supplied in moisture-proof packages. The electrodes should be stored in a dry location. Deterioration of the flux covering can be rapid when electrodes are exposed to moist air. The entire covering can be affected in only a few hours of exposure to a humid atmosphere.

The best quality welds are obtained by using welding wire as soon as possible after it is removed from the package. Even a high quality wire can produce welds of inferior quality if the wire surface is exposed to high humidity.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O8) dealing with performing GTAW fillet and groove welds on T and butt joints on various metals in various positions.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand compatibility of filler metal to parent metal; and,
B. Use the AWS Filler Metal Classification System.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Discuss shielding gas and filler metal selection
C. Identify the AWS GTAW filler metal classification systems
D. Identify GTAW equipment and the process of introducing the use of filler metal
E. Identify the effects of filler metal on weld quality
F. Metallurgy and metals characteristics of most popular metals

Student Activities:
A. Set up GTAW equipment
B. Use AWS filler metal alloy charts
C. Perform in process weld inspection
D. Make adjustments to GTAW equipment and process to improve weld quality
E. Perform in process rework (if required)
Student laboratory exercises as assigned by Instructor.

**GAS TUNGSTEN ARC WELDING (GTAW)**

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture

b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging

c. List the polarity that air carbon arc is run on

d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes

e. Connect air carbon torch arc and compressed air hose to welding machine

f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld

a. Locate root of weld

b. Demonstrate control of depth of cut

c. Demonstrate control of width of cut

d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique

e. Make gouges of uniform depth

f. Observe discontinuities as gouging proceeds

g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect

a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth

b. Measure to make sure excavation is at proper location and depth

c. Use air carbon arc equipment. Shape excavation to ensure proper fusion

d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate

a. Check area for safety

b. Set SMAW equipment current and polarity for 1/8" E7018

c. Attach work lead

d. Preheat and maintain interpass temperature as required

e. Weld first pass paying special attention to low hydrogen techniques

f. Grind the weld start and stop to remove cold lap and lack of fusion

g. Weld the second pass starting from opposite end

h. Repeat starts and stops until weld is completed

i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints

a. Check work area for safety

b. Position steel in a T joint and tack at ends

c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.

d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW

e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O7
Describe AWS Filler Metal Classification System
Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
WELDER SERIES
MASTER Technical Module No. WLD-008

SUBJECT: WELDING TECHNICIAN
TIME: 12 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (BASIC)
- TASK: Perform GTAW Fillet and Groove Welds on T and Butt Joints on Various Metals in Various Positions

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform gas tungsten arc welding equipment operations;
B. Understand gas tungsten arc welding principles of operations;
C. Understand and control common process variables for gas tungsten arc welding;
D. Start and maintain an arc on plain carbon steel, using applicable filler metal and shielding gas;
E. Start and maintain an arc on aluminum, using applicable filler metal and shielding gas;
F. Start and maintain an arc on stainless steel, using applicable filler metal and shielding gas;
G. Perform flat, single pass, surfacing welds, on plain carbon steel, using applicable filler metal and shielding gas;
H. Perform flat, single pass, surfacing welds, on aluminum, using applicable filler metal and shielding gas;
I. Perform flat, single pass, surfacing welds, on stainless steel, using applicable filler metal and shielding gas; and,
J. Following safe GTAW practices.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition
Specification for Bare Stainless Steel Electrodes and Rods, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of GTAW weld sequence
- A class demonstration of effective welding techniques and control of variables
- A discussion on methods leading to an increase of skill and knowledge

PRESENTATION OUTLINE:

Instructional Topics:

A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify the AWS GTAW filler metal classification systems
D. Identify GTAW welding variables and their effects on weld quality
E. Match electrodes or filler metals to base metals
F. Use GTAW equipment in a safe and effective manner
G. Troubleshoot and make minor repairs

Student Activities:

A. Set up GTAW equipment for welding
B. Make adjustments to GTAW equipment and process to improve weld quality
C. Perform GTAW fillet and groove welds on T fillet and butt-joints on various metals in various positions
D. Perform in process weld inspection
E. Perform in process rework (if required)
F. Perform other weld exercises in student handbook as recommended by instructor

PRACTICAL APPLICATION:

This module will provide the student practice using various electrodes and filler metals in typical professional welding assignments.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Each weld will be inspected and evaluated in accordance with AWS Standards.
SUMMARY:

GTAW processes can provide high quality welds, contingent upon skill, planning, and intelligent use of materials of the operator/welder. GTAW will weld more kinds of metals and metal alloys than any other welding method. It also produces little or no spatter. There is no requirement for flux in this process and no slag deposits to remove.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O9) dealing with passing a performance qualification test using GTAW on carbon steel in the 6G position on pipe.
WLD-O8-HO1
Perform GTAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions

GAS TUNGSTEN ARC WELDING (GTAW)
1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine
2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship
3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship
4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
Fit up and tack a T joint and place in the 4F overhead position
Weld a .050" fillet weld using .045" ER308-L
Visually inspect joint for burn through, weld size and workmanship

Weld on 1/8" Material and 100% Penetration
Conduct safety inspection of the area and equipment
Weld on 304 stainless steel
Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
Cut stainless steel and grind a .30" bevel on edges
Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld on 2G Position Using GTAW
Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
Cut stainless steel and grind a .30" bevel on edges
Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld 3G Position Using GTAW
Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
Cut stainless steel and grind a .30" bevel on edges
Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
    c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth, air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O8
Perform GTAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions Self-Assessment

Circle the best answer.

1. Tungsten is a metal with which of the following physical properties?
   A. High strength and good electrical conductivity
   B. Highest melting point of any element
   C. High yield and high ductility
   D. Low yield, high strength, and good insulation

2. The end of the filler rod must be kept close to the weld zone
   A. Because it is much easier to see and control
   B. To prevent it from becoming oxidized
   C. To keep the rod hot so it melts more easily
   D. To keep the rod cool so it does not melt

3. The best working temperature for a tungsten is when it is
   A. Above a white hot temperature
   B. Below a dull red temperature
   C. Above a dull red temperature
   D. Just above room temperature

4. Excessively high shielding gas flow rates can
   A. Help protect the weld
   B. Reduce oxide contamination
   C. Prevent arc blow
   D. Cause turbulence and poor weld puddle shielding

5. The grinding stone used to shape a tungsten should be
   A. A fine, hard stone
   B. Coarse, in order to quickly shape the tungsten
   C. Used only for tungsten and stainless steels
   D. Both B and C

6. Why is post-welding gas flow required?
   A. To protect the hot tungsten from oxidation
   B. To protect the hot weld metal from oxidation
   C. To prevent oxides from entering the weld pool
   D. Both A and B
7. Which tip color is used to identify pure tungsten?
   A. Green
   B. Yellow
   C. Red
   D. Blue

8. Post-weld gas flow time should be
   A. At least 20 seconds
   B. For as long as the weld is hot
   C. Set according to the cup and tungsten sizes used
   D. No longer than needed to protect the tungsten and weld

9. Argon is used as a shield gas with GTAW because argon
   A. Is lighter than air
   B. Allows cathodic cleaning
   C. Produces deep penetration
   D. Prevents electrode waste

10. If the water supply is suddenly shut off, a water cooled GTA welding torch power
    cable will
    A. Work like an air-cooled torch cable
    B. Automatically stop the current
    C. Rapidly overheat
    D. Have no problem carrying the welding current
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

SUBJECT: WELDING TECHNICIAN          TIME: 10 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (ADVANCED)
- TASK: Pass a Performance Qualification Test Using GTAW on Carbon Steel in the 6G Position on Pipe

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Various types of filler metal rods and wires
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-09-H01)
MASTER Handout No. 2 (WLD-09-H02)
REFERENCES:

TEXT:

OTHER:

*Competency Standards*, American Welding Society, Latest Edition

*Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods*, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition

*Specification for Bare Stainless Steel Electrodes and Rods*, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the versatility of GTAW applications
- A discussion on methods leading to an increase of skill and knowledge in pipe welding applications
PRESENTATION OUTLINE:

Instructional Topics:
   A. Summary of safety precautions
   B. Identify the importance and variations of shielding gas mixtures
   C. Identify GTAW equipment
   D. Identify GTAW welding variables and their effects on weld quality with carbon steel pipe
   E. Use GTAW to weld carbon steel in the 6G position on pipe

Student Activities:
   A. Set up GTAW equipment
   B. Perform welding process prescribed in the 6G position on pipe
   C. Perform in process weld inspection
   D. Perform in process rework (if required)
   E. Perform other weld exercises in the student handbook, as may be assigned by the instructor

PRACTICAL APPLICATION:

This module will assist the student increasing knowledge and skill in GTAW processes for pipe welding.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Each weld will also be inspected and evaluated by the student and the instructor.

SUMMARY:

The purpose of this module is to prepare the student to use GTAW in welding carbon steel pipe. Performance qualification tests are necessary to verify professional level quality by welders. Qualification in the 6G (pipe axis inclined, fixed) position qualifies for all position fillet welding of plate and pipe and all position groove welding of plate and pipe, except for T-, V-, and K- connections.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-O10) dealing with passing a performance qualification test using GTAW on aluminum in the 6G position on pipe.
WLD-O9-HO1
Pass a Performance Qualification Test Using GTAW
On Carbon Steel in the 6G Position on Pipe
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Identify GTAW welding variables and their effects on weld quality with carbon steel pipe
E. Use GTAW to weld carbon steel in the 6G position on pipe

Student Activities:
A. Set up GTAW equipment
B. Perform welding process prescribed in the 6G position on pipe
C. Perform in process weld inspection
D. Perform in process rework (if required)
E. Perform other weld exercises in the student handbook, as may be assigned by the instructor
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
    c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
SUBJECT: WELDING TECHNICIAN

TIME: 10 HOURS

- DUTY: GAS TUNGSTEN ARC WELDING (GTAW) (ADVANCED)
- TASK: Pass a Performance Qualification Test Using GTAW on Aluminum in the 6G Position on Pipe

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on Gas Tungsten Arc Welding
Transparencies will be prepared to emphasize each subject
Hobart Institute Video Material
Student worksheets and alloy charts
Personal protective equipment
GTAW equipment
Power supply
Control unit with shielding gas equipment and GTAW air cooled or water cooled torch
Examples of tungsten electrodes
Examples of torch gas nozzles in various sizes and styles
Various types of filler metal rods and wires
Shielding gas regulator, flow meters and accessory equipment
Selected metals for welding exercises
Welding shop tools
MASTER Handout No. 1 (WLD-O10-HO1)
MASTER Handout No. 2 (WLD-O10-HO2)

*Competency Standards*, American Welding Society, Latest Edition

*Specification for Bare Aluminum and Aluminum Alloy Welding Electrodes and Rods*, ANSI/AWS A5.9, American Welding Society, Miami, FL, Latest Edition

*Specification for Bare Stainless Steel Electrodes and Rods*, ANSI/AWS A5.12, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the versatility of GTAW applications
- A discussion on methods leading to an increase of skill and knowledge in aluminum pipe welding applications
PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Select electrode or filler metal, as appropriate
D. Identify GTAW equipment and inspect for safe operations
E. Identify GTAW welding variables and their effects on weld quality with aluminum pipe
F. Use GTAW to weld aluminum in the 6G position on pipe

Student Activities:
A. Set up GTAW equipment
B. Perform welding process prescribed in the 6G position on pipe
C. Perform in process weld inspection
D. Perform in process rework (if required)
E. Perform other exercises in student handbook, as recommended by instructor

PRACTICAL APPLICATION:

This module will assist the student in GTAW processes for aluminum pipe welding. To reduce the number of weld performance qualifications that may be required, qualification under certain conditions also qualifies for other conditions.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

The purpose of this module is to prepare the student to use GTAW in welding aluminum pipe. Performance qualification tests are necessary to verify professional level quality by welders.

Qualification in the 6G (pipe axis inclined, fixed) position qualifies for all position fillet welding of plate and pipe and all position groove welding of plate and pipe, except for T-, V-, and K- connections.

The qualification tests described are specially devised to determine the ability of a welder, welding operator, or tack welder to produce sound welds in accordance with the requirements for the Welding Procedure Specification.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-P1) dealing with identifying and describing the function of Plasma Arc Cutting (PAC) equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Select electrode or filler metal, as appropriate
D. Identify GTAW equipment and inspect for safe operations
E. Identify GTAW welding variables and their effects on weld quality with aluminum pipe
F. Use GTAW to weld aluminum in the 6G position on pipe

Student Activities:
A. Set up GTAW equipment
B. Perform welding process prescribed in the 6G position on pipe
C. Perform in process weld inspection
D. Perform in process rework (if required)
E. Perform other exercises in student handbook, as recommended by instructor
WLD-O10-H02
Pass a Performance Qualification Test Using GTAW
On Aluminum in the 6G Position on Pipe
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.
      With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.
      With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch.
      With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
a. Use non-low hydrogen electrodes
b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
a. Use low hydrogen electrodes
b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
a. List the names and draw side views of the five basic joint configurations
b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon
      gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect
20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter
21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away
22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

WELDER SERIES
MASTER Technical Module No. WLD-P01

SUBJECT: WELDING TECHNICIAN

TIME: 5 HOURS

- DUTY: PLASMA ARC CUTTING AND WELDING
- TASK: Identify and Describe the Function of Plasma Arc Cutting (PAC) Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of equipment;
B. Understand the principles of operation; and,
C. Identify equipment and apparatus requirements.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written tests on plasma arc cutting
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P1-HO)

REFERENCES:

TEXT:

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses.

INTRODUCTION:

The Course Introduction will Include:
- A description of applications for plasma arc cutting and welding

PRESENTATION OUTLINE:

Instructor Topics:
A. PAC power sources
B. The principles involved in PAC equipment operation
C. Process conditions and gas selection
D. Typical PAC conditions for carbon steel and aluminum alloys
E. Identify polarity requirements using PAC on various metals
F. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
G. Identify welding variables and their effects on weld quality

Student Activities:
A. Perform cutting of carbon steel and aluminum in four positions
B. Use oscillating and non-oscillating welding technique

PRACTICAL APPLICATION:

The purpose of this program is to assist the student in the use of plasma arc cutting equipment
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

Plasma-Arc Cutting (PAC) uses a jet of plasma to pierce, cut, and gouge metal. The plasma-arc cutting process requires an electrical power supply and a cutting gas. The plasma is created by superheating gas in an electric arc. Depending on the current flow, the temperature of the plasma may reach temperatures of 30,000 degrees Fahrenheit. The contact with metal of the jet plasma transfer tremendous heat, melting the metal instantly. The molten metal is blasted away by the jet blasts forming a hole, groove, or gouge. In most cases, the processes are faster and more efficient than any other cutting methods. The advantages of Plasma Arc Cutting are: (a) cuts both ferrous and nonferrous metals, (b) minimal slag, (c) high cutting speed, (d) very little or no distortion, and (e) very thin heat-affected zone.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-P2) dealing with identifying and describing the function of Plasma Arc Welding (PAW) equipment.
WLD-P1-HO
Identify and Describe the Function of Plasma Arc Cutting (PAC) Equipment
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of equipment;
B. Understand the principles of operation; and,
C. Identify equipment and apparatus requirements.

MODULE OUTLINE:

Instructor Topics:
A. PAC power sources
B. The principles involved in PAC equipment operation
C. Process conditions and gas selection
D. Typical PAC conditions for carbon steel and aluminum alloys
E. Identify polarity requirements using PAC on various metals
F. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
G. Identify welding variables and their effects on weld quality

Student Activities:
A. Perform cutting of carbon steel and aluminum in four positions
B. Use oscillating and non-oscillating welding technique
WELDER SERIES
MASTER Technical Module No. WLD-P02

SUBJECT: WELDING TECHNICIAN  TIME: 6 HOURS

• DUTY: PLASMA ARC CUTTING AND WELDING
• TASK: Identify and Describe the Function of Plasma Arc Welding (PAW) Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of Plasma Arc Welding equipment;
B. Understand the principles of operation;
C. Identify equipment and apparatus requirements; and,
D. Understand safety factors with the operation and shut-down procedures.

INSTRUCTIONAL MATERIALS:

Student Workbook

MASTER Handout (WLD-P2-H0)

REFERENCES:

TEXT:

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete the following technical module:

**WLD-P01**  "Identify and Describe the Function of Plasma Arc Cutting (PAC) Equipment"

INTRODUCTION:

The Course Introduction will Include:

- An overview of the applications of plasma arc welding

PRESENTATION OUTLINE:

**Instructor Topics:**

A. Principles involved in the operating of PAW equipment
B. Joint design concepts for PAW
C. Preparation of welding surfaces
D. Prepare butt joints, and tee joints, for welding
E. Demonstrate PAW in positions that are permitted for safe operations
F. Identify polarity requirements using PAW on various metals
G. Identify welding variables and their effects on weld quality

**Student Activities:**

A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality
PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of plasma arc welding equipment to improve skill levels in order to pass any welding test or certification test for employment as a welding technician, or to provide supplemental training for persons previously or currently employed in these occupations.

The student will gain an understanding of more exotic forms of welding of higher melting point metals. PAW can weld stainless steel as well as titanium.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

A plasma arc torch makes possible the melting of the most refractory materials and the welding of the higher melting point metals. The PAW water-cooled torch has two channels for gas - one for plasma gas and one for shielding gas. With the plasma torch, temperatures as high as 30,000 degrees F can be developed and even higher temperatures are possible. Advantages are greater energy concentration, improved arc stability, higher welding speeds, and lower width to depth ratio for a given penetration.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-P3) dealing with understanding the safety factors in Plasma Arc Cutting and Plasma Arc Welding processes.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of Plasma Arc Welding equipment;
B. Understand the principles of operation;
C. Identify equipment and apparatus requirements; and,
D. Understand safety factors with the operation and shut-down procedures.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAW equipment
B. Joint design concepts for PAW
C. Preparation of welding surfaces
D. Prepare butt joints, and tee joints, for welding
E. Demonstrate PAW in positions that are permitted for safe operations
F. Identify polarity requirements using PAW on various metals
G. Identify welding variables and their effects on weld quality

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality
SUBJECT: WELDING TECHNICIAN  TIME: 4 HOURS

• DUTY: PLASMA ARC CUTTING AND WELDING
• TASK: Understand the Safety Factors in Plasma Arc Cutting and Plasma Arc Welding Processes

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Select and use No. 6 filter lens, with side shields, as recommended when welding with transferred arc currents up to 5A; and,
B. When welding with transferred arc currents between 5 and 15A, use a full face light green plastic shield as recommended in addition to eye protection with No. 6 filter.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on plasma arc safety and procedures
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P3-HO)

REFERENCES:

TEXT:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- Background facts and general principles requiring only the highest levels of safety when using PAC and PAW processes

PRESENTATION OUTLINE:

Instructor Topics:

A. Principles involved in the operating of PAC & PAW equipment
B. Joint design and welding terms
C. Proper application of welding skills for PAC and PAW processes
D. Adequate preparation of welding surfaces
E. Increase knowledge of current industry standards and techniques
F. Demonstrate PAC & PAW in the positions that can be safely used with existing equipment
G. Identify polarity requirements using PAC & PAW on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Match PAC & PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of plasma arc protective equipment and explain safety factors in PAC and PAW processes.

In this module, the student will gain a greater knowledge of safety requirements and gain confidence with PAC and PAW applications.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

Controls on larger units typically include a power on/off switch, output current control and a meter, gas flow controls and gauges, gas selector controls, local/remote switch and open circuit volt meter. Larger units often operate with several types of gases.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-P4) dealing with setting up Plasma Arc Cutting equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Select and use No. 6 filter lens, with side shields, as recommended when welding with transferred arc currents up to 5A; and,

B. When welding with transferred arc currents between 5 and 15A, use a full face light green plastic shield as recommended in addition to eye protection with No. 6 filter.

MODULE OUTLINE:

Instructor Topics:

A. Principles involved in the operating of PAC & PAW equipment
B. Joint design and welding terms
C. Proper application of welding skills for PAC and PAW processes
D. Adequate preparation of welding surfaces
E. Increase knowledge of current industry standards and techniques
F. Demonstrate PAC & PAW in the positions that can be safely used with existing equipment
G. Identify polarity requirements using PAC & PAW on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Match PAC & PAW electrodes to an appropriate base metal

Student Activities:

A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality
SUBJECT: WELDING TECHNICIAN

TIME: 6 HOURS

DUTY: PLASMA ARC CUTTING AND WELDING

TASK: Set-Up Plasma Arc Cutting (PAC) Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify power hook-up requirements;
B. Identify air pressure requirements for Plasma Arc Cutting (PAC) equipment;
C. Perform set-up Plasma Arc Cutting (PAC) equipment in a safe manner; and,
D. Troubleshoot Plasma Arc Cutting (PAC) equipment.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P4-HO)

TEXT:

OTHER:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of special applications for PAC and PAW processes

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasizes the principles involved in the operating of PAC equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAC on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAC electrodes to an appropriate base metal
Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The purpose of this program is to assist the student in the use of PAC and PAW equipment to improve skill levels.

The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:
A start or idle arc is ignited between electrode and the nozzle. A small amount of gas is injected into the arc chamber where it is heated to a plasma and escapes through the torch nozzle as a fine jet. The control unit increases the amperage and gas flow to produce the longer cutting arc.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-P5) dealing with setting up Plasma Arc Welding equipment.
WLD-P4-HO
Set-Up Plasma Arc Cutting Equipment
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify power hook-up requirements;
B. Identify air pressure requirements for Plasma Arc Cutting (PAC) equipment;
C. Perform set-up Plasma Arc Cutting (PAC) equipment in a safe manner; and,
D. Troubleshoot Plasma Arc Cutting (PAC) equipment.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of PAC equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAC on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAC electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-P05

SUBJECT: WELDING TECHNICIAN
TIME: 5 HOURS

- DUTY: PLASMA ARC CUTTING AND WELDING
- TASK: Set-Up Plasma Arc Welding Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform set-up of Plasma Arc Welding (PAW) equipment in a safe manner;
B. Troubleshoot Plasma Arc Welding (PAW) equipment;
C. Understand terms and definitions of Plasma Arc Welding (PAW) processes;
D. Understand principles of operation of manual Plasma Arc Welding (PAW) [per AWS Recommended Policies for Plasma Arc Welding C5.1-73;3.2]; and,
E. Understand equipment and apparatus requirements (per AWS C5.1-73;4.1).

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P5-HO)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of PAW applications
- A class demonstration of effective plasma arc welding techniques

PRESENTATION OUTLINE:

Instructor Topics:

A. Emphasizes the principles involved in the operating of PAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAW in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAW on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions approved and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class.
Welds will be evaluated by instructor and student.

SUMMARY:
Filler metals for PAW, when needed, are generally the same as those used in GTAW.
The metal in the filler rod should match the base metal as closely as possible.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-P6) dealing with performing Plasma Arc Cutting and Plasma Arc Welding on various materials.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform set-up of Plasma Arc Welding (PAW) equipment in a safe manner;
B. Troubleshoot Plasma Arc Welding (PAW) equipment;
C. Understand terms and definitions of Plasma Arc Welding (PAW) processes;
D. Understand principles of operation of manual Plasma Arc Welding (PAW) [per AWS Recommended Policies for Plasma Arc Welding C5.1-73;3.2]; and,
E. Understand equipment and apparatus requirements (per AWS C5.1-73;4.1).

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of PAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAW in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAW on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions approved and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-P06

SUBJECT: WELDING TECHNICIAN

TIME: 6 HOURS

DUTY: PLASMA ARC CUTTING AND WELDING

TASK: Perform Plasma Arc Cutting and Plasma Arc Welding on Various Materials

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Gouge ferrous and non-ferrous metals according to industry standards;
B. Cut various angles on ferrous and non-ferrous metals; and,
C. Weld ferrous and non-ferrous metals according to industry standards using Plasma Arc Welding (PAW) equipment.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P6-HO)

TEXT:

OTHER:

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of applications with industries to include aerospace and NASA
- A class demonstration of effective plasma arc cutting and welding techniques
- A discussion on methods leading to increased skills

PRESENTATION OUTLINE:

Instructor Topics:

A. Principles involved in the operating of PAC & PAW equipment
B. Knowledge of joint design and welding terms
C. Interpret drawings and blueprints for PAC and PAW applications
D. Proper application of welding skills
E. Preparation of welding surfaces
F. Description of skill levels needed to pass certification tests offered by an employer
G. Prepare joints for welding
H. Demonstrate PAC & PAW in the flat, horizontal, vertical and overhead positions
I. Identify polarity requirements using PAC & PAW on various metals
J. Demonstrate preheat and how to maintain desired temperature
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match PAC & PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions, or as approved by instructor for safe conditions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality

PRACTICAL APPLICATION:
The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:
An examination will be given at the end of this section to determine the progress of the class. Cutting and welding will be compared to AWS and industry standards.

SUMMARY:
In PAW, the arc from a tungsten electrode heats and ionizes a gas. A high frequency generator starts the plasma arc. In practice, welding currents are at least 1 Amp and seldom exceed 400 Amps.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-P7) dealing with performing shut down procedures on Plasma Arc Cutting and Plasma Arc Welding equipment.
Perform Plasma Arc Cutting and Plasma Arc Welding on Various Materials

Attachment 1: MASTER Handout

**OBJECTIVE(S):**

Upon completion of this unit the student will be able to:

A. Gouge ferrous and non-ferrous metals according to industry standards;
B. Cut various angles on ferrous and non-ferrous metals; and,
C. Weld ferrous and non-ferrous metals according to industry standards using Plasma Arc Welding (PAW) equipment.

**MODULE OUTLINE:**

**Instructor Topics:**

A. Principles involved in the operating of PAC & PAW equipment
B. Knowledge of joint design and welding terms
C. Interpret drawings and blueprints for PAC and PAW applications
D. Proper application of welding skills
E. Preparation of welding surfaces
F. Description of skill levels needed to pass certification tests offered by an employer
G. Prepare joints for welding
H. Demonstrate PAC & PAW in the flat, horizontal, vertical and overhead positions
I. Identify polarity requirements using PAC & PAW on various metals
J. Demonstrate preheat and how to maintain desired temperature
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match PAC & PAW electrodes to an appropriate base metal

**Student Activities:**

A. Preheat weld surface
B. Perform welds in four positions, or as approved by instructor for safe conditions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WELDER SERIES
MASTER Technical Module No. WLD-P07

SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: PLASMA ARC CUTTING AND WELDING
- TASK: Perform Shut-Down Procedures on Plasma Arc Cutting and Plasma Arc Welding Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures on Plasma Arc Cutting (PAC) and Plasma Arc Welding (PAW) equipment;
B. Perform air and gas shut-down procedures; and,
C. Perform clean-up of work area.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
Personal protective equipment
Plasma Arc Cutting and Welding Equipment
Welding shop tools
Power supply – control unit
Torch with torch cable
Ground clamp and lead assembly
Plasma, shielding and cooling gases and gas control components
MASTER Handout (WLD-P7-H0)

REFERENCES:

TEXT:

OTHER:
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- The need for extreme care to be exercised in shut down procedures for PAC and PAW processes
- A class demonstration of effective shut down and clean up from PAC/PAW techniques
- A discussion of hazards that may be encountered in this phase of production welding

PRESENTATION OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAC & PAW equipment
B. Gouging and Cutting of ferrous and non-ferrous metals
C. Joint preparation and cleaning of surfaces for welding
D. Shut down sequence for PAC and PAW processes

Student Activities:
A. Perform shut down operation for PAC and PAW
B. Inspect equipment
C. Clean weld surface
D. Clean workplace and equipment
PRACTICAL APPLICATION:

The purpose of this program is to assist the student by emphasizing safe shut down procedures for PAC and PAW processes. The student will gain knowledge and experience with as much practice as possible.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

Shut down operations are always very significant steps for the welder. Welder equipment must be inspected, maintained, cleaned and properly secured.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-Q1) dealing with checking weld size.
OBJECTIVE(S):  

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures on Plasma Arc Cutting (PAC) and Plasma Arc Welding (PAW) equipment;
B. Perform air and gas shut-down procedures; and,
C. Perform clean-up of work area.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAC & PAW equipment
B. Gouging and cutting of ferrous and non-ferrous metals
B. Joint preparation and cleaning of surfaces for welding
C. Shut down sequence for PAC and PAW processes

Student Activities:
A. Perform shut down operation for PAC and PAW
B. Inspect equipment
C. Clean weld surface
D. Clean workplace and equipment
MARY JANE THOMPSON

WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

<table>

- M-26 Describe OMAW filler wires
- M-27 Demonstrate ASME class classification system
- M-29 Pass a performance qualification test using OMAW on pipe in the 6G position
- M-30 Describe methods of minimizing detrimental effects of pressure and heat on pipe systems
- M-31 Perform a performance qualification test using OMAW on pipe in the 6G position

**WELDER**

**Duties**

- M2 OMAW Short Circuit Transfer (Intermediate)
- M3 OMAW Spray and Pulse Spray, Pulse Transfer (Advanced)
- N Plug Arc Welding (PCAW)
- O1 Gas Tungsten Arc Welding (GTAW) (Basic)
- O2 Gas Tungsten Arc Welding (GTAW) (Advanced)
- P Plasma Arc Cutting and Welding
- Q In-Process Weld Inspection
- R In-Process Work
- S Headwelding Activities
- T Emergency Vehicle Technology
- U Wellness/Physical Abilities
SUBJECT: WELDING TECHNICIAN   TIME: 4 HOURS

- DUTY: IN-PROCESS WELD INSPECTION
- TASK: Check Weld Size

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld specification;
B. Identify weld gages and their use;
C. Identify the symbol for weld size (specification); and,
D. Identify common causes of discontinuities related to shape, size and contour.

INSTRUCTIONAL MATERIALS:

Student Workbook
Written test on welding discontinuities and defects
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-Q1-HO)

REFERENCES:

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society; Miami, Florida, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- The importance of weld quality to customers
- A class demonstration of effective inspection techniques
- A discussion on methods leading to increase of skill and knowledge in order to become a competent weld inspector

PRESENTATION OUTLINE:

Instructor Topics:
A. Welding size variation and specification
B. Illustrate visual inspection
C. Identify welding variables relevant to the prevention of specific weld imperfections
D. How to gage weld size
E. How to follow a welding procedure specification (WPS)
F. When to apply multi-pass welds
G. When to apply weaving technique
H. How to determine speed of travel

Student Activities:
A. Increased knowledge and skill of weld inspection by demonstration
B. Determine weld quality for acceptability to a code or standard
C. Determine defects in weld quality
D. Perform dye penetration test

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of in process weld inspection techniques. The student will apply skills learned in this module to determine weld defects.
EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class. Students will use measurement tools to determine weld size.

SUMMARY:

The module focused on knowledge and application of quality standards applied through selected weld processes and individual weld techniques during welding operations.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-Q2) dealing with performing visual inspection.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld specification;
B. Identify weld gages and their use;
C. Identify the symbol for weld size (specification); and,
D. Identify common causes of discontinuities related to shape, size and contour.

MODULE OUTLINE:

Instructor Topics:
A. Welding size variation and specification
B. Illustrate visual inspection
C. Identify welding variables relevant to the prevention of specific weld imperfections
D. How to gage weld size
E. How to follow a welding procedure specification (WPS)
F. When to apply multi-pass welds
G. When to apply weaving technique
H. How to determine speed of travel

Student Activities:
A. Increased knowledge and skill of weld inspection by demonstration
B. Determine weld quality for acceptability to a code or standard
C. Determine defects in weld quality
D. Perform dye penetration test
SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

DUTY: IN-PROCESS WELD INSPECTION

TASK: Perform Visual Inspection

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Identify and define weld discontinuities and defects;
B. Identify the Welding Inspectors responsibilities relating to discontinuity and defects;
C. Identify the common causes of discontinuities related to shape, size and contour;
D. Identify the common causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Identify the common causes of discontinuities related to weld and base metal properties.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written test on welding discontinuities and defects
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-Q2-HO)

REFERENCES:

TEXT:

OTHER:
Competency Standards, American Welding Society, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of quality inspection techniques
- A class demonstration of effective inspection techniques
- A discussion on methods leading to an increase of skill and knowledge in order to determine defects and discontinuities

PRESENTATION OUTLINE:

Instructor Topics:

A. Welding size variation and specification
B. Visual inspection methods
C. Welding variables that can be controlled to prevent specific weld imperfections
D. How to gage weld size
E. Include nondestructive and destructive testing techniques
F. How to follow a Welding Procedure Specification (WPS)
G. Selection of samples for tests
H. Proof and leak tests
I. How to inspect for welding defects: cracks, cavities, solid inclusions, incomplete fusion, defects in weld shape and contour, arc strikes, and excessive spatter
J. Non-destructive evaluations: dye-penetrant, fluorescent penetrant, magnetic particle, ultrasonic, and radiographic
K. Destructive evaluations: mechanical (tensile and sheer), metallurgical (specimen for photomicrographs of metallic structure, defects, etc.)
Student Activities:
A. Determine weld quality for acceptability to a code or standard
B. Determine defects in weld quality
C. Perform destructive and non-destructive testing

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of visual inspection to determine defects and discontinuities. The student will apply skills learned in lab to determine weld defects and perform testing.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

The discussion will focus on quality standards, weld inspection, and weld testing methods.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-R1) dealing with removing weld defect and prepare for re-weld.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify and define weld discontinuities and defects;
B. Identify the Welding Inspectors responsibilities relating to discontinue and defects;
C. Identify the common causes of discontinuities related to shape, size and contour;
D. Identify the common causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Identify the common causes of discontinuities related to weld and base metal properties.

MODULE OUTLINE:

Instructor Topics:
A. Welding size variation and specification
B. Visual inspection methods
C. Welding variables that can be controlled to prevent specific weld imperfections
D. How to gage weld size
E. Include nondestructive and destructive testing techniques
F. How to follow a Welding Procedure Specification (WPS)
G. Selection of samples for tests
H. Proof and leak tests
I. How to inspect for welding defects: cracks, cavities, solid inclusions, incomplete fusion, defects in weld shape and contour, arc strikes, and excessive spatter
J. Non-destructive evaluations: dye-penetrant, florescent penetrant, magnetic particle, ultrasonic, and radiographic
K. Destructive evaluations: mechanical (tensile and sheer), metallurgical (specimen for photomicrographs of metallic structure, defects, etc.)

Student Activities:
A. Determine weld quality for acceptability to a code or standard
B. Determine defects in weld quality
C. Perform destructive and non-destructive testing
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

WELDER SERIES
MASTER Technical Module No. WLD-R01

SUBJECT: WELDING TECHNICIAN TIME: 6 HOURS

- DUTY: IN-PROCESS REWORK
- TASK: Remove Weld Defect and Prepare for Re-weld

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld defects;
B. Understand surface preparation; and,
C. Perform remodel of weld discontinuities.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written tests on weld re-work
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-R1-HO)

REFERENCES:

TEXT:

OTHER:
Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of weld defects
- A class demonstration of effective defect removal or re-weld techniques
- A discussion on methods leading to prevention of defects

PRESENTATION OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of facilities and equipment to remove weld defects and prepare for re-weld, if applicable. The student will make use of air tools, grinders, files and welding equipment to remove weld defects and gain knowledge on how to identify weld defects to improve quality.
EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.

SUMMARY:

The student should master defect removal, as well as prevention of defects.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-R2) dealing with verifying defect removal.
WLD-R1-HO
Remove Weld Defect and Prepare for Re-Weld
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld defects;
B. Understand surface preparation; and,
C. Perform remodel of weld discontinuities.

MODULE OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for reweld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
WELDER SERIES
MASTER Technical Module No. WLD-R02

SUBJECT: WELDING TECHNICIAN

DUTY: IN-PROCESS REWORK
TASK: Verify Defect Removal

TIME: 6 HOURS

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld defects; and,
B. Remove weld defects.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written test on weld re-work
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-R1-HO)

Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of the defects and process of removal
- A discussion on methods leading to prevention of defects

PRESENTATION OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in verifying defect removal and the performance of repairs. The student will make use of air tools, grinders, files and oxyacetylene equipment to remove weld defects and gain knowledge on how to identify weld defects to improve quality.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.
SUMMARY:

The student must be aware of common problems with welding equipment, as well as substandard welding techniques, and how to rectify problem.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-R3) dealing with pre-heating weld (if required).
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld defects; and,
B. Remove weld defects.

MODULE OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
WELDER SERIES
MASTER Technical Module No. WLD-R03

SUBJECT: WELDING TECHNICIAN

TIME: 5 HOURS

• DUTY: IN-PROCESS REWORK
• TASK: Pre-Heat Weld (If Required)

OBJECTIVE(S):
Upon completion of this unit the student will be able to:
A. Understand pre-heating procedures and requirements; and,
B. Understand post-heating requirement procedures.

INSTRUCTIONAL MATERIALS:
Student Workbook
One written test on weld re-work
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-R3-HO)

REFERENCES:

TEXT:

OTHER:
Competency Standards, American Welding Society, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of a fast growing technical field with many opportunities and excellent pay

PRESENTATION OUTLINE:

Instructional Topic:
A. Rationale for pre-heating and post-heating
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size
K. Post-heat, if specified

Student Activities:
A. Practice pre-heat
B. Practice post-heat

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the performance of pre-heating and post-heating during rework and weld repairs.

The student will understand the reasons for pre-heating and post-heating.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.
SUMMARY:
The student must be aware of common problems that are associated with metal preparation.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-R4) dealing with performing re-weld.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand pre-heating procedures and requirements; and,
B. Understand post-heating requirement procedures.

MODULE OUTLINE:

Instructional Topic:
A. Rationale for pre-heating and post-heating
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size
K. Post-heat, if specified

Student Activities:
A. Practice pre-heat
B. Practice post-heat
WELDER SERIES
MASTER Technical Module No. WLD-R04

SUBJECT: WELDING TECHNICIAN TIME: 6 HOURS

- DUTY: IN-PROCESS REWORK
- TASK: Perform Re-weld

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform pre-heat;
B. Understand weld requirements; and,
C. Perform reweld as required.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written test on weld re-work
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-R4-HO)

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:
- An overview of the purpose of rework
- A discussion on methods leading to preventing rework

PRESENTATION OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of welding facilities and equipment for rework. The student will make use of air tools, grinders, files and welding equipment to remove weld defects and re-weld as appropriate.

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class.
SUMMARY:

The student should be aware of common problems with rework and understand the proper methods of re-welding the product.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-R5) dealing with repeating in-process inspection.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform pre-heat;
B. Understand weld requirements; and,
C. Perform reweld as required.

MODULE OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

• DUTY: IN-PROCESS REWORK
• TASK: Repeat In-Process Inspection

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform in-process rework;
B. Inspect weld after repair; and,
C. Understand weld requirements.

INSTRUCTIONAL MATERIALS:

Student Workbook
One written test on inspection techniques
Transparencies prepared to emphasize each subject
Hobart Institute Video Material
The classroom handouts will consist of student worksheets and alloy charts
MASTER Handout (WLD-R5-HO)

REFERENCES:

TEXT:

Competency Standards, American Welding Society, Latest Edition

2067
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.

INTRODUCTION:

The Course Introduction will Include:

- An overview of the welding inspection text by the American Welding Society
- A discussion on effective inspection methods leading to prevention of rework

PRESENTATION OUTLINE:

Instructional Topic:

A. Perform visual inspection
B. Testing of welds
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:

A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece

PRACTICAL APPLICATION:

The purpose of this module is to assist the student in the use of inspection methods recommended by the American Welding Society. The student will repeat the inspection process to insure good product and reinforce the need for "quality the first time".

EVALUATION AND/OR VERIFICATION:

An examination will be given at the end of this section to determine the progress of the class and mastery of AWS inspection standards.
SUMMARY:

Quality is doing the job right the first time and verifying it according to standards.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-S1) dealing with returning unused consumables.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform in-process rework;
B. Inspect weld after repair; and,
C. Understand weld requirements.

MODULE OUTLINE:

Instructional Topic:
A. Perform visual inspection
B. Testing of welds
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece

SUBJECT: WELDING TECHNICIAN  TIME: 2 HOURS

- DUTY: HOUSEKEEPING ACTIVITIES
- TASK: Return Unused Consumables

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Place unused materials in their assigned locations for future use; and,
B. Understand the rationale for tracking programmed materials for specific jobs.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-S1-H0)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Students must complete all previous modules.
INTRODUCTION:

Welding employers expect welders to practice "supply economy" or placing unused materials in the assigned location where they can be used by others in production.

PRESENTATION OUTLINE:

Instructional Topics:
A. Principles of economy in the use of materials  
B. Assigned locations materials located for specific jobs  
C. Assigned locations for consumables  
D. Tracking costs of misplaced or lost materials

Student Activities:
A. Exercises assigned by instructor to recommend location for materials and consumables  
B. Estimating costs of misplaced or lost materials

PRACTICAL APPLICATION:

Students will be more aware of the potential loss of materials and the cost of production in time and dollars.

EVALUATION AND/OR VERIFICATION:

A quiz will be given at the end of the module to verify employee awareness of the problem.

SUMMARY:

Major quantities of welding materials are lost each year by industrial production and construction firms.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-S2) dealing with storing tools.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Place unused materials in their assigned locations for future use; and,  
B. Understand the rationale for tracking programmed materials for specific jobs.

MODULE OUTLINE:

Instructional Topics:

A. Principles of economy in the use of materials  
B. Assigned locations materials located for specific jobs  
C. Assigned locations for consumables  
D. Tracking costs of misplaced or lost materials

Student Activities:

A. Exercises assigned by instructor to recommend location for materials and consumables  
B. Estimating costs of misplaced or lost materials
SUBJECT: WELDING TECHNICIAN

TIME: 5 HOURS

- DUTY: HOUSEKEEPING ACTIVITIES
- TASK: Store Tools

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Place tools in their assigned location; and,
B. Maintain tools in a safe condition in an available status.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-S2-HO)

REFERENCES:

TEXT:

OTHER:

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.
INTRODUCTION:

The availability of safe, well maintained tools is a major consideration for the professional welder. They should not be left in a “hot” condition or on aisles or corridors.

PRESENTATION OUTLINE:

Instructional Topics:
A. The significance of tools to the professional
B. How to maintain welders tools and equipment
C. How to secure welders tools and equipment
D. How to inspect the tools for operability

Student Activities:
A. Assigns locations and layout of tools
B. Practical exercise in mandatory tools

PRACTICAL APPLICATION:

Students will become aware of the criticality of tool condition and status.

EVALUATION AND/OR VERIFICATION:

A quiz will be used to verify student awareness and knowledge of the subject.

SUMMARY:

Many jobs have required rework or have been rejected, costing time and money, as a result of tool condition or non-availability.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-S3) dealing with securing welding equipment.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Place tools in their assigned location; and,
B. Maintain tools in a safe condition in an available status.

MODULE OUTLINE:

Instructional Topics:
A. The significance of tools to the professional
B. How to maintain welders tools and equipment
C. How to secure welders tools and equipment
D. How to inspect the tools for operability

Student Activities:
A. Assigns locations and layout of tools
B. Practical exercise in mandatory tools
SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: HOUSEKEEPING ACTIVITIES
- TASK: Secure Welding Equipment

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Shut down equipment; and,
B. Secure equipment in a safe, stable, and non-operational state.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-S3-HO)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.
INTRODUCTION:

Equipment shut down procedures and storage in assigned location are matters of great cost consideration due to potential safety hazards and possible liability cost.

PRESENTATION OUTLINE:

Instructional Topics:
A. Essential shut down operations (specifics are covered in other modules)
B. Equipment to be left in stable, non-hazardous state
C. Equipment to be located in safe location
D. Final inspection of equipment to preclude future loss and insure operability

Student Activities:
A. Recommended locations for all equipment
B. Inspect shop by OSHA Rules

PRACTICAL APPLICATION:

Students will be aware of potential safety and cost risks to themselves and their employers.

EVALUATION AND/OR VERIFICATION:

A quiz will be given to verify knowledge of shut down procedures and determine new responsibility/attitude to this process.

SUMMARY:

Losses from improper shut down have been very great to industry and construction enterprises.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-S4) dealing with securing welding gases.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Shut down equipment; and,
B. Secure equipment in a safe, stable, and non-operational state.

MODULE OUTLINE:

Instructional Topics:
A. Essential shut down operations (specifics are covered in other modules)
B. Equipment to be left in stable, non-hazardous state
C. Equipment to be located in safe location
D. Final inspection of equipment to preclude future loss and insure operability

Student Activities:
A. Recommended locations for all equipment
B. Inspect shop by OSHA Rules
SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: HOUSEKEEPING ACTIVITIES
- TASK: Secure Welding Gases

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Secure welding gases in a safe condition; and,
B. Shut down gas operations in an approved manner.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-S4-HO)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.
INTRODUCTION:

Approved storage procedures for welding gases should be mandatory at all companies.

PRESENTATION OUTLINE:

Instructional Topics:
A. How to identify damage to compressed gas cylinders, valves, hoses, gages, and regulators.
B. Indications of leaks and corrosion
C. Contaminated valves
D. Flammable and non-flammable hazards of compressed gases used in welding process
E. Securing of lines and regulators
F. Proper storing of all gases and liquids

Student Activities:
A. Practice securing equipment
B. Practice storing or locating equipment in proper location

PRACTICAL APPLICATION:

Operation of shop will be performed in compliance with OSHA rules and regulations.

EVALUATION AND/OR VERIFICATION:

Examination to verify knowledge and understanding of these processes.

SUMMARY:

Proper shutdown and storage saves lives, equipment, and time. It also insures continued future production.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-S5) dealing with cleaning work area(s).
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Secure welding gases in a safe condition; and,
B. Shut down gas operations in an approved manner.

MODULE OUTLINE:

Instructional Topics:
A. How to identify damage to compressed gas cylinders, valves, hoses, gages, and regulators.
B. Indications of leaks and corrosion
C. Contaminated valves
D. Flammable and non-flammable hazards of compressed gases used in welding process
E. Securing of lines and regulators
F. Proper storing of all gases and liquids

Student Activities:
A. Practice securing equipment
B. Practice storing or locating equipment in proper location
WELDER SERIES
MASTER Technical Module No. WLD-S05

SUBJECT: WELDING TECHNICIAN
TIME: 5 HOURS

- DUTY: HOUSEKEEPING ACTIVITIES
- TASK: Clean Work Area(s)

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Clean work area(s);
B. Use approved cleaning methods for welding equipment; and,
C. Perform final inspection of work area(s).

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-S5-HO)

REFERENCES:

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete all previous modules.
INTRODUCTION:

Clean work areas are essential to safety, quality control, and continued operations.

PRESENTATION OUTLINE:

Instructional Topics:
A. How to clean a welding shop operation
B. Use or non-use of compressed air
C. Use of approved cleaning materials
D. Segregation of gases and equipment in approved areas
E. General layout for efficiency
F. Knowledge of hazardous chemicals

Student Activities:
A. Recommend cleaning materials
B. Recommend cleaning methods
C. Have "wall to wall" cleaning activity

PRACTICAL APPLICATION:

Students will learn how to lay out a welding shop and clean it with continuous discipline.

EVALUATION AND/OR VERIFICATION:

A quiz will be given to verify knowledge and attitude concerning housekeeping.

SUMMARY:

Professional welders are known to operate with a dedication to cleanliness and neatness in every aspect of welding operations.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-T1) dealing with displaying a general understanding of emergency vehicle terminology.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Clean work area(s);
B. Use approved cleaning methods for welding equipment; and,
C. Perform final inspection of work area(s).

MODULE OUTLINE:

Instructional Topics:
A. How to clean a welding shop operation
B. Use or non-use of compressed air
C. Use of approved cleaning materials
D. Segregation of gases and equipment in approved areas
E. General layout for efficiency
F. Knowledge of hazardous chemicals

Student Activities:
A. Recommend cleaning materials
B. Recommend cleaning methods
C. Have “wall to wall” cleaning activity
WELDER...that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

WELDER SERIES
MASTER Technical Module No. WLD-T01

SUBJECT: WELDING TECHNICIAN        TIME: 6 HOURS

- DUTY: EMERGENCY VEHICLE TERMINOLOGY
- TASK: Display a General Understanding of Emergency Vehicle Terminology

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the technologies and scope of company products; and,
B. Understand company systems and manufacturing processes.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-T1-H0)

REFERENCES:

TEXT:

OTHER:
Specific Manufacturing Systems and Manufacturing Instructions, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

2094
STUDENT PREPARATION:
Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses.

INTRODUCTION:
- Overview of the need for each employee to understand the basic technologies and scope of company products
- The need for each employee to understand the company's organization, systems, and manufacturing processes

PRESENTATION OUTLINE:
1. Company products and customer base
2. Company goals, employee goals, and quality plan
3. Company organization and support systems
4. Company production processes and technologies
5. Production work flow and job relationships
6. Company's competitive position in world market
7. Individual employee roles and contributions to company success
8. Future growth potential for individual and company goals or services

PRACTICAL APPLICATION:
Tour of company's facilities and support systems.
Presentation on product technologies and assembly processes.

EVALUATION AND/OR VERIFICATION:
Student will define his/her role (as an employee) in the manufacturing process, product quality, and customer satisfaction.

SUMMARY:
Students will understand the production work flow and recognize the important relationship of specific jobs to product quality and acceptance.

NEXT LESSON ASSIGNMENT:
MASTER Technical Module (WLD-T2) dealing with understanding the functions of equipment being assembled.
WLD-T1-HO
Display a General Understanding of Emergency Vehicle Terminology
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the technologies and scope of company products; and,
B. Understand company systems and manufacturing processes.

PRESENTATION OUTLINE:

1. Company products and customer base
2. Company goals, employee goals, and quality plan
3. Company organization and support systems
4. Company production processes and technologies
5. Production work flow and job relationships
6. Company's competitive position in world market
7. Individual employee roles and contributions to company success
8. Future growth potential for individual and company goals or services
WELDER SERIES
MASTER Technical Module No. WLD-T02

SUBJECT: WELDING TECHNICIAN
TIME: 6 HOURS

- DUTY: EMERGENCY VEHICLE TERMINOLOGY
- TASK: Understand the Functions of Equipment Being Assembled

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the general production processes; and,
B. Understand specific equipment, major assemblies, and sub-assemblies.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-T2-HO)

REFERENCES:

TEXT:

OTHER:

Specific Manufacturing Systems and Manufacturing Instructions, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete the following module:

WLD-T1 "Display a General Understanding of Emergency Vehicle Terminology"

INTRODUCTION:

- Employees should understand the flow of work and the importance of the job they perform
- Identifying the related work steps just before and just after their work station

PRESENTATION OUTLINE:

1. Purpose of major assemblies and sub-assemblies in product use, operation, and functionality
2. Potential for improvement in work flow or use of tools
3. Work team interactions and responsibilities
4. Team problem-solving and continuous improvement

PRACTICAL APPLICATION:

Equipment functionality has direct relationship to controls and accessories that may be installed by several teams. Improved understanding may lead to employee suggestions for improvements in use of tools and assembly methods.

EVALUATION AND/OR VERIFICATION:

Written examination on company products, assemblies, and sub-assemblies

SUMMARY:

Well informed employees are better prepared to suggest product improvements, and are more concerned about the total system performing to specifications.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-T3) dealing with understanding how components relate as a total system.
WLD-T2-HO
Understand the Functions of Equipment Being Assembled
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the general production processes; and,
B. Understand specific equipment, major assemblies, and sub-assemblies.

MODULE OUTLINE:

1. Purpose of major assemblies and sub-assemblies in product use, operation, and functionality
2. Potential for improvement in work flow or use of tools
3. Work team interactions and responsibilities
4. Team problem-solving and continuous improvement
WELDER SERIES
MASTER Technical Module No. WLD-T03

SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

- DUTY: EMERGENCY VEHICLE TERMINOLOGY
- TASK: Understand How Components Relate as a Total System

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the company’s systems and subsystems; and,
B. Understand the importance of functional areas such as marketing, product design, purchasing, production planning, etc.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-T3-HO)

REFERENCES:

TEXT:
Specific Manufacturing Systems and Manufacturing Instructions, Latest Edition

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must complete the following modules:

- **WLD-T1** 
  "Display a General Understanding of Emergency Vehicle Terminology"
- **WLD-T2** 
  "Understand the Functions of Equipment Being Assembled"

INTRODUCTION:

- Overview on the need to understand the total functional sub-systems of the company in support of the product or service
- Use of systems and sub-systems by the employee

PRESENTATION OUTLINE:

1. The company organization
2. Functional staff and support activities
3. Systems and sub-systems
4. Computer information applications and their use
5. Design and documentation
6. Production planning (job orders and raw materials)
7. Financial and inventory/assets
8. Quality systems, corrective action reports, and continuous improvement
9. Marketing, warranty, and customer satisfaction
10. Human resources and employee programs
11. Safety and occupational health/wellness

PRACTICAL APPLICATION:

Employees should have a sound understanding of the company products, assembly and sub-assembly processes, quality and warranty policies, and health and wellness benefits offered by the employer.

EVALUATION AND/OR VERIFICATION:

Students (employees) will be asked to evaluate the importance and effectiveness of this company training.

SUMMARY:

Well informed employees identify with their employer in a positive way. Employees that understand the systems of the company, will use the informational and documentation
features to increase their value added contributions to day-to-day operations and total company success.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-U1) dealing with demonstrating ability to lift 50 pounds.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the company's systems and subsystems; and,
B. Understand the importance of functional areas such as marketing, product design, purchasing, production planning, etc.

MODULE OUTLINE:

1. The company organization
2. Functional staff and support activities
3. Systems and sub-systems
4. Computer information applications and their use
5. Design and documentation
6. Production planning (job orders and raw materials)
7. Financial and inventory/assets
8. Quality systems, corrective action reports, and continuous improvement
9. Marketing, warranty, and customer satisfaction
10. Human resources and employee programs
11. Safety and occupational health/wellness

- M160: Demonstrate welding techniques (vertical, horizontal, and flat)
- M165: Demonstrate welding techniques (vertical, horizontal, and flat)
- M170: Demonstrate welding techniques (vertical, horizontal, and flat)
- M175: Demonstrate welding techniques (vertical, horizontal, and flat)
- M180: Demonstrate welding techniques (vertical, horizontal, and flat)
- M185: Demonstrate welding techniques (vertical, horizontal, and flat)
- M190: Demonstrate welding techniques (vertical, horizontal, and flat)
- M195: Demonstrate welding techniques (vertical, horizontal, and flat)
- M200: Demonstrate welding techniques (vertical, horizontal, and flat)
WELDER SERIES
MASTER Technical Module No. WLD-U01

SUBJECT: WELDING TECHNICIAN

TIME: 4 HOURS

DUTY: WELLNESS/PHYSICAL ABILITIES

TASK: Demonstrate Ability to Lift 50 Pounds

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand the methods and physics involved in lifting;
B. Understand the mechanisms and limitations of lifting;
C. Be able to lift products safely in accordance with safe methods and physical limitations; and,
D. Use lift trucks and other lift-assist equipment in a safe manner.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U1-HO)

REFERENCES:

TEXT:

OTHER:

Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student should present a current statement of health.

INTRODUCTION:

- Overview of the potential for back and muscular injuries
- Need for realistic evaluation of capability
- Need to follow safe lifting methods

PRESENTATION OUTLINE:

1. Safety and industrial health statistics for back and muscular injuries from improper lifting techniques
2. Approved methods for safe lifting within the job description
3. Use of lift assist devices on the job
4. Need for individual assessment with full consideration for physical limitation and any prior injuries
5. Procedure for physical examination by company or private physician
6. Minimizing risk for company and the individual
7. Procedure for reporting personal injuries on the job

PRACTICAL APPLICATION:

In an effort to reduce risk to the employee and the company, it is important that the student (employee) have realistic evaluation of personal lift capability, using approved methods, and to understand the need for training in the safe methods of lifting advocated by the company.

EVALUATION AND/OR VERIFICATION:

Student (employee) will demonstrate safe lifting methods and the proper use of various lift-assist devices.

SUMMARY:

Some workers tend to volunteer for jobs that go beyond their physical limitations or capabilities. They need to understand the risks and realistically assess their capabilities, with the help of medical or industrial health specialists. Using approved lift methods and lift-assist equipment can reduce risk of back injuries. This is an area that requires careful study and evaluation by the employee and the employer.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-U2) dealing with demonstrating ability to tolerate heights up to 100 feet.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the methods and physics involved in lifting;
B. Understand the mechanisms and limitations of lifting;
C. Be able to lift products safely in accordance with safe methods and physical limitations; and,
D. Use lift trucks and other lift-assist equipment in a safe manner.

MODULE OUTLINE:

1. Safety and industrial health statistics for back and muscular injuries from improper lifting techniques
2. Approved methods for safe lifting within the job description
3. Use of lift assist devices on the job
4. Need for individual assessment with full consideration for physical limitation and any prior injuries
5. Procedure for physical examination by company or private physician
6. Minimizing risk for company and the individual
7. Procedure for reporting personal injuries on the job
SUBJECT: WELDING TECHNICIAN

DUTY: WELLNESS/PHYSICAL ABILITIES

TASK: Demonstrate Ability to Tolerate Heights up to 100 Feet

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand capability to tolerate and adjust to safe working conditions from Heights; and,
B. Understand safe working conditions above ground level.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U2-HO)

REFERENCES:

TEXT:

OTHER:

Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of
required prerequisite courses. Student should present a current statement of health. Student must complete the following module:

WLD-U1 "Demonstrate Ability to Lift 50 Pounds"

INTRODUCTION:

- Welding is a hazardous occupation that also involves occasionally working from heights while secured in a safe manner
- All welders that accept such jobs should know safe and approved methods of work and types of work encountered at heights

PRESENTATION OUTLINE:

1. Types of work encountered at heights
2. Methods of securing individual and equipment
3. Methods of controlling movement
4. Backup and fail-safe systems
5. Methods of tolerating heights
6. Realistic assessment of capabilities and risks
7. Following OSHA and company approved procedures

PRACTICAL APPLICATION:

Welders will realistically accept their limitations for working at heights, and learn safe working procedures if they engage in such work.

EVALUATION AND/OR VERIFICATION:

Engage in low level demonstration of safety and security methods.

Examination and check out on safe working procedures at heights.

SUMMARY:

Welders that wish to accept work at heights should apprentice themselves to an expert worker and highly dedicated manager, to not only understand the methods, but to gradually condition themselves to the safe performance of this work.

NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-U3) dealing with ability to work from various positions while standing on concrete for extended periods.
WLD-U2-HO
Demonstrate Ability to Tolerate Heights up to 100 Feet
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand capability to tolerate and adjust to safe working conditions from Heights; and,
B. Understand safe working conditions above ground level.

MODULE OUTLINE:

1. Types of work encountered at heights
2. Methods of securing individual and equipment
3. Methods of controlling movement
4. Backup and fail-safe systems
5. Methods of tolerating heights
6. Realistic assessment of capabilities and risks
7. Following OSHA and company approved procedures
WELDER SERIES
MASTER Technical Module No. WLD-U03

SUBJECT: WELDING TECHNICIAN  TIME: 3 HOURS

- DUTY: WELLNESS/PHYSICAL ABILITIES
- TASK: Ability to Work from Various Positions While Standing on Concrete for Extended Periods

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the various positions the welder assumes while standing; and,
B. Understand the reasons for wearing personal protective equipment.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U3-HO)

REFERENCES:

Safety in Welding, Cutting and Allied Processes, ANSI/ASC Z49.1-94,
American Welding Society, Miami, FL, Latest Edition
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand the principles of basic physical science and mathematics as verified by placement test or completion of
required prerequisite courses. Student must present a current statement of health. Students must complete the following modules:

- **WLD-U1** “Demonstrate Ability to Lift 50 Pounds”
- **WLD-U2** “Demonstrate Ability to Tolerate Heights up to 100 Feet”

**INTRODUCTION:**

- The standing position (one of its variations) is the most typical work position in industrial assembly and welding.
- Worker needs to vary work position to lessen fatigue and maintain alertness.
- Welders must wear appropriate personal protective equipment.

**PRESENTATION OUTLINE:**

1. Methods of working from the standing position
2. Approved variations of the standing position
3. Placement of fixtures, tools, and gas bottles
4. Movement of welding apparatus or machine
5. Wearing the proper shoes is important to comfort as well as safety
6. Relaxation techniques to use during break periods
7. Working with a planned approach that reduces stress
8. Walking relaxes body tension

**PRACTICAL APPLICATION:**

Employees move around naturally if left to work in a fixed position.

**EVALUATION AND/OR VERIFICATION:**

Student (employees) observe and record the actions of another group of workers engaged in separate tasks while standing.

Discussion of variation of standing positions as practiced by the study group - any observed unsafe actions and those most likely to cause fatigue.

**SUMMARY:**

The common deviations in standard positions of work need to be observed by the welder so he/she may follow the examples of the expert welders with the best welding techniques.

**NEXT LESSON ASSIGNMENT:**

**MASTER Technical Module (WLD-U4)** dealing with displaying ability to work in hot/cold environment for 8-10 hours.
WLD-U3-HO
Ability to Work from Various Positions
While Standing on Concrete for Extended Periods
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the various positions the welder assumes while standing; and,
B. Understand the reasons for wearing personal protective equipment.

PRESENTATION OUTLINE:

1. Methods of working from the standing position
2. Approved variations of the standing position
3. Placement of fixtures, tools, and gas bottles
4. Movement of welding apparatus or machine
5. Wearing the proper shoes is important to comfort as well as safety
6. Relaxation techniques to use during break periods
7. Working with a planned approach that reduces stress
8. Walking relaxes body tension
WELDER SERIES
MASTER Technical Module No. WLD-U04

SUBJECT: WELDING TECHNICIAN     TIME: 3 HOURS

• DUTY: WELLNESS/PHYSICAL ABILITIES
• TASK: Display Ability to Work in Hot/Cold Environment for 8-10 Hours

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the risks of working in hot/cold environment for extended periods; and,
B. Understand the need to wear protective equipment, and take appropriate measures to protect against heat-stroke or frost-bite in extreme temperatures.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U4-HO)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition
STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of required prerequisite courses. Student must present a current statement of health. Students must complete the following modules:

- **WLD-U1** “Demonstrate Ability to Lift 50 Pounds”
- **WLD-U2** “Demonstrate Ability to Tolerate Heights up to 100 Feet”
- **WLD-U3** “Ability to Work from Various Positions While Standing on Concrete for Extended Periods”

INTRODUCTION:

- An overview of the need for workers to protect themselves against the adverse conditions of hot and cold temperatures.

PRESENTATION OUTLINE:

1. The body’s reaction to hot temperatures and radiation from the sun
2. Degree of bodily injury from heatstroke/sunstroke, sunburn,
3. Preventive measures, protective clothing and first aid
4. The body’s reaction to cold temperatures, frost-bite, and wind chill
5. Degrees of injury from cold temperatures and wind chill
6. Preventive measures, protective clothing, and first-aid
7. Medical follow-up following exposure

PRACTICAL APPLICATION:

Workers need to plan for the work day, with appropriate clothing, fluids to drink, and notification of work site supervisor should worker need an unscheduled break periods for rest and assessment of physical condition.

EVALUATION AND/OR VERIFICATION:

Review case studies of accidents that have occurred as a result of worker exposure to hot and cold temperatures

SUMMARY:

Workers should be cautioned when working in extreme temperatures not to become drowsy and fall asleep. Make sure they carry sufficient food and drink; and that they protect the skin from radiation, sunburn, or frost-bite.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-U5) dealing with presenting a history of documented regular attendance at work.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the risks of working in hot/cold environment for extended periods; and,
B. Understand the need to wear protective equipment, and take appropriate measures to protect against heat-stroke or frost-bite in extreme temperatures.

MODULE OUTLINE:

1. The body's reaction to hot temperatures and radiation from the sun
2. Degree of bodily injury from heatstroke/sunstroke, sunburn,
3. Preventive measures, protective clothing and first aid
4. The body's reaction to cold temperatures, frost-bite, and wind chill
5. Degrees of injury from cold temperatures and wind chill
6. Preventive measures, protective clothing, and first-aid
7. Medical follow-up following exposure
WELDER SERIES
MASTER Technical Module No. WLD-U05

SUBJECT: WELDING TECHNICIAN
TIME: 3 HOURS

• DUTY: WELLNESS/PHYSICAL ABILITIES
• TASK: Present a History of Documented Regular Attendance at Work

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the need for prompt reporting to work; and,
B. Take pride in the professional responsibility displayed by a regular attendance schedule.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U5-HO)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of
required prerequisite courses. Student must present current statement of health. Student must complete the following modules:

WLD-U1  “Demonstrate Ability to Lift 50 Pounds”
WLD-U2  “Demonstrate Ability to Tolerate Heights up to 100 Feet”
WLD-U3  “Ability to Work from Various Positions While Standing on Concrete for Extended Periods”
WLD-U4  “Display Ability to Work in Hot/Cold Environment for 8-10 Hours”

INTRODUCTION:

• An overview of the pitfalls, safety hazards, and interruption of production that may occur if a key member of the work team does not report to work as scheduled.

PRESENTATION OUTLINE:

1. The worker’s reputation of starting on time is one of reliability, delivery of work as promised, and ability to work as a team
2. Starting at the scheduled time may also be a reflection of dedication, lifestyle, and good health
3. Workers that are consistently late usually have a series of problems that need to be identified individually - if not addressed promptly, the worker may be released
4. If a lesser skilled supervisor or entry level worker has to fill in for a highly skilled worker, possible results are poor quality, accidents, machine maintenance problems, interruptions, and equipment down time

PRACTICAL APPLICATION:

The importance of good attendance at work cannot be over emphasized. The absence or tardiness of employees can create some work hazards, loss of production, and loss of revenue.

EVALUATION AND/OR VERIFICATION:

Students should check their class attendance records, and workers their “late starts” or absences - analyzing reasons for each

SUMMARY:

If an employee accepts a job with prescribed hours of work he/she must make every effort to be on the job on time or a few minutes early to facilitate the “hand off” from the previous shift. Disabled and handicapped workers have some of the best attendance records in industry.
NEXT LESSON ASSIGNMENT:

MASTER Technical Module (WLD-U6) dealing with applying wellness information to lifestyle to maintain health.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the need for prompt reporting to work; and,
B. Take pride in the professional responsibility displayed by a regular attendance schedule.

PRESENTATION OUTLINE:

1. The worker’s reputation of starting on time is one of reliability, delivery of work as promised, and ability to work as a team
2. Starting at the scheduled time may also be a reflection of dedication, lifestyle, and good health
3. Workers that are consistently late usually have a series of problems that need to be identified individually - if not addressed promptly, the worker may be released
4. If a lesser skilled supervisor or entry level worker has to fill in for a highly skilled worker, possible results are poor quality, accidents, machine maintenance problems, interruptions, and equipment down time
WELDER SERIES
MASTER Technical Module No. WLD-U06

SUBJECT: WELDING TECHNICIAN
TIME: 8 HOURS

DUTY: WELLNESS/PHYSICAL ABILITIES
TASK: Apply Wellness Information to Lifestyle to Maintain Health

OBJECTIVE(S):

Upon completion of this unit the student will be able to assess personal health and fitness levels by evaluation in lifestyles, fitness components, stress management, nutrition and weight control.

INSTRUCTIONAL MATERIALS:

MASTER Handout (WLD-U6-HO)

REFERENCES:

TEXT:

OTHER:
Welding Inspection, American Welding Society, Miami, FL, Latest Edition

STUDENT PREPARATION:

Student must demonstrate appropriate communication skills and understand principles of basic physical science and mathematics as verified by placement test or completion of
required prerequisite courses. Student must present a statement of current health status.
Student must complete the following modules:

- **WLD-U1** "Demonstrate Ability to Lift 50 Pounds"
- **WLD-U2** "Demonstrate Ability to Tolerate Heights up to 100 Feet"
- **WLD-U3** "Ability to Work from Various Positions While Standing on Concrete for Extended Periods"
- **WLD-U4** "Display Ability to Work in Hot/Cold Environment for 8-10 Hours"
- **WLD-U5** "Present a History of Documented Regular Attendance at Work"

**INTRODUCTION:**

- An overview of the factors that limit wellness and personal fitness
- The need for self improvement plans based upon personal information developed from this module

**PRESENTATION OUTLINE:**

1. Life scan profile
2. Heart factors and cardiovascular endurance
3. Cholesterol and blood sugar
4. Pulmonary assessment
5. Muscular and skeletal flexibility assessment
6. Muscular strength
7. Nutritional analysis

**PRACTICAL APPLICATION:**

Development of methods for improvement of overall health and wellness

**EVALUATION AND/OR VERIFICATION:**

Evaluation of lifestyle improvement plan, with scheduled follow-up evaluations

**SUMMARY:**

Employees that understand the factors of wellness tend to lead a healthy lifestyle for themselves and their families. They should also have minimum absence for illness and minimum absenteeism.

**NEXT LESSON ASSIGNMENT:**

This completes the Welding modules.
OBJECTIVE(S):

Upon completion of this unit the student will be able to assess personal health and fitness levels by evaluation in lifestyles, fitness components, stress management, nutrition and weight control.

MODULE OUTLINE:

1. Life scan profile
2. Heart factors and cardiovascular endurance
3. Cholesterol and blood sugar
4. Pulmonary assessment
5. Muscular and skeletal flexibility assessment
6. Muscular strength
7. Nutritional analysis

ACKNOWLEDGEMENTS

This project was made possible by the cooperation and direct support of the following organizations:

National Science Foundation - Division of Undergraduate Education
MASTER Consortia of Employers and Educators

MASTER has built upon the foundation which was laid by the Machine Tool Advanced Skills Technology (MAST) Program. The MAST Program was supported by the U.S. Department of Education - Office of Vocational and Adult Education. Without this prior support MASTER could not have reached the level of quality and quantity that is contained in these project deliverables.

MASTER DEVELOPMENT CENTERS
Augusta Technical Institute - Central Florida Community College - Itawamba Community College - Moraine Valley Community College - San Diego City College (CACT) - Springfield Technical Community College - Texas State Technical College

MASTER PROJECT EVALUATORS
Dr. James Hales, East Tennessee State University and William Ruxton, formerly with the National Tooling and Machine Association (NTMA)

NATIONAL ADVISORY COUNCIL MEMBERS
The National Advisory Council has provided input and guidance into the project since the beginning. Without their contributions, MASTER could not have been nearly as successful as it has been. Much appreciation and thanks go to each of the members of this committee from the project team.
Dr. Hugh Rogers-Dean of Technology-Central Florida Community College
Dr. Don Clark-Professor Emeritus-Texas A&M University
Dr. Don Edwards-Department of Management-Baylor University
Dr. Jon Botsford-Vice President for Technology-Pueblo Community College
Mr. Robert Swanson-Administrator of Human Resources-Bell Helicopter, TEXTRON
Mr. Jack Peck-Vice President of Manufacturing-Mercury Tool & Die
Mr. Don Hancock-Superintendent-Connally ISD

SPECIAL RECOGNITION
Dr. Hugh Rogers recognized the need for this project, developed the baseline concepts and methodology, and pulled together industrial and academic partners from across the nation into a solid consortium. Special thanks and singular congratulations go to Dr. Rogers for his extraordinary efforts in this endeavor.

Dr. Don Pierson served as the Principal Investigator for the first two years of MASTER. His input and guidance of the project during the formative years was of tremendous value to the project team. Special thanks and best wishes go to Dr. Pierson during his retirement and all his worldly travels.

All findings and deliverables resulting from MASTER are primarily based upon information provided by the above companies, schools and labs. We sincerely thank key personnel within these organizations for their commitment and dedication to this project. Including the national survey, more than 2,800 other companies and organizations participated in this project. We commend their efforts in our combined attempt to reach some common ground in precision manufacturing skills standards and curriculum development.
Manufacturing in Florida

During the past two decades, the Central Florida region near Florida’s Space Coast, Melbourne, Cape Canaveral, Coala, Orlando, and the I-4 corridor to Tampa has experienced unprecedented economic growth. This growth has been especially evident in the fields of aerospace, electronics, laser electro-optics, and simulation enterprises. From 1990 to 1997 the area’s population grew by more than 13 percent to approximately 4 million.

Manufacturing companies in the region now number more than 3000. The products manufactured range from aerospace to space launch equipment, advanced technology emergency vehicles, to sophisticated electronic and simulation components, circuit boards, laser equipment, wireless data systems, communication devices, and metals fabrication. Much of the nation’s aerospace, satellite, and space facilities are concentrated in the region, including NASA, Lockheed Martin, E.G. and G. Inc., Boeing, McDonnell Douglas, Rockwell, Raytheon, Grumman, and Harris Corporation. Electronic companies such as Siemens, AT&T, Lucent, and Motorola serve both U.S. and export markets.

Central Florida, with three interstate highways (I-95, I-4, and I-75), is home to the University of Central Florida, its 27,000 students, and programs which include comprehensive engineering and engineering technology. Central Florida’s growth has helped to fuel the State of Florida’s growth to fourth largest state in the U.S. with a population of 14.6 million. By 2010 the state’s population is projected to increase by more than 13 percent with 9 percent of its total workforce involved in manufacturing.

Central Florida Community College

Central Florida Community College (CFCC), serving a total of 6,000 students, offers a center of emphasis in Electronics, a Manufacturing Technology program with an internship requirement, an Industrial Maintenance/Machining program, a CADD program, and a Computer Design/Application program. Ocala, home of the college, has rapidly become an industrial center, with Lockheed Martin’s Microelectronics Circuit Board Facility, and a second plant for Defense/Commercial Satellite Communications Manufacturing. E-One Corporation and other companies contribute to 17 percent of the local workforce being engaged in manufacturing.

Development Team

- **Project Coordinator**: Dr. Hugh Rogers, former Dean of Technical Education; served as the primary administrator and academic coordinator for the MASTER project. He also conducted the occupational skills profile interviews and benchmarked the welding instructional modules with review at four other colleges: Moraine Valley (Palos Hills, IL), IVY Tech (Terra Haute, Ind), Macomb Community College (Sterling Heights, MI), and Henry Ford Community College (Dearborn, MI).
- **Subject Matter Experts**: Mr Bill Rhodes and Mr Doug Wilson were responsible for developing skill standards and course/program materials for the welding technology components of the MASTER project. Other colleges and the American Welding Society.
Introduction:
STUDENT LABORATORY MANUAL

Prior to the development of this Student Laboratory Manual, MASTER project staff visited over 150 companies; conducted interviews with over 500 expert workers, and analyzed data from a national survey involving over 2800 participating companies. These investigations led to the development of a series of Instructor Handbooks, with each being fully industry-driven and specific to one of the technologies shown below:

- Advanced CNC and CAM
- Automated Equipment Repair
- Computer Aided Design & Drafting
- Conventional Machining
- Industrial Maintenance
- Instrumentation
- LASER Machining
- Manufacturing Technology
- Mold Making
- Tool And Die
- Welding

Each Instructor's Handbook contains a collection of Technical Training Modules which are built around a Competency Profile for the specific occupation. The Competency Profile which is the basis for this Student Laboratory Manual may be found on the following page (and on each of the tab pages in this book).

This Student Laboratory Manual has been developed as an learning aid for both the instructor and for the student, and is intended to be used in conjunction with the Instructor's Handbook.

This Student Laboratory Manual is arranged by Duty groupings (Duty A, Duty B, etc.) with learning modules available for each Task Box on the Competency Profile.

This Student Laboratory Manual is supplied with an accompanying Instructor's Handbook for use by the instructor.

Each module in the Instructor's Handbook has a corresponding learning module in the Student Laboratory Manual.
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

WLD-A1-HO
Demonstrate Understanding of Safety Rules
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify safety rules;
B. Describe specific requirements for safety in welding operations;
C. Identify reference resources for welding safety information;
D. Discuss common ability to follow safety practices;
E. Demonstrate ability to follow safety practices; and,
F. Conduct a safety inspection of student work area.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. A lecture on safety and the hazards found when working in environments involving power equipment, high temperatures, high voltage electricity, combustible gases, high ventilation requirements, sparks and high intensity light from metal arcs.
2. A demonstration of safe practices in the welding lab.
The purpose of this exercise is to learn to recognize hazards in the workplace. Many of the hazards which you will find are common safety practices by people who simply no longer see the danger.

The instructor will guide all students through the shop and welding facilities. Each student should write down, in the space provided on the form, as many safety hazards as are found.

It should be remembered that anyone can cause a hazard merely by failing to "see the mop bucket that sits in front of the fire exit" or "the hoses that are left on the floor". Such tunnel vision is the result of familiarity and demonstrates the importance of keeping a fresh perspective every day.

Due to the nature of this laboratory exercise, no universal answer key is presented.

WLD-A1-LA
Demonstrate Understanding of Safety Rules
Attachment 3: MASTER Laboratory Aid

Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine, except in an emergency
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a) No loose clothing, including ties;
   b) Long hair properly stowed and secured;
   c) No jewelry;
   d) Hard, closed-toe shoes;
   e) Eye protection (safety glasses); and
   f) Ear protection (plugs or headset).
5. Follow all institutional safety rules
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify protective equipment and clothing;
B. Identify the location of others in coordination with the work performed;
C. Identify personal safety hazards of welding operations;
D. Discuss OSHA regulations concerning welding operations;
E. Explain the need for personal responsibility when working;
F. Operate exhaust system;
G. Shield others from "Arc Flash"; and,
H. Discuss the meaning and use of safety signs and symbols.

MODULE OUTLINE:

I. Assume Responsibility for the Personal Safety of Oneself and Others
   A. Safety is a way of life, not an option
   B. Always operate with alertness and safety foremost in mind

II. Develop a Personal Attitude Towards Safety
   A. The key to safety is individual safety
   B. Everyone must develop a safe attitude
   C. Each step of the operation must be carefully planned

III. Interpret Safety Manual Directives
   A. Read and understand safety manual
   B. Read machine operation instructions

IV. Comply with Established Safety Practices
   A. Personal safety
      1. Body: body must be protected from burns, cuts, and bruises
      2. Proper lifting technique
         a. Personal lifting
            1) Lift with the legs, not the back
            2) Proper physical position while lifting
            3) Proper clearance for carrying
            4) "Buddy system" for heavy lifting
         b. Equipment lifting
            1) Checking ratings for lifting devices
            2) Checking lifting points on lifted item
            3) Overhead clearance requirements
            4) Static lifting devices (slings, jack stands) should be used
               instead of moving lifting devices (jacks or forklifts) for
               actually holding heavy items up while working on them
   B. Eyes: always wear safety glasses
C. Head: keep long hair up; wear hard hat whenever required
D. Ears: wear protection to prevent damage from noise
E. Jewelry: no rings, watches, bracelets, necklaces (they can get caught in machinery and they are conductors of electricity)
F. Clothing: keep sleeves and pant legs rolled down; and ties, strings, and belts away from moving parts
G. No horse-play
H. Do not talk to someone while that person is operating a welding machine (unless for safety reasons)
I. Do not talk to someone while you are operating a welding machine (unless for safety reasons)

V. Identify and Control Common Machine Shop Hazards
A. Chip formation
B. Moving machine parts
C. Spills and other debris
D. Electrical lines
E. Hydraulic and pneumatic lines

VI. Cover specific safety policies of the company
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify safety issues unique to each type of welding;
B. Describe the protective equipment used in welding operations;
C. Explain the hazards which demand the use of protective equipment; and,
D. Demonstrate the proper use and care of protective equipment.

MODULE OUTLINE:

I. Wear Protective Safety Clothing as Required
   A. Different types of safety clothing
      1. Protection from debris, cuts, and blows
         a. Hard hat, safety glasses or goggles, work gloves when necessary
         b. Sturdy footwear
         c. Long sleeved shirt (sleeves rolled down and buttoned)
      2. Fire-retardant and fire-resistant clothing
         a. Long sleeved, 100% cotton shirt
         b. Long pants, 100% cotton
         c. Leather chest protector, sleeves
      3. Optical filters to protect vision from intense light
         a. Welding hood or goggles
         b. Safety glasses or goggles for grinding
         c. Tinted goggles for cutting torch work
      4. Breathing protection
         a. Mask for dust, lint, smoke
   B. Function and use of safety clothing
      1. Man made fiber clothing melts to worker’s skin when ignited
      2. Prevents cuts and abrasions
      3. Keep shirt sleeves rolled down (hangs on equipment)
      4. Do not cuff pant legs (causes tripping)
      5. Do not wear jewelry
         a. Catches in moving parts
         b. Conducts electricity
      6. Do not wear neckties around moving parts of machinery
      7. Keep belts and apron strings tied and away from moving equipment

II. Maintain and Use Protective Guards and Equipment on Machinery
   A. Purposes of various guards
      1. Do not operate a machine until guards are in place
      2. Stop the machine to make adjustments or repairs
3. Disconnect power before removing guards or panels

B. Evaluation and maintenance of protective equipment
   1. Use only those electrical devices which have been approved by UL
      (Underwriters' Laboratories)
   2. Do not use defective equipment
   3. Report defective or unsafe equipment immediately
   4. Make sure equipment is properly grounded

III. Locate and Properly Use Signs, Devices, and Barriers
   A. Install Safety Barriers
   B. Use caution signs
   C. Install lock and tag devices
   D. Know where fire extinguishers are and how to use them

IV. Use Lifting Aids When Necessary
   A. Discuss recommended limits on single-person lifting
   B. Discuss proper lifting methods (use of the legs)
      1. Use your legs (bend your knees)
      2. Keep the load close to your body
      3. Don't twist your body while lifting
      4. Make sure you can see where you are going
      5. Wear support belts
   C. Discuss team-lifting
      1. Keep load the same height while lifting
      2. Move and lift on command
      3. Use dolly, wheelbarrow, or forklift
   D. Determine lifting ratings of lifting equipment
      1. Know how your forklift operates
      2. Understand load characteristics (weight, size, shape)
   E. Determine holding ratings of static lifting devices
   F. Evaluate positions on the workpiece for placement of lifting and holding devices
The instructor will display as much protective equipment, such as welding masks, breathers, and hard hats as is practical and desirable. The instructor should demonstrate the proper use of this equipment.
Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a. No loose clothing, including ties;
   b. Long hair properly stowed;
   c. No jewelry;
   d. Hard, closed-toe shoes;
   e. Eye protection (safety glasses); and
   f. Ear protection (plugs or headset).
5. Follow all institutional safety rules
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Use material safety data sheet (MSDS).
B. Identify signs and symbols on hazardous materials used in welding.
C. Discuss safety precautions to be observed with chemical hazards.
D. Discuss safety precautions to be observed welding gas hazards.
E. Demonstrate safe handling of hazardous materials in a work site.

MODULE OUTLINE:

I. Define Hazardous Materials According to the EPA
   A. What makes a material hazardous?
      1. It is hazardous if it causes harm to people or environment

II. Identify Hazardous Materials
    A. Material Safety Data Sheets (MSDS)
       1. Companies that make and distribute hazardous substances must provide your company with a MSDS on hazardous material
       2. MSDS developed by OSHA
       3. MSDS is part of the Hazard Communication Standard or Right to Know regulation
       4. MSDS is an easy reference for information on hazardous substances
    B. Information in MSDS
       1. What it is
       2. Who makes or sells it
       3. Where they are located
       4. Why it is hazardous
       5. How you can be exposed to the hazard
       6. Conditions that could increase the hazard
       7. How to handle the substance safely
       8. Protection to use while working with it
       9. What to do if exposed
       10. What to do if there is a spill or emergency

III. Know the Chemical and Physical Characteristics
    A. Corrosive
       1. Burns skin or eyes on contact
    B. Explosive
    C. Flammable
       1. Catches fire easily
    D. Radioactive
    E. Reactive
1. Burns, explodes
2. Releases toxic vapors

F. Toxic
1. Causes illness or possibly death

IV. Describe Storage, Transportation, Disposal
A. Resource Conservation and Recovery Act (RCRA)
   1. Designed to reduce hazards of waste by tracking and regulating the substance
   2. Method used is called from cradle (creation) to grave (disposal)
   3. Tells what hazards are and how to keep track of them
   4. Sets up rules for handling wastes
   5. Provides strict documentation system to track them

B. Your employer may have to report to the Environmental Protection Agency (EPA) on how the company is meeting the RCRA responsibilities

C. The law requires companies that treat, store, or dispose of hazardous wastes to:
   1. Have a permit
   2. Identify and analyze new hazardous waste
   3. Provide a secure facility that keeps unauthorized people out
   4. Inspect the facility regularly
   5. Have a contingency plan for fire, explosion, and spills
   6. Practice emergency response for fire, explosion, spills
   7. Provide proper protective clothing and equipment
   8. Maintain EPA-required records
WLD-A4-LA
Demonstrate Proper Handling of Hazardous Materials
Attachment 2: MASTER Laboratory Aid

Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a. No loose clothing, including ties;
   b. Long hair properly stowed;
   c. No jewelry;
   d. Hard, closed-toe shoes;
   e. Eye protection (safety glasses); and
   f. Ear protection (plugs or headset).
5. Follow all institutional safety rules
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Discuss injury hazards which may occur in welding operations;
B. Describe the steps in assisting an injured person;
C. Describe the purpose and location of lock-out switches;
D. Outline the steps for performing CPR;
E. Perform first aid on a simulated injury; and,
F. Perform CPR on laboratory mannequin.

MODULE OUTLINE:

In this module students, seeking competency as a welder, will receive:
1. Lecture on common trauma injuries.
2. Lecture on burn injuries.
3. Lecture on breathing problems and cardiac arrest.
4. Performance demonstration on simulated wound(s).
5. Performance demonstration of cardiopulmonary resuscitation (CPR).
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand tool safety;
B. Identify the proper tool to use for specific results;
C. Know the location of others when using tools;
D. List safety precautions for use of manual hand tools;
E. List safety precautions for use of a disc grinder;
F. List safety precautions for use of a bench grinder;
G. List safety precautions for use of a cut off saw;
H. List safety precautions for use of a band saw;
I. List safety precautions for use of a drill press;
J. List safety precautions for use of a hydraulic tool; and,
K. Practice proper maintenance of tools and equipment.

MODULE OUTLINE:

I. Identify and Understand Safe Machine Operating Procedures
   A. Never make adjustments on a machine while it is running
      1. Keep guards in place at all times
      2. Discontinue power before servicing
      3. Keep body parts clear of moving machinery
      4. Beware of sharp edges and flying debris
      5. Secure work pieces to prevent slipping
      6. Never stand directly in line with blades or knives
      7. Avoid kickback
      8. Feed stack into machine correctly
   B. Electrical safety
      1. Use only those electrical devices which have been approved by UL (Underwriters’ Laboratories)
      2. Stand on dry surface when working on electrical equipment
      3. Replace defective cords or plugs on equipment
      4. Use only those tools that are in good condition
      5. Use only carbon dioxide or dry chemical fire extinguishers for control of electrical fires
      6. Obtain help when working on equipment that may become energized
   C. Avoid horseplay and practical jokes
   D. Keep work area clean

II. Demonstrate Safe Machine Operation
   A. Good Housekeeping
      1. Materials and equipment should be stacked straight and neat
2. Keep aisles and walkways clear of tools, materials, and debris
3. Dispose of scraps and rubbish daily
4. Clean up spills
5. Clean and store hand tools

B. Good techniques
1. Always walk – do not run
2. Never talk to or interrupt anyone who is operating a machine
3. Never leave tools or pieces of stock lying on table surface of a machine being used
4. When finished with a machine, turn power OFF and wait until blades or cutters have come to a complete stop before leaving
5. Check stock for defects before machining
   a. Do not use a machine until you understand it thoroughly
   b. Do not jam or rush stock into machinery
   c. Keep guards in place
   d. Make sure power is OFF before working on or servicing
6. Keep hands and fingers away from moving parts
7. Don’t try to run too small a piece through the machine
8. Use a brush to clean the surface table
9. Keep your eyes focused on what you are working on
10. Never use an air hose to blow debris off yourself or other workers
11. Report faulty machinery to your supervisor
12. Make sure machinery is properly grounded
13. Never leave a piece of machinery that is running unattended
14. Make sure stack is solidly supported

C. Miscellaneous materials
1. Molten metal – can splash and cause serious burns
2. Chemicals – burn or irritate the skin or cause eye damage
3. Broken glass – causes cuts, can get in the eyes
4. Pointed objects – knives, screwdrivers, punches, staples can puncture the skin
5. Rough material – can scrape your skin and cause infections

D. Machinery
1. Understand the safety regulations that involve the guarding of moving parts
2. Know what parts of the equipment are energized
3. Use all safeguards that have been provided to protect people from machinery
4. See that all guards and protectors are in place before you start to work
5. If you must work nearer, turn the machine off and lock out the power
6. Never work in, around, or near dangerous, unguarded openings without wearing a safety belt and a lifeline that is properly seamed

E. One-fifth of all injuries on the job involve moving parts, machinery, or tools
Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine, except in an emergency
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a) No loose clothing, including ties;
   b) Long hair properly stowed and secured;
   c) No jewelry;
   d) Hard, closed-toe shoes;
   e) Eye protection (safety glasses); and
   f) Ear protection (plugs or headset).
5. Follow all institutional safety rules
Demonstrate Proper Wearing and Use of Safety Equipment

Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify safety factors;
B. Use face shields, safety glasses, protective apparel, and gloves;
C. Utilize proper breathing apparatus;
D. Demonstrate correct selection of safety equipment for a given task;
E. Demonstrate how the equipment is properly worn; and,
F. Demonstrate proper use of safety equipment for given welding tasks.

MODULE OUTLINE:

In this module students, seeking competency as a welder, will receive:
1. Lecture on welding safety equipment.
2. Demonstration of proper selection of welding safety equipment.
3. Wear personal protective equipment
   a. List personal protective equipment for shielded metal arc welding
   b. List personal protective equipment for gas tungsten arc welding
   c. List personal protective equipment for gas metal arc welding
   d. List personal protective equipment for flux cored arc welding
   e. List personal protective equipment for submerged arc welding
   f. List personal protective equipment for oxy fuel cutting
   g. List personal protective equipment for plasma arc cutting
   h. List personal protective equipment for air carbon arc gouging
   i. During shop work, wear applicable personal protective equipment at all times
   j. List personal safety equipment including clothing, shoes, etc.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand that a clean work area is a safe work area;
B. Protect self and others from arc flash;
C. Demonstrate eye-safety precautions;
D. Mark “Hot Work”;
E. Discuss the safety rules and procedures for using equipment;
F. Identify common hazards in the welding shop, including:
   1. Improper machinery;
   2. Unguarded machinery;
   3. Tripping and falling;
   4. Electrical hazards;
   5. Improper lifting;
   6. Gas and chemical hazards;
G. Explain the importance of “good housekeeping” in the shop; and,
H. Explain the importance of storing material in a secure manner.

MODULE OUTLINE:

I. Keep Work Areas Clean
   A. Discuss the associated dangers of the most common hazards of the work place
      1. Tripping/falling hazards caused by spills, loose objects, etc.
         a. Wipe up spills immediately
         b. Dispose of scrap material
         c. Do not wear loose clothing
         d. Never roll sleeves or pants
         e. Keep shoe strings tied
         f. Position electrical cords and air hoses in safe areas
      2. Chemical hazards
         a. Inhalants
         b. Chemical burns
         c. Flammable liquids
         d. Explosives and explosive combinations
         e. Toxins
      3. Electrical hazards
      4. High-pressure hazards
   B. Discuss methods of avoiding and correcting common hazards

II. Clean Machine/Hand Tools When Work Is Completed
III. Put Tools Away When Work Is Finished
IV. Keep Isles Clear of Equipment and Materials
V. Perform Preventive Maintenance as Required
   A. Discuss that certain machines require extra precautions
   B. Discuss how general maintenance enhances general safety

VI. Understand the Use of Material Safety Data Sheets (MSDS)
   A. What chemicals have MSDS?
   B. Where are the MSDS kept?
   C. What information is on the MSDS?
      1. Product identification
         a. Specific product name and common name
         b. Precautionary labeling
         c. Safety equipment
         d. Precautionary label statements
         e. Storage color code
      2. Hazardous components
      3. Physical data
         a. Boiling point
         b. Vapor pressure
         c. Melting point
         d. Vapor density
         e. Specific gravity
         f. Evaporation rate
         g. Solubility in water
         h. Percentage of volatile components by volume
         i. Appearance & odor
      4. Fire and explosion hazard data
         a. Flash point
         b. NFPA 704M rating
         c. Flammable limits (upper and lower)
         d. Fire extinguishing media
         e. Special fire-fighting procedures
         f. Toxic gases produced
      5. Health hazard data
         a. Threshold limit value
         b. Permissible exposure limit
         c. Toxicity
         d. Carcinogenicity
         e. Effects of over-exposure
         f. Target organs (those most affected by exposure)
         g. Medical conditions aggravated by exposure
         h. Routes of entry
         i. Emergency and first-aid procedures
      6. Reactivity data
         a. Stability
         b. Hazardous polymerization
         c. Conditions to avoid
d. Incompatible materials
e. Decomposition products

7. Spill and disposal procedures
   a. Procedures: Spill or discharge
   b. Procedures: disposal
   c. EPA hazardous waste number

8. Protective equipment
   a. Ventilation
   b. Respiratory protection
   c. Eye/skin protection

9. Storage and handling precautions
   a. Storage color code
   b. Special precautions

10. Transportation data and additional information
    a. Domestic transport
        1) DOT shipping name
        2) Hazard class
        3) UN/NA
        4) Labels
        5) Reportable quantity
    b. International
        1) IMO shipping name
        2) Hazard class
        3) UN/NA
        4) Labels
STANDARDS OF PERFORMANCE:

Student shall demonstrate safe work habits in the work shop by:
Using OSHA required safety equipment for the shop;
Safety glasses;
Hearing protection;
Face shields;
Gloves;
Not wearing rings, watches, jewelry, or loose clothing while operating equipment;
and,
Not participating in horse play or practical joking.

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand that a clean work area is a safe work area;
B. Protect self and others from arc flash;
C. Demonstrate eye-safety precautions;
D. Mark "Hot Work";
E. Discuss the safety rules and procedures for using equipment;
F. Identify common hazards in the welding shop, including:
   1. Improper machinery;
   2. Unguarded machinery;
   3. Tripping and falling;
   4. Electrical hazards;
   5. Improper lifting;
   6. Gas and chemical hazards;
G. Explain the importance of "good housekeeping" in the shop; and,
H. Explain the importance of storing material in a secure manner.

READING ASSIGNMENTS:

The following chapters are assigned to read from textbook:

Title
Manual Handling Methods; Lifting and Carrying; Equipment for Handling;
Hand Trucks, Ropes, Chains and Slings; Fiber Ropes; Rope Slings
MODULE OUTLINE:

I. Identify Safety Equipment Used When Working Aloft
   Note: Each industry has its own safety manual with rules for working aloft and they may be more stringent than OSHA
   A. Equipment common to most personnel when working aloft
      1. Safety glasses
      2. Hard hat
      3. Safety belt or harness

II. Describe How to Set up a Portable Ladder for Use
   A. Portable ladders are broken down in the CFR's as metal and wood ladders
   B. Wood ladders see 29 CFR 1910.25
      1. Single section ladder
      2. Two section ladder
      3. Special use wood ladders
      4. Step ladder
   C. Metal ladders see 29 CFR 1910.26
   D. Set up 29 CFR 1910.26
      1. Simple rule is to set the base a length of 1/4 the working length from the vertical wall

III. Basic Safety Concerns While Working from Scaffolding
    Note: This module does not address scaffolding erection because special training is required
    A. Employees working from scaffolding are subject frequently to hazards such as hot pipes, low overhead, possible sharp edges from tiewire
    B. Typical safety equipment would be hard hat, safety glasses, gloves, safety belt or harness
    C. Never lean over the handrails to perform work

IV. Concerns While Working from a Man Basket or Personnel Lift
    A. Use basket or lift for employees and tools only, not freight
    B. If basket has integral test weights insure weights are removed prior to lifting personnel
    C. Hands must be inside basket while basket is moving
    D. Safety belts or harness must be worn and properly affixed to number designed for securing lifeline
    E. Always inspect basket rigging prior to entry
    F. Once the basket is in position it must be tied off if egress from the basket is required

V. Demonstrate Proper Set up and Use of an Extension Ladder
    A. Determine wall to base of ladder distance
    B. Demonstrate how to tie off the ladder and how to use a safety belt when performing work from a ladder
STANDARDS OF PERFORMANCE SAFETY:

Student shall demonstrate safe work habits in the work shop by:
Using OSHA required safety equipment for the shop;
Safety glasses;
Hearing protection;
Face shields;
Gloves;
Not wearing-rings, watches, jewelry, or loose clothing while operating equipment, and,
Not participating in horse play or practical joking.

CONDUCT:

1. If in doubt as to safe operation of the equipment, STOP and seek guidance from the instructor.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Explain danger to eyes from welding operations;
B. Discuss the function of safety equipment in protecting eyes from ARC flash; and,
C. Demonstrate the correct use of eye protection equipment.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture on the danger of ARC flash.
2. Demonstration of ARC flash eye protection equipment.
WLD-A10-HO
Demonstrate Eye Safety Precautions
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Use safety glasses;
B. Use face shields during operations;
C. Discuss the dangers to eyes found in the welding environment; and,
D. Describe the safety equipment used for eye protection.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture on eye physiology with emphasis on potential for light and/or heat damage.
2. Demonstration of eye hazards found in the welding environment.
OBJECTION(S):

Upon completion of this unit the student will be able to:
A. Identify the locations of people before operating equipment;
B. Identify the location of flammable or hazardous material before grinding;
C. Demonstrate the safe use of a disc grinder;
D. Demonstrate the safe use of a bench grinder; and,
E. Demonstrate safe technique(s) for brushing.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture on safe grinding, brushing techniques.
2. Lab demonstration on grinding and brushing techniques.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Identify and understand safe machine operating procedures; and,

b. Demonstrate safe machine operation.

MODULE OUTLINE:

I. Identify and Understand Safe Machine Operating Procedures
   A. Never make adjustments on a machine while it is running
      1. Keep guards in place at all times
      2. Discontinue power before servicing
      3. Keep body parts clear of moving machinery
      4. Beware of sharp edges and flying debris
      5. Secure work pieces to prevent slipping
      6. Never stand directly in line with blades or knives
      7. Avoid kickback
      8. Feed stack into machine correctly
   B. Electrical safety
      1. Use only those electrical devices which have been approved by UL
         (Underwriters' Laboratories)
      2. Stand on dry surface when working on electrical equipment
      3. Replace defective cords or plugs on equipment
      4. Use only those tools that are in good condition
      5. Use only carbon dioxide or dry chemical fire extinguishers for control
         of electrical fires
      6. Obtain help when working on equipment that may become energized
   C. Avoid horseplay and practical jokes
   D. Keep work area clean.

II. Demonstrate Safe Machine Operation
   A. Good housekeeping
      1. Materials and equipment should be stacked straight and neat
      2. Keep aisles and walkways clear of tools, materials, and debris
      3. Dispose of scraps and rubbish daily
      4. Clean up spills
      5. Clean and store hand tools
   B. Good techniques
      1. Always walk - do not run
      2. Never talk to or interrupt anyone who is operating a machine
3. Never leave tools or pieces of stock lying on table surface of a machine being used
4. When finished with a machine, turn power OFF and wait until blades or cutters have come to a complete stop before leaving
5. Check stock for defects before machining
   a. Do not use a machine until you understand it thoroughly
   b. Do not jam or rush stock into machinery
   c. Keep guards in place
   d. Make sure power is OFF before working on or servicing
6. Keep hands and fingers away from moving parts
7. Don't try to run too small a piece through the machine
8. Use a brush to clean the surface table
9. Keep your eyes focused on what you are working on
10. Never use an air hose to blow debris off yourself or other workers
11. Report faulty machinery to your supervisor
12. Make sure machinery is properly grounded
13. Never leave a piece of machinery that is running unattended
14. Make sure stack is solidly supported

C. Miscellaneous materials
1. Molten metal - can splash and cause serious burns
2. Chemicals - burn or irritate the skin or cause eye damage
3. Broken glass - causes cuts, can get in the eyes
4. Pointed objects - knives, screwdrivers, punches, staples can puncture the skin
5. Rough material - can scrape your skin and cause infections

D. Machinery
1. Understand the safety regulations that involve the guarding of moving parts
2. Know what parts of the equipment are energized
3. Use all safeguards that have been provided to protect people from machinery
4. See that all guards and protectors are in place before you start to work
5. If you must work nearer, turn the machine off and lock out the power
6. Never work in, around, or near dangerous, unguarded openings without wearing a safety belt and a lifeline that is properly seamed

E. One-fifth of all injuries on the job involve moving parts, machinery, or tools
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand chemical hazards and MSDS;
B. Use ventilation systems;
C. Use proper breathing apparatus;
D. Recognize a closed work environment;
E. Identify the composition of a normal atmosphere;
F. Discuss the potential dangers to the normal atmosphere during welding operations; and
G. Describe the ventilation requirements for safe welding operations.

MODULE OUTLINE:

I. Keep Work Areas Clean
   A. Discuss the associated dangers of the lack of ventilation in the workplace
      1. Chemical Hazards
         a. Inhalants
         b. Chemical burns
         c. Flammable liquids
         d. Explosives and explosive combinations
         e. Toxins
      2. Electrical hazards
      3. High-pressure hazards
   B. Discuss methods of avoiding and correcting common hazards

II. Clean Machine/Hand Tools When Work Is Completed

III. Put Tools Away When Work Is Finished

IV. Keep Isles Clear Of Equipment And Materials

V. Perform Preventive Maintenance As Required
   A. Discuss that certain machines require extra precautions
   B. Discuss how general maintenance enhances general safety

VI. Understand the Use of Material Safety Data Sheets (MSDS)
   A. What chemicals have MSDS?
   B. Where are the MSDS kept?
   C. What information is on the MSDS?
      1. Product identification
         a. Specific product name and common name
         b. Precautionary labeling
         c. Safety equipment
2. Hazardous components
3. Physical data
   a. Boiling point
   b. Vapor pressure
   c. Melting point
   d. Vapor density
   e. Specific gravity
   f. Evaporation rate
   g. Solubility in water
   h. Percentage of volatile components by volume
   i. Appearance and odor
4. Fire and explosion hazard data
   a. Flash point
   b. NFPA 704M rating
   c. Flammable limits (upper and lower)
   d. Fire extinguishing media
   e. Special fire-fighting procedures
   f. Toxic gases produced
5. Health hazard data
   a. Threshold limit value
   b. Permissible exposure limit
   c. Toxicity
   d. Carcinogenicity
   e. Effects of over-exposure
   f. Target organs (those most affected by exposure)
   g. Medical conditions aggravated by exposure
   h. Routes of entry
   i. Emergency and first-aid procedures
6. Reactivity data
   a. Stability
   b. Hazardous polymerization
   c. Conditions to avoid
   d. Incompatible materials
   e. Decomposition products
7. Spill and disposal procedures
   a. Procedures: spill or discharge
   b. Procedures: disposal
   c. EPA hazardous waste number
8. Protective equipment
   a. Ventilation
   b. Respiratory protection
   c. Eye/skin protection
9. Storage and handling precautions
   a. Storage color code
b. Special precautions

10. Transportation data and additional information
a. Domestic transport
   1) DOT shipping name
   2) Hazard class
   3) UN/NA
   4) Labels
   5) Reportable quantity
b. International
   1) IMO shipping name
   2) Hazard class
   3) UN/NA
   4) Labels
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Keep work areas clean;
b. Clean machine/hand tools when work is completed;
c. Put tools away when work is finished;
d. Keep isles clear of equipment and materials;
e. Perform preventive maintenance as required; and,
f. Understand chemical hazards and the use of Material Safety Data Sheets (MSDS).

MODULE OUTLINE:

I. Keep Work Areas Clean
   A. Discuss the associated dangers of the lack of ventilation in the workplace
      1. Chemical Hazards
         a. Inhalants
         b. Chemical burns
         c. Flammable liquids
         d. Explosives and explosive combinations
         e. Toxins
      2. Electrical hazards
      3. High-pressure hazards
   B. Discuss methods of avoiding and correcting common hazards

II. Clean Machine/Hand Tools When Work Is Completed

III. Put Tools Away When Work Is Finished

IV. Keep Isles Clear Of Equipment And Materials

V. Perform Preventive Maintenance As Required
   A. Discuss that certain machines require extra precautions
   B. Discuss how general maintenance enhances general safety

   A. What chemicals have MSDS?
   B. Where are the MSDS kept?
   C. What information is on the MSDS?
      1. Product identification
         a. Specific product name and common name
         b. Precautionary labeling
         c. Safety equipment
         d. Precautionary label statements
         e. Storage color code
      2. Hazardous components
      3. Physical data

2177
a. Boiling point  
b. Vapor pressure  
c. Melting point  
d. Vapor density  
e. Specific gravity  
f. Evaporation rate  
g. Solubility in water  
h. Percentage of volatile components by volume  
i. Appearance and odor

4. Fire and explosion hazard data  
a. Flash point  
b. NFPA 704M rating  
c. Flammable limits (upper and lower)  
d. Fire extinguishing media  
e. Special fire-fighting procedures  
f. Toxic gases produced

5. Health hazard data  
a. Threshold limit value  
b. Permissible exposure limit  
c. Toxicity  
d. Carcinogenicity  
e. Effects of over-exposure  
f. Target organs (those most affected by exposure)  
g. Medical conditions aggravated by exposure  
h. Routes of entry  
i. Emergency and first-aid procedures

6. Reactivity data  
a. Stability  
b. Hazardous polymerization  
c. Conditions to avoid  
d. Incompatible materials  
e. Decomposition products

7. Spill and disposal procedures  
a. Procedures: spill or discharge  
b. Procedures: disposal  
c. EPA hazardous waste number

8. Protective equipment  
a. Ventilation  
b. Respiratory protection  
c. Eye/skin protection

9. Storage and handling precautions  
a. Storage color code  
b. Special precautions

10. Transportation data and additional information  
a. Domestic transport

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Define "Hot Work";
B. Identify materials used when marking "Hot Work";
C. Demonstrate techniques for safety marking "Hot Work"; and,
D. Use safety precautions for self and others.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture on the precautions to be taken when "Hot Work" is present in the shop.
2. Demonstration of proper marking and warning of "Hot Work".
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Additional Information

- Must have completed high school or GED.
- Must have at least 1 years of experience in welding.
- Must have passed a welding proficiency test.

---

**BEST COPY AVAILABLE**
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Recognize and solve problems; and,
B. Understand what worker empowerment is and how to effectively use.

MODULE OUTLINE:

Major Topics: \textbf{Worker Empowerment For Continuous Improvement}

I. What is Empowerment?
A. Define Empowerment
   1. Philosophy that provides each employee an “opportunity” to be creative and make changes to the product and life-cycle processes.
   2. Opportunity includes both the authority to make changes and the authority to do what it takes to enable the change.
   3. Opportunity also means accepting responsibility for your decisions.
B. Discuss what this means to the class
   1. Empowerment is more complex than just giving permission to make changes.
   2. Authority or decision-making is a granted right and can be easily taken away if proper responsibility is not demonstrated.
   3. Authority is often granted in steps. i.e. You can do up to this before getting further approval from management.
   4. Authority is not to be taken likely. Decision making decisions will be evaluated just as your production etc.
C. Define Product life cycle processes. Processes refer to those processes that define, design, develop, produce, deliver, sell, service, use of, disposal/recycling of our products and by-products.

II. Why is empowerment necessary?
A. To effectively create quality!
B. The Manufacturers’ Alliance for Productivity and Innovation stated that “Organizations that empower employees as a part of their total management effort are twice as likely as other firms to report significant product or service improvement.”
C. Employees will be more motivated to accomplish organizational goals and objectives if they have the authority to make decisions.

III. 4 critical dimensions of empowerment
A. Teamwork and communication
B. The evolution of empowerment
C. The bounds of empowerment

2185
D. Education and training

IV. Evolution of empowerment
A. Empowerment is not a quick fix, attitudes and habits are hard to change and come slowly.
B. Empowerment usually requires a change to the company infrastructure.
C. Effective empowerment demands personal growth in the areas of trust, technical knowledge.
D. Effective empowerment demands a maturing in accepting/using responsibility and authority.
E. The growth and maturing will be evolutionary and not accomplished instantly.
F. People need time to learn and adjust; some will need to grow more than others.
G. Certain individual can not or will not change and may require removal from the team.

V. Discuss Workplace Environment Stages and compare traditional, employee involvement and employee empowerment.

VI. Discuss Six conditions for empowerment - Is a trust-based model.
A. Character-Refers to what a person is. i.e. personal virtues such as Vision and enthusiasm, wisdom, courage, commitment, self-discipline, responsibility, persistence, patience, faith, compassion, trustworthiness, and honesty
B. Skills-Refers to what a person can do. i.e. personal knowledge of and proficiency in job related activities.
C. Win-win agreement-Refers to a social contract which delineates results (desired outcomes), guidelines (policies and procedures), resources (human machine, financial), accountability (performance standards and methods of evaluation), and consequences (organizational and personal impact). Basically an agreement that neither party is harmed at the expense of another. The most difficult and intricate condition.
D. Self-supervision-Refers to self-initiation and self-control with respect to the win-win agreement.
E. Structures-Refers to the organizational format and functional activities with respect to executing the win-win agreement.
F. Accountability-Refers to the establishment and acceptance of personal responsibility for affecting and producing results.

VII. Barriers to success
A. Management not supportive, means giving up authority, control by senior management
B. Personnel issues
C. Supervisor resistance
D. Lack of transfer of power to teams
E. Misalignment (compensation and team structure)
F. Difficulty with new roles (team members, supervisors, or management)

VIII. Bounds on empowerment
A. The new boundaries must be identified and communicated to team members to be effective.
   1. A new set of expectations must be developed.
2. Without careful planning and communication in these areas, misunderstanding and coordination problems will develop.

B. Responsibilities are typically assigned to the team, shared, or the supervisors.

1. Team Responsibilities: Survey of responsibilities and percent of teams with.

<table>
<thead>
<tr>
<th>Responsibility</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safety and housekeeping</td>
<td>69%</td>
</tr>
<tr>
<td>Assign tasks to members</td>
<td>58%</td>
</tr>
<tr>
<td>Work with internal customers</td>
<td>53%</td>
</tr>
<tr>
<td>Stop work for quality issues</td>
<td>46%</td>
</tr>
<tr>
<td>Routing equipment maintenance</td>
<td>45%</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Supervisors' Responsibilities</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compensation decisions</td>
<td>70%</td>
</tr>
<tr>
<td>Prepare and manage budgets</td>
<td>55%</td>
</tr>
</tbody>
</table>

2. Shared responsibilities:

<table>
<thead>
<tr>
<th>Responsibility</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select work methods</td>
<td>54%</td>
</tr>
<tr>
<td>Determine training methods</td>
<td>53%</td>

</tr>
</thead>
<tbody>
<tr>
<td>Compensation decisions</td>
<td>70%</td>
</tr>
<tr>
<td>Prepare and manage budgets</td>
<td>55%</td>
</tr>
</tbody>
</table>

C. Key differences between traditional and empowered organizations

1. Empowered firms:
   - Accomplish work through independent teams.
   - Fosters an environment that develops, encourages, and rewards empowered people and teams.
   - Encourage people to build social and technical skills.
   - Align personal and firm goals and see that people understand their roles.
   - Exhibit a high level of individual and team self-management
   - Participate in work design, set direction, and resolve problems.
   - Provide people with the information they need - without asking
<table>

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Define TQM;
B. Understand management philosophy for TQM;
C. Define the concepts of TQM;
D. Understand the cultural changes needed for TQM;
E. Understand TQM organizations; and,
F. Identify quality and the segments to achieve.

MODULE OUTLINE:

Major Topics: Total Quality Management
I. Introduction to TQM
   A. Definition of TQM
      1. A leadership philosophy
      2. A process, not product orientation
      3. A philosophy of continuous improvement
II. Management Philosophy
   A. Management responsible for the system, not the worker
III. Concepts of TQM
IV. Cultural changes for TQM
V. TQM Organizations
VI. Quality
   A. Defining Quality
   B. A Customer Right
   C. Strategy for TQM Implementation
   D. Planning and Organization for Quality
   E. Plan-Do-Check-Act
WLD-B3-HO
Implement Concepts of Quality in the Workplace
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the concepts of continuous process improvement; and,
B. Work through a structured problem solving exercise to improve quality.

MODULE OUTLINE:

Major Topics: Total Quality Management

I. Continuous Process Improvement
   A. Principles
      1. Sources
      2. Causes
      3. Statistical Concept of Variation versus Engineering Concept
      4. Improving for stability

II. Structured Problem Solving
    A. Defining the Problem
    B. Implementing Containment Actions
    C. Identifying Root Causes
    D. Developing and Verifying the Solution
    E. Implementing the Solution
    F. Standardize the Improvement
OBJECTIVE(S): 

Upon completion of this unit the student will be able to:
A. Understand the concepts of quality control;
B. Identify common investigative questions; and,
C. Identify sources of process variations.

MODULE OUTLINE:

Major Topics: Total Quality Management
I. Quality Control
   A. History and Concepts of Quality Control
      1. Corrective Actions
      2. Measurements
      3. Data Used
      4. Implementation
   B. Common Investigative questions
   C. Sources of Process Variations
WLD-B5-HO
Establish Methods, Plans and Procedures to Maintain Quality
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to establish methods, plans and procedures to maintain quality.

**BEST COPY AVAILABLE**
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the importance of work schedules;
B. Understand various scheduling methods;
C. Understand the need for promptness and readiness to work on time;
D. Be flexible and willing to help others in case of emergencies; and,
E. Recognize his/her role as a team member.

MODULE OUTLINE:

Instructional Topics:
A. Typical company policies and procedures on attendance and tardiness
B. Policies on disciplinary actions for repeated absences or tardiness
C. Personal planning methods for time scheduling, preparation for work, and travel to work to ensure timely arrival
D. Timely notification of employer in event of emergencies
E. Safety factors, job hazards, and actions to continue operations in event of emergencies
F. Contingency planning for continuation of operations
G. Job transition between shift crews to insure and provide continuation of operations
H. Team advisories for quality, production in planning, materials, and tools
I. Completing the production hand-off transition in an efficient and courteous manner
J. Job priorities and emergency operations plans
K. Personal habits and planning of leisure activities to prevent interferences with work schedule

Student Activities:
Prepare a work schedule that forecasts the cost impact on equipment down time, reduction of production, and project with one hour tardiness of the workforce at 5/10/15% and absenteeism at one work day per month per employee

[29 CFR 1910.133(a)(2)] □ YES □ NO

22 Are appropriate safety glasses, face shields, etc., used while using hand tools or equipment which might product flying materials or be subject to breakage?

[29 CFR 1910.133(a)(1)] □ YES □ NO
Audit Item/Practice | Check (☑) if Item/Practice not in compliance
--- | ---
Welding | ☐ Are only authorized and trained personnel permitted to use welding, cutting or brazing equipment? 29 CFR 1910.252(a)(2)(iv)(C)
Are each operator have a copy of the appropriate operating instructions and are they directed to follow them? 29 CFR 1910.253(e)(4), (d)(6), (f)(7)(A)
Is red used to identify acetylene (and other fuel-gas) hose, green for oxygen hose, and black for inert gas and air hose? 29 CFR 1910.253(e)(5)(i)
Are pressure-reducing regulators used only for the gas and pressures for which they are intended? 29 CFR 1910.253(e)(6)(i)
Is a check made for appropriate ventilation in and where welding or cutting is performed? 29 CFR 1910.252(b)(1)(i), (2)(3), (b)(4)(i)
When in confined places, are environmental monitoring tests taken and means provided for quick removal of welders in case of an emergency? 29 CFR 1910.252(c)(4)
Compressed Gas Cylinder Management | ☐ Are compressed gas cylinders regularly examined for obvious signs of defects, deep rusting, or leakage? 29 CFR 1910.254(d)(4): .255(e)
Is care used in handling and storage of cylinders, safety valves, safety relief valves, etc., to prevent damage? 29 CFR 1910.253(b)(2)(ii), (3)(ii)(B)
Before a regulator is removed, is the valve dose and gas released from the regulator? 29 CFR 1910.253(b)(5)(ii)(D)
Are cylinders, cylinder valves, couplings, regulators, hoses, and apparatus kept free of oil or grease substances? 29 CFR 1910.253(b)(5)(i)
Are the cylinders kept away from elevators, stairs, or gangways? 29 CFR 1910.253(b)(2)(i)
Are cylinders without fixed hand wheels have keys, handles, or non-adjustable wrenches on stem valves when in service? 29 CFR 1910.253(b)(5)(ii)(B)
Are compressed gas cylinders rollers or supports? 29 CFR 1910.253(b)(5)(ii)(K)
Are care taken not to drop or strike cylinders? 29 CFR 1910.253(b)(5)(ii)(B)
Unless secured on special trucks, are regulators removed and valve-protection caps put in place before moving cylinders? 29 CFR 1910.253(b)(5)(ii)(D)
Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage? 29 CFR 1910.253(b)(4)(ii)
Personal Protective Equipment | ☐ Is PPE functional and in good repair? Does it have ANSI or ASTM specifications marked on it? 29 CFR 1910.132(a)
Are all employees required to use personal protective clothing and equipment when handling chemicals (gloves, eye protection, respirators, etc.)? 29 CFR 1910.132(a)
Are all employees required to use personal protective clothing and equipment when handling chemicals (gloves, eye protection, respirators, etc.)? 29 CFR 1910.132(a)
Are employees exposed to the hazards created by welding, cutting, or brazing operations protected with personal protective equipment and clothing? 29 CFR 1910.253(b)(3)
Is is personal protective equipment provided and are all employees required to use PPE as needed to protect against eye and face injuries? 29 CFR 1910.132(a)
Are protective goggles or face shields provided and worn when there is any danger of flying particles or corrosive materials? 29 CFR 1910.133(a)(1)
Are are approved safety glasses required to be worn at all times in areas where there is a risk of eye injuries such as punctures, abrasions, contusions, or burns? 29 CFR 1910.133(a)(2)
Are are appropriate safety glasses, face shields, etc., used while using hand tools or equipment which might produce flying materials or be subject to breakage? 29 CFR 1910.133(a)(1)
Are are employees who need corrective lenses (glasses or contacts) in working environments where harmful emissions are required to wear only approved safety glasses, protective goggles, or use other medically approved precautionary procedures? 29 CFR 1910.133(a)(3)
Are is appropriate foot protection required where there is the risk of foot injuries? 29 CFR 1910.133(a); .136(a)
Are are appropriate hand protection required where there is the risk of hand injury? 29 CFR 1910.133(a): .136(a)
Are are hard hats and worn where danger of falling objects exists? 29 CFR 1910.135(a)(1)
Are are hard hats inspected periodically for damage to the shell and suspension system? 29 CFR 1910.135(b)
Are is personal protective clothing provided and are all employees required to check (☑) it if Item/Practice not in compliance

Supervisor ___________________________ Date ________________
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Assess core values of the individual with those of the work group and corporation; and,
B. Understand the importance of personal ethics to product quality and production outcomes.

MODULE OUTLINE:

Instructional Topics:
1. A code of ethics for professionals
2. The process of values clarification
3. Permit some mistakes so employees can learn
4. Be concerned about small things as well as larger or major events
5. Demonstrate what you believe about ethics in your work
6. Do the right thing, with full consideration of your values
7. Stay out of ethical debt to others
8. Communicate with others
9. Understand the position of each person on the work team

Student Activities:
1. Discuss a case study in situational work ethics
2. Define professional integrity
Safety Incentives Program
General Safety Checklist

1. Are empty compressed gas cylinders appropriately marked and their valves closed?

[29 CFR 1910.133(a)(1)] □ YES □ NO
WORKPLACE AUDIT / INSPECTION REPORT
Welding Area

Location:

Audited by:

Audit Item/Practice

☐ Are protective goggles or face shields provided and worn where there is any danger of flying particles or corrosive material? 29 CFR 1910.133(a)(1)

☐ Are approved safety glasses required to be worn at all times in areas where there is a risk of eye injuries such as punctures, abrasions, contusions, or scratches? 29 CFR 1910.133(a)(2)

☐ Are appropriate safety glasses, face shields, etc., used while using hand tools or equipment which might produce flying materials or be subject to breakage? 29 CFR 1910.133(a)(1)

☐ Are employees who need corrective lenses (glasses or contacts) in working environments having harmful exposures required to wear only approved safety glasses, protective goggles, or use other medically approved precautionary procedures? 29 CFR 1910.133(a)(3)

☐ Is appropriate foot protection required where there is the risk of foot injuries? 29 CFR 1910.132(a), (a)(6)

☐ Are hand tools provided and worn where working in falling objects? 29 CFR 1910.135(a)(1)

☐ Are hard hats inspected periodically for damage to the shell and suspension system? 29 CFR 1910.135(b)

Air emissions

☐ If welding creates hazardous air emissions, is the welding area appropriately marked to indicate this? 29 CFR 1910.252(c)(5)(v)(A) - (C)

☐ If welding creates hazardous air emissions, have ventilation or local exhaust systems been provided to keep fumes below the maximum allowable concentrations? 29 CFR 1910.252(c)(iii)

Fire Prevention

☐ Are precautions taken to prevent the mixture of air or oxygen with flammable gases, except at a burner or in a standard torch? 29 CFR 1910.253(a)(1)

☐ Are signs reading "DANGER NO SMOKING, MATCHES, OR OPEN LIGHTS" on the walls, posts, or other conspicuous locations? 29 CFR 1910.132(a); .136(a)

☐ Is combustible scrap, debris, and waste stored safely and removed from the work area promptly? 29 CFR 1910.253(b)(2)(i), (vii), (xv)(C)(2)

Fire Alarm Systems

☐ If you have a non-supervised fire alarm system, is it tested bimonthly? 29 CFR 1910.165(d)(2)

☐ If you have a supervised employee alarm system (that is, does the alarm have a device that indicates system malfunction), is it tested yearly? 29 CFR 1910.165(d)(4)

Portables Fire Extinguishers

☐ Are appropriate fire extinguishers mounted, located, and identified so that they are readily accessible to employees? 29 CFR 1910.157(c)(1)

☐ Are all fire extinguishers inspected and recharged regularly, and noted on the inspection tag? 29 CFR 1910.157(e)

☐ Are portable fire extinguishers provided in adequate number and type? 29 CFR 1910.157(d)

Aisles/Housekeeping

☐ Are aisles marked? 29 CFR 1910.22(s)(2)

☐ Are aisle widths maintained? 29 CFR 1910.22(b)(1)

☐ Are aisles in good condition? 29 CFR 1910.22(b)(1)

☐ Are work areas clean? 29 CFR 1910.22(a)

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand that the act of hiring a new employee involves trust by the employer;
B. Understand how to work with honor and respect; and,
C. Follow the principles of honesty on the job.

MODULE OUTLINE:

Instructional Activities:
1. Continue individual values clarification
2. Meanings and applications of honesty in the workplace
3. Employees in a position of trust and responsibility
4. Working from a perspective of honor and respect

Student Activities:
1. Students will discuss the meaning of "honesty" on the job
2. Students will be asked to take a position on case studies of honesty reflected by the use of property, materials, time, reporting, production rates, and communications
Safety Incentives Program
General Safety Checklist

1. Are empty compressed gas cylinders appropriately marked and their valves closed?
   [29 CFR 1910.253(b)(1)(ii), (5)(ii)(H)] □ YES □ NO

5. Are exhaust hazards controlled from forklifts or other gas, or diesel powered equipment?
   [29 CFR 1910.1000(a)] □ YES □ NO

6. Is the facility free of environmental hazards – dust, chemicals, radiation, welding rays, heat, cold, or excessive noise -- that result from working?
   [29 USC 654, Sec. 5(a)(1)] □ YES □ NO

7. Are all hazardous chemicals appropriately labeled?
   [29 CFR 1910.1200(f)(5)&(6)] □ YES □ NO

8. If hazardous waste is stored, are all hazardous waste requirements complied with?
   □ YES □ NO

9. Are rotating or moving parts of equipment guarded to prevent physical contact?
   [29 CFR 1910.212(a)(1); 243] □ YES □ NO

Display a Neat and Clean Workplace
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the rationale for a clean workplace; and,
B. Apply the principles of planning to the layout of a safe and well-arranged area.

PRESENTATION OUTLINE:

Instructional Topics:
1. Locating and storing tools, fixtures, and raw materials (metals, electrodes, etc.) for efficiency
2. Scheduling of time for cleanup of area and preventive maintenance of tools
3. Scheduling preventive maintenance of machines and apparatus
4. Storage and work accessibility of gases, hoses, and regulators used in welding processes
5. Disposal of generated waste or scrap metal
6. Cleaning methods and tools in support of shop operation

Student Activities:
1. Students will inventory, reorganize, and clean a welding shop in disarray
2. A discussion on "lessons learned" will follow
Safety Incentives Program
General Safety Checklist

1. Are empty compressed gas cylinders appropriately marked and their valves closed?
   [29 CFR 1910.253(b)(1)(ii), (5)(ii)(H)]  □ YES □ NO

2. Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage?
   [29 CFR 1910.253(b)($)(iii)]  □ YES □ NO

3. Does type of PPE used match the needs of current operations?
   [29 CFR 1910.132(d)(1)(i)]  □ YES □ NO

4. Is each work area adequately ventilated?
   □ YES □ NO

5. Are exhaust hazards controlled from forklifts or other gas, or diesel powered equipment?
   [29 CFR 1910.1000(a)]  □ YES □ NO

6. Is the facility free of environmental hazards – dust, chemicals, radiation, welding rays, heat, cold, or excessive noise -- that result from working?
   [29 USC 654, Sec. 5(a)(1)]  □ YES □ NO

7. Are all hazardous chemicals appropriately labeled?
   [29 CFR 1910.1200(f)(5)&(6)]  □ YES □ NO

8. If hazardous waste is stored, are all hazardous waste requirements complied with?
   □ YES □ NO

9. Are rotating or moving parts of equipment guarded to prevent physical contact?

WORKPLACE AUDIT / INSPECTION REPORT
Welding Area

Location:

Audited by: ______________________ Date: ______________________

Audit Item/Practice
Check (V) if item/Practice not in compliance

Welding
☐ Are only authorized and trained personnel permitted to use welding, cutting or brazing equipment? 29 CFR 1910.252(a)(2)(i)(C)
☐ Does each operator have a copy of the appropriate operating instructions and are they directed to follow them? 29 CFR 1910.253(a)(4), (d)(6), (f)(7)(A)
☐ Is red used to identify acetylene (and other fuel-gas) hose, green for oxygen hose, and black for inert gas and air hose? 29 CFR 1910.253(e)(5)(i)
☐ Are pressure-reducing regulators used only for the gas and pressures for which they are intended? 29 CFR 1910.253(e)(6)(i)
☐ Is a check made for appropriate ventilation in and where welding or cutting is performed? 29 CFR 1910.252(c)(1)(ii), (2)-(13), (b)(4)(ii)
☐ When working in confined places, are environmental monitoring tests taken and means provided for quick removal of welders in case of an emergency? 29 CFR 1910.252(c)(4)

Equipment Markings
☐ Are red used to identify acetylene (and other fuel-gas) hose, green for oxygen hose, and black for inert gas and air hose? 29 CFR 1910.253(e)(5)(i)

Compressed Gas Cylinder Management
☐ Are compressed gas cylinders regularly examined for obvious signs of defects, deep rusting, or leakage? 29 CFR 1910.254(d)(4); 255(e)
☐ Is care used in handling and storage of cylinders, safety valves, relief valves, etc., to prevent damage? 29 CFR 1910.253(b)(6)(i)(B)
☐ Are liquid-gases stored and shipped valve-end up with valve covers in place? 29 CFR 1910.253(b)(5)(ii)(A)
☐ Before a regulator is removed, is the valve closed and gas released from the regulator? 29 CFR 1910.253(b)(5)(iii)(D)
☐ Are cylinders, cylinder valves, couplings, regulators, hoses, and apparatus kept free of oil or greasy substances? 29 CFR 1910.253(b)(5)(iii)
☐ Are the cylinders kept away from elevators, stairs, or gangways? 29 CFR 1910.253(b)(2)(iv)
☐ Is it prohibited to use cylinders as rollers or supports? 29 CFR 1910.253(b)(5)(ii)(H)
☐ Is care taken not to drop or strike cylinders? 29 CFR 1910.253(b)(5)(viii)(B)
☐ Unless secured on special trucks, are regulators removed and valve—protection caps put in place before moving cylinders? 29 CFR 1910.253(b)(2)(vii)
☐ Do cylinders without fixed hand wheels have keys, handles, or non-adjustable wrenches on stem valves when in service? 29 CFR 1910.253(b)(5)(viii)(E)
☐ Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage? 29 CFR 1910.253(b)(4)(ii)

Personal Protective Equipment
☐ Is PPE functional and in good repair? Does it have ANSI or ASTM specifications marked on it? 29 CFR 1910.132(a)
☐ Are all employees required to use personal protective clothing and equipment when handling chemicals (gloves, eye protection, respirators, etc.)? 29 CFR 1910.132(a)
☐ Are employees exposed to the hazards created by welding, cutting, or brazing operations protected with personal protective equipment and clothing? 29 CFR 1910.250(b)(3)
☐ Is personal protective equipment provided and are all employees required to use PPE as needed to protect against eye and face injury? 29 CFR 1910.132(a), 151(b)(1)
☐ Are protective goggles or face shields provided and worn where there is any danger of flying particles or corrosive materials? 29 CFR 1910.133(a)(1)
☐ Are approved safety glasses required to be worn at all times in areas where there is a risk of eye injuries such as punctures, abrasions, contusions, or burns? 29 CFR 1910.133(a)(2)
☐ Are appropriate safety glasses, face shields, etc., used while using hand tools or equipment which might produce flying materials or be subject to breakup? 29 CFR 1910.133(a)(1)
☐ Are employees who need corrective lenses (glasses or contacts) in working environments having harmful exposures required to wear only approved safety glasses, protective goggles, or use other medically approved precautionary procedures? 29 CFR 1910.133(c)
☐ Is appropriate foot protection required where there is the risk of foot injuries? 29 CFR 1910.129(a); 136(a)
☐ Is appropriate hand protection required where there is the risk of hand injury? 29 CFR 1910.133(a); 136(a)
☐ Are hard hats provided and worn where danger of failing objects exists? 29 CFR 1910.135(a)(1)
☐ Are hard hats inspected periodically for damage to the shell and suspension system? 29 CFR 1910.135(b)

Air Emissions
☐ If welding creates hazardous air emissions, is the welding area appropriately marked to indicate that? 29 CFR 1910.252(b)(4)(iv)-C
☐ If welding creates hazardous air emissions, have ventilation or local exhaust systems been provided to keep fumes below the maximum allowable concentrations? 29 CFR 1910.252(c)(vi)

Fire Prevention
☐ Are precautions taken to prevent the mixture of air or oxygen with flammable gases, except at a burner or in a standard torch? 29 CFR 1910.253(a)(1)
☐ Are signs reading "DANGER NO SMOKING, MATCHES, OR OPEN LIGHTS" or the equivalent, posted in welding areas? 29 CFR 1910.253(a)(1)
☐ When welding is done on metal walls, are precautions taken to protect combustibles on the other side? 29 CFR 1910.252(a)(2)(ix)
☐ Before hot work is begun, are used drums, barrels, tanks, and other containers so thoroughly cleansed that no substances remain that could explode, ignite, or produce toxic vapors? 29 CFR 1910.252(a)(3)
☐ If welding gases are stored, are oxygen and acetylene separated by a 5-foot noncombustible barrier? 29 CFR 1910.253(b)(4)(iii)(ii)
☐ Is combustible scrap, debris, and waste stored safely and removed from the work site promptly? 29 CFR 1910.252(a)(2)(ii), (vi), (b)(v)(C)(2)
☐ Are fire watchers assigned when welding or cutting is performed in locations where a serious fire might develop? 29 CFR 1910.252(a)(2)(v)(A), (d)(iv)(v)

Fire Alarm Systems
☐ If you have a supervised employee alarm system (that is, does the alarm have a device that indicates system malfunction), is it tested yearly? 29 CFR 1910.165(d)(4)

Portable Fire Extinguishers
☐ Are appropriate fire extinguishers mounted, located, and identified so that the are readily accessible to employees? 29 CFR 1910.157(c)(1)
☐ Are all fire extinguishers inspected and recharged regularly, and noted on the inspection tags? 29 CFR 1910.157(e)
☐ Are portable fire extinguishers provided in adequate number and type? 29 CFR 1910.157(d)

Aisles/Housekeeping
☐ Are aisles marked? 29 CFR 1910.220(b)(2)
☐ Are aisles in good condition? 29 CFR 1910.220(b)(1)
☐ Are work areas clean? 29 CFR 1910.220(a)

Repairs/corrections must be completed by (date) ______________________ Date: ______________________

Repaired/corrections from above have been done.

Supervisor ______________________ Date: ______________________

Page______ of____
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand that careful use means the conduct of safe welding operations with proper tools; and,
B. Understand that preventive maintenance means daily checkout, troubleshooting, and clean-up of equipment and surrounding area.

MODULE OUTLINE:

A. Classification of tools by intended purpose or use
B. Specified location of tools and equipment to perform the scope of work
C. Check-out of tools and equipment prior to each shift
D. Reporting of deficiencies, tagging, or replacement of equipment
E. Minor repairs
### Safety Incentives Program
#### General Safety Checklist

1. Are empty compressed gas cylinders appropriately marked and their valves closed?
   - [29 CFR 1910.253(b)(1)(ii), (5)(ii)(H)]
   - □ YES  □ NO

2. Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage?
   - [29 CFR 1910.253(b)(3)(iii)]
   - □ YES  □ NO

3. Does type of PPE used match the needs of current operations?
   - [29 CFR 1910.132(d)(1)(i)]
   - □ YES  □ NO

4. Is each work area adequately ventilated?

5. Are exhaust hazards controlled from forklifts or other gas, or diesel powered equipment?
   - [29 CFR 1910.1000(a)]
   - □ YES  □ NO

6. Is the facility free of environmental hazards – dust, chemicals, radiation, welding rays, heat, cold, or excessive noise -- that result from working?
   - [29 USC 654, Sec. 5(a)(1)]
   - □ YES  □ NO

7. Are all hazardous chemicals appropriately labeled?
   - [29 CFR 1910.1200(f)(5)&(6)]
   - □ YES  □ NO

8. If hazardous waste is stored, are all hazardous waste requirements complied with?

9. Are rotating or moving parts of equipment guarded to prevent physical contact?
   - [29 CFR 1910.212(a)(1); 243]
   - □ YES  □ NO

Does each operator have a copy of the appropriate operating instructions and
are they directed to follow them? 29 CFR 1910.253(a)(4), (d)(6), (f)(7)(A)
Is red used to identify acetylene (and other fuel-gas) hose, green tor oxygen
hose, and black for inert gas and air hose? 29 CFR 1910.253(e)(5)0)
Are pressure-reducing regulators used only for the gas and pressures for
which they are intended? 29 CFR 1910.253(06)(i)
Is a check made for appropriate ventilation in and where welding or cutting is
perlormed? 29 CM 1910.252(c)(1)(iii). (2)-(13), (b)(4)(ii)
When working in confined places, are environmental monitoring tests taken
and means provided for quick removal of welders in case of an emergency?
29 CFR 1910.252(c)(4)

Equipment

O
O
O

Are only approved apparatus (torches, regulators, pressure-reducing valves,
acetylene generators, manifolds) used? 29 CFR 1910.253(a)(3)
is open circuit (No Load) voltage of arc welding and cutting machines as low
as possible and not in excess of the recommended limits? 29 CFR
1910.254(0)(3)(1)-(iv)
is grounding of the welding machine frame and safety ground connections of
(c)(6)

Equipment Markings

O
O

Is red used to identify acetylene (and other fuel-gas) hose, green for oxygen
hose, and black for inert gas and air hose? 29 CFR 1910253(e)(5)(i)
Are empty compressed gas cylinders appropriately marked and their valves
closed? 29 CFR 1910.101(0); .253(b)(1)(ii), (2)(iii), (5)(ii)(H)

Compressed Gas Cylinder Management

O
O

Are compressed gas cylinders regularly examined for obvious signs of
Is care used in handling and storage of cylinders, safety valves, relief valves,
etc.. to prevent damage? 29 CFR 1910.253 (b)(2)(ii), (5)(iii)(B)

O Are liquified gases stored and shipped valve-end up with valve covers in

O
O

Before a regulator is removed. is the valve closed and gas released from the
regulator? 29 CFR 1910253(b)(5)(iii)(D)
Are cylinders, cylinder valves, couplings, regulators, hoses, and apparatus
kept tree of oily or greasy substances? 29 CFFI 1910.253(b)(5)(i)

a Are the cylinders kept away from elevators, stairs, or gangways? 29 CFR

a
O
O

1910.253(b)(2)(ii)
Is it prohibited to use cylinders as rollers or supports? 29 CFR
1910253(b)(5)(ii)(K)
is care taken not to drop or strike cylinders? 29 CFR 1910253(b)(5)(ii)(B)
Unless secured on special trucks, are regulators removed and
valve-protection caps put in place before moving cylinders? 29 CFR
1910.253(0)(5)(11)(D)

Do cylinders without fored hand wheels have keys, handles, or non-atfiustable
O Are empty compressed gas cylinders appropriately marked and their valves
O Are fuel gas cylinders and oxygen cylinders separated by distance, fire
resistant barriers. etc.. while in storage? 29 CFR 1910.253(b)(4)(iii)

Personal Protective Equipment
Is PPE functional and in good repair? Does it have ANSI or ASTM
specifications marked on it? 29 CFR 1910.132(e)
O Are all employees required to use personal protective clothing and eqUiPment
when handling chemicals (gloves, eye protection, respirators. etc.)? 29 CFR
1910.132(a)
O Are employees exposed to the hazards created by welding, cubing, or brazing
operations protected with personal protective equipment and clothing? 29
CFR 1910252(0)(3)
Is
personal protective eouipment provided and are all employees required to
O
use PPE as needed to protect against eye and face injury/ 29 CFR
1910.132(a); .133(a)(1)

O

O Are protective goggles or face shields provided and worn where there is any
danger of flying particles or corrosive materials? 29 CFR 1910.133(a)(1)
O Are approved safety glasses required to be worn at all times in areas where
there is a risk of eye injuries such as punctures, abrasions, contusions, or
bums? 29 CFR 1910.133(a)(2)
O Are appropriate safety glasses, face shields. etc., used while using hand tools
or equipment which might produce flying materials or be subject to
breakage? 29 CFR 1910.133(a)(1)
o Are emptoyees who need corrective lenses (glasses or contacts) in working
environments having harmful exposures required to wear only approved
safety glasses, protective goggles, or use other medically approved
precautionary procedures? 29 CFR 1910.133(03)
Is
appropriate foot protection required where there is the risk of foot Injuries?
O
29 CFR 1910.132(a); .136(a)
O Is appropriate hand protection required where there is the risk of hand injury?
29 CFR 1910.132(a); .138(a)
O Are hard hats provided and worn where danger of falling objects exists? 29
CFR 1910.135(a)(1)
O Are hard hats inspected periodically for damage to the shell and suspension
system? 29 CFR 1910.135(0)

Air emissions

O
O

If welding creates hazardous air emissions. is the welding area appropriately
marked to indicate this? 29 CFR 1910.252(c)(iv)(A)-(C)
If welding creates hazardous air emissions, have ventilation or local exhaust
systems been provided to keep fumes below the maximum allowable
concentrations? 29 CFR 1910252(c)(iii)

Fire Prevention
O Are precautions taken to prevent the mixture of air or oxygen with flammable
gases, except at a burner or in a standard torch? 29 CFR 1910.253(01)
O Are signs reading 'DANGER NO SMOKING, MATCHES. OR OPEN LIGHTS'
or the equivalent, posted in welding areas?
O Are provisions Made to never crack a fuel-gas cylinder valve near sources of
O When welding is done on metal walls. are precautions taken to protect
combustibles on the other side? 29 CFR 1910.252(a)(2)(x)
O Before hot work is begun, are used drums. barrels, tanks, and other
containers so thoroughly cleaned that no substances remain that could
explode, ignite, or produce toxic vapors? 29 CFR 1910252(a)(3)(i)
O If welding gases are stored. are oxygen and acetylene separated by a 5-foot
noncombustible barrier? 29 CFR 1910253(b)(4)(1)-(iii)
g cylinders kept away from sources of heat? 29 CFR
Ar1e9comp53re(sswed(2)(aso

o

Is combustible scrap, debris. and waste stored safely and removed from the
O Are fire watchers assigned when welding or cutting is performed in locations
Fere Alarm Systems
O If you have a non-supervised fire alarm system, is it tested bimonthly? 29
CFR 1910.165(d)(2)
O if you have a supervised employee alarm system (that is. &VS the alarm havi
a device that indicates system malfunction), is it tested yearly? 29 CFR
1910.165(d)(4)

O

Portable Fire Extinguishers

O
O
O

Are appropriate fire extinguishers mounted, located, and ldefitified so that the
are readily accessible to employees? 29 CFR 1910.157(c)(1)
Are all fire extinguishers inspected and recharged regularly, and noted on the
inspection tag? 29 CFR 1910.157(e)
Are portable fire extinguishers provided in adequate number and type? 29
CFR 1910.157(d)

Aisles/Housekeeping

O

Are aisles marked? 29 CFR 1910.22(b)(2)

O

Are aisles in good condition? 29 CFR 191022(b)(1)

O Are aisle widths maintained? 29 CFR 191022(0)(1)

O Are work areas clean? 29 CFR 191022(a)

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Practice the selection and use of the right tools for the right job at the right time in the right location;
B. Understand the need for precision and quality in products produced or services delivered; and,
C. Be motivated to achieve only the highest quality through continuous improvement.

MODULE OUTLINE:

A. Problem solving for welders
B. Benchmarking with the best
C. Continuous improvement methods for welders
D. Control of variables in the welding processes
E. Verifications and inspections for quality weldments
1. Are empty compressed gas cylinders appropriately marked and their valves closed?
   [29 CFR 1910.253(b)(1)(ii), (5)(ii)(H)]  □ YES  □ NO

2. Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage?
   [29 CFR 1910.253(b)(3)(iii)]  □ YES  □ NO

3. Does type of PPE used match the needs of current operations?
   [29 CFR 1910.132(d)(1)(i)]  □ YES  □ NO

4. Is each work area adequately ventilated?
   □ YES  □ NO

5. Are exhaust hazards controlled from forklifts or other gas, or diesel powered equipment?
   [29 CFR 1910.1000(a)]  □ YES  □ NO

6. Is the facility free of environmental hazards – dust, chemicals, radiation, welding rays, heat, cold, or excessive noise -- that result from working?
   [29 USC 654, Sec. 5(a)(1)]  □ YES  □ NO

7. Are all hazardous chemicals appropriately labeled?
   [29 CFR 1910.1200(f)(5)&(6)]  □ YES  □ NO

8. If hazardous waste is stored, are all hazardous waste requirements complied with?
   □ YES  □ NO

9. Are rotating or moving parts of equipment guarded to prevent physical contact?
10 Are grinders, saws, and similar equipment provided with appropriate safety guards?
[29 CFR 1910.243(a)(1), (c)(l)-(4), (e)(1)(i)] □ YES □ NO

11 Are power tools used with the correct shield, guard, or attachment recommended by the manufacturer?
□ YES □ NO

12 Are storage cabinets used to hold flammable liquids, labeled "Flammable-Keep Fire Away"?
[29 CFR 1910.106(d)(3)(ii)] □ YES □ NO

13 Are flammable liquids, such as gasoline, kept in an approved safety can?
[29 CFR 1910.106(d)(2); 144(a)(1)] □ YES □ NO

14 Are work areas clean?
[29 CFR 1910.22(a)] □ YES □ NO

15 Are work surfaces kept dry or are appropriate means taken to assure the surfaces are slip-resistant?
[29 CFR 1910.22(a)(2)] □ YES □ NO

16 Are all spilled materials or liquids cleaned up immediately?
[29 CFR 1910.141(a)(3)(ii)] □ YES □ NO

17 Are aisles kept clean and free of obstructions?
[29 CFR 1910.22(b)(1)] □ YES □ NO

18 Are fire aisles, access to stairways, and fire equipment kept clear?
[29 CFR 1910.178(m)(14)] □ YES □ NO

19 Are exits kept free of obstructions?
[29 CFR 1910.36(d)(1)] □ YES □ NO

20 Do you control dusts, vapors, gases, fumes, smoke, solvents, or mists which may be generated in your workplace through general dilution or local exhaust ventilation systems?
[29 CFR 1910.94(a)(2)(ii); (b)(2); (c)(2); (d)(1)(ii), (5), (6)] □ YES □ NO
21. Are approved safety glasses required to be worn at all times in areas where there is a risk of eye injuries such as punctures, abrasions, contusions, or burns?

[29 CFR 1910.133(a)(2)]

☐ YES ☐ NO

22. Are appropriate safety glasses, face shields, etc., used while using hand tools or equipment which might produce flying materials or be subject to breakage?

[29 CFR 1910.133(a)(1)]

☐ YES ☐ NO
**WELDING LOCATION - EQUIPMENT**

- Are pressure-reducing regulators used only for the gas and pressures for which they are intended? 29 CFR 1910.253(e)(3)
- Is a check made for appropriate ventilation in and where welding or cutting is performed? 29 CFR 1910.252(c)(1)(iii), (2)-(13), (b)(4)(i)
- When working in confined places, are environmental monitoring tests taken and means provided for quick removal of welders in case of an emergency? 29 CFR 1910.252(c)(4)

**Equipment**

- Are compressed gas cylinders regularly examined for obvious signs of defects, deep rusting, or leakage? 29 CFR 1910.254(d)(4); .255(e)
- Are signs reading 'DANGER NO SMOKING, MATCHES, OR OPEN LIGHTS' or the equivalent, posted in welding areas? 29 CFR 1910.252(c)(iv)(A)-(C)
- Are compressed gas cylinders marked to indicate this? 29 CFR 1910.252(c)(iv)(A)-(C)
- Are compressed gas cylinders regularly examined for obvious signs of defects, deep rusting, or leakage? 29 CFR 1910.254(d)(4); .255(e)
- Are compressed gas cylinders marked to indicate this? 29 CFR 1910.252(c)(iv)(A)-(C)

**Personal Protective Equipment**

- Is it prohibited to use cylinders as rollers or supports? 29 CFR 1910.253(b)(5)(ii)(K)
- Are compressed gas cylinders kept away from acids, alkalies, or corrosives? 29 CFR 1910.253(b)(2)(ii)
- Are compressed gas cylinders kept away from acids, alkalies, or corrosives? 29 CFR 1910.253(b)(2)(ii)
- Are compressed gas cylinders kept away from acids, alkalies, or corrosives? 29 CFR 1910.253(b)(2)(ii)

**Fire Extinguishers**

**Supervisor**

- Repairs/Corrections from above have been done.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand how impressions and public images are important to product success; and,
B. Understand the significance of company employee attitude, as displayed in public, that may convey lack of respect and concern for customers perceptions.

MODULE OUTLINE:

1. Welder clothing and protective equipment
2. Actions of a professional versus carefree “party animal” caricature
3. Implications for company reputation and liability if customer has wrong impression of welder
4. Attitudes and demeanor that affect customer opinion of products and services
5. Appearance of equipment or mobile welding truck that influences customer opinion
6. Appropriate use of company logo and markings
7. Inappropriate clothing, bumper stickers, and markings

Support a Positive Work Environment
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate positive attitude and active in support of quality goals; and,
B. Share resources to support fellow workers and work teams.

MODULE OUTLINE:

1. Definition of a positive work environment
2. Characteristics and indicators of a positive work environment versus a “negative” work environment
3. Worker attitudes and belief systems
4. Helping workers define needs and assisting workers to meet needs
5. Consensus on company goals and worker goals
6. The establishment of “win - win” situations for workers, work teams, and management.
Safety Incentives Program
General Safety Checklist

Practice a Positive Attitude
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand basic needs of individuals and groups; and,
B. Understand the benefits of a positive approach to meeting those needs.

PRESENTATION OUTLINE:

1. Basic human needs as depicted in Maslow’s hierarchy
2. Individual needs, family, and group needs
3. Importance of the relationships of honor and trust with others
4. The importance of recognition for a positive goal of a job well done versus recognition for being “bad” or “cool”
5. The company culture and individual acceptance or denial of this culture
6. Alternatives for the individual in denial of company culture to be discussed
7. Individual attitude toward the work, the workplace, and the co-workers
8. Attitude assessment, process and examples
9. Attitude change process and belief systems from the worker perspective
Safety Incentives Program
General Safety Checklist

1. Are empty compressed gas cylinders appropriately marked and their valves closed?
   [29 CFR 1910.253(b)(1)(ii), (5)(ii)(H)] □ YES □ NO

2. Are fuel gas cylinders and oxygen cylinders separated by distance, fire resistant barriers, etc., while in storage?
   [29 CFR 1910.253(b)($)iii)] □ YES □ NO

3. Does type of PPE used match the needs of current operations?
   [29 CFR 1910.132(d)(1)(i)] □ YES □ NO

4. Is each work area adequately ventilated?
   □ YES □ NO

5. Are exhaust hazards controlled from forklifts or other gas, or diesel powered equipment?
   [29 CFR 1910.1000(a)] □ YES □ NO

6. Is the facility free of environmental hazards – dust, chemicals, radiation, welding rays, heat, cold, or excessive noise – that result from working?
   [29 USC 654, Sec. 5(a)(1)] □ YES □ NO

7. Are all hazardous chemicals appropriately labeled?
   [29 CFR 1910.1200(f)(5)&(6)] □ YES □ NO

8. If hazardous waste is stored, are all hazardous waste requirements complied with?
   □ YES □ NO

9. Are rotating or moving parts of equipment guarded to prevent physical contact?
   [29 CFR 1910.212(a)(1); 243] □ YES □ NO

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Explain the preparations necessary to be an active listener;
B. Describe how to stay involved as a listener;
C. Discuss the importance of listening in the classroom; and,
D. List the barriers to becoming a good listener.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. A presentation on listening skills, including:
   A. Preparation for listening,
   B. Staying involved as a listener,
   C. Keeping an open mind,
   D. Eliminating barriers to listening.
2. A class discussion group in which every student participates as a speaker and an “active” listener. Each student will be asked to list the main point of every other student speaker.
Demonstrate Good Reading, Comprehension and Writing Skills
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Read and discuss technical documents on welding;
B. Define important technical welding terms;
C. Explain the need for, and use of, written technical materials; and,
D. Write technical notes, using complete sentences.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture(s) containing word exercises on how to read and comprehend technical welding materials.
2. Presentation of technical job functions, responsibilities, and tasks that need to be interpreted and written and transmitted to others.
3. Methods of definition, analysis, and language of the trade that conveys precise meaning.
OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Describe a simple welding manufacturing process;
B. Discuss the steps in a welding manufacturing process;
C. Define the terms in a welding manufacturing process; and,
D. When given specifications, document a welding manufacturing process.

MODULE OUTLINE:

In this module students, seeking competency as an entry level welder, will receive:
1. Lecture on the purposes and techniques for documenting welding manufacturing processes.
2. A description of the layout of welding manufacturing work stations
3. A typical sequence of operations
4. Instructions on documenting a typical welding manufacturing process.
WLD-D4-HO
Prepare a Recommendation for Continuous Improvement
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Describe the steps in a continuous improvement program;
B. Discuss the importance of communication in continuous improvement;
C. Outline the parts of a written recommendation; and,
D. Prepare the data for a continuous improvement recommendation.

MODULE OUTLINE:

I. Continuous Process Improvement
   A. Principles
      1. Sources
      2. Causes
      3. Statistical concept of variation vs. engineering concept
      4. Improving for stability

II. Structured Problem Solving
   A. Defining the problem
   B. Implementing containment actions
   C. Identifying root causes
   D. Developing and verifying the solution
      1. Implementing the solution
      2. Standardize the improvement

III. Quality Control
   A. History and concepts of Quality Control
      1. Corrective actions
      2. Measurements
      3. Data used
      4. Implementation
   B. Common investigative questions
   C. Sources of process variations

2240
OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Explain the need for a priority list of work responsibilities;
B. Discuss how work responsibilities are determined; and,
C. Describe the steps in preparing a priority list of work responsibilities.

MODULE OUTLINE:

1. The need for work priorities
2. How to identify work priorities
3. Criteria for ranking work priorities
4. Creation of summarized work priority lists
5. Priority lists and production methods
6. Work priorities and KANBAN
7. Work schedules and just-in-time methods
8. Sharing resources with the work team
WLD-D6-HO
Display Ability to Follow Directions, Give Directions
And Accept Constructive Criticism
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:

A. Explain the importance of following direction and instructions of others in the production of quality work;
B. Discuss the ability to convey clear directions when explaining work to others; and,
C. Describe the need to accept, understand, and use constructive criticism in the production of quality work.

MODULE OUTLINE:

1. Listening to directions
2. Understanding directions clearly, and asking questions when uncertain.
3. The importance of clarity to the production of quality work.
4. The need to convey clear directions to others on the job when needed.
5. The use of welding terms and definitions
   a. Follow verbal instructions
   b. Follow written details
   c. Prepare time and job cards (reports & records)
6. The need to accept and give constructive criticism while maintaining good working relationships with others.
7. The methods of conflict resolution generally accepted in the workplace.
WLD-D7-HO
Demonstrate Positive Communication Skills
with Co-Workers and Supervisors
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Discuss the importance of communications on the job;
B. Describe the conditions for positive communication to take place;
C. Discuss the role one’s attitude plays in positive communication; and,
D. Adapt to changing job or work conditions with a positive approach in communicating with one’s supervisors.

MODULE OUTLINE:

1. The use of positive communication skills
2. Workers attitudes and beliefs
3. The need of individual positive reinforcement
4. Goals and positive reinforcement
5. Incentives for quality work

**REMARKS**

- The table above represents a comprehensive list of duties and tasks associated with the role of a welder. Each task is designed to ensure that the welder is proficient in various aspects of their job, from understanding safety rules to performing welding operations and maintaining adequate ventilation.

- The duties are structured to ensure that the welder is knowledgeable about the materials and processes used in welding, as well as the importance of quality in the manufacturing process.

- The tasks are designed to be performed in a systematic manner, starting from basic principles and gradually moving towards more complex applications. This ensures that the welder is well-prepared for any task that may arise in their workplace.

- The role of a welder is crucial in ensuring the quality and safety of the work produced, making it essential for them to have a strong understanding of the principles and practices involved in welding.

### Tasks

| M-1 Describe machine adjustments (voltage, amps, wire speed) | M-4 Perform weld sequence |
| M-10 Perform weld process | M-13 Perform weld technique |
| M-17 Understand welding characteristics of various shielding gases |
| M-21 Post clean welding process |
| M-23 Weld sequence, weld number, and wire type |
| M-25 Perform weld sequence |
| M-28 Demonstrate ability to lift 50 pounds |

- **Tasks**
  - M-1 Describe the welding process
  - M-4 Perform weld sequence
  - M-10 Perform weld process
  - M-13 Perform weld technique
  - M-17 Understand welding characteristics of various shielding gases
  - M-21 Post cleaning welding process
  - M-23 Weld sequence, weld number, and wire type
  - M-25 Perform weld sequence
  - M-28 Demonstrate ability to lift 50 pounds

- **Duties**
  - M-1 Describe machine adjustments (voltage, amps, wire speed)
  - M-4 Perform weld sequence
  - M-10 Perform weld process
  - M-13 Perform weld technique
  - M-17 Understand welding characteristics of various shielding gases
  - M-21 Post clean welding process
  - M-23 Weld sequence, weld number, and wire type
  - M-25 Perform weld sequence
  - M-28 Demonstrate ability to lift 50 pounds
OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Understand and apply the concepts of teams and team building;
B. Apply principles and tools of continuous quality improvement;
C. Understand the importance of quality in manufacturing process;
D. Understand the roles of team members; and,
E. Respect peer relationships.

MODULE OUTLINE:

I. Definition of Team - A group of people working together to achieve common goals and objectives
   - Teamwork is planned because it results from preparation and organization
   - The nucleus of team building is trust
   - One cornerstone of TQ is a team-based structure
   - Synergy – The whole (team) is greater than the sum of its parts (members)
I. Major elements of team synergy
   - Listening and clarifying (concentrate on what is being said)
   - Supporting (create a positive climate)
   - Quality (make a personal commitment to improve)
   - Acceptance (respect other member’s viewpoints)
   - Feedback (honest communication)
II. Achieving positive team synergy
   - Getting to know team members
III. Need for a team
   - Most problems occur across functional lines
   - 85% of teams are cross-functional
   - Change is critical to enable an organization to remain competitive in today’s world
   - Increasing quality and productivity main reasons for teams
IV. Advantages of teamwork
   - Improved skills – by accessing more talent, expertise, and technical competence
   - Improved communication – communication is both vertical and lateral, is across department lines, more ideas, mutual respect.
   - Improved participation – boosts morale, allows for buy-in to changes, higher job satisfaction
Improved effectiveness – solutions more likely to be implemented, people have process ownership

V. Team Size

A. Three basic types of teams
   1. Quality Council – Normally high level functional leaders/managers. The council is responsible for establishing and sustaining commitment, direction, and energy for the organization’s quality improvement.
   2. Work Unit – A group of employees that are responsible for the entire process, including such items as meeting technical specs, schedules, basic production problems, and interface with to some degree, with suppliers and external customers. Supervisors and functional experts take on the role as facilitators and coaches.
   3. Cross Functional – A special team put together to address specific situations that require knowledge and expertise from different fields. Team selection normally chosen from those that are affected by the problem, that possess knowledge or expertise related to the problem, and that will be involved with carrying out the solution. Cross functional teams have two distinct advantages; most use a consensus

VI. Roles of Team Members
   • Responsibilities
   • Accountability
OBJECTIVE(S):

Upon completion of this module the student will be able to:

A. Define resources that are individually held and commonly held in production operations;
B. Demonstrate how resources can be more economically applied, with greater force, and with more lasting effect if they are shared by workers; and,
C. Explain the responsibility and outcomes of sharing resources.

MODULE OUTLINE:

I. Characteristics of an Effective Team
   - The atmosphere is informal and relaxed, without obvious tension
   - Everyone participates in the discussion
   - The team’s task is understood and accepted by the members
   - Members listen to each other; each idea is given a hearing.
   - The team is comfortable with disagreement and does not avoid conflict simply to keep everything in agreement.
   - Decisions are reached by consensus.
   - Criticism is frequent, frank, and relatively comfortable with no personal attacks.
   - People are free to express their feelings and ideas on the team’s problems.
   - When action is taken, clear assignments are made and accepted.
   - The leader does not dominate, nor does the team.
   - The team is self-conscious about how it functions and examines how it is performing.
   - Team members can recognize and can work with a variety of personalities
   - Each team member is aware of the skills of the other members and how these skills can be applied to reach the team’s goals.

II. Reasons Why Teamwork and Sharing is Crucial for Effectiveness/Excellence
   - Is a crucial element of the empowerment process.
   - Allows for the pooling or complement of each others skills.
   - Not all change results in improvement.
   - A change (improvement) in one area may result in an impact for another area.

II. Conditions for an Effective Team
   - Interdependence – Working on problems that each person has a stake. Teamwork is crucial.
   - Effective leadership – The leader will take risks to improve group performance.
   - Joint Decision – All members agree to participate.
• Equal influence – Each member has an equal vote, equal say. Teams must become proficient in both problem-solving and decision making processes.

III. Three Main Roles for Team Members
• Group task. Initiator-contributor, information seeker, opinion seeker, opinion giver, elaborator, coordinator, orienter, evaluator critic, energizer, procedural technician, recorder
• Group maintenance. Encourager, harmonizer, compromiser, gate keeper and expediter, standard setter, group observer, follower.
• Individual. Team player, aggressor, blocker, recognition seeker, self-professor, playboy, dominator, help seeker, special interest pleader.

IV. Importance of sharing resources to improve mission accomplishment
OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Encourage good work ethics;
B. Maintain time and work attendance;
C. Encourage honesty, quality work and high standards; and,
D. Provide a fair rate of work at high quality for the invested time.

MODULE OUTLINE:

1. Why be concerned about work ethics?
   A technician or craftsman’s reputation has great value (to be enhanced or diminished). Responsibility to employer for quality work performed in a timely manner without defect.

2. What is a fair rate of work?
   Supply, demand, and ethics. Team roles and responsibilities.
OBJECTIVE(S):

Upon completion of this module the student will be able to:

A. Enable students to experience and solve problems with various methods and tools;
B. Encourage proper definition of the problem; and,
C. Understand root cause failure analysis.

MODULE OUTLINE:

Students will receive information on:

1. Problem definition
2. Determining facts pertaining to this problem
3. Problem indicators
4. Major considerations pertaining to the problem
5. Affinity method
6. Pareto chart
7. Cause-effect diagrams
8. The scientific method
9. Cost-benefits method
10. Creative thinking
11. Consideration of alternatives
12. Testing of recommended solutions
13. Trial and follow-up
14. Design and experiments
WLD-E7 and WLD-E8-HO
Support a Positive Attitude
Encourage Good Feelings and Morale
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Encourage an attitude of work that is geared toward positive achievement;
and,
B. Promote high morale and good feeling among the work force instead of
   negative attitudes that may become barriers.

MODULE OUTLINE:

Students will receive information on the following:
1. The basis for trust and confidence
2. Employer belief systems and outcomes in the workplace
3. Case studies where employee morale made a difference
WLD-E9 and WLD-E10-HO
Understand Purpose and Goals of the Organization
Apply Creative Thinking
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Understand the process of developing company purposes and goals; and,
B. Understand the planning and organizing of work in an organization with teams.

MODULE OUTLINE:

Students will receive information on the following:
1. The goals process
2. Company vision – a shared experience
3. Purposes of the enterprise
4. Means of accountability
5. Goods, work tasks, and work teams
6. A robust enterprise
7. The house of quality
WLD-E11, WLD-E12, and WLD-E13-HO
Be Willing to Lead in Areas of Knowledge and Expertise
Demonstrate Willingness to Learn New Methods and Skills
Demonstrate Good Personal Relations Skills
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this module the student will be able to:
A. Understand leadership and be willing to lead in areas of knowledge and expertise
B. Be willing to learn new methods and skills
C. Understand the need for good personal relations and interpersonal skills

MODULE OUTLINE:

Students will receive information on the following:
1. Definition of leadership
2. Leadership – situations and circumstances
3. Is knowledge all there is?
4. Leadership success is related to style, meeting needs, and maintaining good interpersonal relations
5. How is leadership learned?
6. Is a good leader a role model?
7. What values does the leader need?
8. Does the leader share resources and ideas?
9. Where does the leader change?
10. Are there levels of leadership and new responsibility?
11. Can leadership be distributed?
12. Does a leader need new methods and skills?
13. How important are human relations and interpersonal skills?
Welder... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

WLD-F1-HO
Exhibit Understanding of Basic Arithmetic Functions
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform operations and applications with real numbers;
B. Perform addition operations with whole numbers;
C. Perform subtraction operations with whole numbers;
D. Perform multiplication operations with whole numbers;
E. Perform division operations with whole numbers;
F. Utilize hand-held calculators for problem solving with whole numbers; and,
G. Understand the roots of numbers and the percent base.

MODULE OUTLINE:

Major Topics

I. The hand-held calculator - Operations with real numbers,
   A. Whole numbers
II. Estimation
   A. Addition and subtraction
   B. Multiplication and division
III. Problem solving: Using calculators
    A. Whole numbers
IV. The roots of numbers as the opposite of powers
V. The percent base and how to solve for each variable
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform operations and applications with fractions and decimals;
B. Perform addition operations with fractions and decimals;
C. Perform subtraction operations with fractions and decimals;
D. Perform multiplication operations with fractions and decimals;
E. Perform division operations with fractions and decimals; and,
F. Utilize hand-held calculators for problem solving with fractions and decimals.

MODULE OUTLINE:

Major Topics

I. The Hand-Held Calculator - Operations with Fractions
   A. Fractions: Percent (%) forms
II. Estimation of Fractions
   A. Addition and Subtraction
   B. Multiplication and Division
III. Problem Solving: Using Calculators
   A. Fractions: Percent (%) forms
   B. Fractions: Decimal forms
WLD-F3-H01
Demonstrate Practical Mathematics in the Use of Measurement Tools
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand Industrial Concepts of measurement;
B. Demonstrate ability to correctly solve problem applications;
C. Understand the proper utilization of measuring tools; and,
D. Demonstrate ability to properly use measuring tools.

MODULE OUTLINE:

Major Topics

I. Industrial Concepts of Measurement
   A. Approximate and Exact Numbers
   B. Precision
   C. Accuracy
   D. Tolerance
   E. Significant Numbers
   F. Absolute and Relative Error
   G. Problem Solving Applications

II. Measuring Tools and Problem Solving
   A. Tape Measure
   B. Steel Tape
   C. Vernier Caliper
   D. Micrometers
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the use of metrology in manufacturing;
b. Discuss the Inch system of measurement;
c. Discuss the Metric system of measurement;
d. Discuss semi-precision and precision measurement; and,
e. Discuss the following: precision, reliability, discrimination, and accuracy.

MODULE OUTLINE:

I. Discuss the Use of Metrology in Manufacturing
   A. Discuss the function and reason for measurements in manufacturing
   B. Discuss the changes (metrology related) in manufacturing today
      1. Interchangeable manufacture
      2. World trade
      3. High precision

II. Discuss the Inch System of Measurement
    A. Discuss fractional (scale) dimensions for linear measurement
    B. Discuss decimal dimensions for linear measurement
    C. Convert fractional to decimal
       1. Review mathematical conversion method
       2. Fractional/decimal conversion charts
    D. Practice and demonstration of skills listed above

III. Discuss the Metric System of Measurement
     A. Discuss the units of measure commonly used in the metric system
     B. Convert inch to metric
        1. Review mathematical method (1 inch = 25.4 mm)
        2. Conversion charts
     C. Practice and demonstration of skills listed above

IV. Discuss Semi-Precision and Precision Measurement
    A. Discuss the difference between semi-precision and precision measurement
       1. Semi-precision measurements are 1/64" (.5mm) or greater
       2. Precision measurements are less than 1/64" (.5mm)
    B. Discuss the five categories of precision measurement
       1. Outside measurement
       2. Inside measurement
       3. Depth measurement
       4. Thread measurement
       5. Height measurement
V. Discuss the Following Measurement Terms: Accuracy, Precision, Reliability, and Discrimination

A. **Accuracy** - whether or not something is made according to standard. (The standard for manufacturing is the blueprint.)

B. **Precision** - the degree of exactness required for an application or design requirement

C. **Reliability** - the ability to consistently obtain the desired result

D. **Discrimination** - the degree that a measuring instrument divides its basic unit of length
WLD-F3-HO3
Demonstrate Practical Mathematics in the Use of Measurement Tools
Attachment 3: MASTER Handout No. 3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Identify basic semi-precision measuring tools;
b. Identify precision measuring tools;
c. Justify use of particular measurement tools based on tool characteristics;
d. Identify error possibilities in measurement tool selection; and,
e. Demonstrate proper care of precision measuring tools.

MODULE OUTLINE:

I. Describe and Discuss the Following Semi-Precision Measuring Tools
   A. Steel rules
   B. Calipers
   C. Squares

II. Describe and Discuss the Following Precision Measuring Tools
   A. Micrometers (outside, inside and depth)
   B. Verniers (calipers and height gage)
   C. Gages (small hole, telescope, fixed, and dial bore)

III. Justify Use of Particular Measurement Tools Based on Tool Characteristics
   A. What tolerance is required by the print?
   B. What physical characteristics of the part influence tool selection?
   C. What is the discrimination of the tool?
   D. How much time is available for part measurement/inspection?
   E. Will the tool be used by itself or in conjunction with some other tool?
   F. What is the most reliable tool for this application?

IV. Identify Error Possibilities in Measurement Tool Selection
   A. Part not being produced to specifications
   B. Too much time spent trying to measure correctly by not having the right tool

V. Demonstrate Proper Care of Precision Measuring Tools
   A. Storage
   B. Handling
   C. Cleaning
WLD-F3-HO4
Demonstrate Practical Mathematics in the Use of Measurement Tools
Attachment 4: MASTER Handout No. 4

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Measure with steel rules (metric and inch);
b. Measure with micrometers;
c. Measure with comparison measuring instruments (e.g., calipers, telescope gages);
d. Measure with direct measuring instruments (e.g., vernier, dial and digital instruments); and,
e. Measure with fixed gages (go and no-go gages).

MODULE OUTLINE:

I. Discuss the Importance of Learning and Practicing Proper Measurement Techniques
   A. Show the video “Measuring Tools”
   B. Give each student a copy of the handout “Proper Measuring Techniques”

II. Discuss and Demonstrate Proper Measurement Techniques Using the Steel Rule

III. Discuss and Demonstrate the Use of Micrometer Type Measuring Instruments
    A. Outside micrometers
    B. Inside micrometers
    C. Depth micrometers
    D. Practice and demonstration of skills listed above

IV. Discuss and Demonstrate the Use of Transfer Type Measuring Instruments
    A. Spring calipers (inside and outside)
    B. Telescope gages
    C. Small hole gages
    D. Practice and demonstration of skills listed above

V. Discuss and Demonstrate the Use of Direct Measuring Instruments
    A. Vernier calipers
    B. Dial calipers
    C. Digital calipers
    D. Practice and demonstration of skills listed above

VI. Discuss the Purpose of Fixed Gages and Demonstrate Their Use
    A. Cylindrical plug and ring gages
    B. Taper plug and ring gages
    C. Snap gages
    D. Thread plug gages
    E. Practice and demonstration of skills listed above

VII. Complete Practical Exercises on all above material
Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a. No loose clothing, including ties;
   b. Long hair properly stowed;
   c. No jewelry;
   d. Hard, closed-toe shoes;
   e. Eye protection (safety glasses); and
   f. Ear protection (plugs or headset).
5. Follow all institutional safety rules
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the concepts of ratios;
B. Understand the concepts of proportions;
C. Understand the concepts of measures (linear, area, capacity, weight);
D. Show proficiency in the English system;
E. Show proficiency in the Metric system;
F. Understand Integers; and,
G. Demonstrate ability to solve problems in these areas.

MODULE OUTLINE:

Major Topics

I. The Concept of Ratios
   A. A numerical Comparison
   B. Percent as a Ratio
   C. Equivalent Fractions
   D. Problem Solving Applications

II. The Concept of Proportions
    A. The Equality of Ratios
    B. Direct Relationships
    C. Inverse Relationships
    D. Problem Solving Applications

III. Measurement Concepts: Selecting/Counting/Units
     A. Linear Measures
     B. Area Measures
     C. Capacity Measures
     D. Weight Measures

IV. The English System
V. The Metric System
VI. Problem Solving Applications
VII. The Integers
     A. The meaning of Signed Numbers
     B. The Real Number Line Graph
     C. Operations with Integers
     D. Problem Solving Applications
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the use of metrology in manufacturing;
b. Discuss the Inch system of measurement;
c. Discuss the Metric system of measurement;
d. Discuss semi-precision and precision measurement; and,
e. Discuss the following: precision, reliability, discrimination, and accuracy.

MODULE OUTLINE:

I. Discuss the Use of Metrology in Manufacturing
   A. Discuss the function and reason for measurements in manufacturing
   B. Discuss the changes (metrology related) in manufacturing today
      1. Interchangeable manufacture
      2. World trade
      3. High precision

II. Discuss the Inch System of Measurement
    A. Discuss fractional (scale) dimensions for linear measurement
    B. Discuss decimal dimensions for linear measurement
    C. Convert fractional to decimal
       1. Review mathematical conversion method
       2. Fractional/decimal conversion charts
    D. Practice and demonstration of skills listed above

III. Discuss the Metric System of Measurement
     A. Discuss the units of measure commonly used in the metric system
     B. Convert inch to metric
        1. Review mathematical method (1 inch = 25.4 mm)
        2. Conversion charts
     C. Practice and demonstration of skills listed above

IV. Discuss Semi-Precision and Precision Measurement
    A. Discuss the difference between semi-precision and precision measurement
       1. Semi-precision measurements are 1/64" (.5mm) or greater
       2. Precision measurements are less than 1/64" (.5mm)
    B. Discuss the five categories of precision measurement
       1. Outside measurement
       2. Inside measurement
       3. Depth measurement
       4. Thread measurement
       5. Height measurement
Discuss the Following Measurement Terms: Accuracy, Precision, Reliability, and Discrimination

A. **Accuracy** - whether or not something is made according to standard. (The standard for manufacturing is the blueprint.)

B. **Precision** - the degree of exactness required for an application or design requirement

C. **Reliability** - the ability to consistently obtain the desired result

D. **Discrimination** - the degree that a measuring instrument divides its basic unit of length
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Identify basic semi-precision measuring tools;
b. Identify precision measuring tools;
c. Justify use of particular measurement tools based on tool characteristics;
d. Identify error possibilities in measurement tool selection; and,
e. Demonstrate proper care of precision measuring tools.

MODULE OUTLINE:

I. Describe and Discuss the Following Semi-Precision Measuring Tools
   A. Steel rules
   B. Calipers
   C. Squares

II. Describe and Discuss the Following Precision Measuring Tools
    A. Micrometers (outside, inside and depth)
    B. Verniers (calipers and height gage)
    C. Gages (small hole, telescope, fixed, and dial bore)

III. Justify Use of Particular Measurement Tools Based on Tool Characteristics
     A. What tolerance is required by the print?
     B. What physical characteristics of the part influence tool selection?
     C. What is the discrimination of the tool?
     D. How much time is available for part measurement/inspection?
     E. Will the tool be used by itself or in conjunction with some other tool?
     F. What is the most reliable tool for this application?

IV. Identify Error Possibilities in Measurement Tool Selection
    A. Part not being produced to specifications
    B. Too much time spent trying to measure correctly by not having the right tool

V. Demonstrate Proper Care of Precision Measuring Tools
   A. Storage
   B. Handling
   C. Cleaning
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Measure with steel rules (metric and inch);
b. Measure with micrometers;
c. Measure with comparison measuring instruments (e.g., calipers, telescope gages);
d. Measure with direct measuring instruments (e.g., vernier, dial and digital instruments); and,
e. Measure with fixed gages (go and no-go gages).

MODULE OUTLINE:

I. Discuss the Importance of Learning and Practicing Proper Measurement Techniques
   A. Show the video "Measuring Tools"
   B. Give each student a copy of the handout "Proper Measuring Techniques"

II. Discuss and Demonstrate Proper Measurement Techniques Using the Steel Rule

III. Discuss and Demonstrate the Use of Micrometer Type Measuring Instruments
   A. Outside micrometers
   B. Inside micrometers
   C. Depth micrometers
   D. Practice and demonstration of skills listed above

IV. Discuss and Demonstrate the Use of Transfer Type Measuring Instruments
   A. Spring calipers (inside and outside)
   B. Telescope gages
   C. Small hole gages
   D. Practice and demonstration of skills listed above

V. Discuss and Demonstrate the Use of Direct Measuring Instruments
   A. Vernier calipers
   B. Dial calipers
   C. Digital calipers
   D. Practice and demonstration of skills listed above

VI. Discuss the Purpose of Fixed Gages and Demonstrate Their Use
   A. Cylindrical plug and ring gages
   B. Taper plug and ring gages
   C. Snap gages
   D. Thread plug gages
   E. Practice and demonstration of skills listed above

VII. Complete Practical Exercises on all above material
Rules of Conduct

1. Absolutely no horseplay or practical joking will be tolerated
2. Do not talk to anyone who is operating a machine
3. Walk only in the designated traffic lanes
4. Dress appropriately; at the absolute minimum, you must have:
   a. No loose clothing, including ties;
   b. Long hair properly stowed;
   c. No jewelry;
   d. Hard, closed-toe shoes;
   e. Eye protection (safety glasses); and
   f. Ear protection (plugs or headset).
5. Follow all institutional safety rules
WLD-F5-HO
Perform Practical Mathematical Applications
Relevant to Area of Work
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate proficiency in algebraic operations;
B. Understand Laws of Exponents;
C. Understand Scientific Notation;
D. Solve basic equations;
E. Solve formulas through substitution and with variables;
F. Solve linear equations;
G. Understand the systems of linear equations;
H. Understand the basic concepts of Trigonometry such as:
   - Ratios and right angles;
   - Naming trigonometric ratios;
   - Functions for given angles and Angles for given functions;
   - Proficiency in calculator usage to solve trig functions;
I. Understand right triangle applications;
J. Understand and solve problems in angular measures;
K. Understand and solve problems with circles;
L. Understand and solve problems with geometric shapes; and,
M. Understand and solve problems with geometric solids.

MODULE OUTLINE:

Major Topics

I. Algebraic Operations
   A. Addition of Algebraic Expressions
   B. Subtraction of Algebraic Expressions
   C. Multiplication of Algebraic Expressions
   D. Division of Algebraic Expressions
   E. Problem Solving Applications

II. Laws of Exponents
   A. Multiplication
   B. Division

III. Scientific Notation

IV. Solving Equations: Introduction
   A. Addition/Subtraction Principles
   B. Multiplication/Division Principles
   C. Combined Operations
   D. Problem Solving Applications
V. Solving Formulas: Introduction
   A. Substitution
   B. Solving for a Variable
   C. Problem Solving Applications

VI. Solving Linear Equations
   A. The Coordinate Plane
   B. Locating Points: Ordered Pairs
   C. Graphing Procedures
   D. Slope/Intercept
   E. Problem Solving Applications

VII. Solving Systems of Linear Equations
   A. Graphing Procedures
   B. Substitution Procedures
   C. Elimination of a Variable
   D. Problem Solving Applications

VIII. Introductory Trigonometry
   A. Ratios and Right Angles
   B. Naming Trigonometric Ratios
   C. Functions for Given Angles
   D. Angles for Given Functions
   E. Calculator Skills with Trig Functions
   F. Problem Solving Applications

IX. The Right Triangle-Applications
   A. Ratios and Proportions
   B. Problem Solving Techniques
   C. Problem Solving Applications

X. Angular Measures
   A. The Protractor/Units
   B. Naming Angles/Triangles
   C. The Pythagorean Theorem
   D. Complimentary/Supplementary Angles
   E. Problem Solving Applications

XI. The Circle
   A. Properties of Circles - Common Terms
   B. Circumference
   C. Arc Length/Cords/Tangents
   D. Problem Solving Applications

XII. Geometric Shapes - Area Measures
   A. The Circle: Sectors and Segments
   B. The Ellipse
   C. Common Polygons
   D. Problem Solving Applications

XIII. Geometric Solids: Surface Area, Volume, and Weights
   A. Cylinders and Prisms
   B. Cones and Pyramids
C. Spheres and Composite Solids
D. Problem Solving Applications
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the interpretation of graphs, and,
B. Construct various graphs.

MODULE OUTLINE:

Major Topics

I. The Interpretation of Graphs
   A. The Purpose of Graphs
   B. The Structure of Graphs
   C. Reading Graphs
II. The Construction of Graphs
   A. Bar Graphs
   B. Line Graphs
   C. Broken-Line Graphs
   D. Curve-Line Graphs
   E. Problem Solving Applications
WELDER... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand job method plan; and,
B. Understand blueprint requirements.

MODULE OUTLINE:

Instruction Topics:
- a) Identify symbols and specifications
- b) Add, subtract, multiply and divide whole numbers, fractions and decimals
- c) Convert SI (metric) to US (customary) units and vice versa
- d) Use calculator to perform basic arithmetic operations
- e) Use standard tapes, rules and square
- f) Use angle devices, such as inclinometer and protractor
- g) Determine weld requirements for specific material
- h) Perform measurement and inspection
- i) Identify error possibilities within measurement procedures
- j) Identify calibration requirements of various precision instruments
- k) Alloys and selection of proper welding rod

Student Activities:
- a) Review blueprints and/or drawings
- b) Perform measurements with precision instruments
- c) Find angles with precision instruments
- d) Review the benefit of a jig or fixture to increase production and accuracy
- e) Identify alloy of parent metal
- f) Identify alloy for welding rod to be compatible with parent metal
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review work orders, standard procedures, codes and requirements; and,
B. Make changes to paperwork when necessary.

MODULE OUTLINE:

Instruction Topics:

a) Identify symbols and specifications  
b) Work orders  
c) Production planning  
d) Job tickets or packets  
e) Obtaining proper materials and alloys

Student Activities (in practical exercise format):

a) Review blueprints and/or drawings  
b) Review codes and specifications  
c) Follow job order process  
d) Ordering and casting of appropriate materials  
e) Complete production planning
WLD-G3-HO1
Interpret Drawings and Blueprints
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand information given from a blueprint or drawing;
B. Understand lines, letter descriptions and abbreviations;
C. Understand types of projections; and,  
D. Understand section views.

MODULE OUTLINE:

Instruction Topics:
  a) Identify symbols and specifications  
  b) The layouts of blueprints  
  c) Lines and abbreviations  
  d) Special instructions for welders

Student Activities:
  a) Review blueprints and/or drawings  
  b) Prepare a drawing for an assigned welding project
WLD-G3-HO2
Interpret Drawings and Blueprints
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Identify organizations that classify metals;
b. Distinguish between types of metal by manufacturing method and/or shape;
c. Identify designation of each digit of a metal classification;
d. Identify carbon and alloy content of a metal using classification system;
e. Identify content of an unknown metal using shop tests; and,
f. Identify conformity of a metal to a specification system.

MODULE OUTLINE:

I. Identify the Organizations That Classify Metals and Discuss the Significance of Each
   A. American Iron and Steel Institute (AISI)
   B. Society of Automotive Engineers (SAE)
   C. American Society for Testing and Materials (ASTM)
   D. American National Standards Institute (ANSI)
   E. Aluminum Association

II. Identify Classifications by Manufacturing Methods or Processes
    A. Hot rolled
    B. Cold rolled
    C. Turned and polished (sometimes referred to as ground and polished)
    D. Castings
    E. Forgings
    F. Galvanized

III. Identify Classifications by Shape
     A. Sheet and plate
     B. Bar stock
     C. Pipe and tubing
     D. Rod and wire
     E. Coil or strip
     F. Structural steel

IV. Discuss the AISI-SAE Numbering Systems for Carbon Steels
    A. Plain carbon steels (AISI-SAE 10xx and 15xx)
    B. Free-cutting steels (AISI-SAE 11xx and 12xx)

V. Discuss the AISI-SAE Classification Systems for Alloy Steels
    A. Manganese steels (AISI-SAE 13xx)
    B. Nickel steels (AISI-SAE 2xxx)
    C. Nickel-chromium steels (AISI-SAE 3xxx)
    D. Molybdenum steels (AISI-SAE 4xxx)
    E. Low chromium steels (AISI-SAE 5xxx)
VI. Discuss the AISI-SAE Classification of Stainless Steels
   A. Chromium-nickel austenitic steels (SAE 30xxx or AISI 20x and 3xx)
   B. Ferritic chromium steels (SAE 5 bxxx or AISI 4xx and 50x)
   C. Martensitic chromium steels (SAE 5lxxx or AISI 4xx and 50x)

VII. Discuss the AISI Classification of Tool Steels
    A. High speed tool steels (AISI type M and T)
    B. Hot work tool steels (AISI type H)
    C. Cold work tool steels (AISI type D, A, and O)
    D. Shock resisting tool steels (AISI type S)
    E. Mold steels (AISI type P)
    F. Special purpose tool steels (AISI type L and F)
    G. Water hardening tool steels (AISI type W)

VIII. Discuss the Classification of Nonferrous Alloys
    A. Aluminum and aluminum alloys (Aluminum Association four digit system)
    B. Magnesium alloys (SAE type 5x and 5xx)
    C. Nickel and nickel alloys (by name)
    D. Titanium and titanium alloys (titanium and chief alloying element)
    E. Copper and copper alloys (by name and SAE standard number)

IX. Discuss the Classification of Castings
    A. Brass and bronze castings (SAE standard number)
    B. Aluminum casting alloys (Aluminum Association four digit system)
    C. Cast Iron (ASTM grade)
    D. Steel Castings (ASTM grade)

X. Discuss the Unified Numbering System (UNS) for Metals and Alloys

XI. Discuss the Basic Identification of an Unmarked Piece of Steel Using Shop Tests
    A. Observation
    B. Magnet test
    C. Hardness test
    D. Scratch test
    E. File test
    F. Chemical test
    G. Spark test

XII. Identify Specification Systems for Metals and Alloys
     A. American Society for Testing and Materials (ASTM)
     B. American National Standards Institute (ANSI)
     C. U.S. Department of Defense (military specifications)
     D. General Accounting Office (federal specifications)

List of Materials for Shop Tests and Illustration

1. **Observation Test**  
   Sample of round bars with various surface finishes (cold finished, hot rolled, ground and polished)

2. **Magnet Test**  
   Sample of carbon steel, ferritic or martensitic stainless steel, austenitic stainless steel, aluminum, and nickel steel

3. **Hardness Test**  
   Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

4. **Scratch Test**  
   Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

5. **File Test**  
   Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

6. **Chemical Test**  
   Sample of carbon steel, type 302 or 304 stainless steel, type 316 or 317 stainless steel

7. **Spark Test**  
   Sample of low carbon steel, high carbon steel, cast iron, high speed steel, tool steel, and manganese steel

8. **Observation Test**  
   Samples of bar stock (round and square), hot rolled sheet, cold finished coil strip, galvanized sheet, small diameter pipe, small diameter tubing, small gauge wire, hot rolled rod, and cold finished rod
WLD-G3-LE
Interpret Drawings and Blueprints
Attachment 7: MASTER Laboratory Exercise

1. The instructor will:
   a. Demonstrate use of drafting machine;
   b. Demonstrate use of drafting instruments;
   c. Demonstrate drafting techniques to create basic geometric elements;
   d. Demonstrate sketching techniques, including:
      (1) Isometric sketching;
      (2) Oblique sketching; and,
      (3) One-point and two-point perspective sketching.

2. The student will:
   a. Demonstrate use of drafting machine;
   b. Demonstrate use of drafting instruments;
   c. Demonstrate drafting techniques to create basic geometric elements, which include:
      (1) Bisecting a line or a circular arc;
      (2) Bisecting an angle and to transfer an angle;
      (3) Constructing a line parallel to a given line at a given distance;
      (4) Dividing a line into equal or proportional parts;
      (5) Constructing a triangle with the length of the sides given;
      (6) Inscribing a circle in a triangle;
      (7) Constructing a right triangle with hypotenuse and one side given;
      (8) Constructing a line through a point and perpendicular to a given line at the prescribed point and from a point off the given line;
      (9) Constructing a square with a side given;
      (10) Inscribing a regular pentagon in a given circle;
      (11) Inscribing and circumscribing a hexagon on a given circle;
      (12) Inscribing an octagon in a given square;
      (13) Constructing a circle through three given points not in a straight line;
      (14) Constructing a circle of a given size tangent to a given line and passing through a given point;
      (15) Constructing a circle tangent to a given line at a prescribed point on that line and passing through a given point not on that line;
      (16) Constructing a circle of a given size tangent to a given circle and passing through a given point;
      (17) Constructing an arc of a given size tangent to two given intersecting lines at acute or obtuse angles;
      (18) Constructing a given size circle tangent to two given circles;
      (19) Constructing an ellipse using the concentric circle method with major and minor diameters given;
(20) Construct an approximate ellipse with major and minor diameters given;

d. Demonstrate sketching techniques, including:
   (1) Isometric sketching;
   (2) Oblique sketching; and,
   (3) One-point and two-point perspective sketching.

3. The instructor will grade the student's performance on the student's ability to:
   a. Demonstrate use of drafting machine;
   b. Demonstrate use of drafting instruments;
   c. Demonstrate drafting techniques to create basic geometric elements, which include:
      (1) Bisecting a line or a circular arc;
      (2) Bisecting an angle and to transfer an angle;
      (3) Constructing a line parallel to a given line at a given distance;
      (4) Dividing a line into equal or proportional parts;
      (5) Constructing a triangle with the length of the sides given;
      (6) Inscribing a circle in a triangle;
      (7) Constructing a right triangle with hypotenuse and one side given;
      (8) Constructing a line through a point and perpendicular to a given line at the prescribed point and from a point off the given line;
      (9) Constructing a square with a side given;
      (10) Inscribing a regular pentagon in a given circle;
      (11) Inscribing and circumscribing a hexagon on a given circle;
      (12) Inscribing an octagon in a given square;
      (13) Constructing a circle through three given points not in a straight line;
      (14) Constructing a circle of a given size tangent to a given line and passing through a given point;
      (15) Constructing a circle tangent to a given line at a prescribed point on that line and passing through a given point not on that line;
      (16) Constructing a circle of a given size tangent to a given circle and passing through a given point;
      (17) Constructing an arc of a given size tangent to two given intersecting lines at acute or obtuse angles;
      (18) Constructing a given size circle tangent to two given circles;
      (19) Constructing an ellipse using the concentric circle method with major and minor diameters given;
      (20) Construct an approximate ellipse with major and minor diameters given.

d. Demonstrate sketching techniques, including:
   (1) Isometric sketching;
   (2) Oblique sketching; and,
   (3) One-point and two-point perspective sketching.

III. Answer the following questions:

A. What is the out-of-round tolerance for 2-1/2" diameter hot rolled bar?

B. What is the size tolerance for 1-3/4" cold finished hexagon bar made from 1045?

C. If the only requirements given you were 1" 1018 square bar with a size tolerance of -.006, would you choose hot rolled (much cheaper) or cold finished stock?
IV. Record the results of your shop test below.

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand specifications and procedures; and,
B. Understand tolerances, defects, and discontinuities.

MODULE OUTLINE:

Instruction Topics:

a) Identify symbols and specifications  
b) Accepted procedures for types of welding operations (sources)  
c) Dimensioning tolerancing  
d) Weld defects and discontinuities  
e) Weld quality standards

Student Activities:

a) View blueprints and/or drawings  
b) See examples of weld defects and discontinuities
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Identify organizations that classify metals;
b. Distinguish between types of metal by manufacturing method and/or shape;
c. Identify designation of each digit of a metal classification;
d. Identify carbon and alloy content of a metal using classification system;
e. Identify content of an unknown metal using shop tests; and,
f. Identify conformity of a metal to a specification system.

MODULE OUTLINE:

I. Identify the Organizations That Classify Metals and Discuss the Significance of Each
   A. American Iron and Steel Institute (AISI)
   B. Society of Automotive Engineers (SAE)
   C. American Society for Testing and Materials (ASTM)
   D. American National Standards Institute (ANSI)
   E. Aluminum Association

II. Identify Classifications by Manufacturing Methods or Processes
   A. Hot rolled
   B. Cold rolled
   C. Turned and polished (sometimes referred to as ground and polished)
   D. Castings
   E. Forgings
   F. Galvanized

III. Identify Classifications by Shape
   A. Sheet and plate
   B. Bar stock
   C. Pipe and tubing
   D. Rod and wire
   E. Coil or strip
   F. Structural steel

IV. Discuss the AISI-SAE Numbering Systems for Carbon Steels
   A. Plain carbon steels (AISI-SAE 10xx and 15xx)
   B. Free-cutting steels (AISI-SAE 11xx and 12xx)

V. Discuss the AISI-SAE Classification Systems for Alloy Steels
   A. Manganese steels (AISI-SAE 13xx)
   B. Nickel steels (AISI-SAE 2xxx)
   C. Nickel-chromium steels (AISI-SAE 3xxx)
   D. Molybdenum steels (AISI-SAE 4xxx)
   E. Low chromium steels (AISI-SAE 5xxx)
   F. Other alloy steels (AISI-SAE 6xxx, 8xxx, and 9xxx)

VI. Discuss the AISI-SAE Classification of Stainless Steels
A. Chromium-nickel austenitic steels (SAE 30xxx or AISI 20x and 3xx)
B. Ferritic chromium steels (SAE 5 lxxx or AISI 4xx and 50x)
C. Martensitic chromium steels (SAE 5lxxx or AISI 4xx and 50x)

VII. Discuss the AISI Classification of Tool Steels
A. High speed tool steels (AISI type M and T)
B. Hot work tool steels (AISI type H)
C. Cold work tool steels (AISI type D, A, and O)
D. Shock resisting tool steels (AISI type S)
E. Mold steels (AISI type P)
F. Special purpose tool steels (AISI type L and F)
G. Water hardening tool steels (AISI type W)

VIII. Discuss the Classification of Nonferrous Alloys
A. Aluminum and aluminum alloys (Aluminum Association four digit system)
B. Magnesium alloys (SAE type 5x and 5xx)
C. Nickel and nickel alloys (by name)
D. Titanium and titanium alloys (titanium and chief alloying element)
E. Copper and copper alloys (by name and SAE standard number)

IX. Discuss the Classification of Castings
A. Brass and bronze castings (SAE standard number)
B. Aluminum casting alloys (Aluminum Association four digit system)
C. Cast Iron (ASTM grade)
D. Steel Castings (ASTM grade)

X. Discuss the Unified Numbering System (UNS) for Metals and Alloys

XI. Discuss the Basic Identification of an Unmarked Piece of Steel Using Shop Tests
A. Observation
B. Magnet test
C. Hardness test
D. Scratch test
E. File test
F. Chemical test
G. Spark test

XII. Identify Specification Systems for Metals and Alloys
A. American Society for Testing and Materials (ASTM)
B. American National Standards Institute (ANSI)
C. U.S. Department of Defense (military specifications)
D. General Accounting Office (federal specifications)
WLD-G4-HO3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss classification system for metals; and,

b. Describe general characteristics for carbon steels, tool steels, stainless steels, structural steels, cast irons, aluminum, and other commonly used metals.

MODULE OUTLINE:

I. Discuss the Physical Properties of Metal
   A. Brittleness - the property of a metal which permits no permanent distortion before breaking
   B. Ductility - the ability of the metal to be permanently deformed without breaking
   C. Elasticity - the ability of a metal to return to its original shape after any force acting upon it has been removed
   D. Hardness - the resistance to forcible penetration
   E. Malleability - the property of a metal which permits it to be hammered or rolled into other sizes and shapes
   F. Tensile strength - the maximum amount of pull that a material will withstand before breaking
   G. Toughness - the property of a metal to withstand shock or impact

II. Discuss the Classification System for Steel
   A. Carbon steels
      1. Low carbon steel - contains from 0.02 to 0.20 percent of carbon
      2. Medium carbon steel - contains from 0.30 to 0.60 percent of carbon
      3. High carbon steel (tool steel) - contains over 0.60 percent of carbon
   B. Alloy steels - alloying elements allow steels to possess special characteristics
   Discuss Table 1.1 "Effects of Alloying Elements on Steel"
   Discuss Table 1.2 "SAE-ANSI Numerical Designation of Alloy Steels"

III. Describe General Characteristics For:
   A. Carbon Steels
   B. Tool Steels
   C. Stainless Steels
   D. Structural Steels
   E. Cast Irons
   F. Non-Ferrous Metals
      1. Aluminum and Its Alloys
      2. Copper and Its Alloys
      3. Nickel Alloys
      4. Precious Metals
      5. Others

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Briefly describe and list the advantages and disadvantages for each of the following: casting processes, hot working processes, and cold working processes;

b. Discuss service requirements (strength, hardness, etc.);

c. Discuss fastening processes (fasteners, welding, bonding, etc.); and,

d. Discuss corrosion resistance methods.

MODULE OUTLINE:

I. Describe Casting Processes
   A. Discuss the following casting processes: sand, evaporative, shell molding, permanent mold, centrifugal, investment, and die casting
   B. Discuss pattern and mold design factors for each of the above casting processes
   C. List the advantages and disadvantages of the casting processes

II. Describe Hot Working Processes
   A. Discuss the following hot working processes: rolling, strand casting, forging, drawing, extrusion, spinning, and roll forming
   B. List the advantages and disadvantages of the hot working processes

III. Describe Cold Working Processes
   A. Discuss the following cold working processes: rolling, blanking, pressing, drawing, extruding, wire and bar drawing, bending, shearing, and roll forming
   B. List the advantages and disadvantages of the cold working process

IV. Evaluate Alternative Manufacturing Processes
   A. Discuss the powder metallurgy process (PM)
   B. Discuss the following nontraditional machining processes: EDM, laser machining, ultrasonic machining, hydrojet machining, electron beam machining, and plasma beam machining
List of Materials for Shop Tests and Illustration

1. **Observation Test**  
Sample of round bars with various surface finishes (cold finished, hot rolled, ground and polished)

2. **Magnet Test**  
Sample of carbon steel, ferritic or martensitic stainless steel, austenitic stainless steel, aluminum, and nickel steel

3. **Hardness Test**  
Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

4. **Scratch Test**  
Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

5. **File Test**  
Sample of mild steel, medium carbon steel, high carbon steel, alloy steel, and tool steel

6. **Chemical Test**  
Sample of carbon steel, type 302 or 304 stainless steel, type 316 or 317 stainless steel

7. **Spark Test**  
Sample of low carbon steel, high carbon steel, cast iron, high speed steel, tool steel, and manganese steel

8. **Observation Test**  
Samples of bar stock (round and square), hot rolled sheet, cold finished coil strip, galvanized sheet, small diameter pipe, small diameter tubing, small gauge wire, hot rolled rod, and cold finished rod

WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Duties

| A.1 | Describe/Understand safety rules, adherence and responsibilities. |
| A.2 | Describe personal safety equipment and their importance. |
| A.3 | Describe the importance of the welding process. |
| A.4 | Describe the processes and equipment used. |
| A.5 | Describe the impact of welding equipment on environmental parameters and their effects on workers. |
| A.6 | Draw and interpret the process and equipment used. |
| A.7 | Describe the impact of welding equipment on environmental parameters. |
| A.8 | Draw and interpret the process and equipment used. |
| A.9 | Draw and interpret the process and equipment used. |
| A.10 | Draw and interpret the process and equipment used. |
| A.11 | Draw and interpret the process and equipment used. |

### Tasks

| B.1 | Practice the planning, layout, and operation of welding equipment. |
| B.2 | Practice the planning, layout, and operation of welding equipment. |
| B.3 | Practice the planning, layout, and operation of welding equipment. |
| B.4 | Practice the planning, layout, and operation of welding equipment. |

*Note: The table continues with similar entries for other duties and tasks.*
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

**WELDER**

**Tasks**

| **M-14** | Demonstrate machine adjustments (voltage, amps, wire speed) |
| **M-15** | Perform weld sequence |
| **M-16** | Control weld technique |
| **M-17** | Understand welding characteristics of various shielding gases |
| **M-18** | Post-class weld |
| **M-19** | Perform interpass preparation |
| **M-20** | Demonstrate short circuit GMAW, stick, horizontal, vertical, and overhead welds |
| **M-21** | Post-tack weld |
| **M-22** | Describe GMAW filler wires |
| **M-23** | Describe basic weld discontinuities |

**WELDER**

**Duties**

| **M2** | OMAW Short Circuit Transfer (Intermediate) |
| **M3** | OMAW Spray and Pulsed Spray, Pulsed Transfer (Advanced) |
| **N**  | Gas Metal Arc Welding (GMAW) (Basic) |
| **O1** | Gas Tungsten Arc Welding (GTAW) (Basic) |
| **O2** | Gas Tungsten Arc Welding (GTAW) (Advanced) |
| **P**  | Plasma Arc Cutting and Welding Processes |
| **Q**  | In-Process Weld Inspection |
| **R**  | In-Process Review |
| **S**  | Hourly Reports and Activities |
| **T**  | Emergency Preparedness and Recordkeeping |
| **U**  | Wellness/Physical Abilities |
OBJECTIVE(S):  

Upon completion of this unit the student will be able to:  
A. Introduce related terms and definitions;  
B. Define proper terms and definitions;  
C. Define lines, dimensions and notes;  
D. Perform metric conversions;  
E. Discuss orthographic views;  
F. Interpret blueprint information; and,  
G. Depict proper layout.  

PRESENTATION OUTLINE:  

Instructional Topics:  
A. Review the use of jigs and fixtures in layout and fitup  
B. Demonstrate how to use the reference on a blueprint  
C. Lines, dimensions and notes  
D. Demonstrate how to scribe a line using a square and a protractor  
E. Illustrate how to use the print to find angles  
F. Define the following: precision, reliability and accuracy  
G. Define tolerance and how to find it on a blueprint  
H. Metrics for welders  
I. Demonstrate semi-precision measurements techniques  
J. Discuss the importance of the tolerance  
K. Discriminate between accepted measurement procedures and improper measurement procedures  
L. Explain calibration requirements of various precision instruments  
M. Illustrate where to locate measurements  

Student Activities:  
A. Frame and scribe parts for welding and cutting  
B. Use measuring techniques on parts  
C. Produce a drawing which includes weld symbols
WLD-H1-HO2
Understand Parts of Blueprint
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
      1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
   5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
Describe Alphabet of Lines

Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify orthographic views;
B. Understand standard drawing lines and symbols; and,
C. Interpret blueprint information.

MODULE OUTLINE:

Instructional Topics:
A. Present basic lines and views
B. Locations and alignment of views
C. Review print notes, dimensions and symbols
   1) Interpret AWS standard welding symbols
   2) List essential components found in general notes on drawing
   3) Determine acceptable tolerances for drawing
   4) Determine code requirements, process and procedure requirements required by drawing
   5) Interpret multi-view drawings
   6) Work from drawings
D. Identify basic layouts of drawings
E. Interpret drawing lines, views, and symbols
F. Interpret welding symbols
G. Convert metric to English
H. Understand print specifications
I. List assembly procedure per print
J. Understand various types of welding prints
K. Visualize final weldment from print
L. List flaws and mistakes on drawings
M. Interpret AWS standard welding symbols

Student Activities:
A. Use basic sketching techniques
B. Frame and scribe parts for welding and cutting
C. Use measuring techniques on parts
D. Produce a drawing which includes weld symbols
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
       1. Straightness
IV. Explain and Use Profile Tolerances
   A. Explain profile tolerance
   B. Identify and use profile tolerance symbols
      1. Profile of a line
      2. Profile of a surface
      3. Profile of an arc
      4. Profile of irregular curves
      5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
   A. Explain orientation tolerances
   B. Identify and use orientation tolerance symbols
      1. Parallelism
      2. Perpendicularity
      3. Angularity

VI. Explain and Use Runout Tolerances
   A. Explain runouts
      1. Circular
      2. Total
   B. Identify and use runout tolerances symbols
      1. Circular
      2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
   A. Maximum Material Condition (MMC)
   B. Regardless of Feature Size (RFS)
   C. Least Material Condition (LMC)
   D. Datum feature symbol
   E. Datum reference frame concept
      1. Primary datum plane
      2. Secondary datum plane
      3. Tertiary datum plane
   F. Datum target symbol
      1. Target point
      2. Target line
      3. Target area

VIII. Explain and Use the Feature Control Frame
   A. Explain feature control frame
   B. Explain the compartments of a feature control frame
      1. Geometric characteristic symbol
      2. Geometric tolerance
      3. Zone descriptor
      4. Material condition symbol
      5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Countersink/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Countersink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the function of measurement tools;
B. Demonstrate the capabilities of shop lay-out tools; and,
C. Understand related terms and definitions.

PRESENTATION OUTLINE:

Instructional Topics:
A. Review the use of jigs and fixtures in layout and fitup
B. Demonstrate how to use the reference on a blueprint
C. Demonstrate how to scribe a line using a square and a protractor
D. Illustrate how to use the print to find angles
E. Define the following: precision, reliability and accuracy
F. Define tolerance and how to find it on a blueprint
G. Demonstrate semi-precision measurements techniques
H. Demonstrate use of steel rules, tapes, micrometers, and vernier calipers
I. Discuss the importance of the tolerance
J. Discriminate between accepted measurement procedures and improper measurement procedures
K. Explain calibration requirements of various precision instruments
L. Illustrate where to locate measurements

Student Activities:
A. Frame and scribe parts for welding and cutting
B. Use measuring techniques on parts
C. Practice use of measurement tools with measurement exercises assigned by the instructor
D. Interpret engineering drawings provided by the instructor
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;

b. Interpret and apply general and specific notes;

c. Determine and apply dimensions on a drawing;

d. Identify basic symbols and abbreviations found on a drawing;

e. Identify tolerances or limits on a drawing; and,

f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
   a. Unidirectional system
   b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and sizes
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
   6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;

b. Explain and use geometric positional tolerancing and symbols;

c. Explain and use tolerances of form and symbols;

d. Explain and use the feature control symbol; and,

e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing

A. General/conventional tolerancing
   1. Definitions of general/conventional tolerancing
      a. Dimension
      b. Reference dimension
      c. Feature
      d. Feature of size
      e. Actual size
      f. Stock size
   2. Maximum material condition
   3. Least material condition
   4. Basic fits
   5. Clearance fit
   6. Allowance
   7. Clearance
   8. Force fit

B. Geometric dimensioning and tolerancing
   1. Definition of geometric dimensioning and tolerancing
   2. Dimensioning rules
   3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols

A. Explain positional / location tolerances

B. Identify and use geometric position tolerancing symbols
   1. Position
   2. Concentricity
   3. Symmetry

III. Explain and Use Tolerances of Form Symbols

A. Explain form tolerances

B. Identify and use tolerances of form symbols
   1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
   5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols

A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the use of shop lay-out tools in a safe manner;
B. Understand the function of shop lay-out tools; and,
C. Demonstrate the capabilities of shop lay-out tools.

MODULE OUTLINE:

Instructional Topics:
A. Review the use of jigs and fixtures in layout and fitup
B. Demonstrate how to use references on a blueprint
C. Demonstrate the application of the framing square
D. Demonstrate how to scribe a line using a square and a protractor
E. Illustrate how to use the print to find angles
F. Define the following: precision, reliability and accuracy
G. Define tolerance and how to find it on a blueprint
H. Demonstrate semi-precision measurements techniques
I. Understand the difference between accepted measurement procedures and improper measurement procedures
J. Illustrate where to locate measurements

Student Activities:
A. Frame and scribe parts for welding and cutting
B. Use measuring techniques on parts
C. Layout a welding job with framing square, jigs, and fixtures
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
      1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
   5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
WLD-H5-H01
Use Level and Other Devices to Verify Layout
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the use and care of shop lay-out tools; and,
B. Perform leveling methods related to part lay-out for sheet metal, structural and pipe fabrication.

MODULE OUTLINE:

Instructional Topics:
A. Review the use of jigs and fixtures in layout and fitup
B. Demonstrate how to use levels and squaring tools
C. Illustrate how to use the print to establishing layout
D. Demonstrate semi-precision measurements techniques
E. Discuss the importance of fixturing to insure alignment

Student Activities:
A. Use of levels and squaring tools
B. Use measuring techniques on parts
C. Produce a sketch or drawing of the fit-up workplace
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing, and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
   a. Unidirectional system
   b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
1. General tolerances
2. Limit dimensioning
3. Plus and minus dimensioning
   a. Unilateral system
   b. Bilateral system
4. Single-limit dimensioning
5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
    A. Explain positional / location tolerances
    B. Identify and use geometric position tolerancing symbols
       1. Position
       2. Concentricity
       3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
       1. Straightness
IV. Explain and Use Profile Tolerances
   A. Explain profile tolerance
   B. Identify and use profile tolerance symbols
      1. Profile of a line
      2. Profile of a surface
      3. Profile of an arc
      4. Profile of irregular curves
      5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
   A. Explain orientation tolerances
   B. Identify and use orientation tolerance symbols
      1. Parallelism
      2. Perpendicularity
      3. Angularity

VI. Explain and Use Runout Tolerances
   A. Explain runouts
      1. Circular
      2. Total
   B. Identify and use runout tolerances symbols
      1. Circular
      2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
    A. Maximum Material Condition (MMC)
    B. Regardless of Feature Size (RFS)
    C. Least Material Condition (LMC)
    D. Datum feature symbol
    E. Datum reference frame concept
       1. Primary datum plane
       2. Secondary datum plane
       3. Tertiary datum plane
    F. Datum target symbol
       1. Target point
       2. Target line
       3. Target area

VIII. Explain and Use the Feature Control Frame
      A. Explain feature control frame
      B. Explain the compartments of a feature control frame
         1. Geometric characteristic symbol
         2. Geometric tolerance
         3. Zone descriptor
         4. Material condition symbol
         5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand concept related to work area preparation;
B. Understand drawing, sketching and specifications; and,
C. Interpret shop drawings.

MODULE OUTLINE:

Instructional Topics:
A. Interpretation of linear and angular dimensions
B. Use of fractional dimensions and decimal fractions
C. Terms for hole preparation - drill, ream, or flame cut
D. Dimensioning chambers and bevels
E. Dimensioning radius and arc
F. Use of tolerance dimensions
G. Use of thread dimensions
H. Symbols or geometric tolerancing and dimensioning

Student Activities:
A. Interpret engineering drawings by answering questions in each area represented
B. Prepare a sketch that will be critiqued by others in the class for specific meaning and clarity
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
    a. Diamond
    b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
  1. General tolerances
  2. Limit dimensioning
  3. Plus and minus dimensioning
     a. Unilateral system
     b. Bilateral system
  4. Single-limit dimensioning
  5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
      1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
   A. Explain profile tolerance
   B. Identify and use profile tolerance symbols
      1. Profile of a line
      2. Profile of a surface
      3. Profile of an arc
      4. Profile of irregular curves
      5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
   A. Explain orientation tolerances
   B. Identify and use orientation tolerance symbols
      1. Parallelism
      2. Perpendicularity
      3. Angularity

VI. Explain and Use Runout Tolerances
   A. Explain runouts
      1. Circular
      2. Total
   B. Identify and use runout tolerances symbols
      1. Circular
      2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
    A. Maximum Material Condition (MMC)
    B. Regardless of Feature Size (RFS)
    C. Least Material Condition (LMC)
    D. Datum feature symbol
    E. Datum reference frame concept
       1. Primary datum plane
       2. Secondary datum plane
       3. Tertiary datum plane
    F. Datum target symbol
       1. Target point
       2. Target line
       3. Target area

VIII. Explain and Use the Feature Control Frame
     A. Explain feature control frame
     B. Explain the compartments of a feature control frame
        1. Geometric characteristic symbol
        2. Geometric tolerance
        3. Zone descriptor
        4. Material condition symbol
        5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols

A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
Objective(s):
Upon completion of this unit the student will be able to:

a. Identify types of drawings;
b. Identify parts of a drawing and list components of each;
c. Identify types of lines on a drawing;
d. List and describe the different views found on a drawing;
e. List and apply the three primary planes of projection;
f. List and apply the six principal views;
g. Apply auxiliary views, and,
h. Apply sectional views.

Module Outline:

I. Interpret and Understand Basic Layout of Drawings
   A. ANSI & ISO sheet size layout
   B. ANSI & ISO forms of lettering arrangements

II. Interpret and Understand Types of Drawings
   A. Orthographic and multi-view projection
   B. Perspective or central projection
   C. Oblique projection
   D. Axonometric projection

III. Identify Parts of a Blue Print/Drawing and List Components of Each
   A. Body
   B. Title block
      1. Drawing number
      2. Drawing title
      3. Scale
      4. Signatures
      5. Job number
      6. Material list number
      7. Reference drawings
      8. Distribution section
      9. Revision
      10. Work order number
   C. Bill of Materials
      1. Piece mark number
      2. Number of pieces required for each piece mark
      3. Description of materials
      4. Traceability requirements
      5. Material specifications
6. Length
7. Gross weight
8. Total weight

IV. Identify Types of Lines on a Drawing
A. Visible line
B. Hidden line
C. Center line
D. Section line
E. Dimension line
F. Extension line.
G. Leaders line
H. Cutting plane/viewing plane line
I. Short-break line
J. Long-break line
K. Phantom line
L. Stitch line
M. Chain line
N. Cylindrical break/conventional break lines

V. List and Describe the Different Views Found on a Drawing
A. One view
   1. Sphere
   2. Plate
B. Two view
   1. Cylinder
   2. Rectangle
C. Three view
   1. Pyramids
   2. Multi-view projection

VI. List and Apply the Three Primary Planes of Projection
A. Frontal projection plane
B. Profile projection plane
   1. Right side
   2. Left side
C. Horizontal projection plane

VII. List and Apply the Six Principal Views
A. Front view
B. Rear view
C. Right side view
D. Left side view
E. Top view
F. Bottom view

VIII. List and Apply Auxiliary Views
A. Surfaces needing auxiliary views
   1. Inclined surfaces
   2. Oblique surfaces
B. Primary auxiliary views
C. Secondary auxiliary views
D. To generate an auxiliary view
  1. Folding-line method
  2. Reference-plane method
E. Classifications of auxiliary views
  1. Depth auxiliary views
  2. Height auxiliary views
  3. Width auxiliary views
F. Dihedral angles
G. Partial auxiliary views
H. Half auxiliary views
I. Auxiliary sections
J. Basic four uses of auxiliary views
  1. True length of line
  2. Point view of line
  3. Edge view of plane
  4. True size of plane

IX. List and Apply Sectional Views
A. Need for sectional views
B. Cutting plane
  1. Direction
  2. Labels
  3. Alternate styles
C. Section lining
  1. Techniques
  2. Symbols
D. Types of sectional views
  1. Full section
  2. Half/partial section
  3. Broken-out section
  4. Revolved section
  5. Removed section
  6. Offset section
  7. Aligned section
  8. Auxiliary section
  9. Partial section
Demonstrate Knowledge of Welding Symbols
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the basic elements if the A.W.S. Welding Symbol System;
B. Identify welding symbols for basic joints for weldment fabrication;
C. Use fillet weld in combination with other symbols;
D. Understand supplementary symbols and arrangements;
E. Understand plug and slot-weld symbols;
F. Understand spot weld and seam weld symbols;
G. Understand groove weld symbols;
H. Understand backing, back, melt through and surfacing symbols;
I. Understand flange and combination weld symbols; and,
J. Compare AWS symbols to international symbols.

MODULE OUTLINE:

Instructional Topics:
A. Present the basic elements if the A.W.S. Welding Symbol System
B. Present welding symbols for basic joints for weldment fabrication
C. Present fillet weld in combination with other symbols
D. Present supplementary symbols and arrangements
E. Present plug and slot-weld symbols
F. Present spot weld and seam weld symbols
G. Present groove weld symbols
H. Present backing, back, melt through and surfacing symbols
I. Present flange and combination weld symbols
J. Compare AWS symbols to international symbols

Student Activities:
A. Identify AWS symbols on drawings
B. Identify ISO symbols on drawings
C. Plan a job that includes symbols and specifications from AWS and ISO
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and size
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
   6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
WLD-H7-HO3
Demonstrate Knowledge of Welding Symbols
Attachment 3: MASTER Handout No. 3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
       1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
   5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
   10. Spherical radius
   11. Arc length
   12. Counter sink
   13. Depth
   14. Conical taper
   15. Place, times, or by
   16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand structural shapes; and,
B. Understand how to measure structural shapes.

MODULE OUTLINE:

Instructional Topics:
A. Structural shapes frequently encountered by the welder
B. How sizes are specified
C. Measurement techniques for structural shapes
D. Use of gages for sheet steel, brass, aluminum, copper and others
E. Weight and size specifications for reinforcing members of the structure
F. Sizing of pipe
G. Structural beams classified as four shapes
H. Ordering structural metal

Student Activities:
A. Use of appropriate measurement techniques for structural shapes
B. Selection of gages for sheet metal
C. Ordering of materials
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
    A. Identify organizations that determine dimension standards
       1. American National Standards Institutes (ANSI)
       2. International Standards Organization (ISO)
    B. Determine dimensions on a drawing
       1. Size dimensions
       2. Location dimensions
    C. Applying dimensions on a drawing
       1. Scale of drawing
       2. Techniques of dimensioning
       3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
    A. Explain positional / location tolerances
    B. Identify and use geometric position tolerancing symbols
       1. Position
       2. Concentricity
       3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
       1. Straightness
IV. Explain and Use Profile Tolerances
   A. Explain profile tolerance
   B. Identify and use profile tolerance symbols
      1. Profile of a line
      2. Profile of a surface
      3. Profile of an arc
      4. Profile of irregular curves
      5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
   A. Explain orientation tolerances
   B. Identify and use orientation tolerance symbols
      1. Parallelism
      2. Perpendicularity
      3. Angularity

VI. Explain and Use Runout Tolerances
   A. Explain runouts
      1. Circular
      2. Total
   B. Identify and use runout tolerances symbols
      1. Circular
      2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
    A. Maximum Material Condition (MMC)
    B. Regardless of Feature Size (RFS)
    C. Least Material Condition (LMC)
    D. Datum feature symbol
    E. Datum reference frame concept
       1. Primary datum plane
       2. Secondary datum plane
       3. Tertiary datum plane
    F. Datum target symbol
       1. Target point
       2. Target line
       3. Target area

VIII. Explain and Use the Feature Control Frame
      A. Explain feature control frame
      B. Explain the compartments of a feature control frame
         1. Geometric characteristic symbol
         2. Geometric tolerance
         3. Zone descriptor
         4. Material condition symbol
         5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand metal structures and foundation of buildings

MODULE OUTLINE:

Instructional Topics:
A. Discuss the types of metal beams used in building construction
B. Discuss the types of metal piping used in building and fluid distribution systems
C. Discuss methods of construction that require welding skills

Student Activities:
A. Visit a construction site where metal beams and piping are being installed
B. Demonstrate cutting or welding of metal components used in construction
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and size
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
6. Allowance

B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols

A. Explain and use additional modifying symbols.
1. Diameter
2. Radius R
3. Reference ( )
4. Counterbore/spotface L/
5. Square
6. Dimension origin O
7. Slope
8. Projected tolerance zone
9. Spherical diameter
10. Spherical radius
11. Arc length
12. Counter sink
13. Depth
14. Conical taper
15. Place, times, or by
16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand gussets and cross members for support of structures

MODULE OUTLINE:

Instructional Topics:
A. Use of welded supports in structures
B. Selection of metal support members
C. Types of welds for supports
D. Verification of quality in welds
E. Codes and standards for supporting structures

Student Activities:
A. Visit a construction site where this work is done
B. Visit a metals manufacturer where design work is performed
Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
    a. Diamond
    b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and sizes
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
6. Allowance

B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
   A. Fits between mating parts
      1. Clearance fit
      2. Interference fit
      3. Transition fit
      4. Line fit
   B. Limits and fits for cylindrical parts
      1. Running or sliding clearance fits
      2. Locational clearance fits
      3. Transition clearance interference fits
      4. Locational interference fits
      5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
    A. Explain positional / location tolerances
    B. Identify and use geometric position tolerancing symbols
       1. Position
       2. Concentricity
       3. Symmetry

III. Explain and Use Tolerances of Form Symbols
     A. Explain form tolerances
     B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
1. Diameter
2. Radius R
3. Reference ( )
4. Counterbore/spotface L/
5. Square
6. Dimension origin O
7. Slope
8. Projected tolerance zone
9. Spherical diameter
10. Spherical radius
11. Arc length
12. Counter sink
13. Depth
14. Conical taper
15. Place, times, or by
16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand blueprint requirements for welds; and,
B. Understand weld size gauges.

MODULE OUTLINE:

Instructional Topics:
A. Selection of the base metals
B. Sizing of the weld
C. Use of gages
D. Length of weld and extent of welding
E. Pitch, contour, and finishing

Student Activities:
A. Practice use of symbols for fillet welds
B. Interpret specifications and plan work from a drawing with fillet welds
WLD-H11-H02
Identify Fillet Weld Sizes for Various Thicknesses of Base Metals
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
    A. Identify organizations that determine dimension standards
       1. American National Standards Institutes (ANSI)
       2. International Standards Organization (ISO)
    B. Determine dimensions on a drawing
       1. Size dimensions
       2. Location dimensions
    C. Applying dimensions on a drawing
       1. Scale of drawing
       2. Techniques of dimensioning
       3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and size
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
   6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
WLD-H12-HO1
Describe Proper Sequence When Cutting Various Shapes
To Structural Drawing Specs
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand removal of components to specifications; AND,
B. Understand replacement of components to specification.

MODULE OUTLINE:

Instructional Topics:
A. Preparation of the base material
B. Grinding and heat treating required
C. Surfaces and edges to be welded (surface roughness)
D. How to avoid cutting beyond prescribed lines
E. Inspection and repair of cut edges
F. Limits of acceptability and repair of discontinuities
G. Control of distortion and shrinkage

Student Activities:
A. Practice cutting to specification
B. Examine quality of finished part
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and size
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
6. Allowance

B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits

A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
Describe Proper Sequence When Cutting Various Shapes To Structural Drawing Specs
Attachment 3: MASTER Handout No. 3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
    A. Explain positional / location tolerances
    B. Identify and use geometric position tolerancing symbols
       1. Position
       2. Concentricity
       3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
B. Identify and use tolerances of form symbols
   1. Straightness
   2. Flatness
   3.Circularity
   4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
WLD-H13-H01
Describe Methods for Layout Slopes and Rolling Tolerances
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the references of a blueprint and drawing; and,
B. Understand precision, reliability, accuracy.

MODULE OUTLINE:

Instructional Topics:
A. Demonstrate how to use the reference on a blueprint
B. Define precision, reliability and accuracy
C. Define tolerance and how to find it on a blueprint
D. Demonstrate semi-precision measurement techniques
E. Discuss the importance of the tolerance
F. Discriminate between accepted measurement procedures and improper measurement procedures

Student Activities:
A. Use measuring techniques on parts
B. Produce a drawing which includes weld symbols
WLD-H13-H02
Describe Methods for Layout Slopes and Rolling Tolerances
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
    A. Identify organizations that determine dimension standards
       1. American National Standards Institutes (ANSI)
       2. International Standards Organization (ISO)
    B. Determine dimensions on a drawing
       1. Size dimensions
       2. Location dimensions
    C. Applying dimensions on a drawing
       1. Scale of drawing
       2. Techniques of dimensioning
       3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
A. Traditional terms used to describe various shapes, processes, and sizes
B. Identify abbreviations used to describe various shapes, processes, and size
C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
A. Identify tolerances or limits
   1. Nominal size
   2. Basic size or dimension
   3. Actual size
   4. Tolerance
   5. Limits
   6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit
B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units
II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry
III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
   1. Diameter
   2. Radius R
   3. Reference ( )
   4. Counterbore/spotface L/
   5. Square
   6. Dimension origin O
   7. Slope
   8. Projected tolerance zone
   9. Spherical diameter
  10. Spherical radius
  11. Arc length
  12. Counter sink
  13. Depth
  14. Conical taper
  15. Place, times, or by
  16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to understand the use of fixtures and jigs for assembly and accuracy.

MODULE OUTLINE:

Instructional Topics:
A. Review the use of jigs and fixtures in layout and fitup
B. Use of clamps and holding devices for correct alignment
C. Placement of tack welds

Student Activities:
A. Use clamps and holding devices to properly align parts to be welded
B. Weld or prepare a fixture for production welding
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
    A. Identify organizations that determine dimension standards
       1. American National Standards Institutes (ANSI)
       2. International Standards Organization (ISO)
    B. Determine dimensions on a drawing
       1. Size dimensions
       2. Location dimensions
    C. Applying dimensions on a drawing
       1. Scale of drawing
       2. Techniques of dimensioning
       3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
    a. Diamond
    b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance

2420
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
Describe the Use of Jigs and Fixtures in Layout and Fit-Up
Attachment 3: MASTER Handout No. 3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;

b. Explain and use geometric positional tolerancing and symbols;

c. Explain and use tolerances of form and symbols;

d. Explain and use the feature control symbol; and,

e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
    A. Explain form tolerances
    B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
1. Profile of a line
2. Profile of a surface
3. Profile of an arc
4. Profile of irregular curves
5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
1. Parallelism
2. Perpendicularity
3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
1. Circular
2. Total
B. Identify and use runout tolerances symbols
1. Circular
2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
1. Primary datum plane
2. Secondary datum plane
3. Tertiary datum plane
F. Datum target symbol
1. Target point
2. Target line
3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
1. Geometric characteristic symbol
2. Geometric tolerance
3. Zone descriptor
4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
1. Diameter
2. Radius R
3. Reference ( )
4. Counterbore/spotface L /
5. Square
6. Dimension origin O
7. Slope
8. Projected tolerance zone
9. Spherical diameter
10. Spherical radius
11. Arc length
12. Counter sink
13. Depth
14. Conical taper
15. Place, times, or by
16. Basic dimension
WLD-H15-HO1
List the Steps to be Followed When Planning a Job
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand job lists for materials; and,
B. Understand work orders and sequence of work.

MODULE OUTLINE:

Instructional Topics:
A. Review the steps in job planning
B. Demonstrate how to select materials based upon drawing specifications
C. How to source and obtain prices for the materials
D. How to use sourcebooks and vendor information for availability and price
E. How to use modern systems for job orders and tracking of raw materials
F. How to deliver the work, close out the job, and bill for payment

Student Activities:
A. Prepare a project summary worksheet to track the progress and cost of the project
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
    A. General notes applied
       1. Title strip/title block
       2. Parts list/bill of material
    B. Interpret general notes
       1. Including material
       2. General tolerances
       3. Heat treatment
       4. Pattern information
       5. Processes of manufacture
       6. Requirements of the product
    C. Interpret specific notes
       1. Apply to specific operations
       2. Apply to specific processes of manufacture
       3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
    A. Identify organizations that determine dimension standards
       1. American National Standards Institutes (ANSI)
       2. International Standards Organization (ISO)
    B. Determine dimensions on a drawing
       1. Size dimensions
       2. Location dimensions
    C. Applying dimensions on a drawing
       1. Scale of drawing
       2. Techniques of dimensioning
       3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
    a. Diamond
    b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and sizes
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
WLD-H15-HO3
List the Steps to be Followed When Planning a Job
Attachment 3: MASTER Handout No. 3

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;

b. Explain and use geometric positional tolerancing and symbols;

c. Explain and use tolerances of form and symbols;

d. Explain and use the feature control symbol; and,

e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
    A. Explain positional / location tolerances
    B. Identify and use geometric position tolerancing symbols
       1. Position
       2. Concentricity
       3. Symmetry

III. Explain and Use Tolerances of Form Symbols
     A. Explain form tolerances
     B. Identify and use tolerances of form symbols
1. Straightness
2. Flatness
3. Circularity
4. Cylindrical

IV. Explain and Use Profile Tolerances
A. Explain profile tolerance
B. Identify and use profile tolerance symbols
   1. Profile of a line
   2. Profile of a surface
   3. Profile of an arc
   4. Profile of irregular curves
   5. Profile of coplanar surfaces

V. Explain and Use Tolerances of Orientation
A. Explain orientation tolerances
B. Identify and use orientation tolerance symbols
   1. Parallelism
   2. Perpendicularity
   3. Angularity

VI. Explain and Use Runout Tolerances
A. Explain runouts
   1. Circular
   2. Total
B. Identify and use runout tolerances symbols
   1. Circular
   2. Total

VII. Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A. Maximum Material Condition (MMC)
B. Regardless of Feature Size (RFS)
C. Least Material Condition (LMC)
D. Datum feature symbol
E. Datum reference frame concept
   1. Primary datum plane
   2. Secondary datum plane
   3. Tertiary datum plane
F. Datum target symbol
   1. Target point
   2. Target line
   3. Target area

VIII. Explain and Use the Feature Control Frame
A. Explain feature control frame
B. Explain the compartments of a feature control frame
   1. Geometric characteristic symbol
   2. Geometric tolerance
   3. Zone descriptor
   4. Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols
A. Explain and use additional modifying symbols.
1. Diameter
2. Radius R
3. Reference ( )
4. Counterbore/spotface L/
5. Square
6. Dimension origin O
7. Slope
8. Projected tolerance zone
9. Spherical diameter
10. Spherical radius
11. Arc length
12. Counter sink
13. Depth
14. Conical taper
15. Place, times, or by
16. Basic dimension
OBJECTIVE(S):

Upon completion of this unit the student will be able to use detail drawings and structural details

MODULE OUTLINE:

Instructional Topics:

A. Detail drawings as compared to the general engineering drawing
B. Dimensions needed for construction
C. Directions, as may be indicated by notes and symbols for the work required
D. The assembly print, showing the complete and assembled item, with relationships
E. Subassembly prints, which assist as preparation of the bill of materials
F. General structural shape and size specifications

Student Activities:

A. Use subassembly prints to prepare bill of materials
B. Practice size specifications with assigned structural shapes
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between general and specific notes;
b. Interpret and apply general and specific notes;
c. Determine and apply dimensions on a drawing;
d. Identify basic symbols and abbreviations found on a drawing;
e. Identify tolerances or limits on a drawing; and,
f. Identify ANSI limits and fits.

MODULE OUTLINE:

I. Distinguish Between General and Specific Notes
   A. General notes
   B. Specific notes/local notes

II. Interpret and Apply General and Specific Notes
   A. General notes applied
      1. Title strip/title block
      2. Parts list/bill of material
   B. Interpret general notes
      1. Including material
      2. General tolerances
      3. Heat treatment
      4. Pattern information
      5. Processes of manufacture
      6. Requirements of the product
   C. Interpret specific notes
      1. Apply to specific operations
      2. Apply to specific processes of manufacture
      3. Apply to the requirements of the product

III. Determine and Apply Dimensions on a Drawing
   A. Identify organizations that determine dimension standards
      1. American National Standards Institutes (ANSI)
      2. International Standards Organization (ISO)
   B. Determine dimensions on a drawing
      1. Size dimensions
      2. Location dimensions
   C. Applying dimensions on a drawing
      1. Scale of drawing
      2. Techniques of dimensioning
      3. Placement of dimensions
4. Choice of dimensions
5. Types of lines used in the dimensioning process
6. Arrowheads used on drawings
7. Leaders used on drawings
8. Dimensioning systems
   a. Fractional
   b. Decimal
   c. Metric
   d. Combination dimensioning
9. Dimension figures
10. Direction of dimension figures
    a. Unidirectional system
    b. Aligned system
11. Dimensioning angles
12. Dimensioning arcs
13. Dimensioning fillets and rounds
14. Identify surfaces to be machined
15. Contour dimensioning
16. Dimensioning of curves
17. Dimensioning of rounded-end shapes
18. Dimensioning of threads
19. Dimensioning of tapers
20. Dimensioning of chamfers
21. Dimensioning shaft centers
22. Dimensioning keyways
23. Dimensioning knurls
   a. Diamond
   b. Straight
24. Dimensioning along curved surfaces
25. Tabular dimensions
26. Dimensioning standards
27. Coordinate dimensioning

IV. Identify Basic Symbols and Abbreviations Found on a Drawing
   A. Traditional terms used to describe various shapes, processes, and sizes
   B. Identify abbreviations used to describe various shapes, processes, and size
   C. Identify a variety of dimensioning symbols used to replace traditional terms and abbreviations

V. Identify Tolerances or Limits on a Drawing
   A. Identify tolerances or limits
      1. Nominal size
      2. Basic size or dimension
      3. Actual size
      4. Tolerance
      5. Limits
      6. Allowance
B. Methods of expressing tolerances
   1. General tolerances
   2. Limit dimensioning
   3. Plus and minus dimensioning
      a. Unilateral system
      b. Bilateral system
   4. Single-limit dimensioning
   5. Angular tolerances

VI. Identify ANSI Limits and Fits
A. Fits between mating parts
   1. Clearance fit
   2. Interference fit
   3. Transition fit
   4. Line fit

B. Limits and fits for cylindrical parts
   1. Running or sliding clearance fits
   2. Locational clearance fits
   3. Transition clearance interference fits
   4. Locational interference fits
   5. Force or shrink fits
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Distinguish between conventional and geometric dimensioning and tolerancing;
b. Explain and use geometric positional tolerancing and symbols;
c. Explain and use tolerances of form and symbols;
d. Explain and use the feature control symbol; and,
e. Explain and use modifiers in geometric dimensioning and tolerancing.

MODULE OUTLINE:

I. Distinguish Between Conventional and Geometric Dimensioning and Tolerancing
   A. General/conventional tolerancing
      1. Definitions of general/conventional tolerancing
         a. Dimension
         b. Reference dimension
         c. Feature
         d. Feature of size
         e. Actual size
         f. Stock size
      2. Maximum material condition
      3. Least material condition
      4. Basic fits
      5. Clearance fit
      6. Allowance
      7. Clearance
      8. Force fit
   B. Geometric dimensioning and tolerancing
      1. Definition of geometric dimensioning and tolerancing
      2. Dimensioning rules
      3. Dimensioning units

II. Explain and Use Geometric Positional Tolerancing and Symbols
   A. Explain positional / location tolerances
   B. Identify and use geometric position tolerancing symbols
      1. Position
      2. Concentricity
      3. Symmetry

III. Explain and Use Tolerances of Form Symbols
   A. Explain form tolerances
   B. Identify and use tolerances of form symbols
I.  Straightness
2.  Flatness
3.  Circularity
4.  Cylindrical

IV.  Explain and Use Profile Tolerances
A.  Explain profile tolerance
B.  Identify and use profile tolerance symbols
   1.  Profile of a line
   2.  Profile of a surface
   3.  Profile of an arc
   4.  Profile of irregular curves
   5.  Profile of coplanar surfaces

V.  Explain and Use Tolerances of Orientation
A.  Explain orientation tolerances
B.  Identify and use orientation tolerance symbols
   1.  Parallelism
   2.  Perpendicularity
   3.  Angularity

VI.  Explain and Use Runout Tolerances
A.  Explain runouts
   1.  Circular
   2.  Total
B.  Identify and use runout tolerances symbols
   1.  Circular
   2.  Total

VII.  Explain and Use Modifiers in Geometric Dimensioning and Tolerancing
A.  Maximum Material Condition (MMC)
B.  Regardless of Feature Size (RFS)
C.  Least Material Condition (LMC)
D.  Datum feature symbol
E.  Datum reference frame concept
   1.  Primary datum plane
   2.  Secondary datum plane
   3.  Tertiary datum plane
F.  Datum target symbol
   1.  Target point
   2.  Target line
   3.  Target area

VIII.  Explain and Use the Feature Control Frame
A.  Explain feature control frame
B.  Explain the compartments of a feature control frame
   1.  Geometric characteristic symbol
   2.  Geometric tolerance
   3.  Zone descriptor
   4.  Material condition symbol
5. Primary datum reference
6. Secondary datum reference
7. Tertiary datum reference

IX. Additional Supplementary Modifying Symbols

A. Explain and use additional modifying symbols.
1. Diameter
2. Radius R
3. Reference ( )
4. Counterbore/spotface L/
5. Square
6. Dimension origin O
7. Slope
8. Projected tolerance zone
9. Spherical diameter
10. Spherical radius
11. Arc length
12. Counter sink
13. Depth
14. Conical taper
15. Place, times, or by
16. Basic dimension
Describe Methods for Straightening and Removing Damaged Structural and Machinery Parts
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand heat expansion of metal; and,
B. Understand methods for structural repairs.

MODULE OUTLINE:

Instructional Topics:
A. Metal properties and methods of repair
B. Types of structural damage that can usually not be repaired
C. Inspection and test of repaired items
D. Common machine repairs and testing of outcomes

Student Activities:
A. Use cutting methods for assigned removal of damaged parts
B. Use welding methods for assigned repairs of machinery
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Tasks

- **A1** Demonstrate understanding of safety rules
- **A2** Assume the personal safety standards for all tasks
- **A3** Describe the use and care of protective equipment
- **A4** Demonstrate the use and care of the welding torch
- **A5** Demonstrate the use and care of the welding helmet
- **A6** Practice the use of the welding torch and equipment
- **A7** Demonstrate the use of the safety equipment
- **A8** Create and maintain a safe work station
- **A9** Demonstrate the use of the safety equipment
- **A10** Demonstrate the use of the safety equipment
- **A11** Perform the work as safe as possible
- **A12** Maintain adequate ventilation
- **A13** Mark the area for safety

- **B1** Demonstrate the understanding of the welding process
- **B2** Implement the principles and tools
- **B3** Describe the principles and tools
- **B4** Demonstrate the proper use of the welding equipment
- **B5** Perform the work as safe as possible
- **B6** Maintain a safe work station
- **B7** Practice the use of the welding torch and equipment
- **B8** Demonstrate the use of the safety equipment
- **B9** Create and maintain a safe work station
- **B10** Demonstrate the use of the safety equipment
- **B11** Perform the work as safe as possible
- **B12** Maintain adequate ventilation
- **B13** Mark the area for safety

- **C1** Demonstrate the use of the welding equipment
- **C2** Implement the standards and tools
- **C3** Describe the principles and tools
- **C4** Demonstrate the proper use of the welding equipment
- **C5** Perform the work as safe as possible
- **C6** Maintain a safe work station
- **C7** Practice the use of the welding torch and equipment
- **C8** Demonstrate the use of the safety equipment
- **C9** Create and maintain a safe work station
- **C10** Demonstrate the use of the safety equipment
- **C11** Perform the work as safe as possible
- **C12** Maintain adequate ventilation
- **C13** Mark the area for safety

- **D1** Demonstrate the use of the welding equipment
- **D2** Implement the standards and tools
- **D3** Describe the principles and tools
- **D4** Demonstrate the proper use of the welding equipment
- **D5** Perform the work as safe as possible
- **D6** Maintain a safe work station
- **D7** Practice the use of the welding torch and equipment
- **D8** Demonstrate the use of the safety equipment
- **D9** Create and maintain a safe work station
- **D10** Demonstrate the use of the safety equipment
- **D11** Perform the work as safe as possible
- **D12** Maintain adequate ventilation
- **D13** Mark the area for safety

- **E1** Demonstrate the use of the welding equipment
- **E2** Implement the standards and tools
- **E3** Describe the principles and tools
- **E4** Demonstrate the proper use of the welding equipment
- **E5** Perform the work as safe as possible
- **E6** Maintain a safe work station
- **E7** Practice the use of the welding torch and equipment
- **E8** Demonstrate the use of the safety equipment
- **E9** Create and maintain a safe work station
- **E10** Demonstrate the use of the safety equipment
- **E11** Perform the work as safe as possible
- **E12** Maintain adequate ventilation
- **E13** Mark the area for safety

- **F1** Demonstrate the use of the welding equipment
- **F2** Implement the standards and tools
- **F3** Describe the principles and tools
- **F4** Demonstrate the proper use of the welding equipment
- **F5** Perform the work as safe as possible
- **F6** Maintain a safe work station
- **F7** Practice the use of the welding torch and equipment
- **F8** Demonstrate the use of the safety equipment
- **F9** Create and maintain a safe work station
- **F10** Demonstrate the use of the safety equipment
- **F11** Perform the work as safe as possible
- **F12** Maintain adequate ventilation
- **F13** Mark the area for safety

- **G1** Demonstrate the use of the welding equipment
- **G2** Implement the standards and tools
- **G3** Describe the principles and tools
- **G4** Demonstrate the proper use of the welding equipment
- **G5** Perform the work as safe as possible
- **G6** Maintain a safe work station
- **G7** Practice the use of the welding torch and equipment
- **G8** Demonstrate the use of the safety equipment
- **G9** Create and maintain a safe work station
- **G10** Demonstrate the use of the safety equipment
- **G11** Perform the work as safe as possible
- **G12** Maintain adequate ventilation
- **G13** Mark the area for safety

- **H1** Demonstrate the use of the welding equipment
- **H2** Implement the standards and tools
- **H3** Describe the principles and tools
- **H4** Demonstrate the proper use of the welding equipment
- **H5** Perform the work as safe as possible
- **H6** Maintain a safe work station
- **H7** Practice the use of the welding torch and equipment
- **H8** Demonstrate the use of the safety equipment
- **H9** Create and maintain a safe work station
- **H10** Demonstrate the use of the safety equipment
- **H11** Perform the work as safe as possible
- **H12** Maintain adequate ventilation
- **H13** Mark the area for safety
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Duties

- **M2** OMAW Short Circuit Transfer (intermediate)
  - M.13 Demonstrate machine adjustments (voltage, amps, speed)
  - M.14 Insulate welding process
  - M.15 Perform weld sequence
  - M.16 Demonstrate welding techniques
  - M.17 Understand welding characteristics of various welding gases
  - M.18 Post-weld inspection
  - M.19 Perform inspection procedures
  - M.20 Demonstrate short circuit OMAW flat, horizontal, vertical and overhead
  - M.21 Post weld
  - M.22 Describe OMAW filler wires
  - M.23 Describe basic weld discontinuities

- **M3** OMAW Spray and Pulsed Spray, Pipe Transfer (Advanced)
  - M.24 Demonstrate pole and spray transfer machines
  - M.25 Demonstrate interpass cleaning
  - M.26 Demonstrate OMAW in tank, horizontal, vertical and overhead positions
  - M.27 Pre-weld joint, if required
  - M.28 Perform weld sequence
  - M.29 DISGAW welding process
  - M.30 Perform weld sequence
  - M.31 Describe weldability problems associated with straight chromium, nickel and stainless steels
  - M.32 Describe detrimental effects of pressure and heat on life of pipe systems
  - M.33 Describe methods of minimizing detrimental effects of pressure and heat on life of pipe systems

- **N** Plasma Arc Welding (PAC) (basic)
  - N.1 Understand the safety potential of PAC equipment
  - N.2 Troubleshoot PAC equipment
  - N.3 Post weld sequence
  - N.4 Shut down PAC equipment
  - N.5 Describe the welding variables and their effects upon weld quality
  - N.6 Troubleshoot equipment
  - N.7 Describe the welding equipment and classification system
  - N.8 Demonstrate the weldability characteristics of various materials
  - N.9 Describe the life of pipe systems
  - N.10 Post weld

- **O1** Gas Tungsten Arc Welding (GTAW) (basic)
  - O.1 Understand the operation of GTAW equipment
  - O.2 Identify the safety standards
  - O.3 Post weld sequence
  - O.4 Troubleshoot equipment
  - O.5 Describe the equipment and classification systems
  - O.6 Demonstrate the weldability characteristics of various materials
  - O.7 Perform GTAW on various materials

- **O2** Gas Tungsten Arc Welding (GTAW) (Advanced)
  - O.8 Post weld sequence
  - O.9 TIG Welding (TIG) equipment
  - O.10 Troubleshoot equipment
  - O.11 Perform weld sequence
  - O.12 Describe the welding variables and their effects upon weld quality
  - O.13 Troubleshoot equipment
  - O.14 Describe the weldability characteristics of various materials
  - O.15 Demonstrate the life of pipe systems
  - O.16 Post weld

- **P** Plasma Arc Cutting and Welding
  - P.1 Identify and describe the function of Plasma Arc Cutting (PAC) equipment
  - P.2 Troubleshoot Plasma Arc Cutting (PAC) equipment
  - P.3 Post weld sequence
  - P.4 Troubleshoot Plasma Arc Cutting (PAC) equipment
  - P.5 Perform Plasma Arc Cutting (PAC) equipment
  - P.6 Troubleshoot Plasma Arc Cutting (PAC) equipment
  - P.7 Demonstrate the weldability characteristics of various materials
  - P.8 Perform Plasma Arc Cutting (PAC) equipment

- **Q** In-Process Weld Inspection
  - Q.1 Check weld with tape
  - Q.2 Troubleshoot equipment
  - Q.3 Post weld sequence
  - Q.4 Perform visual inspection
  - Q.5 Demonstrate the function of Plasma Arc Cutting (PAC) equipment

- **R** Re-Process Rework
  - R.1 Remove weld defect and prepare for rework
  - R.2 Verify post weld defects
  - R.3 Post-weld (if required)
  - R.4 Perform rework
  - R.5 Repeat inspection

- **S** Hourly safety inspections
  - S.1 Return unused consumables
  - S.2 Store good weld equipment
  - S.3 Secure welding gases
  - S.4 Secure welding equipment
  - S.5 Clean work area

- **T** Emergency and workplace
  - T.1 Display a general understanding of emergency procedures
  - T.2 Understood the hazards of equipment being assembled
  - T.3 Post weld sequence
  - T.4 Demonstrate ability to lift 50 pounds
  - T.5 Perform weld sequence

- **U** Wellness/Physical abilities
  - U.1 Demonstrate ability to lift 50 pounds
  - U.2 Troubleshoot equipment
  - U.3 Post weld sequence
  - U.4 Perform weld sequence
  - U.5 Describe the welding variables and their effects upon weld quality

### Tasks

- **M.14** Insulate the welding process
- **M.15** Perform weld sequence
- **M.16** Demonstrate welding techniques
- **M.17** Understand welding characteristics of various welding gases
- **M.18** Post-weld inspection
- **M.19** Perform inspection procedures
- **M.20** Demonstrate short circuit OMAW flat, horizontal, vertical and overhead
- **M.21** Post weld
- **M.22** Describe OMAW filler wires
- **M.23** Describe basic weld discontinuities
- **N.2** Troubleshoot PAC equipment
- **N.3** Post weld sequence
- **N.4** Shut down PAC equipment
- **N.5** Describe the welding variables and their effects upon weld quality
- **N.6** Troubleshoot equipment
- **N.7** Describe the welding equipment and classification systems
- **N.8** Demonstrate the weldability characteristics of various materials
- **N.9** Describe the life of pipe systems
- **O.2** Identify the safety standards
- **O.3** Post weld sequence
- **O.4** Troubleshoot equipment
- **O.5** Describe the equipment and classification systems
- **O.6** Demonstrate the weldability characteristics of various materials
- **O.7** Perform GTAW on various materials
- **O.8** Post weld sequence
- **O.9** TIG Welding (TIG) equipment
- **O.10** Troubleshoot equipment
- **O.11** Perform weld sequence
- **O.12** Describe the welding variables and their effects upon weld quality
- **O.13** Troubleshoot equipment
- **O.14** Describe the weldability characteristics of various materials
- **O.15** Demonstrate the life of pipe systems
- **P.1** Identify and describe the function of Plasma Arc Cutting (PAC) equipment
- **P.2** Troubleshoot Plasma Arc Cutting (PAC) equipment
- **P.3** Post weld sequence
- **P.4** Troubleshoot Plasma Arc Cutting (PAC) equipment
- **P.5** Perform Plasma Arc Cutting (PAC) equipment
- **P.6** Troubleshoot Plasma Arc Cutting (PAC) equipment
- **P.7** Demonstrate the weldability characteristics of various materials
- **P.8** Perform Plasma Arc Cutting (PAC) equipment
- **Q.1** Check weld with tape
- **Q.2** Troubleshoot equipment
- **Q.3** Post weld sequence
- **Q.4** Perform visual inspection
- **Q.5** Demonstrate the function of Plasma Arc Cutting (PAC) equipment
- **R.1** Remove weld defect and prepare for rework
- **R.2** Verify post weld defects
- **R.3** Post-weld (if required)
- **R.4** Perform rework
- **R.5** Repeat inspection
- **S.1** Return unused consumables
- **S.2** Store good weld equipment
- **S.3** Secure welding gases
- **S.4** Secure welding equipment
- **S.5** Clean work area
- **T.1** Display a general understanding of emergency procedures
- **T.2** Understood the hazards of equipment being assembled
- **T.3** Post weld sequence
- **T.4** Demonstrate ability to lift 50 pounds
- **T.5** Perform weld sequence
- **U.1** Demonstrate ability to lift 50 pounds
- **U.2** Troubleshoot equipment
- **U.3** Post weld sequence
- **U.4** Perform weld sequence
- **U.5** Describe the welding variables and their effects upon weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the ability to list material requirements from drawings, sketches and specification package;
B. Understand how to identify material requirements from a material list; and,
C. Select the material from information given by drawings, sketches and specification packages.

MODULE OUTLINE:

Instructional Topics:
A. Illustrate how to determine the blueprints material requirements
B. Demonstrate effective techniques on the choice weld process and equipment to be used
C. Illustrate proper procedure to set up a weld station
D. Sources of information for compatible alloys for base metal, filler metal, electrodes, or appropriate materials for the job
E. Demonstrate how to set-up a safe work environment
F. Demonstrate layout of work table and tools

Student Activities:
A. Gather and assemble raw materials, preparing for the job specified in the engineering drawing or other job instructions
B. Begin the process of setting up equipment and welding apparatus appropriate to the job
C. Layout work table and tools in a safe and efficient manner
WLD-I2-HO
Gather Welding Equipment and Tools
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform initial safety inspection of equipment and accessories;
B. Make minor external repairs or adjustments to equipment and accessories;
C. Understand related terms and definitions; and,
D. Identify the necessary tools to perform specific tasks.

MODULE OUTLINE:

Instructional Topics:
A. Proper selection procedures for welding tools and equipment
B. Schedule availability of tools and equipment for the duration of the job
C. Demonstrate effective techniques on the choice of equipment to be used
D. Demonstrate set-up, operate, and shut down procedures
E. Demonstrate a post production weld process
F. Plan for use testing techniques set by the American Welding Society or specified by the customer
G. Demonstrate how to perform layout to insure safe working conditions
H. Explain the fundamental characteristics of AC and DC current and how this applies to welding and cutting devices

Student Activities:
A. Identify the importance of safety unique to each type of welding
B. Practice job planning and determine equipment needs for the duration of job operations
C. Make minor repairs under supervision of instructor
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand safety in welding and cutting (ANSI/ASC Z49.1);
B. Perform work area inspection;
C. Identify safety hazards; and,
D. Perform minor repairs to equipment to insure safety in operations.

MODULE OUTLINE:

Instructional Topics:
A. Illustrate proper procedure to set up a weld station
B. Demonstrate effective techniques on the choice of weld process equipment to be used
C. Practice safety in welding and cutting (ANSI/ASC Z49.1)
D. Demonstrate set-up, operate, and shut down procedures
E. Demonstrate a post production weld process
F. Use testing techniques set by the American Welding Society
G. Demonstrate how to maintain a safe work environment

Student Activities:
A. Identify the importance of safety unique to each type of welding
B. Perform work area inspection
C. Identify safety hazards
D. Remove flammable materials from the welding area
E. Assemble required accessories and safety equipment (fire extinguishers, curtains and shields, and special protective clothing)
F. Position welding apparatus or machine
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
B. Perform safety inspection of work area and equipment;
C. Position welding apparatus or machine;
D. Check position of work for welding;
E. Check and adjust controls for apparatus and machines; and,
F. Understand gas bottle storage and ventilation requirements.

MODULE OUTLINE:

Instructional Topics:
A. Illustrate proper procedures to select weld process and to set up a weld station
B. Demonstrate effective techniques in inspection of equipment to be used
C. Plan set-up, operate, and shut down procedures
D. Practice initial welding set up operations and shut-down procedures
E. Review of compatible alloys for processes to be practiced
F. Demonstrate how to set-up a safe work environment

Student Activities:
A. Identify the importance of safety unique to each type of welding
B. Use of safety equipment and personal protective equipment
C. Set up individual welding machine
D. Make safe power on settings and adjustments on welding machine as necessary
E. Perform pre-production weld to assure proper adjustment
F. Practice selection and handling of electrodes, filler metals, hoses, cables, tips, holders, and other materials used in the demonstration process
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding equipment and principles of operation;
B. Perform weld to set parameters; and,
C. Make adjustments on equipment for a maximum quality weld.

MODULE OUTLINE:

Instructional Topics:
A. Illustrate proper procedure to set up a weld station
B. Demonstrate effective techniques on the choice of equipment to be used
C. Demonstrate set-up, operate, and shut down procedures
D. Demonstrate the usability of the planned production weld process
E. Use testing techniques set by the American Welding Society or customer specification
F. Illustrate how to determine the blueprints material requirements
G. Review of compatible alloys, filler metals, electrodes (as appropriate)
H. Demonstrate how to set-up and maintain a safe work environment
I. Demonstrate a fundamental knowledge of AC and DC-current and how it applies to welding and cutting devices

Student Activities:
A. Identify the importance of safety unique to each type of welding
B. Set up individual welding apparatus or machine
C. Make adjustments to welding apparatus or machine as necessary
D. Perform pre-production weld to assure proper adjustment

</tbody>
</table>
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand groove angle must be large enough to permit proper manipulation of the filler metal and deposition of stringer or weave weld beads;
B. Understand the many factors that influence joint design; and,
C. Understand the most common design adjustment is to locate the welded joints in regions of known low stress.

MODULE OUTLINE:

Instructor Topic:
A. Identify clean welding surfaces
B. Demonstrate adequate cleaning techniques on various metals
C. Illustrate how to assemble weld joints
D. Use measurement devices to check weld opening or verify setup
E. Illustrate proper tacking of a part
F. Utilize visuals for instruction emphasis
G. Illustrate how to identify impurities on parent metal
H. Demonstrate the purge process on specialty metals
I. Explain the use of chemicals for cleaning and preparing metals
J. Explain the use of particles for cleaning metal

Student Activities:
A. Study joint design using AWS standards
B. Clean weld area using wire brush
C. Tack together test plates and practice plates
D. Check the gap size in practice and test plates
E. Clean weld area using grinders and files
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
a. Discuss classification system for metals; and,
b. Describe general characteristics for carbon steels, tool steels, stainless steels, structural steels, cast irons, aluminum, and other commonly used metals.

MODULE OUTLINE:

I. Discuss the Physical Properties of Metal
   A. Britteness - the property of a metal which permits no permanent distortion before breaking
   B. Ductility - the ability of the metal to be permanently deformed without breaking
   C. Elasticity - the ability of a metal to return to its original shape after any force acting upon it has been removed
   D. Hardness - the resistance to forcible penetration
   E. Malleability - the property of a metal which permits it to be hammered or rolled into other sizes and shapes
   F. Tensile strength - the maximum amount of pull that a material will withstand before breaking
   G. Toughness - the property of a metal to withstand shock or impact

II. Discuss the Classification System for Steel
   A. Carbon steels
      1. Low carbon steel - contains from 0.02 to 0.20 percent of carbon
      2. Medium carbon steel - contains from 0.30 to 0.60 percent of carbon
      3. High carbon steel (tool steel) - contains over 0.60 percent of carbon
   B. Alloy steels - alloying elements allow steels to possess special characteristics
      Discuss Table 1.1 "Effects of Alloying Elements on Steel"
      Discuss Table 1.2 "SAE-ANSI Numerical Designation of Alloy Steels"

III. Describe General Characteristics For:
   A. Carbon Steels
   B. Tool Steels
   C. Stainless Steels
   D. Structural Steels
   E. Cast Irons
   F. Non-Ferrous Metals
      1. Aluminum and Its Alloys
      2. Copper and Its Alloys

---

**Notes:**
- The table provides a numerical designation system used by SAE-AISI for alloy steels.
- Each designation represents a specific composition, with prefixes indicating different types and suffixes indicating specific compositions.
- For example, "10xx" represents plain carbon steels, while "303xx" represents corrosion and heat-resisting steels.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Briefly describe and list the advantages and disadvantages for each of the following: casting processes, hot working processes, and cold working processes;
b. Discuss service requirements (strength, hardness, etc.);
c. Discuss fastening processes (fasteners, welding, bonding, etc.); and,
d. Discuss corrosion resistance methods.

MODULE OUTLINE:

I. Describe Casting Processes
   A. Discuss the following casting processes: sand, evaporative, shell molding, permanent mold, centrifugal, investment, and die casting
   B. Discuss pattern and mold design factors for each of the above casting processes
   C. List the advantages and disadvantages of the casting processes

II. Describe Hot Working Processes
   A. Discuss the following hot working processes: rolling, strand casting, forging, drawing, extrusion, spinning, and roll forming
   B. List the advantages and disadvantages of the hot working processes

III. Describe Cold Working Processes
   A. Discuss the following cold working processes: rolling, blanking, pressing, drawing, extruding, wire and bar drawing, bending, shearing, and roll forming
   B. List the advantages and disadvantages of the cold working process

IV. Evaluate Alternative Manufacturing Processes
   A. Discuss the powder metallurgy process (PM)
   B. Discuss the following nontraditional machining processes: EDM, laser machining, ultrasonic machining, hydrojet machining, electron beam machining, and plasma beam machining
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand surface preparation;
B. Determine specifications for weld appearance; and,
C. Prepare surfaces appropriate to the type joint design and strength requirement.

MODULE OUTLINE:

Instructor Topic:
A. Identify clean welding surfaces
B. Demonstrate adequate cleaning techniques for various metals
C. Demonstrate use of iron-powder electrodes and automatic welding, minimizing spatter and roughness
D. Removal of moisture
E. Eliminate organic contaminants
F. Remove oxide films left by flame beveling and machining
G. Avoid metal contamination from brushes or tools
H. Demonstrate the purge process on specialty metals
I. Explain the use of chemicals for cleaning and preparing metals
J. Explain the use of particles for cleaning metal

Student Activities:
A. Review joint design using AWS standards
B. Check the gap size in practice and test plates
C. Clean weld area grinders, chemicals, and files
D. Minimize spatter with weld techniques
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss classification system for metals; and,

b. Describe general characteristics for carbon steels, tool steels, stainless steels, structural steels, cast irons, aluminum, and other commonly used metals.

MODULE OUTLINE:

I. Discuss the Physical Properties of Metal
   A. Brittleness - the property of a metal which permits no permanent distortion before breaking
   B. Ductility - the ability of the metal to be permanently deformed without breaking
   C. Elasticity - the ability of a metal to return to its original shape after any force acting upon it has been removed
   D. Hardness - the resistance to forcible penetration
   E. Malleability - the property of a metal which permits it to be hammered or rolled into other sizes and shapes
   F. Tensile strength - the maximum amount of pull that a material will withstand before breaking
   G. Toughness - the property of a metal to withstand shock or impact

II. Discuss the Classification System for Steel
   A. Carbon steels
      1. Low carbon steel - contains from 0.02 to 0.20 percent of carbon
      2. Medium carbon steel - contains from 0.30 to 0.60 percent of carbon
      3. High carbon steel (tool steel) - contains over 0.60 percent of carbon
   B. Alloy steels - alloying elements allow steels to possess special characteristics
      Discuss Table 1.1 "Effects of Alloying Elements on Steel"
      Discuss Table 1.2 "SAE-ANSI Numerical Designation of Alloy Steels"

III. Describe General Characteristics For:
   A. Carbon Steels
   B. Tool Steels
   C. Stainless Steels
   D. Structural Steels
   E. Cast Irons
   F. Non-Ferrous Metals
      1. Aluminum and Its Alloys
      2. Copper and Its Alloys
      3. Nickel Alloys
      4. Precious Metals
      5. Others

Objective(s):

Upon completion of this unit the student will be able to:

a. Briefly describe and list the advantages and disadvantages for each of the following: casting processes, hot working processes, and cold working processes;

b. Discuss service requirements (strength, hardness, etc.);

c. Discuss fastening processes (fasteners, welding, bonding, etc.); and,

d. Discuss corrosion resistance methods.

Module Outline:

I. Describe Casting Processes
   A. Discuss the following casting processes: sand, evaporative, shell molding, permanent mold, centrifugal, investment, and die casting
   B. Discuss pattern and mold design factors for each of the above casting processes
   C. List the advantages and disadvantages of the casting processes

II. Describe Hot Working Processes
    A. Discuss the following hot working processes: rolling, strand casting, forging, drawing, extrusion, spinning, and roll forming
    B. List the advantages and disadvantages of the hot working processes

III. Describe Cold Working Processes
     A. Discuss the following cold working processes: rolling, blanking, pressing, drawing, extruding, wire and bar drawing, bending, shearing, and roll forming
     B. List the advantages and disadvantages of the cold working process

IV. Evaluate Alternative Manufacturing Processes
    A. Discuss the powder metallurgy process (PM)
    B. Discuss the following nontraditional machining processes: EDM, laser machining, ultrasonic machining, hydrojet machining, electron beam machining, and plasma beam machining
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand fit-up requirements specified;
B. Understand orthographic views;
C. Understand surface to center line relationships;
D. Understand auxiliary views; and,
E. Perform joint preparation and fit-up.

MODULE OUTLINE:

Instructor Topic:
A. Prepare clean welding surfaces
B. Demonstrate adequate cleaning techniques on various metals
C. Perform spacing, alignment, and arrangement of joint edges
D. Illustrate how to assemble weld joints
E. Use of vise, clamps, braces or special jigs for alignment
F. Use measurement devices to check weld opening or verify fit-up
G. Cleaning joint edges and surfaces
H. Cutting bevels for grooves by machining, grinding, or gas flame cutting
I. Illustrate proper tacking of a part
J. Explain shape, size, and dimensional considerations
K. Explain the use of chemicals for cleaning and preparing metals
L. Explain the use of particles for cleaning metal

Student Activities:
A. Study joint design using AWS standards
B. Clean weld area using recommended method
C. Tack together test plates and practice plates
D. Check the gap size in practice and test plates
E. Clean weld area using chemicals, grinders and files, and other methods as appropriate
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss classification system for metals; and,
b. Describe general characteristics for carbon steels, tool steels, stainless steels, structural steels, cast irons, aluminum, and other commonly used metals.

MODULE OUTLINE:

I. Discuss the Physical Properties of Metal
   A. Britteness - the property of a metal which permits no permanent distortion before breaking
   B. Ductility - the ability of the metal to be permanently deformed without breaking
   C. Elasticity - the ability of a metal to return to its original shape after any force acting upon it has been removed
   D. Hardness - the resistance to forcible penetration
   E. Malleability - the property of a metal which permits it to be hammered or rolled into other sizes and shapes
   F. Tensile strength - the maximum amount of pull that a material will withstand before breaking
   G. Toughness - the property of a metal to withstand shock or impact

II. Discuss the Classification System for Steel
   A. Carbon steels
      1. Low carbon steel - contains from 0.02 to 0.20 percent of carbon
      2. Medium carbon steel - contains from 0.30 to 0.60 percent of carbon
      3. High carbon steel (tool steel) - contains over 0.60 percent of carbon
   B. Alloy steels - alloying elements allow steels to possess special characteristics
      Discuss Table 1.1 "Effects of Alloying Elements on Steel"
      Discuss Table 1.2 "SAE-ANSI Numerical Designation of Alloy Steels"

III. Describe General Characteristics For:
   A. Carbon Steels
   B. Tool Steels
   C. Stainless Steels
   D. Structural Steels
   E. Cast Irons
   F. Non-Ferrous Metals
      1. Aluminum and Its Alloys
      2. Copper and Its Alloys
      3. Nickel Alloys
      4. Precious Metals
      5. Others

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Briefly describe and list the advantages and disadvantages for each of the following: casting processes, hot working processes, and cold working processes;
b. Discuss service requirements (strength, hardness, etc.);
c. Discuss fastening processes (fasteners, welding, bonding, etc.); and,
d. Discuss corrosion resistance methods.

MODULE OUTLINE:

I. Describe Casting Processes
   A. Discuss the following casting processes: sand, evaporative, shell molding, permanent mold, centrifugal, investment, and die casting
   B. Discuss pattern and mold design factors for each of the above casting processes
   C. List the advantages and disadvantages of the casting processes

II. Describe Hot Working Processes
    A. Discuss the following hot working processes: rolling, strand casting, forging, drawing, extrusion, spinning, and roll forming
    B. List the advantages and disadvantages of the hot working processes

III. Describe Cold Working Processes
     A. Discuss the following cold working processes: rolling, blanking, pressing, drawing, extruding, wire and bar drawing, bending, shearing, and roll forming
     B. List the advantages and disadvantages of the cold working process

IV. Evaluate Alternative Manufacturing Processes
    A. Discuss the powder metallurgy process (PM)
    B. Discuss the following nontraditional machining processes: EDM, laser machining, ultrasonic machining, hydrojet machining, electron beam machining, and plasma beam machining
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Use prior modules in sequence with applications;
B. Understand the requirements for joint preparation; and,
C. Inspect the joint preparation.

MODULE OUTLINE:

Instructor Topic:
A. Identify clean welding surfaces
B. Demonstrate adequate cleaning techniques on various metals
C. Illustrate how to assemble weld joints
D. Use measurement devices to check weld opening or verify setup
E. Illustrate proper tacking of a part
F. Explain considerations for economical use of filler metal
G. Explain consideration for base metal type and thickness
H. Demonstrate positions for welding
I. Discuss welding techniques used
J. Discuss type of gases used (as applicable)
K. Demonstrate appropriate power source as having impact upon the weld

Student Activities:
A. Study joint design using AWS guidelines
B. Clean weld area
C. Tack together test plates and practice plates
D. Measure the gap size in practice and test plates
E. Demonstrate understanding of selected welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss classification system for metals; and,
b. Describe general characteristics for carbon steels, tool steels, stainless steels, structural steels, cast irons, aluminum, and other commonly used metals.

MODULE OUTLINE:

I. Discuss the Physical Properties of Metal
   A. Brittleness - the property of a metal which permits no permanent distortion before breaking
   B. Ductility - the ability of the metal to be permanently deformed without breaking
   C. Elasticity - the ability of a metal to return to its original shape after any force acting upon it has been removed
   D. Hardness - the resistance to forcible penetration
   E. Malleability - the property of a metal which permits it to be hammered or rolled into other sizes and shapes
   F. Tensile strength - the maximum amount of pull that a material will withstand before breaking
   G. Toughness - the property of a metal to withstand shock or impact

II. Discuss the Classification System for Steel
   A. Carbon steels
      1. Low carbon steel - contains from 0.02 to 0.20 percent of carbon
      2. Medium carbon steel - contains from 0.30 to 0.60 percent of carbon
      3. High carbon steel (tool steel) - contains over 0.60 percent of carbon
   B. Alloy steels - alloying elements allow steels to possess special characteristics
      Discuss Table 1.1 "Effects of Alloying Elements on Steel"
      Discuss Table 1.2 "SAE-ANSI Numerical Designation of Alloy Steels"

III. Describe General Characteristics For:
   A. Carbon Steels
   B. Tool Steels
   C. Stainless Steels
   D. Structural Steels
   E. Cast Irons
   F. Non-Ferrous Metals
      1. Aluminum and Its Alloys
      2. Copper and Its Alloys
      3. Nickel Alloys
      4. Precious Metals
      5. Others

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Briefly describe and list the advantages and disadvantages for each of the following: casting processes, hot working processes, and cold working processes;

b. Discuss service requirements (strength, hardness, etc.);

c. Discuss fastening processes (fasteners, welding, bonding, etc.); and,

d. Discuss corrosion resistance methods.

MODULE OUTLINE:

I. Describe Casting Processes
   A. Discuss the following casting processes: sand, evaporative, shell molding, permanent mold, centrifugal, investment, and die casting
   B. Discuss pattern and mold design factors for each of the above casting processes
   C. List the advantages and disadvantages of the casting processes

II. Describe Hot Working Processes
   A. Discuss the following hot working processes: rolling, strand casting, forging, drawing, extrusion, spinning, and roll forming
   B. List the advantages and disadvantages of the hot working processes

III. Describe Cold Working Processes
   A. Discuss the following cold working processes: rolling, blanking, pressing, drawing, extruding, wire and bar drawing, bending, shearing, and roll forming
   B. List the advantages and disadvantages of the cold working process

IV. Evaluate Alternative Manufacturing Processes
   A. Discuss the powder metallurgy process (PM)
   B. Discuss the following nontraditional machining processes: EDM, laser machining, ultrasonic machining, hydrojet machining, electron beam machining, and plasma beam machining
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

BEST COPY AVAILABLE
OBJECTIVE(S):

Upon completion of this unit, the student will be able to:
A. Understand basic fundamentals and scientific principles involved in the welding process;
B. Demonstrate the safe handling, use, and storage of oxygen and fuel gas cylinders;
C. Identify oxygen and fuel gas cylinders, oxygen and fuel gas regulators, torch handles, welding tips, cutting torch assemblies, and friction lighters;
D. Use a tip cleaner on oxyacetylene equipment;
E. Demonstrate the assembly and function of each piece of oxyfuel equipment; and,
F. Perform leak detection, safe startup, lighting, and shutdown of equipment.

MODULE OUTLINE:

Instruction Topics:
A. Identify oxygen and fuel gas cylinders
B. Describe preventive and protective measures in use of tools and equipment
C. Illustrate the function of oxygen equipment, fuel gas regulators, and gages
D. Demonstrating pressure adjustments, and inlet/outlet connections
E. Emphasize nomenclature and purpose of components.
F. Demonstrate the selection and use of torches, tips, and friction lighters
G. Illustrate techniques for start up, lighting, and shut down of equipment
H. Introduce methods associated with cutting and welding

Student Activities:
A. Identify, understand, and demonstrate the safe use of equipment at the introductory level.
B. Observe and be coached by the instructor in the introductory set up and shutdown of oxyacetylene gas welding equipment.
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.

m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.

o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.

q. Always keep empty cylinders separate from full cylinders.

r. Mark all empty cylinders as such after use.

s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Identify and Describe the Function of Each Piece of Equipment
Attachment 3 MASTER Laboratory Worksheet No. 1

Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?
2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?
3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?
4. What are the steps in preparing to cut with oxyacetylene?
5. What are the steps in lighting the torch?
6. What are the steps in cutting metal with the torch?
7. What are the steps in extinguishing the torch?
8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.

2480
Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on: Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
WLD-K2-HO1
Identify the Safety Hazards
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Discuss the safety hazards associated with ignition and combustion;
B. Discuss the effect of an oxygen enriched environment;
C. Discuss the importance of ventilation in the oxyacetylene area;
D. Illustrate how to check the connections for leaks;
E. Review the use of check valves and flash arresters;
F. Discuss the importance of making sure o-rings are in good condition;
G. Demonstrate practice of indicators and detection measures for gas leaks;
H. Explain the function of Material Safety Data Sheets; and,
I. Explain the classes of fires and the types of extinguishers.

PRESENTATION OUTLINE:

Instruction Topics:
A. Identify safety hazards
B. Demonstrate preventive and protective measures
C. Describe the function of Material Safety and Data Sheets
D. Explain and practice safe lockout/tagout procedures
E. Practice safe work procedures around electrical hazards
F. Use respiratory protection equipment
G. Safe use of welders hand tools and power tools
H. Demonstrate how to set up and connect equipment
I. Demonstrate how to make pressure adjustments

Student Activities:
A. Inspection of welding shop for all possible safety hazards.
B. Select and demonstrate proper use of personal protective equipment, to include eye protection with required shade of lens, hearing protection, radiation and heat protection methods, and respiratory protection
C. Practice safe methods for lighting, safe use of ladders and scaffolds
D. Practice safe methods for electrical hazards and protection against shock
E. Review HazCom Standards and locate Material Safety Data Sheets
INTRODUCTION:

Welding is considered to be a hazardous occupation. Welding operations are used to cut, repair, and fabricate. Successful use of the welding torch, welding apparatus, and welding machines is based in safe operating procedures.

MODULE OUTLINE:

DON'T CARRY A BOMB IN YOUR POCKET!

NEVER carry a butane lighter into a welding area. These are mini-Molotov cocktails.

I. Safety Procedures Specific to the Welding Process
   A. Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.
      1. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
      2. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
      3. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
      4. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.
   B. Electrical shock can be avoided by following specific safety precautions.
      1. Do not touch live electrical parts.
      2. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
      3. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
      4. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
      6. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
7. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
8. Shut off electrical power when working on welding equipment.

C. Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
1. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.
2. Cover all skin surfaces. Keep shirt sleeves rolled down.
3. Wear cuffless pants to eliminate spatter traps.
4. Wear leather boots. Pant legs should cover boot tops.
5. Wear clean clothing. Oil- and grease-stained clothes will tend to ignite from welding spatter.
6. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.
7. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
8. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.
9. Wear a 100% cotton cap to protect the head from sparks or spatter.
10. Wear long-gauntlet leather gloves.
11. Do not touch hot metal with bare hands. Use tongs or pliers and wear leather gloves.
12. Protect nearby workers from exposure to the welding arc by putting up shields.
13. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (See Figure 1).

<table>
<thead>

</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to the next lighter shade until you find one which gives you sufficient view of the arc zone without exerting a strain on your eyes.

FIGURE 1  FILTER RECOMMENDATIONS
D. Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.
1. If possible, weld in specially designated areas or enclosures of noncombustible construction.
2. Remove combustibles from the work area by at least 35 feet if possible.
3. Cover combustibles that cannot be removed from the welding area with tight-fitting, flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.
4. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.
5. If combustibles cannot be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.
6. Do not weld on materials having either a coating or internal structure that is combustible.
7. Place hot scrap and slag in non-combustible containers.
8. Ensure that fire extinguishers are available nearby.
9. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.
10. Follow all company safety procedures regarding welding in hazardous areas.

E. Specific Safety Precautions for Oxyacetylene Equipment

CAUTION: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment:
1. Use goggles or shield with a number five shade.
2. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
3. When lighting the torch, direct the torch away from yourself and other personnel.
4. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
5. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
6. Never cut on containers that have contained flammable or toxic substances.
7. Either move work away from or protect wooden or other flammable materials which may be close to the work.
8. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
9. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
10. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.

11. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

F. Specific Safety Precautions for Acetylene and Oxygen Cylinders

CAUTION: Handle acetylene and oxygen cylinders carefully:

1. Keep acetylene operating pressures at or below 15 psi.

2. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.

3. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.

4. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene, hoses are colored red and acetylene fittings are left-hand threaded and usually notched.

5. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.

6. Do not use pipe-fitting compounds or thread lubricants for making connections.

7. Never use a cylinder that is leaking.

8. Store and transport cylinders in the upright position.

9. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.

10. Never tamper with fusible plugs or other safety devices on cylinders.

11. To open and dose acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.

12. Never use any cylinder, full or empty, as a roller or support.

13. Never use oxygen as though it were compressed air.

14. Do not handle oxygen cylinders on the same platform with oil.

15. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

17. Always keep empty cylinders separate from full cylinders.

18. Mark all empty cylinders as such after use.

19. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

20. Never bring any arc or flame close to or directly into contact with a cylinder.

21. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment.
If additional flow is needed, then manifold the required number of cylinders together.

G. Specific Safety Precautions for Regulator Burnout (R.B.O.)

CAUTION: Avoid potentially deadly regulator burnout (R.B.O.).

Regulator burnout is a spontaneous explosion that happens when a torch is being lit. To minimize the risk of R.B.O., follow these safety precautions:

1. "Crack" the oxygen cylinder valve (open it slightly) before attaching the regulator. Stand to one side or the rear of the cylinder outlet.

   Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage.

   Dirt can damage an oxygen regulator and may cause R.B.O.

2. Use only oxygen regulators to control oxygen supply. A pressure-reducing regulator must be connected to the oxygen cylinder valve.

   Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal, dust, and other combustibles can cause regulator burnout. Never use an oxygen regulator for other gases.

3. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.

4. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure.

   Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

II. Describe the SMAW Process

Shielded Metal Arc Welding is a welding process which joins metals by heating them with an arc between a covered metal electrode and the metals being joined. Shielding is obtained from the decomposition (breakdown) of the electrode covering. Pressure is not used and filler metal is obtained from the electrode. The electric arc flowing across an air gap produces very intense heat and light. An electric arc has been measured at 10,000°F. Considering that steel melts at around 2800°F, the electric arc is indeed a very fast and efficient heat source for melting steel when welding.

III. Describe the Oxyacetylene Cutting and Welding Process

Oxyacetylene cutting requires the use of specific procedures and specific techniques in order to work safely and to produce acceptable cuts. Proper flame adjustments, torch angles, and flame-to-work distances must be maintained in order to produce good cuts. Oxyacetylene cutting can be done from both fixed cutting stations and from portable cutting stations. The key operations to oxyacetylene cutting are as follows:

1. Prepare to cut.
2. Light the torch.
3. Cut metal with the torch.
4. Extinguish the torch.

HOW TO SELECT THE CORRECT NUMBER OF ACETYLENE CYLINDERS

To determine the number of cylinders required for proper manifold operation, follow the guidelines below:

1. The number of cylinders in the manifold is determined by the volume of gas in cubic feet per hour required. Determine the cubic feet per hour required for the largest tip used and multiply that by the number of torches or stations in operation at the same time. This will give the total volume of each gas required per hour.

2. The manifold should have enough cylinders to provide a minimum of one day's requirements.

3. Maximum acetylene withdrawal for continuous operation is 1/7 (of 14%) of each cylinder capacity per hour. The chart allows for 7.8% excess capacity.

Acetylene Cylinder Manifold Guide

IV. Describe the GTAW (Heliarc) Process
V. Describe the GMAW (MIG) Process
VI. Describe the Band/Flash Welding Machine and Process
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.

m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.

o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.

q. Always keep empty cylinders separate from full cylinders.

r. Mark all empty cylinders as such after use.

s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerf’s, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16” to 1/2” from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on:
   - Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify the protective clothing and equipment used by welders;
B. Explain the purpose and use of personal protective equipment;
C. Identify the safety precautions such as the importance of locating gas lines and checking for leaks before operating equipment; and.
D. Demonstrate proper body position, protective measures involving positioning the body in safe relationship to the work and the torch, and layout of the work with clamps and fixtures.

PRESENTATION OUTLINE:

Instruction Topics:
A. Purpose of wearing personal protective equipment
B. Identify potential safety hazards for all items of equipment
C. Describe protective and accident preventive measures
D. Illustrate the function of personal protective equipment (Hard Hat, Required Lens Shade, Safety Glasses, Safety Shoes, Hearing Protection Devices, and Respiratory Protection Equipment)
E. Understand the U.S. Dept. of Labor’s Occupational Safety and Health Administration’s Hazard Communication Standard (HazCom)

Student Activities:
A. Select and demonstrate proper use of personal protective equipment, to include eye protection with required shade of lens, hearing protection, radiation and heat protection methods, and respiratory protection
B. Practice safe methods for lighting, safe use of ladders and scaffolds
C. Practice safe methods for electrical hazards and protection against shock
D. Review HazCom Standards and locate Material Safety Data Sheets
E. Practice the use of respiratory equipment
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.

m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.

o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.

q. Always keep empty cylinders separate from full cylinders.

r. Mark all empty cylinders as such after use.

s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch’s valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder’s current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released: This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch’s acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch’s oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on:
   - Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
WLD-K4-HO
List the Welding Variables and Describe Their Effects on Weld Quality
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to the visual examination of welds;
B. Perform visual examination of welds;
C. Discuss common weld discontinuities;
D. Explain the impact of welding variables on oxyacetylene processes; and,
E. Demonstrate brazing and soldering techniques.

MODULE OUTLINE:

Instruction Topics:
A. Continue to illustrate the function of Oxyacetylene equipment
B. Demonstrate discontinuities and their effects on weld quality
C. Illustrate welding variables and how procedures can maintain weld quality
D. Illustrate proper techniques of applying welds or beads in various positions
E. Illustrate variables associated with cutting
F. Demonstrate brazing and soldering of various metals in various positions

Student Activities:
A. Identify weld discontinuities
B. Remove discontinuities from cut area using grinders and files
C. Remove oxidation for welding
D. Demonstrate proper cleaning techniques
E. Oxyacetylene weld practice pieces
F. Explain weld variables and use of filler metal for each welding example
G. Evaluate the process followed for each example
H. Braze and silver solder mild steel in various positions
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.
l. Never use any cylinder, full or empty, as a roller or support.
m. Never use oxygen as though it were compressed air.
n. Do not handle oxygen cylinders on the same platform with oil.
o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
p. Store oxygen cylinders separately from fuel gas cylinders.
q. Always keep empty cylinders separate from full cylinders.
r. Mark all empty cylinders as such after use.
s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
t. Never bring any arc or flame close to or directly into contact with a cylinder.
u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
WLD-K4-LW1
List the Welding Variables and Describe Their Effects on Weld Quality
Attachment 3 MASTER Laboratory Worksheet No. 1

Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Precautions for safely handling oxygen and acetylene cylinders:

- Keep acetylene operating pressures at or below 15 psi.
- Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
- Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
- Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
- Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
- Do not use pipe-fitting compounds or thread lubricants for making connections.
- Never use a cylinder that is leaking.
- Store and transport cylinders in the upright position.
- Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
- Never tamper with fusible plugs or other safety devices on cylinders.
- To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
- Never use any cylinder, full or empty, as a roller or support.
- Never use oxygen as though it were compressed air.
- Do not handle oxygen cylinders on the same platform with oil.
- Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
- Store oxygen cylinders separately from fuel gas cylinders.
- Always keep empty cylinders separate from full cylinders.
- Mark all empty cylinders as such after use.
- Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
- Never bring any arc or flame close to or directly into contact with a cylinder.
- Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.

List the Welding Variables and Describe Their Effects on Weld Quality
Attachment 4: MASTER Laboratory Worksheet No. 2

1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on: Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Classify filler metal for oxy-fuel gas welding;
B. Identify parent metal compatibility with filler metal; and,
C. Select welding tips required for the process.

PRESENTATION OUTLINE:

Instruction Topics:
A. Welding Rod defined as: “a filler metal used for welding or brazing which does not conduct the electric current.”
B. Welding rod types, lengths and diameters
C. Common welding rods: mild steel, cast iron, stainless steel, braze welding alloys, aluminum (drawn, extended, cast)
D. Mil-Specifications and AWS Specification numbers
E. Illustrate AWS Oxyacetylene Rod Classification System
F. Factors in selecting welding tips for varied work and thickness of metal

Student Activities:
A. Selection of filler metal based upon compatibility charts and alloy charts
B. Selection of welding tips to perform the work
C. Perform welds using selected filler metals
D. Testing of weld for discontinuities and strength
Attachmen 2: MASTER Laboratory Aid

Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.
l. Never use any cylinder, full or empty, as a roller or support.
m. Never use oxygen as though it were compressed air.
n. Do not handle oxygen cylinders on the same platform with oil.
o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
p. Store oxygen cylinders separately from fuel gas cylinders.
q. Always keep empty cylinders separate from full cylinders.
r. Mark all empty cylinders as such after use.
s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
t. Never bring any arc or flame close to or directly into contact with a cylinder.
u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Describe the AWS Oxyfuel Gas Welding Rod Classification System
Attachment 3  MASTER Laboratory Worksheet No. 1

Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?
2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?
3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?
4. What are the steps in preparing to cut with oxyacetylene?
5. What are the steps in lighting the torch?
6. What are the steps in cutting metal with the torch?
7. What are the steps in extinguishing the torch?
8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
a. Put on gloves.
b. Put on welding goggles.
c. Open the torch acetylene valve one-half turn.
d. Immediately light the torch with a friction lighter only.
e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
   (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
   (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut—assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
   (1) Cutting tip size.
   (2) Oxygen operating pressure.
   (3) Acetylene operating pressure.
   (4) Preheat flame type.
   (5) Size of preheat flame.

b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.

c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.

d. Select the correct torch angle.
   (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
   (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
Describe the AWS Oxyfuel Gas Welding Rod Classification System
Attachment 4: MASTER Laboratory Worksheet No. 2

1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on: Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand stresses caused by welding processes;
B. Use fixtures and clamps to minimize distortion;
C. Understand metal properties exhibited by heating and cooling;
D. Relieve internal stresses by heat treatment; and,

MODULE OUTLINE:

Instruction Topics:
A. Describe stresses caused by welding and the expansion rate of metal
B. Describe heat created by the welding process causing expansion
C. Describe contraction or shrinking caused by cooling
D. If metal does not return to original shape, explain how distortion has occurred
E. Reduce distortion by clamping parts into a fixture while welding
F. Discuss metal properties changed by heat and expansion factors
G. Demonstrate residual stresses relieved by heat treatment
H. Judge temperature by color of materials

Student Activities:
A. Perform welding experiments in heating and contraction of specific metals
B. Practice welding exercises using fixtures and clamping
C. Practice stress relief by heat treatment
WLD-K6-LA
Describe Techniques for Preventing or Reducing Welding Related Distortion
Attachment 2: MASTER Laboratory Aid

Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.
m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.
o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.
q. Always keep empty cylinders separate from full cylinders.
r. Mark all empty cylinders as such after use.
s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Describe Techniques for Preventing or Reducing Welding Related Distortion
Attachment 3 MASTER Laboratory Worksheet No. 1

Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2.

Precautions for safely handling oxygen and acetylene cylinders:

a. Keep acetylene operating pressures at or below 15 psi.

b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.

c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.

d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.

e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.

f. Do not use pipe-fitting compounds or thread lubricants for making connections.

g. Never use a cylinder that is leaking.

h. Store and transport cylinders in the upright position.

i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.

j. Never tamper with fusible plugs or other safety devices on cylinders.

k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.

m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.

o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.

q. Always keep empty cylinders separate from full cylinders.

r. Mark all empty cylinders as such after use.

s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut—assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For *holes*, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the *correct travel speed*, the lines of the cut which project through the thickness of the base metal will be in a straight line. *At too fast a travel speed*, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed *lag or drag* lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;

   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
Weld Mild Steel Sheet Metal Using Techniques That Will Minimize the Effects of Distortion
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Perform welding with mild steel and carbon steel using variety of joints and types of leads and welds;
B. Weld intermittent blocks to decrease distortion;
C. Learn other techniques to prevent warpage and distortion; and,
D. Remove distortion using gas equipment.

MODULE OUTLINE:

Instruction Topics:

A. Identify safety hazards
B. Describe preventive and protective measures
C. Illustrate the function of oxyacetylene equipment
D. Illustrate discontinuities and their effects on weld quality
E. Illustrate AWS Oxyacetylene Rod Classification System
F. Illustrate techniques for preventing or reducing weld related distortion, weld flat plate using stringer bead in flat and horizontal, vertical, and overhead positions; flat plate using weave bead in flat position; lap joint using filler weld in flat position, horizontal, vertical, and overhead positions.
G. Illustrate variables associated with cutting
H. Remove distortion using gas equipment

Student Activities:

A. Cut mild steel plates in a safe manner
B. Remove discontinuities from cut area using grinders and files
C. Remove oxidation prior to and after welding
D. Oxyacetylene weld practice pieces using multiple positions
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.
l. Never use any cylinder, full or empty, as a roller or support.
m. Never use oxygen as though it were compressed air.
n. Do not handle oxygen cylinders on the same platform with oil.
o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
p. Store oxygen cylinders separately from fuel gas cylinders.
q. Always keep empty cylinders separate from full cylinders.
r. Mark all empty cylinders as such after use.
s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
t. Never bring any arc or flame close to or directly into contact with a cylinder.
u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
WLD-K7-LW1
Weld Mild Steel Sheet Metal Using Techniques
That Will Minimize the Effects of Distortion
Attachment 3 MASTER Laboratory Worksheet No. 1

Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?
2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?
3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?
4. What are the steps in preparing to cut with oxyacetylene?
5. What are the steps in lighting the torch?
6. What are the steps in cutting metal with the torch?
7. What are the steps in extinguishing the torch?
8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
Weld Mild Steel Sheet Metal Using Techniques That Will Minimize the Effects of Distortion

Attachment 4: MASTER Laboratory Worksheet No. 2

1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on: Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Provide demonstrations related to shape cutting operations using manual oxyfuel gas cutting equipment;
B. Provide instruction related to visual examination of flame cut edges and surfaces;
C. Demonstrate straight cuts on mild steel of 1/8", 1/4", 1/2", bevel cuts of 3/8", cut holes and shapes on 1/4" and 1/2";
D. Provide training exercises related to shape cutting operations on plain carbon steel, using manual oxyfuel gas cutting equipment;
E. Observe safe oxyfuel gas cutting practices;
F. Operate manual oxyfuel gas cutting and "track burner" equipment;
G. Visually inspect workmanship samples;
H. Demonstrate straight cuts on mild steel of 1/8", 1/4", 1/2", bevel cuts of 3/8", cut holes and shapes on 1/4" and 1/2" with major emphasis on safety practice cutting from multiple positions under close supervision of instructor;
I. Understand different tip sizes for material thickness.

MODULE OUTLINE:

Instruction Topics:

A. Identify safety hazards in oxyfuel gas cutting operations
B. Describe preventive and protective measures
C. Selection of tips for cutting
D. Demonstrate kerfing, gauging, scarfing, and washing
E. Demonstration on cutting steel: straight cuts, bevel cuts, holes and shapes
F. Demonstrate cutting methods in flat or horizontal, vertical, and overhead positions
G. Operation of manual oxyfuel gas cutting and track burner equipment
H. Importance of quality and safety in cutting methods
I. Review other methods of cutting (plasma, laser, water jet), with advantages and disadvantages
J. Evaluating quality of final workmanship

Student Activities:

A. Demonstrate safe techniques in use of oxyfuel gas cutting equipment
B. Perform straight cutting operations using manual oxyfuel gas cutting equipment
C. Perform straight cutting operations on plain carbon steel
D. Demonstrate straight cuts on mild steel of 1/8", 1/4", 1/2", bevel cuts of 3/8", cut holes and shapes on 1/4" and 1/2" with major emphasis on safety practice cutting from multiple positions under close supervision of instructor
E. Use "track burner" equipment
F. Perform shape cutting operations on plain carbon steel, using manual oxyfuel gas cutting equipment
G. Select and change tip size for material, appropriate size to each operation
H. Review different methods of cutting (i.e. plasma, laser, water jet, etc.)
List the Variables Associated with Cutting
Attachment 2: MASTER Laboratory Aid

Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.

l. Never use any cylinder, full or empty, as a roller or support.

m. Never use oxygen as though it were compressed air.

n. Do not handle oxygen cylinders on the same platform with oil.

o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.

p. Store oxygen cylinders separately from fuel gas cylinders.

q. Always keep empty cylinders separate from full cylinders.

r. Mark all empty cylinders as such after use.

s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.

t. Never bring any arc or flame close to or directly into contact with a cylinder.

u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
(3) For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line.
   At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines.
   (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
1. Instructor will demonstrate how to:
   - Braze with bronze rod;
   - Run a bead with a bronze rod;
   - Square butt braze on light steel plate;
   - Braze lap joints;
   - Braze tee joints;
   - Braze beveled butt joints on heavy steel plate; Braze beveled joints on cast iron;
   - Silver soldering of nonferrous metals; and,
   - Silver soldering of ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on:
   - Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.
WLD-K9-HO
Cut Mild Steel Plate in a Safe Manner
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit, the student will be able to:
A. Perform quality multipass single vee groove welds;
B. Perform quality vee groove weld that will pass a guided bend test;
C. Produce quality single vee groove welds in the vertical position;
D. Produce quality single vee groove welds in the overhead position;
E. Produce quality single vee groove welds in the horizontal position;
F. Visually inspect workmanship samples; and,
G. Understand all welding procedures.

MODULE OUTLINE:

Instruction Topics:
A. Identify safety hazards.
B. Describe preventive and protective measures.
C. Demonstrate forcehand or backhand motions for gas welding
D. Adjust gas working pressures according to tip size, producing good fusion
E. Present and demonstrate welding techniques in the flat or horizontal, vertical, and overhead positions
F. Discuss types of welds and joints for carbon steel.
G. Discuss how to perform Single Groove Weld Guided Bend Test.

Student Activities:
Perform the following welding exercises:
A. Single Vee Groove Weld, Butt Joint, Flat Position
B. Single Vee Groove Weld, Guided Bend Test
C. Single Vee Groove Weld, Butt Joint, Vertical Position,
D. Single Vee Groove Weld, Butt Joint, Overhead Position
E. Single Vee Groove Weld, Butt Joint, Horizontal Position
F. Discuss advantages and disadvantages of typical gas working pressures
Caution: Specific preventive and protective safety measures must be followed when using oxyacetylene equipment.

a. Use goggles or shield with a number five shade.
b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots, and soft cotton caps.
c. When lighting the torch, direct the torch away from yourself and other personnel.
d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
f. Never cut on containers that have contained flammable or toxic substances.
g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
h. When cutting, cover, concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.
j. Cut in a well-ventilated area. If adequate ventilation is not possible, use a respirator.
k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

Caution: Handle acetylene and oxygen cylinders carefully:

a. Keep acetylene operating pressures at or below 15 psi.
b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burnback or a fire at a leak in the hose or at a connection.
c. Do not open the acetylene torch valve where acetylene could flow into a bucket or other container and cause a fire.
d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left-hand threaded and usually notched.
e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
f. Do not use pipe-fitting compounds or thread lubricants for making connections.
g. Never use a cylinder that is leaking.
h. Store and transport cylinders in the upright position.
i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
j. Never tamper with fusible plugs or other safety devices on cylinders.
k. To open and close acetylene cylinder valves not provided with handwheels always use the special wrench or key. When cutting leave the key in place for rapid shutdown in case of fire.
l. Never use any cylinder, full or empty, as a roller or support.
m. Never use oxygen as though it were compressed air.
n. Do not handle oxygen cylinders on the same platform with oil.
o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
p. Store oxygen cylinders separately from fuel gas cylinders.
q. Always keep empty cylinders separate from full cylinders.
r. Mark all empty cylinders as such after use.
s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
t. Never bring any arc or flame close to or directly into contact with a cylinder.
u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
Answer the following questions and compare your answers to those listed below.

1. What are the precautions recommended to prevent accidents and protect the welder during oxyacetylene cutting?

2. What are the precautions for safely handling and storing acetylene and oxygen cylinders?

3. What are the precautions for minimizing the risk of regulatory burn out (R.B.O.)?

4. What are the steps in preparing to cut with oxyacetylene?

5. What are the steps in lighting the torch?

6. What are the steps in cutting metal with the torch?

7. What are the steps in extinguishing the torch?

8. What are the steps in closing down the welding station?

Answers:

1. Precautions recommended to prevent accidents and to protect the welder during oxyacetylene cutting:
   a. Use goggles or shield with a number five shade.
   b. Wear gloves, long sleeve shirts, pants of high cotton or wool content, leather boots and soft cotton caps.
   c. When lighting the torch, direct the torch away from yourself and other personnel.
   d. Never leave a lit torch unattended. When leaving your work station, always extinguish your torch.
   e. Never use matches or butane lighters for lighting a torch. Only use spark or friction lighters.
   f. Never cut on containers that have contained flammable or toxic substances.
   g. Either move work away from or protect wooden or other flammable materials which may be close to the work.
   h. When cutting, cover concrete floors with sheet metal where sparks and molten metal are being directed.
i. Before beginning to work, locate the nearest fire alarm and the nearest fire extinguisher.

j. Cut in a well ventilated area. If adequate ventilation is not possible, use a respirator.

k. Keep all petroleum products away from oxyacetylene equipment and operations. The combination of pure oxygen and oil is explosive.

2. Precautions for safely handling oxygen and acetylene cylinders:
   a. Keep acetylene operating pressures at or below 15 psi.
   b. Open the acetylene cylinder valve one-half to one full turn when using a portable rig to be sure that the cylinder can be quickly turned off in the event of burn-back or a fire at a leak in the hose or at a connection.
   c. Do not open an acetylene torch's valve where acetylene could flow into a bucket or other container and cause a fire.
   d. Never attempt to connect an acetylene hose to an oxygen torch connection. Damage to the torch or an explosion could result. Acetylene hoses are colored red and acetylene fittings are left hand threaded and usually notched.
   e. Never use oxygen or fuel gas from a cylinder except through an approved pressure-reducing regulator.
   f. Do not use pipe-fitting compounds or thread lubricants for making connections.
   g. Never use a cylinder that is leaking.
   h. Store and transport cylinders in the upright position.
   i. Secure all cylinders with chain when storing, transporting, or using, to prevent them from being turned over by accident.
   j. Never tamper with fusible plugs or other safety devices on cylinders.
   k. To open and close acetylene cylinder valves not provided with handwheels, always use the special wrench or key. When cutting, leave the key in place for rapid shutdown in case of fire.
   l. Never use any cylinder, full or empty, as a roller or support.
   m. Never use oxygen as though it were compressed air.
   n. Do not handle oxygen cylinders on the same platform with oil.
   o. Never use wire-rope slings or electromagnets for lifting cylinders. Do not lift cylinders by the protective cap alone.
   p. Store oxygen cylinders separately from fuel gas cylinders.
   q. Always keep empty cylinders separate from full cylinders.
   r. Mark all empty cylinders as such after use.
   s. Keep all cylinders stored inside buildings at least 20 feet away from combustible materials.
   t. Never bring any arc or flame close to or directly into contact with a cylinder.
   u. Never exceed the maximum safe withdrawal rate for acetylene cylinders (one seventh of the cylinder's current contents per hour). If acetylene is withdrawn from the cylinder at a greater rate, acetone will also be withdrawn from the cylinder, damaging the cutting equipment. If additional flow is needed, then manifold the required number of cylinders together.
3. Precautions for minimizing the risks of regulatory burn out (R.B.O).
   a. "Crack" the oxygen cylinder valve before attaching the regulator. Stand to one side or the rear of the cylinder outlet. Open the cylinder valve slightly for an instant and then close it to clean the valve of dust and dirt which may have accumulated during storage. Dirt can damage an oxygen regulator and may cause R.B.O.
   b. Use only oxygen regulators to control oxygen supply. A pressure reducing regulator must be connected to the oxygen cylinder valve. Make certain the regulator is clean, free of grease and oil, and has a clean filter installed in its inlet nipple. Oil, grease, coal dust, and other combustibles can cause regulator burnouts. Never use an oxygen regulator for other gases.
   c. Before opening an oxygen cylinder valve, make sure the oxygen regulator pressure-adjusting screw is released. This is done by rotating the screw counterclockwise until it turns, freely. This closes the regulator valve and prevents damage due to a sudden pressure surge.
   d. While opening the oxygen cylinder valve, stand to one side of the oxygen regulator. Do not stand in line with the front or the back of the pressure-adjusting screw. Open the cylinder valve as slowly as possible, until the high pressure gauge reaches cylinder pressure. Never open a cylinder valve suddenly. Sudden surges of high pressure can cause R.B.O.

4. Steps in preparing to cut with oxyacetylene:
   a. Obtain the proper size cutting tip.
      (1) Consult the equipment manufacturer's cutting tip data charts. The charts match up the thickness of the steel being cut with the cutting tip size and also give recommended pressure settings for oxygen and acetylene.
      (2) Be sure that the metal can be cut with an oxyacetylene torch. Oxy-fuel cutting is not used on metals like aluminum, copper, magnesium, and chromium, where the oxide of that metal melts at a higher temperature than the metal itself. Also, stainless steels cannot be easily cut with oxy-fuel because they contain relatively large amounts of chromium and/or nickel.
   b. Screw the cutting torch head in place, hand-tight only.
   c. Before attaching the regulators to the cylinder valves, crack the valves to blow out any dirt and debris.
   d. Attach the regulators, hoses, torch, and correct-sized torch tip.
   e. Make sure the pressure adjusting screws of the acetylene and oxygen regulators are backed out. (That is, that they have been turned counterclockwise until there is a little free play.)
   f. Make sure all cutting torch valves are initially closed.
   g. Open the oxygen cylinder valve all the way. Open the acetylene cylinder valve one full turn only.
   h. Open the acetylene torch valve. Turn the acetylene torch valve off.
i. Turn the acetylene regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

j. Turn the acetylene torch valve off.

k. Turn both oxygen torch valves on.

l. Turn the oxygen regulator pressure-adjusting screw clockwise until the needle on the regulator dial indicates the proper pressure.

m. Turn off the oxygen torch valve on the torch head only.

5. Steps in lighting the torch:
   a. Put on gloves.
   b. Put on welding goggles.
   c. Open the torch acetylene valve one-half turn.
   d. Immediately light the torch with a friction lighter only.
   e. Reduce the acetylene flow at the torch's acetylene valve until the flame just starts to produce black smoke around its edges. Then increase the acetylene flow just enough to get rid of the black smoke.
   f. Open the torch's oxygen valve slowly until the desired type flame is obtained.
      (1) The preheat flame needs to be of the neutral type, which means that equal parts of oxygen and acetylene are being burnt.
      (2) The preheat flame needs to be the right size. Set the pressure correctly, and then follow the directions in "Step e" again. If the preheat flame is too large, there will be or tend to be slag or dross hanging onto the bottom of the cut-assuming that travel speed, tip size, etc., are all correct.

6. Steps in cutting metal with the torch:
   a. Follow the steps in Operation 1 and Operation 2 for the following oxyacetylene cutting variables:
      (1) Cutting tip size.
      (2) Oxygen operating pressure.
      (3) Acetylene operating pressure.
      (4) Preheat flame type.
      (5) Size of preheat flame
   b. Clean the cutting tip. Be sure that the preheat and cutting orifices of the tip are clean. A dirty tip, especially a dirty cutting orifice, will adversely affect the quality of the cut. Dirty orifices can produce such defects as wide kerfs, adherent slag, and rough appearance.
   c. Select the correct flame-to-work distance. The bottom of the preheat flame should be 1/16" to 1/2" from the base metal. Right-handed people should progress from right to left and left-handed people should cut left to right.
   d. Select the correct torch angle.
      (1) For square cuts, the torch should be perpendicular (at 90°) to the base metal and tipped slightly in the direction of travel.
      (2) For beveled cuts, the torch should be held at the angle of the bevel throughout the cutting procedure.
For holes, the torch must be held perpendicular to the base metal throughout the cut.

e. Cut at the proper travel speed. At the correct travel speed, the lines of the cut which project through the thickness of the base metal will be in a straight line. At too fast a travel speed, the lines of the cut will curve back from the progress of the cut and form clearly defined lines termed lag or drag lines. (The amount of drag is often expressed as a percent.)

f. Assure the oxygen level. Although it is possible to make a good weld with an oxygen purity level of only 95%, in order to make good oxy-fuel cut, an oxygen purity level of 99.5% is required. Where leaks in oxygen lines or hoses allow air to be mixed with the oxygen, the quality of the cut can be very seriously affected.

7. Steps in extinguishing the torch:
   a. Close the torch acetylene valve, thus extinguishing the flame.
   b. Close the torch oxygen valve.

8. Steps in closing down the welding station:
   a. Close the oxygen cylinder valve.
   b. Close the acetylene cylinder valve.
   c. Open the torch acetylene valve and bleed the acetylene from the line.
   d. Close the torch acetylene valve.
   e. Turn the acetylene regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
   f. Open the torch oxygen valve and bleed the oxygen from the line.
   g. Close the torch oxygen valve.
   h. Turn the oxygen regulator pressure adjusting screw counterclockwise until there is a little free play. Avoid backing out the pressure adjusting screws so much that they come totally out.
WLD-K9-LW2
Cut Mild Steel Plate in a Safe Manner
Attachment 4: MASTER Laboratory Worksheet No. 2

1. Instructor will demonstrate how to:
   - Brazing with bronze rod;
   - Running beads with a bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

2. Student will practice:
   - Brazing with bronze rod;
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

3. Instructor will grade students performance on:
   - Brazing with bronze rod:
   - Running beads with bronze rod;
   - Square butt brazing on light steel plate;
   - Brazed lap joints;
   - Brazing tee joints;
   - Brazing beveled butt joints on heavy steel plate; Building-up on cast iron;
   - Brazing beveled joints on cast iron;
   - Silver soldering nonferrous metals; and,
   - Silver soldering ferrous and nonferrous metals.

- M-24 Perform weld sequence
- M-25 Perform weld sequence
- M-26 Perform weld sequence
- M-27 Perform weld sequence
- M-28 Perform weld sequence
- M-29 Perform weld sequence

Activities:
- O-1 Identify GTAW equipment
- O-2 Pass a performance qualification test using GTAW on carbon steel in the 6G position on pipe
- O-3 Identify the safety standards
- O-4 Display a general understanding of equipment being used
- O-5 Perform visual inspection
- O-6 Demonstrate ability to lift 50 pounds
- O-7 Return unused consumables
- O-8 Machine set-up ability to weld 50 pounds

Best Copy Available
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Outline safety rules for ARC Welding;
B. Properly adjust machine settings;
C. Understand basis of striking the arc electrode manipulation, and evaluating the puddle;
D. Apply the use of gas to preheat joint on mild steel plate;
E. Apply the pre-heating technique using Electrodes; and,
F. Discuss the use of other ways of preheating (Blankets, etc.).

MODULE OUTLINE:

Instructor Topics:
A. Discuss the principles and theories involved in SMAW operations
B. Emphasize safety rules for ARC Welding equipment
C. Demonstrate machine settings and basis of striking the Arc
D. Electrode manipulation and reading the puddle
E. Demonstrate knowledge of joint design and welding terms
F. Demonstrate ability to interpret drawings and blueprints, using weld symbols
G. Introduce welding variables and demonstrate their effects on weld quality
H. Demonstrate knowledge of adequate preparation of welding surfaces
I. Prepare butt joints, and tee joints, for welding
J. Increase knowledge of current industry standards and techniques
K. Identify polarity requirements using SMAW on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match SMAW electrodes to an appropriate base metal

Student Activities:
A. Demonstrate knowledge of safety rules
B. Demonstrate equipment operation and setting adjustments
C. Preheat weld surface
D. Prepare and task weld coupons
E. Understand D.C. straight and reverse polarity
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Britleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;

b. Use other tests to identify metals; and,

c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

2574
Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which overlap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

h. Chip slag and wire brush weld

i. Grind any lack of fusion and/or high spots

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Weld pipe joint

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Roll weld pipe

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9

2570
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
c. Set welding condition to weld open roots
d. Tack pipe nipples together to form a V groove with a 1/8" root opening
e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
f. Weld balance of the V groove with this procedure
g. Visual inspection is made and evaluated by ASME Section 9
h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
a. Identify process
b. Name joint design
c. List base material
d. Give dimensions for root treatment
e. Name electrode size and type being used
f. List filler material (if required), classification and specification
g. Identify shielding gas - type and mixture
h. List pre and post heat and interpass temperature
i. Describe initial and interpass cleaning
j. Describe technique which is used
k. Produce single or multiple pass weld
l. Choose current type
m. Set current amperage
n. Set current polarity
o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the root pass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

**CAUTION:** Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection
from light welding spatter, and it is cooler in the summer and warmer in the winter.
B. Cover all skin surfaces. Keep shirt sleeves rolled down.
C. Wear cuffless pants to eliminate spatter traps.
D. Wear leather boots. Pant legs should cover boot tops.
E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding
spatter.
F. For more severe welding conditions, wear protective clothing such as heat resistant
jackets, aprons, and leggings.
G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
H. Wear ear protection, not only where there is noise but where there is a chance that
spatter or sparks could get into the ears.
I. Wear a 100% cotton cap to protect the head from sparks or spatter.
J. Wear long gauntlet leather gloves.
K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.
L. Protect nearby workers from exposure to the welding arc by putting up shields.
M. Wear a welding helmet with the correct shade of welding lens. Choose the correct
lens from a filter recommendations table (see Figure 2).

* As a general rule, start with a shade that is too dark to see the arc zone. Then
go to a lighter shade which gives sufficient view of the arc zone without exerting
a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of
property due to welding sparks, spatter, and heat.
A. If possible, weld in specially designated areas or enclosures of noncombustible
construction.
B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails. DON'T CARRY A BOMB IN YOUR POCKET.
1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**

   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be used.
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. **Prepare Weldment for Welding**

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design
(2) Material thickness
(3) Design strength requirements
(4) Welding process employed

b. SMAW weld joint configuration may be a:
   (1) Lap joint
   (2) Tee joint
   (3) Corner joint
   (4) Edge joint
   (5) Butt joint with backing
   (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Apply the use of gas to preheat joint on mild steel plate;
B. Weld Pad of Beads, flat position with 6010 Electrodes, (Weave and Stringer);
C. Weld Pad of Beads (stringer), plate in vertical position, horizontal travel using 6010 Electrodes;
D. Weld Pad of Beads (stringer), plate in vertical position, vertical travel using 6010 Electrodes;
E. Weld Pad of Beads (stringer) overhead position using 6010 Electrodes;
F. Fillet weld Multi-Stringer, horizontal travel using 6010 Electrodes;
G. Fillet weld Multi-Stringer, vertical travel using 6010 Electrodes;
H. Fillet weld Multi-Stringer, overhead using 6010 Electrodes;
I. Weld Open groove, Multi-Stringer, horizontal position using 6010 Electrodes;
J. Weld Open groove, Multi-Stringer, vertical position using 6010 Electrodes;
K. Weld Open groove, overhead position using 6010 Electrodes;
L. Weld Open groove, vertical position, 6010 root pass 7018 fill & cap;
M. Weld Open groove, overhead position 6010 root pass 7018 fill & cap; and,
N. Perform destructive testing on weld samples to determine discontinuities and proficiency.

MODULE OUTLINE:

Instructor Topics:
A. Emphasize the principles involved in the operating of SMAW equipment
B. Discuss fundamentals of joint design and relevance of welding terms
C. How to interpret drawings and blueprints, using SMAW
D. Demonstration of the proper application of welding skills
E. Demonstration of adequate preparation of welding surfaces
F. Prepare butt joints, and tee joints, for welding
G. Identify polarity requirements using SMAW on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Match SMAW electrodes to an appropriate base metal
J. Demonstrate SMAW in the flat horizontal, vertical, and overhead positions
K. Identify welding variables and their effects on weld quality
L. Increase knowledge of current industry standards and techniques
M. Increase skill level to pass certification tests
N. Identify the AISI steel classification system

Student Activities:
A. Preheat weld surface
B. Perform welds in multiple positions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Perform destruction testing on weld samples
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. Chicken Wire markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Brittleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
   A. High-carbon steels show more spark bursts than do low-carbon steels.
   B. Non-ferrous metals
      1. Aluminum
      2. Magnesium
      3. Brass
      4. Bronze
      5. Nickel
      6. Tin
      7. Others

III. Perform Rockwell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

WLD-L2-H04
Initiate Welding Process
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
a. Maintain required weld quality
b. Maintain proper weld width uniformly
c. Maintain proper travel speed
d. Match correct oscillation for various electrodes
e. Match applications to weave techniques, as they apply
f. List the advantages and disadvantages of weave techniques
g. List the advantages and disadvantages of stringer techniques
h. Perform weld using weave technique
i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
a. Weld a dam to outline area being welded for each layer
b. Apply each layer neatly, straight and with good fusion throughout
c. Chip slag after each pass
d. Weld passes which overlap to crown of last weld bead
e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
a. Follow manufacturer's recommended practice
b. Inspect equipment and work area for safety
c. Assemble oxy-fuel equipment
d. Open fuel gas cylinder ½ turn
e. Open oxygen as cylinder all the way
f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
a. Make manual free hand straight line cuts
b. Cut manually straight lines using cutting jib
c. Bevel plate with manual oxy-fuel equipment
d. Manually cut blind holes in thick material
e. Manually cut sheet metal with minimal distortion
Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld

i. Grind any lack of fusion and/or high spots

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Weld pipe joint
   h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
   l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Roll weld pipe
   h. Place pipe coupon on workbench in the 1G roll welding position.
   i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2.00 to 12.30 position
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
   m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

**CAUTION:** Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

**Figure 2** Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
WLD-L2-LW
Initiate Welding Process
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. Choose Proper Power Source
   Step 1. With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.
   Step 2. An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. Choose a Proper Electrode
   Step 1. Choose the proper electrode for the job.
   NOTE: The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   Step 2. Store the electrodes properly.
   a. Low-hydrogen electrodes:
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.
      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.
      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
   NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two
to four hours, depending on the type of base metal to be
welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-
freeze electrodes require the presence of small amounts of
moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used
with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material
to the desired shape/contour for each type of weld joint configuration
needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design  
(2) Material thickness  
(3) Design strength requirements  
(4) Welding process employed  

b. SMAW weld joint configuration may be a:  
(1) Lap joint  
(2) Tee joint  
(3) Corner joint  
(4) Edge joint  
(5) Butt joint with backing  
(6) Butt joint without backing  

Step 2. Clean the areas to be welded prior to fit-up  
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing  
   b. Remove oils and greases with a safe, suitable solvent  

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.  

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.  

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.  

4. Complete Welding Operation  
Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.  
Step 2. Use any preheat that may be required by welding codes or company procedures.  
Step 3. Make the required weld to be defect free and pleasing in appearance.  
Step 4. Use proper weld bead placement according to the weld joint design.  
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.  
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.  
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.  

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.

b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.

c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
WLD-L3-H01
Perform Weld Sequence
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Weld Multi-Stringer beads on steel plate using E6010 & E7018;
B. Weld steel plate using weave technique with E6010 & E7018; and,
C. Weld steel plate with E6010 for a root pass and E7018 fill & cap.

PRESENTATION OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of SMAW equipment
B. Demonstrate knowledge of the proper application of welding skills and techniques
C. Illustrate welding techniques for the five basic welding joints
D. Demonstrate knowledge of adequate preparation of welding surfaces
E. Demonstrate preheat and how to maintain desired temperature
F. Identify welding variables and their effects on weld quality
G. Identify the AISI steel classification system
H. Match SMAW electrodes to an appropriate base metal
I. Illustrate quality weld techniques for SMAW in student exercises

Student Activities:
A. Preheat weld surface
B. Weld multiple stringer beads
C. Use weave technique
D. Use oscillating and non-oscillating welding technique
E. Perform single pass and multi-pass welds;
   1. Flat plate, stringer bead, flat position;
   2. Lap joint, Fillet weld, flat position;
   3. Edge, Stringer bead, flat position;
   4. Flat plate, Pad stinger bead, Horizontal position;
   5. Lap, Fillet weld, Vertical down position;
   6. Lap, Fillet weld, Horizontal position;
   7. “T”, Multipass weave beads, Flat position;
   8. Single “Y” butt, Multipass Groove weld, horizontal position;
   9. Coupling, Fillet weld, Horizontal position;
  10. Single “V” butt, Multipass filler weld, Overhead position;
  11. Square butt, Bead groove weld, Overhead position;
  12. Single “V” butt, Multipass groove weld, Horizontal position;
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
    A. Protective Gear against...
       1. Heat
       2. Fumes
       3. Concussion
    B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
     A. Britteness
     B. Distortion
     C. Discoloration (sometimes unimportant)
     D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
    A. Ferrous metals
    B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
d. Match correct oscillation for various electrodes
e. Match applications to weave techniques, as they apply
f. List the advantages and disadvantages of weave techniques
g. List the advantages and disadvantages of stringer techniques
h. Perform weld using weave technique
i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
c. Chip slag after each pass
d. Weld passes which over lap to crown of last weld bead
e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
c. Assemble oxy-fuel equipment
d. Open fuel gas cylinder ½ turn
e. Open oxygen as cylinder all the way
f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
c. Bevel plate with manual oxy-fuel equipment
d. Manually cut blind holes in thick material
e. Manually cut sheet metal with minimal distortion
Perform Weld Sequence
Attachment 5: MASTER Handout No. 5

Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld.

i. Grind any lack of fusion and/or high spots.

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Weld pipe joint.

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots.

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

5. Roll Weld Pipe - SMAW

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Roll weld pipe.

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position.

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots.
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
g. Tack the single V groove pipe joint with a 3/32" root opening
h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
e. Use the grinder to add a root face of from 3/32" to 1/8"
f. Weld pipe
g. Tack the single V groove pipe joint with a 3/32" root opening
h. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
l. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
WLD-L3-HO6
Perform Weld Sequence
Attachment 6: MASTER Handout No. 6

Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffed pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)
SMAW

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON’T CARRY A BOMB IN YOUR POCKET.
WLD-L3-LW
Perform Weld Sequence
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. Choose Proper Power Source
   Step 1. With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.
   
   Step 2. An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. Choose a Proper Electrode
   Step 1. Choose the proper electrode for the job.
   
   NOTE: The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   Step 2. Store the electrodes properly.
   
   a. Low-hydrogen electrodes:
      
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

      NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

**Figure 5 Welding Rod Polarities**

**Definitions:**
- AC Alternating Current
- DC+(DCRP) Direct Current Reverse Polarity
- DC-(DCSP) Direct Current Straight Polarity

**Figure 6 Typical Current Ranges for Electrodes**

3. **Prepare Weldment for Welding**

   Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

   a. Weld joint configuration will depend upon:
Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing,
      grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent
Step 3. Turn on the power source and set the current range (amps) on the machine
        at the lower end of the setting as suggested for the electrode size.
Step 4. Obtain a piece of scrap metal of the approximate type and thickness for
        the weld joint to be made.
Step 5. Practice welding on the scrap metal and adjust the current setting as
        needed to produce a good weld.

4. Complete Welding Operation
Step 1. Tack weld a joint that is defect free and can be incorporated into the
        finished product.
Step 2. Use any preheat that may be required by welding codes or company
        procedures.
Step 3. Make the required weld to be defect free and pleasing in appearance.
Step 4. Use proper weld bead placement according to the weld joint design.
       a. When making seam welds, produce the weld beads by using very
          little oscillation or some oscillation.
       b. When making fillet welds, produce the weld beads by using some
          oscillation. Fillet welds in the vertical position can also be run
          using a weaving technique.
       c. When making groove welds, produce the weld beads by using
          some oscillation and/or by weaving. When making groove welds
          on butt joints, the amount of weaving will depend on the welding
          position and the weld joints. It may also be limited by applicable
          welding codes and/or company standards.
Step 5. Maintain the correct welding travel speed. Weld bead size can be changed
        by varying the arc travel speed. Bead size and travel speed are inversely
        related: a decrease in travel speed will result in an increase in the weld
        bead height and width, and an increase in travel speed will result in a
        decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.

b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.

c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Use proper welding techniques for light gage metals;
B. Demonstrate proper methods of welding materials of different thickness into a lap joint;
C. Use iron powder or heavy coated electrodes, understand the use and advantage of low hydrogen electrodes; and,
D. Control movement pattern and width of each bead on the overhead position Tee joint using low hydrogen electrodes.

MODULE OUTLINE:

Instructor Topics:
A. Welding technique for light gage metals
B. Proper methods of welding metals of different thickness into a lap joint
C. Use of iron powder or heavy coated electrodes
D. The advantages of low hydrogen electrodes and its applications
E. Proper manipulation of the low hydrogen electrode to make a sound multipass filler in the vertical position
F. To teach control of the movement pattern and width of each bead on the overhead position tee joint, using low hydrogen electrodes
G. To teach the ability to adjust current while welding sheet steel

Student Activities:
Perform the following:
A. Fillet Weld, Lap and Tee Joints Flat and Vertical
B. Fillet Weld, Lap Joint, Vertical Down Position
C. Fillet Weld, Lap Joint, Horizontal Position
D. Fillet Weld, Tee Joint, Vertical Up Position
E. Fillet Weld, Tee Joint, Overhead Position
F. Adjust current while welding sheet steel
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
A. Increased machinability
B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
A. Protective Gear against...
   1. Heat
   2. Fumes
   3. Concussion
B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
A. Britteness
B. Distortion
C. Discoloration (sometimes unimportant)
D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
a. Maintain required weld quality
b. Maintain proper weld width uniformly
c. Maintain proper travel speed
d. Match correct oscillation for various electrodes
e. Match applications to weave techniques, as they apply
f. List the advantages and disadvantages of weave techniques
g. List the advantages and disadvantages of stringer techniques
h. Perform weld using weave technique
i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
a. Weld a dam to outline area being welded for each layer
b. Apply each layer neatly, straight and with good fusion throughout
c. Chip slag after each pass
d. Weld passes which over lap to crown of last weld bead
e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
a. Follow manufacturer's recommended practice
b. Inspect equipment and work area for safety
c. Assemble oxy-fuel equipment
d. Open fuel gas cylinder ½ turn
e. Open oxygen as cylinder all the way
f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
a. Make manual free hand straight line cuts
b. Cut manually straight lines using cutting jib
c. Bevel plate with manual oxy-fuel equipment
d. Manually cut blind holes in thick material
e. Manually cut sheet metal with minimal distortion
Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
h. Chip slag and wire brush weld
i. Grind any lack of fusion and/or high spots
j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Weld pipe joint
   h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
   l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Roll weld pipe
   h. Place pipe coupon on workbench in the 1G roll welding position.
   i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Control Weld Technique
Attachment 6: MASTER Handout No. 6

Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)
SMAW

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
Worksheet:

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the *fast-freeze* family of electrodes and the E7018 belongs to the *low-hydrogen* family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design
(2) Material thickness
(3) Design strength requirements
(4) Welding process employed

b. SMAW weld joint configuration may be a:
   (1) Lap joint
   (2) Tee joint
   (3) Corner joint
   (4) Edge joint
   (5) Butt joint with backing
   (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems
Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
Maintain Preheat and Perform Interpass
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Weld carbon steels using the SMAW process;
B. Apply large fillet welds in multiple position on thick material;
C. Perform weave bead techniques for making large welds; and,
D. Understand and practice the methods of destructive testing.

MODULE OUTLINE:

Instructor Topics:
A. Develop skill in repositioning large fillet welds in the horizontal position on thick material
B. Provide practice in multiple pass welding on heavy workpieces
C. Provide an orientation to the requirements of welding codes as they apply to the qualification of welders and procedures
D. Provide practice in weave bead technique for making large welds
E. Define destructive testing and present a brief description of the different methods of destructive testing

Student Activities:
A. Perform multiple pass welding on heavy workpieces; Fillet Weld, Lap Joint, Horizontal Position (21 Bead)
B. Perform welds using 6 bead and 3-45° weaves: Fillet Weld, Lap Joint, Overhead Position
C. Practice weave bead technique for making large welds, Fillet Weld, Lap Joint, Vertical Position (Uphill)
D. Make adjustments to improve weld quality
E. Perform destructive testing
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
    A. Brittleness
    B. Distortion
    C. Discoloration (sometimes unimportant)
    D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
   A. High-carbon steels show more spark bursts than do low-carbon steels.
   B. Non-ferrous metals
      1. Aluminum
      2. Magnesium
      3. Brass
      4. Bronze
      5. Nickel
      6. Tin
      7. Others

III. Perform Rockwell Hardness Tests
   A. Ferrous metals
   B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
   A. Ferrous metals
   B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which overlap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld.

i. Grind any lack of fusion and/or high spots.

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Weld pipe joint.

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots.

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

5. Roll Weld Pipe - SMAW

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Roll weld pipe.

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position.

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots.
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   b. Place pipe in the 5G position
   c. Weld the root pass to remove high spots and any slag at weld toes

2666
6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   f. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

### FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

**Figure 2** Filter Recommendations

**CAUTION:** Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails. DON'T CARRY A BOMB IN YOUR POCKET.
WLD-L5-LW
Maintain Preheat and Perform Interpass
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. Choose Proper Power Source
   Step 1. With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.
   Step 2. An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. Choose a Proper Electrode
   Step 1. Choose the proper electrode for the job.
   NOTE: The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   Step 2. Store the electrodes properly.
   a. Low-hydrogen electrodes:
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.
      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.
      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
   NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

**Step 3.** Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

3. **Prepare Weldment for Welding**

**Step 1.** Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design  
(2) Material thickness  
(3) Design strength requirements  
(4) Welding process employed

b. SMAW weld joint configuration may be a:
   (1) Lap joint  
   (2) Tee joint  
   (3) Corner joint  
   (4) Edge joint  
   (5) Butt joint with backing  
   (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up  
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing  
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
WLD-L6-HO1
Use the Carbon Arc Process to Cut and Gouge Base Weld Materials
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Cut cast iron with air carbon arc process;
B. Cut carbon steels using shielded metal arc cutting process; and,
C. Gouge carbon steels with air carbon arc process.

MODULE OUTLINE:

Instructor Topics:
A. Cutting cast iron, etc. with air carbon arc process
B. Cutting carbon steels using air carbon arc process
C. Gouging carbon steels with air carbon process
D. Perform interpass preparation

Student Activities:
A. Understand cutting processes for cast iron, and carbon steels
B. Use air carbon arc in cutting and gouging
C. Perform multiple cutting operations
D. Select materials for optimum performance
E. Adjust equipment for performance and quality
F. Practice interpass preparation
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color, and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Britteness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Use the Carbon Arc Process to Cut and Gouge Base Weld Materials
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld

d. Strike an arc

e. Weld with stringer bead technique

f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
a. Maintain required weld quality
b. Maintain proper weld width uniformly
c. Maintain proper travel speed
d. Match correct oscillation for various electrodes
e. Match applications to weave techniques, as they apply
f. List the advantages and disadvantages of weave techniques
g. List the advantages and disadvantages of stringer techniques
h. Perform weld using weave technique

i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
a. Weld a dam to outline area being welded for each layer
b. Apply each layer neatly, straight and with good fusion throughout
c. Chip slag after each pass
d. Weld passes which overlap to crown of last weld bead
e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
a. Follow manufacturer's recommended practice
b. Inspect equipment and work area for safety
c. Assemble oxy-fuel equipment
d. Open fuel gas cylinder ½ turn
e. Open oxygen as cylinder all the way
f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
a. Make manual free hand straight line cuts
b. Cut manually straight lines using cutting jib
c. Bevel plate with manual oxy-fuel equipment
d. Manually cut blind holes in thick material
e. Manually cut sheet metal with minimal distortion
ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld

i. Grind any lack of fusion and/or high spots

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Weld pipe joint

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Roll weld pipe

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique

l. Visually inspect weld on the root and face sides to ASME Section 9

m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position

a. Measure the pipe and

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Weld pipe

g. Tack the single V groove pipe joint with a 3/32" root opening

h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique

i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots

k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique

l. Visually inspect weld on the root and face sides to ASME Section 9

m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique

h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots

j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   f. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)
SMAW

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
Use the Carbon Arc Process to Cut and Gouge Base Weld Materials
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

**Figure 6 Typical Current Ranges for Electrodes**

3. **Prepare Weldment for Welding**

   Step 1. Oxyacetylene cut, carbon arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

   a. Weld joint configuration will depend upon:
(1) Product design  
(2) Material thickness  
(3) Design strength requirements  
(4) Welding process employed  
b. SMAW weld joint configuration may be a:  
   (1) Lap joint  
   (2) Tee joint  
   (3) Corner joint  
   (4) Edge joint  
   (5) Butt joint with backing  
   (6) Butt joint without backing  

Step 2. Clean the areas to be welded prior to fit-up  
   a. Remove rust, paint, and any other coatings by wire brushing,  
      grinding, sanding, or filing  
   b. Remove oils and greases with a safe, suitable solvent  

Step 3. Turn on the power source and set the current range (amps) on the machine  
at the lower end of the setting as suggested for the electrode size.  

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for  
   the weld joint to be made.  

Step 5. Practice welding on the scrap metal and adjust the current setting as  
   needed to produce a good weld.  

4. Complete Welding Operation  
Step 1. Tack weld a joint that is defect free and can be incorporated into the  
   finished product.  
Step 2. Use any preheat that may be required by welding codes or company  
   procedures.  
Step 3. Make the required weld to be defect free and pleasing in appearance.  
Step 4. Use proper weld bead placement according to the weld joint design.  
   a. When making seam welds, produce the weld beads by using very  
      little oscillation or some oscillation.  
   b. When making fillet welds, produce the weld beads by using some  
      oscillation. Fillet welds in the vertical position can also be run  
      using a weaving technique.  
   c. When making groove welds, produce the weld beads by using  
      some oscillation and/or by weaving. When making groove welds  
      on butt joints, the amount of weaving will depend on the welding  
      position and the weld joints. It may also be limited by applicable  
      welding codes and/or company standards.  
Step 5. Maintain the correct welding travel speed. Weld bead size can be changed  
   by varying the arc travel speed. Bead size and travel speed are inversely  
   related: a decrease in travel speed will result in an increase in the weld  
   bead height and width, and an increase in travel speed will result in a  
   decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.

b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.

c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. **Troubleshoot Welding Problems**

   **Step 1.** Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement

   **Step 2.** Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions

   **Step 3.** Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Discuss welder identification systems;
B. Use tools, etc., to apply welder identification; and,
C. Use temperature sticks to indicate temperatures.

MODULE OUTLINE:

Instructor Topics:
A. Welder’s Identification applied using AWS guidelines and welding procedure specification
B. Welders Tools used for marking
C. Marking and Identification of materials by Welding Inspectors
D. Methods to Indicate Temperatures

Student Activities:
Students will observe examples of company procedures for marking:
A. Any required individual identification marked will be adjacent to each weld
B. Companies provide instructions in welding operations manual or manufacturing instructions and procedures
C. Markings are usually made with low stress steel die stamps
D. Requirements for detailed records are included in welding procedure specification
E. Students will practice with temperature “sticks” or indicators that melt or change color
Apply Welders Identification
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. Chicken Wire markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against . . .
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Brittleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
        1. Aluminum
        2. Magnesium
        3. Brass
        4. Bronze
        5. Nickel
        6. Tin
        7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

WLD-L7-HO4
Apply Welders Identification
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which over lap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld.

i. Grind any lack of fusion and/or high spots.

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

4. Produce SMAW - 2G Position Groove Welds
   a. Measure the pipe.
   b. Mark the cut line with a wrap around and soapstone.
   c. Cut the bevel using oxy-fuel gas equipment.
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.
   e. Use the grinder to add a root face of from 3/32" to 1/8".
   f. Tack the single V groove pipe joint with a 3/32" root opening.
   g. Weld pipe joint.
   h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots.
   j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.
   k. Visually inspect weld on the root and face sides to ASME Section 9.
   l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

5. Roll Weld Pipe - SMAW
   a. Measure the pipe.
   b. Mark the cut line with a wrap around and soapstone.
   c. Cut the bevel using oxy-fuel gas equipment.
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.
   e. Use the grinder to add a root face of from 3/32" to 1/8".
   f. Tack the single V groove pipe joint with a 3/32" root opening.
   g. Roll weld pipe.
   h. Place pipe coupon on workbench in the 1G roll welding position.
   i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position.
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots.
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two and eight are root bend specimens. Four and ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
c. Set welding condition to weld open roots
d. Tack pipe nipples together to form a V groove with a 1/8" root opening
e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
f. Weld balance of the V groove with this procedure
g. Visual inspection is made and evaluated by ASME Section 9
h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
a. Identify process
b. Name joint design
c. List base material
d. Give dimensions for root treatment
e. Name electrode size and type being used
f. List filler material (if required), classification and specification
g. Identify shielding gas - type and mixture
h. List pre and post heat and interpass temperature
i. Describe initial and interpass cleaning
j. Describe technique which is used
k. Produce single or multiple pass weld
l. Choose current type
m. Set current amperage
n. Set current polarity
o. Set voltage
Student laboratory exercises as assigned by Instructor.

**PIPE WELDING - SMAW**

1. **Produce End Preparations**
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. **Fit and Tack Weld Pipe**
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. **Roll Weld Open Root Pass on Pipe - 1G Position**
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. **Weld Open Root Pipe Joint - 2G Position**
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. **Weld Open Root Pipe - 5G Position**
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   f. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

**CAUTION:** Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   a. **Low-hydrogen electrodes:**
      
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

      **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

DC+(DCRP) Direct Current Reverse Polarity
DC-(DCSP) Direct Current Straight Polarity

3. Prepare Weldment for Welding

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design
(2) Material thickness
(3) Design strength requirements
(4) Welding process employed

b. SMAW weld joint configuration may be a:
   (1) Lap joint
   (2) Tee joint
   (3) Corner joint
   (4) Edge joint
   (5) Butt joint with backing
   (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
WLD-L8-H01
Control Post-Weld Temperature According to Procedures
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify welding procedure specification;
B. Use welding current or flame to control temperature; and,
C. Use temperature stick or other indicators to indicate temperatures.

MODULE OUTLINE:

Instructor Topics:
A. Welding Procedure Specifications
B. Preheat and interpass temperatures may be specified as:
   1. Minimum temperatures only (mild carbon steel with no special requirements)
   2. Maximum temperature only (aluminum and nickel alloys)
   3. Minimum and maximum temperatures (low alloy steels with impact requirements)
C. Tempering and Stress relieving in post weld heat treatment
D. Heating area and Holding time
E. Cooling rates
F. Applicable Codes and Specifications
G. Heat sources and temperature indication tools must not adversely affect weldment

Student Activities:
A. Heating and cooling materials, following welding procedure specifications
B. Use of heat sources and temperature indicators
C. Making adjustments to improve weld quality
D. Observation of the use of welding procedures during field trip
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against ...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Brittleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

**BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING**

1. Define Selected Welding Terms Per AWS A3.0
   - Define arc welding process terms
   - Define standard joint terminology
   - Define common weld discontinuities
   - Name welding equipment, supply and consumables
   - Define common shop terms including proper equipment names
   - Define material terms
   - Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   - List, describe and define
   - List low hydrogen electrodes
   - List iron powder electrodes
   - Describe electrode by welding position
   - Describe electrode by current and polarity
   - Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   - List polarities for commonly used electrodes
   - Describe both polarities
   - Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   - Describe and demonstrate start for non-low hydrogen SMAW electrode
   - Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   - List reasons for the importance of low hydrogen in weld metal
   - Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   - Inspect area for safety
   - Adjust current and polarity for specific job requirements
   - Choose type and size of electrode
   - Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   - Stand and position oneself correctly
   - Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which overlap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
Control Post-Weld Temperature According to Procedures
Attachment 5: MASTER Handout No. 5

Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a
keyhole technique. Weld the root pass upward producing a root weld
which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld

i. Grind any lack of fusion and/or high spots

j. Weld balance of the groove upward with 3/32" or 1/8" E7018
using the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00
positions prepared and two & eight are root bend specimens. Four &
ten are face bend specimens. Guided bend tests are evaluated to
ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel
face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Weld pipe joint

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a
keyhole technique. Weld the root pass upward producing a root weld
which is well fused and has a 1/16" weld reinforcement above the plate.

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using
the stringer bead technique

k. Visually inspect weld on the root and face sides to ASME Section 9

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00
positions prepared and two & eight are root bend specimens. Four &
ten are face bend specimens. Guided bend tests are evaluated to
ASME Section 9 criteria

5. Roll Weld Pipe - SMAW

a. Measure the pipe

b. Mark the cut line with a wrap around and soapstone

c. Cut the bevel using oxy-fuel gas equipment

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel
face

e. Use the grinder to add a root face of from 3/32" to 1/8"

f. Tack the single V groove pipe joint with a 3/32" root opening

g. Roll weld pipe

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The
weld is performed in the 2:00 to 12:30 position

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
2. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. **Weld only in ventilated areas.** Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.

B. **Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc.** The welding plume could contain harmful fumes and gases.

C. **Provide enough ventilation wherever welding and cutting are performed.** Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.

D. **Do not weld on dirty plate or plate contaminated with an unknown material.** The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. **Do not touch live electrical parts.**

B. **Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.**

C. **Use the correct welding cable size for both the ground lead and the welding lead.** Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.

D. **Be sure all electrical connections are tight, clean, and dry.** Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.

E. **Keep dry.** Moisture and water can conduct electricity. Fix water leaks immediately.

F. **Keep welding cables and connectors in good condition.** Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.

G. **Avoid open-circuit voltage.** Open-circuit voltage is much higher than welding voltage.

H. **Shut off electrical power when working on welding equipment.**

**CAUTION:** Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
Worksheet:

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the *fast-freeze* family of electrodes and the E7018 belongs to the *low-hydrogen* family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be...
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

**Figure 6 Typical Current Ranges for Electrodes**

3. Prepare Weldment for Welding

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design
(2) Material thickness
(3) Design strength requirements
(4) Welding process employed

b. SMAW weld joint configuration may be a:
(1) Lap joint
(2) Tee joint
(3) Corner joint
(4) Edge joint
(5) Butt joint with backing
(6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems
Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify material not associated with weld metal;
B. Use a variety of tools to remove residue material; and,
C. Identify when all slag, etc., is removed.

MODULE OUTLINE:

Instructor Topics:
A. Joint preparation and cleaning of surfaces for welding
B. Post cleaning of weld following welding procedure specifications
C. Examples of cleaning processes followed by major manufacturers
D. Demonstrate knowledge of the proper application of welding skills

Student Activities:
A. Joint preparations and metal cleaning of surfaces for welding
B. Oxygen cutting, air carbon arc, or plasma cutting (may involve marking or grinding followed by cleaning
C. Post cleaning of weld (with examples from major industries of specific products and cleaning methods
D. Oxide layers may be removed by grinding, sanding, or stainless brushing

2730
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. *Chicken Wire* markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Brittleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;

b. Use other tests to identify metals; and,

c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
    A. High-carbon steels show more spark bursts than do low-carbon steels.
    B. Non-ferrous metals
       1. Aluminum
       2. Magnesium
       3. Brass
       4. Bronze
       5. Nickel
       6. Tin
       7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which overlap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder ½ turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

Chip slag and wire brush weld.

Grind any lack of fusion and/or high spots.

Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

Visually inspect weld on the root and face sides to ASME Section 9.

Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

Produce SMAW - 2G Position Groove Welds

- Measure the pipe
- Mark the cut line with a wrap around and soapstone
- Cut the bevel using oxy-fuel gas equipment
- Clean the bevel face with a grinder, remove all oxide and smooth bevel face
- Use the grinder to add a root face of from 3/32" to 1/8"
- Tack the single V groove pipe joint with a 3/32" root opening
- Weld pipe joint
- Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.
- Chip slag and wire brush. Grind any lack of fusion and/or high spots.
- Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.
- Visually inspect weld on the root and face sides to ASME Section 9.
- Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

Roll Weld Pipe - SMAW

- Measure the pipe
- Mark the cut line with a wrap around and soapstone
- Cut the bevel using oxy-fuel gas equipment
- Clean the bevel face with a grinder, remove all oxide and smooth bevel face
- Use the grinder to add a root face of from 3/32" to 1/8"
- Tack the single V groove pipe joint with a 3/32" root opening
- Roll weld pipe
- Place pipe coupon on workbench in the 1G roll welding position.
- Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position.
- Chip slag and wire brush. Grind any lack of fusion and/or high spots.
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
a. Measure the pipe and
b. Mark the cut line with a wrap around and soapstone
c. Cut the bevel using oxy-fuel gas equipment
d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
e. Use the grinder to add a root face of from 3/32" to 1/8"
f. Weld pipe
g. Tack the single V groove pipe joint with a 3/32" root opening
h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
a. Measure the pipe
b. Mark the cut line with a wrap around and soapstone
c. Cut the bevel using oxy-fuel gas equipment
d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
e. Use the grinder to add a root face of from 3/32" to 1/8"
f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
l. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.

CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails. DON'T CARRY A BOMB IN YOUR POCKET.
Worksheet:

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design  
(2) Material thickness  
(3) Design strength requirements  
(4) Welding process employed  

b. SMAW weld joint configuration may be a:  
(1) Lap joint  
(2) Tee joint  
(3) Corner joint  
(4) Edge joint  
(5) Butt joint with backing  
(6) Butt joint without backing  

Step 2. Clean the areas to be welded prior to fit-up  
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing  
   b. Remove oils and greases with a safe, suitable solvent  

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.  

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.  

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.  

4. Complete Welding Operation  
   Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.  
   Step 2. Use any preheat that may be required by welding codes or company procedures.  
   Step 3. Make the required weld to be defect free and pleasing in appearance.  
   Step 4. Use proper weld bead placement according to the weld joint design.  
      a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.  
      b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.  
      c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.  
   Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems
Step 1. Be aware of the welding variables and how they can affect the weld.
   Below is a list of eleven welding variables for the SMAW process:
   a. Type of electrode
   b. Diameter of electrode
   c. Type of current (AC or DC)
   d. Current polarity (DC+ or DC-)
   e. Current setting
   f. Arc length
   g. Travel speed
   h. Electrode angle
   i. Electromagnetic arc blow
   j. Electrode manipulation technique (drag, whip)
   k. Thoroughness of slag removal prior to restarts and new bead placement
Step 2. Be aware of general welding variables and how they can affect the weld:
   a. Type of base metal
   b. Thickness of base metal
   c. Surface condition of base metal (clean, rusty, or painted)
   d. Atmospheric conditions
Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify requirements of the welding procedure specification.
B. Use wire brushes, etc., to meet the requirements of the welding procedure specification.

MODULE OUTLINE:

Instructor Topics:
A. "Post finishing" is defined as the process steps to be followed after welding.
B. These steps may be further testing, cleaning, polishing or metal preparation (hardening, etc.) prior to painting or galvanizing the finished product.
C. Many metal products are purchased by customers who require not only a perfect welding product, a high quality finish or appearance that is important to the end user.
D. Applications of chemical cleaning, sanding, and metal preparation for finishing.
E. Importance of the weld to strength function, fit and finish.

Student Activities:
A. Tour a production facility and observe manufacturing processes beginning with materials selection, preparation, welding, weld inspection, and ending with the finishing of the metal product.
B. Assessing the importance of the weld quality to strength, function, fit, and finish.
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness
II. Discuss the Time/Temperature Chart
III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air
IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. Chicken Wire markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against 
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Britteness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
   A. High-carbon steels show more spark bursts than do low-carbon steels.
   B. Non-ferrous metals
      1. Aluminum
      2. Magnesium
      3. Brass
      4. Bronze
      5. Nickel
      6. Tin
      7. Others

III. Perform Rockwell Hardness Tests
     A. Ferrous metals
     B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

Student laboratory exercises as assigned by Instructor.

**BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING**

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
   b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
   a. Maintain required weld quality
   b. Maintain proper weld width uniformly
   c. Maintain proper travel speed
   d. Match correct oscillation for various electrodes
   e. Match applications to weave techniques, as they apply
   f. List the advantages and disadvantages of weave techniques
   g. List the advantages and disadvantages of stringer techniques
   h. Perform weld using weave technique
   i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
   a. Weld a dam to outline area being welded for each layer
   b. Apply each layer neatly, straight and with good fusion throughout
   c. Chip slag after each pass
   d. Weld passes which overlap to crown of last weld bead
   e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
   a. Follow manufacturer's recommended practice
   b. Inspect equipment and work area for safety
   c. Assemble oxy-fuel equipment
   d. Open fuel gas cylinder 1/2 turn
   e. Open oxygen as cylinder all the way
   f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
   g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
    a. Make manual free hand straight line cuts
    b. Cut manually straight lines using cutting jib
    c. Bevel plate with manual oxy-fuel equipment
    d. Manually cut blind holes in thick material
    e. Manually cut sheet metal with minimal distortion
Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
h. Chip slag and wire brush weld
i. Grind any lack of fusion and/or high spots
j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds
a. Measure the pipe
b. Mark the cut line with a wrap around and soapstone
c. Cut the bevel using oxy-fuel gas equipment
d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
e. Use the grinder to add a root face of from 3/32" to 1/8"
f. Tack the single V groove pipe joint with a 3/32" root opening
g. Weld pipe joint
h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW
a. Measure the pipe
b. Mark the cut line with a wrap around and soapstone
c. Cut the bevel using oxy-fuel gas equipment
d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
e. Use the grinder to add a root face of from 3/32" to 1/8"
f. Tack the single V groove pipe joint with a 3/32" root opening
g. Roll weld pipe
h. Place pipe coupon on workbench in the 1G roll welding position
i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position
j. Chip slag and wire brush. Grind any lack of fusion and/or high spots

2768
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
l. Visually inspect weld on the root and face sides to ASME Section 9
m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the root pass using 1/8" E6010 to ASME Section 9 requirements
   d. Grind the finished root pass to remove high spots and any slag at weld toes
6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
   j. Adjust voltage to procedure specification
   k. Adjust inductance to procedure specification
1. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.

B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.

C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.

D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.

B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.

C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.

D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.

E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.

F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.

G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.

H. Shut off electrical power when working on welding equipment.

**CAUTION:** Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.
A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.

B. Cover all skin surfaces. Keep shirt sleeves rolled down.

C. Wear cuffless pants to eliminate spatter traps.

D. Wear leather boots. Pant legs should cover boot tops.

E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.

F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.

G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.

H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.

I. Wear a 100% cotton cap to protect the head from sparks or spatter.

J. Wear long gauntlet leather gloves.

K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.

L. Protect nearby workers from exposure to the welding arc by putting up shields.

M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.

A. If possible, weld in specially designated areas or enclosures of noncombustible construction.

B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.

D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.

E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.

F. Do not weld on materials having either a coating or internal structure that is combustible.

G. Place hot scrap and slag in non-combustible containers.

H. Ensure that fire extinguishers are available nearby.

I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.

J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.

DON'T CARRY A BOMB IN YOUR POCKET.
Worksheet:

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**

   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.

   **NOTE:** Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be...
kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

**Figure 6 Typical Current Ranges for Electrodes**

3. **Prepare Weldment for Welding**

Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
(1) Product design  
(2) Material thickness  
(3) Design strength requirements  
(4) Welding process employed

b. SMAW weld joint configuration may be a:
(1) Lap joint  
(2) Tee joint  
(3) Corner joint  
(4) Edge joint  
(5) Butt joint with backing  
(6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation
Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.
Step 2. Use any preheat that may be required by welding codes or company procedures.
Step 3. Make the required weld to be defect free and pleasing in appearance.
Step 4. Use proper weld bead placement according to the weld joint design.
a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.
As the material thickness increases, the travel speed must slow down.

For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.

Higher welding speeds are attainable by using the forehand (pushing) technique.

5. **Troubleshoot Welding Problems**

   **Step 1.** Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:
   
   a. Type of electrode  
   b. Diameter of electrode  
   c. Type of current (AC or DC)  
   d. Current polarity (DC+ or DC-)  
   e. Current setting  
   f. Arc length  
   g. Travel speed  
   h. Electrode angle  
   i. Electromagnetic arc blow  
   j. Electrode manipulation technique (drag, whip)  
   k. Thoroughness of slag removal prior to restarts and new bead placement

   **Step 2.** Be aware of general welding variables and how they can affect the weld:
   
   a. Type of base metal  
   b. Thickness of base metal  
   c. Surface condition of base metal (clean, rusty, or painted)  
   d. Atmospheric conditions

   **Step 3.** Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
WELDER... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

  - M-18 Perform weld process
  - M-16 Perform weld sequence
  - N-4 Perform weld sequence
  - P-19 Identify GTAW equipment
  - Q-2 Present a performance qualification test using GTAW on an aluminum plate in various position on pipe
  - S-7 Return consumables
  - T-1 Display a general understanding of emergency vehicle terminology
  - U-1 Demonstrate ability to lift 50 pounds
WLD-L11-HO1
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up work area and equipment;
B. Set-up work piece; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the advantages and disadvantages involved with the use of SMAW equipment
B. Present joint design, concepts, and welding terms for pipe welding
C. Interpret drawings and blueprints for pipe welding
D. Demonstrate the proper application of welding skills for pipe welding
E. Demonstrate adequate preparation of welding surfaces
F. Increase student skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate SMAW in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using SMAW on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match SMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in multiple positions
C. Use welding technique suitable for pipe welding
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
    A. Use of temper color chart for tempering
    B. Chicken Wire markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Britteness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
   A. High-carbon steels show more spark bursts than do low-carbon steels.
   B. Non-ferrous metals
      1. Aluminum
      2. Magnesium
      3. Brass
      4. Bronze
      5. Nickel
      6. Tin
      7. Others

III. Perform Rockwell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
    A. Ferrous metals
    B. Non-ferrous metals

Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

 BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
b. Operate welding helmet
c. Verbally warn others of intent to arc weld
d. Strike an arc
e. Weld with stringer bead technique
f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique
a. Maintain required weld quality
b. Maintain proper weld width uniformly
c. Maintain proper travel speed
d. Match correct oscillation for various electrodes
e. Match applications to weave techniques, as they apply
f. List the advantages and disadvantages of weave techniques
g. List the advantages and disadvantages of stringer techniques
h. Perform weld using weave technique
i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup
a. Weld a dam to outline area being welded for each layer
b. Apply each layer neatly, straight and with good fusion throughout
c. Chip slag after each pass
d. Weld passes which overlap to crown of last weld bead
e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment
a. Follow manufacturer's recommended practice
b. Inspect equipment and work area for safety
c. Assemble oxy-fuel equipment
d. Open fuel gas cylinder ½ turn
e. Open oxygen as cylinder all the way
f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation
g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment
a. Make manual free hand straight line cuts
b. Cut manually straight lines using cutting jib
c. Bevel plate with manual oxy-fuel equipment
d. Manually cut blind holes in thick material
e. Manually cut sheet metal with minimal distortion
WLD-L11-HO5
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 5: MASTER Handout No. 5

Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening

2732
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

h. Chip slag and wire brush weld.

i. Grind any lack of fusion and/or high spots.

j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

4. Produce SMAW - 2G Position Groove Welds

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Weld pipe joint.

h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate.

i. Chip slag and wire brush. Grind any lack of fusion and/or high spots.

j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique.

k. Visually inspect weld on the root and face sides to ASME Section 9.

l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

5. Roll Weld Pipe - SMAW

a. Measure the pipe.

b. Mark the cut line with a wrap around and soapstone.

c. Cut the bevel using oxy-fuel gas equipment.

d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face.

e. Use the grinder to add a root face of from 3/32" to 1/8".

f. Tack the single V groove pipe joint with a 3/32" root opening.

g. Roll weld pipe.

h. Place pipe coupon on workbench in the 1G roll welding position.

i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position.

j. Chip slag and wire brush. Grind any lack of fusion and/or high spots.
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique

l. Visually inspect weld on the root and face sides to ASME Section 9

m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
WLD-L11-HO6
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 6: MASTER Handout No. 6

Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW
1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding
2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening
3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll
4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements
5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
d. Grind the finished root pass to remove high spots and any slag at weld toes

e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
   a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
   b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
   c. Weld remainder of pipe in 1G position using E7018
   d. Perform low hydrogen starts and stops
   e. Weld using stringer bead technique
   f. Weld using weave technique
   g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
   a. Use 1/8" E6010
   b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
   c. Fit together two pipe ends to a single V edge preparation within given tolerances
   c. Weld root pass to ASME Section 9 requirements
   d. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
   e. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
   a. Set up GMAW equipment
   b. Adjust wire feeder drive system
   c. Adjust shielding gas system and flow rate
   d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
   e. Set welding condition for short circuit transfer - Wire Feed Speed
   f. Set welding condition for short circuit transfer - Voltage
   g. Set welding condition for short circuit transfer - Tip to work Distance
   h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
   a. Bevel pipe ends
   b. Touch up bevel face with grinder
   c. Fit and tack backing ring to one pipe end
   d. Fit other pipe over backing ring
   e. Adjust gap and tack in place
   f. Adjust shielding gas flow
   g. Adjust wire feed system
   h. Adjust power source to procedure specification
   i. Set wire feed speed to procedure specification
j. Adjust voltage to procedure specification
k. Adjust inductance to procedure specification
l. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

**CAUTION:** Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.

B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.

C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.

D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

**CAUTION:** Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.

B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.

C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.

D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.

E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.

F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.

G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.

H. Shut off electrical power when working on welding equipment.
CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.

A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.
B. Cover all skin surfaces. Keep shirt sleeves rolled down.
C. Wear cuffless pants to eliminate spatter traps.
D. Wear leather boots. Pant legs should cover boot tops.
E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.
F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.
G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.
I. Wear a 100% cotton cap to protect the head from sparks or spatter.
J. Wear long gauntlet leather gloves.
K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.
L. Protect nearby workers from exposure to the welding arc by putting up shields.
M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

FILTER RECOMMENDATIONS
(adapted from ANSI Safety Standard Z49.1-88)

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.
A. If possible, weld in specially designated areas or enclosures of noncombustible construction.
B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that cannot be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.
D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.
E. If combustibles cannot be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.
F. Do not weld on materials having either a coating or internal structure that is combustible.
G. Place hot scrap and slag in non-combustible containers.
H. Ensure that fire extinguishers are available nearby.
I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.
J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.
DON'T CARRY A BOMB IN YOUR POCKET.
Pass a Performance Qualification Test Using SMAW on Carbon Steel Pipe
In the 6G Position
Attachment 8: MASTER Laboratory Worksheet

Worksheet:

1. Choose Proper Power Source
   Step 1. With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.
   Step 2. An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. Choose a Proper Electrode
   Step 1. Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   Step 2. Store the electrodes properly.
   a. Low-hydrogen electrodes:
      (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.
      (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.
      (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3. Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding
Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.

a. Weld joint configuration will depend upon:
   (1) Product design
   (2) Material thickness
   (3) Design strength requirements
   (4) Welding process employed

b. SMAW weld joint configuration may be a:
   (1) Lap joint
   (2) Tee joint
   (3) Corner joint
   (4) Edge joint
   (5) Butt joint with backing
   (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up

a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing

b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. Complete Welding Operation

Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

Step 2. Use any preheat that may be required by welding codes or company procedures.

Step 3. Make the required weld to be defect free and pleasing in appearance.

Step 4. Use proper weld bead placement according to the weld joint design.
   a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
   b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
   c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely
related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.

a. As the material thickness increases, the travel speed must slow down.
b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.
c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.
WLD-L12-H01
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up work area and equipment;
B. Set-up work piece; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructor Topics:
A. Considerations and principles involved in the welding of pipe with SMAW
B. Joint design and welding terms for pipe welding
C. Interpret drawings and blueprints for pipe welding
D. The proper application of welding skills for pipe welding
E. The adequate preparation of welding surfaces for pipe welding
F. Skill levels needed to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match SMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform pipe welds in multiple positions
C. Use welding techniques appropriate for pipe welding
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WLD-L12-HO2
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 2: MASTER Handout No. 2

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
a. Discuss the reasons for heat treating;
b. Discuss the time/temperature chart
c. List the different quenching media
d. Estimate metal heat temperature by color; and
e. List reasons for stress relieving workpieces.

MODULE OUTLINE:

I. Discuss the Reasons for Heat Treating
   A. Hardening for utility
   B. Tempering for toughness without brittleness

II. Discuss the Time/Temperature Chart

III. List the Different Quenching Media (In order of severity or speed of quenching)
   A. Brine (water and sodium chloride or sodium hydroxide)
   B. Water
   C. Fused (liquid) salts
   D. Molten lead
   E. Soluble oil and water
   F. Oil
   G. Air

IV. Estimate Metal Heat Temperature by Color
   A. Use of temper color chart for tempering
   B. \textit{Chicken Wire} markings warn of overheating

V. List Reasons for Stress Relieving Workpieces
   A. Increased machinability
   B. Increased workability in cold processes

VI. Special Safety Concerns of Heat Treating
   A. Protective Gear against...
      1. Heat
      2. Fumes
      3. Concussion
   B. Toxicity of Certain Media

VII. Special Problems in Heat Treating
   A. Brittleness
   B. Distortion
   C. Discoloration (sometimes unimportant)
   D. Inadvertent heat treating
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

a. Perform file test to test for metal hardness;
b. Use other tests to identify metals; and,
c. Perform Rockwell hardness tests.

MODULE OUTLINE:

I. Perform File Test to Test for Metal Hardness
   A. Imprecise method, good for rough estimates only
   B. Requires more experienced machinist

II. Use Other Tests to Identify Metals
   A. High-carbon steels show more spark bursts than do low-carbon steels.
   B. Non-ferrous metals
      1. Aluminum
      2. Magnesium
      3. Brass
      4. Bronze
      5. Nickel
      6. Tin
      7. Others

III. Perform Rockwell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

IV. Perform Brinell Hardness Tests
    A. Ferrous metals
    B. Non-ferrous metals

V. Other Hardness Tests as Specified by the Instructor
   A. Ferrous metals
   B. Non-ferrous metals

WLD-L12-HO4
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 4: MASTER Handout No. 4

Student laboratory exercises as assigned by Instructor.

BASIC SHIELDED METAL ARC WELDING (SMAW) AND OXY-FUEL GAS CUTTING

1. Define Selected Welding Terms Per AWS A3.0
   a. Define arc welding process terms
   b. Define standard joint terminology
   c. Define common weld discontinuities
   d. Name welding equipment, supply and consumables
   e. Define common shop terms including proper equipment names
   f. Define material terms
   g. Define common metallurgy terms

2. Describe AWS Code for Mild Steel Electrodes
   a. List, describe and define
   b. List low hydrogen electrodes
   c. List iron powder electrodes
   d. Describe electrode by welding position
   e. Describe electrode by current and polarity
   f. Describe electrode by penetration

3. Set Up Welding Machine to Required Polarity
   a. List polarities for commonly used electrodes
   b. Describe both polarities
   c. Describe advantages and disadvantages of alternating current

4. Use Correct Start and Stop Techniques for SMAW Electrodes
   a. Describe and demonstrate start for non-low hydrogen SMAW electrode
   b. Describe and demonstrate stop for non-low hydrogen SMAW electrodes with filled craters
   c. List reasons for the importance of low hydrogen in weld metal
   d. Explain the reason for low hydrogen starts and stops and how they work and why required specifically with E7018

5. Set Up Equipment for Shielded Metal Arc Welding
   a. Inspect area for safety
   b. Adjust current and polarity for specific job requirements
   c. Choose type and size of electrode
   d. Wear applicable personal safety equipment

6. Strike an Arc, Run Continuous Stringer Bead
   a. Stand and position oneself correctly
b. Operate welding helmet

c. Verbally warn others of intent to arc weld

d. Strike an arc

e. Weld with stringer bead technique

f. Perform weld tie ins to make continuous bead

7. Weld Using Weave Technique

a. Maintain required weld quality

b. Maintain proper weld width uniformly

c. Maintain proper travel speed

d. Match correct oscillation for various electrodes

e. Match applications to weave techniques, as they apply

f. List the advantages and disadvantages of weave techniques

g. List the advantages and disadvantages of stringer techniques

h. Perform weld using weave technique

i. Concentrate on dwell times at edges of weld pool

8. Weld Multi-Layer Buildup

a. Weld a dam to outline area being welded for each layer

b. Apply each layer neatly, straight and with good fusion throughout

c. Chip slag after each pass

d. Weld passes which overlap to crown of last weld bead

e. Demonstrate control of bead height

9. Set Up and Shut Down Oxy-Fuel Equipment

a. Follow manufacturer's recommended practice

b. Inspect equipment and work area for safety

c. Assemble oxy-fuel equipment

d. Open fuel gas cylinder ½ turn

e. Open oxygen as cylinder all the way

f. Adjust fuel gas and oxygen working pressure per manufacturer's recommendation

g. Purge lines one at a time. One second for each 10 feet of hose length

10. Cut Steel Plate Using Oxy-Fuel Equipment

a. Make manual free hand straight line cuts

b. Cut manually straight lines using cutting jib

c. Bevel plate with manual oxy-fuel equipment

d. Manually cut blind holes in thick material

e. Manually cut sheet metal with minimal distortion
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 5: MASTER Handout No. 5

Student laboratory exercises as assigned by Instructor.

ADVANCED SHIELDED METAL ARC WELDING (SMAW) AND CUTTING

1. Weld Single V Groove Welds With Open Roots From One Side
   a. Bevel 3/8" steel plate to 37 1/2° using oxy-fuel gas cutting e.g.
   b. Use grinder to remove oxide larger and smooth plate
   c. Use grinder to create root face of 3/32" to 1/8"
   d. Tack single V groove joint with 3/32" root opening
   e. Place joint in the 1G position
   f. Place joint in 2G position once task is mastered
   g. Place joint in 3G position once task is mastered
   h. Place joint in 4G position once task is mastered
   i. Weld the root with Direct Current Electrode Positive using 1/8" E6010. Use tight arc length and keyhole technique to produce a well fused root bead extending 1/16" above the plate.
   j. Weld chipped side slag and the root bead is wire brushed
   k. Fill the balance of the groove with 3/32", 1/8" and/or 5/32" E7018 using the stringer bead technique
   l. Visual test finished weld and root face bends evaluated to AWS D1.1 criteria

2. Weld Various Diameters of Pipe to Plate
   a. Inspect area for safety
   b. Place plate flat on welding table
   c. Place 3" pipe vertically on top of plate and tacked in place
   d. Leave weld coupon in the 2F fixed position
   e. Apply a 3/8" fillet weld using 1/8" E7018 and a stringer bead technique
   f. Visually inspect weld to AWS D1.1
   g. Fill pipe with water for 24 hours
   h. Check for leak

3. Produce SMAW Pipe - 5G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
g. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
h. Chip slag and wire brush weld
i. Grind any lack of fusion and/or high spots
j. Weld the balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
k. Visually inspect weld on the root and face sides to ASME Section 9
l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

4. Produce SMAW - 2G Position Groove Welds
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Weld pipe joint
   h. Place the joint in the 2G fixed position, using an 1/8" E6010 and a keyhole technique. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of the groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
   l. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

5. Roll Weld Pipe - SMAW
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Roll weld pipe
   h. Place pipe coupon on workbench in the 1G roll welding position.
   i. Weld the root bead using 1/8" E6010 and the keyhole technique. The weld is performed in the 2:00 to 12:30 position
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique

l. Visually inspect weld on the root and face sides to ASME Section 9

m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

6. Produce SMAW Pipe - 5G Position
   a. Measure the pipe and
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Weld pipe
   g. Tack the single V groove pipe joint with a 3/32" root opening
   h. Place the joint in the 5G fixed position, using an 1/8" E6010 and a keyhole technique
   i. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   j. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   k. Weld balance of groove upward with 3/32" or 1/8" E7018 using the weave technique
   l. Visually inspect weld on the root and face sides to ASME Section 9
   m. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria

7. Produce SMAW Pipe - 6G Position
   a. Measure the pipe
   b. Mark the cut line with a wrap around and soapstone
   c. Cut the bevel using oxy-fuel gas equipment
   d. Clean the bevel face with a grinder, remove all oxide and smooth bevel face
   e. Use the grinder to add a root face of from 3/32" to 1/8"
   f. Tack the single V groove pipe joint with a 3/32" root opening
   g. Place the joint in the 6G fixed position, using an 1/8" E6010 and a keyhole technique
   h. Weld the root pass upward producing a root weld which is well fused and has a 1/16" weld reinforcement above the plate
   i. Chip slag and wire brush. Grind any lack of fusion and/or high spots
   j. Weld balance of groove upward with 3/32" or 1/8" E7018 using the stringer bead technique
   k. Visually inspect weld on the root and face sides to ASME Section 9
1. Remove four guided bend specimens from 2:00, 4:00, 8:00 and 10:00 positions prepared and two & eight are root bend specimens. Four & ten are face bend specimens. Guided bend tests are evaluated to ASME Section 9 criteria.

8. Create SMAW Pipe to ASME Section 9
   a. Bevel two pieces of pipe to 30° bevel angle using oxy-fuel gas cutting equipment
   b. Clean bevel face and a 3/32" root face is applied using a hand held grinder
   c. Set welding condition to weld open roots
   d. Tack pipe nipples together to form a V groove with a 1/8" root opening
   e. Place pipe in the 5G fixed position. The root pass is welded and cleaned by wire brushing
   f. Weld balance of the V groove with this procedure
   g. Visual inspection is made and evaluated by ASME Section 9
   h. Make four bend samples and evaluate by ASME Section 9

9. Interpret Welding Procedures
   a. Identify process
   b. Name joint design
   c. List base material
   d. Give dimensions for root treatment
   e. Name electrode size and type being used
   f. List filler material (if required), classification and specification
   g. Identify shielding gas - type and mixture
   h. List pre and post heat and interpass temperature
   i. Describe initial and interpass cleaning
   j. Describe technique which is used
   k. Produce single or multiple pass weld
   l. Choose current type
   m. Set current amperage
   n. Set current polarity
   o. Set voltage
Student laboratory exercises as assigned by Instructor.

PIPE WELDING - SMAW

1. Produce End Preparations
   a. Produce end preparations with oxy-fuel cutting
   b. Produce end preparations with plasma cutting
   c. Produce end preparations with mechanical cutting
   d. Produce end preparations with grinding

2. Fit and Tack Weld Pipe
   a. Cut and single bevel pipe to 37 1/2°
   b. Ground bevel face and touch up to within tolerances
   c. Check that pipe ends are square within given tolerances
   d. Prepare root face within given tolerances
   e. Align pipe to within given tolerances
   f. Set root opening to within given tolerances
   g. Tack pipe according to welding procedure specification - maintaining root opening

3. Roll Weld Open Root Pass on Pipe - 1G Position
   a. Fit up and tack pipe joint using 1/8" E6010 electrode, weld the root pass on pipe in the 1 o'clock to (2:00 o'clock position) according to procedure using the roll welding technique
   b. Weld remainder of pipe in the 1G roll welding position with E6010
   c. Weld the remaining portion of the groove using the weave technique using 5/32" E6010 electrode roll

4. Weld Open Root Pipe Joint - 2G Position
   a. Weld using 1/8" E6010
   b. Cut and grind pipe ends will be to single bevel edge preparations of 37 1/2°
   c. Fit together the two pipe ends to a single V edge preparation with given tolerances
   d. Weld root pass to ASME Section 9 requirements
   e. Fill balance of the groove with E6010 using the stringer technique to ASME Section 9 requirements

5. Weld Open Root Pipe - 5G Position
   a. Fit and tack weld pipe to within tolerances
   b. Place pipe in the 5G position
   c. Weld the rootpass using 1/8" E6010 to ASME Section 9 requirements
d. Grind the finished root pass to remove high spots and any slag at weld toes
e. Weld the remainder of the groove using 3/32" and/or 1/8" E7018 using the stringer bead technique to ASME Section 9 requirements

6. Pass Guided Bond Tests Per ASME Section 9
a. Remove bend samples from pipe at the 10, 2, 8 & 4 o'clock positions
b. If the material is 3/8" or thinner 10 o'clock and 8 o'clock receive root bends and 2 o'clock and 4 o'clock receive face bends. If the pipe wall thickness is over 3/8" side bends shall be performed on all samples.
c. Weld remainder of pipe in 1G position using E7018
d. Perform low hydrogen starts and stops
e. Weld using stringer bead technique
f. Weld using weave technique
g. Chip slag wire brush and grind as necessary to assure clean weld deposits

7. Weld Open Root Pipe - 2G Position
a. Use 1/8" E6010
b. Cut and ground pipe ends to single bevel edge preparations of 37 1/2°
c. Fit together two pipe ends to a single V edge preparation within given tolerances
d. Weld root pass to ASME Section 9 requirements
e. Clean weld pass by chipping slag, wire brushing and grinding where necessary to assure a clean, well fused weld deposit
f. Weld remainder of the groove using E7018 with the stringer bead technique

8. Weld Pipe Open Root Passes All Positions Using GMAW
a. Set up GMAW equipment
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for short circuit transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to work Distance
h. Weld root using a string bead technique

9. Weld Pipe With Backing Using FCAW-G
a. Bevel pipe ends
b. Touch up bevel face with grinder
c. Fit and tack backing ring to one pipe end
d. Fit other pipe over backing ring
e. Adjust gap and tack in place
f. Adjust shielding gas flow
g. Adjust wire feed system
h. Adjust power source to procedure specification
i. Set wire feed speed to procedure specification
j. Adjust voltage to procedure specification
k. Adjust inductance to procedure specification
l. Adjust GMAW gun for tip to work distance and shielding gas
m. Weld according to procedure specification
WLD-L12-LA
Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe
In the 6G Position
Attachment 7: MASTER Laboratory Aid

The shielded metal arc welding (SMAW) process has a number of serious safety hazards associated with it:

CAUTION: Specific safety precautions must be taken to ensure a proper breathing atmosphere in all welding areas.

A. Weld only in ventilated areas. Welding shielding gases can displace the air needed for breathing. These gases are odorless and colorless, and most are heavier than air.
B. Weld in a position that will allow your head to be out of the welding plume, but will still give a good view of the welding arc. The welding plume could contain harmful fumes and gases.
C. Provide enough ventilation wherever welding and cutting are performed. Welding in confined spaces may require special procedures, such as the use of an air-supplied hood or hose mask.
D. Do not weld on dirty plate or plate contaminated with an unknown material. The fumes and gases which are formed could be hazardous to health.

CAUTION: Electrical shock can be avoided by following specific safety precautions.

A. Do not touch live electrical parts.
B. Ground all electrical equipment and the work-piece to prevent accidental electrical shocks.
C. Use the correct welding cable size for both the ground lead and the welding lead. Sustained overloading will cause cable failure and result in possible electrical shock or fire hazard.
D. Be sure all electrical connections are tight, clean, and dry. Poor electrical connections can heat up and even melt, causing dangerous arcs and sparks.
E. Keep dry. Moisture and water can conduct electricity. Fix water leaks immediately.
F. Keep welding cables and connectors in good condition. Improper or worn electrical connections can cause short circuits and can increase the chance of an electrical shock.
G. Avoid open-circuit voltage. Open-circuit voltage is much higher than welding voltage.
H. Shut off electrical power when working on welding equipment.
CAUTION: Ultraviolet and infrared rays emitted by the welding arc, as well as the spatter from the welding arc, can injure eyes and burn skin. Specific safety precautions must be followed to ensure adequate protection.

A. Wear 100% cotton clothing. It will not catch fire easily, it offers good protection from light welding spatter, and it is cooler in the summer and warmer in the winter.
B. Cover all skin surfaces. Keep shirt sleeves rolled down.
C. Wear cuffless pants to eliminate spatter traps.
D. Wear leather boots. Pant legs should cover boot tops.
E. Wear clean clothing. Oil and grease stained clothes will tend to ignite from welding spatter.
F. For more severe welding conditions, wear protective clothing such as heat resistant jackets, aprons, and leggings.
G. Wear safety glasses to protect from arc flashes, mechanical injury, or other mishaps.
H. Wear ear protection, not only where there is noise but where there is a chance that spatter or sparks could get into the ears.
I. Wear a 100% cotton cap to protect the head from sparks or spatter.
J. Wear long gauntlet leather gloves.
K. Do not touch hot metal with bare hands. Use pliers and wear leather gloves.
L. Protect nearby workers from exposure to the welding arc by putting up shields.
M. Wear a welding helmet with the correct shade of welding lens. Choose the correct lens from a filter recommendations table (see Figure 2).

<table>
<thead>
<tr>
<th>Application</th>
<th>Minimum Shade No.</th>
<th>Suggested Shade*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60 amps</td>
<td>7</td>
<td>9</td>
</tr>
<tr>
<td>60 to 160 amps</td>

<td>10</td>
</tr>
<tr>
<td>160 to 250 amps</td>
<td>10</td>
<td>12</td>
</tr>
<tr>
<td>250 to 500 amps</td>
<td>11</td>
<td>14</td>
</tr>
</tbody>
</table>

* As a general rule, start with a shade that is too dark to see the arc zone. Then go to a lighter shade which gives sufficient view of the arc zone without exerting a strain on your eyes.

Figure 2 Filter Recommendations

CAUTION: Specific precautions must be taken to ensure that there is no loss of property due to welding sparks, spatter, and heat.
A. If possible, weld in specially designated areas or enclosures of noncombustible construction.
B. Remove combustibles from the work area by at least 35 feet if possible.
C. Cover combustibles that can not be removed from the welding area with tight-fitting flame-resistant material. Items that should be covered include combustible walls, floors, ceilings, and any cracks or other openings that might let a spark pass through it.
D. If welding is to be performed on or adjacent to a metal wall, ceiling, or partition, move combustibles on the other side to a safe location.
E. If combustibles can not be adequately sealed off or removed, station a fire watcher at that location. The fire watcher must have adequate fire extinguishing capabilities.
F. Do not weld on materials having either a coating or internal structure that is combustible.
G. Place hot scrap and slag in non-combustible containers.
H. Ensure that fire extinguishers are available nearby.
I. Conduct a thorough examination for evidence of a fire before leaving the work area, and continue a fire check for at least 30 minutes after the welding operation has been completed.
J. Follow all company safety procedures regarding welding in hazardous areas.

CAUTION: NEVER carry a butane lighter into a welding area. These are considered to be mini-Molotov cocktails.
DON'T CARRY A BOMB IN YOUR POCKET.
**WLD-L12-LW**

**Pass a Performance Qualification Test Using SMAW on Stainless Steel Pipe**

**In the 6G Position**

Attachment 8: MASTER Laboratory Worksheet

---

**Worksheet:**

1. **Choose Proper Power Source**
   
   **Step 1.** With the procedures and electrodes used at maintenance and fabrication facilities, choose a constant current (CC) power source for the Shielded Metal Arc Welding process. Some units are a combination of constant current (CC) and constant voltage (CV). This type of power source will have one or two switches to change from constant current to constant voltage.

   **Step 2.** An alternating current (AC) welding power source could be used with the low-hydrogen family of electrodes, but choose a constant current (CC) power source if possible.

2. **Choose a Proper Electrode**
   
   **Step 1.** Choose the proper electrode for the job.

   **NOTE:** The maintenance technician uses E6010 and E7018 electrodes for most SMAW applications. The E6010 belongs to the fast-freeze family of electrodes and the E7018 belongs to the low-hydrogen family of electrodes. The E6010 provides a deep digging, deep penetrating type of weld and may be used for non-critical fabrication.

   The E7018 low-hydrogen is used as the primary electrode for fabrication and other code-quality welds. The low-hydrogen family also includes E7015, E7016, and E7048. Hydrogen in the weld deposit causes brittleness called hydrogen embrittlement, which leads to cracking and potential weld failure.

   **Step 2.** Store the electrodes properly.

   **a. Low-hydrogen electrodes:**

   (1) These electrodes are packaged in hermetically sealed (watertight) cans. Be careful not to damage the cans which would allow air and moisture to attack the electrodes in the cans.

   (2) Once the cans are opened, store the electrodes in a rod oven at 150°F to 300°F.

   (3) Re-dry electrodes that have been outside a sealed container or a properly heated rod oven for several hours by baking them one hour at 700°F to 800°F and storing them in a rod oven.
NOTE: Some welding procedures also set a time limit on the number of hours that low-hydrogen electrodes can be kept out of a rod oven prior to use. Times vary from two to four hours, depending on the type of base metal to be welded and the humidity levels of the environment.

b. Do not store the E6010 fast-freeze electrodes in rod ovens. Fast-freeze electrodes require the presence of small amounts of moisture in order to run smoothly.

Step 3.

Match the low-hydrogen family members with the polarities that are used with them (see Figure 5).

Figure 6 Typical Current Ranges for Electrodes

3. Prepare Weldment for Welding
Step 1. Oxyacetylene cut, carbon air arc gouge/cut, or machine cut/mill material to the desired shape/contour for each type of weld joint configuration needed for each welding task at hand.
   a. Weld joint configuration will depend upon:
      (1) Product design
      (2) Material thickness
      (3) Design strength requirements
      (4) Welding process employed
   b. SMAW weld joint configuration may be a:
      (1) Lap joint
      (2) Tee joint
      (3) Corner joint
      (4) Edge joint
      (5) Butt joint with backing
      (6) Butt joint without backing

Step 2. Clean the areas to be welded prior to fit-up
   a. Remove rust, paint, and any other coatings by wire brushing, grinding, sanding, or filing
   b. Remove oils and greases with a safe, suitable solvent

Step 3. Turn on the power source and set the current range (amps) on the machine at the lower end of the setting as suggested for the electrode size.

Step 4. Obtain a piece of scrap metal of the approximate type and thickness for the weld joint to be made.

Step 5. Practice welding on the scrap metal and adjust the current setting as needed to produce a good weld.

4. **Complete Welding Operation**

   Step 1. Tack weld a joint that is defect free and can be incorporated into the finished product.

   Step 2. Use any preheat that may be required by welding codes or company procedures.

   Step 3. Make the required weld to be defect free and pleasing in appearance.

   Step 4. Use proper weld bead placement according to the weld joint design.
      a. When making seam welds, produce the weld beads by using very little oscillation or some oscillation.
      b. When making fillet welds, produce the weld beads by using some oscillation. Fillet welds in the vertical position can also be run using a weaving technique.
      c. When making groove welds, produce the weld beads by using some oscillation and/or by weaving. When making groove welds on butt joints, the amount of weaving will depend on the welding position and the weld joints. It may also be limited by applicable welding codes and/or company standards.

   Step 5. Maintain the correct welding travel speed. Weld bead size can be changed by varying the arc travel speed. Bead size and travel speed are inversely
related: a decrease in travel speed will result in an increase in the weld bead height and width, and an increase in travel speed will result in a decrease in the weld bead height and width.

a. As the material thickness increases, the travel speed must slow down.

b. For a given material thickness and joint design, as the welding amperage is increased so is the arc travel speed. Conversely, as the amperage is decreased, the arc travel is slowed.

c. Higher welding speeds are attainable by using the forehand (pushing) technique.

5. Troubleshoot Welding Problems

Step 1. Be aware of the welding variables and how they can affect the weld. Below is a list of eleven welding variables for the SMAW process:

a. Type of electrode
b. Diameter of electrode
c. Type of current (AC or DC)
d. Current polarity (DC+ or DC-)
e. Current setting
f. Arc length
g. Travel speed
h. Electrode angle
i. Electromagnetic arc blow
j. Electrode manipulation technique (drag, whip)
k. Thoroughness of slag removal prior to restarts and new bead placement

Step 2. Be aware of general welding variables and how they can affect the weld:

a. Type of base metal
b. Thickness of base metal
c. Surface condition of base metal (clean, rusty, or painted)
d. Atmospheric conditions

Step 3. Be aware of any weld discontinuity and the relevant welding variables that may have caused it.

Identify GMAW Equipment
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Safely identify and inspect gas metal arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Understand ANSI A49.1, Safety in Welding, Cutting and Allied Processes, Part II-Specific Processes, 11. Arc Welding and Cutting Equipment Safety;
C. Perform routine safety inspections of protective equipment and clothing, gas metal arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area; and,
D. Understand welding related terms and definitions.

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences in equipment from previous classes
B. Illustrate safety and preventive practices
C. GMAW welding variables and adjustments to equipment
D. The most common GMAW welding applications
E. GMAW filler metal classification by AWS standards
F. Shielding gases used with GMAW
G. Power sources used with GMAW

Student Activities:

A. Select and use personal protective equipment for GMAW
B. Set up equipment for GMAW process
C. Understand the operation and purpose of the wire feeder control system
D. Discuss use of shielding gases
E. Understand the power source operation and the output curve characteristics of both constant current and constant potential power sources
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness  
b. Choose the correct electrode for given material and applications both type and size  
c. Set voltage and wire feed speed for a given application, material and material thickness  

7. Weld With GMAW Using Pulsed Spray Transfer  
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness  
   b. Choose the correct electrode for given material and applications both type and size  
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment  
   a. Inspect area for safety  
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
   c. Adjust the welding parameters for this task  
   d. Tack a T joint using GMAW  
   e. Weld 1/4" fillet welds in 2F position using string bead technique  
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1  
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"  

9. Weld Multi-Pass Fillet Welds - All Positions  
   a. Inspect area for safety  
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
   c. Adjust the welding parameters for this task  
   d. Tack a T joint using GMAW  
   e. Weld the second pass with electrode centered at the bottom toe of the first pass  
   f. Weld the third pass with electrode centered at the top toe of the second pass  
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1  

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position  
    a. Inspect area for safety  
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
    c. Adjust the welding parameters for this task  
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to bum away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M2-H01
Identify the Safety Hazards
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review ventilation requirements;
B. Provide demonstrations related to routine safety inspections of protective equipment and clothing;
C. Provide demonstrations related to ANSI Z49.1; and,
D. Provide demonstrations related to safe handling of shielding gas equipment and accessories.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment

Student Activities:
A. Use personal protective equipment
B. Set up procedure for GMAW process and equipment
C. Perform beginning welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Ensure that existing or new training materials are in compliance with the AWS documents specified for this learning objective;
B. Provide instruction related to ANSI Z49.1;
C. Reinforce previous instruction on safety; and,
D. Observe trainee following safe practices.

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used, and the differences of GMAW equipment as compared to oxyacetylene
B. Illustrate safety and preventive practices
C. Understand ventilation requirements for shielded gases
D. Use proper filter lens in helmet and protective clothing
E. Wear safety glasses, properly ground the welding machine, and secure all cylinders with safety chains or cables
F. Illustrate welding variables and adjustments to equipment

Student Activities:

A. Use preventive measures and wear protective equipment
B. Set up procedure to be followed for GMAW process and equipment
C. Perform beginning welds on T fillets and butt-joints with various metals and filler wire using single and multi-pass welds
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
      carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS
      D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step
      1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
      carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the
      first pass
   f. Weld the third pass with electrode centered at the top toe of the
      second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS
      D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of
       carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a
       1/4" fillet in the vertical position, upward using a slight weave
       technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique
WLD-M4-HO1
Identify Welding Variables and Their Effects Upon Weld Quality
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Provide demonstrations related to gas metal arc welding equipment and accessory set up;
B. Provide demonstrations related to shielding gas equipment and accessory set up;
C. Demonstrate gas metal arc welding principles of operation;
D. Identify the shielding gases relevant to the gas metal arc welding process;
E. Understand the gas metal arc welding filler metal identification and selection process;
F. Introduce related terms and definitions;
G. Follow safe practices;
H. Set up gas metal arc welding equipment and accessories;
I. Set up shielding gas equipment and accessories;
J. Develop and administer formative or diagnostic tests relevant to gas metal arc welding principals; and,
K. Demonstrate proficiency in the gas metal arc welding principles of operation, and filler metal identification/selection,

MODULE OUTLINE:

Instructional Topics:

A. Identify the type of equipment to be used and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:

A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee's and butt-joints with various metals and filler wire using single and multi-pass welds
C. Discuss welding variables to include:
   1. Filler metal classification
   2. Material thickness
   3. Joint design
   4. Type of base metal
   5. Welding process
6. Amperage
7. Travel speed
8. Shielding gas flow
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten Allen screw
   c. Screw on gas defuser and tighten Allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to gas metal arc welding component identification;
B. Provide demonstrations related to shielding gas equipment and accessory component identification;
C. Provide demonstrations related to minor external repairs on gas metal arc welding equipment and accessories;
D. Provide demonstrations related to minor external repairs on shielding gas equipment and accessories;
E. Understand related terms and definitions; and,
F. Perform repair assignments when required.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System
G. Demonstrate ability to repair welds
H. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6 to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M6-HO1
Describe AWS Electrode Classification System
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify GMAW Electrodes using AWS Classification System;
B. Identify compatibility of parent metals and electrodes; and,
C. Illustrate compatibility of parent metals and electrodes/wires by proper selection exercises.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Use GMAW filler metal classification by AWS standards
F. Select GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select GMAW electrodes using AWS and Aluminum Association Classification methods
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Illustrate GMAW Filler Metal classifications by AWS standards; and,
B. Demonstrate knowledge of aluminum alloys by practice.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select compatibility filler metal or alloys
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. **Weld Multi-Pass Fillet Welds - 4F Overhead Position**

   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. **Weld Single V Groove With GMAW**

   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. **Weld Pipe - 1G Position**

   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
Describe Most Common Weldability Problems Associated With Aluminum and Copper Alloys

Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand filler metal compatibility associated with aluminum and copper;
   and,
B. Demonstrate knowledge of weldability by selection of materials and practice.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems with aluminum and copper
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform Welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Demonstrate ability to repair welds
E. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. **Weld With GMAW Using Globular Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass  
f. Weld the third pass with electrode centered at the top toe of the second pass  
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1 

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position  
a. Inspect area for safety  
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
c. Adjust the welding parameters for this task  
d. Place the T joint in the 4F overhead position approximately at eye level  
e. Weld a 1/4" fillet weld (wire brush weld after each pass)  
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1 

12. Weld Single V Groove With GMAW  
a. Inspect the work area and equipment for safety  
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle  
c. Use grind to clean the bevel face and apply a 3/32" root face  
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon  
25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps  
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening  
f. Weld root upwards  
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.  
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion  
i. Complete the second pass using GMAW and upward Z weave technique  
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges  
k. Make fourth and final pass with the same technique.  
l. The electrode is weaved from one bevel edge to another  
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges 

13. Weld Pipe - 1G Position  
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M9-H01
Perform GMAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide demonstrations related to gas metal arc welding equipment operations;
B. Provide instruction related to gas metal arc welding principles of operation;
C. Provide instruction related to common process variables for gas metal arc welding;
D. Provide training exercises related to gas metal arc welding equipment operation;
E. Provide training exercises related to starting and maintaining an arc on plain carbon steel;
F. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel, using short circuit transfer, .035 or .045 diameter E70S-X electrodes and a CO₂ or 75% argon/25% CO₂ shielding gas;
G. Provide training exercises related to flat, multiple pass, multi-directional, surfacing welds, on plain carbon steel using spray transfer, .035 or .045 diameter E70S-X electrodes and an argon with shielding gas 2%-5% oxygen;
H. Observe trainee following safe arc welding practices;
I. Observe trainee operating gas metal arc welding equipment;
J. Visually inspect trainee’s workmanship samples; and,
K. Develop and administer formative or diagnostic tests relevant to gas metal arc welding principles of operation and common process variables.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventative practices
C. Discuss use of shielding gases for best results with specific applications
D. Illustrate welding variables and adjustments to equipment
E. Describe the most common GMAW weldability problems
F. Illustrate GMAW filler metal classification by AWS standards
G. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Select shielding gases
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Perform GMAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. **Weld With GMAW Using Globular Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M10-H01
Demonstrate Aluminum GMAW Flat, Horizontal, Vertical and Overhead
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand spray transfer process on GMAW aluminum alloys.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform selection of shielding gases and filler wire
C. Perform welds on Tee’s and butt-joints with various metals and filler wire using single and multi-pass welds
D. Perform welding in multiple positions
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
WLD-M10-HO2
Demonstrate Aluminum GMAW Flat, Horizontal, Vertical and Overhead
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
Describe GMAW Filler Wires
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand compatibility of filler metal to base metal; and,
B. Understand AWS Electrode Classification System for GMAW.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of electrode and classification markings
B. Illustrate the significance of classification numbers
C. Present mechanical property requirements
D. Present impact property requirements
E. Present chemical composition requirement
F. Describe principles of use and storage of rod and filler wire
G. Describe the most common GMAW weldability problems associated with electrodes and filler wire
H. Illustrate GMAW filler metal classification by AWS standards/classification charts
I. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Discuss GMAW filler wires, fluxes, and GMAW applications
B. Perform classification exercises, given weld specifications from the instructor
C. Discuss the importance of mechanical properties, impact properties, and chemical composition of filler wires to the welding process
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M12-H01
Demonstrate Ability to Repair Welds
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the need to repair welds;
B. Understand the removal of discontinuity; and,
C. Repair by re-weld.

MODULE OUTLINE:

Instructional Topics:
A. Identify the type of equipment to be used, and the differences of equipment
B. Illustrate safety and preventive practices
C. Illustrate welding variables and adjustments to equipment
D. Describe the most common GMAW weldability problems
E. Illustrate GMAW filler metal classification by AWS standards
F. Illustrate GMAW filler metal by Aluminum Association Metal Classification System

Student Activities:
A. Set up procedure for GMAW process and equipment
B. Perform welds specified by instructor with various metals and filler wire using single and multi-pass welds
C. Perform welding in multiple positions
D. Determine the defect or non-conformity that can be corrected by re-weld
E. Demonstrate ability to repair welds
F. Demonstrate ability to preheat weld area if necessary
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to perform the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Additional Information

- **WELDING**... that process of joining materials by applying heat or pressure, or both, to cause permanent deformation or fusion.
- **QUALITY**... the state of being free from defects or imperfections.
- **MANAGEMENT**... the process of planning, organizing, leading, and controlling to achieve the organization's goals.
- **EQUIPMENT**... tools, instruments, or apparatus used for a particular purpose.
- **ENGINEERING STANDARDS**... rules or regulations that describe the expected performance of a system or component.
- **SCHEDULE**... a plan of events or tasks to be completed over a specified period.
- **ETHICS**... a branch of philosophy that deals with the nature of good and bad actions and the nature of the right and wrong conduct of humans.
- **ATTITUDE**... a predisposition of mind that gives a ready inclination to a particular state, disposition, or type of action.
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

</table>
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the effects of variables on weld quality; and,
B. Adjust GMAW equipment to improve weld quality.

MODULE OUTLINE:

Instructor Topics:
A. Describe SMAW short circuit transfer methods
B. Emphasizes the principles involved in of GMAW machine adjustments
C. Demonstrate knowledge of voltage and amperes and their effects on welding outcomes
D. Demonstrate uses of wire and wire speed
E. Demonstrate knowledge of the proper application of welding skills
F. Identify polarity requirements using GMAW short circuit transfer on various metals
G. Increase knowledge of current industry standards and techniques
H. Identify welding variables and their effects on weld quality
I. Identify the AISI steel classification system
J. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss GMAW short circuit transfer methods
B. Set machine adjustments to approved values for welding procedure
C. Preheat weld surface
D. Adjust wire feeder mechanism, as appropriate
E. Perform single pass and multi-pass welds
F. Perform welds in four positions
G. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand codes and specifications given to produce a desired weld;
B. Understand welding techniques necessary to produce a desired weld; and,
C. Understand principles and use of short circuit transfer.

MODULE OUTLINE:

Instructor Topics:

A. Discuss applications for GMAW short circuit transfer methods
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of codes and specifications
F. Demonstrate knowledge of the proper application of welding skills
G. Demonstrate knowledge of adequate preparation of welding surfaces
H. Increase skill level to pass certification tests offered by an employer
I. Prepare butt joints, and tee joints, for welding
J. Increase knowledge of current industry standards and techniques
K. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
L. Explain short circuit transfer events of contact, melting, separation, flattening, and recontact
M. Identify polarity requirements using GMAW short circuit transfer on various metals
N. Demonstrate preheat and how to maintain desired temperature
O. Identify welding variables and their effects on weld quality
P. Identify the AISI steel classification system
Q. Match GMAW electrodes to an appropriate base metal

Student Activities:

A. Discuss principles and use of short circuit transfer
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten
      allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power
      sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

6. Weld With GMAW Using Globular Transfer

2903
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique

    2904
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand adequate machine adjustments; and,
B. Perform welds in various positions.

MODULE OUTLINE:

Instructor Topics:
A. Present the advantages and possible disadvantages of use of GMAW short circuit transfer methods for comparable applications.
B. Emphasize the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Discuss advantages and possible disadvantages of the short circuit methods
B. Select shielding gas
C. Preheat weld surface
D. Perform welds in four positions
E. Use approved welding technique
F. Perform single pass welds with thinner metals and multi-pass welds with thicker metals
G. Make adjustments to improve weld quality
Perform Weld Sequence
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements; and,
B. Understand weld techniques to produce specific welds.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M17-HO1
Understand Welding Characteristics of Various Shielding Gases
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand gas bottle safety; and,
B. Perform welds on various metals using various shielding gas and gas mixes.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass qualification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using GMAW short circuit transfer on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Select approved shielding gases
B. Preheat weld surface
C. Perform welds in four positions
D. Use approved and appropriate welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
WLD-M17-HO2
Understand Welding Characteristics of Various Shielding Gases
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld surface preparation;
B. Understand the use of solvents to clean weld surfaces; and,
C. Understand the process chipping and grinding.

MODULE OUTLINE:

Instructor Topics:
A. Weld surface preparation
B. Cleaning of weld surfaces
C. Knowledge of the proper application of welding skills
D. Knowledge of current industry standards and techniques
E. Identify welding variables and their effects on weld quality
F. Identify the AISI steel classification system
G. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-clean weld
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M19-HO1
Perform Interpass Preparation
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements;
B. Understand the use of various tools to prepare welding surfaces; and,
C. Understand the purpose of interpass.

MODULE OUTLINE:

Instructor Topics:
A. Discuss pre-heating and maintaining interpass temperatures
B. Emphasizes the principles involved in preheating and reducing the quench rate
C. Demonstrate preheat and how to maintain desired temperature
D. Demonstrate knowledge of joint design and welding terms
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Prepare butt joints, and tee joints, for welding
G. Demonstrate knowledge of the proper application of welding skills
H. Identify the AISI steel classification system
I. Demonstrate GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Increase skill level to pass certification or qualification tests offered by an employer
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Identify welding variables and their effects on weld quality
M. Increase knowledge of current industry standards and techniques
N. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds, maintaining recommended interpass temperatures
C. Use approved welding techniques
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Perform Interpass Preparation
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M20-HO1
Demonstrate Short Circuit GMAW Flat Horizontal, Vertical and Overhead
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to perform welds in flat, horizontal, vertical and overhead positions using GMAW equipment.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the need for specific techniques and adjustments that maximize weld quality in multiple positions
B. Emphasize the principles involved in the weld sequence/control of basic variables and operation of GMAW equipment
C. Demonstrate knowledge of the proper application of welding skills
D. Demonstrate knowledge of adequate preparation of welding surfaces
E. Demonstrate ability to interpret drawings and blueprints
F. Demonstrate knowledge of joint design and welding terms
G. Prepare butt joints, and tee joints, for welding
H. Identify polarity requirements using GMAW short circuit transfer on various metals
I. Maximize GMAW quality using short circuit transfer in the flat, horizontal, vertical and overhead positions
J. Increase knowledge of current industry standards and techniques
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding techniques, with major consideration for safety
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M21-HO1
Post Finish Weld
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements; and,
B. Understand adjustments of GMAW equipment to increase weld quality.

MODULE OUTLINE:

Instructor Topics:
A. Presents post-finish weld methods and techniques
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
F. Post-finish weld
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

d. 7.

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M22-H01
Describe GMAW Filler Wires
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand filler metal related to the job requirements.

MODULE OUTLINE:

Instructor Topics:

A. Discuss the process of filler wire selection; emphasizes the principles involved in the operating of GMAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Increase knowledge of current industry standards and techniques
F. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
G. Identify polarity requirements using GMAW short circuit transfer on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Identify the AISI steel classification system
K. Match GMAW electrodes to an appropriate base metal

Student Activities:

A. Select, install, and adjust electrode filler wires
B. Preheat weld surface
C. Perform welds in four positions
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten Allen screw
   c. Screw on gas defuser and tighten Allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3"
   X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M23-HO1
Describe Basic Weld Discontinuities
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the welders responsibilities related to discontinuities and defects;
B. Identify and define discontinuities and defects;
C. Understand causes of discontinuities related to shape, size and contour;
D. Understand causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Understand common causes of discontinuities related to weld and base metal properties.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the causes and prevention of weld discontinuities
B. Emphasizes the principles involved in the operating of GMAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Maximize GMAW using short circuit transfer in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using GMAW short circuit transfer on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match GMAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions
C. Use approved welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
Describe Basic Weld Discontinuities
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"
9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique

Demonstrate Pre-Weld Cleaning
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Demonstrate the safe method of cleaning surfaces to be welded using hand tools (wire brush, power tools, etc); and,
B. Describe surface preparation procedures using cleaning solvents such as acetone.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Pre-weld cleaning methods
E. Preparation and assembly of various materials and shapes
F. Describe AISI Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten
      allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power
      sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25%
      CO2
   d. List arc characteristics caused by welding with 95% Argon and 5%
      CO2
   e. List arc characteristics caused by welding with 95% Argon and 5%
      oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to perform material and weld cleaning after each weld pass is applied using wire brush, or power tools with or without cleaning solvents such as acetone.

MODULE OUTLINE:

Instructional Topics:

A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. Discussion on set-up, operation, and shut down procedures
D. Discussion of interpass cleaning techniques
E. Explain and demonstrate interpass cleaning with pipe
F. Preparation and assembly of various materials and shapes
G. Describe AISI Classification System
H. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
I. Make adjustments on GMAW equipment and process to improve weld quality
J. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:

A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Perform interpass cleaning
F. Deposit multiple pass to fill groove
Demonstrate Interpass Cleaning
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform welds using spray and pulsed spray transfer with FCAW, and GMAW equipment;
B. Identify weld variables in the weld quality; and,
C. Make adjustments to GMAW and FCAW equipment to improve weld quality.

MODULE OUTLINE:

Instructional Topics:
A. Discussion of pulse and spray machine adjustments
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes for GMAW
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate destructive and non-destructive tests on various metals welded for pipe

Student Activities:
A. Set-up welding station
B. Perform adjustments on pulse and spray machines
C. Clean weld surface
D. Tack weld joints
E. Deposit root pass
F. Perform interpass
G. Deposit multiple pass to fill groove on various metals
H. Perform destructive and non-destructive tests
WLD-M26-HO2
Demonstrate Adjustment to Pulse and Spray Transfer Machines
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Prepare material for welding;
B. Place material in a designated angle to perform weld;
C. Perform weld sequence in the flat position using GMAW spray and pulsed spray transfer;
D. Perform weld sequence in the horizontal position using GMAW spray and pulsed spray transfer;
E. Perform weld sequence in the vertical position using GMAW spray and pulsed spray transfer; and,
F. Perform weld sequence in the overhead position using GMAW spray and pulsed spray transfer.

MODULE OUTLINE:

Instructional Topics:

A. Introduction to gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive test on various metals.

Student Activities:

A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform flat groove and fillet welds, and horizontal fillet welds
E. Deposit root pass
F. Deposit multiple pass to fill groove
G. Perform vertical and overhead welds under the direct supervision of the instructor
H. Perform nondestructive and destructive testing
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten
      allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power
      sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25%
      CO2
   d. List arc characteristics caused by welding with 95% Argon and 5%
      CO2
   e. List arc characteristics caused by welding with 95% Argon and 5%
      oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given
      application, material and material thickness
   b. Choose the correct electrode for given material and applications both
      type and size
   c. Set voltage and wire feed speed for a given application, material and
      material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness  
b. Choose the correct electrode for given material and applications both type and size  
c. Set voltage and wire feed speed for a given application, material and material thickness  

7. Weld With GMAW Using Pulsed Spray Transfer  
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness  
b. Choose the correct electrode for given material and applications both type and size  
c. Set voltage and wire feed speed for a given application, material and material thickness  

8. Weld T Joints on Carbon Steel Using GMAW Equipment  
a. Inspect area for safety  
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
c. Adjust the welding parameters for this task  
d. Tack a T joint using GMAW  
e. Weld 1/4" fillet welds in 2F position using string bead technique  
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1  
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"  

9. Weld Multi-Pass Fillet Welds - All Positions  
a. Inspect area for safety  
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
c. Adjust the welding parameters for this task  
d. Tack a T joint using GMAW  
e. Weld the second pass with electrode centered at the bottom toe of the first pass  
f. Weld the third pass with electrode centered at the top toe of the second pass  
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1  

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position  
a. Inspect area for safety  
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel  
c. Adjust the welding parameters for this task  
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M28-HO1

Pre-Heat Joint, If Required; Understand Joint Preparation
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand welding requirements for penetration and preparation of surfaces; and,
B. Perform pre-heat on 3/8 and 3/4 plus 1 inch steel and aluminum plate.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to gas metal arc with spray and pulsed spray transfer, welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate non-destructive and destructive testing on various metals.

Student Activities:
A. Set-up welding station
B. Pre-heat joint
C. Tack weld joints
D. Use of spray and pulsed spray arc process
E. Clean weld surface
F. Deposit root pass
G. Deposit multiple pass to fill groove and fillet on various metals
H. Perform Non-destructive and destructive tests as assigned by instructor
WLD-M28-HO2
Pre-Heat Joint, If Required; Understand Joint Preparation
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4” X 3” X 10” pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4” fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8” X 3” X15” with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32” root face
d. Adjust GMAW equipment to run .035” ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8” root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16” above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand weld requirements from procedure;
B. Check all parameters of adjustment; and,
C. Initiate specific process from a procedure.

MODULE OUTLINE:

Instructional Topics:
A. Introduction to AISI Code requirements for GMAW for pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.
I. Perform inspection weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Perform root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand sequence of welding application;
B. Test parameters of adjustment; and,
C. Make adjustments to equipment to ensure quality of welds.

MODULE OUTLINE:

Instructional Topics:
A. Practical applications using gas metal arc with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various materials and shapes
E. Describe AISI Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, and recommended tests on various metals.

Student Activities:
A. Set-up welding station
B. Tack weld joints
C. Clean weld surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended tests on various metals
Perform Weld Sequence
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**
1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance
2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect
3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen
4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6 to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
a. Inspect the work area and equipment for safety
b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system  
c. Adjust shielding gas system and flow rate  
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage  
e. Set welding condition for spray transfer - Wire Feed Speed  
f. Set welding condition for short circuit transfer - Voltage  
g. Set welding condition for short circuit transfer - Tip to Work Distance  
h. Weld using roll welding technique
Describe AISI Stainless Steels Classification System

Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand AISI code requirements.

MODULE OUTLINE:

Instructional Topics:
A. Use of GMAW with spray and pulsed spray transfer welding plate and pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures with spray techniques
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Perform inspections and weld tests on various metals

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand chromium and stainless steel alloy compatibility; and,
B. Understand weldability problems with nickel.

MODULE OUTLINE:

Instructional Topics:
A. Production welding for Gas Metal Arc Welding Pipe
B. Discussion on the safety and health of welders
C. A discussion on set-up, operation, and shut down procedures
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with chromium, nickel, and stainless steel
G. Make adjustments on GMAW equipment and process to improve weld quality
H. Demonstrate visual, guided bend, and nick break test on various metals.

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform guided bend and nick break test
Describe Weldability Problems Associated with Straight Chromium, Nickel and Stainless Steel

Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. **Weld With GMAW Using Globular Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WLD-M33-HO1
Describe Detrimental Effects of Vibration on Life of Piping Systems
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the effects of pressure and steam on metal piping systems; and,
B. Understand the effects of vibration.

MODULE OUTLINE:

Instructional Topics:
A. Effects of pressure, steam, and vibration on piping systems
B. Gas Metal Arc Welding Pipe
C. Set-up, operation, and shut down procedures for GMAW -Pipe
D. Preparation and assembly of various alloy pipe work pieces
E. Describe AISI Stainless Steel Classification System
F. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
G. The reliability of pipe welds under stress
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended tests
J. Welding techniques to counteract stress and strain on pipe welds

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended inspections and tests on welded pipe materials
Student laboratory exercises as assigned by Instructor.

**GAS METAL ARC WELDING (GMAW)**

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

6. Weld With GMAW Using Globular Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
b. Choose the correct electrode for given material and applications both type and size
c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld 1/4" fillet welds in 2F position using string bead technique
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
g. Change weld size once proficiency is reached on 6 to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Tack a T joint using GMAW
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
a. Inspect area for safety
b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
Weld the second pass with electrode centered at the bottom toe of the first pass

Weld the third pass with electrode centered at the top toe of the second pass

Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Place the T joint in the 4F overhead position approximately at eye level
   e. Weld a 1/4" fillet weld (wire brush weld after each pass)
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X 15" with 30° bevel angle
   c. Use grind to clean the bevel face and apply a 3/32" root face
   d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
   e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
   f. Weld root upwards
   g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
   h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
   i. Complete the second pass using GMAW and upward Z weave technique
   j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
   k. Make fourth and final pass with the same technique.
   l. The electrode is weaved from one bevel edge to another
   m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
Describe Methods of Minimizing Detrimental Effects of Pressure and Heat on Life of Pipe Systems
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to understand material requirements and specifications.

MODULE OUTLINE:

Instructional Topics:
A. Analysis of detrimental effects on piping systems welds
B. Use of Gas Metal Arc Welding-Pipe
C. Discussion on the safety and health of welders
D. A discussion on set-up, control of variables, operation, and shut down procedures
E. Preparation and assembly of various alloy pipe work pieces
F. Describe AISI Stainless Steel Classification System
G. Describe the most common weldability problems with aluminum, stainless steel and carbon steel
H. Make adjustments on GMAW equipment and process to improve weld quality
I. Demonstrate recommended and approved tests on pipe materials

Student Activities:
A. Set-up welding station
B. Tack pipe of various alloys in 5G and 6G positions
C. Clean weld joint surface
D. Deposit root pass
E. Deposit multiple pass to fill groove
F. Perform recommended and approved tests on pipe weldments
Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. **Weld With GMAW Using Globular Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. **Weld With GMAW Using Pulsed Spray Transfer**
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. **Weld T Joints on Carbon Steel Using GMAW Equipment**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. **Weld Multi-Pass Fillet Welds - All Positions**
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. **Weld Multi-Pass Fillet Welds - 3F Vertical Position**
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system
c. Adjust shielding gas system and flow rate
d. Adjust GMAW gun to allow proper tip to work distance and gas coverage
e. Set welding condition for spray transfer - Wire Feed Speed
f. Set welding condition for short circuit transfer - Voltage
g. Set welding condition for short circuit transfer - Tip to Work Distance
h. Weld using roll welding technique
WLD-M35-HO1
Pass a Performance Qualification Test
Using GMAW on Pipe in the 6G Position
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):
Upon completion of this unit the student will be able to:
A. Understand the procedures and applications for GMAW pulsed spray with pipe;
B. Learn standards and codes for piping; and,
C. With practice, pass a performance qualification test.

MODULE OUTLINE:

Instructional Topics:
A. Metal pipe materials and weld characteristics
   1. Cast iron,
   2. Low carbon or medium carbon steel
   3. Higher alloy steel
      a. Stainless steel
      b. Aluminum
B. Standards and codes for piping
   1. American Society for Testing Materials (ASTM)
   2. The American Society of Mechanical engineers (ASME)
   3. American Petroleum Institute (API)
   4. American Welding Society (AWS)
C. Spray transfer methods for GMAW
D. Use of shielding gas

Student Activities:
A. Choose the correct shielding gas and flow rate for the given application, material, and material thickness
B. Choose the correct electrode for given material and applications
C. Set voltage and wire-feed speed for a given application, material, and material thickness
D. Apply welding technique
Pass a Performance Qualification Test
Using GMAW on Pipe in the 6G Position
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS METAL ARC WELDING (GMAW)

1. Assemble GMAW Gun and Name All Parts
   a. Install adapter for particular brand of wire feeder
   b. Insert liner of correct size until liner gasket meets adapter and tighten allen screw
   c. Screw on gas defuser and tighten allen screw
   d. Install contact tip
   e. Install gas nozzle
   f. Adjust gun for tip to work distance

2. Understand Gas Metal Arc Power Source
   a. Compare and contrast constant current and constant voltage power sources
   b. List effects of inductance on circuit
   c. List effects of pinch effect

3. Shielding Gas Application
   a. List arc characteristics caused by welding with 100% carbon dioxide
   b. List arc characteristics caused by welding with 100% argon
   c. List arc characteristics caused by welding with 75% Argon and 25% CO2
   d. List arc characteristics caused by welding with 95% Argon and 5% CO2
   e. List arc characteristics caused by welding with 95% Argon and 5% oxygen

4. Weld With GMAW Using Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

5. Weld With GMAW Using Short Circuit Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness
6. Weld With GMAW Using Globular Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

7. Weld With GMAW Using Pulsed Spray Transfer
   a. Choose the correct shielding gas and flow rate for the given application, material and material thickness
   b. Choose the correct electrode for given material and applications both type and size
   c. Set voltage and wire feed speed for a given application, material and material thickness

8. Weld T Joints on Carbon Steel Using GMAW Equipment
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld 1/4" fillet welds in 2F position using string bead technique
   f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1
   g. Change weld size once proficiency is reached on 6. to 3/16" go to step 1 then 5/16"

9. Weld Multi-Pass Fillet Welds - All Positions
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
   c. Adjust the welding parameters for this task
   d. Tack a T joint using GMAW
   e. Weld the second pass with electrode centered at the bottom toe of the first pass
   f. Weld the third pass with electrode centered at the top toe of the second pass
   g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

10. Weld Multi-Pass Fillet Welds - 3F Vertical Position
    a. Inspect area for safety
    b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
    c. Adjust the welding parameters for this task
    d. Position the T joint in the 3F position for vertical welding. Weld a 1/4" fillet in the vertical position, upward using a slight weave technique
e. Weld the second pass with electrode centered at the bottom toe of the first pass
f. Weld the third pass with electrode centered at the top toe of the second pass
g. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

11. Weld Multi-Pass Fillet Welds - 4F Overhead Position
   a. Inspect area for safety
   b. Use oxy-fuel gas cutting equipment cut two 1/4" X 3" X 10" pieces of carbon steel
c. Adjust the welding parameters for this task
d. Place the T joint in the 4F overhead position approximately at eye level
e. Weld a 1/4" fillet weld (wire brush weld after each pass)
f. Visual test welds for size, equal legs, acceptable weld profile to AWS D1.1

12. Weld Single V Groove With GMAW
   a. Inspect the work area and equipment for safety
   b. Use oxy-fuel cutting equipment cut and bevel two pieces of 3/8" X 3" X15" with 30° bevel angle
c. Use grind to clean the bevel face and apply a 3/32" root face
d. Adjust GMAW equipment to run .035" ER70S-3 with 75% Argon 25% CO2 shielding gas at a flow rate of 30 cubic feet per hour at approximately 16 arc volts and 100 amps
e. Using GMAW the two pieces are tacked together to produce a single V groove with a 1/8" root opening
f. Weld root upwards
g. Visual inspect finished root bead after wire brushing. Any high spots and lack of fusion are removed by grinding.
h. Using GMAW and upward Z weave technique the second weld pass is applied. The electrode is moved from one root pass to the other with a slight upward motion
i. Complete the second pass using GMAW and upward Z weave technique
j. Using GMAW and on upward Z weave technique the third pass is welded. The electrode is moved from the left toe of the second pass to the right toe on back. Each weave is accompanied by a slight upward motion. Be careful not to burn away the bevel edges
k. Make fourth and final pass with the same technique.
l. The electrode is weaved from one bevel edge to another
m. Visually inspect weld. The root reinforcement shall extend 1/16" above the base metal, have good fusion etc. The weld face shall meet D1.1 requirements and have parallel and straight edges

13. Weld Pipe - 1G Position
   a. Fit up and tack pipe according to given tolerances
b. Adjust wire feeder drive system

c. Adjust shielding gas system and flow rate

d. Adjust GMAW gun to allow proper tip to work distance and gas coverage

e. Set welding condition for spray transfer - Wire Feed Speed

f. Set welding condition for short circuit transfer - Voltage

g. Set welding condition for short circuit transfer - Tip to Work Distance

h. Weld using roll welding technique
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

**Tasks**

- M-18 Describe welding process
- M-14 Perform weld sequence
- M-19 Conduct weld test
- M-15 Perform weld sequence
- M-36 Describe weld technique
- M-29 Identify welding defects
- M-16 Control weld process
- M-10 Perform weld sequence
- M-20 Demonstrate weld preparation
- M-17 Prepare weld area
- M-22 Describe strata welding wire
- M-28 Describe welding equipment
- M-24 Demonstrate weld preparation
- M-25 Demonstrate weld sequence
- M-30 Perform weld test
- M-31 Describe weld defects
- M-8 Describe OMAW filler wires
- M-26 Describe weld test results
- M-27 Demonstrate welding equipment

**Best Copy Available**
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform safety inspection of work area;
B. Identify an unsafe work environment;
C. Understand the use of protective equipment and clothing; and,
D. Utilize FCAW equipment in a safe manner.

MODULE OUTLINE:

Instructor Topics:
A. Emphasize potential safety hazards with FCAW equipment
B. Emphasizes the principles involved in the operating of FCAW equipment
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Increase skill level to pass certification tests offered by an employer
H. Prepare butt joints, and tee joints, for welding
I. Increase knowledge of current industry standards and techniques
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions
K. Identify polarity requirements using FCAW on various metals
L. Demonstrate preheat and how to maintain desired temperature
M. Identify welding variables and their effects on weld quality
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Identify all FCAW components and analyze them for potential safety hazards
B. Preheat weld surface
C. How to perform welds in four positions recommend and approved
D. How to use larger diameter flux cored electrodes for flat or horizontal filler welds only and use smaller diameter electrodes for all positions
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform inspection of shielded and self-shielded FCAW equipment;
B. Perform equipment adjustments and repair;
C. Understand principles of FCAW process; and,
D. Understand terms and definitions.

MODULE OUTLINE:

Instructor Topics:
A. Discuss the principles involved in the operating of FCAW equipment
B. Present differences in SMAW, GMAW, and FCAW
C. Demonstrate set up of equipment and machine adjustments
D. Demonstrate applications of joint design and welding terms
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Prepare butt joints, and tee joints, for welding
G. Match FCAW electrodes to an appropriate base metal
H. Discuss electrode extension
I. Identify polarity requirements using FCAW on various metals
J. Identify the AISI steel classification system
K. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions

Student Activities:
A. Perform machine set up and troubleshooting
B. Practice using FCAW tubular electrode wire
C. Practice with proper electrode extension
D. Preheat weld surface
E. Perform welds in four positions
F. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Review safety requirements;
B. Perform Flux Core Arc Welding on steel and stainless steel in the flat, horizontal, vertical, and overhead position; and,
C. Practice FCAW using local industry standards as guidelines.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of FCAW equipment
B. Discuss the use of the FCAW flux cored tubular electrode
C. Demonstrate knowledge of joint design and welding terms
D. Demonstrate ability to interpret drawings and blueprints
E. Demonstrate knowledge of the proper application of welding skills the FCAW
F. Demonstrate knowledge of adequate preparation of welding surfaces
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Use larger electrodes in flat and horizontal positions only
J. Demonstrate FCAW in the flat, horizontal, vertical and overhead positions (using smaller diameter electrodes for vertical and overhead)
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify polarity requirements using FCAW
N. Identify the AISI steel classification system
O. Match FCAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Use proper electrode extension
C. Perform welds in four positions
D. Use recommended and approved welding technique
E. Perform single pass and multi-pass welds
F. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures with FCAW equipment; and
B. Perform shut-down procedures with FCAW equipment.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of FCAW equipment
B. Sequence of procedures for equipment shutdown
C. Securing of equipment
D. Safe maintenance and repair of equipment

Student Activities:
A. Shut down equipment, following approved sequence
B. Inspect for safety and make necessary repairs
C. Safely secure and store equipment
**WELDER**...that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

### Tasks

| M1-18 | Demonstrate machine adjustment, speed, etc. to desired weld sequence. | M1-14 | Perform full weld sequence. |
| M1-19 | Perform weld sequence. | M1-17 | Demonstrate welding characteristics of various shielding gases. |
| M1-20 | Post-class weld soundness. | M1-18 | Perform weld sequence. |
| M1-21 | Describe OMAW in various, horizontal, vertical and overhead positions. | M1-22 | Perform full weld sequence. |
| M1-23 | Pre-blow inspection, if required. | M1-20 | Demonstrate basic weld; adjust welding parameters, gases. |
| M1-24 | Post-clean weld. | M1-23 | Perform full weld sequence. |
| M1-25 | Perform weld sequence. | M1-21 | Describe OMAW filler, wire characteristics. |
| M1-26 | Perform weld sequence. | M1-22 | Describe OMAW filler, wire characteristics. |
| M1-27 | Perform weld sequence. | M1-23 | Describe OMAW filler, wire characteristics. |
| M1-28 | Perform weld sequence. | M1-24 | Describe OMAW filler, wire characteristics. |
| M1-29 | Perform weld sequence. | M1-25 | Describe OMAW filler, wire characteristics. |
| M1-30 | Perform weld sequence. | M1-26 | Describe OMAW filler, wire characteristics. |
| M1-31 | Shutoff welding equipment. | M1-27 | Describe OMAW filler, wire characteristics. |
| M1-32 | Perform weld sequence. | M1-28 | Describe OMAW filler, wire characteristics. |
| M1-33 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-29 | Describe OMAW filler, wire characteristics. |
| M1-34 | Perform weld sequence. | M1-30 | Describe OMAW filler, wire characteristics. |
| M1-35 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-31 | Describe OMAW filler, wire characteristics. |
| M1-36 | Perform weld sequence. | M1-32 | Describe OMAW filler, wire characteristics. |
| M1-37 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-33 | Describe OMAW filler, wire characteristics. |
| M1-38 | Perform weld sequence. | M1-34 | Describe OMAW filler, wire characteristics. |
| M1-39 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-35 | Describe OMAW filler, wire characteristics. |
| M1-40 | Perform weld sequence. | M1-36 | Describe OMAW filler, wire characteristics. |
| M1-41 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-37 | Describe OMAW filler, wire characteristics. |
| M1-42 | Perform weld sequence. | M1-38 | Describe OMAW filler, wire characteristics. |
| M1-43 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-39 | Describe OMAW filler, wire characteristics. |
| M1-44 | Perform weld sequence. | M1-40 | Describe OMAW filler, wire characteristics. |
| M1-45 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-41 | Describe OMAW filler, wire characteristics. |
| M1-46 | Perform weld sequence. | M1-42 | Describe OMAW filler, wire characteristics. |
| M1-47 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-43 | Describe OMAW filler, wire characteristics. |
| M1-48 | Perform weld sequence. | M1-44 | Describe OMAW filler, wire characteristics. |
| M1-49 | Demonstrate OMAW in various, horizontal, vertical and overhead positions. | M1-45 | Describe OMAW filler, wire characteristics. |
| M1-50 | Perform weld sequence. | M1-46 | Describe OMAW filler, wire characteristics. |

**BEST COPY AVAILABLE**
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW equipment identification; and,
B. Understand shielding gas equipment.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Identify the AWS GTAW filler metal classification systems
F. Match filler electrodes to base metals
G. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Set up GTAW equipment, identifying all components
B. Start up equipment, emphasizing safe procedures
C. Make adjustments to GTAW equipment and understand process steps to be followed
D. GTAW fillet and groove welds on T and butt-joints on various metals in various positions
E. Perform in process weld inspection
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
Weld a .050" fillet weld using .045" ER308-L

Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
    c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O2-HO1
Identify the Safety Standards
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand GTAW principles of operation; and,
B. Understand storage and safe handling of inert shielding gas.

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the types of shielding gas and gas mixtures
C. Identify GTAW equipment and possible safety hazards
D. Electrode holder assembly
E. Compressed gas cylinders and flow meters
F. Storage and handling of shielding gases (argon, helium)
G. Welding power sources and safe range of operations
H. Safe trouble-shooting and repair methods

Student Activities:
A. Inspect all equipment with safety as a major consideration
B. Set up and test GTAW equipment for safe operation
C. Perform a hazards analysis of the workplace
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   d. Cut stainless steel and grind a .30" bevel on edges
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
   c. Set up GTAW torch for given procedure
   d. Set current for procedure
   e. Adjust shielding gas flow rate
   f. Weld root using free hand technique and using the walking the cup method
   g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
    c. Back-up to previous weld crater holding long arc length
    d. Pre-heat crater with long arc
    e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
    c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
    d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
    c. List the names and draw side views of the T-Joint variations
    d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
    c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O3-H01
Describe the Preventive and Protective Measures
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify to gas tungsten arc welding components;
B. Use shielding gas equipment and accessories component identification;
C. Demonstrate the functions gas tungsten arc welding components;
D. Provide demonstrations in the use of protective clothing and preventive action arc welding equipment and accessories;
E. Perform minor external repairs on shielding gas equipment and accessories;
and,
F. Understand and prevent injury from electric shock, fires, explosions, lack of ventilation, and exposure to infrared and ultraviolet radiation.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance of using shielding gas mixtures in a safe manner
C. Identify GTAW equipment, and areas of greatest potential hazards
D. Discuss safe and unsafe methods of operation
E. Troubleshoot and make minor repairs
F. Matching of electrodes to base metals
G. Identify the AWS GTAW filler metal classification systems
H. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Wear protective equipment
B. Follow preventive and protective measures
C. Set up GTAW equipment
D. Make adjustments to GTAW equipment and process to improve weld quality
E. Make repairs assigned by instructor
Student laboratory exercises as assigned by Instructor.

**GAS TUNGSTEN ARC WELDING (GTAW)**

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration

a. Conduct safety inspection of the area and equipment

b. Weld on 304 stainless steel

c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

d. Cut stainless steel and grind a .30" bevel on edges

e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour

f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld

g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

b. Cut stainless steel and grind a .30" bevel on edges

c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour

d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld

e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

7. Weld 3G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

b. Cut stainless steel and grind a .30" bevel on edges

c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour

d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld

e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide instruction in gas tungsten arc welding principles of operation;
B. Understand shielding gases as related to the gas tungsten arc welding process;
C. Understand the performance and functions of aluminum and stainless steel shapes, and identification/selection;
D. Perform tungsten electrode identification/selection for plain carbon steel, aluminum and stainless steel;
E. Perform gas tungsten arc welding filler metal identification/selection for plain carbon steel, aluminum, and stainless steel; and,
F. Understand gas tungsten arc welding principles of operation, aluminum and stainless steel weldability, and filler metal classification portion of a summative closed book examination.

PRESENTATION OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Troubleshoot and make minor repairs
E. Match electrodes to base metals
F. Identify the AWS GTAW filler metal classification systems
G. The GTAW process
H. Identify GTAW welding variables and their effects on weld quality

Student Activities:
A. Identify weld variables and plan their input settings and control for quality outcomes
B. Input of variables (setting and controls) for specific welds
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Set up GTAW equipment
E. Perform in process weld inspection
F. Perform in process rework (if required)
G. Discuss weld
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system
      such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
a. Conduct safety inspection of the area and equipment
b. Weld on 304 stainless steel
c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten.

Cut stainless steel and grind a .30" bevel on edges.

Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour.

Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld.

Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel).

Prepare tungsten for given procedure.

Set up GTAW torch for given procedure.

Set current for procedure.

Adjust shielding gas flow rate.

Weld root using free hand technique and using the walking the cup method.

Apply second pass using weave.

Use non-low hydrogen electrodes.

Strike arc and hold long arc length 1" away from last weld crater.

Back-up to previous weld crater holding long arc length.

Pre-heat crater with long arc.

Shorten arc length, fill crater and continue welding.

Use low hydrogen electrodes.

Strike arc 1" from crater.

Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length.

Pause at the crater when it is filled. Continue welding.

List the names and draw side views of the five basic joint configurations.

List the names and draw side views of the variations of grooves.

List the names and draw side views of the T-Joint variations.

List the name of the type of weld made in each joint.

Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°.

Clean bevel face with grinder as required.

Cut 1/4" material for backing strip.
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
a. Locate root of weld
b. Demonstrate control of depth of cut
c. Demonstrate control of width of cut
d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
e. Make gouges of uniform depth
f. Observe discontinuities as gouging proceeds
g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
b. Measure to make sure excavation is at proper location and depth
c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
a. Check area for safety
b. Set SMAW equipment current and polarity for 1/8" E7018
c. Attach work lead
d. Preheat and maintain interpass temperature as required
e. Weld first pass paying special attention to low hydrogen techniques
f. Grind the weld start and stop to remove cold lap and lack of fusion
g. Weld the second pass starting from opposite end
h. Repeat starts and stops until weld is completed
i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
a. Check work area for safety
b. Position steel in a T joint and tack at ends
c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Provide safety tour and orientation to gas tungsten arc welding equipment and accessories, and shielding gas equipment and accessories;
B. Provide demonstrations related to ANSI Z49.1, Safety in Welding, Cutting and Allied Processes, Part II - Specific Processes, 11. Arc Welding and Cutting Equipment Safety
C. Provide demonstrations related to routine safety inspections of protective equipment and clothing, gas tungsten arc welding equipment and accessories, shielding gas equipment and accessories, required tools and the work area
D. Introduce related terms and definitions
E. Observe trainee conducting safety inspections
F. Observe trainee following safe practices
G. Observe trainee using proper terms and definitions

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify GTAW equipment
C. Inspection and safe trouble-shooting procedures for all equipment
D. Safety and handling shielding gas mixtures/containers
E. The welding power source configuration
F. How to prevent aspiration of outside atmosphere into the shielding gas
G. Gas flow rates
H. Make minor repairs
I. Electrode diameters and penetration patterns
J. Problems with weld quality related to equipment

Student Activities:
A. Set up GTAW equipment
B. Make adjustments to GTAW equipment and individual techniques to improve weld quality
C. Perform GTAW fillet and groove welds on T fillet and butt-joints on various metals in various positions
D. Perform in process weld inspection
E. Perform in process rework (if required)
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List give applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L

g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration

a. Conduct safety inspection of the area and equipment
b. Weld on 304 stainless steel
c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving fill penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using 1/2" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand AWS Electrode Classification System; and,
B. Understand “filler metal to parent metal” compatibility.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Describe the AWS Electrode Classification System
C. Identify the importance and variations of shielding gas mixtures and filler metal
D. Identify GTAW equipment
E. Types of “non-consumable” tungsten electrodes
F. Describe the possible effects on weld quality of electrode selection
G. Identify resources for research on metallurgy and metals compatibility
H. Describe Classification Systems information available from professional sources and government sources
I. Describe Library/computer software/internet resource materials

Student Activities:
A. Understand the purpose of metals classification and proper filler metal selection
B. Prepare GTAW equipment with various tungsten electrodes
C. Make adjustments to GTAW equipment and process to improve weld quality
D. Select the weld materials required based on job requirements or specification
E. Perform weld inspection following use of different sized electrodes
Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system
      such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16"
      pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L  
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration  
   a. Conduct safety inspection of the area and equipment  
   b. Weld on 304 stainless steel  
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten  
   d. Cut stainless steel and grind a .30" bevel on edges  
   e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour  
   f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld  
   g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW  
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten  
   b. Cut stainless steel and grind a .30" bevel on edges  
   c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour  
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld  
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW  
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten  
   b. Cut stainless steel and grind a .30" bevel on edges  
   c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour  
   d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld  
   e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
   a. Use non-low hydrogen electrodes
   b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
   a. Use low hydrogen electrodes
   b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
   a. List the names and draw side views of the five basic joint configurations
   b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
   a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
   b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand compatibility of filler metal to parent metal; and,
B. Use the AWS Filler Metal Classification System.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Discuss shielding gas and filler metal selection
C. Identify the AWS GTAW filler metal classification systems
D. Identify GTAW equipment and the process of introducing the use of filler metal
E. Identify the effects of filler metal on weld quality
F. Metallurgy and metals characteristics of most popular metals

Student Activities:
A. Set up GTAW equipment
B. Use AWS filler metal alloy charts
C. Perform in process weld inspection
D. Make adjustments to GTAW equipment and process to improve weld quality
E. Perform in process rework (if required)
WLD-O7-HO2
Describe AWS Filler Metal Classification System
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 4F overhead position
Weld a .050" fillet weld using .045" ER308-L

Visually inspect joint for burn through, weld size and workmanship.

Weld on 1/8" Material and 100% Penetration

a. Conduct safety inspection of the area and equipment
b. Weld on 304 stainless steel
c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purger in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld 2G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purger in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld 3G Position Using GTAW

a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purger in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. **Weld Pipe Open Root Passes All Positions Using GTAW**
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. **Produce Welds with Properly Fused Starts and Filled Craters**
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. **Low Hydrogen Starts and Stops**
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. **Design Welded Joints**
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. **Weld V Groove With Backing in Flat Position**
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. **Set Up Air Carbon Arc Equipment for Gouging**
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
e. Make gouges of uniform depth
f. Observe discontinuities as gouging proceeds
g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon
go using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
c. Attach work lead
d. Preheat and maintain interpass temperature as required
e. Weld first pass paying special attention to low hydrogen techniques
f. Grind the weld start and stop to remove cold lap and lack of fusion
g. Weld the second pass starting from opposite end
h. Repeat starts and stops until weld is completed
i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform gas tungsten arc welding equipment operations;
B. Understand gas tungsten arc welding principles of operations;
C. Understand and control common process variables for gas tungsten arc welding;
D. Start and maintain an arc on plain carbon steel, using applicable filler metal and shielding gas;
E. Start and maintain an arc on aluminum, using applicable filler metal and shielding gas;
F. Start and maintain an arc on stainless steel, using applicable filler metal and shielding gas;
G. Perform flat, single pass, surfacing welds, on plain carbon steel, using applicable filler metal and shielding gas;
H. Perform flat, single pass, surfacing welds, on aluminum, using applicable filler metal and shielding gas;
I. Perform flat, single pass, surfacing welds, on stainless steel, using applicable filler metal and shielding gas; and,
J. Following safe GTAW practices.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify the AWS GTAW filler metal classification systems
D. Identify GTAW welding variables and their effects on weld quality
E. Match electrodes or filler metals to base metals
F. Use GTAW equipment in a safe and effective manner
G. Troubleshoot and make minor repairs

Student Activities:
A. Set up GTAW equipment for welding
B. Make adjustments to GTAW equipment and process to improve weld quality
C. Perform GTAW fillet and groove welds on T fillet and butt-joints on various metals in various positions
D. Perform in process weld inspection
E. Perform in process rework (if required)
F. Perform other weld exercises in student handbook as recommended by instructor
Perform GTAW Fillet and Groove Welds on T and Butt Joints
On Various Metals in Various Positions
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system
      such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative,
      40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

Cut stainless steel and grind a .30" bevel on edges

Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour

Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld

Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
   c. Set up GTAW torch for given procedure
   d. Set current for procedure
   e. Adjust shielding gas flow rate
   f. Weld root using free hand technique and using the walking the cup method
   g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
    a. Use non-low hydrogen electrodes
    b. Strike arc and hold long arc length 1" away from last weld crater
    c. Back-up to previous weld crater holding long arc length
    d. Pre-heat crater with long arc
    e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
    a. Use low hydrogen electrodes
    b. Strike arc 1" from crater
    c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
    d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
    a. List the names and draw side views of the five basic joint configurations
    b. List the names and draw side views of the variations of grooves
    c. List the names and draw side views of the T-Joint variations
    d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
    a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
    b. Clean bevel face with grinder as required
    c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

**Duties**

A. Personal Safety Practices
   - A-1 Demonstrate a commitment to personal safety
   - A-2 Work within all established safety procedures

B. Total Quality
   - B-1 Perform job in accordance with quality specifications
   - B-2 Apply quality control procedures

C. Work Ethics
   - C-1 Follow the established work ethic through work performance
   - C-2 Perform duties as instructed

D. Communication Skills
   - D-1 Demonstrate ability to communicate
   - D-2 Read and interpret blueprints

E. Work as a Team
   - E-1 Demonstrate teamwork through cooperation
   - E-2 Perform tasks as instructed

F. Mathematical Skills
   - F-1 Perform basic arithmetic calculations
   - F-2 Apply mathematical concepts to welding problems

G. Weld-Related Requirements
   - G-1 Operate welding equipment
   - G-2 Maintain proper welding equipment

H. Reading, Layout, and Fix-Up
   - H-1 Read and interpret blueprints
   - H-2 Perform layout and fix-up procedures

I. Set-Up Welding Processes
   - I-1 Select welding processes
   - I-2 Prepare welding equipment

J. Preparing Joint for Welding
   - J-1 Align welding equipment

K. Oxyacetylene Cutting and Welding
   - K-1 Identify the type of material
   - K-2 Identify the base material

L. Shielded Metal Arc Welding (SMAW)
   - L-1 Perform welding
   - L-2 Maintain welding equipment

M. Gas Metal Arc Welding (GMAW)
   - M-1 Prepare welding equipment

**Tasks**

A-1 Demonstrate a commitment to personal safety
A-2 Work within all established safety procedures
B-1 Perform job in accordance with quality specifications
B-2 Apply quality control procedures
C-1 Follow the established work ethic through work performance
C-2 Perform duties as instructed
D-1 Demonstrate ability to communicate
D-2 Read and interpret blueprints
E-1 Demonstrate teamwork through cooperation
E-2 Perform tasks as instructed
F-1 Perform basic arithmetic calculations
F-2 Apply mathematical concepts to welding problems
G-1 Operate welding equipment
G-2 Maintain proper welding equipment
H-1 Read and interpret blueprints
H-2 Perform layout and fix-up procedures
I-1 Select welding processes
I-2 Prepare welding equipment
J-1 Align welding equipment
K-1 Identify the type of material
K-2 Identify the base material
L-1 Perform welding
L-2 Maintain welding equipment
M-1 Prepare welding equipment
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

**BEST COPY AVAILABLE**
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Identify GTAW equipment
D. Identify GTAW welding variables and their effects on weld quality with carbon steel pipe
E. Use GTAW to weld carbon steel in the 6G position on pipe

Student Activities:
A. Set up GTAW equipment
B. Perform welding process prescribed in the 6G position on pipe
C. Perform in process weld inspection
D. Perform in process rework (if required)
E. Perform other weld exercises in the student handbook, as may be assigned by the instructor
WLD-O9-HO2
Pass a Performance Qualification Test Using GTAW
On Carbon Steel in the 6G Position on Pipe
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)
1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16” pointed 2% thoriated tungsten
   d. Cut stainless steel to 0.050” X 2” X 10”
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a 0.050” fillet weld using 0.045” ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16” pointed 2% thoriated tungsten
   d. Cut stainless steel to 0.050” X 2” X 10”
   e. Fit up and tack a T joint and place in the 3F position
   f. Weld a 0.050” fillet weld using 0.045” ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16” pointed 2% thoriated tungsten
   d. Cut stainless steel to 0.050” X 2” X 10”
e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
a. Conduct safety inspection of the area and equipment
b. Weld on 304 stainless steel
c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

7. Weld 3G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten

b. Cut stainless steel and grind a .30" bevel on edges

c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour

d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld

e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. **Weld Pipe Open Root Passes All Positions Using GTAW**
   a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
   b. Prepare tungsten for given procedure
   c. Set up GTAW torch for given procedure
   d. Set current for procedure
   e. Adjust shielding gas flow rate
   f. Weld root using free hand technique and using the walking the cup method
   g. Apply second pass using weave

10. **Produce Welds with Properly Fused Starts and Filled Craters**
   a. Use non-low hydrogen electrodes
   b. Strike arc and hold long arc length 1" away from last weld crater
   c. Back-up to previous weld crater holding long arc length
   d. Pre-heat crater with long arc
   e. Shorten arc length, fill crater and continue welding

11. **Low Hydrogen Starts and Stops**
   a. Use low hydrogen electrodes
   b. Strike arc 1" from crater
   c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
   d. Pause at the crater when it is filled. Continue welding

12. **Design Welded Joints**
   a. List the names and draw side views of the five basic joint configurations
   b. List the names and draw side views of the variations of grooves
   c. List the names and draw side views of the T-Joint variations
   d. List the name of the type of weld made in each joint

13. **Weld V Groove With Backing in Flat Position**
   a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
   b. Clean bevel face with grinder as required
   c. Cut 1/4" material for backing strip

14. **Set Up Air Carbon Arc Equipment for Gouging**
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
   a. Locate root of weld
   b. Demonstrate control of depth of cut
   c. Demonstrate control of width of cut
   d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
   e. Make gouges of uniform depth
   f. Observe discontinuities as gouging proceeds
   g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
   a. Given the area of suspected discontinuity its size and depth; air carbon arc gouge using multi pass and stringer gouge to defect depth
   b. Measure to make sure excavation is at proper location and depth
   c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
   d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint 1/2" Plate
   a. Check area for safety
   b. Set SMAW equipment current and polarity for 1/8" E7018
   c. Attach work lead
   d. Preheat and maintain interpass temperature as required
   e. Weld first pass paying special attention to low hydrogen techniques
   f. Grind the weld start and stop to remove cold lap and lack of fusion
   g. Weld the second pass starting from opposite end
   h. Repeat starts and stops until weld is completed
   i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
   a. Check work area for safety
   b. Position steel in a T joint and tack at ends
   c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
   d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
   e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WLD-O10-HO1
Pass a Performance Qualification Test Using GTAW
On Aluminum in the 6G Position on Pipe
Attachment 1: MASTER Handout No. 1

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Set-up welding area and equipment;
B. Set-up work piece and purge gas; and,
C. Weld test piece according to specifications.

MODULE OUTLINE:

Instructional Topics:
A. Summary of safety precautions
B. Identify the importance and variations of shielding gas mixtures
C. Select electrode or filler metal, as appropriate
D. Identify GTAW equipment and inspect for safe operations
E. Identify GTAW welding variables and their effects on weld quality with aluminum pipe
F. Use GTAW to weld aluminum in the 6G position on pipe

Student Activities:
A. Set up GTAW equipment
B. Perform welding process prescribed in the 6G position on pipe
C. Perform in process weld inspection
D. Perform in process rework (if required)
E. Perform other exercises in student handbook, as recommended by instructor
WLD-O10-HO2
Pass a Performance Qualification Test Using GTAW
On Aluminum in the 6G Position on Pipe
Attachment 2: MASTER Handout No. 2

Student laboratory exercises as assigned by Instructor.

GAS TUNGSTEN ARC WELDING (GTAW)

1. Understand Technical Aspects of GTAW
   a. List advantages and disadvantages of GTAW
   b. List five applications where GTAW or PAW are better suited
   c. List five applications which are more suited to SMAW than GTAW
   d. Compare and contrast GTAW and plasma arc welding (PAC)
   e. List by name the parts of a GTAW torch
   f. Describe each control by name and function on the pulsed tig system such as a Lincoln square wave 350 or Miller syncrowave 351 P.
   g. Assemble the GTAW torch, water cooler and GTAW machine

2. Weld Fillet - 2F Horizontal Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 2F position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

3. Weld Fillet - 3F Vertical Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
   e. Fit up and tack a T joint and place in the 3F vertical position
   f. Weld a .050" fillet weld using .045" ER308-L
   g. Visually inspect joint for burn through, weld size and workmanship

4. Weld Fillet - 4F Overhead Position
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
   c. Set GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 1/16" pointed 2% thoriated tungsten
   d. Cut stainless steel to .050" X 2" X 10"
e. Fit up and tack a T joint and place in the 4F overhead position
f. Weld a .050" fillet weld using .045" ER308-L
g. Visually inspect joint for burn through, weld size and workmanship

5. Weld on 1/8" Material and 100% Penetration
   a. Conduct safety inspection of the area and equipment
   b. Weld on 304 stainless steel
c. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
d. Cut stainless steel and grind a .30" bevel on edges
e. Place two pieces of stainless steel in the backing purge in the 1G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
f. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
g. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

6. Weld 2G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 2G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

7. Weld 3G Position Using GTAW
   a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
   b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 3G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver

8. Weld 4G Position Using GTAW
a. Set up GTAW for high frequency start, direct current electrode negative, 40 amps. Remote current control, assemble GTAW torch. With 3/32" pointed 2% thoriated tungsten
b. Cut stainless steel and grind a .30" bevel on edges
c. Place two pieces of stainless steel in the backing purge in the 4G position fixture with a 0" gap. Using 100% Argon as the backing gas at a flow rate of 15 cubic feet per hour
d. Weld achieving full penetration while adding .062" ER308-L. Make a 2 pass weld
e. Remove from backing purge and visually inspect for full penetration. No color on welded surfaces except straw is permitted. The back or root of the weld shall be silver.

9. Weld Pipe Open Root Passes All Positions Using GTAW
a. Fit up and tack weld pipe to within procedure tolerances. (Set up GTAW equipment for welding carbon steel)
b. Prepare tungsten for given procedure
c. Set up GTAW torch for given procedure
d. Set current for procedure
e. Adjust shielding gas flow rate
f. Weld root using free hand technique and using the walking the cup method
g. Apply second pass using weave

10. Produce Welds with Properly Fused Starts and Filled Craters
a. Use non-low hydrogen electrodes
b. Strike arc and hold long arc length 1" away from last weld crater
c. Back-up to previous weld crater holding long arc length
d. Pre-heat crater with long arc
e. Shorten arc length, fill crater and continue welding

11. Low Hydrogen Starts and Stops
a. Use low hydrogen electrodes
b. Strike arc 1" from crater
c. Immediately shorten arc length and back up quickly previous weld crater. Holding short arc length
d. Pause at the crater when it is filled. Continue welding

12. Design Welded Joints
a. List the names and draw side views of the five basic joint configurations
b. List the names and draw side views of the variations of grooves
c. List the names and draw side views of the T-Joint variations
d. List the name of the type of weld made in each joint

13. Weld V Groove With Backing in Flat Position
a. Use oxy-fuel equipment to bevel 3/8" steel to 37 1/2°
b. Clean bevel face with grinder as required
c. Cut 1/4" material for backing strip

14. Set Up Air Carbon Arc Equipment for Gouging
a. List the minimum rated amperage and duty cycle for a welding machine used for air carbon arc gouging according to lecture
b. List minimum flow rate and pressure for an air compressor used in air carbon arc cutting and gouging
c. List the polarity that air carbon arc is run on
d. Describe approximate amperage settings for 1/8", 3/16", 1/4" and 3/8" carbon electrodes
e. Connect air carbon arc torch arc and compressed air hose to welding machine
f. Inspect area for safety

15. Use Air Carbon Arc to Excavate a Partial Pen Groove Weld
a. Locate root of weld
b. Demonstrate control of depth of cut
c. Demonstrate control of width of cut
d. Use air carbon arc cutting equipment to make shallow gouges (about 1/8" deep max.) with stringer technique
e. Make gouges of uniform depth
f. Observe discontinuities as gouging proceeds
g. Gouge until some weld metal is reached

16. Gouge to Excavate Defect
a. Given the area of suspected discontinuity its size and depth; air carbon 1 gouge using multi pass and stringer gouge to defect depth
b. Measure to make sure excavation is at proper location and depth
c. Use air carbon arc equipment. Shape excavation to ensure proper fusion
d. Clean area of all scale, carbon etc.

17. Make X-Ray Quality Weld Repair on a 2F Position T Joint ½" Plate
a. Check area for safety
b. Set SMAW equipment current and polarity for 1/8" E7018
c. Attach work lead
d. Preheat and maintain interpass temperature as required
e. Weld first pass paying special attention to low hydrogen techniques
f. Grind the weld start and stop to remove cold lap and lack of fusion
g. Weld the second pass starting from opposite end
h. Repeat starts and stops until weld is completed
i. Inspect and submit for non-destructive testing RT or UT

18. Produce Fillet Weld on Sheet Steel T Joints
a. Check work area for safety
b. Position steel in a T joint and tack at ends
c. Place T joint in the 2F position with a spacer on each end so the workpiece is not touching the work bench. This stops any heat sink.
d. Produce fillet welds equal in size to the thickness of the smallest joint member. With SMAW E6011, E6013 and GMAW and GTAW
e. Visually inspect to AWS D1.3
19. Produce Fillet Welds on T Joints Made Up of Both Thick and Thin Joint Members Using SMAW
   a. Inspect work area for safety
   b. Set SMAW equipment for type and size of electrode and job requirements
   c. Fit up and tack joint
   d. Weld joint keeping the major portion of heat on thicker section
   e. Clean and visually inspect

20. Use Correct Starts for Low Hydrogen Electrodes
   a. List the AWS steel electrode code last digit designation for low hydrogen electrode
   b. Set up SMAW e.g. and check for safety
   c. Using E7018 strike an arc 1" down the path of welding from where you wish to start
   d. Shorten arc length immediately to low hydrogen arc length
   e. Quickly approximate 3 times as fast as welding travel speed back up the one inch to the point at which the weld should start
   f. Stop movement at starting point and allow weld pool to form
   g. Begin normal travel speed once weld pool reaches required diameter

21. Use Correct Stops for Low Hydrogen Electrodes
   a. Use E7018 to begin weld correctly
   b. Stop increase weld travel speed
   c. Observe weld pool when weld pool size decreases to smallest possible size, break off arc by pulling away

22. Weld Using Large Diameter SMA Electrodes
   a. Set up SMAW equipment for use with 3/16" and E7018
   b. Tack up a T joint using ½" steel
   c. Set amperage from 180 to 200 DC amps
   d. Begin the weld with a low hydrogen start by using a 75° lead angle (To fight arc blow)
   e. Bring lead angle back to normal as the weld progresses 2" along joint
   f. Begin changing the lead angle to a push or forehand angle of 70° to 80° 3" from the end of joint
   g. Make multi-pass fillet welds with smooth contour
   h. Visually inspect to insure
WELDER ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

Identify and Describe the Function of Plasma Arc Cutting (PAC) Equipment

Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of equipment;
B. Understand the principles of operation; and,
C. Identify equipment and apparatus requirements.

MODULE OUTLINE:

Instructor Topics:
A. PAC power sources
B. The principles involved in PAC equipment operation
C. Process conditions and gas selection
D. Typical PAC conditions for carbon steel and aluminum alloys
E. Identify polarity requirements using PAC on various metals
F. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
G. Identify welding variables and their effects on weld quality

Student Activities:
A. Perform cutting of carbon steel and aluminum in four positions
B. Use oscillating and non-oscillating welding technique
WLD-P2-HO
Identify and Describe the Function of Plasma Arc Welding (PAW) Equipment
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand definitions and description of Plasma Arc Welding equipment;
B. Understand the principles of operation;
C. Identify equipment and apparatus requirements; and,
D. Understand safety factors with the operation and shut-down procedures.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAW equipment
B. Joint design concepts for PAW
C. Preparation of welding surfaces
D. Prepare butt joints, and tee joints, for welding
E. Demonstrate PAW in positions that are permitted for safe operations
F. Identify polarity requirements using PAW on various metals
G. Identify welding variables and their effects on weld quality

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Select and use No. 6 filter lens, with side shields, as recommended when welding with transferred arc currents up to 5A; and,
B. When welding with transferred arc currents between 5 and 15A, use a full face light green plastic shield as recommended in addition to eye protection with No. 6 filter.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAC & PAW equipment
B. Joint design and welding terms
C. Proper application of welding skills for PAC and PAW processes
D. Adequate preparation of welding surfaces
E. Increase knowledge of current industry standards and techniques
F. Demonstrate PAC & PAW in the positions that can be safely used with existing equipment
G. Identify polarity requirements using PAC & PAW on various metals
H. Demonstrate preheat and how to maintain desired temperature
I. Identify welding variables and their effects on weld quality
J. Match PAC & PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify power hook-up requirements;
B. Identify air pressure requirements for Plasma Arc Cutting (PAC) equipment;
C. Perform set-up Plasma Arc Cutting (PAC) equipment in a safe manner; and,
D. Troubleshoot Plasma Arc Cutting (PAC) equipment.

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of PAC equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAC in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAC on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAC electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions assigned and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WLD-P5-HO
Set-Up Plasma Arc Welding Equipment
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform set-up of Plasma Arc Welding (PAW) equipment in a safe manner;
B. Troubleshoot Plasma Arc Welding (PAW) equipment;
C. Understand terms and definitions of Plasma Arc Welding (PAW) processes;
D. Understand principles of operation of manual Plasma Arc Welding (PAW) [per AWS Recommended Policies for Plasma Arc Welding C5.1-73;3.2]; and,
E. Understand equipment and apparatus requirements (per AWS C5.1-73;4.1).

MODULE OUTLINE:

Instructor Topics:
A. Emphasizes the principles involved in the operating of PAW equipment
B. Demonstrate knowledge of joint design and welding terms
C. Demonstrate ability to interpret drawings and blueprints
D. Demonstrate knowledge of the proper application of welding skills
E. Demonstrate knowledge of adequate preparation of welding surfaces
F. Increase skill level to pass certification tests offered by an employer
G. Prepare butt joints, and tee joints, for welding
H. Increase knowledge of current industry standards and techniques
I. Demonstrate PAW in the flat, horizontal, vertical and overhead positions
J. Identify polarity requirements using PAW on various metals
K. Demonstrate preheat and how to maintain desired temperature
L. Identify welding variables and their effects on weld quality
M. Identify the AISI steel classification system
N. Match PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in positions approved and supervised by instructor
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
WLD-P6-HO
Perform Plasma Arc Cutting and Plasma Arc Welding on Various Materials
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Gouge ferrous and non-ferrous metals according to industry standards;
B. Cut various angles on ferrous and non-ferrous metals; and,
C. Weld ferrous and non-ferrous metals according to industry standards using Plasma Arc Welding (PAW) equipment.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAC & PAW equipment
B. Knowledge of joint design and welding terms
C. Interpret drawings and blueprints for PAC and PAW applications
D. Proper application of welding skills
E. Preparation of welding surfaces
F. Description of skill levels needed to pass certification tests offered by an employer
G. Prepare joints for welding
H. Demonstrate PAC & PAW in the flat, horizontal, vertical and overhead positions
I. Identify polarity requirements using PAC & PAW on various metals
J. Demonstrate preheat and how to maintain desired temperature
K. Identify welding variables and their effects on weld quality
L. Identify the AISI steel classification system
M. Match PAC & PAW electrodes to an appropriate base metal

Student Activities:
A. Preheat weld surface
B. Perform welds in four positions, or as approved by instructor for safe conditions
C. Use oscillating and non-oscillating welding technique
D. Perform single pass and multi-pass welds
E. Make adjustments to improve weld quality
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand shut-down procedures on Plasma Arc Cutting (PAC) and Plasma Arc Welding (PAW) equipment;
B. Perform air and gas shut-down procedures; and,
C. Perform clean-up of work area.

MODULE OUTLINE:

Instructor Topics:
A. Principles involved in the operating of PAC & PAW equipment
B. Gouging and cutting of ferrous and non-ferrous metals
C. Joint preparation and cleaning of surfaces for welding
D. Shut down sequence for PAC and PAW processes

Student Activities:
A. Perform shut down operation for PAC and PAW
B. Inspect equipment
C. Clean weld surface
D. Clean workplace and equipment

<table>
<thead>
<tr>
<th>Duties</th>
<th>Tasks</th>
</tr>
</thead>
</table>
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld specification;
B. Identify weld gages and their use;
C. Identify the symbol for weld size (specification); and,
D. Identify common causes of discontinuities related to shape, size and contour.

MODULE OUTLINE:

Instructor Topics:
A. Welding size variation and specification
B. Illustrate visual inspection
C. Identify welding variables relevant to the prevention of specific weld imperfections
D. How to gage weld size
E. How to follow a welding procedure specification (WPS)
F. When to apply multi-pass welds
G. When to apply weaving technique
H. How to determine speed of travel

Student Activities:
A. Increased knowledge and skill of weld inspection by demonstration
B. Determine weld quality for acceptability to a code or standard
C. Determine defects in weld quality
D. Perform dye penetration test
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify and define weld discontinuities and defects;
B. Identify the Welding Inspectors responsibilities relating to discontinuity and defects;
C. Identify the common causes of discontinuities related to shape, size and contour;
D. Identify the common causes of discontinuities related to internal inconsistencies and weld metal irregularities; and,
E. Identify the common causes of discontinuities related to weld and base metal properties.

MODULE OUTLINE:

Instructor Topics:
A. Welding size variation and specification
B. Visual inspection methods
C. Welding variables that can be controlled to prevent specific weld imperfections
D. How to gage weld size
E. Include nondestructive and destructive testing techniques
F. How to follow a Welding Procedure Specification (WPS)
G. Selection of samples for tests
H. Proof and leak tests
I. How to inspect for welding defects: cracks, cavities, solid inclusions, incomplete fusion, defects in weld shape and contour, arc strikes, and excessive spatter
J. Non-destructive evaluations: dye-penetrant, fluorescent penetrant, magnetic particle, ultrasonic, and radiographic
K. Destructive evaluations: mechanical (tensile and sheer), metallurgical (specimen for photomicrographs of metallic structure, defects, etc.)

Student Activities:
A. Determine weld quality for acceptability to a code or standard
B. Determine defects in weld quality
C. Perform destructive and non-destructive testing

- M-24 Perform weld sequence
- M-25 Demonstrate understanding of various welding processes
- M-26 Demonstrate understanding of various welding techniques
- M-27 Demonstrate understanding of various weld defects
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Identify weld defects;
B. Understand surface preparation; and,
C. Perform remodel of weld discontinuities.

MODULE OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for reweld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Identify weld defects; and,
B. Remove weld defects.

MODULE OUTLINE:

Instructional Topic:

A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:

A. Remove weld defect
B. Prepare weld surface for reweld
C. Check weld size using gages
D. Re-weld workpiece
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand pre-heating procedures and requirements; and,
B. Understand post-heating requirement procedures.

MODULE OUTLINE:

Instructional Topic:
A. Rationale for pre-heating and post-heating
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size
K. Post-heat, if specified

Student Activities:
A. Practice pre-heat
B. Practice post-heat
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform pre-heat;
B. Understand weld requirements; and,
C. Perform reweld as required.

MODULE OUTLINE:

Instructional Topic:
A. Describe the most common welding problems for various welding processes
B. Perform visual inspection
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
WLD-R5-HO
Repeat In-Process Inspection
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Perform in-process rework;
B. Inspect weld after repair; and,
C. Understand weld requirements.

MODULE OUTLINE:

Instructional Topic:
A. Perform visual inspection
B. Testing of welds
C. Prepare geometry for re-weld
D. Verify defect removal
E. Identify welding variables and their effects on weld quality
F. Make adjustments to welding equipment and welding techniques to improve weld quality
G. Preheat weld (if required)
H. Re-weld and repair area
I. Repeat in-process inspection
J. Check weld size

Student Activities:
A. Remove weld defect
B. Prepare weld surface for re-weld
C. Check weld size using gages
D. Re-weld workpiece
**WELDER** ... that person who is responsible for the planning, layout, fit up of materials, and operation of welding equipment to prepare the work and perform welding operations necessary to produce a work piece to prescribed engineering standards.

**Tasks**

- M1-1 Demonstrate machine adjustments (voltage, charge, wire speed)
- M2-1 Tackle welding process
- M3-1 Perform weld sequence
- M4-1 Optical weld technique
- M5-1 Understand welding characteristics of various shielding gases
- M6-1 Post-clean weld
- M7-1 Perform interpass preparations
- M8-1 Demonstrate short circuit GMAW flat horizontal, vertical and overhead
- M9-1 Perform weld
- M10-1 Describe GMAW flat welding process
- M11-1 Describe basic weld discontinuities
OBJECTIVES:

Upon completion of this unit the student will be able to:
A. Place unused materials in their assigned locations for future use; and,
B. Understand the rationale for tracking programmed materials for specific jobs.

MODULE OUTLINE:

Instructional Topics:
A. Principles of economy in the use of materials
B. Assigned locations materials located for specific jobs
C. Assigned locations for consumables
D. Tracking costs of misplaced or lost materials

Student Activities:
A. Exercises assigned by instructor to recommend location for materials and consumables
B. Estimating costs of misplaced or lost materials
OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Place tools in their assigned location; and,
B. Maintain tools in a safe condition in an available status.

MODULE OUTLINE:

Instructional Topics:

A. The significance of tools to the professional
B. How to maintain welders tools and equipment
C. How to secure welders tools and equipment
D. How to inspect the tools for operability

Student Activities:

A. Assigns locations and layout of tools
B. Practical exercise in mandatory tools
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Shut down equipment; and,
B. Secure equipment in a safe, stable, and non-operational state.

MODULE OUTLINE:

Instructional Topics:
A. Essential shut down operations (specifics are covered in other modules)
B. Equipment to be left in stable, non-hazardous state
C. Equipment to be located in safe location
D. Final inspection of equipment to preclude future loss and insure operability

Student Activities:
A. Recommended locations for all equipment
B. Inspect shop by OSHA Rules
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Secure welding gases in a safe condition; and,
B. Shut down gas operations in an approved manner.

MODULE OUTLINE:

Instructional Topics:
A. How to identify damage to compressed gas cylinders, valves, hoses, gages, and regulators.
B. Indications of leaks and corrosion
C. Contaminated valves
D. Flammable and non-flammable hazards of compressed gases used in welding process
E. Securing of lines and regulators
F. Proper storing of all gases and liquids

Student Activities:
A. Practice securing equipment
B. Practice storing or locating equipment in proper location
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Clean work area(s);
B. Use approved cleaning methods for welding equipment; and,
C. Perform final inspection of work area(s).

MODULE OUTLINE:

Instructional Topics:
A. How to clean a welding shop operation
B. Use or non-use of compressed air
C. Use of approved cleaning materials
D. Segregation of gases and equipment in approved areas
E. General layout for efficiency
F. Knowledge of hazardous chemicals

Student Activities:
A. Recommend cleaning materials
B. Recommend cleaning methods
C. Have “wall to wall” cleaning activity

4 Tasks

M.18 Demonstrate machine adjustments (voltage, amps, wire feed)
M.14 Initiate welding process in pipe and spray transfer positioning
M.21 Perform weld sequence
M.22 Demonstrate GMAW in the horizontal, vertical, and overhead positions
M.28 Demonstrate ability to work from various positions while standing on concrete for 8-hour periods
M.29 Describe welding processes in a history of documented regular attendance at work
M.30 Describe a welding environment at work
M.35 Describe the detrimental effects of smoking and lack of safety
M.36 Describe a welding environment in various positions
M.37 Demonstrate welding procedures with straight, horizontal, and overhead wires
M.38 Describe welding procedures with straight, horizontal, and overhead wires
M.39 Describe welding procedures for 100 feet
M.40 Describe welding procedures for 100 feet
M.41 Describe welding procedures for 100 feet
M.42 Describe welding procedures for 100 feet
M.43 Describe welding procedures for 100 feet
M.44 Describe welding procedures for 100 feet
M.45 Demonstrate welding procedures for 100 feet

M-19 Demonstrate welding procedures for 100 feet
M-14 Initiate welding process in pipe and spray transfer positioning
M-21 Perform weld sequence
M-22 Demonstrate GMAW in the horizontal, vertical, and overhead positions
M-28 Demonstrate ability to work from various positions while standing on concrete for 8-hour periods
M-29 Describe welding processes in a history of documented regular attendance at work
M-30 Describe a welding environment at work
M-35 Describe the detrimental effects of smoking and lack of safety
M-36 Describe a welding environment in various positions
M-37 Demonstrate welding procedures with straight, horizontal, and overhead wires
M-38 Describe welding procedures with straight, horizontal, and overhead wires
M-39 Describe welding procedures for 100 feet
M-40 Describe welding procedures for 100 feet
M-41 Describe welding procedures for 100 feet
M-42 Describe welding procedures for 100 feet
M-43 Describe welding procedures for 100 feet
M-44 Describe welding procedures for 100 feet
M-45 Demonstrate welding procedures for 100 feet
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the technologies and scope of company products; and,
B. Understand company systems and manufacturing processes.

PRESENTATION OUTLINE:

1. Company products and customer base
2. Company goals, employee goals, and quality plan
3. Company organization and support systems
4. Company production processes and technologies
5. Production work flow and job relationships
6. Company’s competitive position in world market
7. Individual employee roles and contributions to company success
8. Future growth potential for individual and company goals or services
WLD-T2-HO
Understand the Functions of Equipment Being Assembled
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the general production processes; and,
B. Understand specific equipment, major assemblies, and sub-assemblies.

MODULE OUTLINE:

1. Purpose of major assemblies and sub-assemblies in product use, operation, and functionality
2. Potential for improvement in work flow or use of tools
3. Work team interactions and responsibilities
4. Team problem-solving and continuous improvement
OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the company’s systems and subsystems; and,
B. Understand the importance of functional areas such as marketing, product design, purchasing, production planning, etc.

MODULE OUTLINE:

1. The company organization
2. Functional staff and support activities
3. Systems and sub-systems
4. Computer information applications and their use
5. Design and documentation
6. Production planning (job orders and raw materials)
7. Financial and inventory/assets
8. Quality systems, corrective action reports, and continuous improvement
9. Marketing, warranty, and customer satisfaction
10. Human resources and employee programs
11. Safety and occupational health/wellness

WLD-U1-HO
Demonstrate Ability to Lift 50 Pounds
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the methods and physics involved in lifting;
B. Understand the mechanisms and limitations of lifting;
C. Be able to lift products safely in accordance with safe methods and physical limitations; and,
D. Use lift trucks and other lift-assist equipment in a safe manner.

MODULE OUTLINE:

1. Safety and industrial health statistics for back and muscular injuries from improper lifting techniques
2. Approved methods for safe lifting within the job description
3. Use of lift assist devices on the job
4. Need for individual assessment with full consideration for physical limitation and any prior injuries
5. Procedure for physical examination by company or private physician
6. Minimizing risk for company and the individual
7. Procedure for reporting personal injuries on the job

3139
Demonstrate Ability to Tolerate Heights up to 100 Feet
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand capability to tolerate and adjust to safe working conditions from Heights; and,
B. Understand safe working conditions above ground level.

MODULE OUTLINE:

1. Types of work encountered at heights
2. Methods of securing individual and equipment
3. Methods of controlling movement
4. Backup and fail-safe systems
5. Methods of tolerating heights
6. Realistic assessment of capabilities and risks
7. Following OSHA and company approved procedures
WLD-U3-HO
Ability to Work from Various Positions
While Standing on Concrete for Extended Periods
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:
A. Understand the various positions the welder assumes while standing; and,
B. Understand the reasons for wearing personal protective equipment.

PRESENTATION OUTLINE:

1. Methods of working from the standing position
2. Approved variations of the standing position
3. Placement of fixtures, tools, and gas bottles
4. Movement of welding apparatus or machine
5. Wearing the proper shoes is important to comfort as well as safety
6. Relaxation techniques to use during break periods
7. Working with a planned approach that reduces stress
8. Walking relaxes body tension
WLD-U4-HO  
Display Ability to Work in Hot/Cold Environment for 8-10 Hours  
Attachment 1: MASTER Handout

OBJECTIVE(S):

Upon completion of this unit the student will be able to:

A. Understand the risks of working in hot/cold environment for extended periods; and,

B. Understand the need to wear protective equipment, and take appropriate measures to protect against heat-stroke or frost-bite in extreme temperatures.

MODULE OUTLINE:

1. The body's reaction to hot temperatures and radiation from the sun
2. Degree of bodily injury from heatstroke/sunstroke, sunburn,
3. Preventive measures, protective clothing and first aid
4. The body's reaction to cold temperatures, frost-bite, and wind chill
5. Degrees of injury from cold temperatures and wind chill
6. Preventive measures, protective clothing, and first-aid
7. Medical follow-up following exposure
PRESENTATION OUTLINE:

1. The worker's reputation of starting on time is one of reliability, delivery of work as promised, and ability to work as a team
2. Starting at the scheduled time may also be a reflection of dedication, lifestyle, and good health
3. Workers that are consistently late usually have a series of problems that need to be identified individually - if not addressed promptly, the worker may be released
4. If a lesser skilled supervisor or entry level worker has to fill in for a highly skilled worker, possible results are poor quality, accidents, machine maintenance problems, interruptions, and equipment down time
OBJECTIVE(S):

Upon completion of this unit the student will be able to assess personal health and fitness levels by evaluation in lifestyles, fitness components, stress management, nutrition and weight control.

MODULE OUTLINE:

1. Life scan profile
2. Heart factors and cardiovascular endurance
3. Cholesterol and blood sugar
4. Pulmonary assessment
5. Muscular and skeletal flexibility assessment
6. Muscular strength
7. Nutritional analysis
